In the second phase the firm must gather and analyze the information on the products/services to outsource and those to produce in-house and decide which to outsource. In this phase the firm must (Jennings 1996: 393-405): 1) identify the products/services to outsource and the expected performance levels; 2) give a clear definition of these products/services and identify the core competencies; 3) determine the present costs of the products/services it intends to outsource and estimate the potential economies; 4) gather references on the supplier.

The other phases that concern the selection of suppliers, contract negotiation, the transfer of activities, and the relationship to enter into with the supplier require in any case a careful evaluation and must therefore be adequately planned in order to ensure a successful outsourcing strategy.

Notes

“(1)”: By “quality” we refer to at least two correlated aspects: 1) the set of characteristics that make a given system/process/object suitable to be used for a particular purpose; this form represents the extrinsic, use, or functional quality; the set of purposes for which the system/process/object can be useful for a particular subject is defined as the use function; 2) the set of characteristics that make a system/process/object conform to a reference sample – either observed or expected – that defines its functioning; this form of quality is defined as the intrinsic, project, or instrumental quality. However, from these basic notions we can see the difficulty of defining the meaning of quality; this term is fleeting, and an understanding of it is normally left to intuition (Mella 2005: 25-52).

Migration represented and represents a very important phenomenon at global level, taking into consideration besides its demographic implications, its extremely diverse implications such as socio-economic, socio-cultural, territorial, or environmental. This represents, probably, the main reason why the research on migration is interdisciplinary, having strong connections with sociology, political sciences, history, economics, geography, demography, psychology, or law, among others. All these disciplines target different aspects of population migration, and a proper comprehension of the phenomenon implies a contribution from the part of all of them. Although migration represents a phenomenon manifested since ancient times, it has never been such an universal or significant phenomenon from the socio-economical or political perspective, as it is in present times. International migration has both a negative and positive impact on both provider and receiving countries, in general playing a very important role in the structure and dimension of the population of a country. Romania is not an exception to the previously expressed statement; furthermore, after the fall of the communist regime, migration became for Romania one of the most important socio-economical phenomena. The present paper aims at analyzing in a descriptive manner the international migration phenomenon in Romania between 1991 and 2008, from quantitative perspective. Based on data identified in the "Statistical Yearbook of Romania" - 2008 and 2009 editions - the analysis revealed the fact that both immigration and emigration flows registered oscillatory evolutions in the analysed period, but the general trend of immigration was of increasing, while the one of emigration was of decreasing. Immigration was dominated by the presence of males, of persons aged between 26 and 40 and of persons coming from the Republic of Moldova. On the other side, in the case of emigration the significant presence of females, of persons aged between 26 and 40, of persons of Romanian nationality and of those who preferred as main destination country Italy, was remarkable.

Keywords: international migration, immigration, emigration, Romania, descriptive analysis.

JEL Classification: F22, O15

Introduction

After the fall of the communist regime in 1989, migration represents one of the most important socio-economic phenomena in Romania. For many years, the high migration potential and the supposed permeability of the Romanian borders represented one of the main reasons which lead to its late adhesion to the European Union (EU) as, in general, West countries were "frightened" of the potential number of Romanian immigrants associated with a high robbery rate, expected as a consequence of the adhesion (Michalon 2005 cited in Potot 2008: 88). In the actual international frame, the migration phenomenon in Romania represents a process which, managed in a proper manner, can become an important generator of prosperity for our country. Taking into

consideration the major economical implications of migration - especially on the labour market - the present paper intends to analyse the international migration phenomenon in Romania between 1991 and 2008 in a descriptive manner from a quantitative perspective, in order to provide it a comprehensive image and to represent a starting point for potential future research on the economical implications of migration in Romania. In this sense, the present paper is structured into two parts. The first one puts forward a series of methodological aspects associated to the conducted analysis, while the second one presents the analysis' main results. The paper ends up with a series of final considerations.

Methodology

For the descriptive analysis of the international migration flows in Romania, data identified in the "Statistical Yearbook of Romania" – 2008 and 2009 editions – was processed. According to the National Institute of Statistics (2010: 39), the terms used in this paper, associated to international migration, are defined as follows:

- "International migration represents the change of permanent residence to another country or, from another country to Romania.
- Data on emigrants refer to Romanian citizens who settled their permanent residence abroad.
- Data on immigrants refer to citizens from another country who settled their permanent residence in Romania."

Furthermore, it is necessary to specify the fact that, whenever the terms of "immigration" or "emigration" are used, they refer to the number of immigrants, respectively emigrants registered during the year. Taking into consideration the above presented definitions associated to international migration, it is mandatory to outline the fact that the statistical data utilized in the analysis refer only to legal definitive migration.

Another series of data utilized in the analysis refers to population. In this sense, according to the National Institute of Statistics specifications, the population has as reference period the 1st of July of each year. "For intercensus years, the inhabitants' number has been determinate based on data from censuses and those from current evidence referring on vital and migration statistics. The inhabitants' number was calculated from data of the Population and Housing Census regarding the population with permanent residence in Romania, plus natural increase and balance of international migration determined by permanent residence changes, for population at national level" (National Institute of Statistics 2010: 37).

Before presenting the descriptive analysis, it is important to mention that the identified data were utilized for processing in the same manner they were identified in the previously mentioned sources; no transformation occurred on them.

Descriptive analysis – main findings

Between 1991 and 2008, both immigration and emigration flows registered oscillatory evolutions (Figure no. 1). In what concerns their trend orientation, in the case of immigration this was positive (the number of immigrants varying from one year to another in average with 496 persons), but in the case of emigration this was negative (the number of emigrants varying from one year to another in average with -2084 persons). Thus, it can be appreciated that, between 1991 and 2008, the general trend was of decreasing the number of persons who legally emigrated definitive from Romania. Legal immigration to Romania registered the highest value from the analysed period in 1998, when it increased with 643.26% in comparison with 1991. Starting with 2005, immigration to Romania was in continuous growth, this being potentially explained by a series of progresses associated to the regulation in the field of migration in Romania, especially in the frame of its adhesion to the EU; over the years, the regulation on migration in Romania has been improved in order to adopt the communitarian acquis in this field. Also, another factor for

explaining the increase in immigration in Romania in the previously mentioned period could be represented by the fact that, starting with 2004 the Romanian labour market expanded. In 2006, a series of branches (such as constructions or confections) were confronted with a lack of labour force; in order to solve this problem, entrepreneurs active in these branches resorted to immigrants supplying labour – especially from Turkey and China (Horváth 2007: 4). In what concerns the evolution of emigration in the analysed period, although the year 1990 was not included in the analysis, it is mandatory to outline the fact that this was the moment when legal definitive emigration from Romania reached its highest value (96929 persons). From the analysed period, the years 1991 and 1992 were the ones when were reached the highest values of emigration from Romania, the maximum being in 1991. The unstable economic and politic environments, emphasised by the political violence and interdictions generated by an administration, in general, inefficient could represent potential causes of high emigration immediately after the fall of the communist regime (Horváth 2007: 1). Also, after the fall of the communism, the free movement of the population was guarantee by the Constitution (Săseanu, Neagu and Petrescu 2010: 778). The years post-accession (2007 and 2008) represented for Romania period of increase of immigration and decrease of emigration; the quality of EU’s member, emphasised by the disequilibrium on the labour market and by the clear trends to a demographic crisis, lead to the becoming of immigration an ongoing demographic phenomenon in Romania (Neguț, di Comite and Neacșu 2010: 577). A factor of explaining the increase in immigration in Romania in 2008, could be represented by the openness – more than ever – of the labour market for individuals supplying low and medium labour (Ministerul Administrației și Internelor 2011). In what concerns the international migration balance, between 1991 and 2008, it was negative expressing a number of emigrants higher than the one of immigrants, leading to the idea according to which Romania represents a provider country of immigrants. Exceptions were registered in 2001, 2007 and 2008 when immigration surpassed emigration; 2001 being a year when the two flows tended to equalise each other (Figure no. 1).

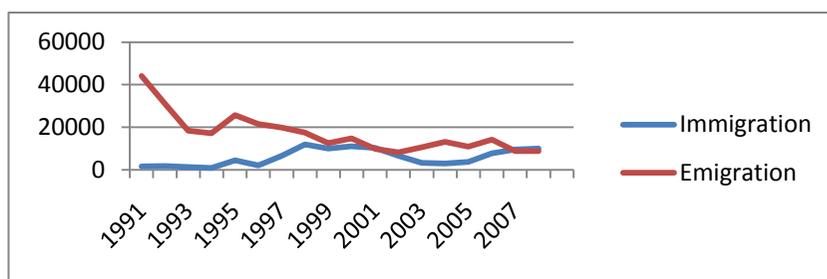

Figure no. 1: Evolution of the international migration flows between 1991 and 2008 (number of persons)

Source: produced by the authors based on data from National Institute of Statistics 2008, 2010

In what concerns the description of the international migration flows by gender, the situation is different in the case of immigration and emigration. In what concerns immigration, in every year of the period 1992-2008, the majority of immigrants in Romania was represented by males. In 1991, males only represented 36.27% out of the total immigrants (Figure no. 2). Thus, it can be stated that, during the whole analysed period, males represented the majority of immigrants to Romania, respectively 55.52%. According to the Ministry of Administration and Interior (2007), the high share of males in the total of immigrants in Romania could be explained by the migration for business; male entrepreneurs immigrants (especially those from Turkey or China) initially migrated in Romania in order to start and to develop a business, and only after reaching a stability point they proceeded to family reunification. In the case of emigration, in each year from

the analysed period, females registered a higher share in the total of emigrants from Romania, in comparison to males; the only exceptions were the years 1992 and 2001, when only 48.37%, respectively 49.49% out of the total emigrants were females (Figure no. 3). Thus, it can be appreciated that, during the whole analysed period, the highest share in the total of emigrants from Romania was represented by females (54%).

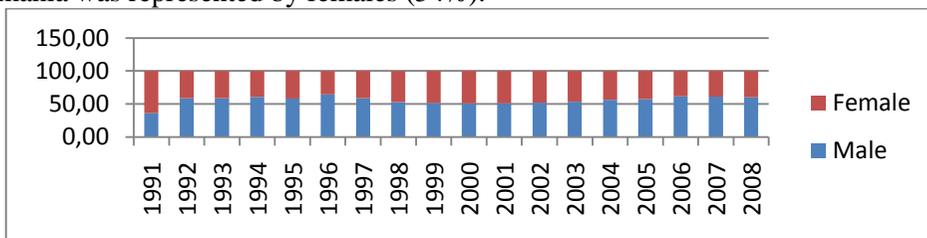

Figure no. 2: Immigration flow's structure, by gender (%)

Source: produced by the authors based on data from National Institute of Statistics 2008, 2010

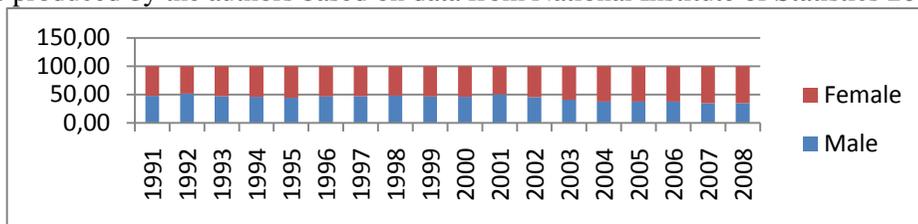

Figure no. 3: Emigration flow's structure, by gender (%)

Source: produced by the authors based on data from National Institute of Statistics 2008, 2010

Also, by dividing the total number of immigrants, respectively emigrants to Romania between 1991 and 2008 by the total population of Romania at 1st of July of each year from the mentioned period, it resulted that, in general, immigrant males have a higher share in the total of males in Romania than have the immigrant females in the total of females in Romania, while in the case of emigration females were more migratory than men in the analysed period.

Furthermore, analysing the international migration flows by age revealed the fact that in the case of immigration and emigration flows, the highest share in the total was represented by the persons aged between 26 and 40, during 1991 and 2008. This category presents a high level of interest for the labour market and it also represents a category of persons already trained, with a high innovation and work potential and extremely flexible (Constantin et al. 2004: 75) (Figure no. 4 and Figure no. 5)

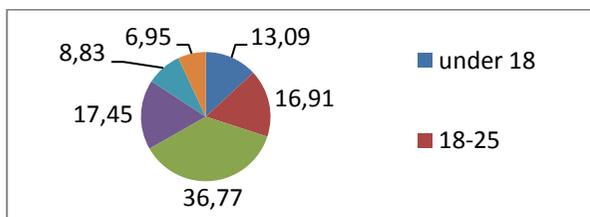

Figure no. 4: The share of the persons from the analysed age categories in the total of persons which immigrated in Romania between 1991 and 2008 (%)

Source: produced by the authors based on data from National Institute of Statistics 2008, 2010

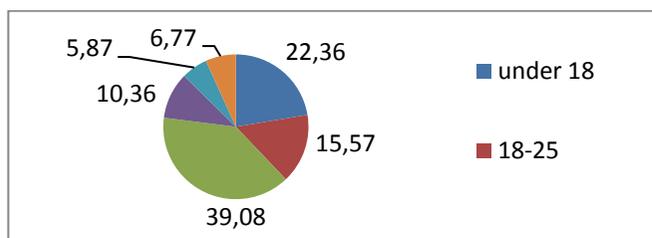

Figure no. 5: The share of the persons from the analysed age categories in the total of persons which emigrated from Romania between 1991 and 2008 (%)

Source: produced by the authors based on data from National Institute of Statistics 2008, 2010

In what concerns the analysis of the immigration flow by origin country, it could be accomplished only for the period 1994-2008 when, the majority of immigrants in Romania were coming from the Republic of Moldova (Figure no. 6).

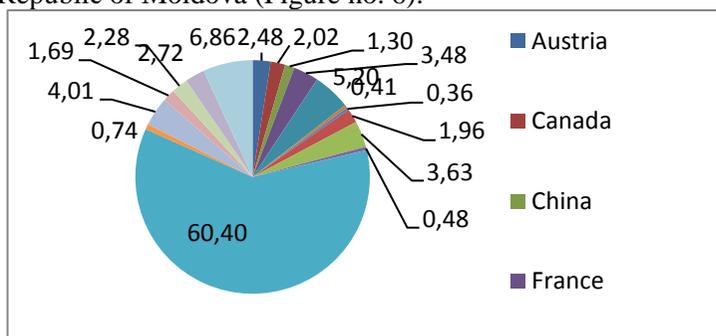

Figure no. 6: The share of the persons coming from the analysed countries in the total of persons which immigrated in Romania between 1994 and 2008 (%)

Source: produced by the authors based on data from National Institute of Statistics 2008, 2010

The descriptive analysis of emigration by nationality, revealed the fact that in all the years between 1991 and 2008 the highest share in the total of emigrants from Romania was represented by Romanians; in 2007 and 2008 they had a share of 97.27%, respectively 97.09%. Also, it is mandatory to outline the high shares of Hungarians and Germans in the total of emigrants from Romania after the fall of the communist regime, respectively the period 1991-1994, in comparison to more actual years like 2007 or 2008 (Figure no. 7). Thus, it can be appreciated that, at the beginning of the '90s, emigration was marked by the ethnic factor; on the basis of ethnic discrimination and hoping for better lives, the ethnic minorities from Romania migrated to countries to which they were historically connected (Horváth 2007: 1; Constantin, Nicolescu and Goschin 2008: 33).

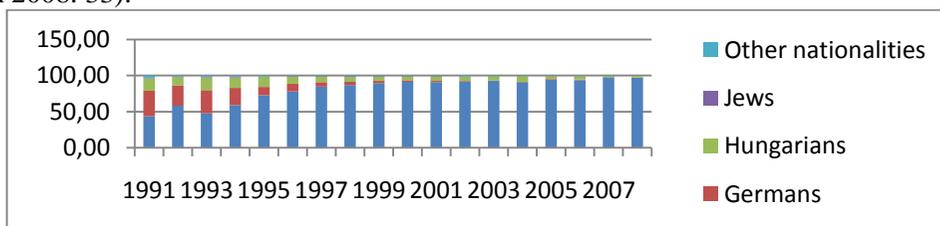

Figure no. 7: Emigration's structure between 1991 and 2008, by nationality (%)

Source: produced by the authors based on data from National Institute of Statistics, 2008 2010

Also, analysing the emigration flow by destination country, it revealed the fact that between 1991 and 2008, the vast majority of emigrants preferred Italy, followed by the U.S.A and Canada (Figure no. 8).

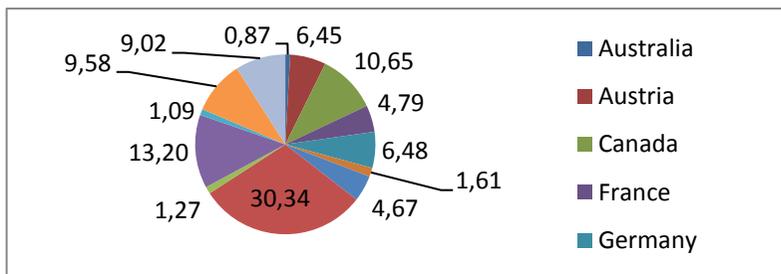

Figure no. 8: The share of emigrants from Romania in the total emigrants from Romania during 1991-2008, by destination country (%)

Source: produced by the authors based on data from National Institute of Statistics 2008, 2010

Conclusions and limits of the analysis

The descriptive analysis revealed the fact that both immigration and emigration flows registered oscillatory evolutions between 1991 and 2008. The general trend of immigration was of increasing, while the one of emigration was of decreasing. Immigration was dominated by the presence of males, of persons aged between 26 and 40 and of persons coming from the Republic of Moldova, while emigration was dominated by the presence of females, of persons aged between 26 and 40, of Romanians and of those who preferred as main destination country Italy. The major limit of the analysis is represented by the fact that, as the used statistical data refer only to legal definitive migration, the analysis does not reflect the real dimension of the phenomenon. Also, another limit refers to the fact that the period of analysis has as final point the year 2008. In this sense, future direction of analysis is represented by updating the series of data - as much as possible - in order to offer a more adequate image of the migration phenomenon in Romania, especially for analysing its evolution in economic crisis period.

THE INTANGIBLE ASSETS INVESTMENTS CHARACTERISTICS AND THE ACCOUNTING TREATMENT

Sacui Violeta

West University Timișoara Faculty of Economics and Business Administration Timisoara

Predișcan Mariana

West University Timișoara Faculty of Economics and Business Administration Timisoara

In the knowledge-based economy the fundamental determinants of the enterprise value, in the present, have an intangible nature. The intangible investments are the most important factors of the enterprise success. Wealth, growth and welfare are driven nowadays by intangible investments. The knowledge economy is characterized by huge investments in human capital and informational technology. Despite of the increased importance of intangible assets, as the source of the firm` competitive advantages, the information regarding these kind of assets, both available in the inside of the firm and, which is presented to the externals, is pour. In this paper I present the reasons for this situation.

Keywords: intangible, investments, assets, accountancy, value

Cod JEL : G31

1. Introduction

It is widely accepted nowadays that, at the begin of the 21th century, economy has become significantly different from the industrial economy previous to the mid-20th century. Economists consider that the main feature of this new economic environment is the essential role played by intangibles as a fundamental determinant of value creation in business companies.

Investment expenditures represent outlays by the firm made in the expectation of future benefits (Fisher 1930). The assets that are the result of the investments are utilized in the firms` activities in the future periods. These assets can be classified function on their nature in tangible and intangible assets.

In the knowledge-based economy the fundamental determinants of the enterprise value, in the present, have an intangible nature. The intangible investments are the most important factors of the enterprise success. Wealth, growth and welfare are driven nowadays by intangible investments. The knowledge economy is characterized by huge investments in human capital and informational technology.

With the arrival of the new information technologies, the structure of firms have changed dramatically, shifting the focus of value creation from tangible based activities to intangible based value creation (MERITUM, 2002).

2. The accounting treatment of intangible assets investments

Despite of the increased importance of intangible assets, as the source of the firm` competitive advantages, the information regarding these kind of assets, both available in the inside of the firm and, which is presented to the externals, is pour.

To a big extent, this can be attributed to the restrictive requirements imposed by accounting standards, in most countries, for the recognition of intangible investments as assets in the financial statements. The current accounting regulation does not allow companies to capitalize a big part of investments in intangibles and to report these as assets in the financial reports. I refer to intangible assets that are produced by a company. There are inconsistencies regarding the book-keeping treatment of the two categories of intangible assets: internally generated and, acquired from the outside of the firm. Generally, the intangible assets independently acquired from the outside of the firm, are capitalized at the cost implied by their acquisition. On the other

part, the costs associated with developing internally generated intangible assets are treated as expenditures and are reflected in the revenues and expenses situation.

When it comes to the recording of internally generated intangibles, very little has changed during the last decades. Traditionally, the sums allocated to the internally generated intangible assets are treated as expenses not like investments that are capable to generate long term economic benefits. The expenditures on R&D, training, marketing are not treated as capital expenditures. As a result, these funds are not capitalized on the balance sheet. This is happening in conditions in which the value of intangible investments has increased very much during the time. The amount of unrecorded intangibles assets has changed enormously in last years being huge in the present.

As a result, the ability of financial statements to provide an accurate view of the firm's financial position seems of potential for future wealth creation. *The book value* of equity is the accounting estimate of the firm's value resulting from deducting debt from the book value of assets (the accounting estimate of the economic value thereof).

Therefore, the difference between the market value and the book value of equity is explained by the existence of intangible assets that are not reflected in the balance sheet.

The proportion of tangible assets to intangible assets has changed dramatically over the past 50 years. For example, in June 2000, Microsoft's physical and financial assets represented less than 10% of its market value, and those of Cisco only 5% (Lev, 2001).

In knowledge intensive industries a firm's book value is often lower than 10% of its market value, of which the largest part are constituted by intangible assets such as relations to customers and business partners, a company's workforce, patents, trademarks or other intellectual property, organizational capital in form of superior business processes, organization structures and a unique corporate culture (Lev, 2001).

2.Intangible investments from an economic and accounting perspective. The results of research

Remaining this category of intangible assets outside of the financial situations should not be taken as evidence that businesses do not recognize the investment nature of intangibles, as they do. The absence of a great part of intangible assets from financial report is explained by the fact that it is considered that intangible investments have economic properties that, for the most part, do not fit into conventional accounting principles (L. C. Hunter, Elizabeth Webster and Anne Wyatt, 2005).

From an economic perspective, intangible investments are any expenditure not immediately embodied in physical matter, but which are intended to generate long-term benefits.

Intangible investments are only recorded in the accounting system, as assets, if the items meet the two categories of criteria (IAS 38): first, *the asset definition criteria* and, second, *the asset recognition criteria*.

As summarized in table 1, the asset definition criteria for intangible assets comprise three attributes: identifiability, control and, future economic benefits.

IAS 38 states an intangible asset as *identifiable* when it is:

- separable (capable of being separated and sold, transferred, licensed, rented, or exchanged, either individually or together with a related contract);
- or, arises from contractual or other legal rights, regardless of whether those rights are transferable, or separable, from the entity, or from other rights and obligations.

This requires apply whether an intangible asset is acquired externally or generated internally.

It is considered that an entity *controls* an asset if the entity has the power to obtain the future economic benefits flowing from the underlying resource and, to restrict the access of others to those benefits (IAS 38).

The accountancy standards include *future economic benefits* as the main feature of an asset. These may include revenue from the sale of products, services, or processes but, also, includes cost savings or other benefits from the use of an asset. The benefits generated by intangibles are incorporated into the financial accounts, but not the value of the assets unless they are acquired from outside of the enterprise.

Recognition, usually, refers to the technical accounting term of whether the asset is included in firms' financial statements (K.P. Jarboe & R. Furrow, 2008).

The accounting standards stipulate that for intangible "resources" to be included as assets in an entities' balance, they must comply with:

- a) The definition of intangible assets;
- b) The recognition criteria established in accounting regulations.

The accounting regulations agree that intangible assets are non-tangible resources (that is, without physical substance), controlled by entities from previous transactions, that will provide future economic benefits to the entity.

According IASB (2001), an item that meets the definition of an element should be recognized if:

- it is probable that any future economic benefit associated with the item will flow to or from the entity; and
- the item has a cost or a value that can be measured with reliability.

If an intangible item does not meet both the definition of and the criteria for recognition as an intangible asset, IAS 38 requires the expenditure on this item to be recognized as an expense.

In table 1 are reflected the general criteria that must be satisfied for recognizing the intangible assets in financial reports (IAS 38).

The distinguishing characteristics of intangible assets render them in many cases outside this description.

Identifiability

For an asset to be recognized under current accounting rules, it must be able to be separated (divided) from other assets of enterprise and transferable to the other entities without the loss of value.

A major problem with intangible assets is that they are often difficult to identify separately, and thus, may not match one of the fundamental requirements for accounting recognition.

It is difficult to separate intangible assets from other intangible assets and, from current expenditures. Breaking up intangibles into discrete, separable entities is difficult. Certain types of intangible assets are easier to separate than others. This is the case of components of intellectual property.

Transferability is closely tied to the issue of separability. A major question defining an asset is whether it can be transferred to other parties without losing value. In the case of intangible assets this is possible only in some cases, as with intellectual property transfers. However, many assets are purely firm-specific and contain little if any value outside of the enterprise that they belong to (K.P. Jarboe & R. Furrow, 2008). Most firm-specific forms of human capital fit into this category, as do marketing and organizational capital.

Napier și Power (1992) make difference between:

- entry separability;
- exit separability

Entry separability means that the asset can be identified as it is produced or acquired by a firm: it therefore requires that the costs of production or acquisition can be accurately assessed and identified with the asset. The accounting standards require the historical cost of an intangible asset to be ascertainable, as a basic premise for recognition.

Exit separability implies that the asset can be traded separately from other intangibles of the firm or from the firm as a whole.

Belkaoui (1992) distinguishes two main types of intangible assets: identifiable intangible assets such as patents, and unidentifiable assets, such as goodwill.

Identifiable (separable) intangibles are those which can be sold or acquired separately.

Unidentifiable intangible assets are reflected in enterprise GW and can not be transferable separately but only with the sale of the whole enterprise.

There are two basic views of goodwill: it may be understood as the consequence of a firm's above-normal ability to generate future earnings, or as a set of assets controlled by an acquired company but not reported in its financial statements.

The unidentifiable intangible assets obtained with the new company acquisition are named *external GW*. These elements including the clients, the name and location of the business, the market position, the structure of organization, prestige and creativity, human resources, are recognized in financial situation and, are recorded as assets since they are valued in a market transaction. Intangibles that are bought as a complete set, externally through the market, are included as assets since they *have a verifiable cost*.

In contrast, *self-generated goodwill* or, *internal goodwill*, does not satisfy the accountancy requirements and can not be recognized as asset in the enterprise financial report. As a consequence internally investment in brand development, workforce skills and new innovations is expensed.

The Future Economic Benefits:

The accountancy standards include future economic benefits as the main feature of an asset. The intangible asset must have capacity to contribute, single or in combination with other assets, directly or, indirectly, to future net cash inflows.

The most obvious evidence of future economic benefit is a market price. The existence of the transaction and paying a price for a element is a prove of it's recognized utility and of it's capacity to generate economic benefits as a result of utilization

It is considered that any element that is bought and sold on the market can generate future economic benefit. And, any element that creditors accept in settlement of liabilities can generate future economic benefit. And, any element that is used to produce goods or services, whether tangible or intangible, and, whether or not, it has a market price, or is otherwise exchangeable, also generates future economic benefit. Incurrence of costs may be also significant evidence of acquisition or enhancement of future economic benefits.

The current accounting systems are based on transactions. The asset recognition criteria related to the probability of benefits generation is always considered to be satisfied in the cases of intangible assets that are obtained from outside of the firms, separately, or as result of business combination. In this case there is a price that is considered both prove of benefits generation, and a reliable indicator of the value.

Since the accounting data are relied upon by managers and outside investors, the accounting rules favor objective, verifiable valuations such as arm's-length, market-based transactions (L. C. Hunter, Elizabeth Webster & Anne Wyatt, 2005).

In the case of firm's acquisition the value of intangible assets purchased (if the purchase price exceeds the book value of the assets) is reflected in the external GW. Because this type of goodwill is the result of a purchase, the accountancy principle allows recognizing it as a asset in balance-sheet. Thus, the purchase puts a value on the intangibles.

The real world phenomena that do not find the origin in past transaction (the elements of internal GW) are not considered suitable for recognizing in financial report (J. García-García & M. I. Alonso de Magdaleno, 2010).

The condition related to the probability of future economic benefits generation is not considered satisfied in the case of this kinds of assets because does not exist neither a benefits generation prove, nor a reliable indicator of the value.

Thus, the risk of these assets is generally higher than that of physical assets, so the property rights over these assets are often not fully capitalized by the company (J. García-García & M. I. Alonso de Magdaleno, 2010).

It must be rejected the argument that costs are assets. Although an entity normally incurs costs to acquire or use assets, costs incurred are not themselves assets. The essence of an asset is its future economic benefit rather than whether or not it was acquired at a cost.

In the efforts made in purpose of recognizing the intangible assets in the balance sheet there are many problems that must be solved related to determine whether future economic benefit will be truly available and, quantifying it, especially, if obtaining of benefits is far away.

The question that requires answer is: how can be treated an element in the following situations:

- in the case in which the value of estimated future benefits is highly uncertain or, even, doubtful;
- in the case in which the future benefits may appear during the short time;
- in the case in which the duration of obtaining benefits is highly uncertain.

The element must be recognized as asset in balance-sheet, expensed, or reflected as a loose? Expenditures for R&D are examples of items for which management's intent clearly is to obtain or increment future economic benefits but for which there is uncertainty about the extent, if any, to which the expenditures succeeded in creating or increasing future economic benefits (J. García-García & M. I. Alonso de Magdaleno, 2010).

The control

The accountancy standards require that for an entity to be able to consider an element in balance-sheet she must be capable to control an item's future economic benefits.

The necessary conditions to control an element are as following:

- the entity has capacity to obtain future economic benefits as result of owning and exploiting the asset;
- the entity has capacity to restrict access of others to these benefits.

The classical view of control over assets is based on scarcity. To enjoy an asset's benefits, an entity generally must be in a position to deny or regulate access to that benefit by others (J. García-García & M. I. Alonso de Magdaleno, 2010).

An entity, usually, gains the ability to control an asset's future economic benefits through a legal right. But the firm can appeal to other methods for this. One of the methods utilized is keeping secrets through the employer's confidentiality.

L. C. Hunter, Elizabeth Webster & Anne Wyatt (2005) mentioned that, generally, exist a limit regarding the enterprise capacity to control the estimated intangible assets benefits for two reasons:

- the domination of the production process by the people (and not by the equipments);
- the ease of copying non-embodied forms of intellectual capital.

Conclusions:

The accountancy standards has not taken steps to allow for the capitalization of most internally generated intangibles. The economic tension lays in the inherent property rights problem associated with the benefits from intangible investment: it is often difficult to obtain defensible property rights because the intangible asset is embodied, often, in employees who cannot be owned. From an economic perspective, this problem does not change the "investment" nature of the expenditures. As a result, the ability of financial statements to provide an accurate view of the firm's financial position seems to have decreased over the last few decades, along with the

increase in the importance of intangibles. The information provided by companies to the financial markets is primarily based on traditional tangible investments in fixed assets, whereas value is more and more relying on investments in intangible assets.

EUROPEAN CROSS-BORDER MERGERS AND ACQUISITIONS- REALITIES AND PERSPECTIVES

Vancea Mariana

University of Oradea Faculty of Economics

This paper analyses the impact of the economic and financial crisis on merger and acquisition activity in Europe and the latest trends manifested on the cross-border merger and acquisition market involving European companies. Thus, a first objective of this research is to reveal the evolution of the European cross-border merger and acquisition activity in terms of dynamics, volume and structure. Another objective of this research is to reveal the short and medium term perspectives on mergers and acquisitions in Europe. Thus, under the continuous economic recovery of the European countries and the other worldwide economies, the recovery of financial markets and the growth of corporate profits, we shall witness an intensive cross-border merger and acquisition activity in Europe. The expansion engine of these operations seems to be represented by the emerging economies. This research is based on a systematic, logical and comparative analysis of scientific literature and statistical data regarding the cross-border mergers and acquisitions that involve European companies in recent years. This paper is part of the doctoral thesis "Mergers and acquisitions- strategies of growth and development of enterprises. European and national particularities", coordinated by professor Ph.D. Alina Bădulescu from University of Oradea, Faculty of Economics. The doctoral research is supported by The Sectorial Operational Program for Human Resources Development 2007-2013, Contract POSDRU 59/1.5/S/1- "Romanian researchers through modern and efficient doctoral programs".

Introduction

This paper is part of the doctoral thesis "Mergers and acquisitions- strategies of growth and development of enterprises. European and national particularities", coordinated by professor Ph.D. Alina Bădulescu from University of Oradea, Faculty of Economics. The doctoral research is supported by The Sectorial Operational Program for Human Resources Development 2007-2013, Contract POSDRU 59/1.5/S/1- "Romanian researchers through modern and efficient doctoral programs".

In the light of recent events that took place on the global economic scene, this paper intends to analyze the impact of economic and financial crisis on merger and acquisition (M&A) activity in Europe and the recent trends shown on the cross-border activity that involved European companies. Thus, in the first part we revealed some aspects regarding the literature on cross-border M&As. The next part deals with a recent analysis of the European activity evolution on cross-border M&As in terms of dynamics, volume and structure. The fourth part of this paper presents the short and medium term perspectives on M&As in Europe. Finally, there are some conclusions drawn from the research that was conducted.

Research methodology

This research is based on a systematic, logical and comparative analysis of scientific literature and statistical data regarding the cross-border M&As that involve European companies in recent

years. Thus, we carried out a quantitative analysis revealing the impact of the economic and financial crisis on M&A activity in Europe and the latest trends manifested on the cross-border merger and acquisition market involving European companies.

A brief review of the literature on cross-border mergers and acquisitions

In the literature, several studies have examined the field of cross-border M&As. Thus, some researches focused on the macroeconomic determinants of cross-border activity (Neto, Brandão și Cerqueira 2010: 21-57; Manchin 2004: 4; Rossi and Voplin 2004). Martynova and Renneboog (2006: 3-4) or Evenett (2003: 443,445) analysed cross-border M&As since 1990s, period that represented the first truly international merger wave, one of its characteristics being the large the share of cross-border activity in the total volume of M&A. Another research area, in cross-border M&As, is represented by their effects on the corporate performance and on shareholders' value creation (Goergen and Renneboog 2004: 9-45; Gugler, Mueller Yurtoglu and Zulehner 2003: 625-653; Moeller and Schlingemann 2003: 533-564). They discovered that the performance of cross-border deals is lower than in the case of domestic operations.

The impact of economic and financial crisis on European cross-border mergers and acquisitions and recent trends

After a five-year period of continuous growth of merger and acquisition activity, touching the peak in 2007, the European M&As have recorded a downward trend since 2008 due to economic and financial crisis. European economy, as well as other world economies, has been seriously affected by economic recession and financial markets turmoil. Economic and financial crisis has spread rapidly throughout the world, reflecting the interdependence of economies. The year 2008 marked the end of a four-year cycle of steady worldwide growth, in Europe too obviously, which reached climax in 2007 with a value volume of cross-border M&As never seen before. The increase of M&As between 2004 and 2007 was favoured by sustained growth of worldwide economy, liberalization of trade and investment regimes and the adoption of large-scale internationalization strategies by many transnational corporations.

The recession that began in 2008 has forced many potential acquirers to change their expansion plans by means of acquisition. Acquirers wishing to continue the taking-over process were to find out that the access to finance was severely affected. Many bidders who have signed agreements with target companies have sought to renegotiate the transaction or waive it. Thus, many transactions were void. However, as often happens in times of recession, companies with large capital provisions have taken advantage of the opportunities arising on the merger and acquisition market. The year of 2009 recorded the lowest level of merger and acquisition activity, both in terms of their value and number. Europe was severely affected by this recession, and within it, the European Union whose companies were major acquirers, but also main targets on the global market of M&A. The EU registered a pronounced decrease related to this activity. This reflects the strong economic relations that exist, on the one hand, between the European Union and the rest of the world, and on the other hand, between the Member States of the Union. The longest and deepest economic recession in the history of the European Union economy, as it is characterized by the European Commission in the economic forecast of 2009 (European Commission 2009:7), resulted in a notable decline of trade and investment flows between the EU and the world, but also among the Member States.

Diminishing the profits of companies and the stock market drop had severely decreased the value and number of cross-border M&As. At the same time, the decrease of demand for goods and services has prompted companies to restrict their investment plans abroad, both through M&As and Greenfield investments, although the latter declined since 2009. The decrease in cross-border M&As has contributed most significantly to the decline of foreign investment flows in 2009, which decreased by 34% worldwide (65% in value), compared to a 15% decrease in the number

of greenfield investment (UNCTAD 2010a:9). The global crisis reduced the funding available for FDIs and merger and acquisition operations.

According to UNCTAD statistics, the global cross-border M&As in 2008 declined by 30.9% to \$706.5 billion compared to the record level registered in 2007 of \$1,022.7. The decline was more pronounced in 2009, therefore the amount of worldwide cross-border M&As had declined by 64.6% compared to the previous year, reaching only \$249.7. The crisis impact on cross-border M&As is obvious, as seen by different regions and economies. Among developed economies, Europe, and especially the **EU-27** economy (which weighs significantly in the total of merger and acquisition activity across Europe) was seriously affected. Thus, net sales in developed Europe cross-border activity declined by 51% both in 2008 compared to 2007 and 2009 compared to 2008 and they reached 133,871 billions \$ in 2009. EU economy faced a 52,3% decline in net sales in 2008 compared to the peak year 2007, respectively 53,7% in 2009 compared to 2008 and reached 116,226 billions dollars, which reflected an emphasis of the recession this year. In 2008 the collapse of M&As that had as target EU companies was more pronounced compared to the one recorded worldwide (30.9%) and by the group of developed countries (34.8%). In 2009, all worldwide regions and economies were badly affected and the downward trend generalised even in countries that had not been affected in the previous year (e.g. in U.S. mergers and acquisitions of companies have continued to grow in 2008 by 37.8% compared to 2007, but in 2009 they have decreased by 82.3%).

Regarding the purchases performed by developed Europe's corporations, these dropped by 36,9% in 2008 compared to 2007, the decline being more pronounced in 2009 when purchases declined by 71,3% compared to 2008, summing up only 102,709 billions dollars. Net purchases realised by EU companies, initially dropped by 42,9%, the decline being more pronounced in this case than for the group of developed countries whose acquisitions have decreased by 32,5% or for Japan whose purchases increased by 85,7%, but less pronounced than in the case of the U.S. whose acquisitions have decreased by 60,9%. In 2009 net purchases realised by UE corporations fall out by 70,7% compared to the previous year at 89,694 billions dollars and the decrease in was even more pronounced than in USA (-66,1%) or Japan (-69%).

Transition economies in South-Eastern Europe were also severely affected, although the amount of their value was much lower than that of developed countries. Practically, on the international merger and acquisition market, the companies located in these countries have played a predominant role of targets of these operations. In terms of cross-border merger and acquisition value in South-Eastern Europe and CIS, in 2008, decreased by 33% compared to the previous year, so that from \$20,337 billion it reached \$7,125 billion. In 2009, the decline was more pronounced, summing up 65%, so that net sales reached only 896 millions dollars. This severely decrease was due to the decline in acquisitions made by the EU-15 companies, which were the main acquirers in the area. Actually, in the last years, firms from UE-15 concentrated their attention on the new member states UE-12 and on the other emerging countries of Europe.

The extent of the decline in cross-border activity was more pronounced in the old member states than in the new ones. The main European bidders came from UE-15 (Great Britain, France, Germany, Italy, Spain), but the global recession produced dramatic changes in the major investors hierarchy. Thus, Great Britain had to cede the leader position in cross-border purchases to France. On the other hand, UE-15 countries represented main targets in European cross-border activity, and the top five countries by net sales value includes Great Britain, Netherlands, Spain, Germany and France. Still, these countries were most affected by the recession, but still Great Britain kept his leader position.

Two thirds of cross-border M&As have involved developed countries, but the share of developing and transition savings, as targets of such transactions, had increased from 26% in 2007 to 31% in 2009 and 34.4% in 2010. European companies were the targets in about 42% of

cross-border M&As in the peak year 2007, their share decreasing thereafter up to 35% in 2010. As purchasers, in 2007 the share of European bidders was 44,4% in the total cross-border volume and it fell to 34,6% in 2010 (UNCTAD 2010:4).

If we look at the EU share in the global cross-border sales, we can observe that the share declined from 52% in 2007 to 47% in 2010 (we mention that the data for 2010 covers only the first five months) and the share of purchases declined from 53% in 2007 to 15% in 2010. USA improved its position both in terms of sales and purchases in the global cross-border activity and Japan improved its position especially regarding purchases. However, UE as entity maintained its global leader position in terms of sales and purchases and is still occupying a place at the forefront globally.

Table no 1. The evolution of UE share in the total volume of cross-border mergers and acquisitions, compared to USA and Japan (in billions of dollars and %)

Region/Economy	Net sales				Net purchases			
	2007	2008	2009	2010	2007	2008	2009	2010
World	1022,7	706,5	249,7	125,2	1022,7	706,5	249,7	125,2

Source: UNCTAD Statistics and own calculations:

http://www.unctad.org/sections/dite_dir/docs/wir2010_anxtab_9.pdf;

http://www.unctad.org/sections/dite_dir/docs/wir2010_anxtab_10.pdf;

Regarding sectorial distribution of European cross-border activity, the impact of the crisis across sectors resulted in a shift in their relative weight in the total value of M&As. The manufacturing industry was the most affected, but the decline was felt also by the primary sector and services (financial services or business services, have recorded a sharper decline) (UNCTAD 2010a: 11).

Despite these adverse evolutions in 2008 and 2009, in the first half of 2010, on the cross-border merger and acquisitions market that involved European companies was outlined a revival of operations and a restart of an upward trend. Thus, the value of cross-border M&As increased by 36% in first five months of 2010 (UNCTAD statistics provide data only until May 2010), compared to the same period of the last year. This reflects the upward trend following the economic growth in the countries of target and acquirer companies, corporate profitability growth and share price growth.

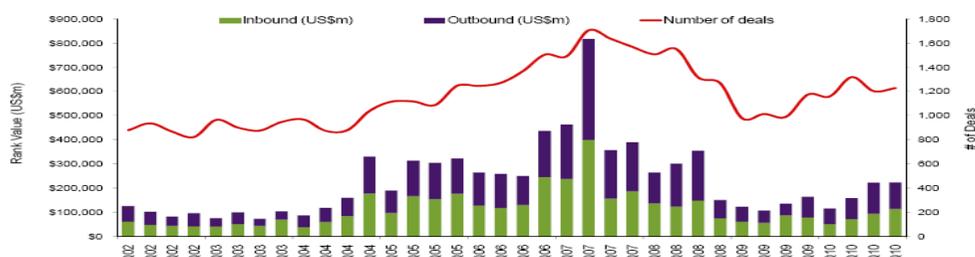

Figure no 1. Evolution of European cross-border mergers and acquisitions

Source: Thomson Reuters, *Mergers and Acquisitions Review, Financial Advisors, 2010: 9*, https://online.thomsonreuters.com/DealsIntelligence/Content/Files/Global_MA_%20Financial_Review.pdf

If UNCTAD statistics provide for the moment data on M&A only for the first half of 2010 (from which general trends can be inferred), the Thomson Reuters company has published a report on merger and acquisition activity for the year 2010. Thus, according to the report drafted by Thomson Reuters company (2010: 9) the year 2010 marked an increase in merger and acquisition activity so that cross-border M&As involving European companies summed up \$716.1 billion, which represented a growth by 35.8% compared to 2009. After a slight decrease in the value of cross-border mergers and acquisitions during the first quarter of 2010, starting with the second quarter and particularly in the second half of 2010, the value of cross-border transactions began to significantly increase. This was due mainly to European corporations, whose acquisitions had increased compared to 2009 by 57.2% to \$388.1 billion.

Short and medium term prospects of cross-border merger and acquisition activity

After the worldwide economy has experienced a deep recession, since 2010 the economic recovery (reflected by the increased production and foreign trade) included most economies, while the EU along with other major economies of the world acted to restore the worldwide financial stability and economic growth. In this context, the prospects for merger and acquisition activity on short and medium term are optimistic, being reinforced by the favourable development recorded in 2010. UNCTAD estimates, in *World Investments Prospects Survey 2010-2012* (2010b: 4), indicate a medium-term optimism related to the business field. Restructuring in the field of industry and privatizing companies (it is expected a new round of privatization within the European countries with large public debt) that were saved during the worldwide turmoil will generate further opportunities in terms of cross-border mergers and acquisitions for corporations.

According to the latest forecast made by the International Monetary Fund, the recovery from recession in Europe continues to make headway but is still modest. However, if the developed countries in Europe record a smaller growth, for 2011 and 2012 being projected increases by 1.7% respectively 1.9%, the emerging states in Europe present a more accelerated growth by 3.7% in 2011 and 4% in 2012 (IMF 2011: 67). Taking into account this scenario, we believe that 2011 will reflect a more dynamic evolution of merger and acquisition activity in Europe and, thus, a continuation of the upward trend started in 2010. This will be encouraged by the fact that the financial situation of corporations has a tendency to improve (corporate profits began to grow), the stock market has increased compared to 2009 and corporate and industrial restructuring is creating new opportunities for acquisitions, especially for the corporations in the emerging countries. By the year 2009, if companies were facing great difficulty in financing M&As, since 2010, the demand for loans to finance external growth operations has increased, fueled by an attenuation of credit standards. The investigation conducted by the European Central Bank in January this year reflects the fact that financing M&As still had a positive impact on the

corporate loan demand, which reflects the desire of companies to resume expansion projects (ECB 2011:7).

In Europe is expected a growth of the operations performed by corporations located in developing countries that are increasingly eager to expand on developed markets. Within the European Union, although the economic recovery is still fragile and unevenly distributed among the Member States, yet this will encourage the corporations in developed countries to expand, in order to enhance the competitive position and access to new markets. Although the developed economies of Europe remain the place where most transactions related to M&As are carried out, there is an increase in the share of these transactions within the European transition economies. We notice a decrease in interest for developed countries concerning M&As and an increase in interest for companies located in transition economies. According to UNCTAD (2010b:12) the top destination regions for investments such as M&As are South-East Asia, the EU-15, North America, Latin America and the Caribbean region, the new EU-12 Member States, South-Eastern Europe and CIS.

Conclusions

The strong decline of cross-border M&A activity in Europe in 2008 and the highlight of the downward trend in 2009 were caused by the reduction of opportunities for companies to invest, as a consequence of restricting the access to financial resources internally (as a result of corporate profits decrease) and externally (due to the reduction of the available liquidity and the increase of funding cost). On the other hand, the market deterioration due to economic recession which practically affected all economies and the unfavourable economic prospects had adversely influenced the companies' predilection to invest. As a result of the global economic slowdown and the recession that affected most economies, the more difficult credit conditions, the sharp reduction of corporate profits and the stock market decline, many companies were forced to abandon their expansion plans and hence the merger or acquisition projects. However, due to the worldwide economic growth that was recorded, the recovery of financial markets, the corporate profit growth, the investment appetite for expansion, national and international development increased significantly since 2010, which was reflected in an increase European cross-border activity. In conclusion, under the continuous economic recovery of the European countries and the other worldwide economies, the recovery of financial markets and the growth of corporate profits, we shall witness an intensive cross-border M&A activity in Europe. The expansion engine of these operations seems to be represented by the emerging economies, whose companies will represent not only attractive targets but also acquirers eager to expand on developed markets.

VISITOR AND EXHIBITOR CLUSTERS AT EASTERN-EUROPEAN AGRICULTURAL FAIRS

Varga Levente

University of Debrecen, Debrecen, Hungary

Faculty of Applied Economics and Rural Development

There is no exact information concerning the economic effect of the agricultural exhibitions neither on national nor on international level. Some publications focus on the positive externalities of exhibitions, but the exhibition itself is a neglected topic. Although the fair is one of the most ancient marketing-tools; its role is still relatively high in the marketing mix of different economic sectors, even nowadays, in the Internet-age. One of these sectors is the agribusiness, where the exhibition is a place of business-to-business communication, Customer Relationship Management, and last, but not least an important Point Of Sale.

The aim of the present paper is to point out the importance of exhibitions through the assessment of their popularity. From this aim, we have derived the following objectives:

- To build a model concerning the relationships among the interested parties.*
- To asses the visitors of five Eastern-European exhibitions.*
- To asses the exhibitors of the same exhibitions.*
- To compare the opinion and expectance of the mentioned groups.*
- To test the model, based on the questionnaires' data.*
- To measure the radius of attraction by the attendees, as well as by exhibitors*

I have collected primary data through questionnaires and site visit, and also have obtained secondary data from printed and electronic documents.

In this paper, I present a model, which describes the relationships among the interested parties. The data was collected on four different exhibitions: Farmerexpo (Debrecen, Hungary) in 2005 and 2006, OMÉK (Budapest, Hungary) from 2005 and Polagra-Farm (Poznan, Poland) 2006.

Keywords: Exhibition, fair, visitors (attendees), exhibitors, radius of attraction, cluster analysis

1. Introduction

It is difficult to make a distinction between the concepts of “exhibition” and “fair”. Even though the two are not identical, they are used interchangeably in everyday language moreover the distinctions that can be made are not consistently marked in the relevant literature, either. Accordingly, in this study, I am not going to differentiate between these two concepts.

Fairs and exhibitions belong to the oldest marketing tools. Many authors deal with evaluation of these events, examining them from different viewpoints.

2. Literature review

2.1. Economic importance of the exhibitions

To introduce the importance of the topic, I present the exhibitions held in Hungary. Table 1 shows the events registered by the Hungarian Chamber of Commerce and Industry. The different groups correspond to the extent the events are related to agriculture. Five groups of fairs can be distinguished, based on international practice:

- 1. Agriculture:* this group of fairs specializes in crop production and animal husbandry and the machinery connected to these activities (AGRO+MASHEXPO).
- 2. Food and Agriculture:* agriculture and food processing have a similar weight at the expos (AGRA SAVARIA, AGRORAAB, OMÉK).
- 3. Food:* exhibitions focused on food products and food processing (FOODAPEST).

4. *General and agriculture*: this group comprises fairs that are designed for a broader audience, however, in addition to consumer products, agriculture and food industry also play a particular role, (ZALAEGERSZEGI ŐSZI VÁSÁR).
5. *Non-agriculture*: not related to agriculture. (HUNGAROTHERM).

Table 1 – Exhibitions and fairs in Hungary 1998-2010

Type/Years	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
Agriculture	23	18	22	15	10	16	14	11	4	8	9	4	3
Food + Agriculture	8	7	5	4	7	6	9	6	9	6	1	4	5
Food	5	12	10	12	10	6	14	12	12	7	11	13	5

Non-agriculture	143	168	163	161	205	210	200	83	201	185	106	85	51
Altogether	182	212	204	193	234	240	240	119	231	209	134	116	73

Source: Forbát 1998, 2000, 2002-2007 and SZ.-Kovács 1999, 2001; 2008-2010 (own edition)

A continuous decrease can be seen in the number of exhibitions, what is also a consequence of the global economic crisis originating from 2008.

2.2. Importance of the exhibitions as marketing instruments

The importance of a fair or show-participation can be summarized as follows: an exhibition makes a good possibility for PR, CRM, and Direct Sale purposes, too, because an exhibition concentrates a market, making it similar to a classic free competition. “Notwithstanding the caliber of the topic, the most cited authors in the territory of marketing have no special attention concerning this type of communication and sale and the buyer-seller relationships” (Narayandas-Rangan, 2004). Kotler’s (1998) “classic” book introduces the motivations of the exhibitors as follows: “The participating sellers want to acquire diverse advantages, for example:

- To make new contracts
- To manage existing customer relations
- Introducing new products
- Meeting new buyers
- Further sales to the present consumer public
- The “school” the consumers with printed materials, videos and other audiovisual methods.”

A summarizing table of the literature between 1976 and 2009 was made concerning the frequency of participating objectives in case of exhibitors, including the above mentioned citation of Kotler (1998). The most salient objectives for exhibitors are the following:

Table 2 – The most salient functions of exhibitions in the literature

Order	Name of the function	Frequency
1	Contracting businesses / Making sales	18
2	Presentation of (new) products / Introduction of new products	16
3	Information sharing / Spreading information	15
4	CRM – Customer Relationship Management	13
5	Sales-promotion	11
6	B2B – Business to Business communication	10

7	Strengthening company image	10
8	Communication	10
9	Searching for wholesalers, retailers, and distributors	10
10	Collecting orders / Finding new customers	10

Source: Own editing – basis: 44 publications between 1976 and 2009*

2.3. Initial Research models

There were two models taking into consideration as blueprint for the research, parallel to the starting objectives. These were the model of *Spiropoulos et al. (2006)* and *Getz (2007) et al.*

The model of *Spiropoulos et al. (2006)* includes six major event stakeholder groups. These are the “Host organization,” the “Host community,” the “Co-workers” and the “Event sponsors,” the “Media,” and the “Participants and spectators” (See Figure 1).

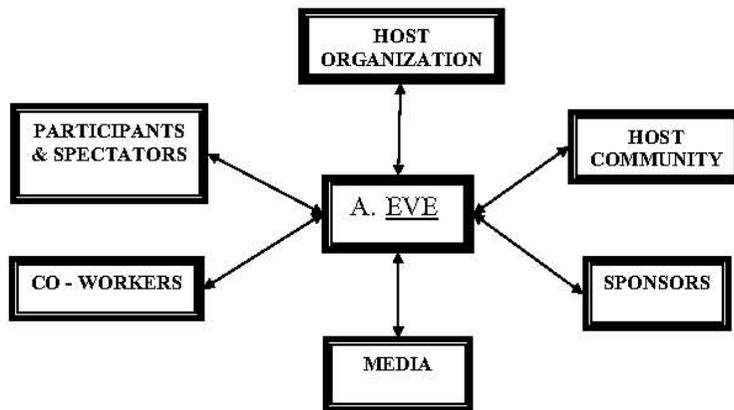

Figure 1 - The relation of stakeholders to events.

Source: *Spiropoulos et al., 2006.* (* “A. EVE” stands for “A.ctual EVEnt”)

Getz (2007) and his colleagues summarize the major stakeholder roles similarly to six groups, but different ones, as we can see in Figure 2.

Figure 2 – Major stakeholder roles

Source: *Getz et al. 2007.*

Based on the previous described models, a starting model was established, where the Organizers and Potential Sellers are on the Exhibitors' side, while the Potential Buyers, Expert companies, Individual experts, Future experts and Laymen represent the Visitors' (or Attendees') side (Figure 3).

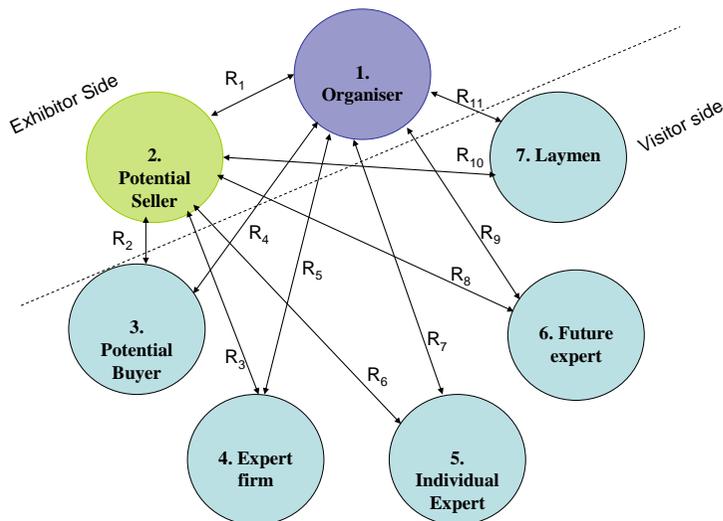

Figure 3 - Network of relations in the exhibition business

Source: own research *(R – Relationship)

The organizers comprise all the companies that play a central role in the organization of the fair. The Potential sellers are the companies that offer their products and services on the stands and, in return, pay the organizers for the use of stands. The term Potential buyer refers to visitors who are in a decision-making position in their (own) firm, planning and researching purchase possibilities. Expert firms include consulting companies, market research firms and professional associations (e.g. Economic Chambers). By Individual expert was meant visitors who gain (total or part of) their income from agriculture or agribusiness. The Future experts are university / secondary-school students or people who intend to start their own agribusiness or agricultural company. Laymen include non-expert visitors who simply seek entertainment at the fair (often family members who belong to the previous groups).

3. Materials and Methods

3.1. The observed fairs

Farmerexpo

From the very first moment (1992), FARMER-EXPO has consciously endeavoured to create opportunities for widening relations, deepening partnerships, supporting agribusiness sector. In accordance with the description above Farmerexpo provides a forum for all the agribusiness employed, and also for the domestic or foreign companies connected to the agricultural sector to introduce their products and services.

The professional programme of the exhibition has been widening year by year. Among the programmes there are professional conferences, forums for agricultural experts to collect new, important knowledge, the latest research results and other practical, useful experiences.

The show had been developing dynamically - taking both the net exhibition area and the number of exhibitors into consideration - until 1999, when an other exhibition organizing company got interested in Farmer-Expo.

The professional programmes provide various subjects from business meetings through plant breeding symposiums to agricultural political forums. The Hungarian Animal Breeders' Association acknowledges FARMER-EXPO as its official live-stock exhibition. Since 1994 - when as first member of the live-stock exhibition the pig appeared - the organizers has consciously broadened the live-stock exhibition year by year. Today 7 species of animals are shown at the exhibition - pork, horse, poultry, cattle, sheep, goat and rabbit. (I1)

OMÉK

The first Hungarian pedigree animal breeding exhibition was organized by István Széchenyi (Significant historic politician in Hungary), in 1829. The initiative of Széchenyi belongs in historical view to the oldest animal exhibitions, such as "Royal Show" in England, or the exhibition in Bern in 1804. Miklós Szabó reported over 53 rural exhibitions between 1867 and 1909. After the World War I. in 1921 participated Minister of Agriculture Nagyatádi Szabó István and Minister President Teleki Pál. After the World War II the first "bigger" international exhibition was located at the area of agricultural exhibitions in 1971: the I. Hunting World Expo. The OMÉK 1990 was represented by numerous participants of research and educational institutions [13].

"OMÉK the International Exhibition of Agriculture and Food is the oldest and largest farming exhibition in Hungary. The history of OMÉK begins with the 1896 Millennial Exposition in Budapest when Hungary celebrated its first thousand years. In 2005 will witness the 74th time this event that welcomes both representatives from the field and the general public as well. It will also see the historic first time the exhibition is being held within the European Union.

OMÉK's role has always been twofold: one, to give an account of where the sector has gone in the previous five years and of what has been achieved; and, two, to set a course for the coming years and outline the tasks that lie ahead in terms of growth and progress. With OMÉK 2005, this dual role has become all the more important in the light of our accession to the European Union: a report must be made on our experience of little more than a year as an EU member-state, one which discusses EU requirements and options for farming and the regions as well as evidence of suitability for EU membership." (I2)

Hódmezőgazda

The „Alföldi Állattenyésztési Napok” Exhibition and Fair became the most significant professional meeting of the Hungarian agriculture. It is organized by the Hód-Mezőgazda Zrt, with the full support of the Hungarian Animal Breeding Association. Since 2005 it has been opened towards the crop production too.

This corporation created the culture of animal breeding shows, whereas the leading animal breeding countries acted as a blueprint. It is connected with impressive, Hungarian-type classic buildings, with the largest number of attendees in the rural Hungary. There are six species in focus: horse, cattle, pork, sheep, goat and poultry. (I3)

Polagra

Poznań International Fair (MTP) was established in 1921. It is one of the trade show organizers with the longest history. The 1st Poznań Trade Fair, a domestic trade show, was organized between 28 May and 5 June 1921 at the initiative of Poznań merchants. In 1927 MTP joins UFI, the Global Association of the Exhibition Industry. In 1929 - General Domestic Exhibition (PWK) was an overview of the economic and cultural achievements of Poland. The exhibitions, organized on a space of 650,000 square metres, attracted 4.5 million visitors. In the 1930s the Poznań International Fair flourished and was ranked the fourth European organizer of international trade shows. In the late 1940s, the trade grounds, which were badly destroyed

during the Second World War, were rebuilt. In the following years the Poznań International Fair developed its exhibition programme and gradually added new exhibitions and trade shows to the programme. Old exhibition halls were rebuilt and expanded and many new halls as well as other facilities were built.

Presently the Poznań International Fair organizes over 60 events every year – different trade shows prepared for over 100 sectors of the economy. Every year it attracts over 300,000 visitors and more than 11,500 exhibitors.

Polagra Farm was a complex agricultural exhibition until 2007, including the machinery, buildings, animal husbandry and the crop production, organized yearly with its complementary: the Polagra Food. Nowadays the Polagra brand is divided for three exhibitions: Food, Tech and Premiery. (14)

3.2. Sampling and statistical methods

The research methodology was determined by the following preconditions, which had to be met:

- a large and representative sample needs to be collected
- close-ended questions need to be complemented by open-ended questions
- qualitative and quantitative evaluation methods need to be combined.

The most appropriate research instrument was the use of questionnaires (comprising a series of case studies), as is shown by the following authors: *Bryman (2004)*, *Kozak (2006)* and *Malhotra (2005 and 2008)*. *Malhotra (2008)* states, that “the questionnaire is a structured method of data collection, which consists of a series of written or oral questions for which the respondents provide answers”.

The size of the samples and the total number of visitors and exhibitors are shown in the following table:

Table 3 – Questionnaires collected at the sample fairs

	Number of exhibitors	Number of questionnaires collected from exhibitors	Number of visitors	Number of questionnaires collected from visitors
Farmerexpo '05	207	89	24 602	810
Farmerexpo '06	304	99	25 116	800
OMÉK '05	604	97	130 000	746
Polagra '06	743	86	70 315	421
Hódmezőgazda '10	420	52	50 000	405
Collected altogether:	-	423	-	3 182
Evaluated:	-	416	-	3 159

Source: Own research

The two (attendee and exhibitor) databases were evaluated by basic descriptive statistical analyses what made a profiling of the average attendee and exhibitor possible, but were also undertaken a tow-step cluster analysis.

4. Results and Discussion

4.1. Average attendee profile

As a result of profiling the “average visitor or attendee”, the following general picture emerged of the typical attendee, based on the most frequent categories and the most characteristic averages. The average visitor of Eastern-European fairs turned out to be:

- a middle aged man (42 years old),
- with a diploma or a degree,
- a member of a family of three or four people.

In addition, the following details emerged:

- if he has a farm, its size is larger than the country average,
- the primary goal of his visit is to gain knowledge, the secondary objective is entertainment,
- making contracts is not one of the main reasons he visits fairs,
- he has income from agriculture,
- he is not an animal breeder.

After describing the average visitor, I now turn to the visitor profile of each fair.

Polagra is significantly different from the other fairs because:

- the attendees came from the longest distance (142 kms),
- the average level of discounts perceived by the visitors is the lowest here.

As for **OMÉK** :

- the visitors came from an average distance of 111 kms,
- the main goal of participation was entertainment,
- visitors had the highest expectations concerning the discounts offered by exhibitors,
- it was attended by the lowest number of visitors who have farms (33%)

In the case of **Farmerexpo**:

- the visitors came from the shortest average distance (65 and 72 kms),
- the visitors rated the fair as the worst in 2005 (at an average of 3.55 points on a scale of 1-5 points aimed at measuring visitors' satisfaction).

Finally, in the case of **Hódmezőgazda**:

- the proportion between the two sexes was the most balanced,
- the visitors had the lowest average age,
- it was the most highly appreciated of all the exhibitions (it received 4.54 points out of a maximum of 5)

4.2. Average exhibitor profile

The profile of the “average exhibitor” is described the same way as that of the “average visitor”. The average exhibitor of an Eastern-European agricultural fair:

- comes from a company's whose form is limited company (Ltd.),
- employs between 5 and 50 people,
- his typical activity is agricultural machinery trade,
- the representatives of the companies are middle-aged,
- the instruments most commonly used at the fair to attract customers are brochures, the presence of professional dealers and giving free advice,
- the customers' expectations about the fair are perceived by the exhibitors' to be one or more of the following items: trying products, watching demonstrations and shows. These perceived expectations do not, for the most part, correspond to the competitive advantages formulated by the exhibitors.
- As for the perceived economic efficiency of exhibitions, the majority of the exhibitors think that the investment incurred by the costs of an exhibition will only return profit on the long run.

While the average exhibitors' profile (see above) described general patterns, the profiles that are characteristic of the four fairs that were observed describe unique properties as well as the parameters of variance.

Polagra, is markedly different from all the other fairs with respect to visitors as well as exhibitors for the following reasons:

- exhibitors come to Polagra from a longer distance (the exhibitor radius of the fair is 363 kms), which is a consequence of the host country's size as well as the importance of agriculture,
- Polish exhibitors consider image building as their highest priority,
- only 28% of the exhibitors prepare special discounts for the fair, which is lower than the percentage of Hungarian exhibitors with special discounts,
- the lower number of companies with special discounts is balanced by the total number of discounts that were given at the fair, which exceeds the Hungarian numbers,
- the use of in-fair customer-attracting instruments is lower in Poznan,
- the companies here are, for the most part, represented by independent, intellectual free-lancers.

Characteristics of **OMÉK**:

- The exhibitor radius is the shortest (115 kms),
- this fair is rated lowest in terms of exhibitors' satisfaction (3.07 of the maximum 5), which is primarily due to the duration of the fair,
- however, the fair is rated highest in terms of the total number of contracted businesses / contacts made, which highlights the fact that satisfaction ratings are based, for the most part, on subjective opinion, and do not reflect the individual firms' interests and success at the fair),
- The use of in-fair customer-attracting instruments is the highest in Budapest.

Characteristics of **Farmerexpo**:

- In 2006 the number of potential business contracts was the highest: on average, 18 businesses were contracted by each exhibitor ,
- the exhibiting firms here are mostly represented by people at the highest management level, which is not typical of the other fairs.

Hódmezőgazda has the following characteristics:

- most of the exhibitors represent animal breeding companies,
- the representatives have a diploma, half of them are top or medium level managers,
- exhibiting activity has decreased significantly over a five year period,
- based on the satisfaction ratings, this fair is the favourite among exhibitors,
- the number of contacts made at the fair is the lowest,
- the majority of Hódmezőgazda exhibitors think that the investment incurred by the cost of the fair will return profit.

4.3. Cluster Structure of Attendees

The profiling of fairs is a method whereby typical values are used to describe the characteristics of a particular phenomenon. Behind the typical values there are unique visitor and exhibitor groups which can be interesting for both groups of stakeholders. In order to explore these groups, the clustering method seems to be the most appropriate measure.

When describing various clustering methods, several authors (cf. e.g. *Sajtos-Mitev* 2008, and *Malhotra* 2008) suggest the subsequent application of a number of methods. Hierarchical and K-means clustering methods do not enable the combination of different – nominal, ordinal and metric – variables without previous standardization. Since in this case different variables have to be combined, *Sajtos-Mitev* (2008) offers a two-step clustering method as a novel approach. A

further advantage of this method is that it determines the optimal number of clusters. The variables incorporated in the cluster analysis are as follows:

a) Categorical variables (nominal and ordinal):

- - the type of exhibitions attended,
- - maximal distance for a fair's visit,
- - primary goal of the visit,
- - secondary goal of the visit,
- - the fair's relatedness to agriculture,
- - type of relatedness,
- - the gender of the attendees,
- - the level of education of the attendees.

b) Metric variables:

- - the number of exhibitions visited on average per year,
- - distance between home and the fair in kilometres,
- - content level (on a 1-5 Likert-scale)
- - share of agriculture in the total income (percentages)
- - size of farm (cultivated area in hectares)
- - attendees' age (in years)

The analysis was performed using the Log-Likelihood distance measure, the Schwarz-Bayes clustering criterion and automatic cluster number determination.

The cluster analysis resulted in two groups, which were named **Laymen (Group 1)** and **Farmers (Group 2)**, these two groups correspond to the "Potential Buyer" group in the initial logical model.

Characteristic differences between the two clusters:

- The Farmers' average visiting radius is higher (105 kms as opposed to 65 kms in the case of Laymen).
- The share of agriculture in the total income of the family is higher in the case of the Farmers (53%) compared to the Laymen (1,3%).
- The Farmers' share is more than 90% with respect to the following variables: their auxiliary/complementary agricultural income, whether or not they are agricultural producers / employees of agribusiness firms.
- The average size of the farms owned by the Farmers (133has), is significantly higher than that owned by the Laymen (less than 1 hectare).
- The Farmers mainly visit agricultural fairs, Laymen visit other types of exhibitions.
- The willingness to travel is greater in the case of Farmers (77% of the Farmers are willing to travel more than 500 kms, while 75% of the Laymen are only willing to participate in local fairs)
- 60% of the Farmers marked "gaining knowledge" as the primary goal of visiting fairs; 65% marked "personal relationship management" and 70% marked "business". Most of the laymen marked "entertainment" as their primary goal of visiting fairs.
- Personal relationship management (65%) and business (70%) also rate high as the Farmer's secondary goals of visiting fairs..
- 64.5 % of the Farmers are men ; women comprise only 38% of this group.

As a result of the cluster analysis, the groups labelled "Experts" , "Future experts" and "Representatives of expert firms" had to be eliminated,. This suggests that exhibiting firms should consider using a more careful pre-selection process of the visitors, since, as the above

findings show, the number of Laymen who visit fairs is high, these groups, however, could be more effectively targeted via PR and image communication measures.

4.4. Cluster Structure of Exhibitors

I performed a similar, two-step analysis in the case of the exhibitor groups as well. The variables incorporated in the cluster analysis were the following:

a) Categorical variables (nominal and ordinal):

- - opinion about the financial efficiency of fairs,
- - company form,
- - main company activity,
- - number of employees,
- - business deals (finding a partner on the long run),
- - presence of special in-fair discounts.

b) Metric variables:

- - frequency of exhibition per year (number of occasions),
- - actual distance between the exhibition and the company headquarters,
- - importance of PR contacts (on a 1 to 5 Likert-type scale),
- - importance of personal contacts (on a 1 to 5 Likert-type scale),
- - importance of business contacts (on a 1 to 5 Likert-type scale),
- - importance of market research (on a 1 to 5 Likert-type scale),
- - satisfaction level (on a 1 to 5 Likert-type scale),
- - number of in-fair communication instruments used.

The methods / settings of the analysis were similar to those used in the course of analysing the visitor-database: Log-Likelihood distance measure, Schwarz-Bayes clustering criterion and automatic cluster number determination.

The clustering methods resulted in two clusters, these were named “Minor Companies” and “Major Companies”. The initial logical model assumed a homogenous exhibitor group with a variety of objectives depending on the attendee groups. However, this hypothesis was disproved because the number of attendee groups is lower than projected, moreover, the exhibitor side, which was presumed to be homogenous, turned out to be fragmented. The following list of features served as a basis for the categorization of the two groups:

- The Major Companies exhibit more often (they hold, on average, 4.79 exhibitions per year compared to 3.72 exhibitions per year in the case of Minor ones)
- The representatives of Major Companies came from longer distances (on average, from 190 kms, while those of Minor ones came from an average distance of 166 kms).
- The satisfaction level of Major firms turned out to be higher on average (3.71 vs. 3.43)
- The number of employees was lower in the case of the Minor companies (lower than 200)
- The Minor companies’ typical business activity involved trading agricultural machinery, while the Major companies’ activity was not so closely related to agriculture.

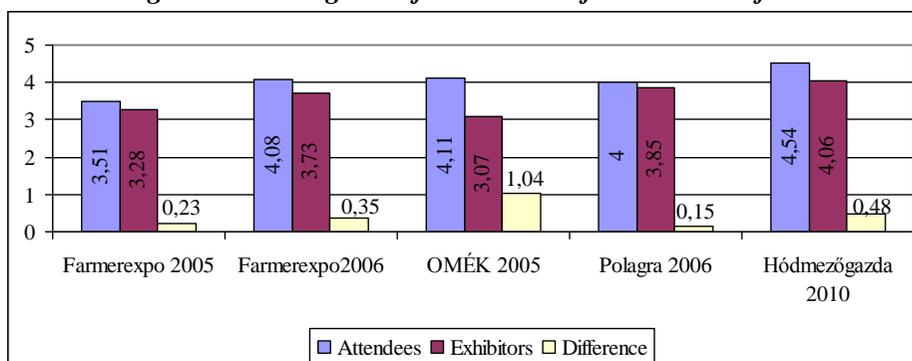

The Major companies differ from the Minor ones along the following parameters: (I) they are bigger in size, (II) they participate in exhibitions more frequently, (III) their representatives travel longer distances to the venue of the exhibition, (IV), they have a higher opinion of PR as a marketing instrument.

The Minor companies are less professional, however, they offer a higher number of special discounts not only at fairs but also in the course of their regular business activity, which is also characterized by regionalism.

4.5. Synthesis of the results with respect to visitors and Exhibitors

There are several correspondences between the questionnaires filled out by the visitors and the exhibitors, the analysis of these enables us to compare the opinion of the different groups of stakeholders. One of the most important correspondences is the average satisfaction level (Figure 6).

Figure 4 – Average satisfaction level of the observed fairs

Source: Own research

Farmerexpo 2005 was held at an unusual date (in spring instead of summer), which caused a low level of average satisfaction level. The expo was held on its usual date of August 20th a year later, which regained the favourable opinion of the stakeholders. The opinions concerning OMÉK are along two extremes: the exhibitors rate it as the lowest among all the expos that were observed, the visitors, however, rate it quite high. Hódmezőgazda, on the other hand, turned out to be popular with both interest groups.

Table 4 – Average radius of attraction of observed fairs

Designation	Attendees	Exhibitors	Difference
	Average	Average	
Farmerexpo '05	65,39	176,68	111,29
Farmerexpo '06	72,01	165,82	93,81
OMÉK '05	111,81	115,32	3,51
Polagra '06	142,75	363,75	221
Hódmezőgazda '10	108,95	182,13	73,18
Altogether:	93,58	194,95	101,37

Source: Own research (Significant differences are marked by different colour)

By far the largest radius of attraction with respect to both groups can be observed in the case of Polagra, which can be explained by the large size of the country. The Exhibitors in Hungary show no significant differences (at a level of 0.05). However, there are significant differences between the fairs held in Hungary with respect to attendees: Farmerexpo turns out to be a primarily local event, while the other Hungarian fairs have an average attraction radius of over 100 kms. (The significant differences are shown in Table 4 marked by different colours.) The radii are also shown in Figure 6, where a Central-European map makes the geographical distances more visible.

Attendees:
 Debrecen: 68 km
 Budapest: 112 km
 Hódmezővásárhely: 109 km
 Poznan: 142 km

Exhibitors:
 Debrecen: 171 km
 Budapest: 115 km
 Hódmezővásárhely: 182 km
 Poznan: 363 km

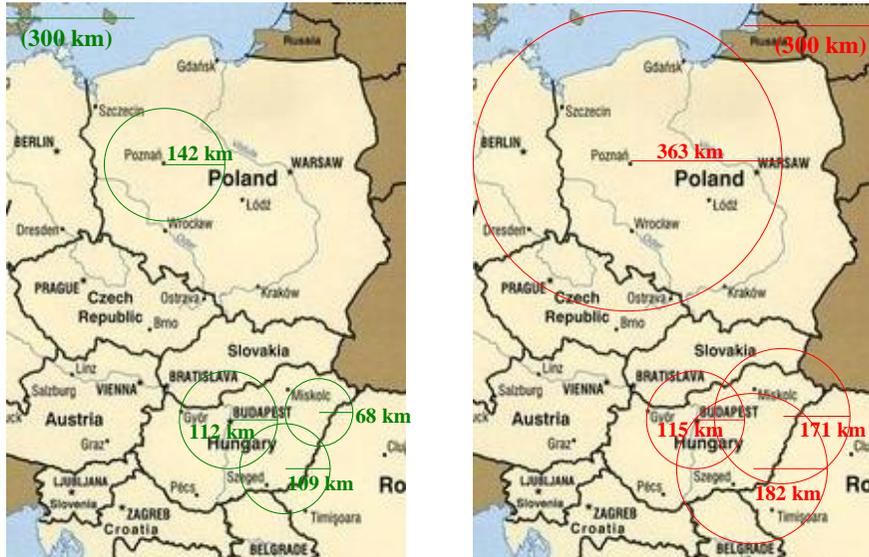

Figure 6 – Radius of attraction on map

The analysis of the correspondences enables us to assess the different perceptions held by exhibitors and visitors, respectively, and to understand the relations between the two stakeholder groups, as presented in Figure 6.

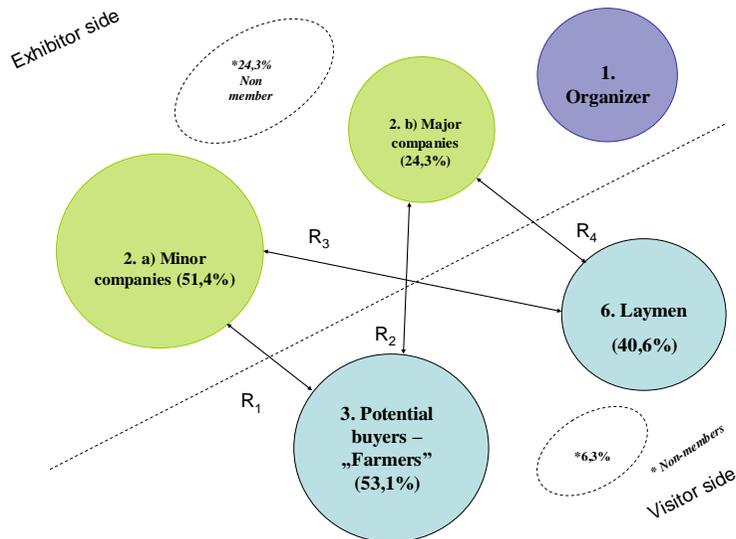

Figure 6 – The modified logical model of stakeholder groups at exhibitions yielded by cluster analysis

If we compare Figures 3 and 6, we can see the differences between the findings of the cluster analysis and our initial logical model in terms of the network of relations that exist between the visitor and exhibitor groups.

Table 5 shows the probabilities for the respective parties to find business partners. The chances of success depend on the proportion of clusters and the primary and secondary goals expressed by the parties concerned.

Table 5 – Relations between exhibitor and attendee clusters

Exhibitor cluster	Objective of exhibitor in the relation	Relation probability	Objective of attendee in the relation	Attendee (Visitor) cluster
Minor companies (51,4%)	Relationship management (CRM), Contracting business, PR	R1 = 27,3%	Gaining knowledge, Personal contact management, Contracting business	Potential buyers - Farmers (53,1%)
	Relationship management - (CRM), Contracting business, PR	R2 = 20,9%	Entertainment	Laymen (40,6%)
Major companies (24,3%)	Relationship management (CRM), Contracting business, PR	R3 = 12,9%	Gaining knowledge, Personal contact management, Contracting business	Potential buyers - Farmers (53,1%)
	Relation ship management - (CRM), Contracting business, PR	R4 = 9,9%	Entertainment	Laymen (40,6%)

As the table shows, a relationship (R1) is most likely to be formed between minor companies and farmers as potential buyers since their objectives meet and their proportions are the highest. The relationship between minor businesses and laymen (R2) is somewhat less likely to be formed, as the two groups have different goals in participating in fairs. Since the major companies are outnumbered, the number of contacts with the farmers (R3) may be limited, but the motivations behind participation are matched in this relationship. What laymen and major businesses (R4) have in common is that the former visit fairs for an opportunity to be entertained, major companies, on the other hand, provide entertainment as part of their PR activity.

By way of summarizing the factors that motivate the various parties concerned it can be established that the main objective of participation is relationship management, followed by the possibility of making business contracts, followed by entertainment/being entertained, a factor which is of primary importance to visitors.

In marketing communication fairs function as multifunctional instruments; their most important role is in general communication and relationship management, while their role in making business contracts is of secondary importance.

SUB-SECTION: ECONOMIC STATISTICS

ROMANIA – PORTUGAL: A COMPARATIVE ANALYSIS OF THE TWO COUNTRIES' LABOUR MARKETS

Dimian Gina Cristina

Bucharest Academy of Economic Studies Faculty of Cybernetics, Statistics and Economic Informatics

Dimian Mihai

Bucharest Academy of Economic Studies Faculty of Management

Our choice was justified by the fact that between the two countries exist some features that make them interesting to study from the employment point of view. Thus, both countries are Latin and this is why we consider they are comparable, because employment means people, more precisely mentalities and attitudes to work.

We considered that it is interesting to see how the labour market from the east Latin Europe has evolved, in a comparable, crucial period, with its counterpart from west Latin Europe. First of all, we would like to point out the fact that our intention is to analyse the periods which from the economic history point of view have influenced in a decisive manner the present evolution of the two countries.

The Portugal labour market is a subject of real scientific interest (we would like to mention that even Michael Porter was interested by this topic). Our paper tries to emphasize the common and different features of the two labour markets, in order to facilitate an experience sharing process on this topic.

To achieve the paper's objectives statistical and cluster analysis have been used. This is one of the best ways to capture the influence of determinant factors on labour market performance.

The degree of originality is given by the assumed objectives, namely studying some very up-to-date problems from an interconnected perspective (historical similarities, structural changes, labour market performance) and analyzing the Romanian situation compared to other EU countries, i.e. Portugal.

The main impact of the paper will be on the practical level through the model outcomes and conclusions. One of the objectives is to look for solutions to the problems identified and to persuade policy makers to give them a greater importance.

Our main contribution is represented by the fact that we have approached this topic from an economic and historical perspective, trying to find explanations for the present situation in the modern past of the two nations.

Key words: labour market, structural changes, education, cluster analysis, EU accession

JEL codes: J21, J24, J88

I. Introduction

Since the second half of 2008, European economies have been affected by a financial crisis of unprecedented severity which had an impact on public finances, people incomes, and not least on the labour markets. In all member states, gross domestic product decreased, and some of them have registered the largest loss of output from the last recession in the early 1970s (Arpaia and Curci 2010).

Across the European Union, employment rate decreased as a result of the economic crisis, ending in the first quarter of 2010 to 63.7%, a level close to that recorded in 2005, while the

unemployment rate was 10.2% the highest since the launch of the Lisbon Strategy (Leschke and Watt 2010).

Portugal is one of the developed countries of the European Union that has strongly experienced the global crisis consequences. With a budget deficit of 8.6% in 2010, by 5.6 percentage points higher than the Euro zone's limit of 3% and the highest unemployment rate in the last 30 years, approximately 11%, the economic recovery of Portugal is announced difficult and complicated. Regarding Romania, this was among the few EU countries which recorded a decrease in gross domestic product per capita of 1.3% in 2010 (Portugal experienced an increase by 1.3%). Although, in the same year, unemployment rate in Romania was below the European average of 9.6%, employment rate was much lower than other Member States, only 58.6%, compared with 66.3% in Portugal.

Despite the differences mentioned between the two Member States in terms of labour market performances, Portugal has many features in common with other countries recently accepted in the European Union such as Romania.

This is proved by many studies, one of them being the paper *Labour market transition in Portugal, Spain and Poland* (Teixeira 2001) in which the author has analysed the Portugal labour market before and after the moment of EU accession. The article encloses a small historical evolution of the labour market starting with the 1970s, after Salazar's dictatorial regime when trade unions were playing an insignificant role in this market and there were no right to strike. Between 1969 and 1974, in the post dictatorship period the labour market started to organise and claim basic rights.

What worth to be noticed is that in 1989 the labour market in Portugal was influenced by major changes in legislation, most of them regarding the labour contracts, especially the fix-term one. Coincidentally or not, after a comparable period from the moment when our country was accepted in the EU (2007), in 2011 Romanian labour market is dramatically transforming due to the new Labour Code, one of the main aria of change being also represented by the fix-term contracts considered by policy makers to be an useful mechanism to increase the employment rate.

After EU entry, Portuguese economy kept the attention of some famous economists like Michael Porter, who in his paper *Portuguese Competitiveness* (2002), emphasised the key role played by the innovative capacity as an input for the productivity (considered similar to competitiveness). In fact, he indicates the human resource as the main factor that can determine the prosperity of an economy. This idea is also reiterated when he approached in a more detailed manner the main factors which influence the productivity and the microeconomic business environment. It is interesting to notice that, in 1994 and even in 2002, over 15 years after the moment of adhesion to EU (1986) Portugal was recording a lack of skilled workforce (including the management).

This might be a cause of the fact that even if from 1995 until 2001 the Portuguese economy has recorded a solid economic growth it wasn't based on productivity. Reading these last statements, most Romanian economists could recognize a kind of pattern that could also be applied to our country. After EU accession (2007), Romanian economy continued to record economic growth based on consume, while the qualified workforce has massively emigrate to the western economies.

II. Positioning Romania and Portugal's labour markets in the European Union

To show the place of the two labour markets, the Romanian and Portuguese one, at the European level, a cluster analysis was performed. The following 9 indicators were included in the model:

- *employment in agriculture, industry and services* (% of total employment) – to capture labour market structure;
- *GDP per person employed* (constant 1990 PPP \$) – to assess labour productivity,

- *labour force with tertiary education* (% of total) – to evaluate the level of education of the labour force;

- *labour participation rate* (% of total population ages 15+), *long-term unemployment rate* (% of total unemployment), *youth unemployment rate* (% of total labour force ages 15-24), *unemployment rate* (% of total labour force) – to capture labour force participation in economic activity and the existence of some vulnerable categories.

The analysis was carried out for the year 2007 because we wanted that the results not to be affected by the financial crisis consequences and to accurately show the structural situation of the labour market in Romania and Portugal.

Cluster analysis or classification analysis is a method of data analysis that allows identification and classification of similar entities (objects or cases), depending on the characteristics they possess, highlighting the similarities of objects within a group (cluster) and differences from objects in other clusters.

Like factor analysis, cluster models study correlations of a whole set of variables without grouping them into categories such as: dependent variable and independent variables, like regression analysis does. If factor analysis aims to reduce the number of variables, cluster analysis is designed to classify objects into homogenous groups based on the characteristics analyzed so that objects in a group should be similar in terms of these variables, but different from other objects groups.

Non-hierarchical algorithms have been preferred for grouping objects into clusters whose characteristics were measured, a method commonly used in economic analysis being k-means.

K-means algorithms are based on the following considerations: if the number of groups is known a priori, objects will be associated with a group at a first step according to certain criteria. It then calculates averages for each group, and each object is associated with a group based on similarity with group averages. Group averages are again computed, and association process continues until objects no longer change their group.

Cluster analysis requires that variables be measured in comparable units and for eliminating the influence of measuring unit, variables were standardized so as to have average 0 and standard deviation 1.

$$x_{ij}^s = \frac{(x_{ij} - \bar{x}_{ij})}{\sigma}, \text{ where } \bar{x}_{ij} \text{ is the average and } \sigma \text{ standard deviation.} \quad (1)$$

Table no. 1 Cluster Membership

Case Number	Cluster	Distance	Italy	2	2.616
Austria	1	1.802	Latvia	1	1.938
Belgium	1	2.493	Lithuania	1	2.824
Bulgaria	2	1.440	Luxembourg	1	2.383
Cyprus	1	2.127	Malta	1	2.683
Czech Republic	2	2.375	Netherlands	1	3.759
Denmark	1	2.296	Poland	2	2.092
Estonia	1	2.297	Portugal	2	1.800
Finland	1	1.415	Romania	2	4.378
France	1	2.064	Slovak Republic	2	2.922
Germany	1	2.414	Slovenia	2	2.331
Greece	2	2.836	Spain	1	2.024

Case Number	Cluster	Distance	Italy	2	2.616
Hungary	2	1.541	Sweden	1	2.354
Ireland	1	1.815	United Kingdom	1	1.456

Source: Authors processing based on World Development Indicators & Global Development Finance

Running cluster analysis allowed grouping the 27 countries in two categories (Table no. 1): Cluster 1 (17 countries): Austria, Belgium, Cyprus, Denmark, Estonia, Finland, France, Germany, Ireland, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Spain, United Kingdom. These countries have common characteristics such as: high labour productivity, a high rate of participation in economic activity, skilled workforce and an economic structure predominantly based on employment in service sector (Table no. 2). Cluster 2 (10 countries): Bulgaria, Czech Republic, Greece, Hungary, Italy, Poland, Portugal, Romania, Slovak Republic, Slovenia. This group of countries have a labour market affected by the problem of unemployment, particularly long-term unemployment and unemployment among young people, while the workforce is employed mainly in primary and secondary sectors (Table no. 2).

Table no. 2 Final Cluster Centres

Variables	Cluster 1	Cluster 2
Employment in agriculture (% of total employment)	-0.382	0.649
Employment in industry (% of total employment)	-0.458	0.779
Employment in services (% of total employment)	0.530	-0.902
GDP per person employed (constant 1990 PPP \$)	0.487	-0.829
Labour force with tertiary education (% of total)	0.385	-0.641
Labour participation rate, total (% of total population ages 15+)	0.328	-0.557
Long-term unemployment (% of total unemployment)	-0.600	0.781
Unemployment, youth total (% of total labour force ages 15-24)	-0.360	0.613
Unemployment, total (% of total labour force)	-0.323	0.550

III. Romania-Portugal, a comparative analysis

The cluster analysis results show that the characteristics of the Portuguese labour market are closer to those of emerging countries such as Romania, which means that the paths of their economies over time may be similar.

Thus, in 1986 when Portugal was accepted in the European Union, its gross domestic product per capita was little more than 50% of the other Member States average. The EU entry advantages were capitalized and Portugal registered a substantial increase in gross domestic product per capita, with a growth rate of 6.5% over the first years after accession. This economic advance was supported by strong investment growth, with a rate of about 18% in 1987 (Table no. 3).

Table no. 3 Key Indicators of Portugal's economy before and after the EU entry

Portugal	GDP per capita (constant 2000 US\$)	GDP per person employed (constant 1990 PPP \$)	Population growth (annual %)	GDP per capita growth (annual %)	Gross fixed capital formation (annual % growth)
1980	6504	19916	1.081	3.465	8.536
1981	6552	20299	0.867	0.741	5.503
1982	6651	20738	0.612	1.512	2.257
1983	6611	19775	0.433	-0.604	-7.132
1984	6464	19656	0.346	-2.219	-17.386
1985	6631	20291	0.224	2.577	-3.547
1986	6906	21091	-0.007	4.148	10.871
1987	7359	21856	-0.167	6.559	17.997
1988	7930	22926	-0.260	7.769	14.833
1989	8467	23604	-0.311	6.773	3.657
1990	8838	23187	-0.413	4.381	7.607

Source: World Bank, World Development Indicators & Global Development Finance

Romanian economy has recorded a similar trend as Portugal a few years before joining the European Union and in the first two years after this event. Thus, in 2007 our country's gross domestic product accounted for 42% of the EU average, an average reduced by the previous enlargements. Catching rate was high. In 2006 GDP per capita recorded a growth rate of over 8% and in the first year after the EU entry of more than 9.5%. In 2007, investment growth rate reached a record level of 30%. But Romania still has very low labour productivity, less than half the labour productivity of Portugal in the 80s. This structural problem is accompanied by demographic issues, i.e. the population maintained a negative trend in the last decade (Table no. 4).

Table no. 4 Key Indicators of Romanian economy before and after the EU entry

Romania	GDP per capita (constant 2000 US\$)	GDP per person employed (constant 1990 PPP \$)	Population growth (annual %)	GDP per capita growth (annual %)	Gross fixed capital formation (annual % growth)
1999	1616	6202	-0.200	-1.002	-4.835
2000	1651	6182	-0.067	2.168	5.494
2001	1770	6584	-1.395	7.185	9.147
2002	1888	7830	-1.497	6.685	8.306
2003	1992	8245	-0.281	5.496	9.200
2004	2165	9096	-0.263	8.686	10.000
2005	2260	9620	-0.233	4.416	2.601

The similarities between the two countries are very evident when their labour markets are analyzed in a comparative manner during the periods close to the accession moment. Thus, participation in economic activity was around 60%, and the main problems of both countries recorded high rates of long-term unemployment and youth unemployment (Fig. no. 1).

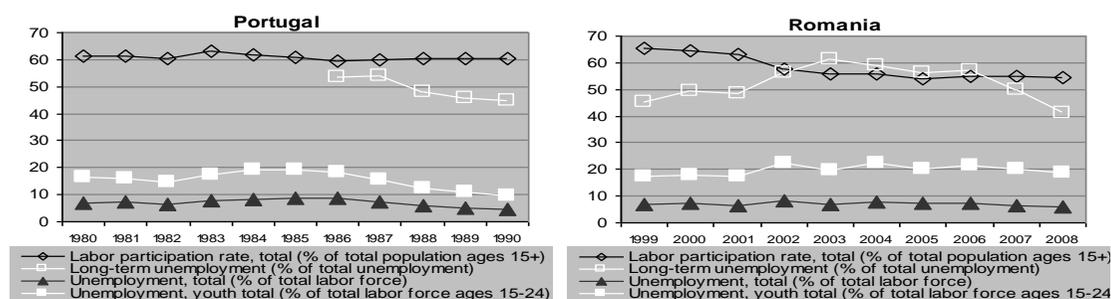

Fig. no. 1 Portugal and Romania's labour market situation

Source: Authors processing based on World Development Indicators & Global Development Finance

The two labour markets are quite similar in terms of labour market structure, Portugal being characterised for a long period by a high rate of population occupied in agriculture and industry, only a small part working in the services area (Fig. no. 2).

Even today, Romania has a different labour market structure compared to the European model, recording a large number of people employed in agricultural activities.

VI. Conclusions

From this paper we can see that the Portugal's experience can be very useful to our country, due to the similitude and why not, to some contrasts. We tried to choose comparable periods from the historical point of view, when the two economies achieved critical milestones in their evolutions.

The economic background of the two countries has been dramatically influenced by their authoritarian political regimes (Salazar and Ceausescu), followed by transition processes to the market economy, and with a lag of 21 years, they joined to EU.

The both economies faced and are still recording problems generated by the low productivity and lack of skilled workforce.

Thus, the evolutions of the Latin extremes of the EU are quite similar, and we can consider that is mostly due to the features of their people. We have seen how they behave in the modern economical history and it will be interesting to watch how the labour markets from these countries will evolve after the current economic crisis, but this generous issue will be the subject of a future paper.

EVALUATING TEACHING PERFORMANCE. FROM THEORY TO PRACTICE USING STATISTICAL TOOLS

Mare Codruta

Babes-Bolyai University, Faculty of Economics and Business Administration

Span Georgeta

Babes-Bolyai University, Faculty of Economics and Business Administration

The teaching performance is influenced firstly by the quality of the educational system. The universities are trying to raise the expectations regarding the methods used for evaluating the teaching quality. In order for the results to be as much as credible the evaluation must defer to the existing theory and to follow the standardized procedures, starting from some basic principles. The most used framework is represented by the 3P model which contains three parts: 1. The input (factors that come under the students and the professor) 2. The learning process (activities focused on learning, teaching methods, practical ability, individual study) 3. The outcome (the output of the learning process). This study presents some results of a questionnaire based on the existing economic theory and applied to a sample of master business students from Romania. The students were asked to give grades from 1 to 5 to several aspects related to the educational process. These aspects took into consideration the following: if the didactic activity was interesting for the students/ the relationship between the objectives of the course and the activity evolved/ the clarity of the presentations/ the degree of students' participation required by the teacher/ the methods and materials used/ the availability of the teacher. The average grade is 4.39, indicating a very high level of satisfaction, taking into account that the grades ranged from 1 to 5. For 50% of the students, the average grade was below 4.53, while for the other half it was above the specified value. But one has to see the value returned for the majority of the students. The mode equals 5, meaning that most of the students involved in the analyzed programme are extremely satisfied with the quality of the educational process. With a significance value $\text{Sig.} = 0.004 < 0.01$, we can state that there is correlation between the level of satisfaction expressed by the average grade and the number of classes missed by a student, at a confidence of 99%. The value of the Pearson coefficient is -0.213, which shows the existence of a weak reverse connection.

I. Introduction

Quality of the higher level educational system is very important in Romania now-a-days. The liberalization of the educational market has increased competition, allowing students to have choice at all tertiary educational levels. This implies that universities have to come up with

interesting study programs, which take into consideration the requests of the labor market. The goal is to make specialists that do not only have a diploma, but can also find a job with that diploma. In this way, the study of the educational process's quality has gained more and more importance. Falling under this evolution, the research in this article assesses the quality of a master program in one of the Romanian universities.

II. Overview

The most important part of the educational quality is learning performance. Learning performance has two major impact factors: the teaching and the learning methods. The most used framework of these correlations is represented by the 3P model (Biggs, 1999) which contains three parts:

1. *The input*. Refers to the factors that come under the students (their knowledge's in their field of interest, its interest for the domain and their aptitudes for learning) and factors that come under the professor (the teaching purpose, the professor's performance, the class environment).
2. *The learning process* (allows for activities focused on learning, the teaching methods, the practical ability of the teaching knowledge, individual study on the gain knowledge).
3. *The outcome* represents the output of the learning process, likeness the knowledge gathered by the students (both quantitative as qualitative).

Based on a pilot study and a quantitative study over a sample of 1278 students from the business field, Nguyen and Nguyen (2010, p.307-308) are testing five hypotheses concerning the mechanisms that determine the learning achievement:

1. Learning motivation will have a positive impact on learning performance.
2. Instructor capability will have a positive impact on learning motivation.
3. Instructor capability will have a positive impact on learning performance.
4. The impact of instructor capability on learning motivation will be stronger for students who have higher levels of personal development competitiveness than that of students who have lower levels of personal development competitiveness.
5. The impact of instructor capability on learning performance will be stronger for students who have higher levels personal development competitiveness than that of students who have lower levels of personal development competitiveness.

The statistical outcomes validate the formulated assumptions and reveal a moderated impact of the professor's abilities over the learning motivation and the learning achievement. Similarly to the empirical studies over the same subject (Mare et al., 2011; Tharenou, 2001), Nguyen and Nguyen (2010) prove that the learning motivation has a positive effect over the learning achievement. The professors' ability and the learning motivation influence in proportion of 75% the achievement of learning (the used value is the variance analysis).

The caretakers of the university development according to the „Bologna Process” have agreed that the responsibility of assuring the quality in the higher education system revives first to each university and to its own system of assuring the quality (Berlin Communique, 2003) in accordance to the principle of the university autonomy. The quality assurance in higher education institutions (HEIs) must be in accordance with the legal national frame and includes the evaluation of the universities and of the study programmes through internal standards (including the students participation), external evaluation (ministerial commissions) and the transparent publishing of the results (Kettunen, 2010). For a correct and objective estimation there is the possibility of the use of cross-evaluation of degree programmes. A cross evaluation is defined by a set of 1) Specific aspects; 2) Followed goals; and 3) Strategic objectives. The cross-evaluation is an example of enhancement-led evaluation, which is programmed to assist the institution both

in improving its educational and other actions. The strength of the evaluation is in its capability to relate learning methods, educational processes, and innovative association among the degree programmes.

One of the main important points now at European level is the lifelong learning process. Increasing it has become a major objective in all the treaties and strategies of the European Union. Another important aspect very much discussed is the correlation between university programmes and the skills the labour market demands. Only with the condition of complying with this “demand” the lifelong learning process will improve. Based on the above mentioned issues, the goal of this research was to see the degree of satisfaction for students involved in the master programmes related to audit at the “Babes-Bolyai” University, Faculty of Economics and Business Administration, Cluj-Napoca, Romania.

III.Methodology

To evaluate the master program, a survey was conducted that dealt with all the important aspects of the educational process – didactic activity, means and materials used during classes, teacher’s attitude, etc. For better understanding of the results, some features of the students were asked. In the end, the students were required to state the most important positive and negative aspects of the program and to make some suggestions to help improving the quality. In the first part of the questionnaire, students were asked to give grades from 1 (meaning the worst impression) to 5 (the best impression) to different aspects of the education process. A new variable was computed that expresses for each individual the average grade at a macro level. Afterwards, different methods of inferential statistics and data analysis were used to get the results. For the study of the relationship between two quantitative variables, the correlation approach was used. The correlation coefficient shows whether a connection exists and of what type.

IV.Results

The students were asked to give grades from 1 to 5 to several aspects related to the educational process. These aspects took into consideration the following:

- if the didactic activity was interesting for the students,
- the relationship between the objectives of course and the activity evolved,
- the clarity of the presentations,
- the degree of students’ participation required by the teacher,
- the methods and materials used,
- the availability of the teacher, and so on.

In the end, for an introductory analysis, the grades given by each respondent were put together. Moreover, for each individual an average grade was computed. This value is considered to render an overall opinion upon the quality of the master program.

As can be seen in Table 1, 190 students were involved in the study. Actually, the questionnaire was applied to 200 master students, but 10 of them were eliminated due to missing answers.

The average of the variable is 4.39, indicating a very high level of satisfaction, taking into account that the grades ranged from 1 to 5. For 50% of the students, the average grade was below 4.53, while for the other half it was above the specified value. But one has to see the value returned for the majority of the students. The mode equals 5, meaning that most of the students involved in the analyzed program are extremely satisfied with the quality of the educational process.

Table 1. Descriptive statistics of the average grade given by each student.

N	Valid	190
	Missing	0
Mean		4.3944
Median		4.5333
Mode		5.0000
Std. Deviation		0.5242
Minimum		2.6000
Maximum		5.0000
Percentiles	25	4.0500
	50	4.5333
	75	4.8000

Source: authors' calculus.

The average minimum value returned by the analysis is 2.6, while the maximum is, of course, 5. For a better picture of the distribution, the quartile values were computed. They show that for 75% of the respondents, the minimum average grade given to the aspects analyzed was 4.05. So, on average, almost all of the respondents are very or extremely satisfied with the master program. The distribution in relation to the percentile values is also shown in the box plot presented in figure 1.

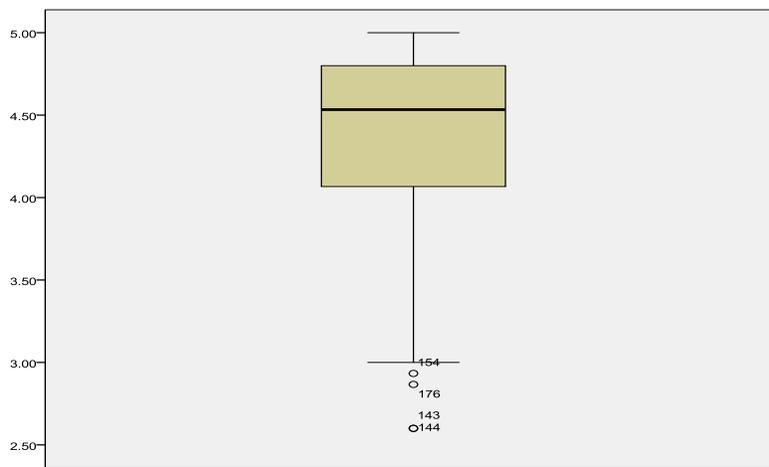

Figure 1. Boxplot of the average grade given by each master student.

Source: authors' calculus.

The boxplot is a very useful figure in such analysis as it emphasizes the grouping of the cases based on the median, the 1st and the 3rd quartile value. In addition, it also displays cases considered outliers. Out of the 190 respondents analyzed, 4 are considered to be outliers in the sense that they do not correspond to what is normal in the population. The four students have an average grade lower than 3 (which would be in between as attitude). Thus, only 4 students out of

190, representing 2%, are quite unsatisfied with the program they are involved in. The rest, 98% are very satisfied.

But for such variables, it is very important the representativeness of the average value and the degree of homogeneity of the distribution. The two aspects are assessed with the help of a single coefficient – the Pearson’s coefficient of variation, which is computed as the ration of the standard deviation to the mean. The value of 11.92% returned by the analysis, which is lower than 30%, clearly shows that mean of the average grade of each individual id representative for the students and that they are homogeneously distributed in respect to it.

But not all the students did come to all the courses. To see if there are any specificities, the relationship between the average grade and the number of classes skipped by a student was analyzed. The scatter plot of the distribution is presented below (figure 2). The correlation was tested with the Pearson coefficient.

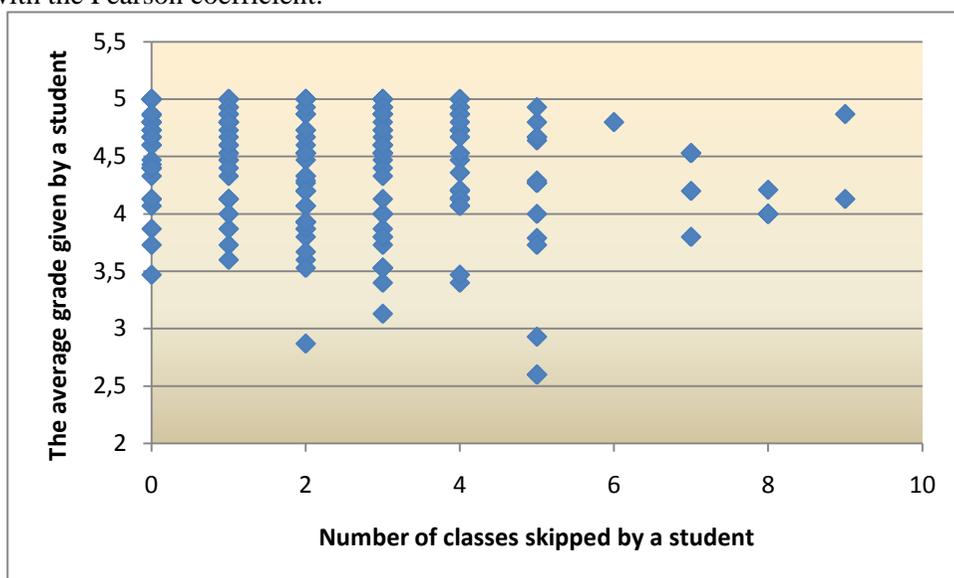

Figure 2. Scatter plot of the average grade and the number of classes skipped by each student.

Source authors' calculus.

Table 2. The correlation with the level of satisfaction

	Value	Asymp. Std. Error ^a	Approx. T ^b	Approx. Sig.	
Interval by Interval	Pearson's R	-0.213	0.060	-2.943	0.004 ^c
N of Valid Cases	184				

Source: authors' calculus.

With a significance value Sig. = 0.004 < 0.01, we can state that there is correlation between the level of satisfaction expressed by the average grade and the number of classes missed by a student, at a confidence of 99%. The value of the Pearson coefficient is -0.213, which shows the

existence of a weak reverse connection. In other words, it is expected that students that missed more classes to have a worse opinion about the quality of the program.

V. Conclusions

The goal of this analysis was to emphasize patterns and expectations related to university programmes from the point of view of the lifelong learning concept. As emphasized in the results part, the Romanian university system is struggling to bring forth programmes that are requested on the market. Increasing the practical level and showing students the relevance of each course leads to a much higher degree of satisfaction among them. And, if students are satisfied, they will recommend the programme to other prospective students.

AN INVESTIGATION OF LONGRUN RELATIONSHIP BETWEEN ECONOMIC GROWTH, INVESTMENT AND EXPORT IN ROMANIA

Meşter Ioana Teodora

University of Oradea Faculty of Economics

Simuţ Ramona Marinela

University of Oradea Faculty of Economics

The objective of this study was to estimate the long-run relationship between economic growth, investment and export in Romania using trimestrial data from the National Bank of Romania as well as National Statistical Institute. The econometric methodology employed was the Cointegration and Granger Causality test.

First, the stationarity properties of the data and the order of integration of the data were tested using the Augmented Dickey-Fuller (ADF) test. We found that the variables were non-stationary in levels, but stationary in first differences; that is, they are integrated of order one (I (1)). Since we used single equation model(s), the application of Johansen multivariate approach to cointegration was necessary to test for the long-run relationship among the variables. The result showed the existence of a single cointegration equation between the variables. The result of the Granger causality test shows a bidirectional relationship between investment and economic growth and also a bidirectional relationship between investment and exports but the result of the causation between export and growth was statistically insignificant.

Keywords: economic growth, investment, export, Romania, VECM model

JEL codes: E52, C32

I. Introduction

In contemporary economic literature, different points of view have been formulated regarding the economic growth. Considering the different points of view regarding the content of the economic growth, it can be defined as that process of increasing the dimensions of the economic results, determined by the combination and usage of the production factors and underlined throughout macro-economical indicators such as the gross domestic product, the national gross product and the national income in real terms (Samuelson and Nordhaus 2000: 632).

The study of the economic growth has old implications. The preoccupations for the study of economic growth have existed since the beginning of the classical school, represented by Adam Smith, David Ricardo and Thomas Malthus. In Malthus' conception, the balance is realized when the income decreases to a level where the work-force offer grows with a diminished rhythm, and the economy is at a stationary state. The classics omitted in their models the contribution of the technological progress to the growth of the production per capita (Socol 2006: 62).

The Keynesian and Neokeynesian models of economic growth consider that the economy is inherently unstable, the intervention of the state being necessary in order to achieve balance. These models propose the utilization of budget and monetary policies to stimulate the economic growth. The Neoclassic theory of economic growth considers that the economy is stable and tends towards a complete use. The Neoclassics start from micro-economy, from the preferences of the households, the companies production functions, the structures of the market, etc. The investments have a short term effect over the national income through the aggregated demand; their effects on the long run manifest themselves through the growth of the potential national income. On the long run, the technological modifications represent the main cause of economic growth, together with the capital investments and the new technologies (Angelescu 2006: 89).

The concept of economic growth on a long term was introduced by Solow and Swan in a macro-economic model that became a classic, by introducing into the models of growth accomplished by classic economists, Ramsey and Havelmomo, a relation which expresses the population growth and a condition regarding the efficient use of the labor force (Scarlat și Chirița: 60). From that moment, the theory of economic growth evolved rapidly as two generations of distinct models. The neoclassical model of Solow-Swan is based on the exogenous aspect of economic growth, sustaining the realization of a process of economic convergence between the countries. In his study, Solow starts from the following hypothesis: the capital is submitted to decreasing capacities; the countries which have at their disposal the same characteristics of demographic growth, technological progress and rate of investments, will have incomes which will converge towards the value present in the most developed country; the scale capacities are constant; the technological process is exogenous; the economy is perfectly competitive; the perfect mobility of the production factors (Marinaș 2010: 79-80).

The interest for the theory of economic growth reignited together with a research of Romer, giving birth to the second generation of economic growth models. Within those models, there are significant improvements, such as an attempt to explain aspects related to dates which had not been discussed in the neoclassical model, a more satisfactory explanation of the differences between the rates of economic growth in different countries, a central attention given to gathering of knowledge; an increased role given to the instruments of the macro-economical policies for the explanation of the growth process (Scarlat and Chirița: 60).

II. Models of economic growth – a short literature review

This paper presents the relationship between the economic growth, exports and investments in Romania. A series of empirical studies tested the correlation between the dynamics of the exports and the process of economic growth, as well as the possibilities of transfer of the effects resulted from the two variables. Pereira and Xu used for the identification of the causal relation between these, the concept of causality in the Granger sense. According to this model, the exports uphold the economic growth, the estimating of the growth variable being improved through the inclusion of the export variable delayed in time. In a similar manner, the growth variable constitutes a cause of the export variable, if the estimation of the export variable registers a reduction of the forecast error, by including the delayed growth variable (Marinaș 2010: 280).

Starting from the same concept of causality in the Granger sense, Omoke Philip Chimobi studies the relation between the economic growth, investments and export. The role of this model was that it determined a long term relation between the three variables. In estimating this relation the Johansen co-integration test was also used, based on which the conclusion was that there was no long term connection between the three variables. Regarding the Granger causality test, it was found that between the investments and the economic growth there exists a bi-directional relations of causality, which from a statistical point of view was insignificant, and it also resulted that there exists a bi-directional relationship between investments and export (Chimobi 2010: 215).

Ullah, Zaman, Farook and Javid have shown with the help of a VECM model showed that the extending of export leads to an economic growth. They also checked whether there is a uni-directional or bi-directional causality between the economic growth, exports, imports, real fix capital and the income per capita (Ullah and others 2009: 269-270).

Subasat showed that the exports constitute a source of economic convergence, the countries with a medium level of development and with an expansion of export, grow faster than those which are not oriented towards export. His fundamental objectives are to try to obtain control over the structural characteristics which determine “the orientation of export” in order to derive an

indicator for the promotion of export which captures only the effects of the policies, and then in order to attest if this indicator is or not essential for the economic growth (Sabasat 2002: 333).

An analysis of the relation between growth, investments and exports, was accomplished by Dritsakis as well . He studied the relation between the three variables for Romania and Bulgaria, with the help of auto-regressive VAR model. The results suggest the existence of a relation of co-integration between the three variables, as well as a positive impact of the exports and the investments on the real GDP (Dritsakis 2004: 1831).

Regarding the investments, the neoclassical theory suggests the importance of the stock capital increase for the countries that are at a low level of economic development. The influence over the economic growth will be for a medium amount of time, until the moment in which a level of stationary balance of the income will be achieved. The sources for the investments refer to the growth of the savings rate, as well as to the fluctuations of the direct foreign investments. In the case in which these direct foreign investments presuppose also transfers of technology, then the process of real convergence will be a sustainable one. For the new members of the European Union, the direct foreign investments have upheld the process of economic growth, two of the channels for the transmission being represented by investments and exports (Marinaş 2010: 280). Modern theories of economic growth underline the unlimited potential of the technological progress, in order to save all the production factors and to sustain the increasing capacities of the investments (Socol 2006: 62).

III. Methodology

In order to investigate the causality between the nominal GDP (LGDP), direct investments (LDI) and export (LEXP) we used trimestrial deseasonalized data in log for 2000:1 – 2010:4 collected from the Monthly Bulletins of the Romanian National Bank and the INSSE Tempo Online series available online on Romanian Statistical Institutes website. The VAR and VECM models have been largely used in macroeconomics, especially because the variables involved are endogenous and exogenous at the same time. It is known that VAR models are used for stationary data while VECM – for nonstationary ones. We investigated the stationarity of data, in order to establish whether a VAR or VECM is most suitable, then we studied the cointegration between the chosen variables as well as the Granger causality. We used the impulse response function as well as the variance decomposition in order to study the model’s goodness of fit.

IV. The model

First we investigated the stationarity of data. We used the Augmented Dickey Fuller test, including in the equation a constant and a linear trend. Following Canova, the choice of the lag length was established using Schwartz’s Info Criterion, as the AIC criterion has been proven to be inconsistent for more than 20 observations.

Table 1. ADF test for variables in level and first difference

	ADF test for variables in level		ADF test for the first difference of the variables	
	T statistic	Test critical values for 5% level	T statistic	Test critical values for 5% level
LGDP	-0.205027	-3.518090	-5.934518	-3.523623
LDI	-1.062859	-3.544284	-3.590803	-3.533083
LEXP	-2.626204	-3.520787	-5.001252	-3.523623

Source: Authors’ calculus

ADF test shows that variables in level are not stationary, but all of them are integrated of order 1, I(1), for a 5% level of confidence.

We next investigated the existence of a cointegration relationship between the chosen variables, using Johansen methodology. The Johansen cointegration without deterministic trend test was then conducted. The Unrestricted Cointegration Rank Test (Trace) as well as the Maximum Eigenvalue test indicated one cointegrating equation at 0,05 level for the model without deterministic trend.

Given the results, a VECM Vector Correction Model with 1 cointegrating equation was estimated. Restrictions were placed on the coefficients of each cointegrating relation as well as on the adjustment coefficients, using the normalized cointegrating coefficients and adjustment coefficients. The VEC Granger causality/block exogeneity Wald test showed that the variables with significant impact on the evolution of GDP were both chosen variables, direct investments as well as export.

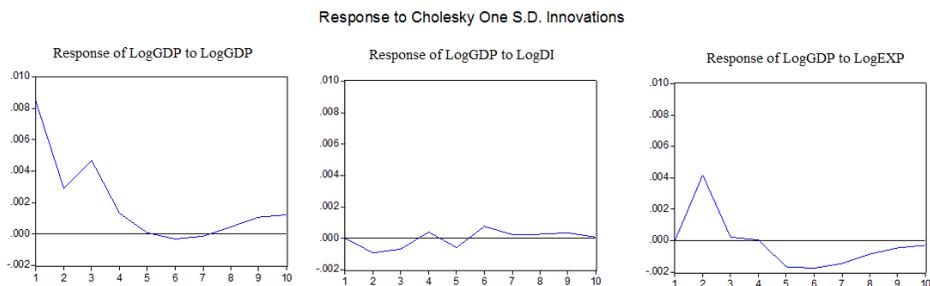

The cointegration relationship can be written as follows:

$$\text{LogGDP} = 0.163234 \text{ LogEXP} + 0.459997 \text{ LogDI}$$

and it reveals a positive correlation on long run between economic growth, exports and direct investments. A 10% increase in exports (in log) determines an increase of 1,6% of GDP in log. The result is consistent with the one of Marinaş. In his VECM model he found an elasticity of 18% of GDP at a increase of 1% of exports.

The VECM model is used in order to investigate the causal relationships between the chosen variables. We found that the model can be written as follows:

$$\Delta \text{LogGDP}_t = -0,29 \Delta \text{LogGDP}_{t-1} - 0,07 \Delta \text{LogDI}_{t-1} + 0,07 \Delta \text{LogEXP}_{t-1} - 0,11 (\text{LogGDP}_{t-1} - 0,08 \text{LogDI}_{t-1} + 0,07 \text{LogEXP}_{t-1} + 3,6)$$

Graph 1. Impulse response functions of LogGDP to a 1% impulse of LogGDP, LogDI and LogEXP

Source: Authors' calculus

Graph 2. Variance decomposition of LogGDP – percent of LogGDP variance due to LogGDP, LogDI and LogEXP

Source: Authors' calculus

We conducted the pairwise Granger causality test with 2 lags. Granger causality tests are defined as joint tests (F-tests) for the significance of the lagged values of the assumed exogenous variable. The estimation result indicated that we reject the null hypothesis for both LogDI and LogGDP and conclude that there exists bidirectional causality between investment and economic Growth at the 5% level of significance. There was statistical significant relationship found to

exist between export and economic growth. Also, with regards to the relationship between investment and export, the result showed that we reject the null hypothesis, indicating that there is bidirectional relationship existing between investment and export in Romania.

V. Conclusions and further implications

The implications of the result is that increase in investment will lead to production of more good which will cause growth in the economy in one hand; and on the other hand, economic growth will guarantee increase in investment. This increase in investment will find development projects such as electricity supply, good road network, good medical care and host of other projects being carried out in Romanian economy. The growth of a country's economy increase the per capita income and subsequently the capability of the citizens to save and reinvest in the economy; hence, a bidirectional causality.

Also Investment which was seen to cause growth will equally enhance export, bearing in mind that increase in export of goods and services will necessitate (cause) Investment in the Romanian economy. It is therefore strongly recommended that policies aimed at increasing the level of Investment be formulated in Romanian economy as a means of engendering economic growth and export which will flow back to as investments.

AN OVERVIEW OF HUMAN RESOURCES IN SCIENCE AND TECHNOLOGY (HRST) FROM RESEARCH DEVELOPMENT AND INNOVATION (RDI) SECTOR DURING 1993-2009 IN ROMANIA

Nicolov Mirela^{1,2}

¹*University of Oradea, Faculty of Economic Science*

²*Aurel Vlaicu University of Arad, Faculty of Engineering*

The present paper present a study done on the Human Resources in Science and Technology (HRST) in Research Development and Innovation (RDI) sector in Romania during 1993-2009. This paper started from the elements defined in Canberra Manual based on the qualification and occupation. Labor force in this study refers to university level and technician level as skill from education. These definitions from Canberra Manual for HRST were used in the present paper in reference to all the researchers in Romania for different areas of research as engineering and technology sciences domains, natural and exact sciences, medical sciences, agricultural science, social sciences and humanities. After a short presentation of the US origin of the Human Resources in Science and Technology Management and the situation from Europe, the present paper are dealing with the area of the Human Resources in Science and Technology system from Romania, the sector of Research Development and Innovation. This study is focused on the employees by categories of the activities in research, development and innovation sector. We took into account the employees with different categories of graduation diploma which are working in the fields of research and development activities too. Samples data were took from Tempo online database from National Institute of Statistics from Romania, updated database in 21 of October in 2010. Data were took for simulations in December 2010. We try to do a simulation on the evolution of Human Resources in Science and Technology (HRST) in Research Development and Innovation (RDI) sector in Romania during this period (1993-2009) and we observed that real data fitting on a regression curve of sixth degree whose coefficients were defined during this study. This type of simulation can be good for future forecasting for Human Resources in Science and Technology in Research Development and Innovation (RDI) sector in Romania.

The present study is part of Doctoral Grant "Implications for innovation, research and development role in the development of Romania's economic competitiveness", during 2010 and 2013 and having Director: Prof. Dr. Alina Badulescu in Oradea University, Faculty of Economic Sciences.

Key words: *Human Resources; Statistical Simulation Methods; Employment; Higher Education and Research Institutions; Labor Force and Employment, Size, and Structure.*

1. Introduction

From Canberra Manual, the fifth Frascati Manual, the demand for Human Resources for Science and Technology (HRST) as definition is based on two dimensions, qualification and occupation. The qualification axis tell us about supply of HRST the number of people who are currently or potentially available to work at certain level. (OECD, Canberra Manual, 1995)

The demand for HRST, the number of people who are actually required in S&T activities at a certain level, is related to the occupation dimension.

HRST are people who fulfill one or other of the following conditions: successfully completed education at the third level in an Science & Technology field of study; and not formally qualified

as above, but employed in a Science & Technology occupation where the above qualifications are normally required.

HRST can be split into two major categories. (OECD, Canberra Manual, 1995): University- level HRST and Technician-level HRST.

The split between those two is related to skill levels and thus mainly to education. In general, education at the third level begins at the age of 17 or 18 and lasts three or more years. Successful completion of either a first or a postgraduate university degree (or equivalent) is the main criterion for university level HRST, whereas an award lower than a first university degree is the criterion for technician-level HRST.

The International Standard Classification of Education (ISCED) is the classification both of levels of education and field of study.

ISCED levels of education. (OECD, Canberra Manual, 1995)

0 Education preceding the first level; **1** Education at the first level; **2** Education at the second level, first stage; **3** Education at the second level, second stage; **4** (Not attributed), **5** Education at the third level, first stage, of the type that leads to an award not equivalent to a first university degree; **6** Education at the third level, first stage, of the type that leads to a first university degree or equivalent; **7** Education at the third level, second stage, of the type that leads to a postgraduate university degree or equivalent; **8** (Not attributed); **9** Education not definable by level.

2. Literature review

The theories of Human Resources Management has the origin in United States of America (Brewster, 2004; Brewster, 1994). The management of Human Resources in particular has been heavily influenced by thinking in USA.

The impact of the globalization was influenced on the way that people are managed, particularly in Europe Union (Brewster, 2004; Brewster, 1994). In human resources management (HRM) in particular is the US model of HRM one that will inevitably be followed in Europe? Our understanding of management in general and human resources management in particular has been heavily influenced by thinking in the United States of America. This is perhaps not surprising from a country that has been for decades the largest economy in the world. HRM like many other aspects of management was originally conceptualized and developed in the United States of America. The study of personal management which was “partly a file clerk’s job, partly a housekeeping job , partly a social worker’s job and partly a fire-fighting to head of union trouble” (Drucker, 1989). The American’s theories about HRM would work anywhere in the world. “Relationships between the structural characteristics of work organizations and variables or organization context will be stable across societies“ (Hickson et. all, 1974). Their main findings from cases in the USA, Canada and then UK were that companies are subject to the same relationships in terms of size, dependence on parent group and technology irrespective of country. Hickson et. all offered a culture free context of organization structure (Hickson et. all, 1974). Kidger appreciated that grew in isolation from the world economy are having their approaches supersede by universally applicable techniques (Kidger, 1991).

Other models of Human Resources Management (HRM) are continually being developed. And the rhetoric at least of HRM has been spread to many other countries both in the theoretical discourse and within employing organizations. From the early days, there have been calls for comparative HRM, studying similarities and differences in management systems and the way people are managed in different countries (Brewster, 2004; Brewster, 1994; Redding, 1994).

The concept of Human Resources Management (HRM) has the origin in Europe (Brewster, 2004).

Whether the US derived visions of Human Resource Management (HRM) apply everywhere in the world is an important question for both theory and practice since following US prescription

in either area may be detrimental if theories are not transferable, for example, the need for a contingent approach encompass cultural, sectorial and regional differences. Similarly, other theorists have also argued for the need to cover both national differences and organizational contingencies, although they have used different terminologies: macro economy, micro economy (Gronghaug,1992) exogenous, endogenous (Brewster, 2004; Brewster, 1994), external and internal variable (Morley, 2004). How the theory applies particularly to the European setting remains a conceptual and empirical challenge. One problem is that the complications noted above make research difficult and there is a scarcity of empirical data (Brewster, 2004; Brewster, 1994). Despite these theories and the complexities of understanding different national contexts geographical differences are apparent, and the effort to understand them is important. There are a number of critical differences between the North American context and the European (Brewster, 1994). Such a comparison involves substantial generalization. We must remain aware of the substantial differences of the substantial differences within North America, even within individual states in the USA and the differences between European countries.

3. Research methodology

Research methodology in this paper is based on the simulation of the data from 1993 to 2009 for employees in research and development activities by occupation and sex and for employees working in the fields of RDI activities. Data were taken from the Romanian National Institute of Statistic updated database Tempo online at 21.10.2010. Data used in this study, for this simulation was taken in December 2010. This research is based on the real data of Human Resources from RDI area, as a case study for Romania.

[Sources:<https://statistici.insse.ro/shop/index.jsp?page=tempo2&lang=ro&context=26:CDP102B>]

The central objective was to see what was happened in the period indicated (1993 -2009) with human resources, if the real data respect a regression curve at a specific order which have to be determined. Another objective is to determine the coefficient for the regression curve obtained for HR data.

4. Descriptive statistics and results

Employees in research and development activities by occupation and sex

Number of employees in research and development activity is the total number of employees at one point, which participate directly or indirectly, to solve problems that are the objects of the unit, being paid for services performed.

Data for the period 1990 - 1992 are not available because the methodology was based on the recommendations of UNESCO (in research and development and design was included) that were different from those used by OECD and Eurostat, according to the Frascati Manual. Since 1993, UNESCO gave the methodology.

Human Resource in Science and Technology (HRST) maximum value was recorded in 1993 when there were 75,618 employees and the minimum value was registered in 2000 and had the value of 37,241. If in 1993 were registered the maximum number of employees 75,618 in Research & Development & Innovation area, 37,878 were women - that was 50.07% and 37,770 were men - that is 49.92%. In 2000 they were registered with the minimum number of employees 37,241 in R&D&I, 17,114 were women - that is 45.95% and 20,127 were men - that is 54.04%. The total human resource engaged in R & D & I area in 1993, researchers 5 and 6 level of education according to ISCED, employees with higher education - level 5 and those with higher education and doctoral - level 6) is 52.32%, technicians (who have only secondary education level) is 23.97% of the total employees engaged in human resource that RDI and the rest up to 100% are other categories of employees. In 2000 the human resource engaged in research

decrease the number of researchers with doctorates and higher education is 62.24% of the total number of employees in RDI, the number of technicians is 18.13% of other categories of employees total RDI sector is 19.62%. In 2009, the human resource of RDI increases compared to 2000 when there was minimum, with 5179 employees, ie by 13.9% compared to 2000, when he was at a minimum. In 2009 the total human resource is lower compared to the maximum value of 1993 to 43.92% ie 33,228 employees, and higher minimum of employees in 2000 to 5179, representing a 13.9% share - more employees than in 2000. You could say that 54.33% of the human resource engaged in RDI sector in 2009 were men and 45.66% were women.

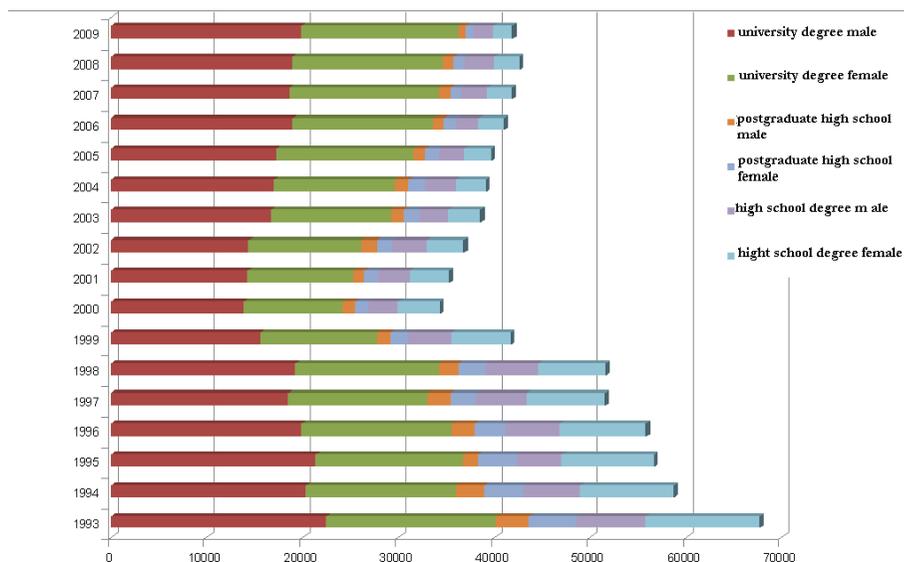

Figure 1: Human resources with different categories of graduation diploma.: University degree (male and female), high school graduation diploma (male and female) and postgraduation high school diploma (male and female).
(Source: author's calculus)

Employees working in the fields of RDI activities

The results used in this study were taken from the site of Romanian National Institute for Statistics data base Tempo online, the updated database on 21.10.2010, Data were taken for simulations in December 2010.

(Source:<https://statistici.inse.ro/shop/index.jsp?page=tempo2&lang=ro&context=26>: CDP102D, and Romanian Statistical Yearbook, 2008) :Number of employees in research and development activity is the total number of employees at a time, that participate directly or indirectly, to solve problems that are the objects of the unit, being paid for services performed.

Depending on training, a diploma of graduation, the researchers are employed on such scientific fields: natural and exact sciences, engineering and technological sciences, medical sciences, agricultural sciences, social sciences and humanities. For the period 1990-1994 data are not available due to data collection, it was not carried out of the research and scientific domains.

To study the number of researchers in scientific fields we used the data available between 1995 and 2009. It seems that the total number of researchers fell in 2000, with the lowest value: 23,179 for Romanian researchers in the whole system, and the highest value was recorded in 1995: the return of 35094. Are placed the number of researchers in 2008 (at 3084 value) and then drop again in 2009 with almost 200 employees in Romania.

In Figure 2 is shown the graphically the variation in time from 1995 to 2009 the number of researchers in total and for the natural and exact sciences, engineering and technological sciences, medical sciences, agricultural sciences, social sciences, humanities.

It may be noted that the highest number of researchers is recorded in engineering and technological sciences and the natural and exact sciences. Were represented graphically for example, the total number of researchers, the number of researchers in the natural and exact sciences and the number of researchers in engineering and technological sciences and found that it corresponds to the order of 6 to regression curves for all 6 areas.

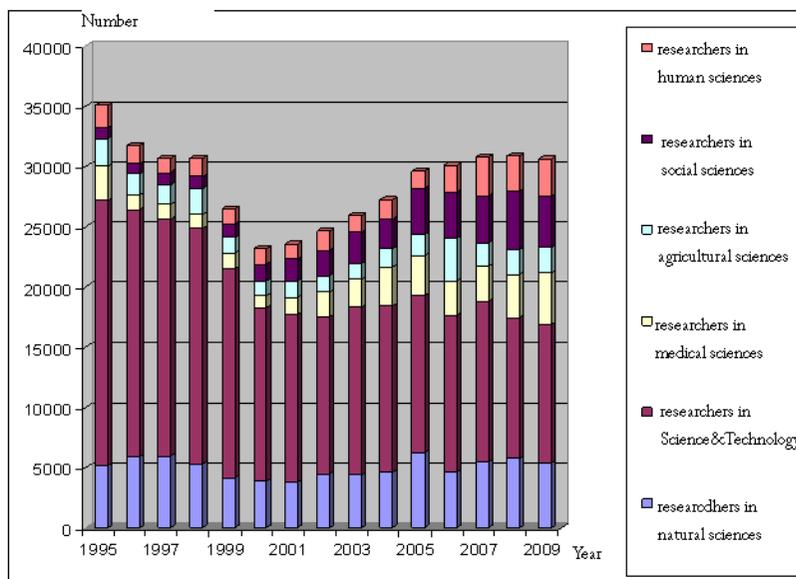

Figure 2: Researchers on different areas of research as human sciences, social sciences, agricultural sciences, medical sciences, Science & Technology and natural sciences.

Table 1: The coefficients C_0, \dots, C_6 , R^2 and order of regression equation for different activities domain

	order of regression eq.	R^2	C_0	C_1	C_2	C_3	C_4	C_5	C_6
Total number of researchers	6	0.947	39998	-8105	3819	-1055	138.6	- 8.254	0.181
Engineering and technological sciences	6	0.977	25033	-5128	2624	-725.1	92.26	-5.364	0.116
Natural and exact sciences	6	0.758	1123	6075	-2493	423	-34.64	1.367	-0.020
Agricultural sciences	6	0.591	5188	-4695	2355	-547.8	62.50	3.392	0.07
Medical sciences	6	0.947	5642	-4325	1668	-341.1	38.61	-2.202	0.048
Social sciences	6	0.975	443.7	807.3	-480.2	124.4	14.79	0.847	-0.018
The humanities	6	0.913	2566	-840.2	144.5	11.15	-5.318	0.489	-0.014

Source: author calculus

The characteristic equation of the regression for the data in the present study is:

$$y=C_6x^6+C_5x^5+C_4x^4+C_3x^3+C_2x^2+C_1x+C_0$$

Coefficients C_0, \dots, C_6 are listed in table 1 for each case.

For **the total number of HRST in RDI**, in 1995 was 35,094 the maximum number recorded, in 2000, the minimum number of 23,179 was registered. For **engineering and technological sciences**, in 1995 was recorded the maximum number of 22,024 researchers and 11,538 is the minimum number of registered 2009. We can observe that HRST engaged in technological sciences and engineering decreased from 62.75% in 1993 to 37.65% in 2009. For **natural and exact sciences**, maximum number of researchers in 2005 is 6238 and 3781 is the minimum in 2001. HRST recorded in RDI in natural and exact sciences and the exact ranges vary from 14.76% of the total number of researchers in 1993 to 17.54% in 2009. For **agricultural sciences** the maximum number of researchers in 2006 was recorded as 3567 and 1244 was the minimum recorded in 2000. The percentage of agricultural science research ranging from 6.6% in 1995 to 5.4% in 1997 then has been an increase from 7% in 1998 and then was an decrease to the minimum value of 5.04% recorded in 2000 and then in 2006 reach to maximum of 11.84%. For **medical sciences** the maximum number of HRST was recorded in 2009 as 4289 and in 2000 was recorded the minimum number of researchers, 972. As percentage, engaged in the RDI as HRST in the field of medical science, increasing from 7.89% in 1995 to 13.99% in 2009. For **social sciences** there was the maximum value recorded for HRST in RDI in 2008, 4862 and the minimum of 834 registered in 1996. As percentage we can say that HRST in social sciences vary from 2.57% in 1995 to 15.75% in 2008. For **the humanities** the maximum value registered for HRST in RDI since 2007 is 3149 and the minimum value recorded is the value of 1153 in 1997. At the humanities sciences, researchers percentage is increasing from 3.76% in 1997 to 10.24% in 2007, then decrease slightly.

This type of study was done in order to make a first type of simulations of HRST in RDI sector in Romania. We deal in this paper with the HRST (used form the updated database at 21.10.2010 of www.insse.ro) having different activities as engineering and natural sciences to humanities and with different graduation degrees. The conclusions are that the smallest amount of HR was recorded in 2000 and the highest was in 1995. We succeed to do a simulation on the evolution of Human Resource during this period (1993-2009) in Romania and we observed that real data fitting on an regression curve of sixth degree whose coefficients were defined during this study. This type of simulation can be good for future forecasting of HRST in RDI sector in Romania.

SOME STATISTICAL RESULTS REGARDING THE EVALUATION OF THE QUALITY OF THE MASTER EDUCATION

Popa Irimie

Babes-Bolyai University, Faculty of Economics and Business Administration

Dragos Cristian

Babes-Bolyai University, Faculty of Economics and Business Administration

Mare Codruta

Babes-Bolyai University, Faculty of Economics and Business Administration

The article emphasizes aspects regarding the evaluation of the higher education's quality. In certain countries, the questionnaires regarding quality of the activity of HEIs (Higher Education Institutions) are administrated by specialized institutions led by the Ministry of Education or the university associations. The evaluation principles derive from well-known economic and social theories, evolving even evaluation models (see the SERVQUAL model). As a result of the Bologna Treaty (1999), the European Union has the objective to become an international reference concerning the higher education quality and to be more attractive than in the present for students, professors and researchers from other regions of the world. So as to fulfill these objectives ENQA (European Association for Quality Assurance in Higher Education) recommends HEIs to include in their development plans regarding quality aspects five principles described in the article. The practical study refers to the results of a questionnaire applied to the master business students from a Romanian university. In order to assess the level of satisfaction of students in relation to the master programme they are involved in, a questionnaire was applied on a sample of 200 such persons. The responses were then analyzed using multidimensional data analysis methods. Out of these, the present research is based on multiple response analysis. In the questionnaire, students were asked to return their level of satisfaction for different aspects related to the educational process they are involved in. The questions were constructed as five-level Likert items. In this way was insured a connection between answers given at each of the questions assessing the quality of the programme. Only 0.2% of the answers given relate to aspects about which the students were not satisfied at all. These answers represent 3.2% of the number of respondents. 30% of the students were slightly satisfied, returning 57 choices of this type. As one can see, the volume of each group increases with the level of satisfaction. The processing of the questionnaire was made on recent economic theories concerning the quality assurance in the university environment, which are briefly presented in the beginning of the article.

Keywords: higher education, teaching quality

JEL classification: I21, I23

I. Introduction

A new master programme has started at the Faculty of Economics and Business Administration, Babes-Bolyai University of Cluj-Napoca. The courses are intended to prepare specialists in European funding audit procedures. The goal of the programme is of major importance now-a-days, taking into consideration the fact that Romania is in the process of structural funds absorption. Having well prepared individuals to work in the field should increase the sums attracted and the quality of the results. This research bring forward partial results of the study. It

aims at presenting a brief description and evaluation of the level of satisfaction of the students in relation to the master programme, based on their demographic characteristics.

II. Overview

In order to compare the results of the students' evaluation some evaluation schemes have become unitary at national level. In Greece for example, the questionnaires regarding the activity quality of HEIs (Higher Education Institutions) are administrated by the Hellenic Quality Assurance Agency for Higher Education. The basic principles of the evaluation start from the SERVQUAL model, developed in the studies of Parasuraman and al. (1988) and Tsinidou, Gerogiannis and Fitsilis (2010) which define five dimensions for quality: 1) *Tangibles* 2) *Reliability* 3) *Responsiveness* 4) *Assurance* 5) *Empathy*.

As a result of the Bologna Treaty (1999), the European Union has the objective to become an international reference concerning the higher education quality and to be more attractive than in the present for students, professors and researchers from other regions of the world (Commission of the European Communities, 2003). So as to fulfill these objectives ENQA (European Association for Quality Assurance in Higher Education) recommends HEIs to include in their development plans from the quality area the following principles (ENQA, 2005):

- 1) Define the policy and procedures for quality assurance of the quality and standards of their programs and awards, including their systematic review. Institutions need to adopt a culture of quality improvement in all aspects of their educational product.
- 2) Assessment of students using published criteria, regulations and procedures consistently applied.
- 3) Quality assurance of teaching staff, facilities and resources.
- 4) Data processing of information collected through surveys and other sources for the effective management of the institution and customer service.
- 5) Objective and up to date information available to the public about a variety of issues such as degrees and awards offered, financial data, quality assessments etc.

For reaching the quality objectives in agreement to the principles stated by ENQA, HQAA utilize an AHP - Analytical Hierarchical Process (see also Saaty, 1980, Mare et al., 2011). The main goal of AHP „is to classify a number of alternatives (e.g. a set of quality determinants) by considering a given set of qualitative and/or quantitative criteria, according to pair wise comparisons/judgments provided by the decision makers” (Tsinidou, Gerogiannis and Fitsilis, 2010, p.231). Keeping with Jadhav and Sonar (2009) the leading advantages of the AHP method are:

- its capability to provide a hierarchical decomposition of a decision problem that helps in better understanding of the overall decision making process;
- the fact that it handles both quantitative and qualitative criteria;
- its repose on relative, pair wise comparisons of all decision elements; instead of arbitrarily defining a percentage score and a weight for each decision element, AHP allows the decision maker to focus on the comparison of two criteria/alternatives, at a time, thus it decreases the possibility of defining ratings based only on personal perceptions of the evaluators or other external influences;
- AHP is applicable to both individual and group-based decision making (this is often achieved by considering the geometric mean of comparison values),
- it enables consistency checks upon pair wise decision judgments;
- it supports sensitivity analysis to examine the effects of changing values of criteria weights on the final ranking of the decision alternatives.

One of the main important points now at European level is the lifelong learning process. Increasing it has become a major objective in all the treaties and strategies of the European

Union. Another important aspect very much discussed is the correlation between university programmes and the skills the labour market demands. Only with the condition of complying with this “demand” the lifelong learning process will improve. Based on the above mentioned issues, the goal of this research was to see the degree of satisfaction for students involved in the master programmes related to audit at the “Babes-Bolyai” University, Faculty of Economics and Business Administration, Cluj-Napoca, Romania.

III. Methodology

In order to assess the level of satisfaction of students in relation to the master programme they are involved in, a questionnaire was applied on a sample of 200 such persons. The responses were then analyzed using multidimensional data analysis methods. Out of these, the present research is based on multiple response analysis. Variables having the same answering pattern were grouped and analyzed together in multiple response sets. The procedure was applied in order to emphasize connections that exist between the variables in the set. Moreover, cross correlations were tabulated between the set and other variables under study. The latests are, in fact, demographic features of the students involved in the research.

In the questionnaire, students were asked to return their level of satisfaction for different aspects related to the educational process they are involved in. The questions were constructed as five-level Likert items. In this way was insured a connection between answers given at each of the questions assessing the quality of the programme. Thus, for each question, 1 represented strong dissatisfaction (not at all satisfied) and 5 a high level of satisfaction (extremely satisfied). In the end, they were asked to give some demographic information about them – sex, employment, education, etc.

IV. Results

From the sample of 200 master students, 10 were eliminated due to too much missing answers that would have distorted the results. Consequently, the final analysis sample consists in 190 persons involved in the programme.

Using the multiple response methodology, variables that assess the level of satisfaction on different areas were put together in a multiple response set. In total, there are 15 variables in the set.

As can be seen in Table 1, most of the students are very satisfied or extremely satisfied with the activities in the master programme. The multiple response analysis deals both with the number of responses and the number of cases. The 190 students gave 2834 answers to the questions in the set. Constructing the ratio, result approximately 15 answers per person surveyed (the value of 1491.6% in the Total row). This means that all of the students gave an answer to the questions under analysis.

Table 1. Multiple response set for assessing the level of satisfaction of the students in relation to the master programme.

		Responses		Percent of Cases
		N	Percent	
Level of satisfaction	Not at all satisfied	6	0.2%	3.2%
	Slightly satisfied	57	2.0%	30.0%
	Moderately satisfied	300	10.6%	157.9%
	Very satisfied	925	32.6%	486.8%
	Extremely satisfied	1546	54.6%	813.7%
Total		2834	100.0%	1491.6%

Source: authors' calculus.

Only 0.2% (6 in absolute value) of the answers given relate to aspects about which the students were not satisfied at all. These answers represent 3.2% of the number of respondents. 30% of the students were slightly satisfied, returning 57 choices of this type. As one can see, the volume of each group increases with the level of satisfaction. Hence, 300 choices of moderately satisfaction were made. The gap between these three groups already presented and the last two is huge. They account for not even 13% of the responses received. Almost 33% of the answers were given for the very satisfied group, while the majority of more than 50% declared to be extremely satisfied. On average, out of 15 individual choices, a person declared to be extremely satisfied in 8 of them. As stated above, we were also interested to see the connections between the level of satisfaction and some characteristics of the individuals. Out of the demographic variables, two have proved to weight more as importance in the analysis – the average grade of the final exam and the status on the labour market.

The results in Table 2 show that most of the students from the studied master programme are students with very good final grades. When going deeper into the analysis, the most important thing to be emphasized is that there is a direct connection between the level of satisfaction and the average final grade of each individual. Thereby, the higher the final grade, the higher the level of satisfaction. From the point of view of the analysis this is very good. Because persons that have studied well during the faculty period have insured themselves a good background, that allows for objective evaluation in respect to the field and the goal of the master programme.

When assessing the status of the individuals on the labour market, there are two main groups identified – students that do not work at all and students who work more than 20 hours a week. The majority of each group is extremely satisfied with the programme. But, at a closer look (see Table 3) students that work more than 20 hours a week are also to be found more in lower satisfaction groups. This because they may have the expertise to make a better evaluation of the programme than persons that have not yet come into contact with the requests of the labour market. The latter group has given 24 answers of slightly satisfaction in comparison with 12 given by the ones that do not work and 17 by the ones that work less than 10 hours/week. They also represent the majority of the ones that are not at all satisfied by the courses in the master programme.

Table 2. Assessing the level of satisfaction in respect to the average grade of the final exam for the bachelor programme.

			Average grade of the final exam			Total
			7-8	8-9	9-10

Source: authors' calculus.

V. Conclusions

The partial results presented here have emphasized the high level of satisfaction of the master students in relation to the programme they are involved in. As presented above, out of 15 possible individual answers, on average, more than 8 of the choices were in the group of extreme satisfaction. This means that the professors have been able to have their courses at a high standard, insuring the quality of the master programme analyzed. This pure descriptive analysis is going to be completed in future studies by more complex data analysis methods intended to put into light specificities of the research.

A STUDY CONCERNING THE OPPORTUNITY OF INTRODUCING THE FLAT TAX IN THE CASE OF THE INCOME TAX FOR INDIVIDUALS IN ROMANIA

Abrudan Leonard Călin

University of Oradea, Faculty of Economic Sciences

Abrudan Cristina Laura

University of Oradea, Faculty of Economic Sciences

In this paper we will try to find out if the flat tax as an income tax has answered the objectives of the governors in the field of the public economy. We will study if the budgetary receipts from this particular tax met the expectations of those who thought that this could be a solution in order to energise the economic and social activity.

Keywords: flat tax, income, budgetary receipts,

JEL: H21, H24, H31

In this paper we will try to determine the way in which the flat tax has influenced or not the social and economic activity in Romania. This topic belongs to the domain of public finances as an element of the public policies applied in our country during the last period. The importance of this theme lies exactly in the meaning of this concept – flat tax - meaning that nowadays is widely used both by the taxpayers, directly supported by them, as well as by the fiscal decision makers who have considered as being adequate for Romania's situation in 2004. At the end of the research we hope to obtain an accurate image of the impact that this sampling method has had on the social and economical dimensions. Unfortunately, the imposed dimensions of the paper will not permit us to approach the flat tax's both directions of action: the income tax and the personal income tax. This is the reason why we will discuss only the part referring to the personal income tax, because we consider that the number of the persons involved is large enough to justify this research. Moreover, we consider that every one of us is interested directly if the election promise made in 2004 had coverage.

Maybe, from a theoretical point of view, the approaches have been multiple during the last 6 years. However, we consider that our research can be of a real help in determining the usefulness of implementing a flat tax in the field of the individuals' taxation.

In order to achieve the proposed objectives, based on statistical data, we will study how government revenues have been realized from the above mentioned source, as well as if the rate at which the individual's tax receipts has answered the expectations of the fiscal policy makers.

First of all, the sphere of the public finances requires the mobilization of the financial resources needed for the state to function properly, and then the allocation of these resources according to opportunity and necessity. (Văcărel et al. 2003: 35). In addition to these two dimensions of the public finances science, this contributes also to the shaping of the social and economic phenomena. Therefore, it is important to look at finances as a cybernetic system which has its own dynamics that is being refined and is being adjusted in a more difficult manner in the real time, requiring feed-before or feed-back adjustment mechanisms. (Corduneanu 1998: 29 - 31). These are used whenever a decision is taken, but it seems to be easier to notice things happening than to predict what will happen. In the present paper, the approach will be *post factum* and we will analyze what happened between 2005-2009, comparing of course, dates and facts with those in the years before the changing of the flat tax on individuals' incomes. Thus,

we turn to statistical yearbooks from the years that we want to study from this point of view and according to these data we will develop tables and graphs to help us to build an accurate image of what happened in our fiscal system, studying the budgetary income and, in the field of the economic and social activities, trying to grasp the impact of switching to the flat tax of 16%.

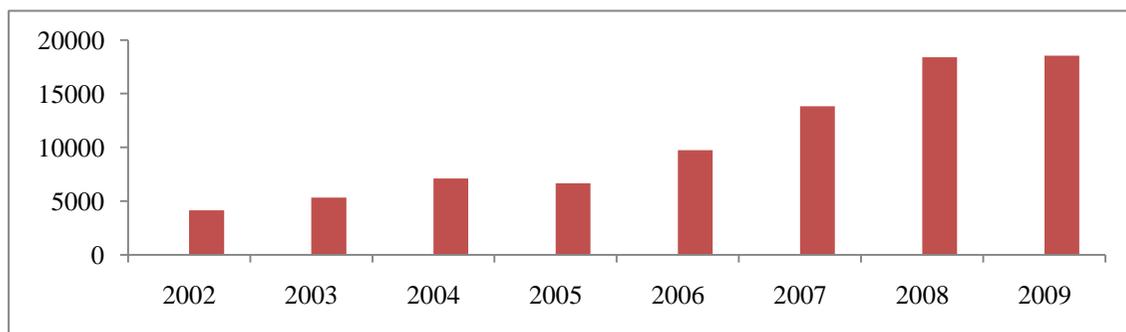

We consider that this way of treating the proposed subject is able to provide the accurate image that we are looking for, and in this respect we will collect the data between 2002-2009, data that will be positioned in a table, in order to facilitate their observation in parallel.

Table no.1. The evolution of budgetary revenues personal income tax in Romania. Years 2002 - 2009 (million)

	2002	2003	2004	2005	2006	2007	2008	2009
Budgetary incomes from the income tax	4132,30	5326,90	7103,70	6670,20	9739,3	13828,8	18398,3	18546,3

Source: Statistical Yearbook of Romania. Time series, 2010 edition. Coordinator: Vergil Voineagu. Edited by the National Institute of Statistics, Bucharest, 2011

As we can easily notice, at the moment of the 16% flat tax's implementation, in 2005, there was a fall in the volume of the receipts from the personal income tax, and during the following years, increases were recorded again. In order to create a more accurate image about the evolution of the receipts, we will make two graphs to help us in this respect. One of these will be in the form of a line, while the other one will be in the form of bars. At the beginning we will insert the bar chart.

Made by the authors

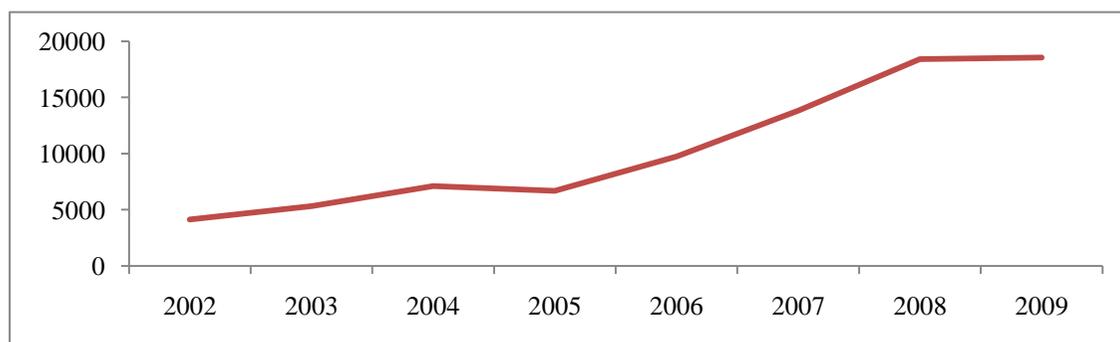

Graph no. 1. The evolution of budgetary revenues from personal income tax in Romania. Years 2002 - 2009 (million lei). Bar graph

From the graph we can observe more easily than from the table, the behaviour of the income tax's receipts on individual's incomes during the period in discussion. The syncope recorded in the studied indicator in 2005, moment in which the 16% flat tax was introduced, can be easily noticed. The desideratum of the persons who promoted this fiscal measure was to make this tax more attractive, because it seems somehow strange and frustrating to yield some of the fruits of your labour, in other words, "the result of income, wealth and welfare may not be in accordance with what the society considers to be just." (Hoanță 2000:71). The attractiveness can be seen from the perspective of another indicator (unfortunately not taken into consideration in

Romania), the one of fairness perceived according to the Economic Report presented by the President of the United States in 1996.

The way the tax payers perceive a certain tax has an extreme importance for a fiscal system, due to the fact that there is a resistance against the tax itself. Finding ourselves in the position of determining the influence of the tax on personal incomes, we can say that the fiscal decision makers should be more concerned about what the taxpayers consider about a sampling or another.

Reducing the sampling rate for this tax, the state considers that the subjects of this, the taxpayers, will show an intention to declare their incomes in a more fair manner, and thus a part of the underground economy comes to the surface. In order to see if this thing has been done, we will make a second graph, the one with lines that will give us an image of the growth slope of the studied tax revenue.

Made by the authors

Graph no. 2. The evolution of budgetary revenues from personal income tax in Romania. Years 2002 - 2009 (million lei). Lines graph

In this graph we distinguish the falling of the budget revenues from the tax on personal income for the year 2005 but we also notice that between 2006 and 2008 the growth slope of the studied indicator was relatively significant.

From both graphs it is absolutely clear the fact that in imposing personal income tax, the crisis was felt, this being the most convenient explanation for the deterioration of the slope for value collection in 2009 in comparison with 2008.

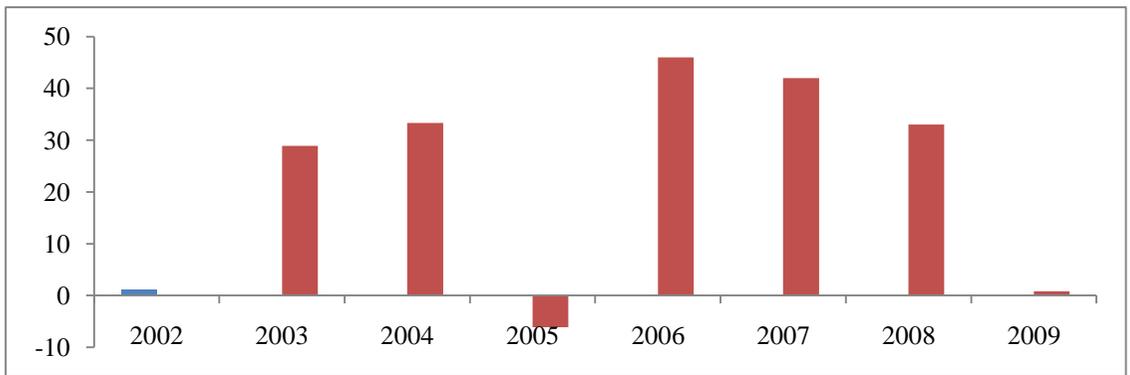

In order to make us a better picture of the evolution of this indicator, we will build another set of table and graph in which we will put data resulting from personal calculations, made using data from Table no.1. In the calculations done, we have searched to catch the growth rhythm of the budgetary incomes from the tax on personal income.

Table no. 2. The growth rhythm of the budgetary revenues from the tax on personal income in Romania. Years 2002-2009 (%)

	2002	2003	2004	2005	2006	2007	2008	2009
The growth rhythm of the revenues	x	28,91	33,36	-6,10	46,01	41,99	33,04	0,80

Source: calculations done by the author based on data from Table no. 1

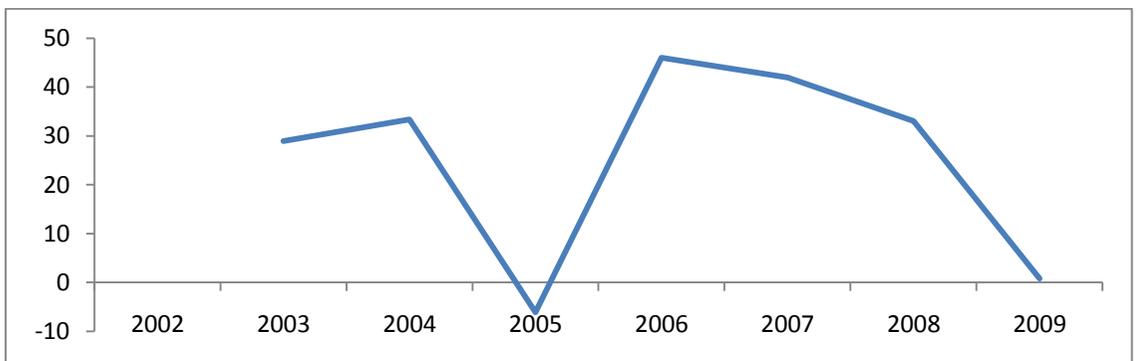

We will attach to table no. 2, the adherent graph:

Made by the authors

Graph no. 3. The growth rhythm of the budgetary revenues from the tax on personal income in Romania. Years 2002-2009 (%) Graph with bars

From the graph it is absolutely clear that the evolution of the growth pace has not been a constant one, but rather heterogeneity of the behaviour, a growth from one year to another being observed in the years preceding the introduction of the 16% flat tax. And during the following years, after the implementation of the fiscal measure, we can notice a sudden fall of the indicator, then a return to the upward slope, and again a constant decrease in 2009. The statistics for 2010 have not been finalised, so we cannot make a picture of the development between 2010 and 2009. We will make another graph, based on the same data, this time with lines, for the ones who want to expand the research in this field to be able to choose whichever seems more appropriate.

Made by the authors

Graph no. 4. The growth rhythm of the budgetary revenues from the tax on personal income in Romania. Years 2002-2009 (%) Graph with lines

Indeed, we could say from this one that the spectacular fall of the growth rhythm of the budgetary revenues on personal income is more evident, both for 2005 and during the period after 2006. In conclusion, we could advance the hypothesis that the introduction of the 16% flat tax on personal income did not answer the expectations of those who have promoted it, to a significant extent, judging from the development pace of the budgetary revenues from this source, even if the amounts provided as budget revenues have increased from one year to another (except for 2005). If the evolution of the earnings growth has been maintained on an upward slope, things would have been different, especially if we take into account the characteristics of the Romanian economy between 2006-2008. Referring to the statistical data (provided by NIS) concerning the gross domestic product for the studied period, and at a deeper analysis the growth rhythm of the

last mentioned indicator, we can make a comparison between the evolutions of the two development rhythms.

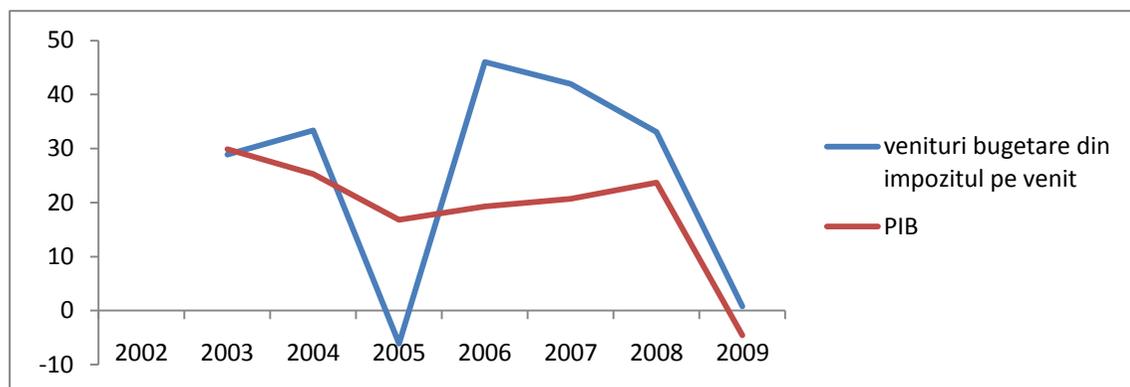

We will make this task all through a set-table in which we will position the values obtained from personal calculations.

Table no. 3. The growth rhythm of the budgetary revenues from the tax on personal income and of GDP in Romania. Years 2002-2009 (%)

	2002	2003	2004	2005	2006	2007	2008	2009
The growth rhythm of revenues	x	28,91	33,36	-6,10	46,01	41,99	33,04	0,80
GDP	x	29,87	25,30	16,81	19,28	20,70	23,72	-4,55

Source: personal calculations of the author

From the table above we cannot make an accurate picture of the parallel evolutions of the two studied indicators, thus we will insert the chart constructed on the basis of the data included in Table no. 3.

Made by the authors

Graph no. 5. The growth rhythm of the budgetary revenues from the tax on personal income and of GDP in Romania. Years 2002-2009 (%) Graph with lines

From the graph we can better notice the development trend of the two studied indicators, between 2002-2009. The correlation between these two is at most incidentals and occurs mainly in the declining areas, but we can once again convince us that the implementation of the flat tax did not bring the fresh budgetary air needed by the Romanian public finances. If we consider the opposite angles of the two indicators' evolution slopes between 2005-2008, we can notice that in the mentioned period there could have been a direct correlation between the two developments for this 16% flat tax to be as expected.

Abstract

Industrial revolutions, the progress in IT industry, the growth rate of developing new technologies, global competition, liberalization of markets, continue to demand change, globalization of market, economic and financial crisis are just some of the causes that have contributed to the restoration of a new global economic with direct impact on business entrepreneur. Changes socio-economic level paradigm is reflected both in changes to management and organization paradigms enterprise activity in the product market, at work, at the performance that follows the entrepreneur.

In this article we tried a summary of mutations in these paradigms, mutations that will rearrange and reposition the business entrepreneur in the current context of a sustainable economy, based on knowledge, so-called "new economy".

Keywords: „new economy”, sustainable development, enterprise, paradigms, changes, global performance

Jel Classification: D00, D20, D30, D40, D60

1.Introduction

The „new economy" so called "post-modern, post-industrial, post-capitalist", "post-traditional" reflects the current transition from industrial society to a new company "information "or" knowledge "is marked by complex and profound changes in all areas of activity, with major implications for economic, social and environmental process has a scale and speed unprecedented in world history.

Peter Drucker (1999) appreciate that: „We can be sure that the world will result from this rearrangement of values, beliefs, economic and social structures, political systems and concepts, in other words the conception of the world will be different from what anyone could imagine today. In some areas - especially in the company and its structure - the basic transformations have already taken place. The fact that the new company will be a non-socialist and post-capitalist one is practically a certainty. And it is also certain that her primary resource will be knowledge. "

The “new economy" or knowledge-based economy reflects that economy development that exceeded the threshold beyond which *knowledge* is the key resource. What makes this knowledge to become a resource so important? There are many factors which result in this most important being: progress in Information and Communication Technology (ICT), the increase the speed of development of new technologies, global competition, liberalization of markets, changing demand due to continuous growth rate of people middle and high income (which to develop a sophisticated demand for quality products), increasing the importance of quality of life. Dictum:

TIME IS MONEY (characteristic of capitalist society) was replaced with: KNOWLEDGE IS POWER (information society, knowledge society).

At present we can summarize three factors that determine the primordial transformations taking place in society, making the transition from industrial-type economy to the “new economy” based on knowledge, namely: *technical-scientific revolution, globalization and financial crisis.*

Human society has changed a lot and change now increasingly faster. Human society has gradually shifted emphasis from manufacturing to the production of automatic type, from individual knowledge to the group, thus emphasizing the importance of communication.

In summary, we present below the specific characteristics and socio-economic development steps:

Table 1: Characteristics of socio-economic development steps

Development Stage	Pre- industrial	Industrial	Post-industrial
Production Sector	Extractive	Manufacturing	Processes, services recycling
Economic Sector	Primary : -agriculture - mining -Fishing -Wood -Oil and Gas	Secondary: -production commodity consumer -goods-producing durable -constructions	Tertiary: -Transport -Utilities Quaternary -Trade -Finance -Insurance Quintenar: -Health -Education -Recreational
Resources Converted	Natural resources: water, wind, power animals, human strength	Energy created: electricity Nuclear power	Information: systems computers and data transmission

Source: W.J.Keegan, Multinational marketing management, Prentice Hall, Inc 1980, p.61

Table 2: Specifics stages of socio-economic development

Development Stage	Preindustrial	Industrial	Postindustrial
Production Sector	Extractive	Manufacturing	Processes, services recycling
Strategic Resources Technology	Raw materials Force	Financial Capital Technology cars	Knowledge Technology intellectual
Methodology	Common sense, experience, and error	Empiricism, Experimentation	Abstract theory, Simulation models, Decision theory, Systems analysis
Perspective temporal	Orientation to the past	Adaptability ad experimentation	Future orientation, predictions programming
Axial principle	Traditionalism	Growth economic	Codification knowledge theoretical, satisfaction and motivation
Key Concepts	group of individuals,	set of processes, teams,	set of knowledge,

Development Stage	Preindustrial	Industrial	Postindustrial
	hierarchy, bureaucracy, strategy	goals, ecosystem, marketing, negotiation	team free expression of creativity (no strict targets), innovation
Role Information	vehicle along hierarchical pyramid	bond between partners collaborate on projects common	scarce resource, support organization "aware" continuous learning

Source: own processing based on W.J.Keegan, Multinational marketing management, Prentice Hall, Inc 1980, p.61

2. General characteristics of the "new economy"

The specifics of these stages of socio-economic development have created the foundations for the development of the "new economy" which can be identified by several key characteristics:

A. *The new economy is based on new digital technologies*

In this new economy is intended exploitation of the potential information-based products and services. The main consequence is that the principles governing the information world (the world of intangible products and services) will soon dominate the hard drive world (the world of reality, of atoms, objects, oil and steel and heavy labor).

B. *The new economy is based on knowledge*

Products made in the "new economy" have a new property: knowledge. Their value is given by the logical facet and not physical - the material they contain. Therefore, they may be called "weightless". From money, materials, equipment and human resources, as the main categories used by the entrepreneur, today we come to recognize the paramount importance of a fifth resource which is information.

C. *The new economy is based on innovation*

The new economy is based on Information and Communication Technology (ICT), to alter radically the nature and trajectory of innovation. In the "new economy" usual economic logic, based on turnover and profit, is gradually replaced by a new logic, based on potential for development (innovation) and ensuring the completion of the three main principles:

- access (and answer) instantly;
- personalized service;
- simultaneous presence in several places (ubiquity)
- higher valuation of the assets "intangible" (which often increase the share value of shares of companies over the material assets).

For these reasons the science, technology and education are key factors in the "new economy"

D. *The new economy is based on learning*

The speed of technological innovation and competitiveness requirements asks for a continuous updating of knowledge and revolutionizes the education and training system, requiring the introduction of the new training concept ("life-long learning").

The "new economy" in all its manifestations, such as changing the requirements for many occupations and basic training in different jobs as follows:

- 80% of existing technology will be replaced in the next decade;
- Average life skills (abilities) of a worker (employee) is 3-5 years;
- In terms of technological advances we "getting old" at every 5 years and we need re-training.

Therefore, in the "new economy" learning process has great significance as a cumulative and continuous over time. New information and communication technologies offer new forms of education and training, distance learning, virtual university, computer training, etc. Learning process should and can take place anytime and anywhere. In the "new economy" learning and initiative are vital and largely determine the effectiveness of the activity.

E. The "new economy" is a global

Developing information and communications technology transform our economy in a global economy in which national economies interact. Trade and capital markets are globally connected and operates continuously (24 hours / day), at a distance and in real time.

F. The "New economy" is a sustainable and socially responsible economy

Currently we assist at the transition from an *uncontrolled development*, which was accompanied by irrational and inappropriate exploitation of resources and raw materials, the size of the profit driven, to sustainable development which has three main dimensions: *economic, social and environmental* development. The enterprises understood that to succeed in business must provide and ensure environmental protection and proper work conditions, pay for collective rights of employees, cooperate to this end with local communities in which they operate, with unions, non-governmental organizations and governmental institutions.

In the context of sustainable development gradually appears the corporate social responsibility concept. This concept defines the direction and attitude of a company for inclusion, voluntarily, in the strategy and its current work, the concerns (projects and activities) with the social and environment in terms of ensuring economic success of the business.

G. The "new economy" and financial crisis. Switching to a "new reconsideration financial economy"

The financial crisis has had an impact on re-establishing a new economic world order. In this context, some authors appreciate that the crisis has produced "breaks" in the history of the world economy, along with a fracture occurring in the economic thinking. Separation of such a model involves both a reform of financial capitalism and the architecture of international relations and building pluralistic development trajectories. (Popescu-Bogdanesti, 2011)

3. The enterprise and the "new economy"

As the main actor of economic phenomena, the enterprise could not remain outside of these concerns to reveal the substance of change. Simultaneously with the development of "new economy" we currently assist to a *change of the companies paradigms*, as follows:

A. Changing the paradigms of production and commercial processes, among which the transition to outsourcing, fragmentation and outsourcing activities, relocation of production ("outsourcing ") which allowed the appearance and growth of multinational transnational companies, and the transition from "a mass production (large series)" to " a flexible and diversified production (depending on individual customer requirements) are more important (in the context of this paper).

B. Changing the organizational and management paradigms, among which we mention the following:

- from the classic organization specializing single purpose, to the partnerships with networks; - from "Companies-structures" to "-project companies";

-from "we are separated and we compete" to "we are connected, we cooperate and we compete."
". Encouraging American proverb "if You Can not Beat Them, Join Them" (if you can not win, joining up with) is the current orientation of the world economy at the beginning of the third millennium.

We currently assist at the companies level to an emphasize of the mergers and consortiums process, to relocation of production ("Outsourcing"), to a virtualization of the organization, outsourcing, fragmentation and subcontracting of the activities

C. Changing the work paradigms

We are currently witnessing to a traditional labor paradigm shift from:

- routine work to "work is constantly changing";
- "office (work) first of all " to " work first of all ";
- Fixed-term work program to "flexible work arrangements";
- work (career) life to "career portfolio" which express the diversification of activities, and the professional and occupational mobility and flexibility.
- "fix" workplace to a "mobile "workplace;
- worker goes to work to "work comes to the worker";
- job choice based on location of residence to " you live in a place - you can work anywhere "or" work at distance . "

Management companies are radically. Firms ask for flexible forms of employment, a greater variety of styles even if they are experimental, the ability to perform several types of work, a greater customer orientation and using new information and communication technologies.

D. Changing the customer paradigms

The environment in which firms are currently developing has changed radically in recent years by:

- a) Taking control of the client, this supports more than to be perceived as a member of the community, and increasingly as an individual;
 - b) Changing customer attitudes towards products and services that:
 - it must be adapted / configured to satisfy customer needs;
 - it must be provided in an accessible and practical possible manner;
 - it must be delivered when it is convenient to the client.
 - c) Market globalization; the client often wants to have products / services worldwide.
- These transformations motivate business customer focus.

E. Changing paradigms of organizational performance assessment

From performance based on profit and then return, beginning of XXI century brings the new approaches of organizational performance assessment so that performance begins to be defined in terms of value creation. Defining performance based on value creation has undergone two stages. The first covers the period 2000-2005 when performance was defined by creating value for shareholders (stakeholders) and from 2005 until now when the performance involves the creation of value for holders of interests (stakeholders.)

In the current globalization of world economy, the performing company is "the enterprise that creates added value for its shareholders, satisfied the customers demand, take into account the opinion of employees and protects the environment. Thus, ownership is pleased that the company has achieved the desired return, the customers have confidence in the company's future and in the quality of its products and services and society benefits through policy adopted by the enterprise, environmental protection "(Jianu, 2006)

F. Changing the market paradigm under the crisis

Soros G. thinks that we need a new paradigm, whereas the dominant so far, the liberal balanced markets one, would have proved "false and misleading" and here the problems arising on the international monetary system. Past crises have only test the system and the present crisis has brought humanity into a turning point, where the old policies have no effect. Sand castle collapses. The moment is dramatic. The dominant balance and market fundamentalism paradigm is unable even to explain the current state of affairs. In this context, Soros G. believes that the time for recognition theory of reflexivity has come. This new theory introduces an element of uncertainty in human enterprises in general and financial markets in particular. (Soros, 2008)

4. Conclusions

The changes we are witnessing at present are unprecedented in human history. To cope with the competitive global marketplace, companies must keep up with these changes. Currently we are witnessing at the change paradigms on which were humanity based for centuries: changing the paradigms of production and commercial processes, the work paradigms, the customer paradigms, the paradigms of organizational performance assessment, the market paradigm under the crisis.

Under these conditions, management of an enterprise must redefine itself and adopt new directions, much more challenging, more flexible, more risky and more opened to the client and to the society as a whole.

TAXATION OF WAGE INCOMES OBTAINED ABROAD BY PHYSICAL PERSONS

Antonescu Mihail

“Spiru Haret” University, Faculty of Financial and Accounting Management Craiova

Buziernescu Radu

University of Craiova, Faculty of Economy and Business Administration

The necessity to improve internal legislation regarding the taxation of incomes earned abroad emerges as a consequence of the harmonization with the provisions of community legislation and of the observance of European directives.

This paper aims to present legal provisions on Romanian taxation of wages from abroad, so that for each case that might be encountered in practice, to find how to declare the income and how these incomes are to be taxed.

The incomes from salaries earned abroad which are subject to taxation in Romania can be obtained not only for the activity carried out in Romania and paid by the foreign employers, but also for the activity carried out abroad and paid by Romanian employers. For individuals' incomes gained in Romania from a foreign employer, the way of taxation should be established according to employer's decision. Thus, if the employer elects for withholding them, neither employers, nor employees, are required to further submit specific statements of these revenues. Otherwise, employers should submit a statement every time when modifications such as activity start/cessation takes place and employees will submit monthly statements.

Legislation has been supplemented by the inclusion of non-resident individuals in the category of persons who submit Form 224. As concerns the wage incomes obtained by Romanian citizens abroad, by 2010 the corresponding box was omitted. Therefore, there were practical uncertainties regarding the method of granting the external fiscal credit for foreign wage incomes of a Romanian resident posted abroad.

Through the most recent legislative amendments, the provisions on granting external fiscal credit were extended to cover wage incomes too. The possibility to refund the taxes withheld by the Romanian employer was also taken into account, but a procedure in this regard has not been established yet.

The purpose of this paper is to highlight the importance of tax implications entailed by the posting of staff to other countries and the importance of compliance of internal legislation with the conventions for the avoidance of double taxation. The clear and concise presentation of the way of declaration and taxation of wage revenues from abroad leads to avoiding the confusions that may arise in practice and of the double taxation of these incomes.

Key words: wages, abroad, physical persons, taxation, declaration

Cod JEL: F53, H24, K34

In the context of evolution of international economic relations, in which the migration of workforce and the relocating of the personnel in other countries are current events, we notice the constant preoccupation of each state to improve the legislation regarding the taxation of incomes obtained abroad, taking into consideration both the necessity of protection, and the increase of budgetary incomes, as well as the observance of the provisions of conventions regarding avoiding double taxation. This state of facts can lead in practice to cases of double taxation of the incomes obtained by physical persons who have their residence in one state but who carry out their activity in another state. Solving these issues is attained by the involved states applying conventions whose main is avoiding double taxation, conventions signed by our country with

other states, which prevail on the provisions of internal legislation. During the time, internal legislation regarding taxation of these incomes was subject to permanent change and improvement, since the Romanian legislator adapted and borrowed a series of existent provisions in the OECD Model Tax Convention.

According to the provisions of the fiscal Code, the incomes from wages represent all incomes in money and/or in nature, obtained by a physical person who carries out an activity on the basis of an individual working contract or on the basis of a special status foreseen by law, irrespective of the period to which it refers, and of the denomination of incomes or the form under which they are given. The amounts or advantages received by physical persons from dependent activities carried out in a foreign state are not included in the category wage incomes and are not subject to taxation, irrespective of the fiscal treatment applied in the state in question, except for wage incomes paid by or in the name of an employer residing in Romania or with the permanent headquarters in Romania – which are subject to taxation irrespective of the period in which the activity is carried out abroad.

In the Commentaries of the OECD Model Tax Convention for avoiding double taxation there is established the general rule of taxation of wage incomes, and there is stated that these wages are subject to taxation by the state in which the work activity is carried out. Nevertheless, the remunerations will be taxed only in the state of residence if the following conditions are observed cumulatively:

- a) the beneficiary is present in the other state during a period or periods which last more than 183 days in any 12-month period which begins or ends in the year in question;
- b) the remuneration is paid by or in the name of the employer which is not resident of the other state
- c) the remuneration is not borne by a permanent headquarters which the employer has in the other state.

1. The taxation of incomes obtained by physical persons, from a foreign employer, for the activity carried out in Romania, and the taxation of incomes obtained by Romanian physical persons hired by diplomatic office or consulate acknowledged in Romania

1.1. Rules of taxation

The beneficiaries of these incomes are bound to pay a monthly final tax which is calculated and is retained at the source by the income payers.

The monthly tax is determined in the following way:

- a) at the place where the main job/function is carried out, by applying the quota of 16% on the basis of calculation determined as difference between the net income from wages, calculated by deduction, from the gross income, of the compulsory contributions afferent to one month and the following:

- personal deduction granted for that month;
- syndicate due payment for that month;
- contributions to the facultative pensions fund, so that, at the level of one year, the equivalent of 400 euros is not exceeded;

- b) for incomes obtained in other cases, by applying the quota of 16% on the basis of calculation determined as difference between the gross basic salary and the compulsory contributions on each place in which the incomes are obtained.

The conversion into lei of the amounts obtained in foreign currency, representing wage incomes, is done at the currency exchange rate communicated by the National Bank of Romania for the last day of the month for which the payments of these rights is done. In the case in which the wage incomes are paid during the month or in the case in which the working relations cease, the currency exchange rate established by the National Bank of Romania in force during the day previous to the one in which the payment is done is taken into account.

1.2. Taxpayers obligations

Physical persons have the obligation to calculate the tax monthly, by themselves or with the aid of a fiscal representative, to declare it and to pay it, till the 25th of the month following the one for which the income was obtained. Diplomatic office and consulates acknowledged in Romania, as well as representations of international organisms or of foreign commercial companies and of foreign economic organizations, authorized according to the law to carry out their activity in Romania, can choose that their employees who gain incomes from wages subject to taxation in Romania, fulfill obligations regarding the calculation, the payment and delivery of tax applied on the wage incomes. In the case in which this option is formulated and communicated to the fiscal representative by the employer, the beneficiaries of incomes from wage do not have anymore the obligation to declare them.

1.3. Declarations

The employees fill in and then submit the form 224 “Declaration regarding the incomes from salaries earned abroad by individuals that carry out their activities in Romania and by Romanian individuals employed by an authorized diplomatic office and consulate in Romania”. The declaration is submitted for free to the taxpayer, at his request. The deadline for submitting the declaration reads as follows:

- it is submitted monthly, till the 25th of the month following the one for which the income was obtained;
- anytime the taxpayer notices errors in the previous declaration, by filling in rectifying declarations, situation in which he puts an “X” in a case especially foreseen in this aim.

The declaration is filled in by taxpayers or by fiscal representatives of these taxpayers, with capital letters, written correctly, including all the data required by the form in two copies:

- the original is submitted to:

- a) the fiscal agency located in the region where the taxpayer has his residence, according to law, or the address where he lives, in the case in which this is different from the place of residence, for physical persons who have their fiscal residence in Romania;
- b) the fiscal agency located in the region where the source of income comes from, for all the other physical taxpayers;

- the copy is kept by the taxpayer.

The declaration is submitted to the registry office of the fiscal agency or at the mail office by recommended letter. Employers submit for each employee the form 222 “Information statement on the starting or termination of the physical persons’ activity, physical persons who carry on activity in Romania and who earn wage income from abroad”, except for the case in which he fulfils the obligation regarding the calculation, the payment and the delivery of tax on wage incomes. It is submitted at the fiscal agency located in the region where the employer has his headquarters or place of residence, anytime there appear changes regarding the starting or termination of the physical persons’ activity in the documents that certify the working relations, in a 15 day period starting from the day the event occurred.

In the category of employers who have the obligation to submit this declaration there are included: representations of other companies in Romania, associations, foundations or organizations with the headquarters abroad, international organizations and organisms that function in Romania and so on.

The declaration is placed for free at the disposal of physical or juridical persons, at their request.

It is filled in two copies:

- the original is submitted to the fiscal agency.
- the copy is kept by the employer.

We can notice that even if incomes are obtained from foreign employers, they will be taxed in Romania, since the activity is carried out in Romania, so the criterion of territoriality is applied in

this case. If till 2004 only the Romanian employees- physical persons with their place of residence in Romania- had the obligation to submit a declaration, starting with 2004 (by the Order of the Ministry of Public Finances no 160/2004 for the approval of the model and contents of forms regarding the administration of the tax on incomes earned by physical persons), the legislator took also into account the case of foreign physical persons who carry out activity in Romania and obtain incomes under the form of salaries from abroad. Consequently, the declaration is submitted by all the physical persons (Romanian or foreign) who carry out activity in Romania and obtain incomes under the form of salaries from abroad.

Thus, non-resident physical persons who earn wage incomes from abroad for the activity carried out in Romania, must pay tax in Romania in the following cases:

- the physical persons have their place of residence in states with which Romania has not yet signed conventions on the avoiding of double taxation and physical persons who cannot prove that they have their place of residence in a state with which Romania has signed conventions on the avoiding of double taxation. The incomes obtained by these persons from resident or non-resident employers is taxed in Romania starting with the first day in which they carry out activity in Romania;

- the physical person is present in Romania for one or more periods of time which last more than 183 days in any 12-month consecutive period which ends in the year in question (the principle of 183 days) or in the period and under the conditions mentioned in the convention regarding avoiding double taxation signed between Romania and a foreign state, in which case the taxpayer submits to the fiscal agency the monthly tax return declarations which will comprise the monthly incomes earned in the period previous to their prolonging their staying in Romania, within a delay of 15 days from the last day of the period of 183 expired days or the period mentioned in the convention. In the case in which the income beneficiary obtains the salary in a global amount on a time interval, after which the period of 183 days has expired or the period mentioned in the convention, the sums filled in the declarations can be established at the level of a monthly average, respectively the global amount of the declared salary divided by the number of months from that period.

2. Taxation of incomes obtained from salaries from abroad by Romanian physical persons with their place of residence in Romania, for the activity carried out abroad

Physical persons who owe tax on the incomes from salaries from abroad for the activity carried out abroad are:

a) Romanian physical persons with their place of residence in Romania;

b) physical persons who comply with the conditions of residence stated below during three consecutive years:

- the centre of vital interests is located in Romania;

- they are present in Romania on a period or periods which last more than 183 days in any 12-month consecutive period which ends in the year in question.

These persons have the right to be granted external fiscal credit, that is to benefit from the deduction of the tax paid abroad from the income tax due in Romania, except for the incomes from dependent activities carried out abroad and paid by a non-resident employer. These incomes are not taxed in Romania and they are not subject to external fiscal credit. In this category there are included Romanian physical persons with their place of residence in Romania and who comply with the conditions of residence, who are paid by a Romanian employer and are transferred abroad. In this case, if the Romanian employee paid by the Romanian employer is detached/transferred abroad for a period which lasts more than 183 days, the foreign state in which he carries out his activity must collect a tax from him, according to the conventions concerning the avoiding of double taxation. At the same time, the income payer-the Romanian

employer- is obliged to retain the tax afferent to wage incomes, which can lead to the double taxation of these incomes. Consequently, there will be applied methods for avoiding double taxation foreseen by internal legislation correlated with Conventions on avoiding double taxation signed by our country.

2.1. Conditions for granting the external fiscal credit

The external fiscal credit for incomes from salaries is granted if the following conditions are accomplished cumulatively:

- 1) the provisions of the convention on avoiding double taxation – signed between Romania and the foreign state in which the tax was paid – are applied;
- 2) the tax paid abroad for the income earned abroad was paid directly by the physical person or by his legal representative or by withholding tax at source by the income payer. The payment of the tax abroad is proved by a justifying document, issued by the competent authority of the foreign state in question.

The condition regarding the existence of a convention on avoiding double taxation signed between the state in which the Romanian person carries out his activity and Romania was introduced starting with 2010 (by O.U.G. no 59/2010 for the modification of Law no 571/2003 regarding the Fiscal Code). Through the most recent legislative amendments, the provisions on granting external fiscal credit were extended to cover wage incomes too. For incomes earned in the state with which Romania has signed a convention on avoiding double taxation and which have not been globalized with a view to taxation, the external fiscal credit is limited to the income tax paid abroad, but not more than the tax owed for a similar income in Romania.

We can thus be faced with two situations:

- a) the tax rate applied abroad is higher than the one foreseen by internal legislation, in which case the external fiscal credit is limited to the calculated income tax, applying the rate foreseen in internal legislation;
- b) the tax rate abroad is lower than the tax rate on a similar income from Romania, in which case the external fiscal credit is calculated at the level of income paid abroad, and the annual tax which is left to be paid in Romania is calculated as difference between the income tax applying the tax rate foreseen by internal legislation and the income tax paid abroad for the income earned abroad.

Taxpayers who carry out activity abroad and who are paid by a Romanian employer, are subject to taxation in Romania for the incomes obtained from the work activity carried out abroad. In the context of these provisions, in practice we will encounter cases of double taxation of incomes obtained by Romanian physical persons from a Romanian employer for the activity carried out abroad, in which case the Romanian employee paid by the Romanian employer is detached/transferred abroad for a period which lasts more than 183 days, and the Romanian state will tax according to the conventions on avoiding double taxation. At the same time, the income payer (Romanian employer) is obliged to withhold tax afferent to incomes from salaries obtained by the employees. In order to avoid double taxation of these incomes, the competent fiscal authority from Romania will proceed to the regularization of the tax due by the Romanian resident. In this case, the taxpayer will submit to the registry office of the competent fiscal agency or by mail a request of return, accompanied by the following justifying documents:

- a) the tax record drawn by the employer resident in Romania or by a permanent headquarters in Romania that is able to make wage payments;
- b) the certificate acknowledging the payment of the tax abroad by the taxpayer;
- c) the transfer contract;
- d) any other documents that can constitute the basis for determining the amount of the tax paid abroad for incomes paid by the employer resident in Romania or by a permanent headquarters in Romania.

In order to calculate the external fiscal credit, the fiscal authority will turn into lei the amounts expressed in foreign currency, at the average exchange rate of the currency market communicated by the national Bank of Romania, in the year when the income was obtained.

2.2. Methods for avoiding double taxation

In international practice, there are two concrete methods for avoiding double taxation: sparing and crediting. The difference between the two methods consists in the fact that while sparing refers to the income, crediting refers to tax. Starting from the provisions of article no 23, "Eliminating double taxation" from the OCDE Model Convention, with a view to avoiding double taxation of incomes of Romanian physical persons, the Romanian legislator takes also into account the methods foreseen in the conventions signed between Romanian and the foreign state, respectively the credit method or the sparing method, according to the case. Even if most of the times, in the Romanian fiscal legislation the method used for avoiding double taxation is ordinary crediting, by the latest modifications brought to the fiscal code, for incomes obtained from salaries we also take into account the sparing method. We must mention the fact that in some fiscal conventions signed by Romania there is not mentioned the crediting method as method used to avoid double taxation between the two signing parties/countries, and the settlements of conventions on avoiding double taxation prevail against the provisions of Romanian fiscal legislation. The following fiscal conventions signed by Romania with Albania, Alger, Austria, Belgium, Bulgaria, Croatia, Egypt, Luxemburg, Morocco, Moldavia, Slovakia and Ukraine are examples for this situation (Antonescu, Țuculină and Cojoacă 2001: 101).

According to the OCDE Model Convention the sparing principle can be applied by two main methods:

- total sparing method, according to which the state of residence of the income beneficiary will not take into account at determining the income subject to taxation, the income subject to taxation obtained by its resident in the source-state, so it ignores the incomes earned by the resident in the source-state;
- progressive sparing method, by which the income earned by the resident in the source-state is not subject to taxation in the state of residence, but it is taken into consideration when we determine the tax afferent to the rest of the income.

The crediting method is used within fiscal conventions in two forms:

- total crediting method- by this method, the state of residence totally deduces from the tax calculated on the total of incomes earned by the taxpayer (both in the state of residence and in the source-state), the tax paid in the source-state.
 - the method of ordinary crediting- consists in the deduction from the tax calculated on all the incomes earned by the taxpayer ((both in the state of residence and in the source-state), of an amount which can be equal to or lower than the amount effectively paid as tax in the source-state.
- Applying these methods is achieved only in the case in which the taxpayer will place in an annex to the declaration regarding the earned income the documents justifying the earned income and the paid tax, issued by the competent authority in the country where the income was obtained and with which Romania has signed a convention on avoiding double taxation.

2.3. Declarations

Romanian physical persons with their place of residence in Romania and physical persons who comply with the conditions of residence mentioned above, who obtain incomes from abroad, subject to taxation in Romania, as a result of the activity carried out abroad, will submit form no 201 "Declaration regarding the incomes earned abroad". In this situation, the declaration also represents a request of return of the tax on the wage incomes paid for the activity carried out abroad by an employer or in the name of a employer resident in Romania or by a permanent headquarters in Romania. The incomes obtained from the activity carried out abroad are declared for each source-country and for each category of earned income. With a view to filling in the

amounts in form 201, the amounts expressed in foreign currency will be translated into state currency at the annual average exchange rate of the currency market communicated by the National Bank of Romania, in the year for which the income was obtained.

The declaration is available at the fiscal agency and it is submitted:

- each year, till the 15th of May of the year following the one for which the income was earned;
- anytime the taxpayer notices errors in the previous declaration, by filling in rectifying declarations, situation in which he puts an "X" in a case especially foreseen in this aim.

It is filled in with capital letters by the taxpayer or by his representative in two copies:

- the original submitted to the fiscal agency;
- the copy is kept by the taxpayer.

3. Conclusions

Transferring staff or detaching personnel can generate fiscal problems that can become complex. That is why for the companies hiring employees it is important to know the fiscal implications that emerge in these situations. On the other hand, the legislator must take into account the observance of provisions of international treaties in which Romania is one of the parties, since these provisions prevail against internal legislation. From a fiscal point of view, the complexity of this issue regarding the taxation of incomes from activity carried out abroad originates in the fact that the fiscal authority must take into account the harmonization of provisions of internal legislation with the international fiscal settlements, respectively avoiding the phenomenon of double taxation of these incomes.

The elaboration of clear provisions in order to establish the way in which is attained taxation of incomes from wages earned abroad is essential, if we take into account the fact that each involved state tries to attract incomes to its budget. From our analysis, we can notice that the Model Convention and the Commentaries to this Model Convention serve as guidelines in interpreting internal legislation as far as taxation of revenues from abroad. Taking into account the lack of clear information that appear in practice regarding the taxation of wage incomes abroad, in the past few years there have been modified a series of legislative provisions regarding the way in which avoiding double taxation can be achieved, borrowing in internal legislation the methods for avoiding double taxation foreseen in the OCDE Model Convention. At the same time, there have been made improvements to the way in which the declaration and statement of wage incomes from abroad is done, by the introduction of new headings and columns that concern these incomes obtained abroad.

COMPULSORY SOCIAL CONTRIBUTIONS REGULATED BY THE TAX CODE

Antonescu Mihail

“Spiru Haret” University The Faculty of Financial Accounting Management

Antonescu Ligia

University of Craiova Faculty of Economy and Business Administration

As of January 1st, 2004, the social contributions owed by natural persons with the capacity of employer, as well as the individual contributions owed by their insured are managed by the tax organs within the National Agency for Tax Administration, as they are bound, in the exercise of their attributions to apply the provisions of the special normative acts which used to regulate the social contributions.

As of January 1st, 2011, all the compulsory social contributions owed by the employers and assimilated to them, and to the insured for which they are bound to calculate, withdraw and transfer individual contributions, are regulated by the Tax Code. This measure has been imposed as a necessity to unify the calculation bases of individual contributions and social contributions owed by the employers. This measure also aimed at broadening the calculation base for social contributions and perfecting the collection by the method of stoppage at source. As a logical consequence of this measure, it was implemented that a single statement should be submitted regarding the payment obligations of social contributions, of income tax and the nominal records of natural persons with compulsory insurance in the social insurance systems.

This paper aims at emphasizing the categories of natural/legal persons with the capacity of taxpayer in the social insurance systems, and the establishment of the calculation base for social contributions. An emphasis will be placed on the exceptions from the inclusion in the calculation base of certain income, as the situations where the calculation base of social contributions is capped.

For the social contributions regulated by the Tax Code, the taxpayers are, as the case may be, resident/non-resident natural persons obtaining income from the activities carried out, natural and legal persons who pay the income of those persons and the public institutions calculating, detaining, paying and, as the case may be, bear, according to the statutory provisions, the compulsory social contributions, on behalf of the insured.

As a general rule, the calculation base for the social contributions is represented by the gross earnings achieved from the activity carried out, namely the income achieved according to the special statutory provisions.

The social contributions regulated by the Tax Code are the following:

- the individual contribution of social insurances and the contribution owed by the employer at the state social insurances budget;*
- the individual contribution of social health insurances and the contribution owed by the employer at the budget of the Unique National Fund for social health insurances;*
- the contribution for vacations and social health insurances and the contribution owed by the employer at the budget of the Unique National Fund for social health insurances;*
- the individual contribution at the unemployment insurance budget and the contribution owed by the employer to the unemployment insurance budget;*
- the contribution for insurance in case of labour accidents and professional diseases owed by the employer at the state social insurances budget;*
- the contribution to the Fund for granting the payment of salary receivables, owed by the natural and legal persons who have the capacity of employer.*

Key words: social contributions, social insurances, calculation base, gross earnings, nominal evidence

JEL Classification: H30, K34

In the social insurance systems, the **taxpayers** are, as the case may be:

- **resident natural persons** obtaining income from activities based on an individual labour agreement, of an employment relationship or a special statute provided by the law, as well as those obtaining income assimilated to salaries, as they are defined in the Tax Code;
- **non-resident natural persons** obtaining the above-mentioned income, while observing the provisions of international legal instruments of which Romania is a part;
- **persons obtaining professional income**, *others than the salaries*, namely income from copyright and related rights and/or activities from professional activities carried out on the grounds of agreement/conventions entered into according to the Civil Code for which there is an obligation of paying the individual contribution of social insurance and unemployment insurance;
- **the retired** with income from pensions exceeding 740 lei;
- **natural and legal persons who have the capacity of employers**, as well as the entities assimilated to the employer who have the capacity of income payers from dependent activities, both during the activity of resident or non-resident natural persons, and during the time in which they get vacations and indemnities for social health insurances;
- **public institutions** which calculate, detain, pay and, as the case may be, bear the compulsory social contributions, according to the statutory provisions, on behalf of the insured;
- **any payer** of income of the salary type or assimilated to salaries.

The individual compulsory social contributions are calculated on a monthly basis by applying the quotas provided by the law on the calculation base representing the **gross income earned**, including:

- **the income from salaries**, obtained by natural persons carrying out their activity on the grounds of an individual labour agreement or a special statute provided by the law. In the situation of the Romanian staff sent on a permanent mission abroad, the income from salaries comprise the basic salary corresponding to the positions on which those persons are employed in the country, where, as the case may be, increments and bonuses are added according to the law;
- **the indemnities** from activities carried out as a result of a **position of public dignity**, established according to the law;
- **the indemnities** from activities carried out as a result of a position chosen within the **non-profit legal persons**;
- **the rights** of monthly pay, indemnities, bonuses, premiums, increments and other rights of the **military staff**, granted according to the law;
- **the gross monthly indemnity**, as well as the **amount from the net profit**, owed *to the administrators* in national companies/enterprises, companies where the state or an authority of the local public administration is a controlling shareholder, as well as the autonomous administrations;
- **the remuneration** obtained by the **managers** on the grounds of a mandate agreement corresponding to the provisions of Companies Act.
- the amounts received by the **representatives in the general stockholders' assembly, in the board of directors meeting, the members of the management and the supervision council, as well as the censors commission**;
- the amounts received by the **representatives in tripartite organisms**, according to the law;
- the monthly **indemnity of the sole associate**;

- **the indemnity** of administrators, and the **income from the net profit**, owed to *the administrators* of companies according to the articles of association or established by the general stockholders' assembly;
- the amounts representing *salaries or differences of salaries established on the grounds of a ruling which remained final and binding*, as well as their *update* with the inflation index;
- the monthly **indemnities** paid according to the law by employers during *the period of non-competition*, established according to the individual labour agreement;
- **the indemnities** received *during the delegation or secondment* to another location, in the country and abroad, for business purposes, granted by non-profit legal persons and other entities which do not pay profit tax, *over the limit of 2.5 times the indemnity granted to employees in public institutions*;
- the **remuneration** received by the *president of the landlords' association or by other persons, on the grounds of the mandate agreement*, according to the law regarding the establishment, organization and operation of landlords' associations;
- *any other amounts of the salary type or advantages assimilated to salaries* for taxation purposes.

In case of taxpayers – *natural and legal persons who have the capacity of employers*, as well as the *entities assimilated to the employer who have the capacity of payers of income from dependant activities, and any payer of income of the salary type or assimilated to salaries* - the monthly calculation base for the social insurances contribution, the health insurance contribution, the unemployment insurance contribution, the contribution to the Fund granting the payment of salary receivables, the contribution for labour accidents and professional disease and the contribution for vacations and indemnities of social health insurances is represented by **the total amount of gross earnings** obtained by the resident/non-resident natural persons.

The law provides certain *limitations of the calculation base* for certain individual social contributions or social contributions owed by the employers.

The individual social insurances contribution, on each place where the income is obtained, cannot exceed the value of 5 times the average gross salary used at the substantiation of the budget of state social insurances and approved by the law of the budget of state social insurances.

The calculation base of the *contribution of social insurances owed by the employer* cannot exceed the multiplication product from the number of insured people for whom the employer owes differentiated contribution depending on the working conditions, from the month for which this contribution is calculated and the value corresponding to 5 times the average gross salary income.

At *the contribution for vacations and indemnities of social health insurances*, the monthly calculation base cannot exceed the multiplication product of the number of insured of the month for which the contribution is calculated and the value corresponding to 12 gross minimum income salaries at the level of the country granted in the payment.

At the *contribution of insurance for labour accidents and professional diseases*, the monthly calculation base is represented, as the case may be, also the minimum gross base salary at the level of the country granted in the payment, corresponding to the number of business days from the medical leave, except for the cases of labour accidents or professional disease.

During the period in which the resident/non-resident persons obtaining incomes from activities on the grounds of an individual labour agreement, of an employment relationship or a special statute provided by the law, as well as those getting medical leaves and indemnities of social health insurances, except for the cases of labour accidents or professional diseases, *the monthly calculation base for the social insurance contribution* owed to the budget of state social insurance is the amount representing 35% of the average gross salary income, corresponding to the number of business days in the medical leave.

For the persons **obtaining income of professional nature**, for which there is an obligation to pay the individual social insurances contribution and insurances for unemployment, the calculation base of the *individual social insurance contribution* and the *individual contribution for unemployment* is: for the income from copyright and related rights, the gross income diminished by the quota of lump sum expenses provided by the Tax Code; for the income from activities carried out on the grounds of the civil agreements/conventions, the gross income obtained.

For these persons, the payer of income assimilated to the employer *does not owe* the social insurance contribution and the contribution to the budget of unemployment insurances *in its capacity of employer*.

The contribution to the social health insurances is owed and it is also detained for the indemnities for temporary incapacity of work, granted as a result of a labour accident or a professional disease. The contribution to the social health insurances is borne by the employer or from the insurance fund for labour accidents and professional diseases established under the terms of the law.

No social contribution is owed for the following categories of income:

- the amounts received by the founding members of companies established by public subscription;
- the non-taxable incomes provided by the Tax Code, except for the rights to food granted by the employers to the employees and the income from salaries as a result of the activity for creating computer programs.
- food tickets, vacation tickets, gift tickets and day care tickets, granted according to the law;
- advantages received in relation to a dependant activity, such as: the use of any property, including a vehicle of any type, from the assets of the business, for personal purposes, except for the travelling round trips from the address of residence to the place of work; accommodation, food, clothing, the staff for domestic work, as well as other property or services provided on a free basis or at a price lower than the market price; the subscriptions and the cost of phone conversations, including phone cards, for personal use; the travel permits by any means of transportation, used for personal purposes; insurance premiums paid by the supporter for its own employees or another beneficiary of salary incomes, at the moment that premium is paid, other than the compulsory ones.

For certain income obtained by natural persons compulsorily insured by law, the lawmaker provided certain **exceptions from the payment of individual contributions and/or contributions owed by the income payers**.

Thus, *the individual contribution of social insurances and the contribution owed by the employer at the state social insurances budget* are not required for the following income:

- the amount owed for the participation of the employees to the profit;
- the session indemnities for local and county counsellors;
- benefits in the form of the employer bearing the contributions paid at the facultative pension funds, within the limits of deductibility established according to the law;
- the gross monthly indemnity, as well as the amount from the net profit, owed to the administrators in national companies/enterprises, companies where the state or an authority of the local public administration is a controlling shareholder, as well as the autonomous administrations;
- the indemnity of administrators, and the income from the net profit, owed to the administrators of companies according to the articles of association or established by the general stockholders' assembly;
- the services borne from the budget of state social insurances, including those for labour accidents and professional diseases.

No ***insurance contribution for labour accidents and professional diseases is owed*** by the employers in the defence institutions, public order and national safety institutions, as well as the institutions in the suborder of the National Administration of Penitentiaries and the General Directorate for Protection and Anticorruption, both for the military staff and the civil staff employed on the grounds of an agreement.

The insurance contribution for labour accidents and professional diseases owed by the employer is not calculated for the following income:

- the amount owed for the participation of the employees to the profit;
- the session indemnities for local and county counsellors;
- benefits in the form of the employer bearing the contributions paid at the facultative pension funds, within the limits of deductibility established according to the law;
- the gross monthly indemnity, as well as the amount from the net profit, owed to the administrators in national companies/enterprises, companies where the state or an authority of the local public administration is a controlling shareholder, as well as the autonomous administrations;
- the indemnity of administrators, and the income from the net profit, owed to the administrators of companies according to the articles of association or established by the general stockholders' assembly;
- the services borne from the budget of state social insurances, including those for labour accidents and professional diseases.

The contribution for vacations and indemnities of social health insurances owed by the employer is not calculated for the following income:

- the rights of monthly pay, indemnities, bonuses, premiums, increments and other rights of the active military staff and those of civil servants with a special statute, granted according to the law;
- the amounts received by the representatives in the general stockholders' assembly, in the board of directors meeting, the members of the management and the supervision council, as well as the censors commission;
- the amounts received by the representatives in tripartite organisms, according to the law;
- the monthly indemnity of the sole associate;
- the amount from the net income, owed to the administrators of companies according to the articles of association or established by the general stockholders' assembly;
- the monthly indemnities paid according to the law by employers during the period of non-competition, established according to the individual labour agreement;
- the indemnities received during the delegation or secondment to another location, in the country and abroad, for business purposes, granted by non-profit legal persons and other entities which do not pay profit tax, over the limit of 2.5 times the indemnity granted to employees in public institutions;
- the remuneration received by the president of the landlords' association or by other persons, on the grounds of the mandate agreement, according to the law regarding the establishment, organization and operation of landlords' associations;
- the income representing compensatory payments borne by the employers, according to the collective labour agreement, obtained by the natural persons who are not in legal relations with the employers;
- the session indemnities received by the local and county counsellors;

The individual contribution of unemployment insurances and the contribution owed by the employer to the state social insurances budget are not required for the following income:

- the income in cash and/or in kind granted to retired persons;

- the rights of monthly pay, indemnities, bonuses, premiums, increments and other rights of the military staff, granted according to the law;
- the gross monthly indemnity, as well as the amount from the net profit, owed to the administrators in national companies/enterprises, companies where the state or an authority of the local public administration is a controlling shareholder, as well as the autonomous administrations;
- the monthly indemnity of the sole associate;
- the indemnity of administrators, and the income from the net profit, owed to the administrators of companies according to the articles of association or established by the general stockholders' assembly;
- the monthly indemnities paid according to the law by employers during the period of non-competition, established according to the individual labour agreement;
- the remuneration received by the president of the landlords' association or by other persons, on the grounds of the mandate agreement, according to the law regarding the establishment, organization and operation of landlords' associations;
- the amounts received by the representatives in the general stockholders' assembly, in the board of directors meeting, the members of the management and the supervision council, as well as the censors commission;
- the compensations granted, under the terms of the law or those of the collective or individual labour agreement, to the persons dismissed for reasons beyond themselves or who, according to the law, are discharged or go in retreat;
- the income obtained by the natural persons who are not in legal relations with their employers anymore, but they cash in revenues as a result of the fact that they had legal relations with them and those revenues are granted, according to the law, subsequently to the termination of the legal relations, except for the amounts representing the salaries, differences of salaries, income assimilated to salaries or differences of income assimilated to salaries, on which there is an obligation of paying the insurance contribution for unemployment established on the grounds of a final and binding ruling, as well as their update with the inflation index;
- the services borne from the budget of state social insurances, the Unique National Fund for health Insurances, including those granted for labour accidents and professional diseases.
- the income granted according to the statutory provisions in the form of participation of the employees to the profit;
- the amounts received by the representatives in the board of directors meetings, the consultative councils and the commissions established according to the law;
- the session indemnities for local and county counsellors;

During the time in which the employment or work relations are suspended, according to the law, Except for the period of temporary incapacity of work in which the payment of the indemnity is borne by the company, no unemployment insurance contribution is owed.

CONCLUSIONS:

Although a certain harmonization of the calculation bases has been attempted for social contributions and for the income from salaries, there are noteworthy differences between the categories of income which are included in the calculation base of the income tax and the calculations bases of social contributions. The regulation of social contributions by the Tax Code provided the creation of a unitary legislative framework with respect to the definition of the incomes, for which there is an obligation of calculation, deduction, payment and declaration of social contributions and income tax, according to the provisions of the Tax Code, the taxpayer no longer has to identify the legal base from various regulations.

Moreover, a calculation base is established, which comprises mostly the same categories of income and meets the conditions for granting the services provided to insured persons.

The implementation of the "Unique Statement" provides the integration of the flows of information between the National Agency for Tax Administration, which has among its attributions to collect tax liabilities and the Social Insurance Houses, which according to the statutory provisions, administer the social insurance systems and provide the social services to the insured people. By means of this statement, both the payment liabilities to the budgets of social insurances and special funds are declared, and the individual statement of the persons who are not insured in the social insurance systems, statement which will be submitted at a single institution.

In this paper, the authors make an analysis of the second wave of the actual World Financial Crisis. They present the consequences of the first wave of the World Financial Crisis, namely the Banking Crisis, on the EU countries public debts.

Key words: analysis, crisis, public debts, EU

JEL Classification: G30

1. European Bailout Plan

The first wave of the global financial crisis consisted of a deep crisis within the international banking system caused by mortgage contracts. The devastating effects of this first wave were only delayed - not eliminated - by states interventions through state bailouts given to banks in difficulty. To mitigate the effects of this crisis, the European Bailout Plan was passed in 2008 within the EU Zone, which in summary provided the following:

- Any financial support had to be given on time and it was temporary;
- Taxpayers interests had to be protected;
- Remaining shareholders had to deal with governmental interventions;
- Governments were free to change companies management when necessary;
- Governments were entitled to changing banking wage policies;
- Stipulations relating to EU Bailout Plan had to be followed as stated;
- No secondary effects on other UE members were allowed.

Besides the bailout amount of 1465 billion Euros, the EU Bailout Plan also stipulated that bailed banks could not give dividends to investors until the total amount received by them was returned to the governments. Moreover, governments had the right to be represented on the board of directors of bailed banks by special observers. As a consequence of the above stipulations, European stock markets fell the very next day this plan was approved.

There were also some exceptions. Many French banks like Credit Agricole or BNP Parisbas refused governmental help because of its interfering role in bank management. Other banks accepted the bailout plan, as following: Barclay's (UK): 1.62 billion £; Royal Bank of Scotland (UK): 5 billion £; Fortis (The Netherlands/Belgium): 11.2 billion €; Dexia (France/Belgium): 6.4 billion €; Hypo Real Estate (Germany): 35 billion €.

This bailout given to banks by EU states was misunderstood by them, for several reasons, among which the following:

- When banks know that the state will support them during crises, they can afford to take bigger risks.
- Without more regulation, banks are driven to increase their returns by taking bigger risks.
- When banks gain huge amounts of money, they keep the profits; when banks lose, it is the state that pays.

Looking back, one can see that the European public has discovered an interesting fact: the 2008-2009 fiscal stimulus programs, which were aimed at forestalling an even greater crisis, generated more debts than jobs. By analyzing this situation, one conclusion arises: cheap money (through cost and high liquidity levels) has deepened the crisis.

2. It's all in the history

Recent past history showed, on one hand, the financial crisis deepened the problems of several European countries because of the monetary and financial structures of the Euro zone. On the other hand, the crisis resulted in extreme shortage of liquidity for European banks. During 2007-2008, banks of core Euro zone countries (**Germany, France, The Netherlands, Belgium**) continued to lend to peripheral countries (Italy, Spain, Ireland, Greece, Portugal). Gross cross-border claims from core to periphery reached 1.5 trillion Euros in 2008, representing almost three times the capital of core banks.

The European Central Bank (ECB) intervened, lending freely and making it possible for banks to start dealing with their weak position. Also, the ECB reaction was very different in 2009 when states were facing growing borrowing needs due to the crisis. The ECB watched as interest rates rose, financial institutions speculated against state debt, and state bankruptcy raised its head. In such a difficult financial environment, the Euro zone left each state to defend itself in the financial markets.

When looking closer at the above mentioned time line, the following can be stated: The financial crisis has been followed by a wave of governmental defaults on public debt obligations; The financial crisis has led to, or exacerbated, sharp economic downturns, low government revenues, widening government deficits, and high levels of debt, pushing many governments into default; As recovery from the global financial crisis begins, the global recession endures, at some point to the threat of a second wave of the crisis: **sovereign debt crisis**.

3. Sovereign debt crises

In a financial crisis, government spending increases dramatically in the attempt to stabilize the financial system and stimulate economic activity. Hence, tax revenues fall, fiscal surpluses turn into deficits and existing deficits increase. Because of the difficult financial situation, all sixteen members of the European Monetary Union (EMU) have violated treaty limits on allowable budget deficits (some more than four times). Moreover, the leading economies of the world have all seen their deficits shoot higher, some to record levels.

Among all the obstacles, there is a certainty: when economies are contracting or even grow slowly, bringing these deficits back down to earth, the situation turns into an unenviable challenge. Governments have to survive by turning to the markets. Then those increased deficits turn into growing debt loads. When debt reaches 80 percent of the GDP threshold, the borrowing costs for governments start ticking higher and so does the market scrutiny. Related to this topic and in the attempt to warn financial markets, the IMF stated in 2010 that five of the top seven developed countries in the world would have debt levels exceeding 100 percent of GDP during the next four years.

If deficits and debts rise and economic activity appears unlikely to solve fiscal problems, the creditworthiness of the government falls under intense scrutiny. That's when downgrades appear. This is the situation many countries around the world had to face in 2009 and 2010, when the

sovereign debt crises burst. Greece's sovereign debt rating has been downgraded to *junk* status. Spain has lost its AAA rating. UK could have lost its AAA status if its deficit would not have been addressed. Across the ocean, Japan's outlook has been cut to negative and rating agencies have even warned the U.S.

In such an environment, when investors see more risk, they require more return. Therefore, the borrowing costs for troubled countries rises. Then, it becomes harder to finance spending needs and harder to finance existing debt. That's when defaults show up. Unless governments can **demonstrate** they're willing to take tough steps to reign in debt, crisis can spread quickly.

4. Public deficit, nowadays problem in the EU

Regarding the issue of the EU public deficit, it must be stated that this economic phenomenon is accepted within the union until it exceeds values stated in documents like: Maastricht Treaty (1992); Stability and Growth Pact (1997).

According to the Maastricht Treaty, countries have to meet several convergence criteria, among which the following:

- An inflation rate no more than 1.5% higher than the average of the three lowest inflation rates of EU member states over the previous year;
- Long-term interest rates must not exceed by more than 2% the lowest inflation rates of EU countries over the previous year;
- The Member State is required to join the exchange-rate mechanism (ERM II) for two consecutive years before entering the Euro zone and it should not have devalued its currency during the period;
- A government budget deficit must not exceed 3% of each country's GDP at the end of the preceding fiscal year;
- A gross debt to GDP ratio must not exceed 60% at the end of the preceding fiscal year.

On the other hand, the Stability and Growth Pact (1997) provided:

- mechanisms for multilateral surveillance and enforcement;
- stated that budgetary positions should normally be "close to balance or in surplus";
- if requirements are broken, EU can apply a fine of 0.5 % of the GDP to its members.

To comply with the provisions of the two treaties, EU members had to impose a strict budget discipline, because the budget positions of some countries pose a risk for the sustainability of the public finances of these countries and of the European Monetary Union (EMU) as a whole. Moreover, the national fiscal policies of EU members were strictly subordinated to the inflation target of the European Central Bank. Also, the national governments were obliged to meet rigid parameters and could not use fiscal policies freely to increase growth and employment.

Nevertheless, since the financial meltdown has begun, 20 EU countries (among which all 16 of the EMU's members) have been guilty of excessive spending. During all this period, European governments were and still are struggling to rein in deficits after the worst downturn since World War II. The table below presents some data concerning the amount of deficits:

Table no. 1 Budgetary Deficit/GDP

COUNTRY	2007	2008	2009
Ireland	0.1	-7.3	-14.3
Greece	-5.1	-7.7	-13.6
United Kingdom	-2.8	-4.9	-11.5
Spain	1.9	-4.1	-11.2
Portugal	-2.6	-2.8	-9.4
Iceland	5.4	-13.5	-9.1
Latvia	-0.3	-4.1	-9
Lithuania	-1	-3.3	-8.9
Romania	-2.5	-5.4	-8.3
France	-2.7	-3.3	-7.5
Netherlands	0.2	0.7	-5.3
Hungary	-5	-3.8	-4
Bulgaria	0.1	1.8	-3.9
Malta	-2.2	-4.5	-3.8

Source: Eurostat data

As it can be seen, twenty member countries are facing EU deadlines to get their budgets back in shape. They are all deemed crucial to economic stability and growth as the EU claws back from recession. A review of the situation in Hungary, Latvia, Lithuania and Malta shows all four countries have taken adequate steps to narrow their deficits. There are requests that Malta and Lithuania are granted another 1 and 2 years to get back in shape.

Most analysts stated that in 2010 unemployment rate in the EU would reach the level of 10.25% and the public deficit would be 7.5% of EU GDP. In 2009 budget shortfalls of two or three times the EU limit would have been unthinkable in most countries. Because many countries have exceeding deficits, the EU Commission proposed deadlines to reduce gaps. Here are some examples:

- Hungary met its 2009 deficit target of 3.9% of GDP. It has until 2011 to bring its deficit below 3%.

- Latvia ended 2009 with a deficit projected at just below 10% of GDP, as recommended by the EU. The target for 2010 was 8.5%.

- 13 countries were given 2-5 years to reinstate fiscal discipline: Italy, Belgium (until 2012); Germany, France, Spain, Austria, the Netherlands, the Czech Republic, Slovakia, Slovenia, Portugal (until 2013); Ireland (until 2014); UK (until 2014-2015).

The significant indicator for any country is Gross Debt to GDP Ratio, which has deteriorated strongly due to recession, stimulus, capital injection in banks, and reached dangerous levels in 2010 for the balance of European economies, as it follows: Greece 115%; Italy 116%; Belgium 97.2%; UK 78.7%; Portugal 77.4%, France 76.1%; Germany 72.1%; Austria 69.1%; Ireland 64%, Finland 41.3%. Many analysts think that the problem in today's Europe is due to a natural evolution of things and that the evolution of the financial crisis follows this pattern: over

indebtedness was shifted from home buyers on to banks, then transferred to governments (e.g. the recent sovereign debt crisis in Greece is only a natural development of things).

To prevent amplification of budgetary problems and their propagation in the EU, the 27 EU states have to reduce public deficit and have received guidelines from the EU to achieve this goal within 2011-2014.

5. The situation of Greece, “Achilles Heel of the EU”

Greece has accumulated high levels of debt during the decade before the crisis, when capital markets were highly liquid. As the crisis has unfolded, and capital markets have become more illiquid, Greece may no longer be able to roll over its maturing debt obligations. Some analysts have discussed the possibility of a Greek default. Greece has relied heavily on external financing for funding the budget. Between 2001, when it adopted the euro as its currency, and 2008, Greece’s reported budget deficits averaged 5% per year, compared to a Euro-zone average of 2%. Its current account deficits averaged 9% per year, compared to a Euro-zone average of 1%.

The causes of financial crisis in Greece can be grouped into two categories, namely:

- *Domestic causes*: high government spending of successive Greek governments; weak revenue collection; structural rigidities in Greece’s economy.
- *International causes*: access to capital at low interest rates after adopting the Euro; weak enforcement of EU rules concerning debt and deficit ceilings facilitated Greece’s ability to accumulate high levels of external debt.

To prevent the entry of Greece into collapse, Euro-zone countries and the International Monetary Fund, seeking to halt a widening European debt crisis that has threatened the stability of the Euro, agreed to extend Greece an unprecedented €110 billion (\$147 billion) rescue in return for Draconian budget cuts. Germany, whose population has been deeply sceptical of a bailout, bore the largest share of the Euro-zone contribution, namely €22.3 billion of the total amount. The Euro-zone loans carry an interest rate of about 5%, compared to about 3% for the IMF contribution. Some €10 billion will be set aside as “bank stabilization” fund for use if the condition of Greek financial institutions worsens.

The Greek government has promised to slash and then freeze public sector wages, raise sin taxes, increase value-added taxes, impose a new levy on businesses, cut pension payments and increase retirement ages for some public-sector workers. The steps are expected to save the state €30 billion through 2013. Thus, the Greek government has adopted the following measures:

- Public sector limit of €1,000 introduced to bi-annual bonus, abolished entirely for those earning over €3,000 a month;
- An 8% cut on public sector allowances and a 3% pay cut for DEKO (public sector utilities) employees;
- Limit of €800 per month to 13th and 14th monthly pension instalments; abolished for pensioners receiving over €2,500 a month;
- Return of a special tax on high pensions;
- Changes concerning laws governing lay-offs and overtime payment;
- Extraordinary taxes imposed on company profits;
- Increases in VAT to 23%, 11% and 5.5%.
- 10% rise in luxury taxes and taxes on alcohol, cigarettes, and fuel;
- Equalization of men and women pension age limits;
- General pension age has not been changed, but a mechanism has been introduced to scale them to life expectancy changes;
- Average retirement age for public sector workers has increased from 61 to 65;
- Public-owned companies to be reduced from 6,000 to 2,000.

Only the nearest future will show whether these harsh methods have generated the appropriate results.

6. Broader implications of Greece crisis: Spillover Effect

During the last two years, there were several concerns that Greece's crisis could spill over to other European countries in difficult economic positions, including Portugal, Ireland, Italy, and Spain. European authorities warned that debt programs in Greece and other high deficit countries such as Spain, Portugal, Ireland and even Italy may affect stronger European countries. Greece's foreign policy focus on the region and growing trade volumes between neighbour countries like Serbia, Albania, Macedonia, Romania, Bulgaria and Turkey could not remain indifferent to the magnitude of the crisis next door.

All their concerns were entirely justifiable. PIIGS ZONE, that is Portugal, Ireland, Italy, Greece, Spain, borrowed heavily during the credit bubble. Some argued that the spillover effect could appear in Europe just as it appeared in Asia, where investors' herding behaviour contributed to the spillover of Asian financial crisis (1997-1998). Others argued the spillover hypothesis was unlikely to happen: the low levels of national savings in Greece and Portugal put these countries in the weakest financial position, at 7.2% of GDP and 10.2% of GDP respectively, compared to an EU average of approximately 20%. Spain and Ireland, by contrast, were closer to the EU average at 19% of GDP and 17% of GDP, respectively, putting them in a stronger financial position.

Two macroeconomic indicators were significant for the evolution of these countries, namely: government expenditure as percent of GDP and government consolidated gross debt as percent of GDP. The figures for each country were as following: Portugal: spending 51%; debt 77%; Ireland: spending 48%; debt 64%; Italy: spending 52%; debt 116%; Greece: spending 50%; debt 116%; Spain: spending 46%; debt 53%.

7. Conclusions

All in all, when referring to the implications of the world financial crisis on the European public deficit, it can be stated that the bubble disease has spread to the whole financial system, making governments to bail banks and acquire liabilities. Although liabilities are necessary, borrowing more to satisfy previous debt obligation will only delay the problem, not solve it. Nowadays, it's too early to measure the effectiveness of the bailout plan for the Euro-zone. In our view, time is the best solution to the debt problem. Giving it 5-8 years, reducing spending and increasing saving to pay down the debts is the most pragmatic way of solving it.

THE OPPORTUNITIES AND CHALLENGES OF MICROINSURANCE

Bențe Corneliu

University of Oradea, The Faculty of Economics

Microinsurance is a term increasingly used to refer to insurance characterized by low premium and low caps or low coverage limits, sold as part of a typical risk-pooling and marketing arrangements, and designed to service low-income people and businesses not served by typical social or commercial insurance schemes.

As a relatively new field, few studies evaluating the impact of microinsurance projects exist. Of these, even fewer have a rigorous methodology leading to reliable results.

Our research aimed to:

- examine the viability of microinsurance as a mechanism of risk transfer and tool for risk management in developing countries;*
- provide a state of the art analysis of microinsurance for a better understanding of currently operational microinsurance schemes;*
- reflect on the opportunities and challenges of microinsurance in developing countries, highlighting both the potential benefits and limitations of microinsurance as an instrument for transferring risk;*
- consider the interests and perspectives of different stakeholders and the incentives and disincentives for participating and investing in a micro-insurance scheme;*
- enhance dialogue and collaboration on this topic between and within the commercial insurance sector and the disaster risk reduction communities;*
- assess the opportunity of introducing microinsurance in Romania.*

Reflecting on the opportunities and challenges of introducing microinsurance in Romania, there is absolutely necessary to understand both the supply side (current insurance market) and the demand side (risks faced by low-income persons and the coping strategies used to manage these risks). The majority of the primary research was conducted on-site in Romania, in Oradea and its environs, during the month of December 2010. Qualitative research techniques were utilized, including focus group discussions (FGD) and guided individual interviews with members of both the public and private sector, as well as with international non-governmental organizations, such as the World Bank, and IMF.

The research revealed the main risks faced by low-income households, and the fact that microinsurance is a mostly unknown concept in Romania. There is a clear need and demand for microinsurance in Romania. The potential market is estimated to include approximately 4.3 million persons in 2008.

Keywords: microinsurance, microfinance, low-income, direct sales, performance

JEL Code: G22

1. Definitions of microinsurance

Microinsurance is part of the broader concept of microfinance, which includes a variety of “micro” financial services targeted to lower-income households.

In definition, microinsurance is not very different from traditional insurance, except that it targets a different segment of a population. In reality, however, this entails an entirely different way of thinking about insurance: new, simpler products, alternative distribution channels and marketing instruments, as well as a focus on efficient operations.

Microinsurance is a financial arrangement to protect low-income people against specific perils in exchange for regular premium payments proportionate to the likelihood and cost of the risk involved (Churchill C. 2006: 2).

This definition is essentially the same as one might use for regular insurance, except for the clearly prescribed market: low-income people.

The author of this definition adds that microinsurance does not refer to: (i) the size of the risk-carrier (some are small and even informal, others very large companies); (ii) the scope of the risk (the risks themselves are by no means "micro" to the households that experience them); (iii) the delivery channel: it can be delivered through a variety of different channels, including small community-based schemes, credit unions or other types of microfinance institutions, but also by enormous multinational insurance companies, etc.

Though the concept of microinsurance is gaining in popularity across the globe, there is no commonly accepted definition. We can define microinsurance by the following characteristics:

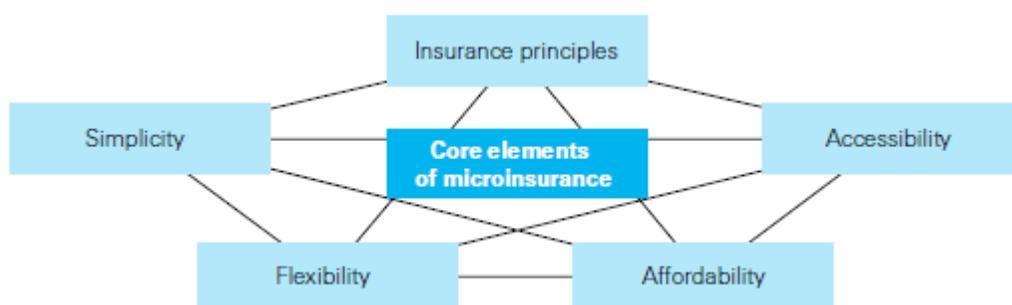

Figure 1. Core elements /characteristics of microinsurance

Source: Swiss Re Sigma No.6/2010 –“Microinsurance-risk protection for 4 billion people”, p.2

Insurance principles: it is based on insurance principles and involves payment of premiums by the policyholders (or on the policyholder’s behalf by governments, developmental agencies) in exchange of the promise of indemnification by the insurer in the event of covered loss.

Accessibility: Microinsurance targets the segment of society with low and instable income who would not otherwise be able to afford conventional insurance.

Affordability: Premiums and coverage are kept at a low level in order to make products affordable for the target population. Premium subsidies provided by governments or developmental agencies also help to ensure products are affordable.

Flexibility: Since the low-income segment of the society is not homogenous cluster, microinsurance products require customization to meet the community requirements in a effective way. For instance, premium collections, can be tailored to suit the irregular income stream of policyholders.

Simplicity: Microinsurance should be structured simply in terms of product design, underwriting conditions, premiums collection, policy language and claims handling. This takes into consideration the lack of actuarial data in many cases and help to make the products easy to understand and more acceptable.

The low-income households are facing the following main risks by: death or serious illness of a breadwinner, loss of the year’s harvest due to natural disaster, and property loss.

2. Microinsurance delivery models

Methods and models for delivering microinsurance products depend on the organization, institution, and provider involved. In general, there are four main methods for offering microinsurance. Each of these models has their own advantages and disadvantages.

-Partner agent model

A partnership is formed between the micro-insurance scheme and an agent (insurance company, microfinance institution, donor, etc.), and in some cases a third-party healthcare provider. The micro-insurance scheme is responsible for the delivery and marketing of products to the clients, while the agent retains all responsibility for design and development. In this model, micro-insurance schemes benefit from limited risk, but are also disadvantaged in their limited control.

-Full service model

The micro-insurance scheme is in charge of everything; both the design and delivery of products to the clients, working with external healthcare providers to provide the services. This model has the advantage of offering micro-insurance schemes full control, yet the disadvantage of higher risks.

-Provider-driven model

The healthcare provider is the micro-insurance scheme, and similar to the full-service model, is responsible for all operations, delivery, design, and service. There is an advantage once more in the amount of control retained, yet disadvantage in the limitations on products and services.

-Community-based/mutual model

The policyholders or clients are in charge, managing and owning the operations, and working with external healthcare providers to offer services. This model is advantageous for its ability to design and market products more easily and effectively, yet is disadvantaged by its small size and scope of operations.

3.The microinsurance market

A range of players and institutions are involved in the microinsurance supply chain. They include insurance regulators, risk carriers, administrators, delivery channels, technology platforms, and related service providers. The risk carriers are mainly comprised of insurance providers, including private and public insurers, non-governmental organizations, mutuals and community organisations

The microinsurance market can be categorized in two broad segments, based on the consumption level of the people and their ability to afford premiums (Re Sigma No.6/2010 : 9). Those living above the international poverty line of 1,25 USD/day, and up to 4 USD/day represent the target market segment for the commercially viable microinsurance. For this group, it is possible to have an independent market-based approach, whereby microinsurance products are sold at a price that is still affordable to the clients, but also commercial sustainable.

The other segment is at the bottom of the income pyramid, which includes people living below 1,25 USD/day, also referred to us as the extremely poor population. The population falling into this category earn so little that they find it hard to afford even basic necessities for their families, let alone the cost of commercially viable micro-insurance products. However there are other approaches to extend social protection and micro insurance programs to this group. For instance, government can introduce large scale social security measures on their own or subsidise microinsurance premiums through public private partnership programmes.

It is estimated that 2,6 billion people fall in the range of 1,25 USD/day and 4 USD/day (Re Sigma No.6/2010 : 9). This is the potential target for various commercially viable microinsurance products. On the other hand, some 1,4 billion people live on less than 1,25 USD/day and require support from governments and developmental agencies to access microinsurance products. In total, up to 4 billion people can potentially benefit from microinsurance and/or public private partnership. This translates into 2 to 3 billions policies insurance products. In USD terms, the

potential market is valued up to USD 40 billion. The current market size, however is far less. It is estimated that the current penetration of the microinsurance is close to 2%-3% of the potential market, which translates into around USD 0,8-1,2 billion of direct premium.

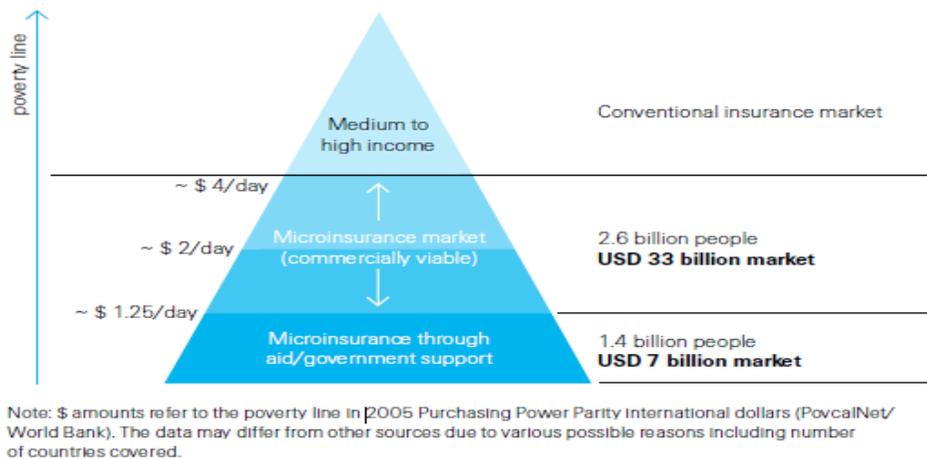

Figure 2. Potential market estimates of the global microinsurance market

Source: Swiss Re Sigma No.6/2010 –“Microinsurance-risk protection for 4 billion people”, p.9

South Asia has the lowest ratio of low-income individuals living under \$4/day to the total population. The entire Asia-Pacific region represents 70% of the world’s low-income population.

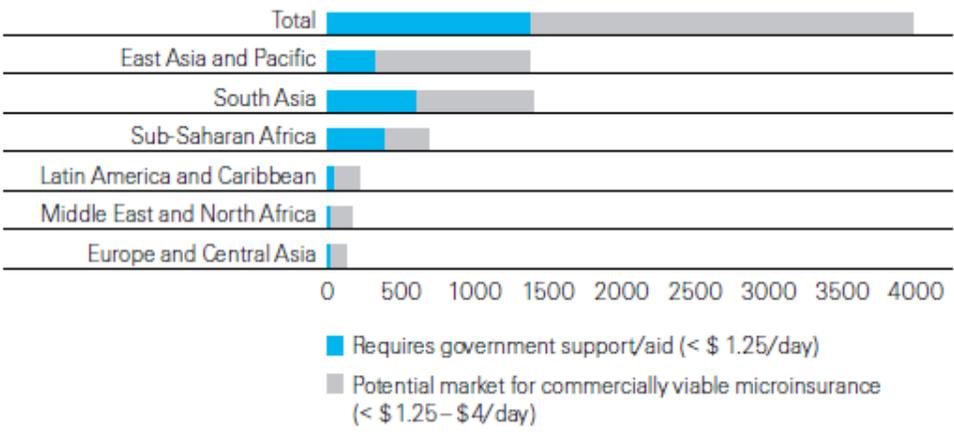

Figure 3. Low income population by region (data in millions)

Source: Swiss Re Sigma No.6/2010 –“Microinsurance-risk protection for 4 billion people”, p.10

Sub-Saharan Africa along with the Middle East and North Africa are the next major regional markets with 865 million low-income individuals. Latin America and Caribbean, where microinsurance is much more developed compared to Africa , accounted for some 5% of the

low-income population. The incidence of extreme poverty is highest in a South Asia and Sub-Saharan Africa, totaling almost a billion people.

The concept of microinsurance is relatively new in Central and Eastern Europe(CEE) and Turkey, even though there are an estimated 73 million people living under \$4. The five markets (The Russian Federation, Turkey, Romania, Ukraine and Poland), account for nearly 90% of the low income population in the region, and can be considered major markets for microinsurance products. Moldova and Albania, on the other hand have the highest proportion of low-income population, with 4 million people.

4.The oportunity of introducing microinsurance in Romania

The purpose of the present study was to assess the oportunity of introducing microinsurance in Romania. To address this key question, an understanding of both the supply side (current insurance market) and the demand side (risks faced by low-income persons and the coping strategies used to manage these risks) was necessary. The majority of the primary research was conducted on-site in Romania, in Oradea and its environs, during the month of December 2010. Qualitative research techniques were utilized, including focus group discussions (FGD) and guided individual interviews with members of both the public and private sector, as well as with international non-governmental organizations, such as the World Bank, and IMF.

In Romania it is estimated that 4,19 million people fall in the range of 1,25 USD/day and 4 USD/day in 2008, conform to Development Research Group of the World Bank(World Bank). This is the potential target for various commercially viable microinsurance products. On the other hand, some 0,11 million people live on less than 1,25 USD/day and require support from governments and developmental agencies to access microinsurance products. In total, up to 4,3 milion people can potentially benefit from micoinurance and/or public private partnership.

The research revealed the following main risks faced by low-income households: death or serious illness of a breadwinner, loss of the year's harvest due to natural disaster, and property loss. Currently, most households use self-insurance and informal insurance as their primary risk management tools; savings and the purchase of fixed assets are utilized ex-ante, while borrowing or migrating for work are used to cover expenses ex-post. Clearly, the effectiveness of such strategies is limited.

However, most low-income persons do not currently consider insurance as a viable risk management alternative. There are many ways to explain this: firstly, there is a lack of financial education among the population about the purpose and benefits of insurance. Secondly, there is a widespread lack of trust in institutions. In addition, most low-income households feel they do not have sufficient financial resources, perceiving insurance as an "extra" or even "wasteful" expense, or as a luxury product. Finally, most insurance firms do not offer any products targeted to the lower-income population, nor are making a marked effort to reach out to this segment.

Currently, most insurance firms offer a traditional product range, many relying on automobile and other compulsory insurances. Direct sales through intermediaries (agents and brokers) is very common, and marketing is primarily executed through traditional mass media (television, radio, print advertising). One of the main issues with the current product offering is that most products are not affordable, but also payment is required in full and upfront.

Microinsurance is a mostly unknown concept in Romania. There is no specific microinsurance legislation, although the government has expressed openness to the possibility of developing one in the future. Microfinance, however, is quite well-developed and regulated, which is often a pre-requisite for the successful launch of microinsurance into a new market.

5. Conclusions

Microinsurance supports the insurance sector's long-term development. With favorable trends, such as rising personal and household income, improving economic fundamentals and increased efforts on poverty reduction, it is expected that a high percentage of the low-income households will move into the middle income segment in the near future. This socio-economic transformation will offer huge business opportunities to the financial services industry.

There is a clear need and demand for microinsurance in Romania. The potential market is estimated to include approximately 4.3 million persons in 2008 conform to Development Research Group of the World Bank(World Bank). A microinsurance product would need to offer both quality and flexibility, at a reasonable cost and with a flexible payment plan. The recommended microinsurance products which are addressing to the low-income persons in Romania are personal accident, credit life, agriculture and property insurance. Furthermore, trustworthy and far-reaching distribution channels which would reliably provide access to the maximum number of people is important. For Romania, the recommended distribution channels are microfinance institutions and SCAs.

Premium payments and claims disbursements could also be handled through the Post Office, which has the widest and most accessible branch network of any institution in Romania. For operations, the partnership model is recommended, whereby Zurich would liaise with an on-site partner, who would in turn coordinate the respective delivery channels and manage regulatory compliance.

Finally, investment in financial education is necessary for the success of microinsurance. Raising the financial education and helping to build an insurance culture fosters a favorable environment for all parties involved – buyers and suppliers. Therefore, it is recommended that educational programs be implemented in collaboration with the government as well as international organizations, trade associations and rural organizations.

THE LEGAL INDEBTEDNESS CAPACITY OF ROMANIAN LOCAL GOVERNMENTS – THEORETICAL AND EMPIRICAL EVIDENCES

Oprea Florin

„Al. I. Cuza” University of Iași Faculty of Economics and Business Administration

Bilan Irina

„Al. I. Cuza” University of Iași Faculty of Economics and Business Administration

The factual, not only formal capacity of local governments to appeal to borrowed resources is, considering the current conditions, a prerequisite for ensuring economic and social development of local communities. In this paper we intend to position the main theoretical and empirical evidences on local governments' indebtedness capacity, mainly focusing on its sizing according to Romanian regulatory framework. With respect to previous research, the issue approached is one of great interest as it has not been, in the Romanian literature on local public finances, subject to a separate analysis of proportions.

The undertaken analysis comprises a quantitative dimension, based on processed data from the consolidated general budget of Romanian local governments for 2007-2009, in permanent conjunction with monitoring and analysis of the involved qualitative aspects. To ensure the relevance of the research results, the analysis undertaken refers to the legal framework in function throughout the considered period of time, without involving the legislative changes operated in mid-2010.

The main conclusions drawn from our analysis indicate that, considering the current Romanian socio-economic environment, under the impact of specific factors of different nature, the legal indebtedness capacity is far from being well valued, thus bringing its benefits to local communities development. This conclusion is valid from a global perspective as well as for different types of local communities. This appears to be inconsistent with the permanently claimed need to fund important local public investments, mainly in infrastructure, indicating, despite the high legal indebtedness capacity, the lack of factual access to borrowed resources.

We suggest, therefore, to introduce the concept of effective indebtedness capacity, the result of a particularized correlation for different local governments between legal indebtedness capacity and the manifestation of several factors with specific action and we intend to contribute, by future research, to its measurement.

Keywords: legal indebtedness capacity, effective indebtedness capacity, local governments, local public debt, local autonomy

JEL Codes: H74

1. Introduction

Self-financing should be the key word when it comes to supporting expenditures of local governments which are autonomous (both administratively and financially). However, the whole modern world is confronted to the existence of vertical and horizontal fiscal imbalances, mainly caused by the heterogeneity of local fiscal potential which, combined with some equivalence of local public needs, determine local governments to permanently confront with the need to obtain more resources to cover all expenditures.

In these circumstances, central governments apply different solutions to restore equilibrium (operating subsidies, grants, subsidies, transfers, grants and quotas from shared taxes etc.), under

the generic title of intergovernmental transfers system (inter-administrative in the case of unitary states). However, local socio-economic development, especially in countries that pass or have recently gone through transition, demands for major investments, especially in infrastructure, the regions "left behind" being, from this point of view, the most obliged.

In accordance with the above mentioned situation, the need of local governments to finance higher expenses compared to the resources normally raised at their disposal, determines their options for the use of extraordinary resources, usually raised via local (public) loans. It should be noted, however, that recourse to loans is not a good solution in any circumstances (there are, for example, legal borrowing limits) and that the employment of such a solution basically represents a deferred payment through additional taxes, as the latter will represent the basis for raising public financial resources allocated for the repayment of loans and of additional costs generated by loans (interests, fees etc.).

2. The subject of the research, methodology and state of knowledge

The use of local public loans raises the issue of the indebtedness capacity of involved subjects, under two major aspects: what are the legal limits of indebtedness and how are they set, respectively, what is the effective capacity of local authorities to borrow. An analysis based only on the legal regulation of the limits would be unrealistic if it is not accompanied by a proper interpretation (analysis) of the effective indebtedness capacity of these communities.

Under these circumstances, the paper seeks to position the main theoretical and empirical evidences in the field based on a quantitative analysis (data from the consolidated general budget of local governments, 2007-2009), in permanent conjunction with monitoring and analysis of the involved qualitative aspects. For ensuring the relevance of the research results, the analysis undertaken refers to the legal framework in function throughout the considered period of time, without involving the legislative changes operated in mid-2010.

The issue proposed for debate did not represent the subject of a major and distinctive research in Romanian literature, partially being captured in the broader context of treating local public finances issues. Thus, I. Văcărel (Văcărel et al. 2006: 591-602) notes that the possibility of local indebtedness incurrence is closely related to the manifestation of local autonomy. Gh. Voinea (Voinea 2008: 103) deals with the content of legal indebtedness limits, concluding that they must be cautiously set.

3. Qualitative dimensions of the legal indebtedness capacity of Romanian local governments

The Romanian legal framework on local governments borrowing mainly consists in Law no. 273/2006 on local public finances, which enables local governments to approve the contracting or guaranteeing of loans for local public investments and local government debt refinancing, subject to certain conditions. Thus, according to the legal provisions in force between 2007 and 2009, the total amount of annual debt payments representing the principal on contracted and/or guaranteed loans, interests and other related charges, including those on the loan which was intended to be contracted and/or guaranteed (but excluding, in line with the objective of improving the absorption of European funds, the loans contracted or guaranteed by local governments to ensure pre-financing or co-financing for projects benefiting from European financial assistance), should not exceed 30% of local budgets' own revenues.

Considering this legal requirement, we can measure the legal capacity (potential) of indebtedness as the difference between the limit of 30% for the share of local public debt service in local governments' own revenues and the actual level of this indicator in the reference year.

Since 2010, in line with Government Emergency Ordinance no. 63/2010, the condition required to allow for new local government borrowing has been reconsidered by referring to the last three

years average indicators and excluding local revenues from the sale of goods. The compliance with the limit is, thus, assessed according to the following formula:

$$C_c + C_n \leq 30\% * \frac{\sum_{i=1}^3 [V_p(t-i) - V_c(t-i)]}{3} \quad (1)$$

where: C_c/C_n - principal + interests + other fees for old/new loans

V_p – local governments' own incomes

V_c - revenues from the sale of goods

t - year of reference

We appreciate that the most sensitive issue regarding the dimensions of the legal indebtedness capacity is represented by their validation into practice, so that the local (financial) autonomy expresses, as it would be natural, not just as management of legal tasks as in the devolution system, but as a support and incentive for originality, innovation, creativity and development in line with local preferences, as direct expression of a local "entrepreneurial" administration, indispensable in our times. As it results from our analysis, for Romania, under the impact of specific factors of different nature, taking advantage of the legal indebtedness capacity is far from bringing its benefits to local communities' development.

4. Quantitative dimensions of the legal indebtedness capacity of Romanian local governments – comparative perspectives

Globally considered, the indebtedness capacity of Romanian local governments reflects the general state of the economic and social environment, being directly connected with. Although repeated local public finance reforms sought to satisfy the permanent request of local communities representatives and also the recommendations of international community representatives to increase the level of local governments' own revenues (by reference to the expenditures assigned to them), the situation has not registered substantial progress. In fact, allowing for additional revenue sources for local governments as well as the transfer in various forms (mainly grants and quotas from shared taxes) of increasing amounts of resources in nominal size from the state budget to local budgets has permanently been overtaken by increasing local expenditures, as a result of transferring more and more responsibilities from central governments to local governments.

On such basis, combined with the lack of adequate predictability of local revenues and, recently, with deteriorating overall economic situation, most revenues have been directed towards current expenditures and not capital ones. In this context, the lower orientation towards investments was reflected in some conservation of the indebtedness capacity of local governments, which decreased over the period of analysis, but not so much as it would have been expected within a local environment where the need for infrastructure and capital repairs is obvious.

Considering the indebtedness capacity, determined as the difference between the legal limit of the local public debt service share in local governments' own revenue, of 30%, and its effective level, corresponding data for all Romanian local governments are summarized in table no.1.

Table1. Overall share of local public debt service in local governments' own revenues

Indicators/Year	2007	2008	2009
Own revenues of local governments (million lei)	17317,4	20587,7	21117,6
Local public debt service (million lei)	769,2	1290,6	1732,3
Local public debt service/Own revenues (%)	4,44	6,27	8,20

Source: author's own calculations, data from the Ministry of Public Finances

The data in table no. 1 show that, during the period of our analysis, overall local governments have exploited only 27,33% of their legal indebtedness capacity, which is fundamentally inconsistent with the permanently claimed need for additional financial resources and the

relatively low level of urban and rural development in Romania, especially when considering the infrastructure.

However, the average value of the indebtedness capacity must be subject to cautious interpretations, since it hides different realities from one region to another, from one type of area or administrative division to another. For the Romanian development regions, indebtedness capacity data are reflected in table no. 2.

Table2. Local public debt and the share of its service in local governments' own revenues, by development regions

Development region/Year	2007		2008		2009		Local public debt (millions lei)
	SDL/VP* (%)	Rank	SDL/VP (%)	Rank	SDL/VP (%)	Rank	
Nord-Vest	3,38	5	5,30	4	11,16	6	945,0
Nord-Est	14,34	8	15,56	8	11,82	7	1432,7
Sud-Vest Oltenia	1,70	1	3,23	1	4,62	1	415,9
Sud-Est	4,33	6	5,77	6	9,79	5	701,4
Sud-Muntenia	2,80	3	4,11	2	6,02	2	1004,7
Vest	7,22	7	9,71	7	8,36	4	758,4
Centru	2,58	2	5,73	5	11,47	7	1055,9
București Ilfov	3,01	4	4,73	3	6,13	3	4409,5

*SDL/VP - local public debt service/local governments' own revenues

Source: author's own calculations, data from the Ministry of Public Finances

Data in table no. 2 show that the North-East region, ranking last in terms of development, appreciated through GDP per inhabitant had, between 2007 and 2009, the lowest indebtedness capacity, the situation being consistent with the need to support investment projects in this region. On the other hand we can see that, although the North-East region ranks last in terms of the indebtedness capacity, from the perspective of the overall public debt it occupies the penultimate position. In opposition, the București Ilfov region ranks first in terms of overall local public debt, definitely detaching from the other regions, but ranks among the top three positions in terms of indebtedness capacity. Basically, the Bucuresti-Ilfov region simultaneously records a high local public debt and high indebtedness capacity. South-West Oltenia region also has a special position, occupying, in terms of overall public debt, the last position and ranking first in terms of the indebtedness capacity.

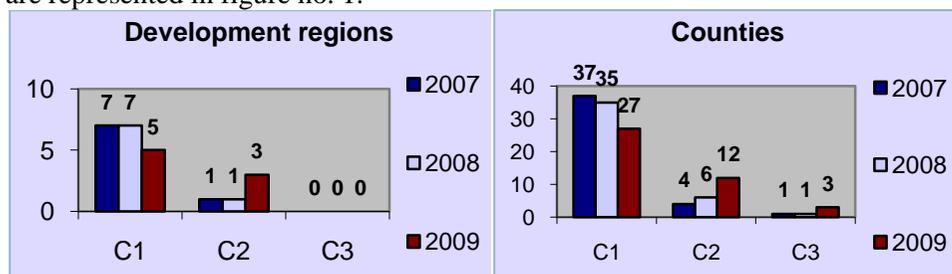

Considering the difference between urban and rural areas, we can note that rural communities have a greater indebtedness capacity, as a result of lower borrowing, as shown in table no. 3. Although the registered situation is normal, the spread of the indebtedness capacity is not as broad as the spread of overall local public debt between rural and urban communities.

Table 3. The share of local public debt service in local governments' own revenues by urban and rural areas and administrative divisions

Communities-Type of administrative division/Years		2007	2008	2009
Communities	Urban (%)	4,25	6,99	9,24
	Rural (%)	5,30	3,05	3,49
Administrative divisions	Communes (%)	5,30	3,05	3,49
	Cities, other towns and sectors of București(%)	4,51	7,96	10,21
	Counties, București (%)	3,68	4,98	7,27

Source: author's own calculations, data from the Ministry of Public Finances

Considering the administrative divisions, the situation is similar. The data in table no. 3 show that towns have the lowest indebtedness capacity, followed by counties and communes. For the particular case of Romania, this is also due to the lack of consistent practice of partnerships between different counties, which could provide a more consistent support for local borrowing. Globalizing the results of our analysis, we propose a grouping of Romanian communities on three categories: local communities with public debt service share in local governments' own revenues below 10% (C1) are regarded as having a high indebtedness capacity, those for which this indicator takes values between 10 to 20% (C2) have average capacity and those with more than 20% (C3) reduced indebtedness capacity. The results for development regions and counties are represented in figure no. 1.

Source: author's own calculations, data from the Ministry of Public Finances

Figure 1. Number of development regions/counties by indebtedness capacity

From the above grouping it may be noted that most counties had, over the period of our analysis, high indebtedness capacity, but their number is declining, especially in the last year of analysis (from 37 in 2007 to 27 in 2009). Presently, only three out of 42 counties have reduced indebtedness capacity, which represents approximately 7% of the total. Similarly, the analysis by development regions shows that none of them has reduced indebtedness capacity, as a result of the offsetting effects that occur at intra-regional level, and few have medium capacity (highly approaching to the lower limit of the interval, of 10%) although, in this case also, we find that their number is increasing (from 1 in 2007 and 2008 to 3 in 2009).

Compared with the findings of our analysis, there are, nevertheless, enough reasons, in the current socio-economic context deeply marked by the international crisis, for the disparities to become more acute, the negative effects being primarily noticeable for the small local communities with low fiscal potential.

5. Conclusions

The analysis conducted clearly highlights the fact that Romanian local governments have a high legal indebtedness capacity, though it would be expected that the specific development needs determine them to use borrowed resources to a greater extent. This situation can be explained by the amount of local debt, by the unstable economic and legal context, but also by their excessive caution and socio-economic circumstances. In this respect, the restrictions imposed on local

borrowing in the context of the current Romanian economic crisis (the 30% limit being determined with reference to local governments' own revenues, excluding capital ones) might prove counterproductive in the short term, although they have economic and financial rationality. We might confront with the unfavorable situation where local governments will no longer have wide access to borrowing, and central government will not, at its turn, be able to guarantee their loans, sometimes indispensable to finance new investment objectives. We also insist on the idea that the main role, in this context, goes to local financial decision makers, which should have a proactive approach towards identifying new sources of revenue or more efficiently exploiting those already existing, which should provide them with more consistent own resources.

Judging cautiously, it must be noticed that the analysis carried out on local governments indebtedness capacity only highlights their formal, conventional indebtedness potential which is, in most cases, fundamentally different from the effective indebtedness capacity. The latter is actually the result of a particularized correlation for different local governments between legal indebtedness capacity and the manifestation of several factors with specific action. Among them stand local administrative capacity, financial market conditions, political, economic or social internal and international circumstances etc. In this regard, it is relevant the case of the city of Botosani which failed, in 2010, to issue bonds on the financial market, the subscriptions being below the minimum required limit. We propose in this context, to accept the need for a clear distinction between the legal and effective indebtedness capacity, accompanied by a permanent focus of public decision making processes on the latter. Only this way the correspondence with the real situation, essential for the appropriate development of local governments, could be achieved.

In these circumstances, setting a single limit, valid for all local governments, as happens in the Romanian system, appears in many cases counterproductive in relation to the reasons and rationality of the indebtedness. An example of good practice that could be considered a general benchmark for a future regulatory framework, could be that of Portugal, which practices legal borrowing limits annually personalized for each local government, thus valuing their real potential. No doubt, such an approach raises some difficulties when we consider more than 3000 administrative units and not 300 as in the case of Portugal, but we think that there are adequate decision-making structures at the central authority for public finances level, that could design and implement a such a strategy, especially considering that the informational systems facilitate these processes.

From this perspective, we believe it to be interesting, useful and necessary to develop through future scientific studies an independent concept of effective indebtedness capacity, based on justified and measurable indicators which could capture the different practical situations in which local governments could find themselves at different moments in time, research direction that we intend to follow.

Global economic conditions have pushed many countries into the delicate situation of contracting foreign loans, leading overnight at alarming volumes of public debt. The need for control and relevant analysis for the sustainability of a country's public debt has led us to use the Kalman filter in predicting future values of the key indicators of public debt. The development of a mathematical model of analysis for public services and the budget deficit was necessary to objectively assess the level of the public debt sustainability. Knowing future values of the public debt or the future evolutions of the revenues for the operational budget, offers the possibility of a better handling of the operational expenditures and finally a better balance for the public budget deficit. Using the mathematical mechanism of Kalman filters implemented in Matlab programming language, we generated the estimated future values of the proposed model proposed and key indicators, the results confirming the fears of a low public debt sustainability for Romania. We predicted the future values for the debt service, the public external debt and the operational public revenues, expenditures and deficit, and compared them, to obtain an image of the future evolution and position of the sustainability of the public debt. The work in this paper is an innovative one for the public science sector, and the results obtained are promising for future researches. The values estimated by the Kalman filter are an orientation for the future public policies, and indicate a rather stable but negative evolution for the public debt service. The sustainability of the public debt depends on the decisions taken for the correction of the estimated values, in changing the negative evolution of the budgetary indicators into a positive one. Taking all this into consideration we will conclude that the mathematical mechanism of the Kalman filters offers valuable informations for Government and future research should be oriented to develop it's returned results.

Keywords: Kalman filter, debt, sustainability, deficit, prediction.

I. Introduction

The financial crisis, transformed almost overnight into the global economic crisis, gave serious headaches to the central governments concerned with the reduction of the public budget deficits that the economic crisis has left behind. Although some economists (Nouriel Roubini(1)) have provided since before a housing price drop, a brutal shock of oil prices, a dramatic drop in the consumer's confidence, and inevitably a crisis, they were not taken into account. What was almost incomprehensible about the financial crisis proved to be a shocking reality shortly. A tough warning from the economists has become reality before long.

Many of those who saved, once the crisis began saw their dreams to gain access to education or to benefit from pension insurance shattered. With the financial crisis the global economy fell,

financial economics and central governments were faced with huge budget deficits that were threatening the national security of states.

The consequence of global economic crisis on the public budget was immediate. Business activities have suffered contractions and with this the budget revenues began to decrease dramatically. Consumers have abandoned durable goods, and reduced their consumption of utilities and remained at emergency levels of consumption goods for food and clothing. The times were almost apocalyptic for national economies, especially since governments have had to take a series of measures to delay public spending.

What did the central government to these financial hurricanes that have had to face?

Firstly., consider the case of Romania. Central Government faced a slump in income from the budget sought to adopt a strategy of rationalization of public expenditure in two ways. The first way was to reduce by 25 percent the salaries in the public sector. With all the strength that unions have expressed the measure was implemented and the effects are felt today in the public sector. Only 15% from the reduction of public sector wages that has been applied with the start of the crisis, were recovered. A second way, similar to the first, was also in rationalizing expenditure, so that the central government tried to approve the reduction with 15 percent of the pensions. But Romania's Constitutional Court rejected the government's decision and considered it as unconstitutional. So this measure has been replaced with a last resort one, the increase of VAT with 5 percent. It remains to be seen whether this measure has proved to be a rational from the perspective of increasing public government revenues or the measure will impact on the long term, the individual consumption of the population. Whatever the hedging strategies for covering the huge budget deficits that were triggered by the global economic crisis, government should identify the measures necessary to prevent insolvency for its own employees or even worse, to its financial creditors.

Moreover, as the mentioned measures were not sufficient, the government decided to contract a loan from the International Monetary Fund worth 20 billion euros, known at that time as Romania's belt. The declared purpose of the loan was to cover the budget deficit and to strengthen Romania's foreign reserve.

The reality is that the national economy was in need of strengthening its foreign exchange reserves to mitigate pressures on the exchange rate. So to avoid another financial risk that could embarrass macroeconomic conditions triggered by global economic crisis, namely the risk of uncontrolled growth of foreign exchange. It would inevitably affect the consumers whom could not exert influence on the growth of consumer's goods prices.

Threats of the huge budget deficits, the rising of the public debt (almost exponentially) and the uncontrolled increase in the exchange rate are just some of the unwanted consequences of the global economic crisis.

How have other states responded to these threats? Overall the recipe was pretty much the same. Streamlining personnel expenditures (reduction with 2-3 percent for Germany, Italy and France) followed by a sustaining of the capital expenditures are the steps that states followed not to be affected from the huge budget deficits. Moreover, the ultimate saving came from the International Monetary Fund, which conditioned the public loans to cover budget deficits, with the the implementation of fiscal policy measures that have often proved unpopular. It is also interesting the case of Hungary, which identified the public service monopolies and financial institutions (banks) as a source of additional revenue to the public budget. In this way, additional profits were taxed from the banks and from the state companies operating in monopoly markets, particularly the gas market and electricity market.

It is obvious that all central governments saw public borrowing as the easiest path to follow for avoiding the risk of default, or to avoid cash shortages which threatened more than ever the public institutions.

The explanation is simple: You can not stimulate economic growth in order to collect additional revenue to the public budget by supporting short-term measures. This requires a long-term fiscal and budgetary strategy, including support for public investment, leading ultimately to economic growth necessary to supplement revenue to the public budget.

But public debt and debt service raises serious problems resulting from its sustainability in the budget. A simple rule shows that debt sustainability should be supported from the outturn of the operational budget. This means that the current revenues of the budget, after covering the operational expenditures are to cover the public debt service. But the current public budget revenues depend on two variables namely the impact of fiscal policies that support the central government in general and economic growth recorded by the national economies.

Sound fiscal policies of automatic stabilizers include those that can stimulate economic growth so as to get that extra needed public income for the debt sustainability. Therefore the paper proposes to use an innovative tool for the science of public finance, the Kalman filters(2). They will support the public finance manager (authorizing officer) to acknowledge what will be the future trend for the recorded current income in future periods of time, because on this basis he can predict those situations with the risk of default that may threaten the public debt service. Furthermore, in order to exercise a prudent control over the risk of default(3), the financial manager can anticipate situations that will appeal to refinance public debt, caused by the effect of volatile evolution on the current revenue received from the budget.

II. State of knowledge for the use of Kalman filters in economics

R.E. Kalman published his famous work, in the early '60s, which describes a recursive solution to the discrete data linear filtering problem(4). Since then, largely due to advances in digital computing, Kalman filter has been the subject to extensive research and applications, especially in autonomous or assisted navigation. Among the first approaches to the filter idea, as an introduction to the general idea of Kalman filter, can be found in Chapter 1 of Peter Maybeck's - Stochastic Models, Estimation and Control(5), while a more complete introductory discussion can be found in Harold Sorenson's books(6). More extensive references are included in the work of Gelb(7), Grewal, Lewis Jacobs and Evensen(8).

Prior to presenting the state of knowledge, for the Kalman filters, it is necessary to analyze the work of Norbert Wiener(9). Wiener described an optimal response for a finite impulse (FIR) filter, meaning the average quadratic error. We will not discuss his solution here, even though there are many parts in common with Kalman filter. Just remember that his solution uses both auto correlation and cross correlation of the signal received with the original data to obtain a response in a filter impulse.

Kalman has also submitted a option for quadratic errors of the filter. However Kalman's version has some advantages over Wiener's study: avoids the need to determine the filter impulse response. Kalman described his procedure of filtration using state space techniques, which unlike Wiener's method, allows a filter to work as an adjustant, as a filter or as a predictor. The latter depending on the applicability of the filter, Kalman filter that is able to be used to predict future data proved to be a very useful feature. This has led to the Kalman filter to a wide range of tracking and navigation usage. Defining the filter in terms of state space methods also simplifies the implementation of the filter in discrete values, another reason for its widespread use.

The concept of debt sustainability has been discussed for at least two decades. Two general approaches have been followed, first considers that the interest rate at which a government can not borrow more than the rate of economic growth, so that the ratio of debt to GDP does not increase, and an unsustainable debt does not appear. Another approach considers that if there is a constraint on the present loan, which could limit the amounts borrowed, then it would be the main criterion for achieving sustainability. Gupta (1992)(10) in an exponential work, consider

these two approaches to Asian countries. In both approaches, it underlines and show the importance of two key issues: the selection of an appropriate interest rate and use taxes. A useful discussion on these aspects and positions of different authors is presented in his book (Gupta, 1992).

III. The arithmetic of the public debt and of the budget deficit

Public debt sustainability should be a major concern of central governments to avoid default risk and a deterioration of the country's credit rating may lead to unjustified price rises in the cost of procuring the necessary financial resources to support any state deficits budget.(11)

Any theory of public debt should be confined to a seemingly simple question but with major implications for the public budget: How to ensure sustainability of public debt?

To answer this question it is necessary to resort to science expertise in public finance. This implies that government revenue should be divided into two distinct categories, namely current income, respectively capital income. In turn, public spending must also be structured into two categories, namely current expenditure, respectively capital expenditure. It thus forming two major categories of budgets for public debt sustainability analysis, namely the operational budget, respectively capital budget.

The operating budget is supposed to sustain the current activity of the state to finance the operating costs of the public institutions whose financing comes from the public budget, while the capital budget expenditure may support the investments and public expenditures on interest and on loans. The two budgets, apparently unconnected, communicate via the operational budget balance.

In the current income category, are included according to the speciality theory, tax and non-tax revenues consisting primarily of taxes and/or revenues from concessions and rentals, while operating expenses category includes personnel costs and material expenses and services are necessary for the public institutions financed from public funds.

Denoting the category of the state's current revenue with (V_C) and current project expenditures with (Ch_C), results that the first condition of public debt is the result of budget implementation for the operational budget to record levels to be higher or at least equal to debt service (S_{DP}), according to the relationship:

$$V_C - Ch_C = S_{DP} \quad (1)$$

Taking into account the relationship (1) and the analytic form of the income and expenses above the current relationship can be rewritten as follows:

$$V_f + V_{nef} - (Ch_{pers} + Ch_{mat} + A_{chmat}) = S_{DP} \quad (2)$$

In the literature the difference between current revenues and current expenditures is known as gross operating results which may take the form of surplus / deficit. If from the gross operating result is deducted the debt service we achieve the net operating result .

Through the arithmetic describing the public debt sustainability can be easily deduced at least two particular cases obtained by comparing the specific sustainability of public debt to the gross operating result, namely:

Situation 1 $\frac{S_{DP}}{R_{bop}} \geq 1$ corresponding to a situation where debt is sustainable from the gross

operating result which implies that there isn't a risk of entry of default on debt service. However the situation is a bit risky if the value of the indicator is close to one, which can trigger a long-term warning for the central government, on the ability to repay the debt service.

Situation 2 $\frac{S_{DP}}{R_{bop}} < 1$ is corresponding to a situation in which the debt service is not sustainable

from the gross operating result which means that central governments should support the refinancing of public debt service, through borrowing money from the public, which often can be quite expensive because of the high cost of the financing sources, necessary to cover the debt service.

Whatever values the indicator may take is important to note that the literature is purely innovative. Although the service is calculated as the ratio between the debt service level (S_{DP}) and gross operating result (R_{bop}) known as the indicator of debt sustainability (I_{SDP}), is the "supplier" of information about public debt service related to financial capacity that the state has to support for the debt service on which committed.

It is interesting to consider in this context, central government policies that can promote to ensure the sustainability of public debt service. There are two categories in my view that government policies can promote.

The first type of fiscal policy-oriented to public debt sustainability refers to the policy of increasing the income fiscal tax base. That is why one of the indicators examined in this context is the ratio of debt service and gross domestic product (GDP) to identify the possible growth potential at national level but also additional public budget revenues. It should be noted that there is no alternative to increase tax rate for tax revenue but this kind of fiscal policy is rather difficult to implement because of the opposition that usually the taxpayers manifest.

The second type of fiscal policy also focused on the public debt sustainability refers to rationalizing public spending. This policy may be a rational only if applied on the operating costs of public institutions. Otherwise, the damage brought to capital expenditures may inhibit the incentive effect of the public debt needed for economic growth especially in times of economic crisis.

Also important is the correlation between the budget deficits and public debt, because any explanation that we try to give for public debt in terms of substantiating its necessity, it is based on the deficit recorded during the financial year.

Between two consecutive periods of time, the deficit is determined by the level of government spending (Ch_G), the level of public revenues collected on the budget (V_{BUG}) and the interest expense due to debt service set according to interest rate (i) and public debt (D_p) as a relationship form ($i \times D_t$).

Arithmetic equation describing the budget deficit will be given by:

$$D_t - D_{t-1} = Ch_G - V_{BUG} + i \times D_t \quad (3)$$

Analysis of this equation of evolution of the budget deficit without going into a detailed analysis that otherwise has been made in the literature, shows that every positive (ΔD_t) has to be covered by debt service, while negative values of this indicator can lead to identify the implications of budgetary surpluses already known to specialists in the field.

Regardless of the correlation that must exist between the budgetary deficit and public debt service is worth noting that for a manager of public financing resources, is important the knowledge of future evolutions, with a certain degree of certitude, for the operating income and the current expenditures. This is because it offers the possibility to anticipate future risks related to failure of payment of central government and can be taken to avoid such risk situations that may endanger the national security of states.

The response for all this information for the financial manager will be given by using an innovative tool in the science of public finances, namely Kalman filters.

IV. Kalman Filter mechanism

Kalman filter addresses the general problem of trying to estimate the $X \in R^n$ state for a discrete time process, described by the following linear stochastic equation:

$$x_{k+1} = F \times x_k + w_k; \quad (3)$$

where x_k a state vector of the process at the moment k , F is the transition matrix from the state k to the state $k+1$, and is supposed to be stationary for the whole period, and w_k is the white noise associated to the process the known covariance, Q .

The observation upon this variable can be modeled in the following form:

$$z_k = H \times x_k + v_k \quad (4)$$

where z_k is the measurement of x at the moment k ; H the connection between the state vector and the measurement vector, and is supposed to be stationary during the whole period, while v_k is considered to be a measurement error, a white noise, (12) with the known covariance, R .

The difference between the estimated state \hat{x}_k and x_k is also known as error

$$f(e_k) = f(x_k - \hat{x}_k) \quad (5).$$

Considering the error function that is strictly positive and monotonically increasing, we can write $f(e_k) = (x_k - \hat{x}_k)^2$. Since it is necessary to consider the filter's ability to forecast data series over long periods of time, we rewrite the loss function $E(f(e_k))$, from where it results the least square function: $e_t = E(e_k^2)$.

Consider that the two covariances for the errors are: $Q=E[w_k, w_k^T]$ and $R=E[v_k, v_k^T]$.

The least square function is $P_k=E[e_k, e_k^T]$, where P_k is the covariance matrix at the k moment. This equation can be extended to the following form:

$$P_k=E[(x_k - \hat{x}_k)(x_k - \hat{x}_k)^T]. \quad (6)$$

In demonstrating the Kalman filter equation, start by putting as objective finding an equation that uses an a posteriori state estimate \hat{x}_k with an a priori estimation \hat{x}_k' , and the difference between the measured value z_k and a prediction of the measure, $H\hat{x}_k'$,

$$\hat{x}_k = \hat{x}_k' + K_k(z_k - H\hat{x}_k'), \quad (7)$$

where K_k is considered the Kalman gain. This is a matrix that has the role to minimize the a posteriori covariance error.

$$\text{Note } i_k = z_k - H\hat{x}_k'. \quad (8)$$

By making replacements in the covariance matrix P_k , the derivation of the function by K_k , and the utilization of the matrix trace we obtain the following formula for K_k :

$$K_k = P_k' H^T (H P_k' H^T + R)^{-1}. \quad (9) \quad (13)$$

The covariance matrix for i_k prior denoted is $H P_k' H^T + R$.

The projection of the x_k variable, is $\hat{x}_{k+1}' = F \hat{x}_k$.

To complete the repetition is necessary to find an equation that projects the error covariance matrix in the next moment, $k + 1$. This is accomplished by writing an expression for the previous error: $e_{k+1}' = x_k - \hat{x}_k'$

$$\begin{aligned} &= (F x_k + w_k) - F \hat{x}_k' = \\ &= F e_k + w_k \quad (10) \end{aligned}$$

Using equation 4 and rewriting it for the moment of time k , we get:

$$P_k' = E[(F e_k + w_k)(F e_k + w_k)^T] \quad (11).$$

Given that between w_k and e_k , there is any correlation because w noise accumulates between moments k and $k + 1$, while the error is that by the time k . Therefore:

$$P_k' = E[e_{k+1}' e_{k+1}'^T] =$$

$$=E[F e_k (F e_k)^T] + E[w_k w_k^T] = F P_k F^T + Q \quad (12)$$

In essence the use of Kalman filter requires the use of two sets of equations:

For prediction

-The prediction of the future state

$$\hat{x}_{k+1} = F \times \hat{x}_k + w_k$$

-The prediction of the covariance error

$$P'_k = F P_k F^T + Q$$

For measurement or correction,

-The Kalman gain calculus

$$K_k = P'_k H^T (H P'_k H^T + R)^{-1}$$

-The update of the estimate on the extent of z_k

$$\hat{x}_k = \hat{x}'_k + K_k (z_k - H \hat{x}'_k)$$

-The update of the covariance error for the next step

$$P_k = (I - K_k H) P'_k. \quad (14)$$

V. Kalman filters use the debt sustainability analysis

In our analysis, we developed a Matlab (15) code for the program, code for mathematical equations proposed by Kalman filter, which, based on the analyzed data sets, generated estimates for periods of time so that we had real data sets comparison estimates, but also on future periods of time, for the purposes of prediction.

Following repeated simulations, needed to allocate the value of the transition matrix F, measurement matrix H, the two white noises, v and w, and their covariances, Q and R, the best simulations were obtained by assigning the following values :

$$F = \begin{bmatrix} 0 & 1 & 0 & dt & 0 & 0 \\ 0 & 0 & 1 & 0 & dt & 0 \\ 0 & 0 & 0 & 1 & 0 & dt \\ 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \end{bmatrix}; \text{ Where } dt=1. \quad H = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 \end{bmatrix}, \text{ and matrixes Q and R where identity}$$

matrixes of order 6 and 2. (16)

The key element in the ecuational system is the Kalman gain, which is the variable that stores the past evolution of the data series. This projected increase accuracy of the information as the number of variables taken into account in constructing the time series is more widespread.

In Fig. 1 is shown the evolution of Romania's foreign public debt service for a period of 74 months December 2004 - January 2011. Using the Kalman filter, we generated starting with the 40th month, predictions for the public debt service evolution, comparing the data obtained in parallel with the real values of the debt service recorded. One can see a aproximation for the projected Kalman filter values. The values are predicted for a single month, then renewed their series filter data used to generate the next prediction.

<p>● - The real recorded value for public debt</p> <p>● - The value predicted through the Kalman Filter</p>

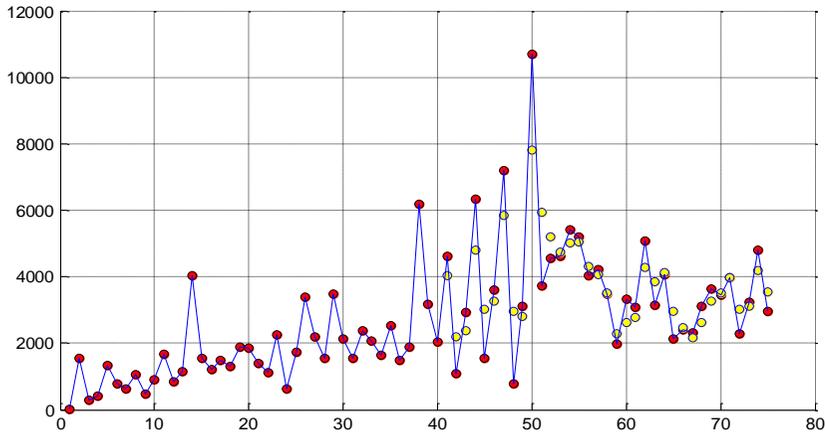

Fig 1. The evolution of the total external debt service and the prediction through the Kalman filters, comparison for the last 25 values of the data series; Monthly data series december 2004 – january 2011

Date source: bnro.ro, insse.ro

In order to achieve public debt sustainability at the national level is essential to have a number of indicators for the present and past values, so you can make accurate estimates of the future development. Thus, using Kalman filter, for the time series for Romania's foreign debt between January 2005 - January 2011, we generated future values for external debt over a period of 10 months. One can see that will continue the future upward development trend, but not with the same intensity.

In figure 3, one can observe the errors or deviations between the expected values generated and the actual values. You can also see the main feature of the use of Kalman filter, namely, the generation of more precise data on the growth of the data series used. Thus, the Kalman filter is not a simple prediction mechanism, it is a mathematical tool, generating an active process of updating the information in order to generate more reliable information.

However, in our research to assess the current and future sustainability of external debt, to have a clearer picture, we need to consider as we mentioned in the paper, the financial capacity of the budget to cover the public debt service.

Figures 4 and 5 show the evolution for the relevant indicators with a view to public debt sustainability analysis. A future perspective on the level of the revenue for the state budget, may provide an important advantage in view of future risk reduction, given by an unsustainable level of debt. Based on the Kalman filter used in fig. 4 can see a negative forecast for the developments in the next six months for the operational costs, while income level is only slight fluctuations over the prospect of the final level of expenditure growth.

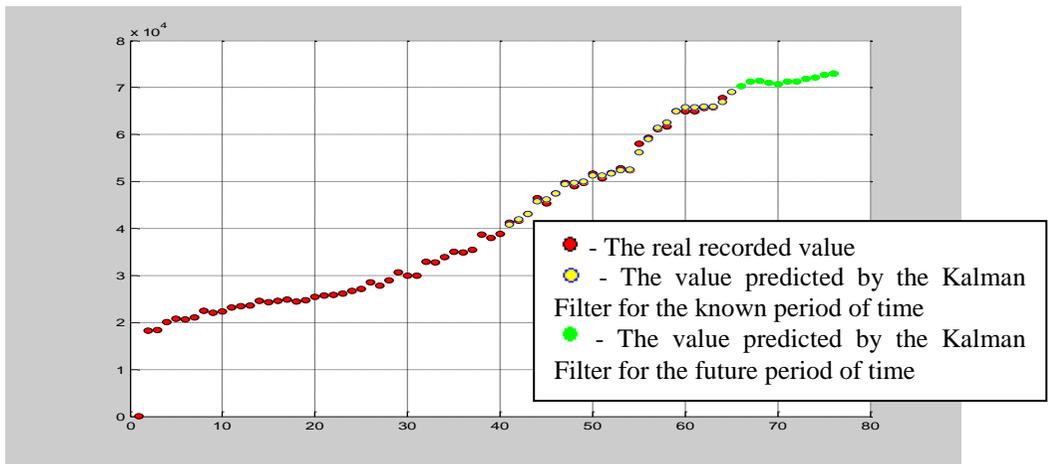

Fig 2. Evolutia datoriei externe, si previziunea prin filtrele Kalman Serii de date lunare ianuarie 2005 – ianuarie 2011 (mil. E)
 Sursa date: bnro.ro, insse.ro

As mentioned above, a level of debt service to be covered by a lower level of the primary deficit, or preferably, to a surplus. In Figure 5 we can see an upward trend in the gap between deficit and debt service. Beyond the 25th month, is found as the difference between the two indicators, create the base of a costly debt service. Expected future developments based on Kalman filters, also reveal a negative trend, especially in the penultimate month, when this difference tends to reach one of the highest levels.

VI. Conclusions, proposals and future research

Public debt sustainability is an issue of major concern for central and local governments in the European Union. Whatever indicators are analyzed to study the sustainability of public debt it remains as a fact that public funding of any government debt service can not be achieved only with a positive result of the implementation of the operational budget. The results of the operational budget should be sufficient to cover the debt service. Based on these assumptions we have developed a relevant indicator, that can provide factual information about public debt sustainability. This indicator was calculated as the ratio between debt service and operating budget outcome. Positive values indicate a debt sustainability while below par values indicate the contrary that may affect the public debt service, respectively the risk of default.

For any manager of financial resources is important to know information about the predictability of the operational income and operational expenditures. How predictable are they? Which are the future periods of time that may affect the sustainability of the public debt? It is a question which we attempted to answer through the application of the Kalman Filter.

It was found after the application of the Kalman Filter, that the operational income recorded a fairly stable evolution, while operational expenses for the period recorded a high enough fluctuation.

Debt service, during the projected period through the Kalman filters, also has a fairly stable level, continuing the late of trend. This means that debt service can be affected by the results of the operational budget deficits. That is why careful monitoring is necessary for the operational expenses of public institutions to reduce the default risk for the public debt service payment.

The advantages of using the Kalman Filter to predict, from classical methods, is given by the recursive mechanism, effective and accurate directly proportional to the series features the processed data.

Our future research directions in this area will move towards efficient fine tuning of the transition matrix and white noise used in the mathematical model. The study will also cover deepen regarding the progress of non-stationary series, where the results of Kalman Filters are known in the literature as being superior to other forecasting methods.

ANEXES

The paper aims to approach innovative financial instruments for the management of public resources. In the category of these innovative tools have been included polynomial spline functions used for budgetary sizing in the substantiating of fiscal and budgetary policies. In order to use polynomial spline functions there have been made a number of steps consisted in the establishment of nodes, the calculation of specific coefficients corresponding to the spline functions, development and determination of errors of approximation. Also in this paper was done extrapolation of series of property tax data using polynomial spline functions of order I. For spline implementation were taken two series of data, one referring to property tax as a resultative variable and the second one referring to building tax, resulting a correlation indicator $R=0,95$. Moreover the calculation of spline functions are easy to solve and due to small errors of approximation have a great power of predictability, much better than using ordinary least squares method.

In order to realise the research there have been used as methods of research several steps, namely observation, series of data construction and processing the data with spline functions. The data construction is a daily series gathered from the budget account, referring to building tax and property tax. The added value of this paper is given by the possibility of avoiding deficits by using spline functions as innovative instruments in the public finance, the original contribution is made by the average of splines resulted from the series of data.

The research results lead to conclusion that the polynomial spline functions are recommended to form the elaboration of fiscal and budgetary policies, due to relatively small errors obtained in the extrapolation of economic processes and phenomena.

Future research directions are taking in consideration to study the polynomial spline functions of second-order, third-order, Hermite spline and cubic splines of class $C2$.

Keywords: fiscal policy, budget deficits, spline functions, budget justification, debt crisis

I.Introduction

After about two years from the financial crisis debut, local governments from everywhere are preoccupied to ensure the financial resources needed to finance budget deficits and to ensure quality public services provided for the interests of beneficiaries.

The financial crisis has left deep scars in local communities. Financial pandemic has spread rapidly throughout the economic system. Budget revenues have fallen dramatically, budget deficits have become chronic and in front of these realities the local authorities had to identify solutions to avoid the financial collapse .

Often local authorities have had to turn to central government to finance budget deficits or to support throughout the budget transfers some categories of public services. The dependence of central government proved to be mostly harmful. This is because local authorities could not avoid political influence in their own public policies. In this way there was created a financial dependency on central government, which had had an impact on the quality of public services provided. The explanation for this financial dependence is not justified only by the economic crisis. There is another reason that explains this phenomenon resulting from the manner in which it was understood the financial autonomy of local governments written in the European Charter on Local Autonomy in Strasbourg. The common denominator of financial autonomy is that local governments have the property tax as a revenue source for their own budgets. But this proved to be insufficient compared to the funding needs on public services that local governments have to ensure. The solution identified to introduce a new type of tax in the configuration of financial resources available to local governments has proved to be a useful solution yet insufficient. It is about shared taxes which are included in own revenues of local governments in Romania, does not fully cover financing needs of their local communities. Therefore the needs for financing, most often over the financing capacity of local governments are the result of transferring competences, duties and responsibilities regarding public services. It is about public services such as preuniversity education, health and social protection, local police, evidence of the population and lately the public health services.

In this way budget transfers were maintained as a last minute solution for decentralized financing of public services which are useful but only turns local authorities into simple financial resources cashiers who runs the operations of receipts and payments. There has been tried budgetary balance solution by means of balancing allowances contained sharing of income tax (currently 22%) and also for balancing amounts allocated by the central government to local governments, but the criteria allocating these amounts are subject to dispute between the Ministry of Finance and local governments interested in obtaining an opportunity to exploit the maximum amount in the allocation on these financial resources.

Therefore the central government in the process of budget elaboration divides financial resources into two major categories namely: own revenues and transfers from the budget. Also own revenues include income tax on property taxes, income tax shared revenues from concessions and assets of local governments which are public property. Most of the times own income does not exceed 50% of the total revenues available to local governments, which confirms the theory that local governments are financially dependent on central governments and has a poor financial capacity which is relatively low compared to the funding needs that local governments generally have.

Budgetary transfers even though they are significant in amount, they have most cases fixed destination so that local governments operates receipts and payments transactions which runs between the central government and local governments.

There is a natural question and in the same time legitimate: are there interested local governments to ensure a prudent and efficient management of own financial resources? And the answer, especially in times of financial crisis, can only be yes.

But managing their own financial resources can not be ensured without a budget process governed by modern tools and techniques that allow the decision-makers (local governments) to measure the level of these financial resources, to identify new alternative tax bases and then through the mechanisms of public funds to ensure financing of public services.(1)

The key element in the budget process is the budget formulation stage. Either it is known that the planned financial resources is equal to the financial resources consumed. The simple rule of budgetary balance. What did the science of public finances so far? has provided series of structured budgeting methods into two categories namely: traditional methods and modern

methods budgeting. A brief recap of their category indicates which in classical methods included direct method of increase / decrease and modern methods which include zero base approach or rationalize expenditures budgeting method.

These methods(2) had the disadvantage that are relatively unpredictable because are based throughout the series of data from the previous period of time and do not take into account the various correlations that may occur between different variables within in portfolio of any local budget revenues . Moreover, in the process of budget forecasting for time periods of three or five years, these methods have proved to be highly unnecessary as there had long-term low predictive power.(3)

The major disadvantages have been the motivation of developing this work, which was necessary to identify other ways to approach the predictions in the planning of budgetary resources to prove his worth. For this was an innovative area was identified in the science of public finances namely the use of spline functions.

II. What are spline functions and how they can be applied in the substantiating of fiscal and budgetary policies of local governments?

II.1. Brief history of spline functions. State of knowledge in the field of spline functions.

The notion "spline" comes from ancient times, from a mechanical device used by draftsmen in draw smooth curves. The term spline function in mathematics was first used by Schoenberg in 1946.(4)

In 1946, mathematicians began to study the shape of splines and derivatives of polynomial formula known as the term spline curve or the term spline function.(5)

This has led to widespread use such computer aided design functions, particularly in the areas vehicle designs. IJ Schoenberg had given the name of spline function after its resemblance to the mechanical used by draftsmen.

The word "spline" comes from term used by shipbuilders, referring to pieces of thin wood. In the past 40 years, functions have become very popular in computer graphics, computer animation and computer aided design field. It is difficult to find any industrial product, no spline substance . Also, they are widely used in studies of mathematics such as interpolation approximation. Spline gives another way to represent the class of functions. For decades, mathematicians had used for the polynomial calculus. In the early 20th century, with advances in approximation theory, spline functions had started to appear. The basic idea is simple. In essence, they consist of portions of polynomials with local support.

In the late 1950, two French mathematicians, Pierre Bézier from Renault and Casteljau Paul from Citroen, had independently developed spline-based computer aided design systems for cars.(6)

In last decades a very important place in the scientific field is taken by spline functions, which its crowd forms a linear space. They present the major advantage to be easy programable leading to final numerical solutions. Also it important the fact that polinomyal spline functions have the property to minimize a seminorma of spline interpolation function odd degree, the using Hilbert space techniques can be defined as a unique spline element solution of a variational problem. This allows to obtain important properties of all multitude linear spline functions such as spline functions of polynomial, trigonometric, exponential, L-spline functions, etc. Chebyshev type. One can thus study the convergence of spline interpolation functions to the function which interpolates in usual rules Chebyshev and L2, and the order of convergence.(7)

Spline functions are characterized by their shapes subintervals between two nodes (which can be various known functions) and certain conditions for connecting the nodes.

Spline functions in recent years had found wide application, the main purpose being the interpolation. For spline interpolation was not deducted an expression of the error of

approximation, a straightforward manner, as polynomial interpolation. It was retained only the statement that continuous function can be approximated as well all the interval $[x_1, x_N]$ when the number divisions increases, ie, spline interpolation is always convergent.. Because the derivative of order m , $s^{(m)}$, of a polinomial spline function is a step function (constant on intervals) while step function as well approximates continuous function splines on the interval when the number of divisions increases, we may give error assessment based on the maximum deviation between the derivatives $f^{(m)}(x)$ and $S^{(m)}(x)$ suppose that $f^{(m)}(x)$ exists and is continuos.(8)

Spline functions are used mostly in the industrial world. There are very few areas of production and engineering where these interesting functions are not used, and their use continues to grow at a rapid pace.

Robin Forrest describes "lofting", as a tehnique used in airplane industry during the World War II to build splines from thin wood for airplanes. Later the „lofting conic” was discovered, wich replaced so called splines in the early 1960 due to JC Ferguson`s work at Boeing.

At Boeing, these functions are used not only to represent geometrical models, for shape and curve modelling but also at the engineering analysis.(9)

Engineering analysis and simulation is very important especially for a big engineering company such as Boeing. The examples are various, from sophisticated simulations for fluid dynamic calculation to simple codes of linear analysis wich uses simple physics models. Some codes are used to calibrate the calculations, while others use B-spline, wich forms a base for any kind of space given by the spline function as finite elements. In the finite element case, engineering codes creates spline approximation to de ordinary diferential equations, equations with partial derivatives, integral equations and algebrical, beeing a popular approach done by Boor and Swarts in 1973.(10)

II.2.Spline functions algorithm

To clarify the spline functions algorithm we start from several features considered as work hypotheses to explain this rational mechanism with the possibility of applying in economic sciences, namely:

a) we consider a series of data with the values $(x_1, x_2, \dots, x_{n-1}, x_n)$ wich are in the same time a division $\Delta \cdot a = x_1 < x_2 < \dots < x_{n-1} < x_n = b$ of the interval $[a, b]$;

b) the space of spline function is considered as:

$$S_m^k(\Delta) = \left\{ s, s \in C^k[a, b], s|_{[x_i, x_{i+1}]} \in P_m, i = 1, 2, \dots, n-1 \right\} \text{ with } m \geq 0, k \in N \cup \{-1\}$$

where m represents the spline degree and k the smoothness class of spline function`s space .

If $k = m$ then function $s \in S_m^m(\Delta)$ are polynomials.

For $m = 1$ and $k = 0$ we obtain linear splines.

The division points of the interval $[a, b]$ are called nods, and in each nod we know the value of the function $f(x_i)$ form $y_i = f(x_i)$;

If we note $s(x_i)$ the spline function with wich approximate the function $f(x_i)$ on the interval $[a, b]$ then we have to identify the form of the function $s(x_i) = f(x_i)$ wich take values $(x_1, x_2, \dots, x_{n-1}, x_n)$.

In the interpolation approximation we suppose that (x_i, y_i) are known. If due to various reasons the nods are affected by errors then the interpolation criterion is inadequate.(11)

With other words spline function $s(x_i)$ approximate the function $f(x_i)$ on the $[x_i, x_{i-1}]$ interval with the following conditions:

1. the restrictions of spline functions on the subintervals $[x_i, x_{i-1}]$ are polynomial of m degree, $s|_{[x_i, x_{i-1}]} = p_{m,i}$

2. $s(x_i)$ is derivable (m-1) times on the interval $[a, b]$;

3. When connecting the nods, each nod is conditioned by:

$$p_{m,i}^{(k)}(xi + 1) = p_{m,i+1}^{(k)}(xi + 1), k = 0, 1, \dots, m - 1, (1)$$

wich means that on the x_{i+1} frontier between the two subintervals, the polynomial from left side of $p_{m,i}$ and its first m-1 derivatives must have the same values with the polynomial from the right side of, $p_{m,i+1}$. Outside the interval [a,b] the function $s(x_i)$ it can extend throughout polynomial of degree $\leq m$. (12)

The three cumulative conditions defines the spline function $s : [a, b] \rightarrow R$ wich is known in the scientific literature as polynomial spline function of m degree. (13)

In these conditions the polynomial spline functions can substantial contribute in the economic field in interpolating problems but also in approximation of functions wich describes the economic processes and phenomena with direct influence in economic variables predictibility and identifying the financial risk helping the managers to administrate the resources in the public sector. (14)

In the scientific literature there are three categories of polynomial spline functions known, 1st degree, 2nd degree and 3rd degree.

The **polynomial spline functions of first degree** have the following expression.

$$S(x) = S_i(x) = s_{i,0} + s_{i,1}(x - x_i), x \in [x_{i-1}, x_i] \quad (2)$$

with the coefficients $s_{i,k}$ wich are determined throughout the condition:

$$S(x_i) = y_i, i = \overline{0, n}; \quad (3) \text{ și } S_i(x_i) = S_{i+1}(x_{i+1}), i = \overline{1, n-2}; \quad (4)$$

The spline functions of first degree, also applied in this paper approximate with remarcable results, series of data with linear distribution and increasing evolution.

The coefficients of polynomial functions are determined from the two specific conditions of spline functions namely that value of the spline function in nods is equal with the value of the function $y_i = f(x_i)$ and from the continuity condition of spline function in each ond of the $[x_i, x_{i-1}]$ interval;

The **second degree polynomial spline** function use also in problems of interpolation and approximation have the expression:

$$S(x) = S_i(x) = s_{i,0} + s_{i,1}(x - x_i) + s_{i,2}(x - x_i)^2, x \in [x_{i-1}, x_i] \quad (5)$$

with the coefficients determined from the conditions:

$$S(x_i) = y_i, i = \overline{0, n};$$

$$S_i(x_i) = S_{i+1}(x_i), i = \overline{1, n-1}; \quad (6)$$

$$S_i'(x_i) = S_{i+1}'(x_i), i = \overline{1, n-1}; \quad (7); \quad S_0'(x_0) = 0; \quad (8) \quad (15)$$

The polynomial functions of second degree is introducing two suplimentary conditions in order to find the coefficients namely, the condition for the first derivatives in the continuity points of

spline functions and the local extremum condition for one of the extremities of second degree spline which usually is chosen in x_0 .

The **polynomial spline function of third order** has the expression:

$$S(x) = S(x_i) = s_{i,0} + s_{i,1}(x - x_i) + s_{i,2}(x - x_i)^2 + s_{i,3}(x - x_i)^3, x \in [x_i, x_{i+1}] \quad (9)$$

with the following conditions needed to determine the coefficients:

$$S(x_i) = y_i, i = \overline{0, n};$$

$$S_i(x_i) = S_{i+1}(x_i), i = \overline{1, n-1};$$

$$S_i'(x_i) = S_{i+1}'(x_i), i = \overline{1, n-1};$$

$$S_i''(x_i) = S_{i+1}''(x_i), i = \overline{1, n-1}; \quad (10)$$

$$S_i''(x_0) = S_{n-1}''(x_{n-1}) = 0; \text{ or } S_1'(x_0) = y_0', S_{n-1}'(x_{n-1}) = y_{n-1}'$$

Spline functions of third-order polynomial best fit the functions whose graphical representation is sine wave.

Additional conditions also refers to local conditions for two extreme ends of the second degree polynomial spline function.

The specialized literature has established and developed series of Spline functions along with the polynomial, as outlined above, with different applications especially in technical sciences. In the category of spline functions used for interpolation we know the cubic splines, the spline functions with Hermite interpolation on intervals, cubic splines of class C^2 etc. (16)

II.3. Spline functions mechanism in the public finance

The mechanism resumes to present the algorithm of application of polynomial spline functions in public finance. This mechanism was applied on series of data at a local budget level, in comparison with other techniques studied in the econometric field such as linear regression.

These steps are presented below for the polynomial spline function of first order.

Step I: Establishing the nodes $x_i; i = \overline{1, n}$; Usually the nodes are established randomly, equidistant, for every determined interval $[x_i; x_{i+1}]$ spline functions to achieve accurate approximation;

Step II: For each interval $[x_i; x_{i+1}]$ we establish the form of the spline function $S_i(x_i)$ using the expressions described above for the polynomial spline functions of first order;

Step III: Determination of coefficients $s_{i,k}$ from the spline function conditions, to take value in the delimited nodes in Step 1 and from the continuity conditions on the interval $[x_i; x_{i+1}]$;

Step IV: Establishing the form of the spline functions from regarding the coefficients determined for each interval and verifying the error of approximation using the relation:

$$e_x = f(x_i) - f(s_i) \quad (16)$$

Step V: Establishing the spline function used for prediction by calculating the average of the spline functions for each interval $[x_i; x_{i+1}]$ which they can estimate the values of function $f(x_i) = y_i$ when x_i is known for the future period.

Table no.1 – The algorithm of applying spline functions for series of data registered in economic process and phenomena analysis

The steps mentioned above are not limitative. They describe first-order polynomial spline functions adapted to the needs of economic researchers to estimate and study the predictability of economic phenomena and processes.

II.4. Using possibilities of polynomial spline functions of first-order in tax policies substantiation of local authorities

Nowadays tax and budgetary policies are very important for local governments which are aware of the importance of financial resources.

Budget deficits, public loans, public services, all of them are depending on tax policies. Unfortunately the tax policy is based almost entirely on the property tax which proved to be insufficient to satisfy the public needs of local communities. Although apparently were part of fiscal policies, shared taxes, are not in direct "coordination" of local authorities. This is because the shared taxes are collected by the central authorities after which the shares are allocated to local communities.

Based on these considerations we tried to realise a group of fiscal policies based on their role in stimulating the economic development. These attempts led to dividing the fiscal policies into the following category, namely:

Agressive fiscal policies: which are characterized by the fact that the tax rate and tax base are established at extreme values, imposed by law so they don't have a stimulative effect for the business environment neither to economic development.

Stimulative fiscal policies: are policies which are characterized by the fact that the tax rate and tax base plays a great role in the business environment stimulation. In this sense the local authorities provides tax incentives depending on the investment values and number of jobs created in order to stimulate the investments in the region.

Neutral fiscal policies: are those policies which have on their base the property tax but having values that doesn't change the taxpayer's behaviour.

Also budgetary policies includes the expenditure policy administration which are based on cutting the operational expenditures or based on supporting the long-term investments which leads to the local economic development.

Regardless of the theory of fiscal policy budget how spline functions are used in the substantiation of the fiscal policy? The answer is not simple. It can be formulated on two different directions, namely: by using the $r_i \times B_i$ method or predicting the budgetary revenues collected on the entire budget.

The first way, which is used at substantiation of property tax revenue it has to be known the base for a period of time, minimum one year in order to establish the future collected tax.

Polynomial spline functions of first-order will have the expression:

$$S(B_i) = s_{1,0} + s_{1,1}(B_i - B_{ii}), B_i \in [B_i, B_{i+1}]$$
 with the conditions imposed for the coefficients ($s_{i,k}$) of spline functions regarding the equality of the values in nodes and the continuity condition through nodes $S_i(B_{ii}) = S_{i+1}(B_{ii})$. (17)

This way of using spline functions determines the substantiation of fiscal policies depending on tax base. That is way local authorities have to identify a benchmark for the collected revenues from the property tax, and have to identify ways to increase the tax base at the a certain level proposed to realise.

The second direction, within fiscal policy of local authorities aims to predict the collected taxes from property when there is registered certain values of building tax. In this way using a polynomial spline function of first-order allows to establish certain property tax when building tax projection is known.

Regardless of the way spline functions are used, they permit approximating the evolution of tax property or other categories of revenues with a greater accuracy than other means known in the economic field (ie. econometry).

III. The research results obtained by applying functions in the substantiation of fiscal-budgetary policies

III.1. Research methodology

In order to realise the research there have been used as methods of research several steps, namely observation, series of data construction and processing the data with spline functions. The data construction is a daily series gathered from the budget execution, referring to building tax and property tax, and in the end the process of data was made according to the methodology described at 2.3.

III.2. Research results obtained through series of data processing using polynomial spline functions of first-order

To study the use of spline functions were considered two types sets of data from the budget execution for the year 2009 of Oradea Municipality (due to its easy acces at the database), respectively the **property tax** and **building tax indicators** registered in **February** 2009 and verified the appliance of spline functions in order to size the revenues for next month (**March**). The reason why past series were chosen is to verify the accuracy of using spline functions in extrapolations facing them with the real data registred in March 2009 for property tax.

From the given series of February were determined the polynomial spline functions of first-order wich is relevant for the evolution of tax property depending on building tax.

There were identified four nod, established at a range of seven days and were determined four polynomial spline functions of first-order for each week of February. Each spline is related to a week, taking equidistant range between the nod. Also were established the function wich describes the series through the **ordinary least squares (OLS)** method in order to compare the results of research using the extrapolation for OLS and for polynomial spline function of first-order.

In order to verify the accuracy of extrapolation using spline functions were considered three cases to reflect de difference between the function determined with OLS and polynomial spline functions of first-order.

Case I

Last spline function on February has been considered $S_4(x_i)$.

$$Y = 1.29872X + 123675$$

Case II

We consider the average of four spline functions resulted for each week

$$Y = 1,316065X + 10685$$

Case III

The function resulted from linear regression has been determined (Ordinary Least Square method)

$$Y = 1,28617X + 154722$$

In order to underline the efficiency of these 3 methods, throughout Gretl software, we have compared the extrapolated values for the property tax with the real values of property tax for March.

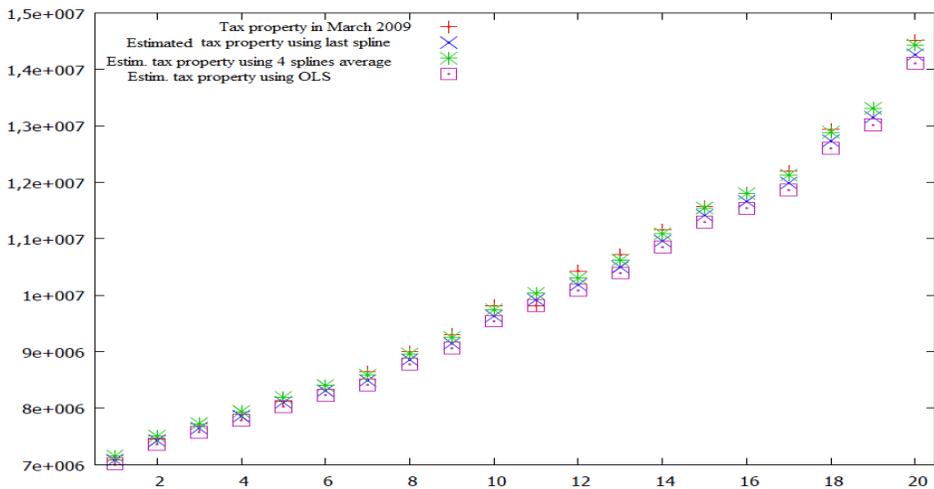

Fig.no.1 Comparison between the expected values fo March 2009 and real values,
 Source: Budgetary Account Oradea 2009

We can notice that approximating the revenues from property tax depending on building tax for March 2009 was realised with the greatest accuracy by the average of 4 spline functions resulted from the February 2009 series.

Also the function resulted using OLS method proved to be less efficient to describe the trend for the next period of time.

To underline the efficiency of these three methods were calculated the errors.

$$\varepsilon Y = Y - \hat{Y}, (11)$$

where: Y – real property tax, ε – error, \hat{Y} - estimated property tax;

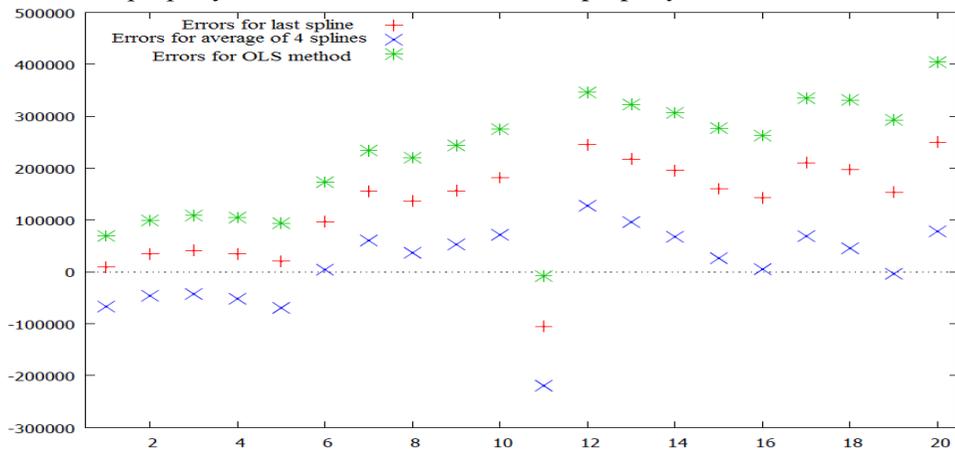

Fig.no.2 Resulted errors from extrapolation
 Source: Budgetary Account Oradea 2009

We can notice from Fig.2 that the smallest errors are given by the average of 4 splines method, the evolution of errors being close to zero. Also for the first week from March the better extrapolation is done by the last spline resulted from the last week of February, though the average of four splines proves to be the most accurate method.

The linear regression using OLS proves to be less efficient, the errors achieving high values. In order to underline the utility of spline functions we have built 2 series of data. By using MATLAB programming language we have generated the function which approximate the

distribution of variables fixing equidistant nodes and points of interpolation in the nodes for a better approximation.

We observe in Fig.no.3 the fact that spline functions is approximating the most efficient way in comparison with the regular polynomials. The polynomial of 6th order is decently approximating but in the end spline function is most accurate. The secret of splines is using polynomials of 3rd order on the intervals (2000-2500,2500-3000, ... , 4500-5000) known as cubic splines.

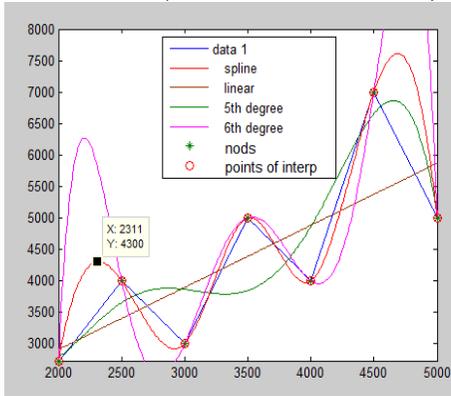

Fig.no.3 Comparison between spline functions and regular polynomials Source: author

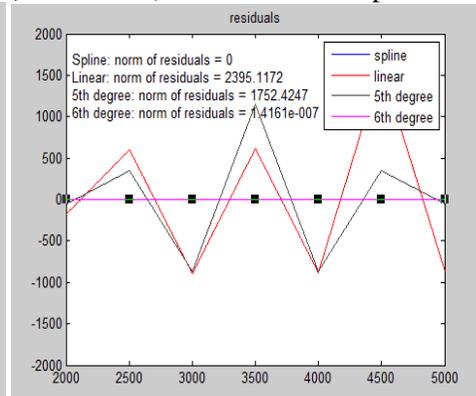

Fig.no.4 Error comparison between splines and regular polynomials Source: author

Also in the fig.4 we can observe the residuals being insignificant for the 6th order polynomial and even zero for spline functions.

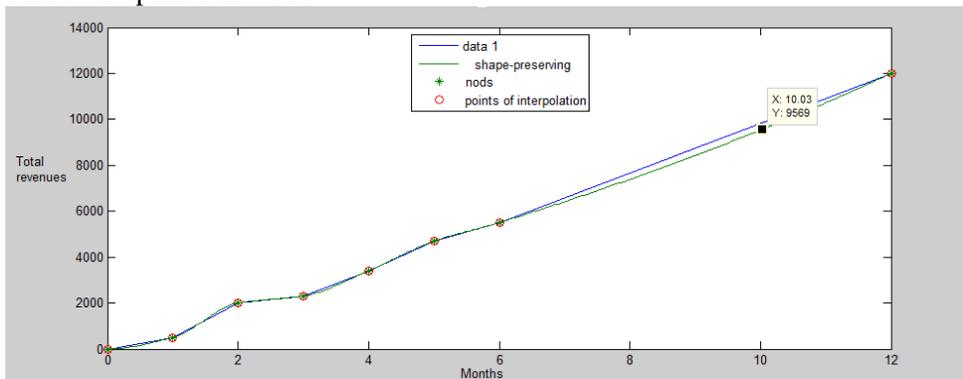

Fig.5 Monitoring the budget execution Source: author

As well, monitoring and controlling the budget execution can be made using polynomial spline functions by fixing a node at the end of a year. We know the values of revenues collected in the first 6 months and we can compare the revenues in month 10 with the collected revenues in order to see the difference between the estimated with the collected revenues. This method helps the public manager to size the expenditures for the next period in order to avoid budget deficits.

IV Conclusions

As a result of simulations made on real and theoretical data the opportunity of using polynomial spline functions as innovative instruments in sizing financial resources as well in other economic fields.

The accuracy of results obtained in the process of budget sizing, due to small errors of approximation, recommends spline functions as modern instruments in sizing the resources of budget.

Therefore, spline functions can be used for public **revenues predictability**, for finding the **trend of expenditures** in accordance to the **Case II** presented earlier also **tracking deviations recorded in the budgetary execution** of the planned budget. The two approaches of using spline functions increase the efficiency of public management. Using spline functions can result in avoiding incontrollable budget deficits and treasury deficits wich have an impact on taxpayers who will support the cost of public loans.

Using splines in the process of budget elaboration may lead the managers to be more aware of budget deficits and can take decisions according to the situation.

Regarding the tax policies of local authorities, by using splines can be established the tax policy wich has to be adopted when are establishing the revenues from property tax.

The polynomial spline functions has the advantage of easy calculation, free of specific complex tests used in linear regression.

INCREASE IN THE ROLE OF THE FINANCIAL SYNTHESIS REPORTS FOR ACCESSION OF THE EUROPEAN STRUCTURAL FUNDS

Chirilă Emil

University of Oradea, Faculty of Economics

Droj Laurențiu

University of Oradea, Faculty of Economics

European integration is supported through important financial resources in order to sustain the investment effort for aligning the business infrastructure and increase in the business competitiveness in order to fulfill the European Union standards.

The financial management, a basic component of the general management, has as scope to realize complex financial analysis in order to substantiate the decisions for investments and financing which should ensure the maximization of results, ensuring also the elaboration of the project budget as an essential document in the identification of the needs for resources and for obtaining the non-reimbursable financial sources.

An essential role in the investment decision making, having as support European funding, is realized by the financial-accounting reporting documents such as balance sheet, profit and loss account, table of the treasury flows, which together with a realistic established actualization rate ensures the relevance and efficiency of the financial indicators: Net present Value(NPV), Internal Rate of Return(IRR), the investment recovery period, the benefit/cost ratio.

This study has as its goal to realize a critical analysis over the main simulation methods and techniques for forecasting annual return based on its growth rate, which should ensure the success of the implementation and operation of an investment realized through European structural funds respecting also the requirements for minimization of risks. In this research it is shown the importance of proper generation/modeling of the annual turnover in an investment project. Several methods were presented and case study was realized. Since the annual turnover constitutes the basis for the entire financial analysis it is very important that a realistic growth rate is used. Otherwise the provisions within the financial analysis of the investment (including CBA), the project implementation strategy and later the plan for the utilization of the newly realized investment might prove difficult to be fulfilled.

Key words: Structural funds, Financial Statements, Annual Turnover, Annual Growth rate

JEL Codes: G30, O16, G34, G38

Introduction

European integration is supported through important financial resources in order to sustain the investment effort for aligning the business infrastructure and increase in the business competitiveness in order to fulfill the European Union standards (European Commission, 2009).

The financial management, a basic component of the general management, has as scope to realize complex financial analysis in order to substantiate the decisions for investments and financing which should ensure the maximization of results, ensuring also the elaboration of the project budget as an essential document in the identification of the needs for resources and for obtaining the non-reimbursable financial sources.

An essential role in the investment decision making (European Commission, 2008) having as support European funding, is realized by the financial-accounting reporting documents such as balance sheet, profit and loss account, table of the treasury flows, which together with a realistic established actualization rate ensures the relevance and efficiency of the financial indicators(Droj

L., 2010): Net Present Value(NPV), Internal Rate of Return(IRR), the investment recovery period, the benefit/cost ratio.

This study has as its goal to realize a critical analysis over the modeling of the annual turnover an essential element in the financial analysis over an investment realized through European structural funds respecting also the requirements for minimization of risks.

The fundamental element of the financial modeling for an investment project is the accurate estimation of the annual turnover. The factors which should be taken into consideration for estimation of the volume of sales are:

- a) The tendency which is registered in the evolution of sales for the last period (the trend analysis). Extrapolation of the past tendency is a method which is often used, but not always in a realistic way, and in this way the modeling and prevision based on a global annual turnover, determined only by the past evolution can be erroneous, being necessary also a thorough analysis
- b) the discomposure of the annual turnover on product categories or services and analysis of the evolution of sales on each category.
- c) The analysis of the global level of the market of products and services, making estimations over the market share, which is depending also by the production capacity of the company, quality of products, the applied price strategy, competition, opportunity of external financing(credit), promotion campaigns.
- d) Dimensioning of the annual turnover at the level of the sustainable growth rate, will generate an insufficiency of funds, and the company will use external financing through loans, thus changing the degree of indebtedness, which will lead to higher costs related interest.

Generation of the Annual turnover - Literature Review and Research methodology

The existing theory (Dragotă, V., Ciobanu, A., L., Dragotă, M, 2003 and Higgins, Robert C., 1995) and financial practice is recommending the following methods for prevision of the annual turnover:

(A) Usage of the historic data

Assuming that there is a connection between the growth rates of turnover a company registered in the past and their future development, aggregation methods involve several alternatives:

(a) Using the average growth rate, projected growth rate of turnover is the average (simple or weighted arithmetic) growth rates recorded in the past. Simple arithmetic mean is:

$$\bar{g} = \frac{\sum_{t=1}^T \text{growth.rate}_t}{\text{no. periods}} = \frac{\sum_{t=1}^T (CA_t - CA_{t-1})/CA_{t-1}}{T}$$

Disadvantage of this method is that all periods analyzed are given the same importance. This drawback is eliminated by using the weighted average, which gives higher rates closer to the time periods forecast. Weighted arithmetic mean is:

$$\bar{g} = \frac{\sum_{t=1}^T \text{growth.rate}_t \times t}{\sum_{t=1}^T t} = \frac{\sum_{t=1}^T ((CA_t - CA_{t-1})/CA_{t-1}) \times t}{\sum_{t=1}^T t}$$

Depending on the average (simple or weighted arithmetic) growth in turnover, you can determine the projected turnover for next period:

$$CA_{prev(T+1)} = CA_T (1 + \bar{g})$$

Outlook depends on the length used as a source of information for extrapolating the average growth rate of turnover.

(b) Using the growth rate estimated by linear regression, assuming that the rate of growth recorded over time, based on a trend, so that the future growth rate is determined by the trend foreseen; regression is between turnover and the time using the method of least squares.

$$CA_t = \alpha + \beta \cdot t + \varepsilon_t,$$

where $t=1,2,\dots,T$;

α = amount of annual turnover when 0;

$\beta=\partial CA/\partial t$ represents the absolute change in annual turnover in a certain period of time;

ε =error (deviation) CAreal (CA_t) over the estimated Annual turnover(CA) estimated through by the β and free term α ($\alpha+\beta t$), respectively

$$\varepsilon_t = CA_t - (\alpha + \beta t)$$

Parameters α si β of the regression is determined based on data recorded from 1-T, so that errors be as small. By estimating the regression coefficients it can be determined the estimated turnover for the next period:

$$CA_{T+1} = \alpha + \beta(T + 1)$$

The deficiency of the linear model is given by the fact that the model, although it specifies an increase in the monetary units (ΔCA) is not appropriate for forecasting future growth.

$$\Delta CA / CA_{t-1}$$

Using historical data to estimate future growth in annual turnover is a useful but is not presents sufficient information. The empirical analysis demonstrates that it is unlikely that firms that have registered faster growth in certain periods are able to continue the same pace in future periods.

The relevance of the past data for forecasting future data depends on the establishment of the company and the business environment in which it acts; stability is influenced by the following factors:

-the volatility of growth rates is represented by change (dispersion) of growth rates compared to average growth rate calculated for a given sample size T (the records are from the period $t = 1$ at $t = T$)

$$\sigma_g^2 = \frac{\sum_{t=1}^T (g_t - \bar{g})^2}{T-1}$$

where : σ_g^2 = growth rate variation of CA

g_t = growth rate of the CA in the year t

\bar{g} = average growth rate registered in the period 1, T

-Firm size-measured in percentages- with increasing firm size becomes more difficult to maintain higher growth rates.

- Economic cycle - if the company's activity is influenced by economic change is essential when choosing data analysis - if there is a period of economic census, one can expect "increase" negative, so the forecast is irrelevant.

- Structural changes - the growth rates recorded are the result of the policy mix adopted by the company: investment policy and dividend policy. In case that the company changes one of these policies, the information by that time become irrelevant for predicting future developments.

(B) Using the sustainable growth rate

The rate of increase in turnover can be calculated:

$$g_t = \frac{CA_t - CA_{t-1}}{CA_{t-1}}$$

Increased turnover involves increasing proportion of the asset that corresponds to an increase equal to the liability. The concept of sustainable growth rate refers to the rate of increase in turnover to generate the maximum possible without financial imbalance, taking into account the following assumptions:

-The firm is unwilling to seek issuance of new equity shares; increasing profit is achieved by incorporating

$$\Delta CPR = \text{Reinvested Profit} = \text{Net Profit} - \text{Dividends}$$

- The company seeks to maintain the current capital structure (ratio of debt / equity = L = constant), increasing debt cannot be achieved only by increasing the proportion of equity

$$\frac{\text{Financial.Debits}}{\text{Equity}} = \frac{\text{Financial.Debits} + \text{New.loans}}{\text{Equity} + \text{Re invested Profit}}$$

-The firm seeks to maintain current dividend policy (dividend distribution rate = d = constant), the undistributed profits (left to the investment within the company) is (1-d), sustainable growth rate will be:

$$\begin{aligned} g_t^* &= \frac{\Delta ACTIV}{ACTIV_{t-1}} = \frac{\Delta Equity + \Delta Debits}{\Delta Equity_{t-1} + \Delta Debits_{t-1}} = \frac{\Delta Equity(1+L)}{Equity_{t-1}(1+L)} = \\ &= \frac{\Delta Equity}{Equity_{t-1}} = \frac{\text{Reinvested.Pr ofit}}{Equity_{t-1}} = (1-d) \frac{\text{Netprofit}}{Equity_{t-1}} = (1-d) R_{fin}^{13} \end{aligned}$$

There are three possible situations:

-the actual growth rate of annual turnover is higher than the sustainable growth rate - this can not be achieved only by relaxing one of the hypotheses: either resort to attract additional resources by issuing shares or debt increase or decrease rate of dividends, this strategy is not recommended to be used for a long term as it leads to excessive debt or shareholder discontent;

- actual growth rate is lower than the annual turnover rate with sustainable growth - the company does not use all available resources, so that opportunity costs are incurred;

- the actual growth rate of turnover is equal to the rate of sustainable growth – optimal option, so it can be use to forecast turnover rate with a sustainable growth:

$$g^* = \frac{CA_{prev} - CA_{actual}}{CA} \quad CA_{prev} = CA_{actual}(1 + g^*)$$

Investment decisions are an important part of the financial planning process, opportunities for capital expenditure, even they may seem financially attractive, can be rejected if would not lead to achievement of the proposed targets. Proper perspective on investment analysis is that strategic plans should create an umbrella to achieve operational and capital budgeting.

Growth and its management presents specific problems in financial planning, many executives saw growth as something to be maximized based on an increase in market share and profits. From a financial perspective, growth is not always a blessing, can substantially affect the company's resources and if are not taken adequate measures to control it, could lead to bankruptcy. It is regrettable that companies which pass the market test with their products, are failing because they lack sources of funding for management growth. Size of the growth rate can be analyzed by defining a sustained growth rate and by indicating a maximal rate of increasing company's sales without affecting the financial resources.

Management should analyze all the options when the target growth rate exceeds the rate of sustained development and increases falling below the level of support, ignoring the financial limit growth to preserve power.

Case study – Evaluation of the residual value and of its influences over the IRR in case of a Romanian production company

Financial analysis as component of the financing plan is intended to fundament the performance and sustainability of the proposed investment, the financial support, long-term sustainability, financial performance indicators in order to justify the financial assistance(Droj, 2010). Approval and implementation of investment with financial assistance from European structural funds needs the elaboration of different investment alternatives(European Commission, 2008) for a period of 5 years plus the period of implementation as follows:

- Inertial scenario – which forecasts with no investment option based on the present work
- Scenario with investment - which forecasts the activities and cash flow after realization of proposed investment: with and without financial assistance from structural funds.

The financial statements elaborated in order to fundament the investment process include(Guvernul României, 2010):

- funding needs for the business plan / project
- financial resources during the implementation period and after the structural funds assistance
- the balance sheet, profit and loss calculation of liquidity (cash flow) annually, estimated during the analysis.

Management generally is interested in the profit and loss forecast, profit being considered as a measure of performance while financial management is interested in estimating future financial needs. The projected revenues are interpreted in the context influence over the balance sheet in order to determine the optimal size of external financing.

Based on the financial contract presented by Guvernul României(2010) there are different situation for returning of grants as following:

- Reasons during investment implementation period:
 - false statements on the investment conditions
 - lack of proper justification and non-realistic expenditure
 - breach in the principles of sound financial management
 - non-contractual provisions for monitoring, information and publicity
- Reasons during investment operation period (5 years):
 - closure of business, relocation or maintenance of the investment for less than 3 years after the project completion
 - failure activities and not fulfillment of the objectives of the application form

In order to avoid the risk of return grants, investors must make a thorough analysis of objectives and results expected from the investment, according to the application form on:

- tangible or intangible, acquired by the project
- modernized production-area (agreed by the project)
- increase in turnover
- number of jobs created and maintained.

Based on projected turnover the required financial analyses should be forecasts. The most effective way of forecasting the balance sheet and profit and loss is correlated with the future turnover; some elements are dependent, varying in proportion to sales volume, while others are independent, due to other factors. Considering the methodology presented in the previous chapter, below we generated an annual turnover modeling for an existing Romanian company which tried to access European funding.

Table 1. Modelation of the Annual Turnover

Indicator	Year 0	Year I	Year II	Year III	Year IV	Year V
Annual turnover	7,421,224	7,725,075	8,057,275	8,404,875	8,852,475	9,307,775
Production Sales	7,419,073	7,722,924	8,055,124	8,402,724	8,850,324	9,305,624
Sale of Goods	2,151	2,151	2,151	2,151	2,151	2,151
Yearly forecast the annual turnover growth rate	-	4.09%	4.30%	4.31%	5.33%	5.14%

Source: own calculation

As observed in the first year after realization of the proposed investment will be obtained an increase with 4.09% of the annual turnover, which later will stabilize and will have annual growth increase rates between 4.30%-5.33%, in close correlation with the expected annual growth rate of the industry. Since realistic annual growth rate was proposed for the annual turnover in the years which are following the investment, the company was capable to maintain and even surpass the forecasted growth rate.

Conclusions

The previous realized analysis shows the importance of proper generation/modeling of the annual turnover in an investment project. Several methods were presented and case study was realized. Since the annual turnover constitutes the basis for the entire financial analysis it is very important that a realistic growth rate is used. Otherwise the provisions within the financial analysis of the investment (including CBA), the project implementation strategy and later the plan for the utilization of the newly realized investment might prove difficult to be fulfilled. Further studies should be carried out, especially in Romania, regarding the best method which should be adapted for Romanian case studies, taking into considerations all the particularities of the Romanian companies.

THE IMPORTANCE OF THE JURIST AND ECONOMIST GHEORGHE N. LEON IN THE EVOLUTION OF FINANCIAL SCIENCE

Cîrmaciu Diana

Universitatea din Oradea Facultatea de Științe Juridice

Popa Carmen

Universitatea din Oradea Facultatea de Științe Juridice

The economical-financial problems have always constituted a challenge for all the decisional factors at the state level and not only, thus the financial sciences – which also aim to regulate the relationships to create, assign and use the financial funds of the state and of the public institutions, destined to satisfy the social-economical needs of the society – recorded a great doctrinal interest.

Thus, a series of jurists and economists had understand the necessity and opportunity of knowledge in the domain of financial science, of the financial law, taking into consideration the fact that the difficulties which they have met at those times obliged them to take the responsibility to make every simple citizen and every person with political or administrative responsibility by the state understand the problems of public administration.

In approaching the given subject I have chosen to use some of the methods of scientific research, respectively: the historical method (financial science being presented succinct through the process of its evolution along the years), interpretation methods and a combination of quality and quantity approach, namely the method of analyzing archive documents and the studies of professor Gheorghe N. Leon.

In these contexts have asserted and developed himself in the university and political environment, Gheorghe N. Leon, having a rich activity of intellectual creation, approaching in his works the complex aspects of the science of financial law. Thus, starting with the rules and principles of this domain, Gheorghe N. Leon had realized a veritable incursion in the history of finances and in the theory of taxation, public and budgetary credit.

Analyzing a part of his scientific works, we can affirm that a personality with such a complex structure, like Gheorghe N. Leon is hard to define, but surely, through the prism of his works and through his long-lasting and rich scientific activity, his name can be mentioned among the personalities of the academic education in the domain of financial science.

At the same time we can affirm that in this actual period, when public finances represent an essential component of social-economical life of any nation, the scientific process of the most economists, the process of approaching notions and concepts specific to this domain was and remains fully justified.

Keywords – financial science, economical-financial politics, inter-war period, legislation, financial problematic

Code JEL: Economic History N00-General

The preoccupations of professor Gheorghe N. Leon in the expansive and extremely captivating domain of finances (of the financial study, in general) had concretized themselves in valuable works, appreciated by specialists, taking into consideration his great contribution in the development of the earlier mentioned research domain.

Spending most of his life with didactical activity, Gheorghe N. Leon have passed all its levels. After graduating at the Faculty of Law from Iasi (in 1911) he obtains his scientific doctor's title in economical sciences at the University from Jena (Germany), in 1914, the subject of his work being the study of direct taxation in Romania („*System der direkten Steuern in Rumänien*”). The study is dedicated to the critical exposition of the direct taxation system in Romania, discussions upon the optimal tax liability, being often subject of specialty researches. His work was remarkable because of its coherence and its responsible approach of research upon taxes, considered to be privileged instruments of public expenses „(1)”.

We can observe that Gheorghe N. Leon was a part of the category of young people with high hopes aiming towards the Central and West-European social and intellectual model. In that period finishing doctorate studies at a University from abroad have constituted a guarantee for social success, for a career and even a certification of intellectual competences. On the other hand, an important role in the formation of the young Gheorghe N. Leon had his father, professor Dr. Nicolae Leon, former rector of the University of Iași (in 1918 and between 1920-1921).

The first part of his university career of professor Gheorghe N. Leon have started at Cluj-Napoca. At the beginning of the university year 1919/1920 of the University Dacia Superioară, Gheorghe N. Leon, who will become a great personality of the Romanian economical and judicial education, begins his teaching activity at the Faculty of Law from Cluj as a professor, working by the financial and statistics department.

Even though the researches of Gheorghe N. Leon were often in the attention of lawyers and economists – those refined observers of the special phenomena of Romanian economics and finances – there are only a few syntheses upon them, and some aspects, especially the works published before beginning his didactical activity remain without much study upon them. Generally those critics and people who embrace the scientific opinions of professor Gheorghe N. Leon publish only some general reflections which cannot fully cover his various studies. Because of these facts his work must be reevaluated and confronted with some contemporaneous value criteria, there must be a detailed study upon the not well-known or „ignored” aspects of the intellectual creation of Gheorghe N. Leon.

Among the first studies published by Gheorghe N. Leon there is a study from 1914 entitled *Bosnia and Herzegovina under the Austrian-Hungarian reign* (Leon 1914), dedicated to the analysis of the evolution of the earlier mentioned territory in the period of the Austrian-Hungarian dominance – an investigation considered by the author to be necessary from an objective point of view to know „what are we allowed to do and what not in the conquering battle against a nation which still has aspirations for free life and autonomy of existence” (Leon 1914: 3). In the same time, it can be useful for any country also the observation of the administrative organizing models or that of the economical sector approached by the „neighbor” reign upon the occupied territory.

For the beginning there are relevant those three directions established by the author and the scientific argumentation, respectively: the population, the administrative and political organization and the economical development.

The author Gheorghe N. Leon discusses the economical life from the mentioned territory, the eternal subject of the economical relations being actual in any moment and by any community. Taking into account that the judicial regulations are a part of the ordinance concept of the economical relations (and taking into consideration the judicial formation of Gheorghe N. Leon), one of the approached problems was one related to the interferences between the economical action sphere and judicial action sphere. The author introduces at that moment the possibility of an association between these two notions, with some many intersections even in the specialty literature or the practice of today, especially because in the same time with the evolution of economical-social relations, this has become an actual and interesting subject. This way appear

the premises of analyzing this necessary association between the economical and judicial domain, association which always causes complex and different opinions. The author outlines with great talent the essence of this indissoluble relation between the two spheres, affirming, for example that no one will be able to fully understand the agrarian life of a nation „without knowing the judicial principle upon which the law of propriety is based” (Leon 1914: 16), that no one will be able to reach the aspects of the commercial life in a certain country “without knowing the principles based on which it was created” (Leon 1914: 16).

After examining the case in study chosen by the author, namely: Bosnia and Herzegovina in the period of the Austrian-Hungarian reign there are accentuated the structural changes suffered by this and the realized progress.

In conclusion, we can affirm that the work of Gheorghe N. Leon represents an actuality in any moment because the sources and the understanding of the economical and social-cultural growth of a country are important factors for the definition of the development strategy of any society. On the other hand the factors and models of economical growth have constituted a preoccupation of the researches of all times.

In 1915 Gheorghe N. Leon publishes the work *Mining politics in different states and its relation to the mining politics in Romania*, affirming that „mining was always an important factor in the economical and cultural history of the nations”.

For the profound study about the complex and specific phenomenon of mining, the author tries to make clear the meaning of some notions, and to eliminate some contradictory interpretations he creates some definitions (for example, the author tries to define the general meaning in judicial terms of – mining activity, mining politics etc). The examination of the essential particularities of these terms from the mining domain continues to show interest not only from scientific point of view, but also from the practical point of view. This way, even nowadays the legislator outlines through the Law of mining „(2)” some legal definitions regarding for example to: mining activity, mining, radioactive ore, mining products, mineral resources etc.

Usually the state has an active role in the economical life. In our concrete case, regarding to the stimulation of validating the natural resources of the country, its interventional measures were composed by the creation of legal norms for the development of mining activity, the establishment of some institutions for mining education, taking some measures to assure transparency in the mining activity.

The author accentuates in this discussion another part of the problematic of mining, respectively the considerations of the interests of the state in this domain, accentuating that the following categories must be distinguished: interests of economical nature; interests of political-social nature; interests related to the private economical sphere; interests regarding to the national economy.

To offer for the specialists a perspective upon the ensemble of relations in the mining law, Gheorghe N. Leon – showing us a great documentation – outlines the historical evolution of these relations and of the systems of mining proprieties in different states (beginning with the system of Roman law and reaching some case studies from the English, French or Romanian law).

In every situation there must be clarified the aspects which are related to the interference between the object (the mineral resources) and the subject of mining law. Mainly, the above mentioned object could belong: to the proprieties of the surface (of the land) – the system of accession; to the state – the system of domain, the state owing the propriety rights upon the mineral resources, based on a collective title; to the „discoverer” – the system of concession.

The author states that in the matter of study of mining law from Romania we can discuss about three periods, respectively: the period of traditional laws (from the very beginning until the laws of Calimachi and Caragea), the period of written laws (from 1818 until Mining Law from 21 April 1895) „(3)” and that of the modern law (beginning with 1895).

The work of Gheorghe N. Leon contains for example a new element in the content of the Organic Regulations, namely the fact that the legislator is conscious about the need to assure the continuity of the mining of mineral resources taking into account environmental protection and the renewal of the environment in case that it is affected by the mining activities.

The necessity of promoting these ideas, admitted a long time ago, can be found everywhere. We can discover the actuality of this subject also nowadays, when, though there is a regulation frame which addresses itself to the resorting institutions, to mining operators, there are difficulties signaled in taking responsibility in the matters of the environment (for example in rehabilitation of mines etc.) and in the matters of registering the environmental degradations caused by these activities.

After a critical analysis of the Romanian legislation in this domain, the author suggests some measures to make more efficient the reform process in this sector, like: promoting the principle of free mining; promoting the system of concession, but a concession realized by respecting of some special regulations adopted in this matter; the institution of mining monopole; administrating mines as a propriety of the state and developing mining activities through particular companies (renting); the institution of the possibility that the state owns a part of the profit (represented by its rights for the benefits of the concessions, resulted from mining) or taking part from the mining activity, not only by benefits.

Proves of his constant preoccupation and even of his passion in approaching the problems from the domain of mineral oil are his works *Romanian oil and the new law project of mining* (Leon 1943: 303-313), respectively *Romanian oil and the politics of the state*.

Taking into consideration the appreciations of the time, according to which the legislation of mining from 1929 must have been modified, Gheorghe N. Leon in his work *Romanian oil and the new law project of mining* presented his own arguments for realizing these steps.

After serious theoretical and practical observations „(4)”, which were scientific discussed, the author presented the situation of the oil mining operations. Showing a great knowledge in the discussed domain, he was pleading for the modification of the law project of the judicial frame of the moment. The idea of reformation of the special regulations from the oil mining domain was based on economic (and also politic) realities of the country. Practically, there was a necessity of approaching under different complex and objective aspects of the politics of the state in the matter of oil mining. In the authors opinion the general directions of this politics must follow: „to assure the production sources and to assure the national security in the hands of the state, for the benefit of the nation; to create some resources for the necessities of the future; to assure the control of the state upon mining and oil industry” (Leon 1943: 304). Gheorghe N. Leon felt himself responsible to draw the attention of his contemporaries upon the fact that in states like Mexico, U.S.A., England, in the mining zones of *British India* and *Netherlands India* there was a unitary politic in this sector, and respectively one to assure „the ownership of the oil resources” for the conational under the control and guidance of the state (Leon 1943: 304). This measure directly aimed the participation of the nation by the resources of the country and it was in great balance with the necessity of preventing and fighting the forced and uncontrolled exploitation of some limited natural resources. Even more, the economists and politicians representants of this power had a great fight to create strategic reserves to assure future needs, the history of fighting for oil revealing us the fact, that one of the applied strategies was buying territories and of concession of mining of the territories belonging to other states. Even the American president Warren G. Harding – 1921-1923 – promoted the formula „Exploit as much oil as you can from other countries” (Leon 1943: 306).

In these circumstances, the author affirms with conviction that the new law must create a connection between oil mining politics on one hand and the politics of the state, on the other hand. The national priority is to assure some responsibilities in the matter of sustaining an intense

participation of the national capital by the mining and distribution of oil, under the control of the state.

In 1918, the proof of the power of the scientific-practical thinking of Gheorghe N. Leon is materialized under the form of a rich study upon expropriation – his research being important even in the conditions that the analyzed institution appeared as a restriction of the right for propriety. The work contains an exposition and an analysis of the doctrine and legislation in the matter of expropriation, the author suggesting for those who are interested a useful working instrument for the solution of some problems of the sensitive field of the special ways of giving birth to the proprieties of the state (this way we can mention requisition, confiscation, vacant successions etc).

In the text of the work there were developed and explained general notions regarding to the right of expropriation and some scientific ideas developed by the author related to the judicial justifications of expropriation or related to extent of the compensations. We must outline the fact that along the time in the literature of this domain there were announced a lot of definitions of the notion of expropriation, but the dominant conception was that expropriation was an „intervention” in the sphere of private law, especially regarding to propriety rights. Even more, this intervention was considered to be an administrative one. We also mention the fact that only through a legal disposition could a propriety right be restricted, but the concrete cases of expropriations could be established by the administrative power, in some limits established by law.

In 1918, continuing to observe the social-economical evolution and analyzing the financial problematic, Gheorghe N. Leon published the work *The financial problem and the matter of money*. We must also mention the professionalism and dedication of the author by dealing with this subject, which brought him the well-deserved acknowledgement, the work being awarded by the Romanian Academy (Leon 1930: 304).

Synthesizing the objectives treated by the author, we can point the central idea of the study and namely the existing relation between currency and public finances. In addition, there was discussed the solution to mobilize the soil – declared by some specialists of the time to be a saving one to dissolve the financial crisis.

In that moment the actuality of the subject was perceived also related to the negative impact of the World War upon the budgets of the belligerent states.

In the opinion of the author the preoccupations of the politicians with attributions in the domain of public finances must aim the preservation of the normal limits of currency emission and of accumulating gold to cover the existing currency. Besides, cautiousness in the matter of currency politics was and remains an essential characteristic, because the appearance of a currency excess generates negative effects like inflation etc. A substation importance in the study is represented by the presentation of the key-moments of the evolution of the currency system, because the anterior experiences can contribute to its future efficiency. This way, respecting the limits of an objective analysis, the author presents the continuous success or in other cases the recognized failure of some currency systems, like: the system of John Law – beginning in France in 1716; the reform project of Jacques Necker – in France 1789 etc.

Also related to currency politics we must observe that the author offers special attention to the fighting of the tendency of some doctrines to confuse two different notions: one being *currency* (money) and the other being *credit*. It is presented and proved through arguments a part of the economical theory and practice, which can be framed in the etatist school, for example the conceptions of Walter Federn or of Georg Friedrich Knapp etc.

The observations of Gheorghe N. Leon related to the functions currency standard can be sustained even nowadays, because regardless of the acceptance of money, its roles are

concretized as: instrument of transactions; standard of values; reserve of values (Basno, Dardac and Floricel 2003: 8).

On the other hand, the author suggests that currency has a key position in the functional mechanism of the economy and related to the currency system, reflects upon the benefits of the currency system based on the standard of gold.

The conclusion of Gheorghe N. Leon was that, the *fiduciary currency* had no capacity to eliminate or reclaim the effects of a financial crisis, because to sustain the system of public finances there is a need for real and not fictive values.

In the virtue of the sharp correspondence with the social-economical and political realities, Gheorghe N. Leon considers to be opportune the exploitation of the ideology of socialism in comparison with the accentuation of the model of individualism – these two notions being established through the prism of the impacts which these have upon the economy. The professor shared his conceptions related to the economical-financial principles of the socialist doctrine in the content of two works: *Socialism and economical individualism* and *Public administration and socializing*.

Gheorghe N. Leon, a personality with mature economical thinking, presents himself opened to embrace the possibility to solve the problems of the state with the help of social politics.

Keeping the same idea, through the prism of the diversity of the problems of economical life with which the state had to confront in the inter-war period and which limited its development, professor Gheorghe N. Leon proposes a concrete study upon the concepts of *public administration – private administration*, namely upon the phenomenon of *socializing* (nationalizing).

Thus, in his work *Public administration and socializing* the author attributes to the private administration (private domain), beyond abstract theoretical notions, a great importance for the existence of public administration. In reality, a large part of the incomes of the state is originating from taxes and fees upon particular incomes.

From the study it is clearly outlined the conclusion that a dangerous factor for the prosperity of the collective can be constituted by the „elimination fight” between public administration and private administration – in the opinion of Gheorghe N. Leon, it would be ideal the co-work of these two sectors (public-private) for the general benefit of the nation.

To have a complete imagine upon the implication of professor Leon in the study of the essential characteristics of the Romanian economy and finances, we must also mention his works *The history of public economy in Romania* and *Elements of financial science* through which there are outlined a series of principles of regulations from the studied domain, which are systematized by the author, illustrating this way the normative fundament of the economical-financial life.

The professor had a great contribution related to the presentation of the historical evolution of the Romanian public finances, publishing the work *The history of public economy in Romania* in a moment when the financial history of Romania was not well-known.

Structured on two parts (Part I *Public economy by Romanians before the foundation of the Participates* and Part II *Public economy in Muntenia and Moldova from the foundation until XVII century*) the work deals with the natural evolutional process of Romanian finances (the system of expanses and incomes, for example the system of services, domain incomes, customs etc). In choosing the subject, the author uses also his own experiences with the difficulties to create exhaustive documentations of a lecture of financial law for the students from Cluj „(4)”, because of the lack of some detailed researches in the domain of history of Romanian finances – this way he tried to cover the well-know lack, in university education, of some bibliographic sources elaborated for the above mentioned problem.

The complex sphere of public finances was presented in the work *Elements of financial science*, the first Romanian study of financial science, in which, based on some detailed researches the

author realized: *in the first volume*, a history of public finances, a presentation of its structure and the evolutionary perspectives of the public incomes and expenses and also a sketch for the announces reform in the system of indirect taxation, and *in volume II* there are conceptual clarifications upon the notion of budget and its executions, namely upon the notion of public credit.

Under the prism of his own research and processing methods used in his works, Gheorghe N. Leon in his work *How to write a book. With special attention for political economy*, militates for analyze and synthesis, induction (based on observing facts) and deduction (based on the generalization of the consequences of some actions), statistical method etc. Furthermore, the professor reveals the fundamental importance of the research methods in the scientific process, stating that: „the method is indispensable for scientific research. Without its help, the most elementary truths can avoid our attention. No one must rely on his good senses, on the brightness of his own intelligence... because one can easier succeed with not so much intelligence, but prepared with a good method, as with a bright intelligence but without any method”.

Undoubtedly our study cannot cover the multitude of researches developed by professor Gheorghe N. Leon, of the controversies and common opinions related to the revealing of the importance of his works in the development of the Romanian economical-financial sciences. But by mentioning in our discussion a part of his works there are outlined a series of theoretical and practical aspects presented by professor Leon in an extremely captivating and important domain.

Notes:

„(1)”We must mention the existence of an objective review of the work, realized by a professor of University from Vienna, E. H. Vogel who had written: „In his interesting critical conclusion upon the taxation system from Romania, the author proves that the indirect taxes in an agrarian state like Romania are very variable, because of the relation of climate and crop, and because of it the disproportion between the incomes of direct and indirect taxes announces a need for a reform of direct taxation. The praiseworthy work offers us an interesting view in the matter of taxation research from Romania and not only and it is a literature full of value” (Leon 1930: 3-4).

„(2)”Art. 3 from Law No. 85 from 18 March 2003 – law of mining, published in the Official Monitor of Romania No. 197/27.03.2003, with the ulterior modifications and completions.

„(3)”The mining Law from 21 April 1895 was important for the development of the mining industry in Romania, organizing mining activities, offering guarantees for the invested capital. Following the argumentations of the legislator it is outlined the idea that the exploiting of mines, the creation and development of the different industries from our country made it necessary to adopt this law. Only by establishing, offering guarantee and regulating the relations between capital, the owner of the territory and the specialists of the domain, we could hope in the development of mining.

„(3)”Gheorghe N. Leon mentions that his was sent abroad by the Institution of Geology from Romania (under the management of prof. L. Mrazec) to study the promlem of mineral oil related to the economical and political interests of the country.

„(4)”The professor had taken into consideration the creation of the work *Elemente de știință financiară*.

WEATHER INDEX- THE BASIS OF WEATHER DERIVATIVES

Ciumaş Cristina

Babeş-Bolyai University, Faculty of Economics and Business Administration

Botoş Horia Mircea

Babeş-Bolyai University, Faculty of Economics and Business Administration

This paper approaches the subject of Weather Derivatives, more exactly their basic element the weather index. The weather index has two forms, the Heating Degree Day (HDD) and the Cooling Degree Day (CDD). We will try to explain their origin, use and the relationship between the two forms of the index.

In our research we started from the analysis of the weather derivatives and what they are based on. After finding out about weather index, we were interested in understanding exactly how they work and how they influence the value of the contract. On the national level the research in the field is scares, but foreign materials available.

The study for this paper was based firstly on reading about Weather Derivative, and then going in the meteorological field and determining the way by which the indices were determined. After this, we went to the field with interest in the indices, such as the energy and gas industries, and figured out how they determined the weather index. For the examples we obtained data from the weather index database, and calculated the value for the period. The study is made on a period of five years, in 8 cities of the European Union.

The result of this research is that we can now understand better the importance of the way the indices work and how they influence the value of the Weather Derivatives.

This research has an implication on the field of insurance, because of the fact that weather derivative are at the convergence point of the stock markets and the insurance market.

The originality of the paper comes from the personal touch given to the theoretical aspect and through the analysis of the HDD and CDD index in order to show their general behaviour and relationship.

Keywords: Weather derivatives, Weather index HDD, CDD

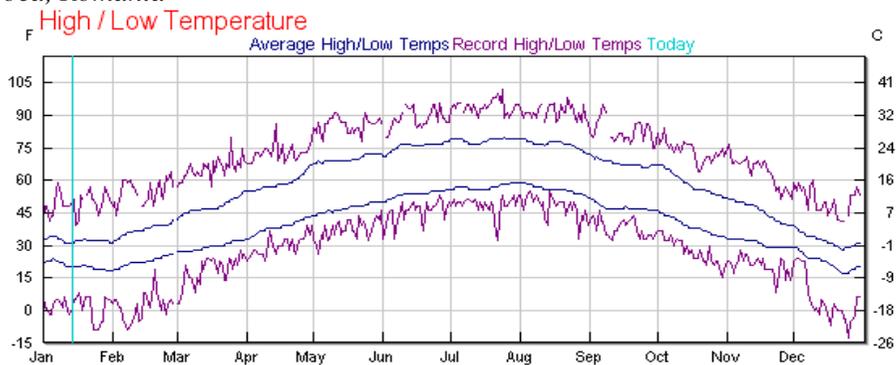

JEL: G22

Weather index - the basis of Weather Derivatives

In order for giving protection against the consequences of extreme weather events, Weather derivatives have as underlying assets a variety of weather variables. Weather Derivatives can be structured accordingly to one or more variables. The most common used variable is *temperature*, either hourly, daily minimum or maximum, or as a daily average. By international consensus, in most countries, the average daily temperature is the arithmetic mean of the maximum and minimum temperatures recorded for a period. In some countries, however, the average daily temperature is calculated as weighted average of values recorded per two day. The time of day when the recording of these temperatures takes place, the method of determining these temperatures can also vary from a country to another. To participate in the weather derivatives market transactions it is needed to examine in detail the meteorological measuring system practiced by each of the country in which weather derivatives are composed and then traded. It is generally known that in the U.S. the measurements are made in Fahrenheit degrees, and in the rest of the countries they are made on Celsius scale.

As an example of heat minimum and maximum values, the chart below shows the minimum, maximum and daily average recorded in Cluj-Napoca, Romania, in 2008.

Chart 1. Evolution of daily minimum, maximum and average daily temperatures, in 2008 in Cluj-Napoca, Romania

Source: Data processed by author using information available on www.wunderground.net

In this chart we graphically illustrated thermal maximum and minimum records in Cluj-Napoca in the year 2008. The dark blue line shows the average temperature in its two forms, maximum and minimum. The purple line stands for the daily fluctuations of the temperatures and turquoise vertical line, represent the value in the day that the data were extracted.

This chart shows the evolution of the minimum and maximum daily values, and also of the daily average, thus we are able to observe the trend manifested by the weather indices. For Cluj-Napoca, the temperature reaches its highest level in July (about 40C) and the minimum is recorded in late December (approx.-24C).

Alongside the temperature, wind and rain measurements can also underpin weather derivatives. Protection against **wind currents**, for example, are of interest to wind "farms" that want to contract these weather derivatives to protect themselves against the decline in wind speed, or in the construction industry, which would have to stop work in the winds blows too strong(e.g. for "sky-scrappers"). These contracts can be also used to replace traditional insurance policies for events such as damage caused by powerful winds, protection of future investments against events as *abundant rainfall* in the agricultural sector or *drought* for the hydro-electric industry. Protection of these events are relevant as are heavy snow falls of interest to mountain resorts, municipalities that must clean the roads in winter, but also for companies that sell products related to the cold-season, such as sport equipment or winter car-tires.

These are contracts that are based on such variables as *the number of sunny hours in the day, the temperature of sea water or river flows*.

In order to plan and build such a weather derivative we require accurate and reliable weather data.

Correlation between relevant meteorological variables and their impact on economic activity that needs protection will vary from one weather event to another and from a company to another. Thus, the contracts will be individualized and constructed on indices that accurately reflect both probability of occurrence and its effects.

Meteorological indices can be defined as the number and characteristics attributed to a phenomenon, process or other complex weather events. Indices that are most commonly used as base for weather derivatives contracts are indices of daily temperature, average temperature index, average cumulative index and heat index weather event. In this paper we will explain the importance of daily temperature index.

Daily temperature index

Using Daily indices is rooted in the energy industry and they are so constructed as to show domestic demand for heating or cooling. Weekly and monthly records of the index can be used also for monitoring and planning further needs, its costs and the heating cost for buildings which have performing air-conditioning systems. Annual records may help in predicting future expenditure for this purpose.

It should be noted that the United States, where the temperature is measured on the Fahrenheit scale, the core temperature (base temperature) for contracts is of 65F (18.33C), and in other countries, where they use the Celsius scale, the basis temperature is set at 18C (64.44F).

Heating Degree Days (HDD)

The Heating Degree Days is a measure designed to reflect the daily need of heating of a home or office space, and thereby is a way of measuring how cold it is (if it is colder the heat demand is higher). There are a variety of ways of defining HDDs used by the energy industry, thus reflecting the differences in consumption between cities, showing that there is a correlation between the ways of defining heat necessity and how well the index reflects the demand. The most common definition of the HDD index for the weather market is:

$$z_i = \max(T_0 - T_i, 0) = (T_0 - T_i, 0)^+ \quad (1.1)$$

Where: T_i - the average temperature in day i

T_0 - base temperature⁶⁰ determined by the contract

During this paper we will assume that the formula depicted above is the calculating formula for HDDs. On a period of N_d days is defined as the sum of daily HDDs during the study:

$$x_{HDD} = \sum_{i=1}^{N_d} z_i \quad (1.2)$$

The daily heat is higher in winter and weaker, almost zero, during summer. In many locations where the heat daily index is of interest, average temperature are recorded in certain periods do not exceed the 18C/65F limit, so the HDD index is always positive.

⁶⁰ Base temperature= temperature that by its variation determines the Heating Necessity or Cooling Necessity. This temperature is often regarded of having the optimal value of 18C(65F)

Table 1 Monthly average number of HDD used in the period 01.01.2006 to 31.12.2010, for 8 European cities. Data are related to a contract with the base temperature of 18C.

⁶¹ ID – Incomplet Data

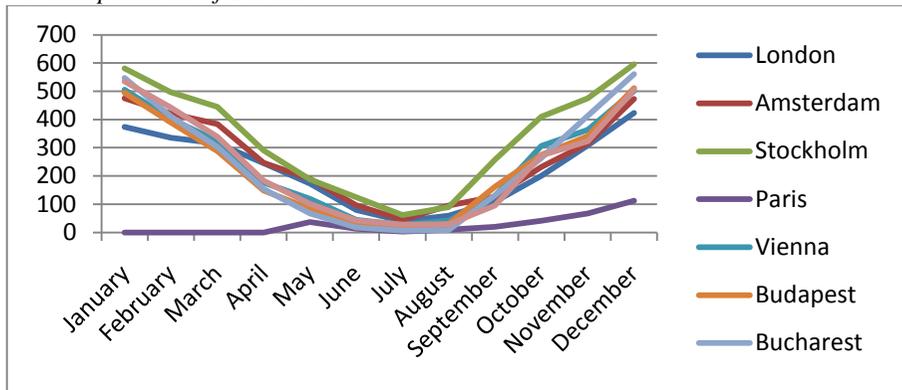

Our purpose is to highlight the monthly HDD values. In the study we chose to analyse cities from Europe, in order for the information to be relevant to the study. The data from (Table 1) shows eight cities from the EU. In the selection process we tried to choose the cities in such a way to minimize errors from the calculations. The period of study is of five years, from 01.01.2006 to 31.12.2010,

Processing the data presented difficulties for Paris, because of the lack of data for this location, only the data of 2010 are available. This lack of data explains why the general data for Paris are less than for the cities nearby, one such example is London.

We can also see that the highest values were recorded in January and December.

From (Chart 2), we note that this index is at maximum level in Stockholm in December. At the opposite point is London, which presents the lowest values for all the studied period. Although the graph shows that Paris would have the lowest value, we can't prove it because of lack of data.

Chart 2. Chart interpretation of Table 1.

Source: Data processed by the author using information available on www.degree-day.net

The use of HDDs in the construction and trading of weather derivatives are used in the USA and Europe, and rarely in Japan.

Cooling Degree Day (CDD)

The daily cooling requirement is mainly used to measure summer energy demand for cooling, so determining how hot is (if it is warmer, the CDD need is higher). Heating systems are powered by electricity or gas, but cooling systems are mainly powered by electricity. This is one reason why CDD's are more relevant to the electricity market. Because electricity is generated recently from natural gas, the CDD's are becoming relevant to the gas industry also. The number of days that require CDD's is calculated:

$$z_i = \max(T_i - T_0, 0) = (T_i - T_0)^+ \quad (1.3)$$

As for the HDDs, the index is the sum over a period N_d of CDDs during the studied period.

$$x_{CDD} = \sum_{i=1}^{N_z} z_i \quad (1.4)$$

Tabel3. Monthly average CDD numbers for eight European cities, in the 01.01.2006-31.12.2010 period. Data is consistent for contract with a base temperature 18C

Source: Data processed by the author using information available on www.degree-day.net

In this analysis we used the same location as for the Heating degree days. London is the main market for weather derivatives in Europe; thus taking into account the nearby cities that show interest in these derivative contracts, as Paris and Amsterdam. I chose Stockholm to exemplify the developments and use of thermal indices in Scandinavia. Vienna, Budapest, Bucharest and Sofia have been selected because they are located in Central-Eastern Europe.

(Tabel3) emphasizes that the daily allowance of coolness, the figures show the opposite then in the case of the HDD index. The CDD index grows in value over the warmer months, reaching its peak in July and August, and in January and December the index is almost null.

From (Graph4) we can see that the maximum value is recorded in August in Bucharest and the lowest in Stockholm also in August. Here we see the formation three groups of cities: Bucharest – which is separated with the highest values; followed by Sofia, Budapest and Vienna, and the lowest values are in the third group formed of London, Amsterdam, Paris and Stockholm. The lowest of the low values are recorded by London and Stockholm. This fluctuation can be also explained through Geography, by the cities situations on the meridians.

Graph 4. Interpretations of the values of Tabel3

Source: Data processed by the author using information available on www.degreeday.net

Derivatives based on CDD's are usually traded in the U.S., however, they are rarely trade in Europe and Japan.

The relationship between and HDD and CDD

The total amount of HDD's and CDD's sites in a given day is shown by the insignificant deviation of the average core temperature: in one day neither HDD nor CDD are zero, or when both are zero then the day temperature is equal with the normal values recorded. Thus, it is apparent that neither HDD nor CDD can have a negative value.

Conclusion

The analysis conducted in this paper, shows that the most common indices used in weather derivatives contracts are the HDDs and CDDs.

In my opinion, this is because weather events can be easily reported as temperature fluctuations in different periods, fluctuations that are accompanied by additional weather phenomena's. Examples would be the case of the low temperatures, which often are accompanied by winds; moisture that is accompanied by rain and atmospheric pressure increase, or excessive heat that can cause drought.

FISCAL DECENTRALIZATION AND FISCAL AUTONOMY IN THE EU MEMBER STATES

Crășneac O.Alexandru

West University of Timișoara, Faculty of Economics and Business Administration

Heteș Roxana

West University of Timișoara, Faculty of Economics and Business Administration

Miru Oana

West University of Timișoara, Faculty of Economics and Business Administration

In the process of fiscal decentralization sub-central governments have gained access to different fiscal resources, but the autonomy in setting the taxes is a key issue when analyzing the degree of decentralization. In this paper we calculated an index of tax autonomy for the EU Member States based on the OECD methodology of classification of sub-central taxes according to the degree of control over these taxes. We have shown that the design of intergovernmental fiscal relations is significantly different among the Member States, and taking into consideration the discretion over sub-national taxes provides a valuable insight on the fiscal decentralization design.

Keywords: fiscal decentralization, tax autonomy, intergovernmental fiscal relations

JEL codes: H71, H77.

Introduction

When analyzing the degree of decentralization we must take into account two important aspects. First, it must be identified the division of responsibilities and resources between different levels of government. The degree of fiscal decentralization is, thus, determined by the volume and importance of responsibilities and revenue assigned to subnational governments. Second aspect, refers to distribution of decision-making powers, i.e., the degree to which decisions to collect and allocate public resources are decentralized. A state in which local authorities have a real autonomy in allocating their expenditure and collecting revenue is more decentralized than another state where local revenue and expenditure are set centrally, although the vertical distribution of public expenditure and revenue is identical in the two states (Stegărescu, 2005: 304).

The indicator most widely used in literature to measure the degree of fiscal decentralization is the share of local expenditure or revenue in total government expenditure, or, respectively, in consolidated general government revenue. Although it is an imperfect indicator of the degree of decentralization, in order to have a standard variable, calculated on the basis of uniform definitions among states, it is used in most studies on the causes and effects of fiscal decentralization (Ebel and Yilmaz, 2002). This indicator's major advantage is, on the one hand, the availability of statistical data, and, on the other hand, the comparability of the results.

An important limit of this indicator refers to the impossibility of determining the vertical structure of decision-making powers. It shows only the revenue and expenditure of subnational authorities, without providing any information on the decision regarding taxation and spending by destinations. Thus, there are many situations where some public spending is performed locally, but the expenditure destination is predetermined by the central government, and they appear in statistical data as expenditure of local government. Also, statistical data do not provide qualitative information on the nature of revenue included in local budgets, because they make no distinction between conditional and unconditional grants, or between tax levies independently

determined and imposed by national legislation. In the analysis of intergovernmental grants, is equally important the distinction between those allocated on the basis of objective criteria using allocation formulas, and those allocated on a discretionary basis.

For these reasons, the share of revenue or expenditures of local budgets in general consolidated budget revenue or expenditure tends to overestimate the degree of fiscal decentralization. Thus, to capture more accurately the degree of decentralization, numerous studies over time have been introduced also non-fiscal variables. For example, Treisman (2002) in order to measure fiscal decentralization has used, along with fiscal variables, a number other variables such as: the number of levels of government, election decentralization or even the share of local public employees in total government employees. Arzaghi and Henderson (2005) have built a decentralization index based on nine variables, including: the vertical structure of government, requirement that local or regional representatives are elected democratically, autonomy in setting local taxes or the ratio between conditional and unconditional transfers.

In this framework, since the share of local revenue and expenditure in total public revenue and expenditure tends to overestimate the degree of fiscal decentralization, in order to have a more accurate descriptor a more detailed analysis of the structure of local tax revenue is necessary.

OECD methodology for classification of tax revenues

In the fiscal decentralization literature there have been several studies that have attempted to quantify the degree of fiscal autonomy of sub-central governments (Pola, 1999; Blankart, 2000; Stegărescu, 2005). Among them is the most detailed study is the one made by the Organization for Economic Co-operation and Development, *Taxing Powers of State and Local Government*, which provided a methodological framework for classification of sub-central taxes according to the degree of autonomy in their determination.

The concept of “tax autonomy” captures various aspects of freedom sub-central governments have over their own taxes. It encompasses issues like sub-central government’s right to introduce or to abolish a tax, to set tax rates, to define the tax base, or to grant tax reliefs. In a number of states taxes are not assigned to one specific level of government but shared between the central and local governments. Such tax sharing measures deny a single local government any control on tax rates and bases, but collectively local authorities may negotiate the sharing formula with central government. Thus, to classify the sub-central tax levies according to the degree of autonomy over them, must be taken into consideration: the powers conferred by law to local authorities to set tax rates, to evaluate the tax bases and to administrate the tax revenue.

Assuming that only taxes that can be set independently and on which local authorities have legislative powers ensure real fiscal autonomy, tax revenues are classified into five categories depending on the degree of control over them. Categories are ranked in decreasing order from highest to lowest taxing power. Category (a) represents full power over tax rates and bases, (b) power over tax rates, (c) power over the tax base, (d) tax sharing arrangements, and (e) no power on rates and bases at all. In order to capture the more refined institutional details the (d) category was further divided into four subcategories to illustrate the many different rules for governments to determine and change their own share.

Local or regional authorities have greater autonomy on revenue included in categories (a) to (d.2.) and on the other, from (d.3.) to (e) they have no control. Basically, the latter are very similar to intergovernmental grants.

Table 1 Classification of local taxes according to the degree of autonomy

(a)	SCG set the tax rate and the tax base;
(b)	SCG set the tax rate only;
(c)	SCG set the tax base only;
(d)	Tax sharing arrangements:
(d.1.)	SCG decide the revenue split;
(d.2.)	Revenue split can be changed only with the consent of SCG's;
(d.3.)	Revenue split may be changed unilaterally by a higher level government (by legislation);
(d.4.)	Revenue split may be changed unilaterally by a higher level government (determined annually by budget laws)
(e)	CG determines tax rate and tax base.

Source: OECD, *Taxing Powers of State and Local Government*, OECD Tax Policy Studies, nr.1, 1999, pp.11.

The study mentioned above preceded to allocation of tax revenues in each of the five categories, and then to calculate the percentage of each category in total, achieving such a detailed structure of tax revenue according to the degree of autonomy in setting them. Of course, this grouping of tax revenue does not fully reflect the degree of local financial autonomy. For example, even if local authorities can determine both the level of tax rates and the tax base, such autonomy may be restricted by law, imposing certain limits that they can choose tax rates between or some assessment criteria of the tax base and, in this case, the revenue generated by these taxes are still falling into category (a). However, we believe that this methodology for the classification of tax levies is a very useful tool to assess local autonomy.

The structure of local and regional taxes in the EU Member States

The structure of public sector internal financial relations and tax legislation differs greatly from one state to another. For this reason, it is impossible to use uniform rules for allocating tax revenues between the five categories. To ensure proper division of taxes, in addition to a detailed structure of tax revenues, also knowledge of tax law provisions in each state is necessary.

Since 1999, the Organization for Economic Co-operation and Development publishes periodically in the report entitled "*Fiscal Relations Across Government Levels*" detailed information on the structure of tax revenue in OECD member states. Thus, we used the results from its latest publication, "*The Fiscal Autonomy of Sub-Central Governments: An Update*", 2009, for Member States of the European Union. The latest revenue structure, extracted from the mentioned report, is that for the year 2005. For countries that are not part of the OECD, we have taken information from an earlier report, "*Fiscal Decentralization in EU Applicant States and Selected EU Member States*". It was completed to evaluate the status of fiscal decentralization in states that joined the European Union after 2004.

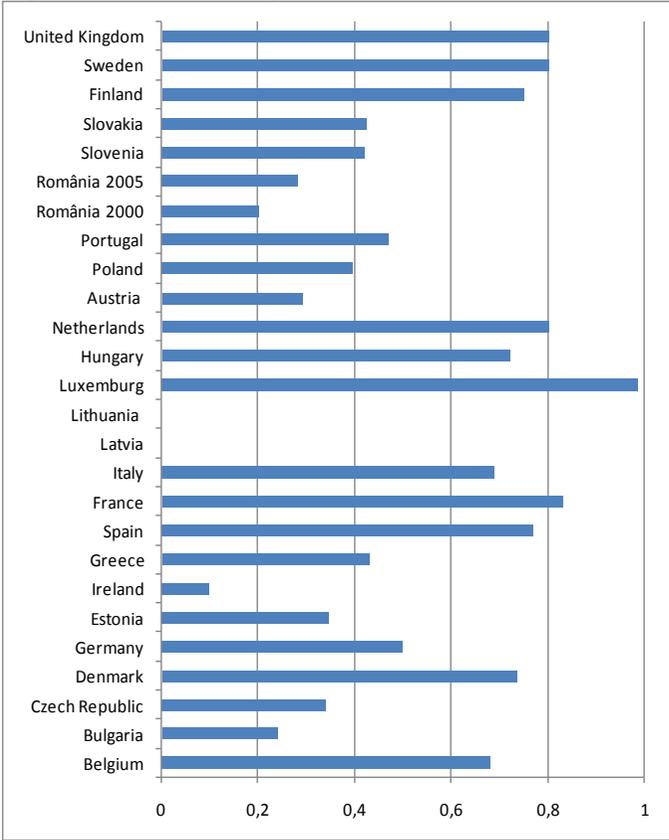

To ensure comparability of results achieved in the case of Romania, with EU Member States we calculated the structure of tax revenue for 2005 and 2000 to show their evolution. Thus, we classified each type of tax in one of five categories, then, using data on local budgets from the Statistical Yearbook of 2007, we calculated the percentage of each category in total.

The tax autonomy index

Using the calculated structure of tax revenue we built an index of tax autonomy for the EU Member States. The index's values indicate the degree of local and regional governments control over their own tax revenues, ranging from 1, signifying a complete autonomy in determining

local taxes, and 0, no control over taxes, i.e. all taxes are set by the central government. In this setting, we multiplied the shares of each taxes that fall in the (a) category with 1.00, (b) with 0.8, then, categories (c) to (e) with 0.7, 0.6, 0.5, 0.3, 0.2, 0, and, respectively, 0.1. For federal states we calculated an average of indices obtained at regional and local level, weighted by the tax revenue volume raised by these two levels of government.

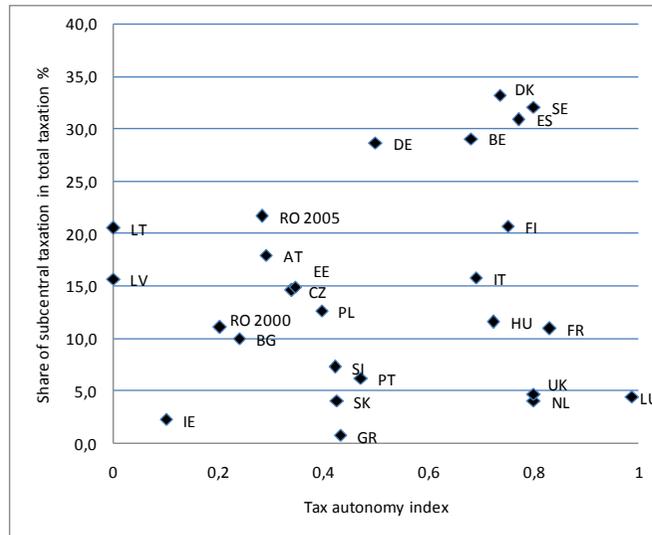

Figure 1 Tax autonomy index in the EU Member States

As shown in Figure 1, there are significant differences in terms of fiscal autonomy of local and regional governments in the EU Member States. In Lithuania and Latvia all local taxes are determined by the central level, while in Luxembourg, local authorities enjoy almost complete freedom to set taxes. In this state 98.5% of local tax revenues are in category (a), local authorities having exclusive competence to determine tax rates and tax bases. Other states where local authorities have greater control over local taxes are France, Britain, Netherlands and Sweden. In Romania, the index increased from 0.2022 in the year 2000 to a value of 0.2825 in 2005. The most important factor contributing to this change is represented by changing the methodology for determining the share of splitting the income tax, which in 2000 could be modified through the annual state budget law, and in 2005 they had a fixed level, established by legislation (Local Public Finance Act).

In Figure 2 we grouped the EU Member States both in relation to the importance of subnational taxes and on the basis of tax autonomy. Tax revenues of local budgets include, in this case, also revenue from tax sharing arrangements. Their distribution by level of government is taken from the Eurostat report, *Taxation Trends in the European Union, 2009 edition*.

Figure 2 Tax autonomy index and the importance of sub-central tax revenues

Thus, we can group the Member States in four categories:

- states where local governments receive a large share of total taxation and have high autonomy in terms of their determination, such as: Sweden, Denmark, Spain, Belgium, Germany and Finland;
- states with a high volume of tax revenue available to subnational governments, but they have limited powers in setting those taxes, like: Lithuania, Austria and Romania;
- states where local authorities have significant powers to set taxes, but their tax revenues are modest, such as Luxembourg, Netherlands, Britain, France and Hungary;
- states where subnational governments have only a small share of total tax revenue and also have limited decision making power to determine them, such as Greece, Ireland, Bulgaria, Slovenia and Slovakia.

Conclusions

Fiscal decentralization tendencies are obvious in the majority of EU Member States in the recent years, and, thus, increasing subnational governments' responsibilities requires more tax revenue at this level. But since traditional local taxes (property taxes, user charges) are insufficient to meet the requirements, many subcentral governments rely heavily on various tax sharing arrangements and intergovernmental grants. In this setting, fiscal decentralization literature shows that the common measures of fiscal decentralization, i.e. the share of local expenditures and revenues, clearly tend to overestimate the degree of fiscal decentralization.

We have shown that regional and local governments in the EU have little discretion over their own taxes. Typically, in the old EU Member States subnational governments have superior control over their own taxes. In the federal states such as Belgium and Germany the local governments have greater autonomy in setting taxes than regional governments, while in Spain and Austria regional authorities enjoy greater taxing powers.

The correlation between different measures of decentralization is weak. For instance, some states with high share of local taxes permit only little discretion over the tax rates and tax bases, while others enjoy great tax autonomy but have limited fiscal resources. Thus, the design of fiscal relations across levels of government varies greatly among EU Member States and there is no single pattern of fiscal decentralization.

STANDING'S PLACE AND ROLE IN THE FINANCIAL ANALYSIS OF THE ECONOMIC ENTITY

In this paper, the authors present the methods of determining the company's financial standing, based on its financial reporting. Hence, in the debate are included concepts commonly used in financial literature and banking practice such as credit worthiness, credit rating and standing.

Keywords: financial standing, creditworthiness, rating, credit-standing

JEL Classification: G32

1. Introduction

Modern and efficient management of an entity must be evaluated using financial performance criteria, covering on one side operational activity and on the other side the actual financial activity conducted over a period of time determined usually by the financial exercise.

With respect to this, many analysts have designed and developed an assessment model of the entity's business based on score, a model that highlights the financial standing of the entity at some point in time. They consider that in between two successive moments of the financial position, reflected by the balance sheet, respectively the beginning and end of the financial exercise, intercedes the work carried out by the firm whose efficiency or inefficiency is reflected in the results, that is the profit and loss account.

2. The Importance of Financial Standing in the Current Financial Crisis

With the help of financial standing, managers can always find out why a company has not paid its debts to suppliers, budgetary obligations, why customers have not been asked to pay for services they received and what are the causes that led to a lack of cash resources. The reason for designing and making some models of standing is that from the beginning of 2010 nearly 16,000 entities have entered into insolvency, twice compared to the entire year 2007. The value of checks and promissory notes issued without coverage reached almost 450 million Lei in September 2010. Analysts stated that this fast growth in the number and amount of payment incidents is due to the economic crisis, which led to financial blockage. Therefore, now more than ever, managers must find out the financial situation of their business partners.

The National Bank of Romania has a database with information about all entities that generated payment incidents, entities that have issued checks and promissory notes without coverage. In order to find out information about an entity, one must seek the services of a bank, which charges a fee to query the CIP database. By consulting this database, one can find out both the payment incidents in which a business partner was involved and also if the serial number of the check the business partner has issued is part of a set of payment instruments approved by The National Bank of Romania or whether this check was previously declared to CIP as lost, stolen, destroyed or withdrawn from circulation.

Specialized Romanian sites can be used to find out financial information about companies, namely from “bonitate.ro” or “vrajitorul.eu”. Moreover, information is also obtained from the databases of the Official Gazette, the Securities Guarantees Archive, the Trade Register or the Insolvency Report. Another solution for a brief check of a business partner is checking public databases. On the website of the Ministry of Finance, financial information of all Romanian companies can be found, both regarding the balance sheets and the profit and loss account. The data provided by the Ministry of Finance must be analyzed and interpreted, in other words a score that reflects the entity’s financial standing must be set.

3. Method and Results

Economists generally believe that is ideal for a business to have had a profit in the last three years of activity. Another important indicator is the degree of indebtedness, calculated as the ratio between equity capital and permanent capital (medium and long term debt plus equity). A share below 30% of equity in total resources available to a company, medium and long term is considered unhealthy. Also, some economists believe that a business with no financial problems is one with general solvency (measured as the ratio between current assets and fixed assets on the one hand and total debt of the other hand) above 1,2.

Financial data in raw form is not always useful. This is why it’s easier to call upon the services of consultants specialized in analysis of standing. In Romania, there are consulting companies that provide more comprehensive reports on companies, including a “credit rating” which assesses the risk of insolvency of a business, based on a scale from 0 (insolvency proceedings pending) to 10 (non-existent risk).

The rating of a company takes into account both the company’s financial indicators (standing indicators, in our view) and qualitative factors such as company’s development, payment system, changes in the number of employees, etc. The way the company has met its payment obligations is also considered. A model of the entity’s standing takes into account the financial performance indicators to be used for estimating the economic value, value creation and future earnings potential in that business.

Most often, some of the following indicators are used in assessing a business performance: net result; operating result; operating cash flows; residual result; value added.

Out of the profitability indicators, the *net result* is the best known. Because of its normative character, it has a limited utility for investors. Analysts generally prefer performance indicators that are not bound to the results.

Operating result is the result before tax and financial expenses, which refers to the ability of managers and employees to create value whatever the tax rate and capital structure is. Operating result is often used as a performance indicator in the analysis of financial statements.

Operating cash flow provides investors with additional information beside the net income. In the U.S., operating cash flow has significantly changed with the introduction of SFAS 95 in 1987. In Europe, the International Standard IAS 7 is according to SFAS 95. This standard has specific rules for calculating treasury cash flow, which is nothing more than the reconciliation between the profit and loss account and balance sheet modifications. For countries that do not adopt these rules, operating cash flow remains an estimated number.

Residual result is the net result less invested capital cost. In recent years, this indicator has gained increased interest. A small but growing number of businesses select this indicator for determining the remuneration of managers.

Value added is the measure of overall performance which is distributed to all partners of the business. The concept of value added aims to provide an indication of the business contribution to national wealth creation.

In the specialty literature, there are opinions (Turliuc and Cocriș 1997: 294) that in the analysis and evaluation of the borrowers performance based on data from the balance sheet and income statement, banks can determine the creditworthiness of customers situation, using for this purpose a system of structure and performance indicators:

- *structural indicators*: turnover; equity; working capital, working capital requirements; net treasury; liquidity (as a milestone, it can be immediate, current and at a future date); solvency; the degree of indebtedness (it is taken into account an overall level of debt and a financial leverage); rotation speed (is determined as index or duration of specific balance sheet items);
- *performance indicators*: profitability can be expressed as the rate of operating return (gross or net), rate of economic return and rate of financial return; financial risk expressed as a degree of covering interest; the rate of value added; share of dividends from the net result.

By corroborating the results of creditworthiness' indicators, the bank can highlight the trader's financial situation marked by "strengths" and "weaknesses", which will make the credit decision to be well reasoned. (Turliuc and Cocriș 1997: 294) As it can be observed, in the banking environment, the *creditworthiness* of the company is of high importance and in the business environment the focus is on the company's *financial standing*, namely on its *rating*.

In their book, Costin Kirișescu and Emilian Dobrescu state that creditworthiness is "a form of trust that a person or legal entity has upon completion an economic and financial transactions, especially credit-based" (Kirișescu și Dobrescu 1998: 43). As a result, *creditworthiness* endorses first of all accessing a credit. This way, bank management specialists believe that the *analysis of the borrower's creditworthiness* represents an important step in the process of bank lending. (Trenca 2004: 179) At this stage, based on documents provided by the client, the bank reviews the documentation for the credit. The need to analyze the economic and financial situation of the client is generated by the bank's need to know all the elements necessary for the credit decision. (Trenca 2004: 179)

In this analysis, a very important aspect represents establishing the creditworthiness of the borrower. Banks, in general must make sure the customer is creditworthy, *which defines, in fact, his ability to support debt service, respectively to repay that loan at maturity and pay interest, and also to prove the existence of insuring guarantees*. (Trenca 2004: 179)

In the context of economic and financial analysis of customers, banks often encounter a question that experts have tried to answer to, namely that if the *client's creditworthiness* established historically can be a compelling argument for future lending. (Trenca 2004: 179) Often it is argued that, in the lending process, excessive reliance that banks show towards *indicators of creditworthiness* resulting from past activities makes the decision of granting or refusing future loans not to be always correct. From this point of view, it would seem that in the process of assessing the credibility of the customers through the *past (historical) creditworthiness*, the ex-post analysis should be given less importance. Analysts should insist on the future, projected work, which otherwise is the purpose of the requested loan, in order to maximize certainty in drawing conclusions. (Trenca 2004: 179)

Other experts believe that creditworthiness can be evaluated (credit rating = *evaluating creditworthiness*) often in the form of a numeric or alphanumeric score (for entities or individuals), so that entities can decide whether to trade with that company or grant a loan to a person. (Koch 2001: 84)

In the Explanatory Dictionary of Romanian Language, creditworthiness is explained either by "credit and payment capacity of a person or an institution" or by "solvency". The term comes from the German word "*Bonität*". (Coteanu, Seche and Seche 1998: 107) In other words, creditworthiness can be characterized by these qualities of the entity. By creditworthiness, other specialists understand "the confidence that some people inspire when applying for a credit;

solvency (being creditworthy is derived from the French *solvabilité*)". In the same time, specialists state that creditworthiness and "good standing" have the same meaning.

In other papers, the term *creditworthiness* is translated as *financial solvency*, solvency, funding capacity. Therefore, some authors regard the three concepts as equal. Also, the word solvency is translated as "credit – standing". In our view, creditworthiness is the degree of confidence that can be drawn between two subjects. Financial standing concept is used in different papers with no explanation of its scientific content. That is why we will focus on it in the following paragraphs.

Romanian financial banking regulators have established for all credit institutions level a number of regulations based on which they periodically assess the performance of borrowers in order to build up reserves in the banks. (Romanian National Bank Regulation No.5/22.07.2002 on the classification of loans and deposits, and the establishment, adjustment and use of credit risk provisions, published in the Official Gazette No.626/ 23/08/2002). Financial performance represents the reflected economic potential and financial strength of an economic entity, obtained after analyzing a set of *quantitative* factors (financial and economic indicators calculated based on compiled data from annual and periodic financial statements, referred to as financial statements) and *qualitative* ones.

The assessment of financial performance of an economic entity will lead to its inclusion in one of the five categories of financial performance (A-E). This assessment is done according to internal rules of credit institutions, based on scores assigned to quantitative and qualitative factors. *Quantitative* factors relate mainly to the following indicators: liquidity, solvency, profitability and risk, including currency risk.

Qualitative factors include at least aspects of the way the analyzed economic entity is administrated: the quality of ownership, collateral received (other than those which are to reduce the exposure to the debtor), the market conditions in which it operates.

The above indicators are determined based on data contained in the company's financial statements, elaborated according to regulations issued by the Ministry of Public Finance or the authorities of other countries with similar competences. The category of financial performance contributes to establishing the category of classification of loans in the month following the one when respective reports are submitted to the bank. If banks are unable to assess the financial performance of a client, this client will be assigned directly in the category E.

Loans and investments are classified into the following categories: standard; under observation; substandard; questionable; loss. Classification of loans and investments is made by the simultaneous implementation of the following criteria, when possible: for *credit institutions*: debt service; financial performance; initiation of legal proceedings; for *non-banking financial institutions*: debt service; starting legal proceedings.

Table no.1 Classification criteria for loans granted to customers outside the credit institutions

		Financial Performance					
		A	B	C	D	E	
0–15 Days	Standard	Under observation	Substandard	Questionable	Loss	No legal procedure initiated	
	Loss	Loss	Loss	Loss	Loss		
16–30 Days	Under observation	Substandard	Questionable	Loss	Loss	No legal procedure initiated	
	Loss	Loss	Loss	Loss	Loss		
31–60 Days	Substandard	Questionable	Loss	Loss	Loss	Legal procedure initiated	
	Loss	Loss	Loss	Loss	Loss		
61–90 Days	Questionable	Loss	Loss	Loss	Loss	Legal procedure initiated	
	Loss	Loss	Loss	Loss	Loss		
min. 90 Days	Loss	Loss	Loss	Loss	Loss	Legal procedure initiated	
	Loss	Loss	Loss	Loss	Loss		

Source: www.wall-street.ro

As can be seen from Table no.1, according to recent regulations of the National Bank of Romania, credit institutions must include borrowers outside the credit institutions sector into financial performance categories, which are marked from A to E, in decreasing order according to quality. (Romanian National Bank Regulation No.3/19.03.2009, on classification of loans and deposits, and the establishment, adjustment and use of credit risk provisions, published in the Official Gazette No.200/03/30/2009)

Therefore, financial standing is focused more on the quantitative side of the entity, which is based solely on financial indicators. This standing has the goal of establishing a score, which classifies the economic entity in a particular *financial performance class* or a *class rating*.

Regarding rating, there is also the issue of the *country rating*, an index which estimates the ability and willingness of a country to repay external debt using foreign currency. Based on these understandings and other sources of information, we consider that *rating* is an evaluation process (assessment) of a system's status, evaluation after which the entity is granted a *mark* (number and/or letter(s) or a score). Hence, the classification of an entity in a *performance class* marked from "A" to "E", based on a *score*, is no more than the *rating* given to that entity.

4. Conclusions

Based on the above aspects, we can state the following.

- an economic entity's financial condition must be the main business target for every manager;
- the assessment of the financial condition can be done with the help of a system of linked financial and non-financial indicators, where the most important are the financial indicators;
- the creditworthiness of a company that involves accessing a loan from a credit institution is subject to banking regulations in Romania, customized at microeconomic level;
- determining the level of each financial indicator ultimately involves determining the financial standing and classification of the entity in a certain group of rating involves the design of a unitary pattern of aggregation of individual scores set for each financial ratio.

APPROACHES REGARDING THE TAX EVASION IN ROMANIA

David Delia

Vasile Goldis West University of Arad Faculty of Economics Science

Pojar Daniela

Babes Bolyai University of Cluj Napoca, The Doctoral School within Faculty of Economics and Business Administration

In any economy, the main purpose of the tax system is to provide a solid and stable source of government revenue. On the other hand, a tax system should aim to enable the country's economic development and support disadvantaged groups. Achieving these objectives should be accompanied by a continuous preoccupation of the tax administration to increase its efficiency. In this process, a particularly important factor consists in reducing the tax evasion, given that it contributes to a diminution in terms of efficiency within the state structures, while being a factor of corruption. Over the past 20 years, in Romania, the presence of tax evasion has reached relatively large dimensions in both the economic area and the underground economy, where the phenomenon is widespread. Taking the road from the particular to the general, distinguishing the legal tax evasion from the fraudulent one, this paper aims to answer the question: Why is it necessary to control the tax evasion phenomenon and how to do this? This question aims at achieving the following objectives: distinguishing between the legal and the fraudulent tax evasion and the methods used by taxpayers to circumvent the tax obligations.

First of all, reaching the objectives was assured by consulting a significant amount of work, that is to say publications of scientific claim, while making use of analysis, induction and deduction, significant volume of quantitative information was examined and submitted to professional reasoning. In literature, there are many Romanian and foreign authors reporting on the tax evasion issue while as far as specialised magazines are concerned, there are just a few discussing about the social protection issues or about the European experience in the tax adjustment whereby the states have gone over the years, such as: the Romanian Economic Journal, the Annals of the American Academy of Political and Social Review of Social Innovation and other authors such as Saguna & Tutungiu (1995), M. Duverger (1965), Carmen Corduneanu (1998), Hoanță (2000). Research results and general conclusions on the issue of tax evasion in Romania are listed at the end of the paper.

Keywords : fiscality , tax evasion, blak labor, romanian taxpayer, the State

JEL Code: H26, K31, K36

1.Introduction:

Taxation has been and is still an objective necessity, despite being inappropriate for taxpayers. Holding backwards a millennial history, accompanying, in time, the birth and development of the state, the tax is one of the most controversial public institutions. Even though it was deemed to be established by the citizens' general consent, the taxpayers opposed the tax burden of the payment, through legal and less legal means in an effort to protect the most important part of their personal income. The literature offers a multiple of interpretations on the concept of tax evasion. One of them defines tax evasion as "all legal and illegal procedures whereby, all those interested peculate, in whole or in part, their taxable material obligations established under the tax laws." (Saguna & Tutungiu, 1995: 45). Another meaning of the concept of tax evasion was given by M. Duverger (1965:77), who considered that this phenomenon "refers to all manifestations of fleeing from tax" in this sense, tax evasion taking place when "the one who is supposed to pay the tax,

doesn't do it, without its obligation to be passed on to a third party." The tax evasion consists in the theft of taxpayers to pay their respective tax liabilities, partially or wholly, using legal loopholes or using clever maneuvers, in order to conceal taxable material. But regardless of how this phenomenon is defined, tax evasion is, ultimately, failure of the taxpayer to assume their tax liability.

The means of concealment employed for avoiding tax obligations can be divided in two categories: extrapolation of legislative failure or even the possibilities left by the legislature in certain illicit intentions and processes. In terms of how it can be accomplished, the relationship that exists between this phenomenon and the current legislation, tax evasion, there are two forms of manifestation: licit tax evasion (shelter built at law) and illegal tax evasion (fraudulent) or fraud tax. In terms of space, it can be identified the national tax evasion (tax lawful and unlawful tax) and the international tax evasion. (Hoanță, 2000: 52).

2. Research Methodology

The demarcation line between the unlawful tax avoidance and the lawful one is necessary and useful, because it gives the possibility, at least theoretically, to estimate the size of the phenomenon, in the two forms of manifestation.

Moreover, this distinction helps to sensitize policy makers and the administrative search and determine appropriate means to limit and control the phenomenon.

The licit tax evasion is the theft of a lawful part from the taxable matter, without this being considered offense or crime. It involves the exploitation of the existing regulatory framework in the sense of a smart capitalization of the inconsistencies, contradictions or equivocations of some legal proceedings in order to avoid legal obligations to the state. In some cases, the intentionality of action, coupled with the fact that it seeks to avoid paying tax obligations, leads to the conclusion that this form of tax evasion attracts the fault of the involved economic subject.

However, it is not the system of punishment that comes with the tax fraud, given that the accused one has not violated any laws, but basically took advantage of the existing legislation (or a lack thereof), "using a combination unforeseen by the legislature and, therefore, which was tolerated to escape from view." The "guilty" one of producing legal tax avoidance is therefore only the legislature. (Saguna & Tutungiu, 1995: 34). The frequency of this type of fraud is higher in the periods when new laws are introduced or changed and when the state uses intentionally tax incentives to promote policies towards certain socio-professional categories or in certain fields. In practice, lawful acts of tax evasion, based on a favourable interpretation of the law, are very diverse, depending on the inventiveness of the taxpayer and the largeness of the law. In Romania, tax evasion was done lawfully, being often based on tax incentives granted by government (rescheduling, postponement or exemption from taxes, increases and penalties relating thereto) and the omissions in the regulation of taxes and fees. Of course, this form of tax evasion can be avoided by correcting and improving the legal framework which has become possible, but often the existence of political, economic and social circumstances determines a tacit tolerance of evasion.

The fraudulent tax evasion (tax evasion) is a form of aggravated circumvention being studied, analyzed, and sanctioned by monetary and custodial measures, whenever it is discovered. This consists in a total or partial illegal concealment of taxable material with the purpose of eliminating or reducing the tax obligations which are incumbent on them. It was considered that this is a "cancer" that affects society and politics and, in some opinions, it would be about 25% of the budget of developed countries, reaching impressive percentages in emerging countries (Clocotici & Gheorghiu, 1996: 56).

This type of evasion is outlined in two forms: the traditional evasion (avoiding partial or total payment of tax obligations, or by completing and submitting incorrect documents, or by failure to

produce the required documents by applicable law, failure to produce employment contracts generate the black employment, declaring the minimum wage to a salary achieved much higher), legal evasion (hiding the true nature of an organism or a contract, although signed, the contract work is not declared at ITM), accounting evasion (creating the impression of accurate accounting records, using false documents in order to increase spending, reduce revenues, reduce taxable income and therefore tax liabilities due the state, per diem expenses, related to fuel the journey within the documents) and the evasion of the assessment (reducing the inventory value, increasing amortization and provisions in the overstatement of profits with the purpose of an increasing future profit). (Gliga, 2007: 45)

In relation to tax regulations, in the case of the taxpayers various tendencies and motivations are manifested in order to evade tax obligations. The extent to which tax evasion arrived in our country makes this phenomenon to be so real that its presence became daily in all lucrative spheres. It can be stated without exaggeration that in the period after 1989, a social norm of tax evasion was gradually but surely established, the Romanian taxpayer, regardless of his financial or social status, trying and succeeding, most of the time, to evade tax payment.

The proliferation of tax evasion in Romania was supported by a number of factors, including a tax law characterized by the presence of gaps, inconsistencies, vagueness and lack of stability over time as well as the late appearance of a law to combat tax evasion (Law no. 87 / 1994 came into force in the late 1994). Until 2004, there was no tax code or a tax procedural code which would have been essential to the tax legislation, as it has as purpose to limit the effect on tax evasion. At that time, there were too high incumbent taxes compared to the Romanian taxpayer's real capacity to pay, the revenue to GDP in 2008 being the lowest (32.8%) of all EU member countries in the context of an increasing corruption in society. In Romania, the most used tax fraud techniques established afterwards the carried out control actions, grouped by categories of tax duty are (Gliga, 2007: 48):

- **The income tax:** reducing the tax base by including expenses on cost categories without supporting documents or legal basis (fines, penalties, etc.) , the registration of oversized or over-permitted by law expenditure, the deduction of the shareholder's personal expenses or interest rates on loans from the companies of their employers, failure to record the total income, the transfer of the taxable income to the newly created company within the same group, in the period of their exemption from the tax payment, along with loss records by the parent company , calculating the tax on profit by the incorrect application of the law, no-calculation of the tax revenues from economic activities by certain nonprofit organizations, not recording differences or income tax obligations in the accounts established by the audit;

- **The value added tax:** the misapplication of the deduction system, not including certain operations which fall within the VAT tax base or not including all invoices in the tax base calculation, not highlighting and not transferring to state the VAT for the advances received from customers, failure to register as Payer once the minimum threshold was surpassed, the issuing of tax receipts and VAT invoices without the trader to be paying and without incurring and transferring VAT, "computation error", etc., are just some of the methods used to defraud the VAT;

- **The Wage tax:** tax exemption for all amounts paid to employees as wage income, not withholding and paying the taxes due on those wages on account of those workers employed on civil conventions or laborers, failure to pay the tax obligations on wages, non-compliance on the tax law, aggregation, tax exemptions and discounts, etc.

- **The Excise tax:** not including all taxable amounts in the tax base, reducing the tax base by undervaluation of imported goods, by using double customs documents, not calculating the excises for alcohol concentration changes, not including the excise tax in the sale price of the products which require excise, not highlighting the excise duty in accounting, avoiding excise

duty by changing the names of the products demanding excise and transferring them to a product category which doesn't owe excise taxes, having reduced rates (for mineral oils, alcohol, etc.).

- *Other taxes and fees owed to the state or local budgets*: highlighting in accounting, buildings at lower values than the actual ones, failure to submit declarations regarding heritage buildings, means of transport in possession and owned terrains or under management operators, declaring erroneous data, Failure in constituting and paying the dividend tax and its wrong calculation, individuals not declaring their incomes for various activities, etc.

3. Research results:

Table number1 shows the data published by the National Tax Administration Agency on fiscal discipline at the national level (in Romania) but also the attitude of the competent bodies in the discovery and punishment of fraudulent tax evasion, data concerning the number of checks and their results for the period 2003- 2009. It may be noted that although the number of checks performed by the control decreased during the period 2003-2009, the frequency of cases of tax evasion has increased. Of course, fewer checks lead to a lower probability for a taxpayer's evasion to be discovered and more than that, it doesn't have a positive impact on the degree of tax compliance of the romanian taxpayer.

Table number 1. The evolution of tax evasion in Romania over year 2003-2009

Nr. Crt.	Indicator	2003	2004	2005	2006	2007	2008	2009
1	Number of checks	446.822	273.020	286.903	259.032	278.623	282.764	276.544
2.	The number of identified cases of tax evasion	195.425	120.077	115.158	181.630	195.982	198.603	212.559
3.	The frequency of tax (%) (2/1*100)	43,70	44,00	40,10	70,01	70,33	70,23	76,86
4.	The total value of the identified tax evasion (thousands of Ron)	798.900	982.350	1.746.304	1.552.673	1.774.060	6.728.000	9.910.000
5.	The total number of applied penalties (thousands of Ron)	1.804.700	1.984.522	1.137.326	1.044.421	1.257.745	1.036.000	2.418.000
6.	The additional drawn amount of money (thousands of RON) (4+5)	2.603.600	2.966.872	2.883.630	2.597.094	3.031.805	7.764.000	12.328.000

Source: National Tax Administration Agency, and the author's own calculations

As far as Cluj County is concerned, the table number 2 and table number 3 are displayed below in accordance with the ITM Cluj activity reports for the 2007-2010. It is noted that since 2009, both the number of employers, including the contracts during the year and the number of employees have decreased. This leads, of course, to a decrease in the number of employers found to be practicing undeclared income, along with an increase number of people identified as working illegally. Analyzing national campaign for detecting and combating undeclared work in Cluj County, in various fields, there is an identification of a large number of unauthorized workers in the construction industry. Based on statistics, national campaigns in certain sectors, which didn't use black labor, did not even refer to this area in the coming years.

Table number 2 . The evolution of black labor in Cluj County

Nr. Crt.	Criteria	2007	2008	2009	2010
		years			
1	Number of verified employers	3.200	3.066	3.509	2.504
2	Number of employers discovered to practice black labor	523	567	551	176
3	Number of employees discovered to practice black labor	1.430	1.212	1.891	576
4	Applied penalties (thousands of lei)	2.126	1.788	1.929	1.112
5	Number of employers existent in records at the end of the year	22.840	23.517	21.485	19.690
6	Number of contracts recorded during the year	106.113	104.011	69.011	53.701
7	Number of contracts active at the end of the year	152.106	156.506	136.278	129.304

Conclusions:

Tax evasion is not a phenomenon specific only to Romania, or to countries with emerging market economies. The phenomenon is as old as the very existence of tax itself is.

The tax evasion doesn't fit into time or space boundaries. However, the extent of this phenomenon represents significant differences from one country to another, generally considering that in countries with unstable and dysfunctional economies, where corruption is manifested in full economy and tax evasion are "at home".

Tax evasion has consequences, primarily at the macroeconomic level, consisting in state's deprivation of income and thereby the opportunities for maneuver are decreased in both the economic and social fields.

On the other hand, entities that avoid paying taxes, having lower costs, will compete unfairly with those who meet their tax obligations and the first ones will distort the smooth operation of free market mechanisms, undermining some industries. Accepting and generalizing this phenomenon would undoubtedly lead to the suppression of the state.

Despite this, in modern times, this is impossible, given the fact that the private initiative was never able to provide social and economic balance to a nation. Now, more than ever, it is universally acknowledge that, during the global economic crisis, the market economy is not a business model to ensure continuous prosperity to those who adopt it.

In conclusion, tax evasion is equal to a "cancer" and it affects the civil and political society which would be around 25% of the budget of a developed country, reaching an impressive percentage in developing countries. Hence, the state must maintain a fair level of taxation in order to keep away the tax evasion phenomenon and to provide diversified and sufficiently severe penalties, fighting for this cause.

A BEHAVIORAL APPROACH TO THE GLOBAL FINANCIAL CRISIS

Dedu Vasile

The Bucharest Academy of Economic Studies

Turcan Ciprian Sebastian

The Bucharest Academy of Economic Studies

Turcan Radu

University of Oradea

The purpose of this paper is to reflect the behavioral biases that led to this global financial crisis. The paper presents briefly the real causes of the crisis (structural and cyclical factors) and puts a greater accent on the behavioral factors. The authors considered to structure the paper in three main pillars: behavioral factors, the collapse of ethical behavior and the role of behavioral finance in studying, regulating and assessment financial risks. The first pillar consists in a brief presentation of the behavioral factors such as: optimism and wishful thinking, overconfidence, greed, regret, pessimism, passing the responsibility, herding - groupthink, anchoring, representativeness biases, informational cascades and “this time is different” syndrome. The second pillar of the paper presents the collapse of ethical behavior that led to the global financial crisis: predatory lending practices, inappropriate compensation schemes, rating agencies behavior, corporate governance reforms and financial institutions opacity in their reporting. The third pillar presents the mismanagement of risk and regulations that led us into this global mess. The paper concludes with the need of integrating biases of human behavior into regulations in order to make them more effective and people become less financially vulnerable.

Keywords: Behavioral finance, regulation, crisis, biases, ethics

Jel Classification: D23, D82, G01, G15, G20, G28

Many reputed professors in economics like Robert Shiller (“Irrational Exuberance”), Nouriel Roubini, Stephen Roach (Morgan Stanley) and analysts from the Bank of International Settlements have been feted for foreseeing the global financial crisis (*Karabell, 2009*), but none of them could see the exact form that it would take and the timing of its onset and ferocity. The risk of the system as a whole rather than of any specific asset or institution has been mismanaged for more than a decade, being precisely the reason for all the imbalances in the global economy and the subsequent global financial meltdown. Individual risks have been small and often properly managed but the risk to the system as a whole was huge and nobody took serious care of, causing global interconnected imbalances that no single authority could manage.

Asset bubbles and financial crises are not new to mankind. Even if risk managers tend to call them “six sigma events” or events that happen a couple of times in a hundred years, actually they happen more frequent. The first asset bubble and burst happened in 1636-1637 (the Dutch tulip mania) and many further examples can be given: the crisis of 1825, 1873, 1890 (Baring Crisis), the panic of 1907, which started in the US after the stock market fell close to 40% from its peak (*Kamalodin, 2011*), the Great Depression (1930s), the Latin American debt crisis (beginning in 1982), the Stock Market Crash (1987), the crisis after the Technology bubble in 2000, the Nordic Financial Crisis (1990s), the European currency crisis (George Soros’s speculations against the sterling pound), the Tequila effect (the massive devaluation of Mexican Peso, leading to a bank crisis), the Asian Flu in the second half of the 1990s, the Brazilian fever and the Russian Cold causing LTCM to fill for bankruptcy, endangering the US financial system (1998). Flash Crash is another “six sigma event” and refers to the US stock market crash on May 6, 2010, in which the

DJIA plunged about 900 points (about 9 percents) only to recover those losses within minutes. It was the second largest point swing, 1010,14 points and the biggest one day point decline, 998.5 points, on an intraday basis in DJIA history (Wikipedia). The only **common denominator** of all those events is **human behavior**. Studying the crisis from a behavioral perspective, allows us to understand how human psychology (so called “**animal spirits**” by Keynes) drives the financial actors’ decisions and the human behavior impact on economics and financial markets. When anxiety, emotional pain and behavioral biases interfere in the judgments and decisions about risk and reward, the success can be systematically compromised. A behavioral approach in studying the “animal spirits” that led to the current global crisis, might lead us to understand what must be changed in society, in economic thinking, in principles, in the approach to economic events in order to avoid similar scenarios in the future (*Florescu, 2009*). We have to learn lessons from the past crises but the solutions applied successfully then might not resolve the problems from now.

According to Daniel Daianu (2008) the roots of the current crisis might be found at both macro and micro level, classifying them in **structural and cyclical factors**: *Structural factors*: the increasing role and the complexity of financial markets in the financial intermediation, securitization that spread the risk across national borders due to globalization, making markets less understandable (opaque), inadequate risk and econometric models, conflict of interests among market participants (CEOs, independent directors, financial institutions vs. customers, rating agencies), intensive run for short term profits (promoting greed and hubris) without regarding the long-term goals (inadequate compensation schemes), imbalances in saving and spending of a number of countries and not last, the over reliance on the self-regulatory virtues of markets. Among *cyclical factors* might be the excessively low risk free interest rates in major economies promoted by authorities in order to avoid a deflationary bust after September 11. Through easy money policies, it has been made easier than ever the use of high leverage in all sectors, including household sector through sub-prime mortgages, corporate sector and thus the financial system as a whole.

The increase in leverage at a systemic level through financial innovations, introduced fragility into the system without noticing for a long time. The acerb competition among financial institutions and the continuous run for high yields, made them to lose lending standards and increase the use of credit derivatives. Due to the complexity in the design of financial innovations, the accounting and reporting standards used for more than several decades, could not reflect and integrate the whole embedded contingent liabilities, leading to opacity and making very difficult to value them especially in moments of increasing uncertainty in the financial markets.

From a **behavioral point of view**, the behavioral factors of the global financial crisis might be multiples. There are so many behavioral biases involved in the investment decision process leading to crisis, that we could write a book about them. Unfortunately we will have to resume to a brief presentation. The main **behavioral factors** met are:

- *Optimism / wishful thinking*: household sector, corporate and the financial sector have increased the use of leverage, underestimating the fragilities and the imbalances that might appear. They all had the illusion that interest rates will remain for a prolonged period at very low levels; there will be liquidity available for all, causing the so called “Irrational Exuberance” (Shiller) necessary for the asset bubbles. The optimism caused even predatory lending practices and the collapse of ethical behavior, in the permanent search for higher yields. They all underestimated the risk of costs while overestimating gains.
- *Greed and over indebtedness*: the mentality of people: “Get rich or die trying” or “Buy now, pay later”.
- *Regret*: manifested after the asset bubble burst, when panic conditions installed and everyone wanted to have a ticket for the so called “flight to quality” program. No one

wanted to admit from the beginning that he was probably wrong – despite evidence, so they wanted for confirmation data (confirmation bias) until the panic and pessimism burst.

- *Herding behavior and Group thinking*: individuals tend to mimic other people's gestures and decisions. During the dot.com bubble they all wanted to have a slice of the grubstake, and when the bubble busted, they wanted to get out all together, if possible in the same time. There is so called "social pressure to conform" with the crowd, even among professionals and financial markets analysts (reputational risk). Herding tends to reduce regret, because mimicking others behavior, makes you feel more comfortable that you did not perform worse than your peers (*Muradoglu, 2010*). Herding amplifies economic and credit cycle effect, as decisions become more uniform (*Rizzi, 2009*). Before 2007 almost nobody doubt about risk models, now it's a real fashion among researches to doubt risk management practices.
- *Informational cascades*: "It's more likely that I'm wrong than that all those other people are wrong. Therefore, I will do as they do." (Wikipedia)
- *Pessimism*: the downturn came when investors adjusted simultaneously their positions triggering a decline in asset prices (*Rizzi, 2009*). October 2008, was probably the moment when the level of irrational pessimism was the highest in a generation (*Martin, 2008*).
- *Overconfidence*: risk managers and investors had the illusion of control by using quantitative risk models; but they did not understand their limitations (Nassim Taleb)
- *Passing the responsibility*: Risk managers used to internalize success while externalizing failures. They attributed success to their skills of predicting the markets, managing individual risks, while passing the responsibility on FED, SEC, speculators, or any other authority, but not ever recognizing that it was only, and absolute only their fault for not taking cautionary measures, not having a contingency plan.
- *Anchoring*: people anchored their expectations based on past data (years of euphoria)
- *Familiarity biases*: many actors had the illusion that they knew what they were doing. Even Greenspan (2008) finally admitted that he was "partially" wrong.
- *Representativeness biases*: people tend to see patterns where they are not, based on stereotypes. Trading financial markets is not a science but an art, that's precisely why you cannot ever rely on past events and statistics in order to predict the risks of the future. People assumed to continue the "easy money" policies for an indefinite term and the housing prices market would not decline as a whole.
- *"This time is different" syndrome*: people were convinced that housing prices would continuously increase and the stock markets overall will get higher and higher.

The collapse of ethical behavior of many actors in the financial markets was probably the most important factor that endangered the viability of the financial system as a whole. If twenty years ago, people obtained their mortgages from their local bank officer, having a close relationship with him for years, nowadays, people obtain their mortgages from agents that come "out of the blue" convincing to finance / refinance their home just like an ordinary car assurance. The agents were paid exclusively on quantity ("*How many mortgages did you bring me today?*") not quality ("*How many good mortgages you bring me today?*") (*Greycourt White Paper*). Agents struggled for selling as many mortgages so they could afford the comfortable living they needed, without ever taking in considerations the risk of default for the contracts signed – "*I have to close thirty loans a month, because that's what my family's lifestyle demands*". The atmosphere among agents „*was like this giant cocaine party you see on TV*" - „*It was like this giant rush of urgency.*" – according to Sylvia Vega Sutfin, an ex account executive at BNC Mortgages. Agents recurred even in falsifying documents and lying people about the real cost of the mortgages: "*Every closing that we had really was a bait and switch*", „*'Cause you could never get them to the table*

if you were honest." Some of them were very creative in falsifying documents: „*They used scissors, tape, Wite-Out, and a photocopier to fabricate W-2s, the tax forms that indicate how much a wage earner makes each year. It was easy: Paste the name of a low-earning borrower onto a W-2 belonging to a higher-earning borrower and, like magic, a bad loan prospect suddenly looked much better.*” (Hudson, 2010). Nobody cared about those practices, because nobody ever thought of carrying the paper on their own balance sheets. Once a mortgage was signed and approved, the agent got paid and would never see again the borrower again. The lenders (Mortgage companies) soon afterwards sold them all further to investment companies that securitized them in a pool, and got also the papers off the balance sheet by selling as an innovative financial product to other investors from all over the world. Lending money and underwriting standards declined since it was in no one’s interest to hold the loans in their books, but concentrate on volume and pass the risk to greedy and naive institutional investors. The lenders made lobby among politicians, lawmakers and other influential figures (the so called „Friends of Angelo” (FOA) VIP Loans program that offered below market terms on mortgages for affluent people) (Darrell, 2009) to attract the support of authorities for the subprime market. Their argument for support was making the American Dream come true and making houses affordable for every citizen. Attracting Government Sponsored Entities like Fannie Mae and Freddie Mac into this business, made possible that risk to be „nationalized” and profits „privatized”. Practically, the risks were passed to them, because they were the entities among other greedy private investors that hold billions of dollars worth of these mortgages on their balance sheets.

Rating agencies were the one who should have protected investors from buying risky financial products, but probably they did not understand the risk very well, either. Probably the rating agencies did not have enough information about the „content of the packages”. Even the brightest minds and quants of Wall Street, nor regulators did not fully understand what was happening in the markets. Some voices argue that the rating agencies should have foreseen the high default rates for subprime borrowers, and they should have given these CDOs much lower ratings than the 'AAA' rating given to the higher quality tranches. If the ratings had been more accurate, fewer investors would have bought into these securities, and the losses may not have been as bad (Petroff – Investopedia). How could they do that, knowing that they receive fees from the security’s creator, how could they maintained their objectivity when running the risk of the underwriter going to a different rating agency that would sell their ratings for a higher bidder?

More ethical failures can be seen among the bonuses that many top executives received even if those „performances” were because of taking too much risk, endangering their companies and causing the global financial meltdown we are passing through. All the compensation schemes, profits, glory and keeping the job measures made people have the will of taking more and more risk, even if they half suspected that it would end badly. Shorting the securities you are selling to your clients cannot be called ethical job, but it’s legal (Greycourt, 2008). That’s precisely what Goldman Sachs did and proudly said it in the 3rd quarter of 2007 Report („*Significant losses on non-prime loans and securities were more than offset by gains on short mortgage positions*”). Customers and investors of the so called „innovative products” were abandoned when they need to convert them in cash, besides of the fact that previous buying them they were assured (banks ensured that the auctions would not fail) of being „*Safe as cash but with a higher yield!*” (Greycourt, 2008). The main problems with banks were that they assumed risks and role that should not have had. Commercial banks are not investment funds, nor hedge fund to take risks, are leverage of more than 25-30 times their equity. Banks have a different role in the financial system. There is more than an ethical issue here, is a behavioral matter: group thinking and herding. Chuck Prince (ex-CEO of Citi) once said: „*When the music plays you have to dance*”. No one would listen to risk managers in good times. Corporate governance reforms

stimulate instituting independent directors or non-executive board members, committees composed of independent directors. They are supposed to induce more rationality, ethics in corporate governance and a fostering debate of flawed exposures policies before they become lethal – render corporate disasters rarer. Morck (2007) say that corporate officers and directors are more loyal to their direct boss (CEO) than to their shareholders and to the law (Enron, WorldCom, Hollinger, AIG), even under clear signs of impending financial doom. Behavioral factors, such as cognitive dissonance, reciprocal favor trading or group conformity may significantly weaken the independence and the authority of directors. According to Higgs Report (2003), almost half the so-called independent directors on British boards were recruited by the CEO through personal contacts or friendships. There is no wonder why we have got into this mess.

Financial markets have been understood based on conventional assumptions of rationality, profit maximization and being informational efficient (EMH), using complex econometric models. Standard models are being put in doubt because they do not take in account the whole picture, especially the behavioral aspects of the markets. As human beings, we have the tendency to make mistakes, to have biases and interpret differently the information available, depending on our own state of mind. People cannot be called rational agents, but „animal spirits”, just like Keynes said. David Tuckett (2009) finds the reason why so many people rely on economic and finance modeling, without questioning too much about their validity: the comfort value of mapping the future. The complex calculus, tables, statistics, charts and many sophisticated and less intelligible information, *„manage anxiety and to create the impression that risk is being managed. Such stories disguise the fact that in many ways we have not come very far from the casino.”* But uncertainty and risks cannot be managed without taking in consideration the emotional part of the decision making process: imagination, desire, behavioral biases like herding, confirmation and many heuristics that provoke anticipated financial consequences depending on the context - *„...financial markets will always tend to be subject to greed, over-excitement, anxiety and panic and divided states of mind”*. (D. Tuckett). Probably the world’s most prolific skeptic about risk models is Nassim Nicholas Taleb. *„Taleb says that Wall Street risk models, no matter how mathematically sophisticated, are bogus; ... risk models have done far more harm than good. And the essential reason for this is that the greatest risks are never the ones you can see and measure, but the ones you can’t see and therefore can never measure. The ones that seem so far outside the boundary of normal probability that you can’t imagine they could happen in your lifetime — even though, of course, they do happen, more often than you care to realize (Nocera, 2009)”*. Taleb detests the original VaR - portfolio risk management tool, because it is based on the past two decades of euphoria data when predicting the risk. Taleb is more concern of the risk that models do not take in consideration, the 1% case event, the so called „six sigma events”, „fat tails” or „black swans”. According to him, *„Any system susceptible to a black swan will eventually blow up.”* David Einhorn, the founder of Greenlight Capital hedge fund, affirmed the useless of VaR as a risk management tool, because *„its use creates a false sense of security among senior managers and watchdogs. This is like an airbag that works all the time, except when you have a car accident.”* (Brown, 2008). Goldman Sachs realized the limits of VaR and the potential loss that might arise from a subprime market meltdown and decided to „get closer to home” – reducing the overall exposure to the residential housing market: *„We proceeded to sell certain positions outright and hedge our long positions in an attempt to achieve this result”* (Testimony) though it lost money on residential mortgage products in 2008 (Harper, 2010). Our personal belief is that you cannot blame equations for being wrong. As Nocera stress it: *„The math alone was never going to be enough”*. You know the principle „garbage in, garbage out” - the most important thing is the data input in the models. As long as the data will include behavioral aspects of the markets (the equations / indicators will be adjusted to the moods of the markets), the models

would do a good work. No one of us is perfect so we couldn't blame models for not being perfect. Humans are error-prone. As a trader, as an investor, as a risk taker or manager you have to always consider the human condition. What matters most in trading is how much money you lose when you are wrong and how much you win when you are right. Nobody is right all the time. Nobody could be consistently Mr. „Know it all”. LTCM considered knowing it all and you all know the story -, „*There are two kinds of people who lose money: those who know nothing and those who know everything*”. *With two Nobel prize winners in the House, Long Term Capital clearly fits the second case*” (Robert Lenzner).

The lack of financial institutions and regulatory oversight over the risk – creating behaviour of mortgage lenders and repackages (Grosse, 2010), over the valuations that were assigned to make this mess happen. Neither securitization, nor complex derivatives instruments should be prohibited, but there is a clear need of improvement in regulation. As Jesse Livermore puts it, „*Wall Street never changes, the pockets change, the suckers change, the stocks change, but Wall Street never changes, because human nature never changes*” – the solution might be regulating greed and speculation. There is need for integrating greed and all the biases of human behavior into regulations, to make it more effective. Even Alan Greenspan, former FED chief and a vehement opposer of regulation, admitted he was „partially” wrong to resist regulation of derivatives – „*Partially, ...I made a mistake in presuming that the self-interests of organizations, specifically banks and others, were such that they were best capable of protecting their own shareholders and their equity in the firms*” (Clark & Treanor, 2008)

As a **conclusion**, we think that an external constraint is needed when the market alone cannot optimize social welfare because of its imperfections, inefficiencies and participants' psychological characteristics, such as: greed, hubris, jealousy, fear, ignorance, group thinking, herd behaviour, incomplete information and lack of knowledge. Once we form a profound understanding of our own psyche, we should be able to manage better the impending crises.

THE VALUE ADDED TAX AND THE EVASION CHAIN OF INTRA-COMMUNITARIAN VAT

The relationship IRS – taxpayer runs the risk of turning into a psychological war in which, however, given the positions held, the IRS is by far on a favorable footing. Between the apparently excessively formal position held by the IRS, which seems to conceal behind the laws, and the sometimes forced interpretation of the laws, by the taxpayer, there are the courts of law, also disturbed by the legislative changes which appear to have entered a perpetual motion.

The objective of the fiscal administration regarding the value added tax is to combat tax evasion and fraud. It is very important to combat evasion in the VAT field because it represents the indirect tax of the largest share in the consolidated general budget. VAT evasion represents the intention of not paying the tax, withholding or not declaring it, or requesting its refund which would not be fit, due to the exaggeration of the deductible amount of the VAT. The essential aim of the IRS inspector is to verify the correctness of the declared amount of the value added tax. It should also be observed whether the incorrectness is deliberate or whether it was due to misunderstanding, carelessness or the ignorance of the payer. In all cases judgment is necessary, as for the cases of negligence the amount to be paid must be corrected and accompanied by applying fines and / or penalties, and in the cases of intended fraud legal actions are to be applied in order to obtain a conviction. Deceitful deductions represent other methods for tax evasion and are undertaken based on fake invoices, invoices often used several times for deduction, or invoices related to purchases that have never been made. Thus there are examples of economic agents who have practiced the right to deduct the VAT due to the acquisition of goods which consisted in the property of other economic agents. In other cases noticed was the deduction of VAT on goods or services that were not included in the activities of the economic agent who purchased them. Registration errors seem innocent, but they occur frequently and have a high value; for example, some economic agents do not calculate the Value Added Tax at the receipt of advanced payments from customers but when the goods are delivered.

Keywords Value added tax, intra-communitarian acquisitions, IRS inspector, deduction, taxpayer

JEL Classification G2, H2, H3

I. Introduction

The value added tax represents the revenue of the state budget, included in the category of indirect taxes, which apply to the operations regarding delivery of tangible assets, transfer of property regarding fixed assets, the import of goods, supply of services, as well as the corresponding operations.

The tax becomes applicable when the legal conditions are set, necessary for the retention of the tax.

The value added tax becomes payable when the IRS becomes legally entitled, at a certain time, to require payment by the persons liable for tax payment, even if the payment may be delayed. The action becomes applicable usually on the date the goods or services are supplied, unless otherwise provided by law.

For imported goods subject to customs duties, agricultural duties and other similar communitarian charges, established as a result of a common policy, the VAT becomes applicable when noticed and the respective communitarian taxes are due.

If imported goods are not subject to communitarian taxes previously foreseen, the VAT would become applicable when due if imported goods were subject to such taxes.

If, when imported, the goods are subject to a special customs regime, the tax becomes applicable on the date these cease to be subject to such a regime.

The tax becomes applicable on the date the goods or services are delivered, in accordance with the exceptions provided in the Fiscal Code of Romania, namely:

- on the date when the invoice is issued, before the date when the tax becomes applicable;
- on the date the deposit is cashed, for advance payments made prior to the date when the tax becomes applicable. Exempted from these provisions are deposits cashed for the payment of import and the VAT for import, as well as any advance payments made for operations exempted from tax payment or not subject to be taxed. The advance payments are considered to be the partial or full payment of the value of goods and services, performed before the supply thereof;
- on the date of cash withdrawal, for supplies of goods or services, performed by automatic vending machines, gaming or other similar machines.

In the case of an *intra-communitarian acquisition* of goods, the tax becomes applicable on the due date for applying tax on the delivery of similar goods, in the Member State where the acquisition is performed, and the tax becomes applicable on the date the invoice is issued to the person performing the acquisition, taking into consideration the entire value of the goods supplied, but not later than the fifteenth day of the month following the month in which the tax became applicable.

The taxable amount for the import of goods is made up of the goods' value at customs, determined in accordance with the customs legislation in force, plus any taxes, fees and other charges due abroad, as well as those due following the imports to Romania, except for value added tax to be levied.

The taxable amount includes incidental expenses such as commissions and packing costs, insurance costs, transportation costs, incurred up to the first destination of goods in Romania, if these expenses were not included in the taxable amount. The first destination point for the goods is considered the destination indicated in the transportation document or any other document accompanying the goods, when they when these enter Romania, or, in the absence of such documents, the first place for unloading the goods in Romania will be considered.

The taxable amount for the import of goods does not include the following:

- Rebates, discounts and other price decreases granted by suppliers directly to customers on the day the tax is due;
- Amounts representing damages, determined by final and irrevocable court decisions, penalties and other amounts requested for the total or partial failure regarding the fulfillment of contractual obligations, in case these are set as additional to prices and / or rates which have already been negotiated on and established. Any amounts which, in fact, represent the value of goods delivered or services rendered, are not to be excluded from the taxable amount;
- Interests received after the delivery date, for late payments;

- The value of packaging and encasing exchanged between suppliers and customers, with no billing.

For the intra-communitarian acquisitions of goods the taxable amount is determined based on the same elements used to determine the taxable amount for the delivery of the same goods within the country.

If the elements used to determine the taxable amount for an import of goods are related to in foreign currency, the exchange rate is determined according to the communitarian provisions governing the calculation of value at customs.

When the elements used to determine the value at customs are set in a currency other than the national one the exchange into lei of the value at customs is to be performed according to the exchange rate recorded in the last but one Wednesday of the respective month and published on that same day. The exchange rate recorded during the last but one Wednesday of the month is used during the next month if it not replaced by an exchange rate determined according to Art.72 of the tax code. If the exchange rate is not registered on the last but one Wednesday or, if it is registered but it has not been published on that certain day, the exchange rate which was last recorded and published in the previous 14 days is to be considered the official exchange rate and registered for that respective Wednesday .

If the exchange rate recorded on the last Wednesday of the month and published on that particular day differs by 5% or over the exchange rate set according to Art. 71 to enter into force next month, the exchange rate replaces the latter one starting with the first Wednesday of the respective month. If within a certain period of application, the exchange rate registered on a Wednesday and announced on that same day differs by 5% or more compared to the rate referred to in this chapter, it is to replace the latter one and enter into force the following Wednesday. The replacing exchange rate remains in effect for the rperiod of time left of the current month, if it is not to be replaced.

If the customs authority accepts, at the request of the declarant, to provide or submit later on some details regarding the declaration on the free circulation of goods, in the form of a global statement, either periodic or reawarding, the use of a single rate may be set for the exchange into lei of the regarded elements used to determine the value at customs, given the case when they appear in currencies other than the national one. In this case, the rate used is the one which is valid on the first day of the period covered by the respective customs declaration.

If the elements used to determine the taxable base of a transaction, other than the import of goods, are set in foreign currency, the exchange rate to be applied would be the most recent exchange rate announced by the National Bank of Romania or the exchange rate related to by the bank hosting the settlements, according to the date by which the taxing of the transaction in question is to be performed and due.

II. The evasion chain of the intra-communitarian VAT

According to our opinion there is a clear split between the economic and the legal background relating to the deductibility of VAT and its form, a break which should be resolved by allotting priority to the form over the essence.

The stake of the issue in question is all the greater as the data missing from the justificative documents appear to deprive them of legal effects, so that together with the non-deductibility of VAT, there may also occur issues related to the non-deductibility of expenditure related to the calculation of the tax on profit *“non-deductible expenses registered in the bookkeeping, which are not based on a justificative document according to the law”*.

We believe that this manner of settlement is the source of conflict between the IRS and taxpayers in what concerns the VAT deductibility issue, and consequently the deductibility of expenses related to the tax on profit.

Questioning a rational solution based on the economic reality, we have to consider, in fact, issues related to the IRS power to ascertain facts or to assess the impact of the lack of some information which should be included in the justificative documents.

If we refer only to the minimal content of the documents, we may note that the legislator himself is not constant in this direction, as even some justificative documents signed the legislator do not meet minimum content requirements. For example, the VAT paid at customs is justified on the basis of a customs declaration or a document issued by the customs authority (regularization decision), documents which contain the essential data regarding the transaction (the contracting parties, the taxable amount, the tax value, etc.), but do not contain other elements such as the tax regime applied by the vendor.

As we already mentioned, we fully agree that these documents contain relevant data and, moreover, are validated by the customs authority.

Consequently, the lack of evidence precludes the strict interpretation and enforcement of tax provisions, and in the opposite direction, their certification by the customs authority confirms the effectiveness of the payment which is subsequently required to be refunded (deductible), thus making the double taxation impossible.

The inadequacies among legal provisions can be outlined in other areas. Thus, if the Tax Code establishes a priori by its content the quality of justificative document for the documents supporting the underlying transactions, the Law of Accounting confers that particular status only after the document was entered in the bookkeeping (Article 6: *Any undergone economic-financial transaction is recorded at the time of its development by a document underlying the accounting records thus acquiring the quality of justificative documentation*).

We do not want to allow priority to either of the two regulations, but we must point out that the “tax status” of a society is based, as a starting point, on the “bookkeeping status” (the tax control itself based on the bookkeeping status, on information resulted from the bookkeeping).

In this regard, a striking example is the purchase of fuel; this is because the tax receipts issued by the cash register do not contain all the elements required as mandatory for justifying the deduction right, moreover in the case of the receipts due to purchases from individuals.

Their registration in accounting (proof of entry of goods into inventory, according to sect. A para. 2 of methodological rules of OMFP. 1.850/2004) confers these registrations the status of documentary evidence, according to the Law of Accounting.

It is more than obvious that the presence of these non-unitary provisions led to an inconsistent practice of the IRS – and of the courts - which has always swung between the core of the problem and its shape.

III. Conclusions

We may note that the activity of both the IRS and the law courts (especially the high-rank ones) has steadily pursued the formal application of the laws, without applying the assessment capacity which they were provided with by law.

The justification of such behavior is even more incomprehensible in the case of the law courts, particularly in the case of the High Court of Cassation and Justice, which, as we have noticed, does not apply a minimal consideration of the violation of neutrality and the avoidance of double taxation those situations where the evidence fully demonstrates compliance with the basic conditions of the deduction.

The effects of such practices transcend from the VAT towards the tax on profit, so that, if the conditioned period of time the taxpayers are able to regulate the deductible tax through the VAT deduction, this is no longer possible in the case of tax on profit.

On the other hand, the invoice - if we refer only to this justificative document - along with the start of contract execution, in terms of commercial and civil regulations would replace the lack of

a written contract. Per a contrario (when something is stated and the contrary is denied), except for the cases expressly prohibited by law (e.g. real estate sale), the invoice may be regarded as the contract between the parties. On hand such a practice, both tax authorities and the courts do nothing but disassociate the justificative value of the invoice as supporting evidence regarding the authenticity of the analyzed commercial transaction.

Specifically, we find that the invoice may replace the justificative document to collect VAT (the VAT rejected at repayment becomes collected tax with the related obligation to pay) or for including in the accounts of a non-deductible expense, but can not justify the right to deduct both of deductible VAT and the expense involved.

In fact we talked about tax neutrality and the avoidance of double taxation and the result would be the following: *the tax authorities may calculate taxes using the documents (even fictional ones, as we noted in the previous examples) which do not act as supporting documents, these not having the same value when it comes to the return of sums the taxpayers are deprived of as a result of applying implicit sanction due to lack of observance regarding formal requirements.*

Such an activity is even more serious if the missing elements of the documents that do not meet the formal requirements of the law refer to the beneficiary (the person audited by IRS). These shortcomings, in the presence of fair practice, should be allowed to be supplemented even during the inspection.

We must not forget that the probative value of commercial bills is complemented by other evidence, which together show the state of fact of the controlled transactions.

For example, O.M.E.F. no. 2.421/2007 states that justification of exempted actions with possibility of deduction will be based on the documents presented in the Instructions included in the Annex to the Order. One such example is the justification for the exemption with deductibility in the case of intra-communitarian supplies, based on the following documents:

- The invoice must contain the information referred to in art.155 par. (5) of the Tax Code, as amended and supplemented, and must also include the registration code for VAT purposes assigned for the buyer in another Member State;
- The document certifying that the goods were transported from Romania to another Member State;
- And, where appropriate, any other documents, such as: contract / order of sale / purchase, insurance documents.

Another example is the tax norm by which taxpayers are required that they should declare twice a year to the tax authorities all domestic deliveries and acquisitions by submitting the procurement no. 394, with the possibility of a cross-check from the IRS. Such a cross-check can be done even at European level through the VIES and INTRASTAT statements so that, by reasonable efforts, the IRS may lead to those transactions which are not covered by the right of deduction.

Without insisting on such additional evidence, we consider that in what VAT is concerned there is an aggregate mechanism for tracking the actions undertaken through the documents which have to be submitted by the taxpayers (log of sales / purchases, the VAT deduction).

Actually, the discussion on justificatory documentation and their completion with other data results finally in ascertaining whether tax authorities do or do not have a say in determining the tax status quo.

A first piece of legislation that gives the IRS such a right is exactly art.11, para. (1) of the Tax Code, according to which “in determining the amount of tax or fee (...) tax authorities may not consider a transaction that has no economic purpose or may recommit the form of a transaction to reflect the economic substance of the transaction”.

In addition to recognizing a right to assess the tax status of the analyzed transactions, in terms of this provision in the Tax Code, the doctrine reveals that the legislator has indicated the

framework, even within the Code, of the principle regarding the prevalence of the economic character over the legal one.

The right of assessment is accompanied also by the correlative obligation which is stated in Art. 6 of the Tax Procedure Code (Ordinance no. 92/2003) according to which the tax authority is directed towards assessment, within its powers and duties, of the *relevance of tax status and towards adopting the solution according to the law, based on the complete findings on all the clear circumstances involved*.

In addition, Art.7 para. (3) of the same legal document provides that “the fiscal authority is required to examine the facts objectively, as well as to advise taxpayers on filing of returns and other documents, in order to correct statements and documents, whenever appropriate”.

In conclusion, we believe that tax control authorities can and must take into account all those factors which may lead to the proper settling of a state of fact, and if the lack of an item in a document can be complemented by other relevant evidence and by a reasonable effort, the refusal to recognize the right of deduction can be interpreted as a breach of legal obligations.

The prevalence of substance over form regarding the communitarian performance, resulted also from the Decision V/2007 of the High Court of Cassation and Justice, is clearly in contradiction with European law and practice, so it is difficult to understand its content, given that, when issued, Romania was already an EU Member State, so the Decisions of the European Court of Justice were binding.

Moreover, we note that since the date of accession, the Tax Code has been amended, and that regarding the VAT deductibility no significant changes were made in order to adjust to the communitarian court decisions.

Using the principle of fiscal neutrality, the European Court of Justice ascertains in its decisions that, in applying the common system of VAT on transactions of goods and services, the tax is proportional to the price of goods and services, regardless of the number of transactions that occur before the stage when the tax is definitely collected. Basically, it can be ascertained that the collected tax varies depending on the applicable share and on the value of goods and services traded.

DETERMINATION OF RESIDUAL VALUE WITHIN THE COST BENEFIT ANALYSIS FOR THE PROJECTS FINANCED BY THE EUROPEAN UNION

Droj Laurențiu

University of Oradea, Faculty of Economics

This paper will be later used within the Doctoral thesis: “The Mechanism of Financing Investment Projects by Usage of European Structural Funds”, which is currently under development at the University Babeş Bolyai Cluj Napoca, Faculty of Economics and Business Management, under the coordination of the prof. univ. dr. Ioan Trenca. An increasing debate is rising recently between the academic community, the business community, the private lending institutions(banks, investment funds, etc.) and the officials of the Romanian Government and of the European Union regarding the proposed method for calculation of the residual value in the European financed investment projects. Several methods of calculation of the Residual Value were taken into consideration and contested by different parties in order to prepare and to submit financial analysis studies for investment projects proposed to be financed within the European Regional Development Fund(ERDF). In this context, the present paper proposes to address the three main methods of calculation of the residual value and later to study its impact over the indicators, especially over the Internal Rate of Return, obtained in the financial analysis for an investment project proposed by a Romanian medium sized company. In order to establish the proper method which should be used for selection and calculation of the residual value previously published studies and official documentations were analyzed. The main methods for calculation of the residual values were identified as being the following: A. the residual market value of fixed assets, as if it were to be sold, B. accounting economic depreciation formula and C. by using the net present value of the cash flows. Based on these methods the research model was elaborated, and using the financial data of the proposed infrastructure investment was created a case study. According to the realized study a pattern was established for proper determination of residual value and for determination of IRR and methods A and C were proposed to be used. This paper tries to analyze a specific problem of the Romanian enterprises which access European funding, so it can be further used to improve the current methodology of the ERDF programme in Romania: Sectorial Operational Programme “Increase of Economic Competitiveness”.

Key words: Cost benefit Analysis, Residual value, IRR, Investment, Structural Funds, Valuation

JEL Codes: G30, O16, G32, G38, F35, C63, C12

Introduction

The integration of the Romania into European Union brought new opportunities for the Romanian private enterprises both concerning the accession of their products and services to the single market and also accession of additional co-financing for funding their business infrastructure investments(Droj, 2010). The issue of attracting European Funds for financing infrastructure investments is also tackled by the author within the Doctoral Thesis: “*The Mechanism of Financing Investment Projects by Usage of European Structural Funds*” which is currently under development at the University Babeş Bolyai Cluj Napoca, Faculty of Economics and Business Management, under the coordination of the prof. univ. dr. Ioan Trenca.

European funding is considered to be one of the hot topics in Romania and all over Eastern Europe since its novelty and its expected capacity to improve the life of the newly integrated European citizens both by financing public and private strategic investments in various fields of activities: public urban infrastructure, transportation services, agriculture infrastructure, social

and educational infrastructure, tourism and business public and private infrastructure, human resources, etc. One of the main goals of these European Funding programmes are to European Union Cohesion policies. As its main instruments and for improvement of the competitiveness of the “weaker” regions were established the European Regional Development Fund (ERDF) and the European Social Fund (ESF), otherwise known as the Structural Funds, as well as the Cohesion Fund. Through these instruments European Commission invests in thousands of projects across all of Europe’s regions to achieve its primary task: to promote economic and social cohesion by reducing these disparities between Member States and regions (European Commission, 2009). The budget of the Cohesion Policy €347 billion EUR for 2007–2013, represents the single largest source of financial support at EU level for investment in growth and jobs, designed to enable *all regions* to compete effectively in the internal market.

In this context, the private companies benefit of increased opportunities for accessing European Funding which gives them a better chance for increasing their competitiveness and for extending distribution of their products and services on the entire European market and beyond. The most important production infrastructure financing programme for the Small and Medium Enterprises(SME) operating in Romania is considered to be the Sectorial Operational Programme “Increase of Economic Competitiveness” (further referred to as SOP IEC) which offers financial support for the consolidation and modernization of productive sector through investments(Guvernul României, 2009).

The SOP IEC aims to strengthen the strategic focus of the Economic and Social Cohesion policies across Romania, and to make the correct and appropriate linkages to the European policies and the Lisbon Strategy for growth and job creation. In order to be financed within this programme the SMEs have to present a business plan containing a cost benefit analysis study. This analysis has as main goals to establish if the proposed investment is sustainable and has potential for generating further economic and financial growth for the company, in particular, and for the society in general terms. One of the most important aspect for a proper realized cost benefit analysis is the calculation of the residual value. Gapenski (2005:592) considers the residual value “much riskier than the other flows”. In this context this paper will cover the most relevant literature in the field and will try to estimate the differences between the most common methodologies used for obtaining a residual value in order to acquire an acceptable IRR.

The importance of the Residual Value – Literature Review and Research methodology

Seriously overlooked, recently, the establishment of a proper residual value for a proposed investment proves to be a key element for obtaining “acceptable” values for the indicators used in the financial analysis. Opinions regarding the most suitable method have been contradictory and transformed this issue in a problematic over the past years.

According to the “*Guide to COST-BENEFIT ANALYSIS of investment projects - Structural Funds, Cohesion Fund and Instrument for Pre-Accession*”(European Comission, 2008:36) the discounted value of any net future revenue after the time horizon of the project has to be included in the residual value. The same document concludes that this “is the present value at year n of the revenues, net of operating costs, the project will be able to generate because of the remaining service potential of fixed assets whose economic life is not yet completely exhausted”. If a sufficiently long time horizon will be selected this value can be also 0 or it should have a negligible value. But in practice this is not always the case, and it should be recorded either “as negative investment or as a benefit the salvage value of fixed asset or any remaining capacity to generate net revenues”. This is why the residual value is also considered to be the liquidation or terminal value(Damodaran, 2002:425) and is considered to have a big importance over the future value with direct implications in the determination of the IRR:

$$\sum_{t=1}^{t=n} \frac{CF_t}{(1+k_c)^t} + \frac{\text{Terminal Value}_n}{(1+k_c)^n}$$

The current literature recommends three possible methods for calculation of the residual value:

- Method A - first choice is by **considering the residual market value of fixed assets, as if it were to be sold** at the end of the time horizon considered, and of remaining net liabilities(European Commission 2008:36). In this case the residual value becomes also the terminal value that reflects the estimated value of the company at that point. This method was highlighted and analysed by several authors (Damodaran, 2002:426, Citybank 302, Livingstone and Grossman 2002:622, Kaliski et all, 2007:301, Helfert, 2001:53). This method is also based on respecting the International Valuation Standards (IVS) established by the International Valuation Standards Comitee(IVSC). Also the method is accepted by the Romanian Management Authority of the SOP IEC programme and is recommended to be used in 2011 SOP IEC call of proposals(Guvernul României, 2011). On the other hand the method is common in Romania to the practice imposed by ANEVAR(National Association of Romanian Valuers) which often use this method for enterprise or mobile goods valuation.

- Method B - by computing **the residual value of all assets and liabilities**, based on some standard **accounting economic depreciation formula** (usually different from depreciation for the determination of capital income taxes), method recognised by European Commission(2008:36) and Citibank(1994:300) and supported by members of several professional associations from Romania(especially CECCAR), but highly contested by the Romanian Management Authority of the SOP IEC programme and forbidden to be used under SOP IEC starting from 2011(Guvernul României, 2011). This method was one the most popular to be used, even if major project implementation specialists have drawn negative conclusions over its effectiveness.

- Method C - by computing **the net present value of cash flows** in the remaining life-years of the project. This method is also called the Gordon Growth Model and is appreciated by most of the specialists(Friedlob and Schleifer, 2003:212, Damodaran, 2002:426, Helfert 2001:231, Citybank 1994:301). Some specialists are also considering the Advanced Gordon Growth Model as it is presented below:

$$\begin{array}{l} \text{Residual value} \\ \text{(using Gordon} \\ \text{Growth Model*)} \end{array} = \frac{\text{Terminal year cash flow} \times (1 + \text{Growth rate})}{\text{Discount rate} - \text{Growth rate}}$$

On the other hand the supporters of this method have drawn several observations regarding the limits of the method, especially when concerning the fact that the growth rate cannot be maintained stable for a longer period of time and it depends also by external factors like fiscal and economic barriers or advantages. Also this method is not considered applicable by the specialists to a large number of companies for which seems impossible to maintain a high growth rate for several years in a row or to have the type of products and activities on a longer period of time.

After the determination of the residual value, the results have to be used in the calculation of the IRR/C and IRR/K as an input in contradiction with the costs of the investments which have to be diminished. For example, in case of a infrastructure investment, the value of the initial investment(including the ERDF grant) is considered to be a contribution with negative value(sign -), the values of the cash flows can be either positive or negative(depending on their real value) and the residual value is considered to bring a positive outcome of the project(sign +), since it is considered to bring additional value for the investment.

The Internal Rate of Return (IRR) is defined as the discount rate that zeroes out the net present value of flows of costs and benefits of an investment, that is to say the discount rate of the equation below(European Commission, 2008:212):

$$NPV(S) = \sum [S_t / (1 + IRR)^t] = 0$$

The authors draw the conclusion that the Internal Rate of Return is an indicator of the relative efficiency of an investment, with known deficiencies, and it should be used with caution. The European Commission(2008:210) brings to attention the fact that: if the sign of the net benefits, benefits minus costs, changes in the different years of the project's lifespan(for example - + - + -) there may be multiple IRRs for a single project. In these cases the IRR decision rule is impossible to implement. Another setback for using IRR can be the fact that IRR contains no useful information about the overall economic value of a project, fact recognized even by the European Commision(208:211) which encourages also the usage of the Net Present Value Method as presented below, to correct false results of the IRR method:

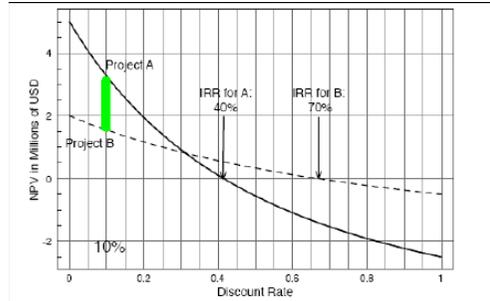

Fig. no 1 IRR and NPV of two mutually exclusive alternatives (Source: Ley, 2007)

Since the goal of this study is to determine which are the differences in the values of the IRR when considering the usage of different residual values(obtained through all presented three methods), in the following chapter we will set a case study using a project proposed by a Romanian production company which tries to access SOP IEC funding in 2011.

Case study – Evaluation of the residual value and of its influences over the IRR in case of a Romanian production company

As mentioned above, a production company which is intending to access European funding to co-finance its infrastructure investments has to fulfil several of the criteria established by the management authorities of the SOP IEC Programme. Some of these criteria are referring to the results of the financial analysis and especially of the results obtained by the Net Present Value and by the Internal Rate of Return Indicators. In the recent months contradictory discussions have been raising between all factors interested in the SOP IEC programme regarding the proposed method for calculation of the residual value in the European financed investment projects. The levels of the debates were extremely high, but no studies have been presented by the involved parties regarding the efficiency of the methods proposed over the final value of the IRR.

In order to test each method for obtaining the residual value Company Test A has been selected. Its activity is mainly production and its management are interested to expand the activity in the following years both as increasing the number of products on the market and also improving the existing products as highly qualitative ones with competitive prices in order to extend their current market abroad in Hungary, Bulgaria, Serbia and Republic of Moldova. The project consists in construction of a new high-tech production facility(4000 sqm) and acquisition of highly productive equipments in the field of plastic fibbers. The total value of the proposed project is considered to be 13,276,000 RON, approximately 3.3 million EUR from which 70% will be requested from ERDF funding.

In order to establish the IRR all three methods for calculation of the residual value have been evaluated, even if method B is not considered eligible by the Management Authority of SOP IEC.

By using **Method A**, respecting the International Valuation Standards (IVS), the investment was evaluated as if it were to be sold at the end of the time horizon considered, and were also evaluated the remaining net liabilities. By using the market price comparison method and the capitalization rate which is used within the field of investment was established that the terminal value is: 7,000,000 RON. In this case the terminal value becomes also the residual value that reflects the estimated value of the investment at that point. It is important to remark that this method is accepted by the Romanian Management Authority of the SOP IEC programme and is recommended to be used in 2011 SOP IEC call of proposals(Guvernul României, 2011). By this method the IRR=0.52% which is considered an excellent value and which recommends the project for financing. By this method the IRR=0.52% which is considered an excellent value and which recommends the project for financing.

The Method B was later used, and the residual value was determined as an accounting residual value, according with the Romanian legislation. The residual value obtained was 2,824,308 RON.

TOTAL	X	X	X	X	X	19.449.933	16.102.721	X	X

RIR/C= -5,870%

Source: own calculation

The value of the IRR, after applying this method, became IRR=-5.87%, a negative IRR which is under the acceptable values for the programme. It also seems not to be correlated with the values of the NPV. From 2011 this method is a forbidden method to be used in realization of CBA in SOP IEC programme.

The third method used the Gordon Growth Model and was limited in the development of the growth rate by a contested measure: to limit the growth rate used in the formula to maximum 5%. In this case the residual value had a non realistic value of 798,467,395 RON and the IRR had been 75.20%, way over the maximum values accepted within a European funded project.

Conclusions

One of the most important aspects for a proper realized cost benefit analysis is the calculation of the residual value. In this paper three methods for calculation of residual values were analyzed, used and tested in the proposed case study. As observed method B is both forbidden by the Management Authorities of the financing programme and also obtains to negative IRR.

Method C is recommended to be used by the management authorities but contested by a part of specialists since its limitations both in general, as analyzed above and in particular: the limitation of the growth rate to be used within the feasibility study. The values obtained are quite high and might endanger the approval of the project. In these conditions and considering the obtained results within the case study I consider that the Method A, which is also proposed by the management authorities, should be used by Test Company A in order to calculate the residual value of the investment and further the IRR.

The general drawn conclusion of this paper, which will be also highlighted further in the PhD thesis: *“The Mechanism of Financing Investment Projects by Usage of European Structural Funds”*, is that a company which considers to access ERDF funding under SOP IEC programme should take in consideration Method A or Method C for obtaining its residual value in order to have an acceptable IRR.

OPTIMIZING LOCAL BUDGET BALANCING IN ROMANIA

György Attila

Bucharest Academy of Economic Studies Faculty of Finance, Assurance, Banks and Stock Exchange

György Adina Cristina

Bucharest Academy of Economic Studies Research Department

The importance of the local public finance is growing in accordance with the increasing proportion of the decentralization process. The mechanism of resource allocation, and especially the allocation criteria used, constitutes subjects of debate. Our objective pursued is to assess whether the avoidance of the first step for balancing the allocation of funds can provide enhanced fairness in balancing the local budgets across the country. Local budgets in Romania receive significant resources from the state budget in the form of amounts and quotas distributed from certain taxes, which are revenues for the state budget. Some of these amounts are designed to balance the local budgets. The distribution of funds from the state budget to the local budgets requires two steps. Firstly, the amounts are divided by county, secondly, these amounts are directed within the county especially towards localities which have a lower financial standing. Given the significant disparities between counties, we believe that this mechanism does not ensure fairness in the allocation because the funds distributed according to the first step may not use fair criteria to meet the requirements for balanced local budgets. Therefore, we intend to simulate a balanced allocation of national funds for eliminating the first step that produces the most significant inequities. Direct application of the second step of allocation, with its two phases, will provide more funds serving those local administrative units for the income tax per capita is lower than the national average. Comparing the values allocated for the year 2011 with those obtained in the simulation we will examine changes that occur after the application of this method which seems to be more equitable and appropriate. This work was supported by CNCSIS–UEFISCSU, project number PNII–IDEI 1780/2008

Keywords: local budget, budgetary resources, budget balancing, resource repartition

Introduction

The decentralization process entailed the need to increase the financial resources of local authorities in order to correlate the expenses with payments (Tudor 2009: 336). A very practical and efficient option to supply the local budgets is the redirection of part of public revenues from the state budget to local budgets. The allocation mechanism is governed by the local public finance law and it envisages two steps: allocation by counties and then, distribution of public resources within the county. (Leonardo and others 2006: 52-54). Taking together, the steps create disturbances in resource distribution leading to inequities between the budgets of municipalities, towns and villages. This mechanism can be adjusted, however, changes might be influenced by the persuasion coming from the interested beneficiaries: the local authorities with high economic potential require the need for reimbursement the significant public resources, while the poorest local authorities need these resources for survival (IPP 2001: 50-51).

While at the macroeconomic level, the allocated amounts for the local budgets are strictly related to the revenues, at the local level, various situations of unfairness among local administrative units may occur due to the current distribution criteria. We consider that the two step division is one of the main causes for the inequities produced. We are pursuing to analyze the negative effects of applying the two steps allocation procedure as compared to the direct assignment.

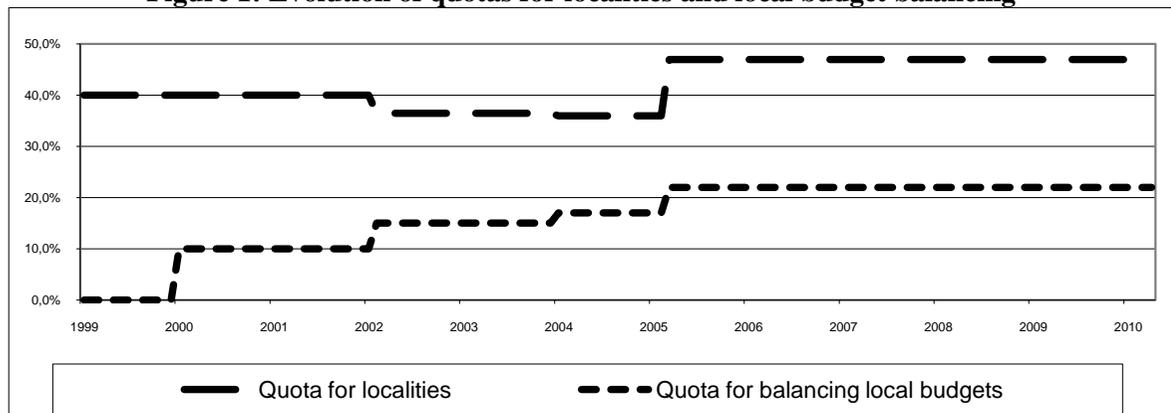

Afterwards, we will quantify the influence on the local budgets when applying the repartition exclusively on the basis of allocation criteria and methodology set out in the current second step of resource distribution.

Our analysis does not apply to amounts allocated to counties, Bucharest municipality and its sectors due to the repartition quotas that are different from those established for towns and communes. Also, the study does not intend to determine the impact of tax collected on allocated resources, as this indicator depends almost on the ability of the local authorities to collect its resources.

Quotas from income tax to balance the local budgets

The income tax received from the state budget in each administrative-territorial units shall be allocated in a quota of 56% share directly to the administrative territorial units where the income tax was collected (44% for the budget of town or commune and 12% for the county budget) while a percentage of 21% is redirected to the county fund to balance the local budgets. In case of Bucharest municipality, there is a special quota system (22.5% allocated to local budgets of the sectors, 44.5% to the local budget of Bucharest and 10% for the local budget balance). The evolution in time of the quotas has taken in consideration the needs and possibilities of the state budget. The evolution of these quotas is presented in the figure below.

Figure 1: Evolution of quotas for localities and local budget balancing

Source: Miricescu et al. 2010:108

The funds redirected to balance the local budgets, i.e. the percentage of 21% from income tax, are divided between the county budget (27%) and other local budgets. From the amounts redirected to towns and communes, 20% of the resources are allocated in projects assigned by the County Councils, the rest of resources being subject to the allocation mechanism in two stages.

In 2011, the volume of income taxes redirected to the local budgets is of 13.32 billion lei, in close correlation with the income earned by individuals from various sources of income. The evolution of income tax in the last five years is shown in the table below.

Table 1: quotas from income tax for local budgets (2007-2011)

Year	2007	2008	2009	2010	2011
Quotas from income tax (billion lei)	10,85	13,37	15,31	14,67	13,32

Source: Yearly budgetary laws

VAT amounts to balance the local budgets

A significant part of the value added tax is shifting to local budgets for the financial support of expenditures specific to the responsibilities decentralized at the local level. In addition to the

destinations clearly provided for the law, there are lump sums to balance the local budgets. In the last years, these amounts represent about 2 billion lei, as indicated in the table below.

Table 2: VAT amounts for local budgets (2007-2011)

Year	2007	2008	2009	2010	2011
VAT amounts for local budgets (billion lei)	12,77	15,06	17,62	17,00	13,12
VAT amounts for balancing local budgets (billion lei)	1,54	2,40	2,00	2,00	2,00

Source: Yearly budgetary laws

The resource allocation for each local budget is done in two steps. Initially, funds are divided per counties in an indirect proportion with the financial capacity of each county and in a direct proportion with its surface. When determining the financial capacity, consideration must be given to the following indicators: income tax per capita collected in the previous year and the number of population. This distribution takes into account the overall situation of each county and does not take into account the individual cases which may significantly influence the overall media. Tying the financial capacity with the number of population in a high proportion will put too much emphasize on the social nature of the key distribution (Cioponea 2008:71).

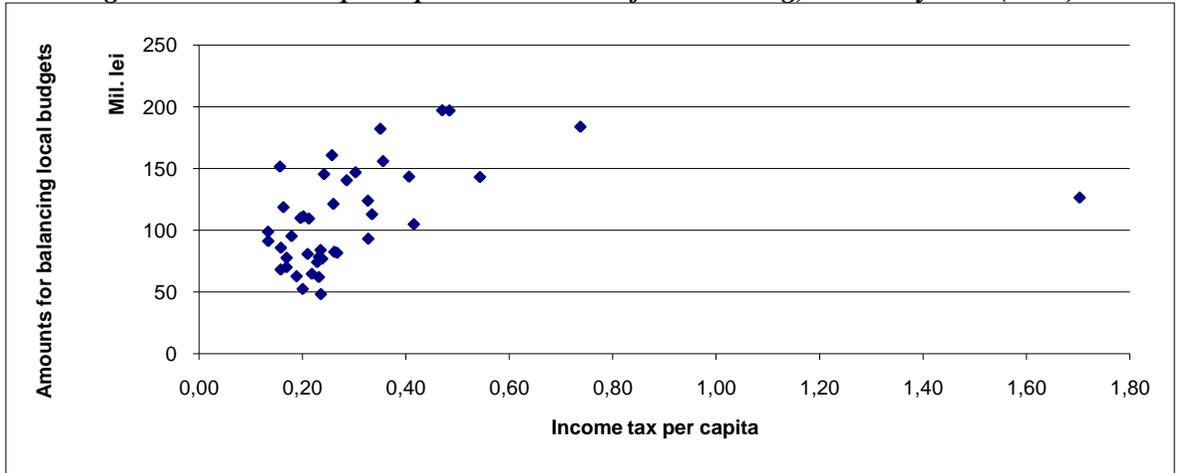

The in-county allocation of funds previously distributed in discriminatory conditions to all the counties takes place only in the second step. This step has two phases. The first phase covers only the localities which have the income tax per capita lower than the average recorded at a county level. The distribution criteria are the number of population and the surface of the in-city lands. Their assigned amounts, combined with those from the previous year may not lead to exceeding the county average. Thus, savings are made by applying the threshold criterion. The savings are redistributed to all localities with sufficient financial capacities and inversely proportional to its number of population.

The local public finance law provides also for granting of amounts derived from other taxes collected from the state budget. Up to now the mechanism has been applied only to VAT, but it will be extended to other taxes as local authorities will take over new powers (György and György 2011:69).

Allocation of resources in 2011

The quotas of income tax to balance the local budgets are allocated in the county in which the income tax were collected. Currently, there are notable disparities between counties in terms of receipts from income tax, such as the income tax per capita in the county which has the highest value (Ilfov County) reported to the county with the lowest value (Vaslui County, with 12.74), as shown in the figure below.

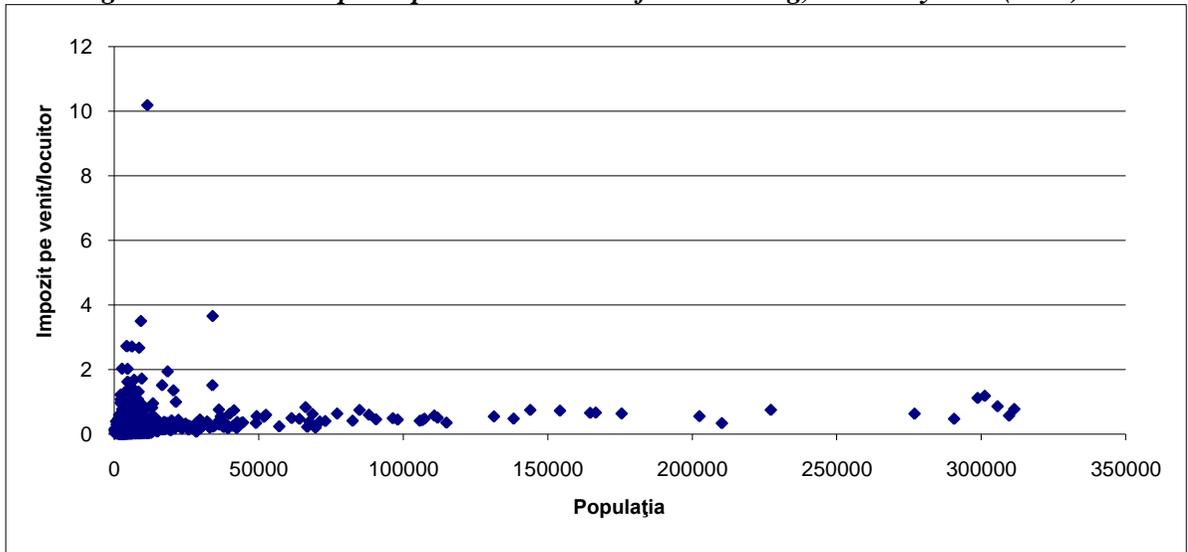

Figure 2: Income tax per capita and amounts for balancing, on county base (2011)

Source: calculations based on MAI data

The allocation of quotas for balancing the local budgets without considering the financial situation of each administrative unit favors the units from the counties having an income tax per capita higher those having an income tax per capita lower. Balancing local budgets in a county with resources collected in the same county only perpetuates the state of wealth or poverty in the respective county. Differences between localities are significant (values range from 13 to 10,191 lei per capita) and, likewise, there is no direct correlation relationship between city size (measured by number of inhabitants) and the amount of income tax per capita.

Figure 3: Income tax per capital and amounts for balancing, on locaity base (2011)

Source: calculations based on MAI data

According to the criteria for allocating quotas to balance the local budgets broken, only those localities having the income tax per capita lower than the average county were included in the first stage. Under the current methodology, localities in Vaslui County with an income tax per capita of 140 lei are not eligible for the first phase of distribution, while towns in Ilfov County with an income tax per capita of 1,700 lei are eligible because they are below the average of Ilfov county. In these circumstances, in 2011, above the average county were included 241 localities

(between 1 and 15 municipalities in each county), industrial and major commercial centers in the county. Due to the large variation of the income tax per capita along the counties, we can not draw a clear conclusion on the categories of localities which were above or below the average per county.

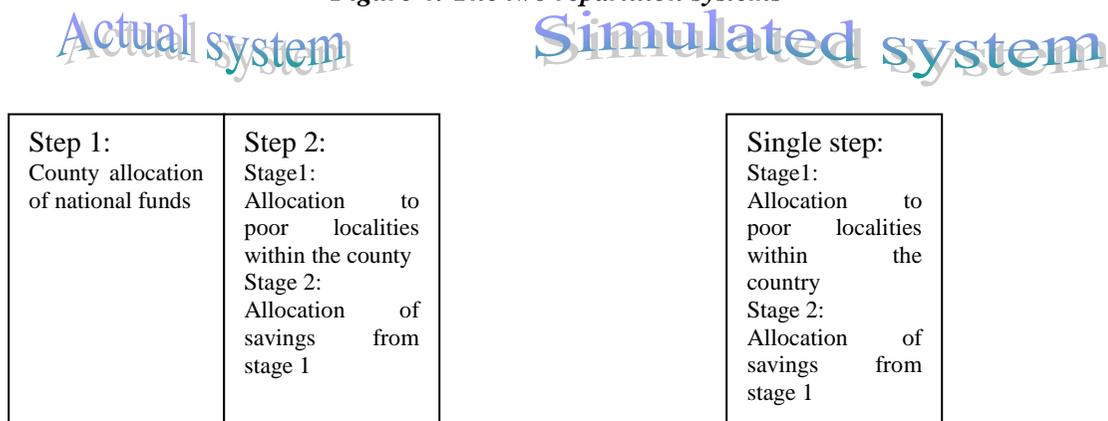

VAT quotas to balance the local budgets were allocated to counties based on their financial capacity. Although counties with high economic potential have been disadvantaged in determining the due amounts, they were not removed from the list of beneficiaries.

The amounts allocated to balance the local budgets have varied according to the following indicators: financial capacity, income tax collected in the previous year, number of population and surface. The smaller amounts of 5,000 lei came from each of the villages Oancea (Galati) and Călnic (Gorj). The largest amounts were allocated to municipalities like Medgidia (11.28 million lei), Hunedoara (12.37 million lei) and Turda (14.53 million lei).

Determination of amounts allocated to local budgets through a single national fund

The great shortcoming of the current distribution method is the fragmentation process in two steps, a mechanism that does not provide for a real support to the poor counties, but a mere slender advantage. We aim at balancing recalculation of benefits (allowances deducted from income tax and VAT quotas) based on a unique methodology by eliminating the barrier constituted from the administrative boundaries of the county. Further on, in the diagram below we present the differences between our proposed methodology and the existent one.

Figure 4: The two repartition systems

Thus, we simulate the entire distribution of values established at national level (excluding Bucharest) in 2011, amounted to over 4.5 billion lei (1.2 billion lei allocated to counties and 0.7 billion lei will be allocated for projects of the county). Subsequently, the amounts actually distributed in the two phases are 2.6 billion lei. Applying a consistent methodology, we do not intend to separate quotas and the amounts deducted accordingly. Distribution rules are set by the local public finance law for the distribution of payments in the county by following two distinct phases.

Summarizing the data at the national level (available for 3180 municipalities), the average income tax per capita is 316.22 lei. In these conditions, 204 localities are above the average while the rest of 2976 is below average. The major part of the 204 locations with the indicator over the average are situated in developed counties (72.5% of localities in Ilfov County, 20% of localities

in Constanta county, 11.5% of the localities in Prahova County) and to a minor extent, in poorer counties (one locality in the county of Calarasi, Salaj, Botosani, Vaslui, Buzau and Iasi).

Eliminating the first step in the distribution of funds, the beneficiary localities have been reclassified by replacing the quotas of rich units with those of the poor counties. Thus, 50 municipalities are eligible for funding in the first stage, while other 87 are not eligible, due to the income tax per capita lower than the national average.

Following the first phase of distribution, public funds were allocated to eligible local budgets amounted to 2.2 billion lei (i.e. 85.4% of the total). The remaining amounts were spent entirely in the second stage by all the budgets of administrative territorial units. Thus, Otopeni (it is the largest city tax income per capita) received only 1749 lei, while Hunedoara was distributed 8.37 billion lei. It can be noted that the margin is much reduced, suggesting a fair distribution.

Following the simulation, a number of 1420 local budgets received smaller amounts, and the remaining 1760 received larger amounts. Differences between the two methods vary from locality to locality. The reductions were registered in a percent over 99% (in 15 localities, all from Ilfov county). The increases occurred in a percent of 1627% for Ocnele town (Vâlcea). Analyzing the absolute values, significant reductions were found in Medgidia (11.08 million lei) and Turda (9.90 million lei). Also, Barlad received significant amounts (6.68 million lei) and Roman (5.70 million lei).

Compiling the data by county, it can be noted a reduction in the amount allocated to those localities that had income tax per capita higher than the national average, redirecting public funds to those administrative units, having the indicator under this threshold (see figures below).

Figure 5: Reduction of allocation for counties using single step repartition

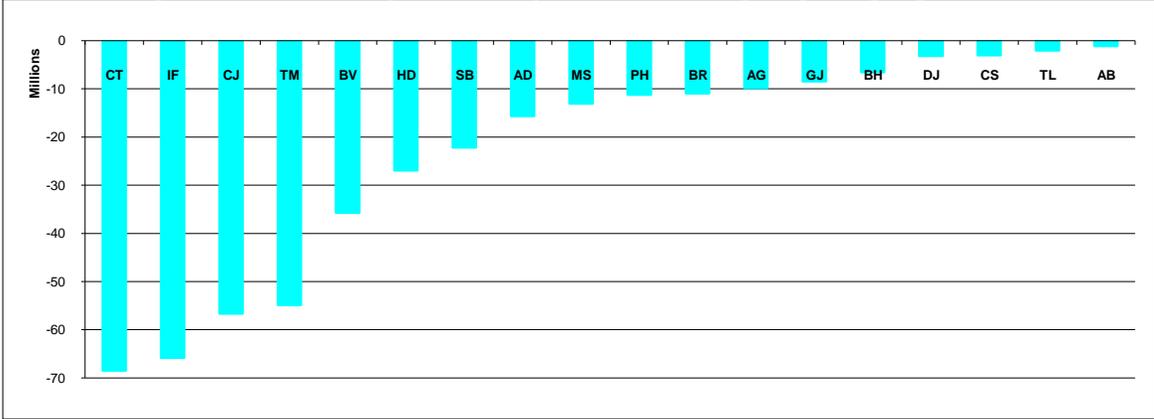

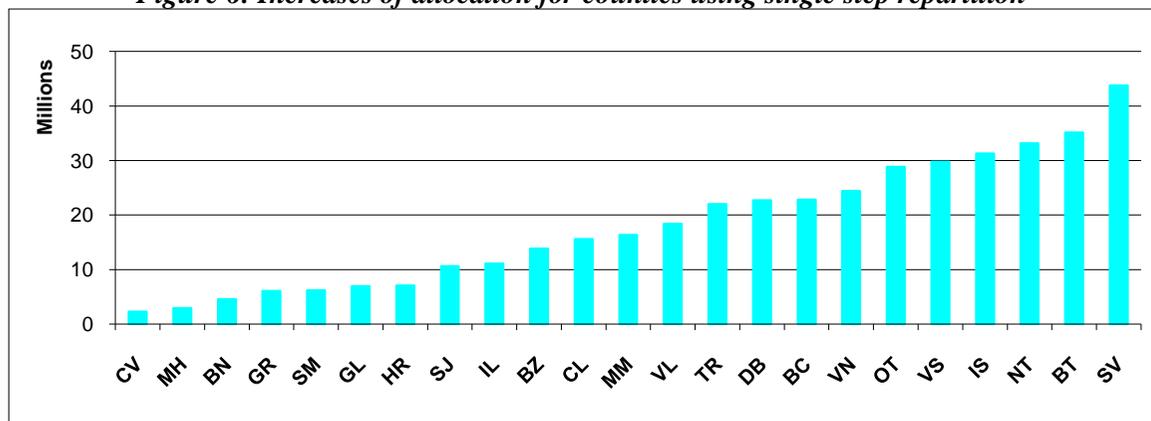

Figure 6: Increases of allocation for counties using single step repartition

Conclusion

The current system of allocating amounts to balance local budgets has two steps, which hamper the distribution and creates a series of inequities between the budgets of municipalities, towns and villages. By withdrawing the first step of the distribution and directly applying the second step might lead to a more equitable distribution because only the second step of the first stage provides a discretionary distribution to local budgets in localities with limited financial capacity. Our simulation performed in all areas of the country (except for Bucharest) highlighted the need for further support towards the poorer counties (Suceava, Botosani, Neamt). Redistribution shall not consider the counties as a whole, but some localities taken individually. The simulation indicated that some localities could be entitled to receive amounts of ten times higher than those actually received in order to reduce disparities.

EFFECTIVE CORPORATE INCOME TAX RATE IN ROMANIA: A MICRO-BACKWARD LOOKING APPROACH

Lazăr Sebastian

University “Al. I. Cuza” of Iasi, Romania

Abstract: Within the framework of micro-backward looking methodology, the paper computes the effective corporate income tax rate for Bucharest Stock Exchange non-financial companies for 2000 – 2009 period, using data from companies financial reports. We find that effective tax rate computed as profit tax/pre-tax income ratio was below the statutory tax rate, throughout the period, except for the year 2009 (when an alternative minimum tax was introduced) and the differences have diminished since the flat tax was adopted (2005). When applying a correlation analysis, we find that the difference between this effective tax rate and the statutory tax rate presents a strong negative correlation with the return on assets ratio (ROA). Also, we have find that commerce is enjoying the most favourable tax regime, while energy is the most heavily taxed.

Key words: effective corporate income tax rate, backward looking methodology

1. INTRODUCTION

Measuring the fiscal burden that companies have to cope is a matter of great interest both for business managers and policy makers. Doing business in a global market often reveals competitiveness issues that are linked to taxation. Often, the tax rates cuts are partial offset by increasing tax bases. Effective tax burden is a matter far beyond the tax rate itself, although it is one of the most significant determinants. Thus, we want to check whether the effective tax rate that companies borne was in line with the general trend of statutory tax rates cuts that took place in Romania, as elsewhere in Europe. Indeed, the tax competition urge governments to cut tax rates consistently, but the ever increasing need for public spending contributes to the adoption of tax base broadening measures such as introducing of thin capitalization rules, limitation of loss relief or of some expenses, among which interest expenses plays a significant role, etc.

In this context, we compute effective corporate income tax rate as profit tax/pre-tax income (earnings before taxes) ratio for the non-financial companies traded at Bucharest Stock Exchange for the period 2000 – 2009. The availability of data is one of the major problems when dealing with micro-backward looking methodology, especially when we are confronting with a transition economy. Thus, for the scope of this paper we will use INFIN database, a database that was created by the author through a research grant and which contains detailed financial data reported by the Bucharest Stock Exchange listed companies.

Romania is generally regarded as a country with low taxation for firms, the corporate income tax rate being only of 16 percents. It is interesting to see, if, in real world, companies manage to take advantage of tax base determinants in order to be able to minimize the profit tax to the extent possible, and if this could result in higher rate of returns. For the scope of this paper, we have considered only corporate income tax, although INFIN database allows for taking into consideration real estate taxes, social contributions and any of all other public finance liabilities that a company has to pay.

Thus, our main research goal is to assess the effective corporate income tax rate for the most relevant Romanian companies, namely those traded at Bucharest Stock Exchange and to see whether companies that bear a lower effective taxation could have higher returns. Throughout the

paper, we provide evidence concerning the effective corporate income tax rate on annual basis and also for different industries.

Several conclusions can be drawn from the analysis. We find that effective tax rate computed as a profit tax/pre-tax income was permanently below the statutory corporate tax rate, except for the year 2009, when an alternative minimum tax was introduced. When performing a correlation analysis, we find that the difference between effective tax rate and statutory tax rate is negatively correlated to return on assets ratio (-0.636). Also, our effective tax rates have recorded a constant decrease throughout the period in accordance with the general trend of statutory tax rates. The single notable exception is the year 2009, when our rates increased, showing a poor efficiency of fiscal measures taken by Romanian authorities in their struggle to fight the crisis. As for sector analysis, we find that commerce is enjoying the lowest effective taxation, while energy is the most heavily taxed.

The paper is organized as follows: section 2 describes the methodology in the context of the most relevant previous research in the field, section 3 presents the results and section 4 concludes.

2. METHODOLOGY

Computing the effective taxation of companies can be achieved by two major, well-established methodologies: forward-looking methodology and back-ward looking methodology.

In terms of forward-looking methodology, the Devereux & Griffith approach, which is based on a hypothetically investment project (King and Fullerton) is generally regarded as the standard in the field. Another well-known methodology, based on model firm approach, is European Tax Analyzer, developed by ZEW Mannheim and University of Mannheim. Both were used by European Commission in a series of studies regarding company taxation (CEE, 2001, Spengel et al, 2008). In the recent years, another model firm approach emerged, namely that of Djankov et al. (2010), which is jointly used by the World Bank, International Finance Corporation and PricewaterhouseCoopers (see doingbusiness portal). That methodology includes under the generic names of labour related taxes, the payroll taxes and social contributions for which the statutory incidence falls on companies when assessing the “total tax rate” (TTR).

In terms of backward-looking methodology, the first insights were those of Collins and Shackelford (1995), followed by Buijink, W., Janssen, B., Schols, Y. (2002) and Nicodème, G. (2007). The difficulties of getting the firm level data, along with the differences in accounting standards make this methodology harder to implement. Nevertheless, several rankings were made, and for review see Nicodeme (2007).

Whithin the framework of backward-looking methodology, we will compute the effective tax rates for companies listed on Bucharest Stock Exchange using data from financial reports for the period 2000-2009. We use the unconsolidated data in order to better capture the specific of the fiscal code and also to provide a larger period of comparability of data. The data of the INFIN database cover sixty nonfinancial companies listed on regulated market at Bucharest Stock Exchange, thus offering 600 company years data. The sixty companies taken into survey have an aggregate turnover of about 8.3% of Romanian GDP in 2008, and 6.5% in 2009 when global crisis hit Romania. The period surveyed started in 2000, because this particular financial year was the first in which the companies reported data using procedures congruent to the Fourth European Directive accounting regulations and to the International Accounting Standards. Luckily, the year 2000 also coincides with the start of a new era in Romanian fiscal framework, when the statutory tax rate for profit tax dropped from 38% to 25%. The comprehensive list of companies can be consulted on the National Commission of Securities Exchange site: <http://www.cnvmr.ro/InfoUtile/ro/RapoarteEmitenti/RapoarteEmitenti.html>). The sources of data were financial reports of listed companies available on the Internet sites, both of companies and

Bucharest Stock Exchange and National Security Commission. Also, a subscription access to Bucharest Stock Exchange data directory was needed in order to get the data for earlier years.

In order to compute the effective tax rate, several considerations must be made related to the terms involved. We compute effective corporate income tax rate as profit tax to pre-tax income ratio. We believe that pre-tax income or earnings before taxes (“profitul brut” in Romanian language) is the proper measure of the “tax base”. Previous studies employed either pre-tax income (adjusted more or less) or gross operating profit. Buijink, Janssen and Schols (2002) and Collins and Shackelford (1995) used the pre-tax income when computing their effective tax rates, while Nicodeme (2007) opted for gross operating profit.

Thus, the effective corporate income tax rate, can be expressed as follows:

$$ETR = \frac{CIT}{PI} * 100$$

where: *CIT* = corporate income tax;

PI = pre-tax income;

We think that if we want to take the most out of the features of the micro-backward looking methodology, the most appropriate indicator for the “tax base” is pre-tax income which contains not only operating profit, but also financial profit and exceptional profit. If the latter is almost insignificant in our sample, the financial profit includes interest expenses, which in Romania, as elsewhere, are deductible when computing taxable profit under thin capitalization rules (in certain circumstances). According to conventional theory, this may create an incentive to use debt as oppose to equity, and the price for this action (interest expenses) is reflected in financial outcome of the company.

3. RESULTS

In this framework, we have computed the effective corporate income tax rate for Romanian companies traded at Bucharest Stock Exchange for the period 2000 – 2009. The results are presented in table no. 1. The table also depicts the statutory corporate income tax rate and the between effective corporate income tax rate (ETR) and statutory tax rate (STR)

Table no. 1. The effective corporate income tax rate (ETR), the statutory tax rate (STR) and the difference between them (2000 – 2009)

	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009
Effective corporate income tax rate ETR	19.87	17.36	18.18	22.65	21.42	14.83	13.37	14.86	12.59	16.28
Statutory corporate taxation rate STR	25	25	25	25	25	16	16	16	16	16
Difference ΔR (ETR ₁ – STR)	-5.13	-7.64	-6.82	-2.35	-3.58	-1.17	-2.63	-1.14	-3.41	0.28

Source: fiscal legislation and own computations

As we can see, the effective tax rate was below statutory tax rate throughout all the period surveyed, except for the year 2009. Companies were able to benefit from deductions when computing taxable income, and as the tax rate was reduced to 16% in 2005, the difference diminished as a result of the tax base increase. In 2009, an alternative minimum corporate tax

was introduced, along with a restriction of deductibility for some company's expenses. This led to an increase of effective tax rate above the statutory tax rate in the middle of the economic crisis that hit Romania during 2009. The gap between our effective tax rate and statutory tax rate can be correlated to some financial ratios (return on assets, return on equity and net profit margin). The results are shown in Appendix A, from which we can retain only the strong negative correlation of -0.636 between ΔR and ROA, significant at 0.05 level. The coefficient of determination R^2 is therefore 0.40, so 0.40 of the variability of ROA can be explained by the variability of ΔR .

When performing a sector analysis, we find that commerce is enjoying the most favourable tax regime, while the energy is the most heavily taxed. The results are presented in table no. 2.

Table no. 2. Effective corporate income tax rate for different industries

Sectors	Effective corporate income tax rate
Commerce	14.51
Manufacturing industry	15.76
Energy	31.44
Hotels and restaurants	15.28
Construction	22.27
Extractive industry	21.91
Transport	24.17

Source: own computations

Basically, we can see that we have three major situations: commerce, manufacturing industry and hotels and restaurants that have an effective corporate income tax rate around 15%, construction, transport and extractive industry that bears an effective profit taxation of around 22%-24% and energy with an effective tax rate of 31.44%. Thus, commerce, manufacturing industry and hotels and restaurants were the sectors that managed to the biggest extent to take advantage of tax base determinants in order to reduce the effective corporate income tax rate.

4. CONCLUSIONS

Our results show that effective tax rates declined during the period surveyed, in accordance with the general reduction of statutory tax rates. If we were to assess the efficiency of fiscal policy in fighting the crisis, our data showed that in 2009, the year in which the crisis hit Romania, effective tax rates for companies increased, indicating a poor performance of fiscal tools in addressing the economic downturn. This can be attributed to the adoption of an alternative minimum tax for companies starting and to the limitation of deductibility for certain company expenses (from May 2009). Making more money for public finance can have adverse effects on businesses. One can conclude that in the middle of the economic crisis, the fiscal measures set by Romanian authorities impose a supplementary burden on companies, and this was, undoubtedly, not a good support for companies, which had already been dealing with major difficulties. When applying a correlation analysis, we find that the difference between this effective tax rate and the statutory tax rate presents a strong negative correlation with the return on assets ratio (ROA). Also, we find that commerce was the most favourable taxed sector, while energy has to deal with the heaviest tax burden.

Abstract

This article tries to present the major aspects concerning the value added tax in the context of economic crisis in European Union countries and Romania. The paper realizes an analysis of the impact of economic crises on VAT in the European space underlining the current situation when the revenues from VAT represent a valuable source of financing the public expenditures. In Romania the economic crises has led to increasing of VAT rate from 19% to 24%. This measure is an important fiscal measure for the state budget and this study tries to reflect the impact of this VAT rate increase on the public revenues and consumption.

Keywords: value added tax, economic crises, tax revenues

Cod JEL: H23, H3, H22, G18.

Introduction

Value added tax is a key element of taxation system for many countries, an important and a reliable source of revenue for their budgets. For European Union countries VAT is assuring a significant part of the tax receipts counting 7% of GDP. Considering the share of VAT receipt in total tax receipts the highest ratio is in Bulgaria 35% and the minimum is in Italy only 13% from the total tax revenues and for EU 27 as average is 17%.

In times of economic crisis, the budget revenues are significantly affected by a sharp decrease. Many factors have an important contribution to this decline like: the tendency of some tax bases to contracts – incomes, profits, consumption; a decline in commodity prices and related revenues, or increasing the tax evasion. In this context for all EU countries a major issues is increasing the budget deficit and impossibility to financing the public expenditures.

The significance of VAT has increased in the financial crisis as governments need to raise more revenue to reduce their national debt, but are reticent to raise direct taxes on labour or capital at a time when employment and investment are needed. Personal income taxes increase is not a solution, especially in the context in which Europe is confronted with aging of the population. However it is necessary to increase social contributions in this regard but this increase will not provide budgetary shortfalls. On the other side increase of corporate taxation is not a good solution for the crise time because may be a cause for deepening crisis.

One way to improve the situation of public finances and increasing the tax receipts or at least maintaining at the same level like before the economic crises is through increasing the VAT rate. But this measure requires a careful assessment of the possible macroeconomic and

microeconomics effects. VAT rate increase is reflected in whole or in part on price of goods and services. With an unchanged nominal wages, rising prices is clearly diminishing real income of households (reduction in purchasing power), thus affecting consumption.

In the case of VAT, the most of the countries decide to increase rates, but also a high number of measures narrowing the base. Base narrowing was in many cases linked to equity considerations, as some countries reduced the tax burden on food or necessities. Generally, however, the measures increasing the standard VAT rates have had a much larger (positive) budgetary impact than the base narrowing measures; for the cases for which we have information, the ratio is almost 5:1 (Taxation trends in EU, 2010).

The impact of high VAT rates on consumer prices is not necessarily immediately, depending on many factors, including: the market rank for suppliers, the degree of competition, the elasticity of demand. Thus, firms from some industries prefer on the short term, may not fully pass on prices the VAT rate increased; the result is decreasing its profits to avoid reduction in demand, especially when they do not hold a significant position in the market, competition is strong and / or demand is very elastic.

The increase in VAT rate with only a few percentage points is unlikely to register a significant reduction in consumption, but on the other hand can increase VAT receipts for the state budget. Normally, any VAT rate increase can lead through higher prices to increasing inflation, yet inflation is only a temporary shock.

Increase VAT rate may influence the degree of regressive tax against current income households (VAT is a regressive tax against current income; current income decreased its share in the growing income). If, in addition to the standard rate of VAT, a reduced rate of VAT is applied for some consumption goods prevailing in low-income households, an increase for standard VAT rate would reduce the VAT regressivity and an increase for reduced VAT rate would lead to a higher regressivity. However, if there is a single VAT rate, the increase does not change the degree of regressive tax, according to the size and structure of consumption will not change.

A single rate of VAT means that the VAT payments by low-income households will be a higher proportion of their incomes than payments by higher income households. VAT is not regressive if tax payments are expressed as a percentage not of income but consumption. If consumption is used as the denominator, then by definition the impact would be proportional.

The tax burden of a VAT levied at uniform rate would also be largely proportional if the denominator is lifetime income instead of annual or current income because many income recipients are only temporarily in the lower income brackets. However, the main role of value added tax revenue is assuring the tax receipts for the state budget and not to achieve efficient redistribution of income in society; it is the quality of other taxes.

The VAT rate increase would leave a negative impact on the inhabitants purchasing capacity and the economy in general through decreasing of the consumption. But the negative of VAT rate increase will be felt also on the business activities. The increasing of VAT rate means inevitably results in the drop in consumption, and the consumption decline has a significant impact on the economy in general. During the economic crisis conditions it is important to promote the consumption increase.

VAT in European Union countries

Since 2009, under conditions of economic crisis, many European Union member states have resorted to increasing the standard VAT rate.

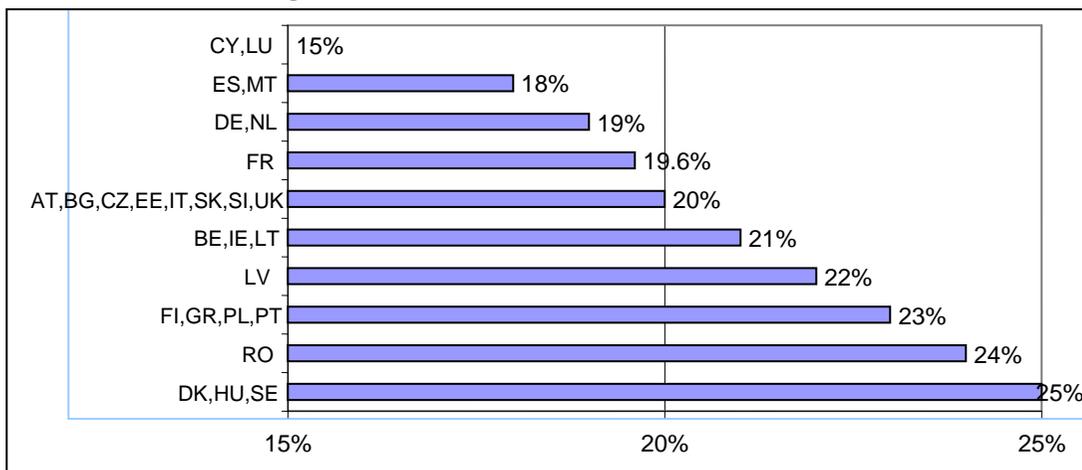

Table 1. VAT rates increases in EU countries

Country	Standard VAT rate increase	Old standard VAT rate	New standard VAT rate	Δ of rate
Czech Republic	01.01.2010	19%	20%	1%
Estonia	01.07.2009	18%	20%	2

	04.01.2011	17,5%	20%	2,5

Source: European Commission

Currently, the standard rates of VAT charged by the EU Member States are between 15% (Cyprus and Luxembourg) and 25% (Denmark, Sweden and Hungary), with an average of 20.7%. It is standard practice ten different levels, being the dominant share of 20% share. It complies with the minimum of 15% imposed by the European Commission but not required and a maximum limit not achieved a significant near standard VAT rates applied by all Member States.

Figure 1. VAT standard rates in EU countries

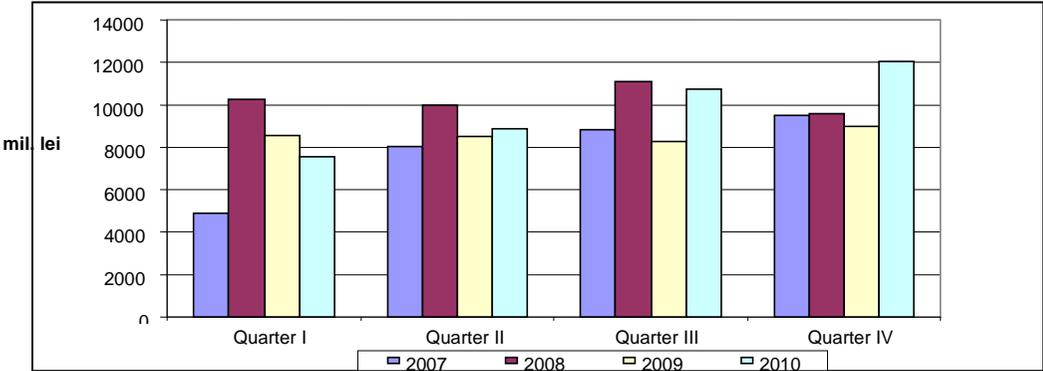

Source: European Commission

Although differences between the standard rates of VAT applied by some Member States are quite high (ranging up to 10 percentage points), there is some convergence of these shares, so 11 of the 27 countries using the standard rate between 19% and 20%. For instance, France has a VAT standard rate of 19.6% and two reduced rates. A reduced rate of 5.5% is applied to the absolutely necessary products and on the restaurant services and the reduced rate 2.1% for newspapers, plays and approved medicines (Sabau-Popa & all, 2010).

Current situation of VAT in Romania

In Romania, VAT receipts recorded in the last quarter of 2008 were only 0.6% higher in nominal terms than revenue in the fourth quarter of 2007, the conditions under which started to manifest in our country financial and economic crisis. It should be noted that although in the last quarter of 2008 saw a economic growth of 2.9%, final consumption fell in real terms than that registered in the fourth quarter of 2007 by 2.8%, while final household decreased by 4.7%, due to reduction in sales volume of retail goods and services rendered (Institutul Național de Statistică, 2009).

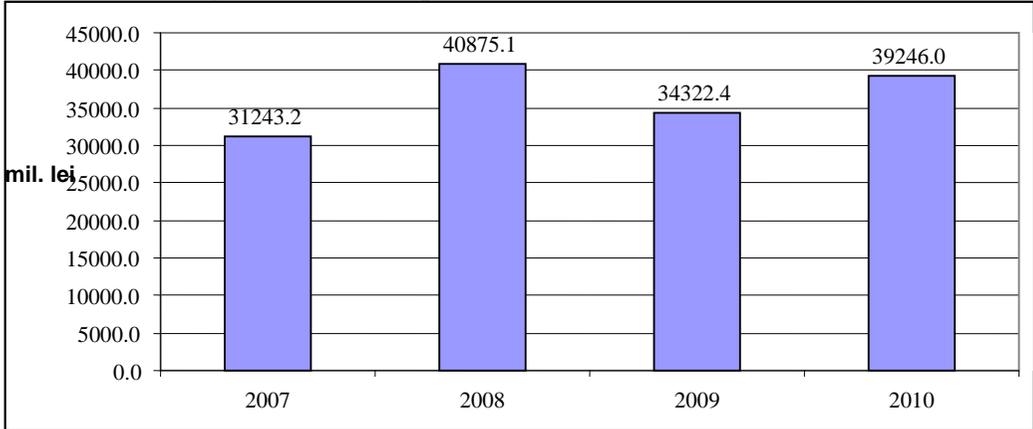

Figure 2. VAT receipts in Romania, 2007-2010, quarterly

Source: own calculation based on Finance Minister Data

Value added tax collected in 2008 was 30.8% higher in nominal terms, than that received in 2007, provided that, in real terms, household final consumption increased by 9.2% , Consumption increased by 8% and gross domestic product grew by 7.1%.

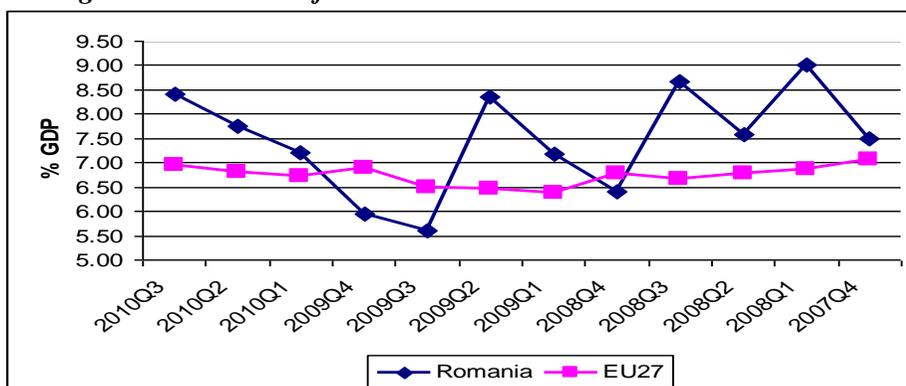

Figure 3. VAT receipts in Romania, 2007-2010, annually

Source: own calculation based on Finance Minister Data

In 2009, there was a significant decrease in revenues from value added tax compared to 2008. They have decreased by 16% in nominal terms, due to real decrease of final consumption of households with 10.8% and total final consumption decrease with 8.2% and 7.1% of gross domestic product (Institutul Național de Statistică, 2009). VAT receipts recorded in 2010 exceeded 14.3% in nominal terms comparative with 2009, while the standard rate of VAT was increased in July 2010 by 5 percentage points amid economic downturn mitigation (in terms real gross domestic product fell by 1.3%, consumption fell by 2.1% and household final consumption decreased by 1.6%) (Institutul Național de Statistică, 2009). Value added tax collected in 2010 was lower, in nominal terms, than that received in 2008 by 4%.

Figure 4. VAT as % of GDP in Romania and EU in economic crises

Source: Based on Eurostat data

Concerning the evolution of VAT as % of GDP in Romania and EU 27 in the economic crises time we can see that for EU there is a constantly evolution with slight fluctuations between 6 and 7 % of GDP. The increasing of VAT rate in Romania has a significant impact on the tax receipts because there is a continuously increase of the share of VAT receipts in GDP for 2010. Following this trend we can say that the rate increase was felt in the budget favorably even if the purchasing power of consumers has been affected.

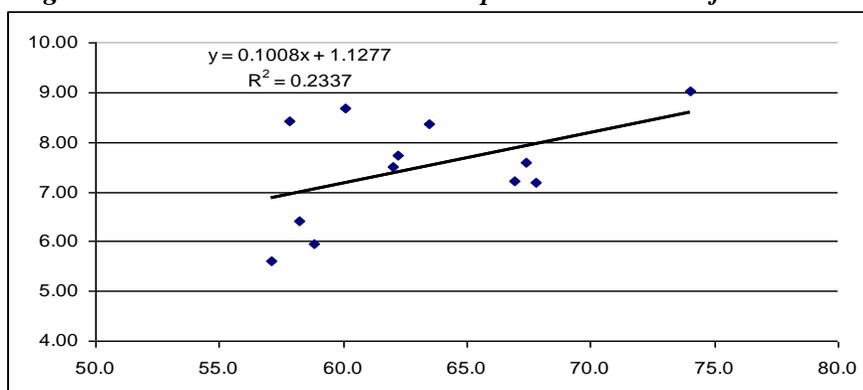

Table 1. Evolution of households' expenditures and VAT as % in GDP

VAT % GDP	Q4	Q3	Q2	Q1
2010		8.42	7.74	7.22
2009	5.96	5.6	8.36	7.19
2008	6.41	8.68	7.59	9.01
Final consumption expenditure of households % GDP	Q4	Q3	Q2	Q1
2010		57.8	62.2	66.9
2009	58.8	57.1	63.5	67.8
2008	58.2	60.1	67.4	74

Source: Source: Based on Eurostat data

Following the correlation between consumption and the VAT for the economic crises there is a direct correlation, if the consumption increase with 10% than the VAT receipt increase with 1%. The VAT receipts are correlated with consumption –in this case only household consumption with 23%.

Figure 5. Correlation between consumption and the VAT for Romania

Source: own calculations based on Eurostat data

Conclusions

In conditions of economic crisis the government may use the VAT to increase the tax receipts but not without macroeconomic consequences. With the emphasis on taxation is increasingly putting more on indirect taxes, value added tax can be considered a tax of the future, being by far the most important and largest indirect tax harmonization success tax.

THE USE OF EXPERT SYSTEMS IN AGRICULTURAL INSURANCE. NECESSITY VS. REALITY

Moisuc Diana-Aderina

“Babeş-Bolyai” University, Cluj-Napoca Faculty of Economics and Business Administration

Nan Anca-Petruța

“Babeş-Bolyai” University, Cluj-Napoca Faculty of Economics and Business Administration

The topic was chosen due to the fact that, although agricultural insurance is particularly needed in agriculture to achieve performance, its achievements are still modest. The importance of this research is in that it tackles a very important sector of the economy, agriculture, and puts forward an immediate viable solution that meets the current needs of farmers. The contribution of the authors is their innovative solution, namely the proposition to implement expert systems in agricultural insurance, as a means of promoting insurance products which, although they are not currently granted the due importance, have started to be acknowledged increasingly in recent times. The interest in this type of insurance is due to the recent climate changes whose effects are extremely damaging, and to the need to improve agricultural competitiveness on the common market as a result of trade liberalization in agricultural products.

The scientific literature in the field of expert systems highlights the benefits of implementing systems in all areas of economic and social activity, including insurance and agriculture, but it does not deal separately with the issue of agricultural insurance, despite its importance in the development of agriculture. This confirms the topicality of the study. Regarding the scientific methodology, in order to easily understand how expert systems work also by those who are not familiar with the field, we opted to present the stages of preparation of the system, namely: (a) preparing the knowledge database, (2) preparing the charts and (3) system encoding and assessment.

The research results, at the conceptual level, confirm the need for agricultural insurance expert systems because of the benefits it would create (ease of use, informing farmers about the existence and importance of agricultural insurance, increasing demand for such type of insurance, which would also lead to the development of agriculture, to the creation of insurance products tailored to farmers' needs) and refers to the authorities that should be appointed to implement these systems.

Keywords: agricultural insurance, expert systems, agriculture

JEL Classification: C80, C88, G22, Q14.

I. Introduction

Since 2007, following Romania's EU integration, Romanian agriculture has been put to heavy trials as it had to meet the challenges imposed by the Common Agricultural Policy. Although, in comparison with European countries, Romania ranks ninth as agricultural area, seventh as arable land, eighth according to the area occupied by pastures and meadows, fourth according to the population engaged in agriculture (Creacă 2002, 23), the impediments that are currently hindering the development of agricultural insurance (e.g. lack of awareness and confidence in insurance, lack of financial means of farmers), entail modest results, despite the significant potential and its importance in the development of agriculture. Thus, due to the fact that modern agriculture can be developed only in the presence of an agricultural insurance system, there is an urgent need to find solutions to promote agricultural insurance products, as both farmers and insurance companies do not show a keen interest in this type of insurance.

Therefore, the following questions arise: Why don't farmers buy insurance? What should be done to change the perception of farmers towards insurance, so as to boost demand for agricultural insurance?

The solution could be offered by artificial intelligence, especially expert systems. Their implementation in agricultural insurance would promote existing insurance products, finding alternatives to farmers' needs according to their possibilities and needs, and allowing for an ongoing improvement of the system as a result of feedback from farmers.

The objective of this paper is to collect data on specific aspects of agricultural, to prepare a knowledge database, to present conceptually a pilot version that will continuously improve based on the farmers' feedback, by showing clearly the collected data which would lead, through their processing, to the most relevant results.

(Ganesan 2006, 263) believes that agricultural production has evolved into a complex business requiring the accumulation and integration of knowledge and information from many diverse sources. Unfortunately, agricultural specialist assistance is not always available when farmer needs it. In order to alleviate this problem, expert systems were identified as a powerful tool with extensive potential in agriculture.

II. Literature Review

Expert systems have started to grow in importance lately, covering all areas of economic and social activity, with the role to collect data from human experts on various aspects in order to assist the user in the reasoning necessary to solve problems, at levels of expert performance, making available to him the acquired knowledge and experience.

The expert system is a software program that incorporates a particular knowledge database and an inference engine. The program acts as an intelligent adviser in a particular area (Frenzel 1987). It is a system that uses human knowledge captured in a computer program to solve the problems that usually require human expertise (Turban, Efraim; Aronson, Jay 2001).

The goal is to offer a solution to a given problem; the expert system must take a decision in this regard. For example - in this period, which is the insurance type that corresponds to the current features of the agricultural production and to the financial means of the farmer?

The ideal expert system first makes use of simple questions and rules to infer more complex knowledge. The system would be self-defensive if, instead of asking simple questions at first, would ask questions that require specialized expertise (Russel and others 1988).

(Trencher 1998, 7) consider that today, a growing number of insurers are using expert systems as a way to improve the quality of human processes - to perform tasks faster, more consistently and with fewer errors.

The main benefits of expert systems are (Turban, Sharda and Delen 2011, 569, 570):

- *Increased output and productivity.* Expert Systems can work faster than humans can.
- *Decreased decision-making time.* This property is important in supporting frontline decision makers who must make quick decisions while interacting with customers.
- *Elimination of the need for expensive equipment.* Often, a human must rely on expensive instruments for monitoring and control. Expert Systems can perform the same tasks with lower-cost instruments because of their ability to investigate the information provided more thoroughly and quickly.
- *Ability to work with incomplete or uncertain information.* Expert Systems can, like human experts, work with incomplete, imprecise, and uncertain data, information, or knowledge. The user can respond with "don't know" or "not sure" to one or more of the system's questions during a consultation, and the Expert Systems can produce an answer, although it may not be a certain one.

- *Provision of training.* Expert Systems can provide training. The explanation facility can also serve as a teaching device.
- *Improved decision quality.* Expert Systems are reliable. They do not become tired or bored. Expert Systems also consistently pay attention to all details and do not overlook relevant information and potential solutions, thereby making fewer errors. In addition, Expert Systems provide the same recommendations to repeated problems.
- *Ability to solve complex problems.*

(Gray 1987) suggested that insurers who have an automated partner generally have a higher probability to succeed in an increasingly complex environment.

While reviewing scientific literature, we found that expert systems are used increasingly more in recent years in agriculture (e.g. *Rice Crop Doctor*, the National Institute of Agricultural Extension Management (MANAGE) has developed an expert system to diagnose diseases and pests for rice crops and to suggest measures for prevention / curing, *AGREX*, the Center for Informatics Research and Advancement, Kerala has prepared an expert system named *AGREX* to help staff called on agricultural land by giving timely and accurate advice to farmers, *Punjab Agricultural University*, Ludhiana, has developed the Farm Advisory System to support agri-business management) (Kiong and others 2005), but we have not found and treated separately agricultural insurance, which would be an incentive to develop agriculture in general and in particular agricultural insurance, because in order to perform a modern agriculture, insurance plays an important role.

III. Research Methodology

The architecture of expert systems consists of 3 basic components:

- the knowledge database : it contains factual and information databases;
- the inference engine: the dynamic component of the expert system, which suggests a possible decision after analyzing the information in the knowledge database. Many expert systems are equipped with the ability to explain to the user **why?** and **how?** they have reached the chosen solutions through their reasoning;
- the user dialogue interface - the component which ensures the dialogue between the user and the computer in an exciting and comprehensible way.

Assuming the use of expert systems in agricultural insurance, we will present hereafter, in a simplified way, the steps that should be followed in building the system to generate the best option of crop insurance for one's needs.

Preparing the Knowledge Database

In order to prepare a more complex knowledge database to be included in the system, one needs to use official documents or diagrams, using specialized information from both agricultural insurance experts and experts from related fields (veterinarians, agricultural consultants, agricultural equipment suppliers, seed suppliers).

Expert systems cannot be designed without the support of a group of experts. An appropriate expert should have extensive knowledge in the field and good communication skills (Turban, Sharda and Delen 2011, 566).

Preparing Charts

Crop insurance, viewed from the perspective of expert systems, consists of multiple first-hand levels (Fig. 1). Each level is an integrated set of sublevels. For example, the "insurance risks" level includes the following sublevels: hail, frost (late spring frost, as well as early autumn frost), torrential rains, storms, hurricanes, tornadoes, landslides of cultivated land, fires caused by natural lightning (thunder, lightning), from which the farmer will choose one according to his needs.

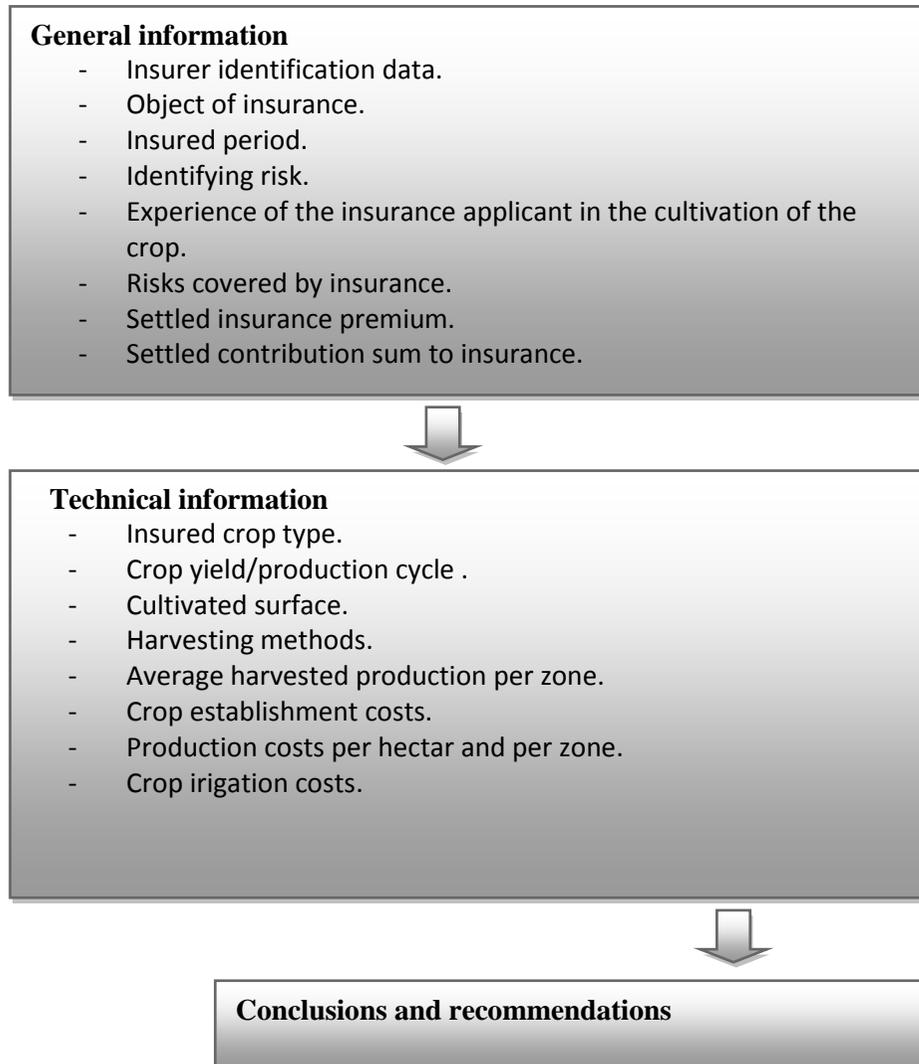

Figure 1: Agricultural insurance chart within expert systems
Source: compiled by the authors

If the reasoning is well done, it translates into the system by IF, THEN rules, which are meant to generate, at the end of the logical algorithm, the best solutions for the user (the farmer). For example: **if** there is a high probability of thunderstorms during the production cycle and **if** the required premium for the risk insured is accessible (within budget), **then** the farmer will subscribe to an insurance contract.

We opted for a simplified schematic representation (on a single level) of a possible expert system for agricultural insurance expert for a better understanding of its functioning, where the system informs the user about existing insurance conditions and provides an alternative, depending on the options chosen.

Encoding and Assessing the System

After choosing a suitable tool, (the most popular is the Corvid system), our attention turns to encoding the knowledge database. A major concern at this stage is whether the encoding process (definition of variables, building logical blocks and command blocks) is properly and effectively managed, to avoid errors. Regarding the assessment of the system, it involves both verifying (by ensuring that the knowledge database contains data acquired from experts and that there are no errors in the encoding phase) and validating the system (by confirming that the system works properly).

IV. Research Results

After observing the necessary steps followed by expert systems, one can easily notice the efficiency of implementing artificial intelligence in agricultural insurance, given that the main benefits are offering the right information to farmers, as well as high quality insurance products tailored to the farmers' needs.

Using expert systems in agricultural insurance would help develop the agricultural sector, bringing both immediate benefits and on the long term because they could track the farmers' behavior over time, their aversion to risk, as well as the frequency and intensity of risks in various regions, and could thus lead to the creation of improved insurance products that meet farmers' needs. These new and improved insurance products would address the different types of risks specific to agriculture, and their expansion to cover the all the farmer's assets is likely to sustain over time the development of this sector and maintain financial flow in agriculture.

The successful implementation of expert systems in agricultural insurance depends on properly understanding the importance of this system, on the availability and capacity of insurance companies to support this area and on the involvement of the Insurance Supervisory Commission and the Ministry of Agriculture.

Although it deals with the topic at a conceptual level, our research moves on to an attempt to present the necessity and importance of implementing expert systems in agricultural insurance as a solution for developing the Romanian agriculture sector because insurance plays a significant role in stimulating investments in agriculture and stabilizing farmers' income.

V. Conclusions

The agriculture of a country may be endangered by the weather which can not be controlled only to a limited extent and which can have major impacts on production achieved. The presence of risk in agriculture is a challenge, particularly for small farmers who are not used to insurance. (Johnson and others 1993, 35-51) showed that many farmers estimate incorrectly the probability of loss and may not correctly predict if an insurance contract is appropriate for them or not.

The implementation of expert systems in agricultural insurance would be an incentive for the development of both agriculture and agricultural insurance, because so as to perform a modern agriculture, it is necessary to maintain funding opportunities under the exact conditions required by the characteristics of the agricultural production. In this respect, the use of expert systems in insurance is a crucial tool for protecting agricultural producers and farmers. That is why the agriculture sector must be developed, especially that lately new risks have arisen as a result of climate change.

Applying expert systems technology in the agricultural insurance is as necessary as it is useful due to the fact that it provides information to farmers about the existing insurance products and it reproduces the reasoning of human experts in a comprehensible form, so that users, regardless of their level of knowledge, can decide which one best suits them at that time.

Despite the importance and necessity of expert systems as an alternative for development of agriculture and agricultural insurance, the implementation of such a system is delayed because of

the lack of involvement of insurance companies and regulatory authorities in the field (Supervisory Insurance Commission and the Ministry of Agriculture).

Kulcsar Edina

University of Oradea, Faculty of Economics

Tax revenues are an important part of budget revenues, and their structure represent the mirror of government's fiscal policy. Also their level and structure reflects the evolution of the economy in general. The evolution of tax revenues has been influenced by the financial crisis of this period. The tax revenue structure in Romania is characterized by relatively high share of indirect taxes revenues in comparison with another European Union states, where the share of revenues from direct, indirect taxes and social contribution is relatively close.

Government expenditure is vital for the economy especially if they are focused on productive areas. They are the engine of economic developments and plays an important role in raising the standard of living of population in a state. In the last years, the growth rate of public expenditure was higher than the trend of tax revenues increase. Sizing revenue and public expenditure is essential for achieving the budget balance target and to meet the criterion stipulated in the Stability and Growth Pact. According to the Pact, the budget deficit may not exceed 3% of GDP. This development asymmetric led to increased deficits in the last years.

The high level of structural deficit has canceled an initiative to tax relaxation in this recession period. The need for fiscal consolidation has been paramount in the context of chronic deficit and difficulties faced in financing it. The opportune solution to finance the high public deficit and to achieve the objective of financial stability of the economy was contracting of public debt from International Monetary Fund. Other measures to reduce the deficit were the reduction of public expenditure and increasing tax revenues.

We propose in this paper to analyze the evolution of fiscal indicators in comparison with the evolution of macroeconomic indicators to capture the reaction of taxpayers and economic environment at measures adopted.

Keywords: fiscal, tax, fiscal revenues, budget, financial crisis

Coduri JEL: E60

I. Introduction

The importance of fiscal policy of a state budget is derived from the impact that it manifests on the main macroeconomic indicators which reflect progress through economic growth. The fiscal –budgetary policy must be linked to macroeconomic policies and support macroeconomic stability objective. The main objectives of fiscal-budgetary policy are to stimulate the economic activity, rising living standards, fiscal consolidation, promotion of countercyclical fiscal policies. The mirror of fiscal-budgetary policy is a state budget, which includes destinations of financial resources and their sources of funding. Some authors considers that budgetary policy represent the concept and actions of government for public revenue and expenditure, the means to raise revenue, the types and size of expenditure which can interfere in the stabilization and economic recovery(Dobrotă N 1999:354). Although the architecture of revenue and expenditure depends

from economic priorities of a state, it must adapt to situations at a time. Through the budgetary policy is reflected the efficiency of public expenditure use and management and the allocation of financial resources. The level and structure of public revenue and expenditure reflects the main trends, directions for action in a state economy. So do not neglect “the important role of policies and budgetary levers in the modern economy”, like it is highlighted by Constantin Tulai professor(Tulai C. 2007:68). Fiscal policy offers the main tools which is used by the government to influence the economy through changes in taxation level or public expenditure adjustment. Fiscal policy plays an important role in mitigating the economic cycle. According to several experts which we subscribe too, the effectiveness of fiscal policy is reflected by its role of stabilizing the economy. Thus, we can say that the optimal tax policy is acting to mitigate the amplitude of business cycle fluctuations, that in periods of recession adopt a lax behavior and in the expansion periods a more restrictive behavior. An important indicator by means of we can estimate if the fiscal policy performs the stabilizing role is the structural deficit. The structural deficit shows how many from the fiscal-budgetary position level reflected through taxes, transfers, expenditure due to economic conditions and how many due to fiscal policy decisions taken. The analysis of this indicator reflects the sustainability of fiscal policy.(Raport anual: Evoluții și perspective macroeconomice și bugetare 2011: 23-24)

By the side of monetary policy, fiscal policy has an important role in the general economic policy objectives. While monetary policy acts on short-term, the effects of fiscal-budgetary policy is outlined in a medium or long time horizon. However the objectives of the two categories of economic policies must be linked.

In the context of Romania integration into the European Union, another concern is adapting the fiscal-budgetary policies to EU requirements. Optimum sizing of public revenue and expenditure is essential to achieve budget balance and to respect the objective criteria laid down in the Maastricht Treaty. According to the Treaty, the budget deficit must not exceed 3% of GDP.

The current financial crisis has exposed some weakness of fiscal budgetary policy direction of Romania that pro-cyclicality. Thus, in the context of excessive growth in the budget deficit in Romania is necessary a budgetary and fiscal consolidation. A growth model based on debt and increase investment in housing and consumer sector, high budget deficits have required fiscal consolidation efforts.

II. The evolution of main fiscal indicators in period 2000-2010

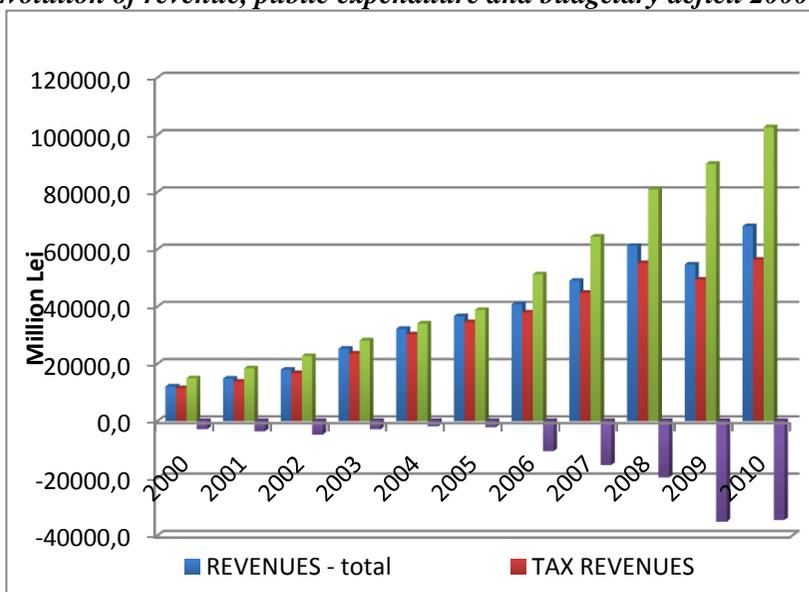

Procyclical nature of fiscal and budgetary policies of economic growth before the financial crisis, canceled fiscal space to stimulate the economy during the recession claiming the need to reduce high budget deficit during the crisis and maintaining pro-cyclical fiscal and budgetary policies. Although Romania is the country with the highest GDP growth in Europe but in the short term this situation marks a number of uncertainties about the outcome of the deep financial crisis(Raport privind situația macroeconomică pentru anul 2009 și proiecția acesteia pe anii 2010-2012: 8).

Analyzing the revenue and expenditure in the period 2000-2010, we notice a trend of growth, but it is noticeable that since 2006 public expenditure growth has outmatched the strong growth trend of public revenues. The share of public revenues in GDP in the period 2008-2010 is situated between 32.2% and 32.7%, while the share of expenditure in GDP have been growing larger, ranging between 37-39, 5%(Ministry of Finance - *Raportul la proiectul Legii bugetului de stat pentru anul 2011 și orizontul 2012-2012:9*).

This development resulted in an exaggerate increase in the budget deficit. Unlike other European Union countries (Ireland, Belgium), where the excessive budget deficits growth is due by measures adopted by national governments to support the banking system, in Romania the budgetary deficit is determined by two main factors: the dramatic loss of budget revenues caused

by the GDP collapse and the structural deficit accumulated by Romania before the starting of financial crisis. If in the period 2001-2007, the budget deficit was fitted within the limits set by the Maastricht Treaty, since 2008 the share of budget deficit to GDP has significantly increase about 5.7% from GDP, exceeding far the permitted threshold of 3 % of GDP. Fiscal adjustment measures aimed primarily efforts to increase tax revenue by increasing the VAT rate with 5%. On the expenditure side, efforts were directed towards a reduction in salaries of public sector, complemented by reducing the number of employees, a decrease of 15% of most social benefits and reduce spending on goods and services by 10%.

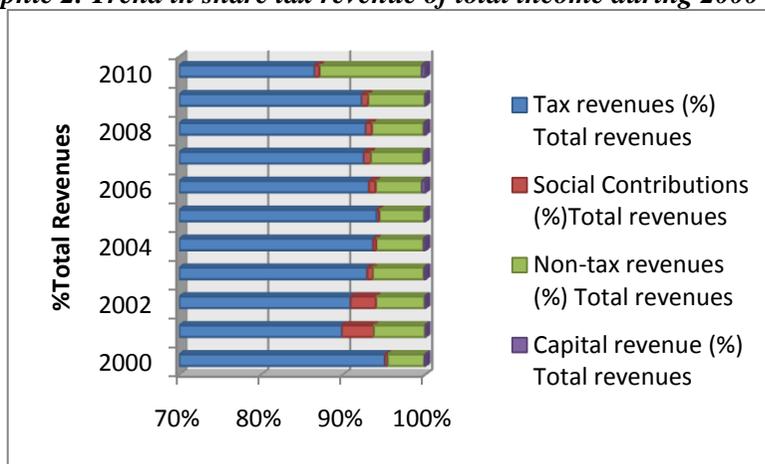

Graphic 1. Evolution of revenue, public expenditure and budgetary deficit 2000-2010

Source: Ministry of Finance- www.mfinante.ro

By the side of public revenues, Romania is the state with the lowest share of budgetary revenues in GDP (32.4% of GDP in 2009), in comparison with other European Union countries, with about 11% lower than the EU average. Also the share of tax revenue to GDP is below the EU average. Analyzing chart below we notice a downward trend in the share of fiscal revenues in total government revenue, emphasizing in the period 2009-2010. This evolution is certainly due to the economic slowdown and GDP downward during 2008-2009 period. Reducing the share of tax revenues in total revenues during 2009-2010 budget is offset by an increase of share of non-tax revenue in the total income.

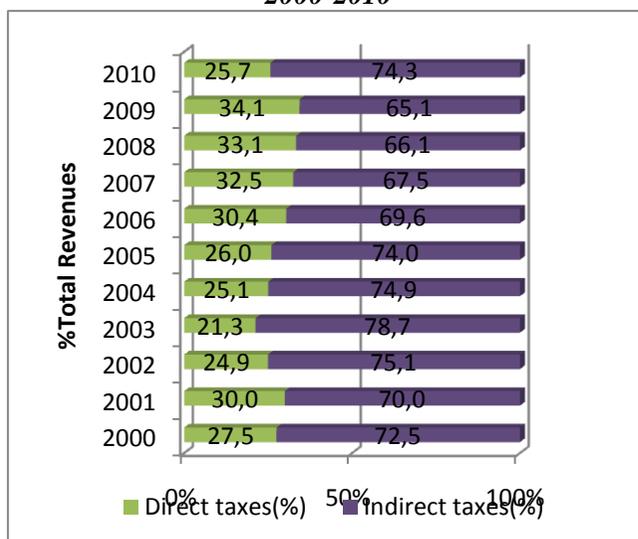

Graphic 2. Trend in share tax revenue of total income during 2000-2010

Source: Ministry of Finance- www.mfinante.ro

The tax revenue structure in Romania is characterized by relatively high share of indirect taxes revenues in comparison with another European Union states, where the share of revenues from direct, indirect taxes and social contribution is relatively close. Although the share of direct taxes fluctuate between 20% and 30% of fiscal revenue in the reviewed period, it is lower in comparison with the share of tax revenues from indirect taxes ranging between 65% and 80%. Analyzing strictly period 2007-2009, we can observe that the revenue from indirect taxes knows slightly downward trend from 67.5% in 2007 to 65.1% in 2009. The orientation of revenue from indirect taxes change in 2010, when an increase of almost 10 percent record compared with 2009. This development is due to austerity measures adopted by the Romanian government among indirect taxes in response to IMF conditions, namely increase in VAT rate from 19% to 24%, gradually increasing excise.

Graphic 3. The share of direct tax and indirect tax revenue to the formation of tax revenues 2000-2010

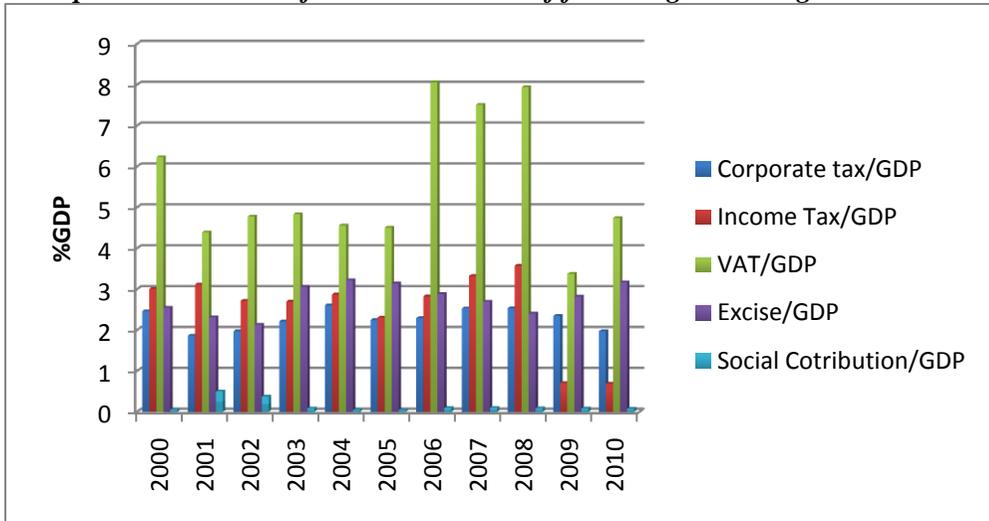

Source: Ministry of Finance- www.mfinante.ro

Analyzing the main categories of sources of revenue: income tax, VAT, excise duties and social contributions can be seen that the largest share is held by value added tax, culminating in 2006 recorded values (8.05% of GDP), 2007 (7.5% of GDP) and 2008 (7.9% of GDP). There then follows a collapse in 2008-2009 of VAT receipts. Then follows a collapse in 2008-2009 of VAT receipts. Since 2010, the revenues from VAT has resumed the ascendant trend as a result to measures taken by the government: the increase in VAT from 19% to 24% by OUG 58/2010 to achieve a balance between revenues and expenditures, where the income were strongly affected by the financial crisis. Government has taken this measure to increase the VAT rate to achieve the objectives of fiscal policy commitments agreed in the bilateral funding agreements concluded with the International Monetary Fund, the World Bank and European Commission. In comparison with the revenues from value added tax, excise revenues are not aware such asymmetric developments in the analyzed period. A slight decrease in revenue from excise duty in 2008 with slight recovery observed in 2009. The slight increase in excise revenue due to the increase of excise duty applied on 1 January 2010 for cigarettes, electricity, heat and gas, to achieve the minimum level required by Community legislation, the increase of the average rate RON / EURO considered at the computation of excise for 2010 and increase the amount of duty on some products. In order to study the impact of fiscal changes on the macroeconomic indicators we can say that measures to increase the rate of VAT and excise duty levels had a negative direct effect of inflation growth in Romania. As regards direct taxes there are high differences among the income taxes, a decrease of approximately 3% of GDP in 2009 compared with 2008. Since may 2008, receipts from corporate income tax recorded a slight decrease. Decreasing receipt from direct taxes is determined mainly by decline of household income and the level of profits as a result of financial crisis. Measures taken by the Romanian government in order to income tax to restore the balance between revenues and public spending was temporary introduction of the minimum tax in April 2009. From the analysis of changes in tax receipts we can observe that the measure do not provided higher receipts from this source, the effect was rather gap mitigation. Social benefits also know a slightly downward trend. The share of social contributions to GDP is steadily falling since 2006. This development is the result of gradually implementation of pension pillar II, which involves targeting gradual shares of social security contribution rate by a private pension fund to invest. Gradually implementation of the pension pillar II is achieved by increasing the share of social contributions redirected from 2.5% to 3% in 2010. In order to restore balance in the public pension system have been adopted reforming measures which include: raising the standard retirement age, increasing the number of those taxpayers with income from professional services, managers, discouraging the number of early retirement, early partial and unfair disability retirement, the expansion base for social contributions.

Overall we conclude that the financial crisis effects have been evident since the end of 2008, resulted in a strong decline are the main sources of financing state budget.

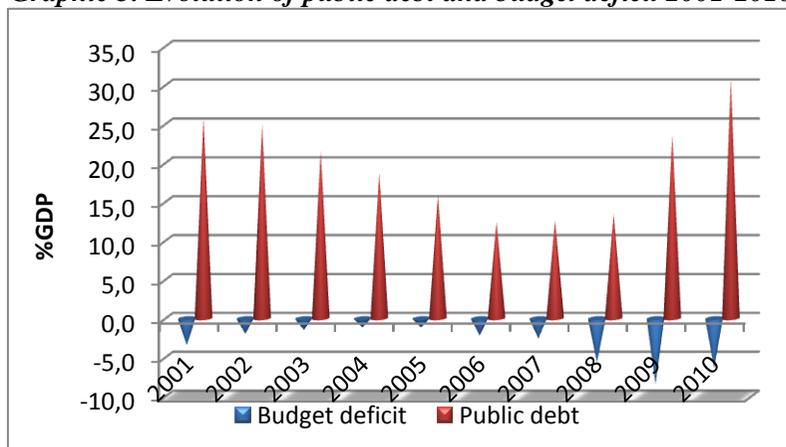

Graphic 4. Evolution of the main sources of financing state budget 2000-2010

Source: Ministry of Finance- www.mfinante.ro

In terms of economic contraction and the budget deficit financing needs in 2008 (5.7% of GDP), Romania's public debt increased. The optimal solution for financing, the high deficit and debt refinancing, respectively to achieve the objective of financial stability of the economy was contracting of public debt from the International Monetary Fund (Mara Eugenia Ramona, Inceu Adrian, Cuceu Ionuț, Achim Monica Violeta 2005: 5). Increasing public debt growth is due mainly by the increasing of government debt, local debt remained constant. The structure of government debt shows that public debt contracted directly by the state is about 90% of the total public debt and debt guaranteed by the state government is about 10% of the total. (privind situația macroeconomică pentru anul 2009 și proiecția acesteia pe anii 2010-2012: 30). Analyzing the public debt by the currencies in 2010, we can observe the most important component is the Euro (44.1%), followed by national currency (43.5%), while other currencies have only 12.4% of total debt government. High share of debt in euros due to the hiring of loans in euro, both domestic and foreign. Romania's public debt has increased significantly in the last two years, reaching the 2010 level of 30.8% of GDP, which is well below the ceiling imposed by the Maastricht Treaty of 60% of GDP.

Graphic 5. Evolution of public debt and budget deficit 2001-2010

Source: Eurostat

III. Conclusions

Through the financing agreements concluded with the IMF and the European Commission, the Romanian government has assumed an adjustment program to reduce the general government deficit at 4.4% of GDP for 2011 of 3% in 2012, and most adjustment measures are already in force. This further implies keeping under control public spending and the elimination of discretionary fiscal policy measures affecting the revenues.

In conclusion we can say that Romania's fiscal policy should remain a conservative, restrictive towards the goal of fiscal consolidation.

PRINCIPLES AND PROCEDURES ON FISCAL

Morar Ioan – Dan

University of Oradea, Faculty of Economics

Fiscal science advertise in most analytical situations, while the principles reiterated by specialists in the field in various specialized works

The two components of taxation, the tax system relating to the theoretical and the practical procedures relating to tax are marked by frequent references and invocations of the underlying principles to tax.

This paper attempts a return on equity fiscal general vision as a principle often invoked and used to justify tax policies, but so often violated the laws fiscality .

Also want to emphasize the importance of devising procedures to ensure fiscal equitable treatment of taxpayers.

Specific approach of this paper is based on the notion that tax equity is based on equality before tax and social policies of the executive that would be more effective than using the other tax instruments.

I want to emphasize that if the scientific approach to justify the unequal treatment of the tax law is based on the various social problems of the taxpayers, then deviates from the issue of tax fairness justification explaining the need to promote social policies usually more attractive to taxpayers.

Modern tax techniques are believed to be promoted especially in order to ensure an increasing level of high efficiency at the expense of the taxpayers obligations to ensure equality before the law tax.

On the other hand, tax inequities reaction generates multiple recipients from the first budget plan, but finalities unfair measures can not quantify and no timeline for the reaction, usually not known.

But while statistics show fluctuations in budgetary revenues and often find in literature reviews and analysis relevant to a connection between changes in government policies, budget execution and outcome.

The effects of inequality on tax on tax procedures and budgetary revenues are difficult to quantify and is among others to this work.

Providing tax equity without combining it with the principles of discrimination and neutrality in the tax to ensure an objective of fiscal policy.

Keywords: fiscal science, the principles of taxation ,fiscal, tax, fiscal revenues, budget, crisis

Coduri JEL:H20

Imposition of the theoretical principles of science is tax procedures such as the practical form of taxation, the latter being comprised of specific operations taxation.

The principles, generally, there are rules, customs, descriptions or definitions accepted in time by repeating to their individualization as dedicated as such time.

How the tax is an important part of social life, from ancient times it was a high regulatory component level in different periods in the evolution of society.

Feeding practices are emerging as national budgets techniques quite late, we can say that the great empires like the Roman Empire, Byzantine Empire or state organizations during the later

Middle Ages and especially in modern times have used techniques that have evolved time, so to speak in contemporary modern tax procedures and techniques.

Although ways to attract financial resources from state treasures states or organizations have the same economic content, however, different forms from country to country while also differed. But the great thinkers and especially classical political economy, Adam Smith precursor fails to define the rules governing the taxation process more objective to be achieved, namely in the form of imposing peaks.

Maximums were imposed along the remaining time and raised in the special cases in the literature so far is talk of three groups of principles of taxation, namely the principles of fiscal efficiency, fiscal equity principles and principles of economic policy and social.

Principles of taxation yield based on the idea that taxes should be placed so that it brings maximum revenue with minimal state expenditure, in other words, is characterized by productivity. Productivity in turn is an indicator that expresses the efficiency, and in this case is also a feature of the tax cost.

As an indication, in general, productivity expresses the ratio between results and effort, and if taxes this indicator is the ratio between tax revenues and state efforts to attract them, in fact, tax administration costs.

These costs are quantified and the fiscal system can be determined, in fact, are the fiscal costs of maintenance. We know that if indirect taxes tax procedures involve a higher tax payers in the process starting with maintenance records purchases and sales, continuing with the calculation of taxes, their declaration and of course their pay.

The participation of contributors to the tax administration requires an effort on their part and savings from the tax authority.

It is interesting to determine the involvement of taxpayers in the administration of taxes and how constitutional law is the imposition of tax by taxpayers that they were required to maintain records on tax and other obligations, such as declarations on a particular type of data carrier, or the obligation to submit and maintain certain records prior accounting and other information related to trim taxes otherwise.

On the other hand in case of direct taxes is based on a fiscal apparatus restricted participation of taxpayers, meaning that taxes on buildings, land, vehicles, tax on personal income from independent activities carried out by the retained the source of rents from agricultural activities and other with the end of regulation, the unit tax on the taxpayer prepares the tax statement, enforceable document, it will be followed to the collection of amounts assessed.

If the profit tax, income microenterprises, dividends and others taxpayer tax return and calculate the actual tax. And if those indirect taxes and direct tax authority has the right and obligation to control activity for each tax separately .In this context we can say that indirect taxes are more profitable than direct taxes.

Tax return is influenced by the level of accuracy of tax law, if it allows or not or if you fraudulent tax evasion against the law even if it is located that you do not leave room for interpretation. If the tax is paid by all taxpayers who have taxable same table, it is characterized by universality, quality tax cost.

So we know that in fact violated tax laws are fraudulent or are bypassed by the taxpayers, so that part of planned to collect tax revenues do not reach the collection. Level budget tax revenue is a function and device performance fiscal control, the device should be based on tax laws and procedures of tax control equivocal performance.

The level of failures to receive is not equal to the degree of tax evasion primarily because we do not know if the planned revenues are well grounded and if he can not evolve as macroeconomic indicators once assumed the public budget planning.

The most important problem of collecting the fraudulent evasion of taxes is an important topic as complicated as it is.

In the literature often talks about avoiding the tax law on an escapist phenomenon without breaking the law, called the fraudulent evasion.

In this context I put my problem reporting escapist content phenomenon, if we refer to tax law, if we refer to planned tax revenues or the principle of universality of taxation. In the first case the tax law is not broken, so in terms of jurisdictional comparison is pointless.

Reporting on planned tax revenue does not generate an eloquent comparison to the process of planning can be faulty and so the comparison suffering. Remains third comparison, the principle of imposing, this principle can be violated, in which, however, does not violate law rule than universally accepted.

I personally, not breaking the law does not accept such employment, considering honest trader and indicates those interested in just talking about tax evasion, fraud phenomenon par excellence. Principles violation of universality, a principle is violated continually bare fact, primarily affecting profitability and return on any taxation can be no question of tax fairness.

A tax and cost is characterized by stability, a tax that must be seen as two spots of view, namely, the stability of the tax law and tax revenue stability. Stability of resistance translates into tax law tax law in time, which means that the law would be well located and comprises all the details required in the tax case.

Cash inflows fiscal stability means that when tax rates change and change proceeds in the same way. It is said that excise taxes are stable so that when tax rates rise and increase revenues.

If these taxes are apparently betting heavily on the psychological factor of about certain flaws in the case of alcohol and tobacco, the habit if auto fuel.

Another quality of taxes, namely the imposition of convenience, in fact one of the maxims of taxation, taxation with fairness, certainty of imposition of taxation and economic qualities, put forward by Adam Smith, can be considered a necessary feature cost taxes, and contributing to increasing the collection tax revenue.

Fairness is a principle of taxation often invoked in literature, but it seems the most difficult fiscal respected in practice. Fair treatment for all taxpayers from the tax authorities is a goal difficult to achieve in practice in tax and general appropriateness societate. Totusi promotion, discrimination and neutrality to the tax authorities may result in equal treatment from the tax law.

Equality before the treasury can be absolute when the taxpayer owes an equal amount of Tax expressed in absolute terms, or may be relative when the taxpayer owes a relatively equal nsuma expressed in relative numbers, in percent, this is the proportional share.

In time, when economic and social life to sophisticated and revenue obtained from various sources the question of contributory capacity taxpayers, taking into account their economic situation, their social, family, their health status and other variables to justify differential treatment to the tax authority, in other words one that can pay more to do.

They rely so under the influence of leftist thought after the French Revolution to provide income tratamentulechitabil public increasingly larger.

The literature talks about horizontal equity and vertical equity on, the evolution of the concept of tax fairness.

Treatment involves horizontal comparison income of two or more persons get equal pay but from different sources, and if vertical equity is to compare the incomes of two or more different persons who earn income from the same source, context in which Professor Constantin Tulai in his "Public Finance and Taxation" highlights the risk of such comparisons, in fact beneficial to

express report with the taxpayer, to transfer the emphasis on gender equality before tax through tax .

Time evolution of the concept of tax equity reflects the intent to transfer treasury importance to gender equality through taxes or tax reports, obviously in financial purposes. Accepting equality through taxes, accept and practice invasive in terms of tax authorities, tax policies are used exclusively for government.

Of course many of our peers need government help because of illness, because of family and of course other reasons that they need help in different ways. In this context, however, we must ask ourselves whether such interventions for social purposes to be promoted through taxes or using other levers.

It is obvious that if the executives involved in the tax account, the first result is that it distorts the acceptance address, that the official intention of the taxpayer and those who do not enjoy such tax benefits conferred will try to bypass the tax law.

I think for social interventions can be promoted through other means, such as state social insurance systems, at other institutions of social protection for the taxpayer and not to confuse the proper push other adverse judgments propriety, and labor market competition capital and ultimately to tax evasion.

On the other hand and tax procedures are hampered and will suffer in terms of efficiency and their bureaucratic phenomenon, by appealing to all sorts of supporting operations to access tax advantages or disadvantages for others put in the work of contributors.

The third group of principles of taxation are those that concern economic and social policies. Taxes are the main source of revenue for the state, but a tool, an effective lever to influence consumer. Principles taxpayers in their capacity as neutral taxation, the tax discrimination, lack of arbitrariness, impersonality and the legitimacy of taxes.

Use taxes in their capacity as leverage requires diversifying financial operations tax procedure.

NOKIA PERFORMANCE AND CASH FLOW ANALYSIS

Moscviciov Andrei

Faculty of Economics and Business Administration Babeş-Bolyai University, Cluj-Napoca, Romania

In this paper the author presents the ways to analyze the performance of the company Nokia. Thus based on a system of indicators are highlighted the key situations that emphasize performance, namely: operational activity, financial balance, cash flows.

Keywords: net sales, gross profit, ROE, ROA

JEL Classification: G32

1. Introduction

Nokia is a consumer led company. There is a progressive and continuous increase in consumer involvement with technology and communications globally. People are broadening their modes of communication to include the web, and social networks are becoming central to how people communicate.

People want to be truly connected, independent of time and place, in a way that is very personal to them. And, Nokia's promise is to connect people in new and better ways.

Nokia's strategy is to build trusted consumer relationships by offering compelling and valued consumer solutions that combine beautiful devices with context enriched services.

2. Method and Results

Analyses of financial performances are based on the income statement. The most important indicators in this process are presented bellow.

- **The net sales** increase year by year with around 20%, the net sales have encountered good values.

- **The gross profit on sales** is influenced by sales and also by cost of sales. Because of the increase in both elements, the increase of gross profit on sales is not the same as for the net sales, so in the first year is only 12% meanwhile in the second it gets to 29%.

- **The operating income** is related to gross profit and also other expenses like those for research and development, selling and marketing expenses and also the general and administrative expenses. These expenses encounter an increase every year, the situation being influenced by the amount of each modification, so the encountered operating profit gets higher and higher every year.

- **The profit before taxes** has almost the same shape as the operating income. Also this is influenced by the financial results which are separated into those related to share of results of associated companies and those related to financial income and expenses.

- **The net result** is materialized during all the period in growing profits but is differentiated from one year to another. Thus in 2009 is a normal increase of around 20%, while in 2010 we have a bigger increase of financial profits by almost 70%.

In order to determine a company's profitability and efficiency, the main indicators used are the ones presented in the Table no.1.

Table no.1 Operating ratios

OPERATING RATIOS	2008	2009	2010
ROA	20.66%	24.26%	21.24%
ROS	13.57%	13.35%	15.64%
Assets Turnover	152.28%	181.81%	135.80%
ROE	28.90%	35.70%	41.56%
Inventory Turnover	-	17.22	15.24
Account Receivable	-	7.32	5.98

2.1. Return on assets (ROA), Return on sales (ROS) and Return on equity (ROE).

The profitability ratios relate the company's income to bases such as assets, sales or owners' equity. The first one's evolution is a complementary one, ROA encountering an increase in 2009 and a decrease the year after, while in case of ROS, it's exactly vice-versa, in 2009 it's going down and one year after it's going up, although the modifications are not significantly. Less favorable developments of ROA and ROS are caused by the following factors:

- a higher increase in total assets, in 2010, compared with the increase in the operating profit;
- lower growth in operating income compared with the sales' growth, in 2009.

The evolution of ROE is a positive one, higher and higher from one year to another, indicating a good efficiency of capital for shareholders.

Inventory and Assets Turnover.

A higher increase in the company's inventories generates a decrease of the Inventory Turnover in 2010, while a big growth of total assets in 2010, much higher than the one in sales leads significant to a decrease in Assets Turnover.

2.2. Financing Ratios

Financing ratios reflect the capital structure of the firm and are widely used by investor analysts in assessing the potential risks and returns related to the firm's debt and equity securities.

Liquidity and Solvency

From the liquidity point of view we can observe that the company is more than able to pay its short-term debts at maturity, even though its liquidity is lowering, both in terms of current ratio and quick ratio. The decrease is the result of the major increase in current liabilities, up to 86% in 2010. In terms of solvency, the ratios are increasing during the years. The first one indicates that over the years approximately 48% of Nokia's capital is financed from borrowed funds.

Equity Ratios

Equity ratios are used in common stock valuation and in the assessment of stock risk. Earnings per Share increases over the followed period, reaching 1.85% in 2010, more than double from the first analyzed year. Market value per share increases its value in 2009, the next year being characterized by a high reduction, reaching a level under the one from 2008. This ratio reflexes a market value of the shares at least eleven times higher than the book value. The dividend per share registered growth in the last year even if it's just a small one.

Growth rates are computed as average annual rates of growth over time periods. All ratios are increasing over the years, the assets encountering the highest raise in 2010 compared with 2009, (66%), followed by the earnings with 55%, in the same year.

Other Ratios

One of the most important indicators in this category is the Price to Earnings ratio (P/E), which in our case is having a sinusoidal evolution, with an increase in 2009, followed by a decrease in 2010. The ratio indicates a lower confidence of investors in Nokia's stocks in 2010, when their value is decreasing.

2.3. Analysis of Cash Flow Statement

Cash flow is the balance of the amount of cash being received and paid by a business during a defined period of time, sometimes tied to a specific project. In constructing its cash flow, the company Nokia uses the indirect method. The three-year data in Table no.2 presents the activities which provide cash flows for the company, activities divided into operating, investing and financing. The most important activity that brings money into the company is the operating one, while the financing activity is the most expensive one, the result over the three years being a negative one, but in decrease. Over the studied period, the amount of cash in the company is increased, in 2010 reaching almost double the value from the beginning of the year.

The table below underlines the indicators most used for correlations between cash and shares.

Table no.2 cash flow indicators

Cash flow indicators	2008	2009	2010
Cash flow per share	0.001	0,001	0,002
Free cash flow	2524	2837	5996
Cash flow from operations (CFOT)	135.51%	127.04%	115.07%
Cash flow from operations (CFOD)	15.46	11.31	6.13

From this table, it can be observed that the cash flow per share is approximately the same during the three years, with a slightly increase in the last one. The cash flow from operations represents at least 115% of the cash flow entered into the company and a level of 135.51% in 2008.

Some correlations between loans and cash flow from operating activities are made in order to evidence the influence of borrowings on company's cash.

3. Conclusions

Over the three years, Nokia has encountered a general ascendant evolution regarding all main financial elements – assets, owners' equity, the company's solvency, as well as the in terms of money that entered the firms accounts. The company's leaders developed it and added value through proper management of heritage, increasing the goodwill at remarkable levels. The financial results for Nokia are bringing profit every year both from operating activities as well as investment activities.

As strengths, it can be mentioned:

- a favorable situation regarding liquidity and solvency ratios;
- very low short-term borrowing;
- earnings, assets and sales growths positive;
- increase in sales and a reduced increase of the costs of sales.

In terms of weak points, the company could make substantial improvements, most important being:

- increasing the speeds of rotation for assets regarding the inventories and accounts receivables;
- reduce its long-term indebtedness, to move the financial result on plus.

Taking into consideration the history of one and a half century of Nokia, period during which it has become the first company in the mobile phone business, we can say that its stocks can be a profitable investment for the future.

PUBLIC DEBT SUSTAINABILITY ANALYSIS: EU CASE

Nicolescu Cristina

West University of Timișoara Faculty of Economics and Business Administration

Pirtea Marilen

West University of Timișoara Faculty of Economics and Business Administration

Boțoc Claudiu

West University of Timișoara Faculty of Economics and Business Administration

The global crisis has caused a serious fiscal deterioration that leaves the world economy with serious challenges. In many developed markets as well as in a few emerging markets (Emerging markets) public finances have already become, or are at least at risk of becoming, unsustainable. Commonly, public debt sustainability is defined as a sovereign's ability to service debt without large adjustments to public revenue and/or expenditure and without ever-increasing public-debt-to-GDP ratios. Hence, this definition refers to both a country's ability and willingness to repay its debt. We also have to add the fact that there isn't an universal accepted definition of fiscal or debt sustainability.

In light of the growing public debt, the issue of debt sustainability has increasingly attracted attention. In this paper we analyse public debt sustainability scenario in EU economies. At least half of the EU countries will have to implement stringent fiscal consolidation programmes over the next few years in order to prevent already high public-debt-to-GDP ratios from a further significant rise, also the case of Romania. However, drastic fiscal policy adjustment may be not feasible in the short term and hence public debt is likely to grow further.

In some scenarios the public-debt-to-GDP ratio is predicted to soar to 133% in 2020, from just over 100% in 2010. By contrast, nearly all EM countries, including major economies, appear to be well positioned to stabilise or even outgrow their current debt ratios without drastic fiscal adjustment.

Institutional improvements may help European countries to maintain fiscal credibility. In light of the future fiscal challenges, many European governments may introduce new or more effective national debt limits, similar to those put in place in the past with good results by some Emerging markets. Such institutional reforms could help to insulate fiscal policies from political pressure and to anchor financial market expectations.

Keywords: public debt, fiscal policy, fiscal sustainability, GDP, fiscal consolidation.

JEL Codes: H63, H30, H69, H60, H59.

I. Introduction

Most economists, policymakers and international financial institutions called for expansionary monetary and fiscal policies to mitigate the adverse effects of the global crisis. So far, bold and coordinated policy actions have successfully prevented a collapse of the world financial system and the global economy.

Nearly all major developed markets as well as some emerging markets have run counter-cyclical fiscal policies, either via automatic stabilisers or through discretionary stimuli. As a result, fiscal accounts have worsened significantly since 2007 not only in Developed markets but also, though to a lesser extent in emerging markets. Fiscal accounts were hit particularly hard in Developed markets with bursting housing market bubbles as well as in countries with already high pre-crisis debt burdens.

Regarding the average GDP-weighted public-debt-to-GDP ratio in Developed markets and Emerging markets, it is obvious that many governments have moved into unexplored territory over the past couple of years. While the GDP-weighted EM public debt stock climbed to around 44% of GDP in 2009 from just 35% in 2006, the DM debt ratio skyrocketed to around 95% of GDP from less than 80%.

Today, most Emerging markets still exhibit relatively manageable public debt levels. The current EM public-debt-to-GDP ratio is well below its late 1990s high of 55% of GDP. Contrary to Emerging markets, DM public-debt-to-GDP ratios are now higher than they were in the late 1990s, measured both on an un-weighted as well as on a GDP-weighted basis.

Since the turn of the century, public finances have worsened in particular in a few major developed markets, as underlined by the growing gap between the un-weighted (simple) and the GDP-weighted DM public debt-to-GDP ratio. Meanwhile, the gap between the un-weighted and GDP-weighted average debt-to-GDP ratio has narrowed in the EM world, indicating that no major EM has a public debt burden that is significantly above the average level of its peers.

The previous findings indicate that tail risks in public finances, as measured by the relative size of an economy, are nowadays highly concentrated in the advanced world. The nine Developed markets that face substantial consolidation needs (Ireland, Germany, the UK, the US, France, Portugal, Greece, Italy and Japan), account for around 85% of the DM sample's total GDP. However, the Emerging markets that are either subject to tangible consolidation needs (the Czech Republic, Hungary, Romania and Poland) or where past efforts to lower high public debt have to continue (Turkey, Brazil, India) account for only 29.8% of the EM's total GDP.

II. Literature review

When analysing public debt sustainability in Developed markets and Emerging markets, it is useful to recall the basic concept of public debt arithmetics. (Eduardo(2005) and Sturzenegger (2002).)

To begin with, the dynamics of debt accumulation can be described in absolute terms as:

$$D_{t+1} - D_t = r_{t+1} \times D_t - PB_{t+1} \quad (1)$$

where:

- D denotes a country's gross public debt stock,
- r captures the real interest rate paid on public debt outstanding, and
- PB represents the government's primary balance, i.e. the government's fiscal balance before net debt interest payments.

The above identity can also be expressed in percent of GDP, which puts the public debt stock in relation to the size of the economy (government's underlying potential tax base):

$$\frac{D_{t+1}}{GDP_{t+1}} = (1 + r_{t+1}) \times \frac{D_t}{GDP_t} \times \frac{GDP_t}{GDP_{t+1}} - \frac{PB_{t+1}}{GDP_{t+1}} \quad (2)$$

After rearranging we obtain:

$$d_{t+1} = \left(\frac{1 + r_{t+1}}{1 + g_{t+1}} \right) \times d_t - pb_{t+1} \quad (3)$$

where:

- d denotes the public debt stock and
- pb the primary budget balance (both in percent of GDP).
- g represents the annual real GDP growth rate.

As shown in equation (3), the current public debt stock depends on the past year's debt stock as well as on today's real interest rate, real GDP growth rate and primary balance. The higher the real interest rates, the lower real GDP growth and the lower the primary balance, the more the

public-debt-to-GDP ratio rises. In other words, strong real GDP growth, low real interest rates and sound fiscal policies (as reflected by primary surpluses) are necessary to avoid ever-rising public debt stocks or to lower public debt to more sustainable levels.

Often it is important to know what primary balances governments have to achieve in order to stabilise their current public-debt-to-GDP stocks under given macroeconomic and financial conditions, i.e. under the prevailing economic growth and interest rates.

It can be shown from (3) that the required primary balance to stabilise the debt-to-GDP ratio, denoted as pb^* , depends on the differential between the real interest rate r and the real GDP growth rate g as well as on the prevailing debt level in year $t=0$:

$$pb^* = \left(\frac{r-g}{1+g} \right) \times d_0 \quad (4)$$

Highly indebted sovereigns may have to achieve more than stabilisation of their current public-debt-to-GDP ratios. Instead, more ambitious fiscal improvements are needed to put public debt dynamics on a sounder footing.

In order to lower the current debt-to-GDP ratio to a target level d^* over the next T years, the required permanent primary balance pb^{**} is given by:

$$pb^{**} = \frac{d_0 \times \left(\frac{1+r}{1+g} \right)^T - d^*}{\sum_{j=1}^{T-1} \left(\frac{1+r}{1+g} \right)^j} \quad (5)$$

III. Methodological framework

In many countries rising public-debt-to-GDP ratios imply the risk of increasing pressure on sovereign financing capacity, creditworthiness and hence ratings. A “positive” shock would be triggered by unexpectedly strong but well-balanced fiscal consolidation. Should economies show signs of a more durable recovery, or – more gloomily – should market and rating agencies’ pressure intensify, such a scenario would not look that far-fetched. But how much adjustment is needed? This depends on the current and desired debt level. As “desired” debt targets we use three different benchmarks:

(1) **Stabilising current debt levels**, as preventing further increases could send a positive signal about fiscal prudence.

(2) **Pre-crisis (2007) debt levels**, to be attained in 5-10 years’ time.

(3) **Prudential public-debt-to-GDP benchmarks** (of 60% for DMs and 40% for EMs), to be attained over a 10-year period.

To stabilise debt at 2011 levels, EM countries – on aggregate – could run a primary fiscal deficit of 1.2% of GDP each year. For the past five years, these countries have run a primary surplus of 0.8%, so the stabilisation of debt appears to be easily manageable. Of course, there are country-by-country differences. Turkey and Brazil, for instance, would need to deliver a substantial permanent primary surplus to stabilise their debt. However, in both EMs the required primary surpluses are largely in line with what was achieved over the last cycle.

In the past decade, DMs ran an average primary deficit of 1.2%. Again, the country-by-country analysis shows significant differences and some silver lining. For example, crisis-struck countries like Spain, the UK and the US could stabilise their 2011 public-debt-to-GDP ratio by running only moderate permanent primary surpluses. Nevertheless, the gap between the primary balance

achieved over the last cycle and the debt-stabilising primary balance indicates that many DM and a few EM governments have to significantly alter their fiscal policy stance. This is also true for countries that could continue to run primary deficits to stabilise debt levels. In Japan, Greece, Slovakia, Portugal, the US, Romania, Hungary, the UK, the Czech Republic, Ireland and Poland (consolidation needs by decreasing size) the debt-stabilising permanent primary balance is at least one percentage point above the average figure of the last cycle.

Lowering debt to pre-crisis levels: here we discuss the permanent primary fiscal balances required to bring current (2011) public-debt-to-GDP ratios back to pre-crisis levels (2007) within five or ten years' time.

Nearly all DMs (16 out of 17, with Switzerland as exception) have to achieve constant primary surpluses of 1-12% of GDP in order to lower public-debt-to-GDP ratios to pre-crisis levels over the next five years. If spread over ten years, the required adjustment ranges from 1-6% of GDP for 13 out of 17 DMs. The consolidation needs are largest in Japan, Ireland, the US, the UK, Greece, Portugal, Slovakia, France, Spain and Germany. This holds true in absolute terms and/or relative to what has been achieved over the past years.

Contrary to most DMs and in line, debt reduction to 2007 levels does not appear challenging for most EMs, according to the average primary balance achieved over the last cycle. The only exceptions are Poland, the Czech Republic, Hungary and Romania. These countries need a tangible improvement on their primary balances to reach their pre-crisis indebtedness.

However, pre-crisis indebtedness is not necessarily a meaningful benchmark for the analysis of debt sustainability. Especially for those countries where the difference between the public debt levels in 2011 and 2007 is small and/or where the pre-crisis debt stock was already elevated, the focus on pre-crisis levels may not show the true sacrifice required to cut public-debt-to-GDP ratios back to more sustainable levels. Thus, we also calculate the permanent adjustment needed on the primary balance to lower public debt to benchmarks considered prudent.

As benchmarks and in line with the IMF's calculations we use public debt- to-GDP ratios of 60% and 40% for DMs and EMs, respectively. Other benchmarks are also perceivable and economic theory offers no widely accepted public-debt-to-GDP limits.

Although the 60% limit for DMs (also part of the Maastricht treaty) has some theoretical justification, it could be considered arbitrary. For EMs we use a limit of 40% of GDP, which is often suggested as a critical external debt limit. At least up to now there are several reasons that support this discount for EMs (e.g. more unfavourable debt structure, higher exchange rate and market access risks).

In a sample only 5 of 17 DMs (Australia, Slovakia, Switzerland, Denmark and Sweden) have public-debt-to-GDP ratios of below 60%. In fact most DM countries, including major economies and most major EMU and EU countries, have debt stocks well above this benchmark. Germany, the UK, the US, France, Portugal, Belgium, Greece and Italy would have to achieve constant annual primary surpluses of 2.5-8% of GDP over the next ten years to reach a public-debt-to-GDP ratio of 60%.

Moreover, the debt reducing primary balances are extremely demanding (with the exception of Belgium and Canada) in relation to past averages. Compared to the last decade these countries will have to improve their primary balances by 2-7 percentage points.

By contrast, in the EM world there seems no widespread need for sharp fiscal consolidation. Nevertheless, fiscal challenges in the EMs should not be underestimated. Within a sample only ten out of 21 EMs have public-debt-to-GDP ratios below the 40% benchmark.

However, compared to DMs the efforts required to reach prudential levels look much more manageable. Only Romania, Hungary, Poland and the Czech Republic would have to alter their fiscal policy stance substantially. However, these EMs enjoy the prospect of joining EMU and hence of migrating to the DM segment. As EMU members they would be able to issue public

debt in a global reserve currency. Thus, the 60% debt limit, well within reach except for Hungary, appears to be a more appropriate benchmark to them.

IV. Results

We want to stress that public debt ratios above 60% (40%) of GDP do not necessarily imply a crisis. Many DMs and Ems have not defaulted despite having borne relatively high debt. However, debt ratios well above these limits and/or on a rising trend certainly increase the risk of market repercussions. At the moment, this applies in particular to DMs. Moreover, the outlook for public debt levels above the 60% benchmark, on the rise and substantially above past levels in a lot of DMs has several implications.

Firstly, record volumes of sovereign issuance will have to be absorbed. This holds true even if some consolidation will be achieved. Thus, regulatory pressure on FIs to absorb this issuance might increase. Moreover, countries with public debt well above benchmarks might suffer from crowding-out effects or may have to accept substantially higher risk premium. Although for some DMs (including EMU members) such risk reprising may be desirable from an economic point of view (i.e. to enforce fiscal discipline), it will complicate the task of preserving public debt sustainability in the short run.

Secondly, the credibility of institutional arrangements like national debt limits in DMs or the EU's Maastricht treaty as well as the Stability and Growth Pact will be under pressure for years.

Thirdly, the fiscal challenges in many DMs may revitalise the longstanding debate on the establishment of ex-ante instruments to deal with sovereign debt problems. Concepts to enforce an insolvency law for sovereign debtors or to establish the IMF as a sovereign bankruptcy trustee (traditionally developed in times of EM crisis) could gain more acceptance. As the design of a potential EMF will have to be part of the current European institutional framework, its design and funding are likely to be partially based on the Maastricht framework. Thus, countries with a public-debt-to-GDP ratio higher than 60% and/or fiscal deficits above 3% of GDP would have to contribute to its funding. The debt target analysis clearly shows that all major EU/EMU members would be contributors for many years. This would help to equip such an institution with adequate capital.

Fourthly, the debt target analysis gives some tentative insight on potential pressures on DM sovereign creditworthiness in the absence of credible consolidation plans along the lines of the sketched requirements. Failure to consolidate could have serious implications for rated quasi-sovereign and private sector entities.

The ultimate bearer of the sketched adjustment costs (e.g. through higher income taxation) is the population, i.e. the electorate of a country. Thus, the quality of policymaking will be crucial in the years ahead. Being aware of this, governments may want to "ring fence" fiscal consolidation from political pressure using (more) effective institutional arrangements such as limits on public indebtedness.

V. Conclusions

In many DMs and a few EMs, one should not forget that expansionary policies mitigated the adverse effects of the global crisis and very likely prevented a collapse of the global financial system and the world economy.

At the moment, it appears that a fiscal exit can take place only gradually. Future scenarios as well as debt target analysis highlight that public debt has become, or is at least at the risk of becoming, unsustainable in many DMs but only in a few EMs. At least in theory, most EMs could afford to run looser fiscal policies, for instance by extending counter-cyclical fiscal policies in order to smooth the fall-out from the global crisis.

Moreover, moderate initial debt levels put them in a relatively comfortable position to stabilise or even outgrow their debt-to-GDP ratios. Only austere and bold fiscal policy adjustments after the worst of the crisis is over, which may lay the foundations for higher potential real GDP growth, lower real interest rates and improved fiscal accounts, would significantly alter the presented public debt dynamics. For some countries the permanent primary balances required to stabilise or even reduce public-debt-to-GDP ratios look very ambitious.

Nevertheless, the required economic and political efforts to consolidate public finances might be much greater than in the past. Overall, medium-term fiscal consolidation is more likely to occur in a supportive macroeconomic environment. During an economic downturn or recession, rising tax rates may not suffice to substantially increase the tax-to-GDP ratio.

Should consolidation fail, policymakers in DMs and some EMs may be tempted to look for other ways to fix the fiscal damage. Either they could tolerate a substantial acceleration in CPI inflation to inflate public debt and/or they risk severe adjustments in the real effective exchange rate. Such adverse scenarios should not be disregarded. The assumption that major macro issues cannot go wrong in the DM world (including EMU) has to be scrapped in the aftermath of the global crisis while this time EM, not DM, economies are the ones in the lead to keep public indebtedness sustainable.

PUBLIC EXPENDITURE POLICY IN THE CONTEXT OF ECONOMIC CRISIS - CHALLENGES AND IMPLICATIONS

Oprea Florin

Al. I. Cuza "University, Faculty of Economics and Business Administration

Mihai-Bogdan Petrișor

Al. I. Cuza "University, Faculty of Economics and Business Administration

Public spending is a key component for both public finances and government financial policy. In this situation, government expenditures are made in direct relation with the results of governance with economic and financial crises and global social welfare of the nation. From this perspective, our article aims to highlight the correlation between public expenditure and budgetary financial and economic crisis and, also, state government responses, anticipating their impact on medium and long term. Also, in the context of the crisis and the concomitant lack of public revenue, we identify the pillars on which to base the budget reduction in public expenditure. The implications of the economic crisis in Romania are analyzed along with proposed measures to be followed by the Government through budgetary fiscal strategy. In relation to the purpose and objectives of the research, documentation was made both in terms of bibliographic resources and the plan of legislative documents and quantitative reporting. We believe that the issue of increasing allocative efficiency of resources is vital to counter the current crisis, but also to maximize the positive effects of public interventions in general and from another state, we consider that state and, consequently, public expenditure budget which should be used to replace the market, can not be regarded as some suggest to be founded and we suggest a line for developed countries. This work was supported by the grant "Post-doctoral studies in Economics: program for continuous forming of elite researchers – SPODE", contract POSDRU/89/1.5/S/61755, project financed by the European Social Fund, by the Operational Sectorial Program Development of Human Resources 2007-2013.

JEL: H50 - General H53 - Government Expenditures and Welfare Programs

Keywords: public expenditures, public debt, tax strategies, economic crises

I. Introduction

The financial crisis that hit the world economy since 2008, had the initial effect of the massive decline in production in many countries, whose level effects were considered comparable with those of the Great Depression. Simultaneously, unemployment rates have increased and will probably be some time still growing in some countries and in Romania. Income tax revenues have also declined, sharply. This crisis can be categorized as having an unusual character, a fact supported by its two main features: (a) how it has spread very quickly from the U.S. to other countries, and (b) how it has become globalized, compared with past financial crises which have generally been limited to one or several countries.

Many analysts considered the current crisis as a clear evidence of market failure, calling for governments to intervene and play an important role both in the short term to stabilize the economy and long term, to expand activities in the public sector and public spending. The theme of the current debate can be considered "more market and less government intervention" (Tanzi 2009: 31). From this perspective, we see that the manifestation of the crisis has provided a convenient argument for increased government spending, but also for their serious restructuring in many countries. In early 2011 states are still involved in the short term to stabilize the market. It is perhaps too early to predict what will happen long term but inevitably short-term actions will

have a major impact on long-term consequences. Now, when countries will come out from the financial crisis, will face a fiscal crisis, which is more difficult to solve.

II.Literature review

The issue of public expenditures was, by its nature, the subject of extensive research in the literature. Normally, however, in the absence of confrontation with another similar economic crisis as it was in 1929-1933, with which currently comparisons are made, no studies have been conducted on evidence showing the correlation between the expression of crisis, government responses and public spending. Extensive studies on the issue of public expenditure were undertaken in the work by Vito Tanzi - *The Changing Role of the State in the Economy: A Historical Perspective*, IMF Working Paper 97/114, International Monetary Fund, Washington in 1997, but also in the work done with L. Schuknecht *Public spending in the 20th century. A global perspective*, Cambridge University Press, 2000, in which was captured a comparative analysis of their impact on society and economy development. Alan Sutherland stressed the impact of public spending in an economy continuously changing conditions in an article entitled *The Expenditures Switching Effect, Welfare and Monetary Policy in a Small Open Economy* CEPR Working Papers published, in April 2004. An important analysis is carried out by Anwar Shah World Bank *Public Expenditures Analysis* in 2005. The issue of public expenditure is enhanced by Vito Tanzi, in the context of recent economic crisis, seeking their role and impact in the new context that most states have faced, in the article *The Economic Role of the State Before and After the Current Crisis* of the 65th Congress International Institute of Public Finance, Cape Town (South Africa), 2009.

III.Research methodology

In relation to the purpose and objectives of the proposed research, documentation was made both in terms of bibliographic resources (books, studies, articles) and the plan of legislative documents (eg., Fiscal and budgetary strategy) and the reporting of quantitative (statistical yearbooks, official reports, national and international forecasts such as those of Eurostat, OECD, World Bank, IMF or the ECB). Data collected were processed and summarized in graphics, in order to capture more adequately the trends identified. It is also used comparative analysis of data which allowed highlighting the differentiation and peculiarities of public spending and their differential impact on social and economic development.

IV.Research results

IV.1.Public expenditure policy in the context of international crisis

At this stage, all states have relied on massive public spending increases, giving rise to major public deficits, public expenditure budget later found related with borrowings, interest and fees. Many institutions (IMF, OECD, ECB, European Commission) have made various estimates of the impact on fiscal variables, implicitly revealing developments in public spending budget. Table no. 1 also reflects estimates by the European Commission in Euro-12 area average and seven other countries. Data refer to the general consolidated budget reflecting final figures for 2007 and projections for the end of 2010.

Table no. 1 Evolution of public expenditure, public debt and balance of payments in the period 2007-2010 (percentage of GDP)

Countries	Balance (excedent/deficit)		Public debt		Public expenditures	
	2007	2010p	2007	2010p	2007	2010p
USA	-2,8	-14,2	63,1	91,1	37,4	43,7
Japan	-2,1	-8,7	173,6	194,0	36,4	46,7
England	-2,7	-13,8	44,1	81,7	44,0	52,4
Germany	-0,2	-5,9	65,1	78,7	44,2	49,0
France	-2,7	-7,0	63,9	86,0	52,3	56,4
Italy	-1,6	-4,8	104,1	116,1	47,9	51,1
Spain	2,2	-9,8	36,2	62,3	38,8	47,1
Euro zone-12	-0,6	-6,5	66,1	83,8	46,1	51,1

* P - forecasts for the end of 2010

Source: European Commission Report, 2010

Year 2010 was the moment expected that the vast majority of countries to overcome the crisis, although in many cases these expectations proved overly optimistic. In this context, should also be noted that the starting point of analysis has specific characteristics, meaning that although 2007 was considered essentially a good year for the economy in general, all countries listed, except Spain, had consistent budget deficits and high public debt, which means that expectations may not materialize in large numbers with positive values in the short term.

According to data summarized in the table, it is noted that there were remarkable increases in public spending as a share of GDP between 2007 and 2010. Elevations range from a minimum of 3.2% of GDP for Italy at a high level 10.3% of GDP for Japan. The increases recorded for the UK (8.4% of GDP), and Spain (8.3% of GDP) are also remarkable, but the fact remains that, in large part, these increases are due especially from lower GDP rather than the real growth of public expenditure.

During this period, local budget deficits, toward which the central budgets of states have initiated substantial balance transfers, in turn led to dramatic increases in deficits in the period 2007-2010. Thus, in the United States and England, deficits reached about 14% of GDP, levels that have not been recorded after World War I and much higher than during the Great Depression. Also, in other countries have recorded spectacular growth, especially in Spain and Japan. As a global effect, increases budget deficits, due to decreasing tendency of gross domestic product and increase public spending budget, have resulted in massive increases in public debt, seen through the prism of its share in GDP, data showing sometimes dramatic levels of the public debt in the analysed countries.

The events of recent years illustrates the danger of an economy in which the financial system operates without careful supervision and regulation, which leads to cycles „boom-bust“, which ultimately are damaging livelihoods and savings of citizens. Forecast estimates that 2011 to represent out of crisis, without knowing what might happen beyond the year 2011 if the crisis would continue. But certainly, these forecasts should take into account the expected increase in public expenditure budget, due to aging and the effects after the crisis. Increase overall public spending and worsening budget deficits will be caused mainly by increases in social spending (pensions, healthcare and long-term care), but also the impact on fiscal revenues and earnings growth rates. In this regard, Table no. 2 reflects the results of forecasts for public spending budget, with the expected adverse demographic issue for the period 2007-2060, in several countries. Even without the impact of the current crisis, these increases in public expenditure

budget will become difficult to bear for countries with an already high level of taxation, high public deficits and debt.

**Table no. 2 Forecasts of Public expenditures due to an aging population: 2007-2060
(percentage of GDP)**

Countries	Pensions	Health	Long-term care	Total growth
Germany	2,2	1,8	1,4	4,8
Spain	6,7	1,6	1,7	9,9
France	1,0	1,2	0,8	2,7
Italy	-0,4	1,1	1,0	1,7
Netherlands	4,0	1,0	4,7	9,4
England	2,7	1,9	0,5	5,1

Source: Economic Policy Committee's forecasts of the European Commission, 2009

In the foreground of the analysis, in which the majority of developed countries are in, but also countries such as Romania, the future potential to increase public spending on the rise in taxation can not be considered feasible. This we can argue in terms of taxation levels which is already high in most states, namely, the fragility of the tax base. In the same context, the possibility of future funding of increased public expenditure can hardly be regarded as sustainable at the expense of contracting new loans because the debt levels are already too high.

In the United States, which are not included in the table, long-term outlook is even more worrisome. The Commission's budget of the US Congress in 2009 stated that "current policies are unsustainable" (Budget Commission of the US Congress 2009), whereas, if they are maintained, and in the most optimistic forecast it will cause deficits (for federal budget) of 7% of GDP in 2020 and a debt of more than 100% of GDP by 2023.

In the current crisis, among countries that have not managed to cope with financial crisis and with a fiscal crisis later, are, first, foremost Dubai Emirate (UAE). Colossus of investment set in motion by the state for construction has generated unprecedented debt and no viable solutions.

Greece is also faced with a violent economic crisis, which has a budget deficit of about 12% of GDP and public debt is estimated to exceed 130% of GDP by 2011. Japan's debt already amounted to 200% of GDP.

Thus, the global financial crisis has exacerbated the fiscal crisis. This is because, on the one hand, the onset of recession, which reduced tax revenues and led to conduct additional public spending on social protection, and on the other hand, in some countries, the huge costs that the public authorities had to bear to avoid bankruptcy of financial institutions.

As we noted earlier, public expenditure budget to GDP increased and is expected to grow in the next period.

Although since the 1980s much of the developed countries, especially European ones, have operated reductions in GDP share of public expenditure, public expenditure as a dynamic have maintained normal growth. The explanation is that these reductions in weight were made against a background of continuing growth of GDP. The most telling example is the one of Great Britain, whose measures were treated as true victories of neoliberal doctrine.

These actions were not long lasting, and the population was willing to choose raising taxes to increase public spending and the various programs provided by them. Thus, governments have returned to welfare programs that (in Britain since Tony Blair's government) have not only financed public expenditure growth based on increases in tax revenue, but also by accepting

shortages of almost 3 % in public construction budgets. Increase public spending in these countries was directed primarily to education and health. Estimates have shown that, in Britain until 2007, nearly a quarter of employed people work at the state and more than 30% of households depended on (over half) of revenues from the state.

Experience in Hong Kong and Singapore, where the public expenditure is usually less than 20% of GDP, confirmed the approach regarding that a low level of public expenditure in GDP, can be a variant of the long term.

We believe that the ability to maintain or decrease the level of public spending as a share of GDP should be correlated with both increased public sector efficiency and greater efficiency with the private sector, able in future to cover part of the economic risks (but not only), facing the citizen. In this context, Vito Tanzi even identify two pillars on which the reduction of public spending budget. The first pillar would require people to be more aware of certain unforeseen events of life and to do so. Obvious examples are considered private insurance for accident and health, along with a package of restrictive measures of social protection offered by the state.

The second pillar would be for government to seize the opportunities offered by globalization and the world market to purchase services not available on the market or are available at a higher cost (Tanzi 2009: 32). These services must be provided even for a small group of citizens, for then they become public. Such services may be the latest medical procedures, training for advanced techniques, etc..

IV.2.Public spending policy in the context of economic crisis in Romania

Deep economic crisis faced by the global economy and, implicitly, the Romanian economy and recent developments that have taken place including Greece, have taken promptly imposed austerity measures. These measures concern in particular the relocation of public expenditure analysis and a new structure to allow a mix of budgetary policies, fiscal and monetary, short stop economic decline, and in perspective on a healthy economic recovery.

In this context, one of the main tools the government has at hand is the public investment program which, through judicious allocation of available resources and spending can correct some imbalances emerged, particularly in construction, or compensate for potential lower instantaneous availability of private sector funding in this area.

In this year, for the public investment expenditure financed from general government budget were allocated resources representing approximately 6.5% of GDP, respectively 16.7% of general government expenditure. In Table no. 3 are presented in the consolidated general government public expenditure and investment expenditure in the period 2008 to 2013 and their share in GDP.

Table no. 3 Total public expenditures and investment expenditures as a share of GDP and percentage from 2008

	Public expenditures in percentage from 2008	Public expenditures % GDP	Public investment expenditures from 2008	Public investment expenditures % GDP
2008		37,0		6,3
2009	101,75	39,4	108,73	7,2
2010p	105,11	39,1	102,47	6,5
2011p	105,24	36,8	104,94	6,3
2012p	112,55	35,8	129,20	7,0
2013p	120,50	34,8	147,00	7,3

Source: own processing after *Fiscal Budget strategy from 2011-2013*, <http://codfiscal.money.ro/strategia-fiscal-bugetara-pe-anii-2011-2013>

The data presented in Table no.3 shows that, in nominal terms, investment costs of the consolidated budget increase each year between 2010 to 2013, are expected in 2011 as the growth of investment expenditure to exceed the the total public expenditure. It is also noted an increasing every year share of investment expenditure in total general government expenditure.

But there are enough doubts of specialists on the rationality of government expectations, based if we consider the realities we face. Thus, for example, is hard to believe that in the current conditions in Romania where the courts reinstate previously earned retirement funds or state employees, counteracting the reduction in public expenditure, there will be enough resources for investment and GDP growth will be most anticipated.

V. Conclusion

Currently increasingly emphasis is put more on exit strategies, and thus the role of the state, involving public expenditure budget, you may have. In the past, these strategies which involved increasing public debt has been passed on increases in inflation, and, on occasion, high economic growth. As it stands, the high economic growth is not feasible in the next few years because of major distortions caused by the crisis, which caused large reductions in output. Moreover, growth rates in recent years, several major countries like the United States, Britain, Spain, etc., but also countries such as Romania, have been somewhat artificially generated massive construction of houses / homes / buildings and their unrealistic prices, excessive profits and which entered the financial market. They maintained artificially increases the rate of economic growth and the tax revenues. In these circumstances, we assume that inflation can not be a solution but, rather, the solution may be to rethink the role in the economy and, implicitly, the judicious use of public expenditure budget. Thus, contrary to many who support the idea of "more public spending and a smaller market" we can analyze the situation in which public expenditure is lower, but more effective and more regulated markets.

Before the crisis, there were views that the changes in dynamics, especially in the structure due to the aging population will create serious problems in terms of sustainability of the state, the current optics. Full effects of these demographic changes will start to be felt fully in the coming years. At present, the crisis will deepen the sustainability of this problem increased public spending states. The idea of giving an economic role in the increasingly important state, in our opinion should not necessarily signify the growth of public spending budget, which in turn would mean higher taxes. Obviously, this perspective should not be understood as a unit, but only applicable to a wider group of countries.

For a number of developed countries including the U.S., supports the idea that the current level of public expenditure may remain constant at this level as long as the state has been able to satisfactorily meet its obligations. Moreover, it focuses particularly on those strategies that will be effective and will streamline public spending as well. We believe that the issue of increasing allocative efficiency of resources is vital to counter the current crisis, but also to maximize the positive effects of public interventions in general.

From another perspective, consider that the claim that state and, consequently, public expenditure budget would be used to replace the market can not be regarded as some founded. The market operates outside the moments of crisis, much better than any government action that you take. In this way, a first possible position adopted for the group of developed countries would be not to intervene in the market, but to print a temporary stimulus to aggregate demand while preparing for post-crisis periods without, usually increases public debt.

FINANCIAL CONTROL EFFICIENCY IN ECONOMIC ENTITIES

Pop Ioan

Faculty of Economics and Business Administration Babeş-Bolyai University, Cluj-Napoca, Romania

In this paper the author presents ways to address issues of financial control efficiency of economic entities through tax administration of budgetary revenues.

Keywords: financial control, fiscal control, economic efficiency

JEL Classification: G32

1. Economic Efficiency of Financial Control

As is generally known, the concept of economic efficiency expresses the ratio between profitable effect or outcome and the effort or expense generated by obtaining it. The higher is the achieved effect per unit of expenditure or, conversely, the lower the cost generated by producing a given profitable effect, the higher we consider economic efficiency is. From theoretical and practical points of view, economic efficiency can be generally applied, since, without a certain labor expense, it is not possible to obtain a certain result; work always is the cause, and the product obtained its effect.

The effect of the action of control is expressed in the results obtained from applying the measures resulted from it. The results of control, namely its effects can be grouped into two categories:

- *direct* and immediate effects of control, quantifiable elements that can be known, tracked and aggregated from one period to another;
- *indirect* effects manifesting in time, such as: extending application of control measures, by industry, spheres of activity or even economy.

As for the effort to achieve control, are taken into account, first of all, all expenses resulted from maintenance and operation of the control system (salaries, allowances, daily allowances, school fees and improving the control authorities, etc.). Also, it must be taken into account the effort of the national economy by depriving it of the contribution of the specialists working in the control system.

In our opinion, the factors that influence the efficiency of financial control can be grouped into two categories: *direct* factors and *indirect* factors.

In the category of direct factors, we have considered the control authority, his consciousness, training and methods used during the inspection to increase its efficiency.

In our view in the category of indirect factors are taken into account the material conditions in which the control takes place, audit-specific legislation, relations between inspectors and economic entity and the factual situation, respectively the control objectives, the control period and the results of the control.

Among the ways to increase the efficiency of financial control, we have taken into consideration: financial stimulation of the control authorities, ensuring the independence of control activity, modernization of the control process, increasing educational level of inspectors and rational organization of the control activity.

Last but not least we mention the fact that improving the results of the financial control by attracting additional amounts identified in the state budget is the corollary of the control activity.

2. The Evolution of the Financial Control Activity in Romania

The main activities of financial control are:

- the management and use of funds allocated from state budget;
- management of properties in the state's public domain and administrative - territorial units;
- financial-budgetary discipline;
- computerizing the financial control activity.

Table no.1 Financial Control Activity in Romania (2008 -2009)

Indicator	2008	2009	Rate 2008/2009 (%)
Number of companies that have received financial control	6381	7680	20.4
Number of controls made, from which	8446	10402	22.6
- State departments	291	361	24.1
- National companies and businesses	529	628	18.7
- State-owned or majority state-owned companies	598	762	27.4
- Other controls	7068	8651	22.4
Fines			
Number	954	881	-7.7
Value of fines imposed (million Lei)	1.2	1.9	58.3

Source: <http://www.anaf.ro/public/wps/portal/ANAF>

The table above (Table no.1) shows that in Romania the number of companies that have received financial control and the number of controls made increased by around 20% in 2009 versus 2008. Within these controls the most of them were done to companies state-owned or majority state-owned (27.4%), followed by state departments (24.1%), other controls and national companies. Following these controls the amount of fines increased by 58.3%.

Table no. 2 The amounts established by financial control

	2008 (million Lei)	2009 (million Lei)	Rate 2009/2008 (%)
Total, from which	2141	3828	78.8
- budgetary	291	361	24.1
-financial	529	628	18.7
-fiscal	598	762	27.4

Source: <http://www.anaf.ro/public/wps/portal/ANAF>

The results of the financial control activity have resulted in additional revenue in the state budget, which per total financial control activity was higher with 78.8% in 2009 compared with 2008. From revenues the most significant increase of amounts is registered by income from tax (27.4%) followed by the ones from budget (24.1%) and financial ones (18.7%).

Table no. 3 Turning the financial control activity into profit

Amounts paid during control	2008 (million Lei)	2009 (million Lei)	Rate 2009/2008 (%)
Total, from which	39.7	649.1	1537
- Financial and budgetary differences	23.0	625.0	2615
- Fiscal differences	15.6	23.3	47
- Imposed fines paid	0.8	0.9	11

Source: <http://www.anaf.ro/public/wps/portal/ANAF>

Financial control efficiency is also manifested during the work of tax inspectors which in 2008 compared to 2009 resulted in a significant increase in the amounts paid during the review of 1537% in 2009 compared with 2008.

Budgetary and financial differences identified during the control activity increased in 2009 compared to 2008 with 2615%, tax differences increased by 47% and imposed fines increased by 11%.

Table no. 4 The main activities in financial control

	Number of acts of control	Amounts assessed additionally (million Lei)
The administration and management of financial resources by companies where the state is a major shareholder and by companies that registered loss	757	636.1
Establishing and providing payment sources of repayable funding guaranteed by the state	218	2927.4
Approval of subsidies and transfers from the state budget requested by companies	5690	21.0
Use of subsidies and transfers allocated from the state budget	337	57.6
Concession of assets and activities that are public property of the state	1087	19.2

Source: <http://www.anaf.ro/public/wps/portal/ANAF>

The financial control activity focused in 2009 on five directions, the number of acts of control and amounts assessed additionally being significant primarily for the management of resources at the state-owned companies and for the creation and provision for payment of reimbursable amounts guaranteed by the state.

3. Conclusions

Although control registers a widening of its sphere of action and a diversification of forms of expression, I would like to point out certain restrictions that should be subject to control.

Knowing these limits and restrictions is important and necessary for both the control authorities (who must know exactly their responsibilities and their limits), and for administrative and management authorities (who have no right to restrict or expand control operations at their own will, to prevent verification of some objectives or request the performance of unnecessary or unlawful interference).

The efficiency of financial control is determined by the contribution it has in preventing and eliminating failures, improving the organization and management of the decision-making process and growing the efficiency throughout the whole economic activity.

Our opinion is that the efficiency of financial control must be determined not by the amount of damage found and penalties applied, but, possibly, by volume of amounts receivable, the debits and credits processed, the available stocks recovered as a result of measures taken after completion of inspections.

Today it is estimated that according to how much focus is on preventing misconduct, on the recommendation of the provisions governing the controlled activity, the efficiency of the control will (therefore) be higher. The efficiency of financial control is determined by the permanent connection between the two strands, namely: between the preventive-operative one and the one of immediate improvement of findings.

TAX CONTROL - PREVENTION AND CONTROL OF TAX EVASION

Pop Ioan

Faculty of Economics and Business Administration Babes-Bolyai University, Cluj-Napoca, Romania

In this paper the author highlights the ways of preventing and combating tax evasion. For this purpose are highlighted the ways Tax Administration acts in the Romanian business environment to attract additional funds to the state budget.

Keywords: fiscal control, tax evasion, economic effects

JEL Classification: G32

1. Fiscal Control and Tax Evasion

Fiscal control is an important component in achieving the management objectives of the Ministry of Finance, part of public management. The main objective is finding relevant solutions that can lead to mitigation and also prevention and combating tax evasion.

Combating tax evasion can be achieved by fiscal policy measures and specialized agencies authorized to prevent and combat tax evasion. These authorized agencies in preventing and combating tax evasion will be analyzed in terms of place, role and limitations conferred by the fiscal controls made by them, in order to identify practical solutions that lead to making them more efficient. Essentially negative, the effects of tax evasion require firm action to prevent and eradicate this phenomenon.

The main objective to be achieved is finding relevant solutions that can lead to mitigation and also prevention and combating tax evasion, but first we must show the importance of mitigation, prevention and combating tax evasion, importance resulting from the many possibilities offered exactly by the fiscal law to avoid paying taxes for all or part of the taxable goods, but also the broad range of expression of impacts, their scope being very broad, found in almost all areas, economic, political, financial or social, with a large range of proliferation of the phenomenon of tax evasion with multiple effects on both short and long term, both on the state and the honest taxpayer that pays his tax debts to the state or the tax evaders.

Mitigation of tax evasion can be achieved by fiscal policy measures (Mosteanu 2008: 74) and specialized agencies, authorized to prevent and combat tax evasion. These institutions authorized in preventing and combating tax evasion will be analyzed in terms of place, role and limitations conferred by the fiscal controls made by them in order to identify practical solutions that lead to making them more efficient. First, we should focus on the meaning of the term "mitigation" and on its boundaries to combat and prevent and, then, I'll present its practical importance and ways to put them into practice.

The prevention of fiscal evasion means heading it off in order to eliminate its adverse effects, by means of precaution taken by the execution factors, in particular, and by the decision ones. The fight against tax evasion means taking measures to destroy, cut off, eliminate this real financial, economic, social and political scourge. Doctors say that "it is easier to prevent than to treat a disease". This saying is, we believe, valid for tax evasion, but specialists in finance almost unanimously say that tax evasion will exist as long as there are taxes and duties to be paid by taxpayers and, regardless of the measures taken against this phenomenon there will always be new and newer methods by which individuals and legal entities to evade in part or totally from paying their tax obligations to the budget.

Should we conclude from this statement that no effective measures can be taken against tax evasion? Our answer is *tax evasion can not be eradicated, cut off, combated, but can be prevented* (Moraru 2009: 116) *and mitigated if it has emerged and reached easily seen dimensions.*

In our opinion, prevention is the most effective measure to avoid confrontation with the phenomenon of tax evasion, but if it has occurred, in order not to let it reach destructive dimensions, the measures to mitigate its effects become very necessary and important. Moreover, the *mitigation* of tax evasion is the sum of actions that can be taken by state authorities to reduce the intensity or severity of the impacts of tax evasion; tax evasion prevention and mitigation are components of fiscal policy and components of the fiscal system of a country. As the fiscal policy is pursued by the Government as executive power and by the Parliament as legislative power it is obvious that tax evasion prevention and mitigation are actions pending on the political will, the priorities given to the country's leadership in one or another of its development stages.

2. Methods of prevention and control of tax evasion

We stated above that preventing, combating and mitigating tax evasion are tasks for Parliament as a legislative body and Government as executive body. As legislative initiatives are generally taken by the executive organs, automatically the leading role in the fight against evasion is the Government's. This creates at central and local level many authorized institutions with tasks in the pursuit and punishment of acts of tax evasion. All these institutions carry out in one form or another, at one level or another, more specialized or general, control of the way of finding and assessing taxable materials, how to determine the amount of tax and how are determined the taxes to be paid to the State by the taxpayers.

2.1. Tax control role in mitigating tax evasion

A component of financial control is fiscal control, which includes all activities aimed at verifying reality, legality and sincerity of declarations, verifying the correctness and accuracy of performance, according to the law, taxpayers' tax obligations and the work of investigating and finding tax evasion. Using the fiscal control the tax administration has the burden to compensate for tax omissions, inadequacies or errors committed by taxpayers. All this has the purpose to prevent tax fraud made by taxpayers. (Preda 2009: 94)

Therefore it has been established that the activity of fiscal control is mainly aimed at preventing violations and establishing responsibility for damage caused, using for this a variety of means, methods and institutions, and financial control is the main instrument that public powers have at hand to ensure public financial resources necessary for the state and to detect, prevent and combat tax evasion.

2.2. Tax control improvement

Control is "a process of knowledge and training, presenting both an objective side, determined by the specific of the subject and a subjective side, in that at times the subject is simplified". Also, control methodology, viewed as a system implies scientific and regulatory interaction of processes and procedures, principles and means enabling the control action. Financial and fiscal control exercised by the state institutions, experienced throughout history changes that were aimed at improving methods and techniques for preventing and combating tax evasion by eliminating duplication.

Tax inspection involves the following methodological steps: preparation of control; conducting fiscal control; completing the control; capitalizing control findings.

A fiscal control is aimed at checking how to determine the taxable base, the amount of tax payable and determining the delay increases, penalties, or propose penalties for violations of tax

laws in any form. Authorized institutions in preventing and combating tax evasion use, as the main tool for achieving this goal, financial and fiscal control. Reduction of tax evasion depends on the organization and efficiency of financial control and also the degree of collection of budget revenues. Lack of effective control will lead to the proliferation of tax evasion with negative consequences to all taxpayers and the state. Hence the importance of strengthening the role and prompt intervention of state authorities and civil society, organizational and functional structures of authorities specialized on control on all social and economic sides.

For a fiscal control to be effective is necessary for the following requirements to be met (Drăgoescu 2006: 34):

- *defining an organizational framework* outlining the responsibilities of those who are granted powers of tax control, and provide guarantees to achieve these tasks outside of any interference from outside the tax system in carrying out the control activity, but also outside of any abuses from control authorities;
- *a legislative framework* as simple, complete and flexible as possible;
- *a qualified and motivated personnel* to accomplish as good as possible the control activity;
- *personnel remuneration* according to the social importance of their work and not directly proportional to the imposed fines, but also they should be punished for disciplinary aberrances;
- *creating an informational system* that makes public at any time the people who have led to bankruptcy their own businesses and forbidding them, for instance, their registration as shareholders, partners or managers in new companies;
- *technical equipment* to support the efficiency and effectiveness of tax administration in general and fiscal control in particular.

Making efficient controls also means that the control is made based on clearly defined rules and criteria, has a specific purpose, avoiding a control that is based on preconceived ideas, opinions to be formulated only after verification of all data is completed and settling all possible remedies to be taken. Tax inspectors to carry out financial-fiscal control must adopt a civilized attitude, be competent in professional terms, possess a moral sense, must be fair, firm, objective and exigent. To do this they must be prepared through briefings, training whenever updates show up in the control area or in the tax area, especially from a legal perspective because the emergence of new laws may cause many taxpayers to do mistakes, either because of their ignorance or because their intention to use the old law. Also, by reviewing cases of control they can get useful information on the causes met in practice which could lead to improving future controls. Training of tax inspectors can be achieved through advanced courses dealing with the control techniques, procedures to be followed, ethical behavior of inspectors, preparation of control documents, etc.

Regarding the selection of personnel for carrying out financial - fiscal control it should be chosen according to qualifications, experience in economic, financial and accounting fields, professional and moral behavior; also the personnel must not be committed politically or carry out public or professional activities which are in contradiction with the profession of financial inspector or the interests of the institution where he/she works. Consideration should be given to training and recruitment of highly qualified specialists with relevant expertise and moral integrity, qualities necessary for the performance of financial control work.

To increase the efficiency of financial - fiscal control the following measures must be taken:

- Improving fiscal control activities by establishing an effective strategic plan to include all branches of activity of companies. By carrying out spot thematic controls on the carrying out of economic activities according to law can be prevented and detected cases of tax evasion. All these controls must be conducted in a professional manner, in compliance with legislation, must be fair and competent and have as purpose, besides collecting revenue for the state budget in the actual amount and according to the date fixed by law, taxpayers' education and awareness towards the degree of voluntary compliance on state tax obligations;

- Improving training of tax inspectors, their attitude, behavior in their relation with taxpayers, and also the way personnel is recruited. All this can be achieved by implementing training programs and existing staff should be reviewed and should be kept only those who meet the professional requirements and then can be specialized according to the degree of preparedness and experience, on certain taxes and fees;

- Improving existing computer system, namely that “tax vector” that allows generalization of all taxpayers’ tax records by updating these records. This computer system should be improved so as to allow data and information exchange between authorized control authorities and between these authorities and the state. All this information can be used to improve control technique and detection of evader taxpayers.

It is also necessary to create a computer system that would allow access to all inspectors to computerized financial - fiscal legislation and also for control activity itself by updating the database on checked taxpayers, preparation of the control activities; development of a planning system of staff requirements in fiscal control and its recruitment; matching the number of staff assigned to the fiscal control with the fiscal control tasks by taking into account the number of taxpayers and their dispersal throughout the area assigned.

All these measures aim to create an efficient framework for achieving financial - fiscal control so that authorized control authorities to work together, to complete each other in the most optimal way to achieve their goals, namely increasing collection degree of budget revenue and preventing and combating tax evasion.

2.3. Tax system improvement

Checking the specialists’ works we find that the most often cited reason for tax evasion is the legislative framework. The legislative framework is an essential component of any tax system. Tax legislation can be defined as “all legal rules governing the procedure for raising and allocation of the state and public institutions funds to meet social and economic needs and functions of the society”. To be effective, any state’ tax system should be characterized by stability. Thus can be obtained the revenues needed to finance the public budget. The objective of the tax system should be increase of its efficiency and reduction of distortions in economic decisions. To achieve these objectives is important to reduce tax evasion. By reducing tax evasion, will be reduced the gap between taxes to be received and the taxes actually received.

In addition to stability and efficiency, any tax system should be designed to be fair, to be characterized by simplicity, transparency, consistency, to be compatible internationally, to ensure maximum revenue with the lowest costs and to meet economic policy needs on medium and long term. The equity and efficiency criteria are the most important in developing or reforming a tax or the entire tax system.

In the fight against tax evasion must be developed a tax system not too complex and wide. Unfortunately, the tax system in our country is characterized by complexity, instability, and interpretability. Thus, it seems necessary to improve the existing tax system. Improving the tax system should consider improving fiscal and budgetary policy and also reducing the tax pressure. A proposal regarding possibilities to mitigate tax evasion is to develop a computerized system that has as essential component of tax activity the tax information.

A system is “a set of interrelated elements (components) presenting a dynamic interaction based on predetermined rules, in order to achieve a specific goal”, and information system means “an interconnected whole in a systemic view of data, information, information flows, information procedures and processing, transmission and storage of information facilities acting inter-correlated in order to achieve the fundamental objectives of a company”.

escapist

2.4. Legal system improvement

Because one of the major causes of determining and facilitating tax evasion phenomenon is the existence of an inaccurate and incomplete tax law (Pătroi 2007: 101), the combating and mitigation process against tax evasion should be based on changing tax laws so as to eliminate all possibilities of circumventing the law.

A contributing factor of the tax evasion phenomenon is the complexity and multiplicity of tax laws that make them difficult to be known, understood and followed. In order to combat or prevent acts of tax evasion are needed some measures to improve legislation such as building a stable legislative framework, easy to apply, consistent, with firm and concise sanctions against acts committed by taxpayers in order to reduce, if not eliminate the practice of tax evasion. A legislative measure to follow would be to remove all tax incentives from the current tax code; this because the existence of such tax incentives generates inequitable taxes that will determine many taxpayers to resort to any means, even illegal, to fall into those “preferential” categories in order not to pay taxes.

Tax incentives create a bleak environment for investors. Who needs to decide in a state’s economic activity is the market forces and not the tax facilities or exemptions. Normative acts that control the creation and establishment of taxes and fees payable to the state should be drafted so as to not require the development of methodological rules, instructions and details in their application because having a certain interpretable provision it will be exploited for tax evasion purposes.

3. Conclusions

Failure to comply with obligations under the law on combating tax evasion is a contravention according to the degree of social danger that it shows, to their gravity.

The penalties are intended to recover the amounts withheld from payments due to the state budget, interest, penalties and other payment differences set by the control authorities. Tax penalties are “the means by which law violations are punished”.

Acts of tax evasion are more difficult to prove compared with other antisocial acts and this is why the penalties to combat tax evasion must be regulated so that taxpayers have the burden of proving the correctness of the calculated tax and that the tax sanction is unwarranted.

In order to achieve efficiency in preventing and combating tax evasion the penalty of deprivation of liberty should not be given up, even if the person caught in the act, by law, pays tax liabilities discovered as stolen, and in addition, bans to management of companies or associations of the tax evaders should be introduced.

As long as tax evaders escape responsibility, not being sanctioned for their actions, by imprisonment, a lot more taxpayers will be tempted to resort to tax evasion mechanisms to obtain fraudulently increasing income without being subject to taxation. Even if they are caught, they pay their due tax liabilities, are not punished according to the law and can continue to conduct economic activity, the gains obtained by fraud enabling a strong position on the competitive market.

VIEWS ON THE CONCEPT OF FINANCIAL POLICY AND ITS MANIFESTATION

Pop Mugurel Gabriel Sorin

*“Dimitrie Cantemir” Christian University Bucharest
Faculty of Economic Sciences of Cluj-Napoca*

The present study proposes an analysis of the main views expressed in the literature on financial policy, as well as the shaping of our own, clear and comprehensive vision, regarding the content of this concept.

The main objective of our research is to clarify the content of the financial policy concept, so that this policy may be effectively used in the service of overall development of our economy and society. Reaching such an objective has implied the research of a vast existing literature on the field, in the country as well as abroad, observing a vast variety of understandings regarding the meaning of the concept itself, the objectives stated within the financial policy as well as the main approaches (ways to follow) for achieving these objectives.

Of course the achievement of such a research is not possible without a meaningful analysis of the principles expressed in this field's literature. In relation to this matter we can see that each author has his own conception regarding the subject under review. These expressed conceptions are, in turn, based on previous research in the analyzed area. The accelerated dynamism proved by the evolution of our economy and society in this stage shows us that through the financial policy, outlined both at a micro and a macroeconomic level, clear fundamental objectives must be formulated that should be possible to achieve by partial objectives (sequential), practical methods and procedures being adapted to them.

Our research is at the present stage, a theoretical and methodological one. It is based on the comparisons we make between the views expressed in the studies of different authors, trying to draw the “red line” of these views and observing the fundamental meaning given to the financial policy concept. We express our conviction that a clear conceptual expression of the financial policy notion comes to the rescue of the general management (macro and microeconomic) facilitating the process of adopting the most appropriate decisions for achieving the objectives set by the financial policy.

The result of our research is represented by the formulation of a clear and comprehensive concept concerning the financial policy.

Removing ambiguities in formulating the concept under review as well as in the means of achieving the formulated objectives is for the benefit of achieving the monetary, financial and budgetary balance at a macroeconomic level, which is the foundation for promoting some beneficial financial policies at a microeconomic level.

Key words: financial policy, financial policy elements, investment policy, financing policy, dividend policy, evolution.

JEL Codes: G 31, G 32

1. Introduction

The financial policy is a complex and controversial, which incited our interest for elucidating its meaning.

It is a complex concept because, looking at it in terms of a system it has two elements, namely:

- macroeconomic financial policy subsystem;
- microeconomic financial policy subsystem.

At a macroeconomic level the following subsystems develop:

- financial policy subsystem;
- budgetary policy subsystem;
- parafiscal policy subsystem.

Within each subsystem, considered as a distinct entity, financial policy's connecting branches develop. We illustrate the statement by the budgetary policy subsystem within which we distinguish: the budgetary revenues policy, the budgetary expenditure policy, the budgetary balance policy.

At a *microeconomic* level we also observe a set of subsystems such as:

- investment policy subsystem;
- current activity financing policy subsystem;
- dividend policy subsystem.

In relation to the financial policy subsystem at a microeconomic level we can also establish the existence of policy ramifications. We illustrate this statement (finding) showing that within the investment policy we distinguish: investments financed with internal resources (national) and investments financed with external resources (international); investments financed from the company's own resources and investments financed from borrowed resources; own overhead investments and contracted out investments.

The controversial nature of the financial policy concept is generated by the fact that each researcher (author) has left his own imprint on the content of the analyzed concept. We, therefore, assumed the burden of detaching the common ideas which are the core of the concept trying to point out each time, the ultimate pursued goal and the methods and procedures used in the practice of financial activity in order to achieve this goal.

2. The financial policy concept

In a general sense, *politics* is understood either as a management activity or as a way of organization and leadership. Since political activity is carried out on the basis of some political programmes, politics is often portrayed as the tactics, the strategy, the methods and the means used to achieve the objectives set out in such programmes.

The way from the concept of politics in general to that of financial policy cannot be crossed without lingering, even just in passing, on the concept of economic policy. Thus, the economic policy is portrayed as an area of government policy, but it is often circumscribed to the concept of economic mechanism. In such an interpretation the economic policy is presented as part of the economic mechanism functioning. We observe that in the system theory, „the economic mechanism appears as a subsystem in economy's organization and management system and government is the most important aspect of the economic mechanism” (Tulai 2003:84-85).

An important element of the general economic policy is the financial policy which is „anchored in the development process of any society” (Onofrei 2000: 11).

Building the financial policy, organizing and managing the company's activity implies, as professor Constantin Tulai used to say: „management strategy and direct practice” (Tulai 2003:92).

In the attempt to define this concept we should start, rightly and without exception, from the statement that the *financial policy* is an element of the economic policy, having to contribute, in its specific ways, at the fulfilment of the economic programme. It is subordinated to this goal but it must exert an active role in achieving it, which means both conception and concrete action and representing the land where the theory offers solutions, strategies confront and options take shape, decisions are taken and also actions to achieve them. Therefore in the defining of the financial policy, as the previously cited author would say, we must take into account at least the following reasons (Tulai 2003:85-86):

- it represents a specific area of the economic policy, it is subordinated to the totality it belongs to, but it carries an active influence on it;

- it implies a certain conception of the financial sector management, they are differentiated by fields of application, solutions are dynamic and always perfectible and the tools are flexible;
- it must be designed and implemented in a way that ensures the financial mechanism's functionality, to establish a proper framework for it to show its self-regulation ability and to exert a favourable influence on the functioning of the economic mechanism as a whole;
- through the specific instruments and levers the achievement of all economic decisions must be ensured under the conditions of superior resource exploitation and high economic efficiency. This means above all, to imperatively take into account, the financial reasons when underlying the economic decisions.

As shown in the literature (Halpern, Weston și Brigham 1998: 216; Bran 1997: 315-317), defining the financial policy concept involves, by default, mentioning its sphere.

Doing a critical analysis of the financial policy sphere, C. Iuga pointed out that sometimes the sphere is restricted to the formulation of its objectives, other times it also includes the used methods and the proper organizational arrangements, pointing out that in his view „the financial policy has a broad coverage area, it establishes the main objectives of the financial activity, the strategy and the tactics of accomplishing them as well as the organizing and management system, respectively, the set of concrete principles, methods and means with regard to the relations, the institutions and financial agencies, which ensure the fulfilment of the functions and roles that belong to finance in the economic and social life” (Iuga 1977: 67).

Such an indication on the financial policy sphere allows us to observe some of its most obvious characteristics, namely:

1. it includes in its sphere, placing first, *setting the main objectives of the financial activity*, derived from the fundamental objective and integrated in the economic policy's objective;
2. the financial policy has *its own objectives*, specific to its domain, and their achievement represents its contribution in the achievement of the overall economic policy's objectives.
3. in order to achieve the established objectives, the financial policy includes financial sector specific policies, but varied in relation to the sub domain they are applied in, being achieved with an appropriate tactics;
4. the achievement of the established objectives through an appropriate strategy and tactics, requires an appropriate organizational framework, the design and use of specific principles, methods, levers and instruments in a framework created by the legislation;
5. on this field the specialized financial institutions and organisms are operating, performing exogenous financial decisions, taking and performing their own decisions, they carry out the financial policy.

Based on these issues and respecting the set out methodological requirements we can conclude that the financial policy, as a specific area of the economic policy, represents a certain conception and a certain way of direct action regarding the organization, management and financial activity deployment.

The financial policy has several characteristic features determined by the nature of the state's prerogatives, as well as by the country's economic, social, etc. objectives in that given stage.

Among the financial policy's characteristic features we mention the following:

- ***The financial policy's scientific nature*** , which is determined by the thorough knowledge of our specific features, by the study of the real, national and international conditions in each stage, by taking into account the economic law's requirements, by the correlation between the financial policy and the nation's interests. Being judiciously planned and enforced, the financial policy is required to fully contribute to the achievement of a high and increasing social work's performance capacity. The financial policy's effects are reflected in the development of productive forces, in the increasing of the gross domestic product, in satisfying the material and spiritual life requirements, of the population which are on the increase.

- ***The financial policy's realistic nature*** resides in the fact that it has to be developed and carried out based on thorough knowledge about the national economy's realities, particularities and possibilities of each stage. The financial policy is designed to help promote national interests, achieve national independence and sovereignty as well as to help collaboration and cooperation at a national level.

- ***The transforming, renewing character*** of the financial policy is generated by the judicious use of financial instruments. The financial policy is not established once and for all, it is not immutable, but it evolves, it changes, it continuously improves and it adapts both regarding the goals as well as in the use of financial instruments.

The financial policy has a certain independence from the state's general policy, because it has its own objectives, it uses specific tools and procedures, which implies the existence of its own methodologies.

Studying the issues of financial policy at a microeconomic level (Halpern, Weston and Brigham 1998: 220), we observe its main manifestation directions:

- selection of investment projects;
- identifying financing modalities;
- substantiation of the company's financial structure and ensuring an optimal ratio between equity and borrowed capital;
- choosing the optimal allocation for net profits and dividends;
- selection of optimal solutions for changing the equity's size.

It must be noted that the company's financial policy is directly influenced by the macroeconomic financial policy, through instruments that at the microeconomic level are considered to be external influence (constraint) factors.

Financial policy involves not only setting goals to pursue in one area or another for a certain period of time but also establishing the means to achieve them. It is also necessary to make a critical analysis of its promotion's results, in order to correct any deficiencies, shortcomings, mistakes came up or occurred in time.

Putting together and comparatively analyzing the many definitions given to the financial policy in the literature (Halpern, Weston and Brigham 1998: 222; Bran 1997: 318), we find both common elements and some differences, not only in shades but also in the sphere coverage. Both of them relate to the three present elements, without exception, in all encountered definitions, namely: ***the reference, the purpose and the used procedures***.

Referring to the ***specific used methods***, they are portrayed as a set of methods and means; principles, methods and means; rules, principles and methods or methods, levers and mechanisms specific in the financial sector. Therefore not only the wording is different but also the number and kind of arrangements involved.

In a different way is presented the field of reference, the same in its essence, namely the ***financial sector***. It circumscribes, in different formulations, the same elements, namely:

- finance, financial relations or in a detailed presentation, their display field (creation, distribution and optimum use of funds);
- institutions and specialized institutions belonging to the financial unit;
- the legal executive legal framework, including financial regulations or legislation.

Finally, for the ***concerned purpose***, the formulations are also different. Some refer to the social and economic policy objectives as a whole, but different in each step or from one program to the other; others are confined to the fundamental strategic objective of the current phase (Chandler 1996: 63); in some of them the aim of achieving the economic policy objectives is fixed ("Help 2003: 87), and finally in others, it is stated that the financial policy is oriented towards achieving the social mission of finances (Văcărel 2007: 76), ensuring the fulfilment of their functions and roles in each phase.

Taking into account the ones mentioned above, we could shape our *own opinion* which means that we can define *financial policy* at a microeconomic level as ***the combination of financial methods and instruments involved in the acquisition, allocation and management of financial resources in order to achieve the ultimate objective of the firm - thus maximizing market value, increasing shareholder wealth.***

3. Company's financial policy elements

At a microeconomic level the financial policy includes a set medium and long term objectives, which relate either to all financial activity or to its major components. Among these we distinguish by their special meanings: the volume and structure of available resources, performers of various activities, financing sources, intermediary and final terms, global and partial indicators.

The specific consequences of financial policy decisions are manifested in combining the company's financial cycles (operating, investing, financial operations) whose graphical representation is depicted in Figure no. 1.

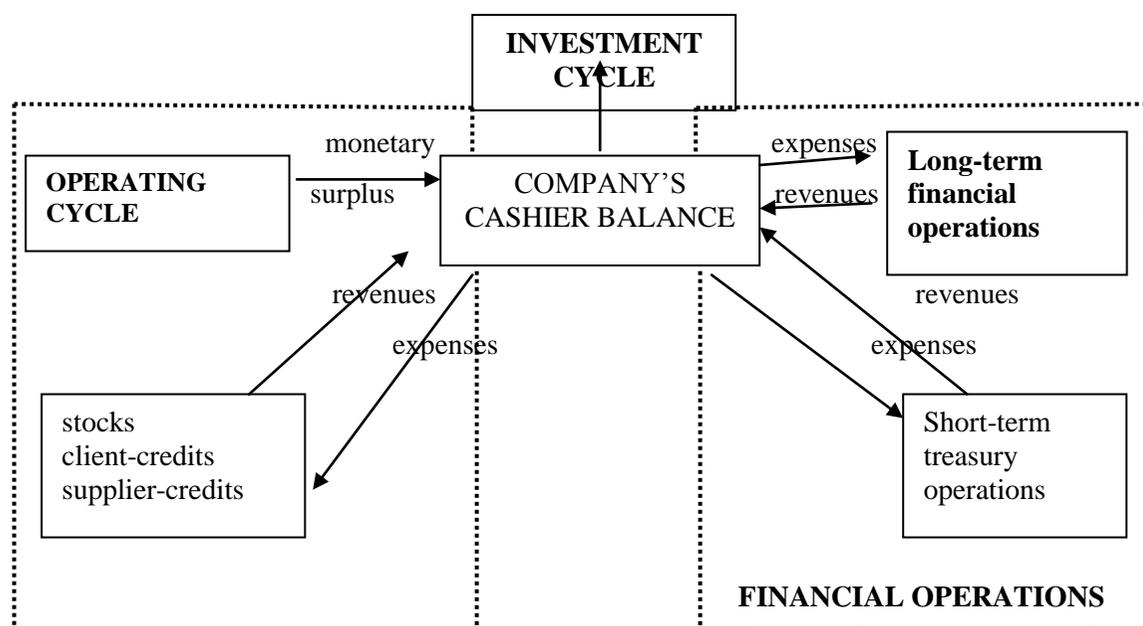

Fig.no.1. The enterprise's financial policy action range

Source: adapted by the author from (Onofrei 2000: 46)

As shown in the figure above, the financial policy's range includes a variety of decisions to be taken by the company's management about the pace and terms of capital creation, namely the financing of the company.

Modern financial theory holds that, at the firm's level, there can be identified three broad categories of policies (Stancu 2007: 47), which are considered interdependent, namely:

- investment policy (internal / external);
- financing Policy (own sources and / or borrowed);
- dividend policy (distribution and / or reinvestment of dividends).

The investment policy is considered primal, whereas it affects capital for a longer period of time. Involving significant capital expenditure in the hope of obtaining a successful future, underlying the investment decision (policy) should aim at:

- the investment's participation in the total value of assets (net present value);
- payback period of invested capital and hence the starting moment of net gaining from that

investment;

- alternative analysis of investment's further exploitation or disinvesting and seeking other forms of investment (decision tree method).

The financing policy is determined and in the same time it is determining the investment policy. The financing policy's foundation is represented by the proposed amount of investment, by the existing capital and the one necessary to continue to run the investments. Of particular importance is the company's financial structure, namely the relationship between equity and borrowed capital.

The dividend policy is determined by the predilection and in the same time the investor's wish to receive annual dividends. Although theoretically, in perfect market conditions, dividend policy does not affect the firm's value, recent studies have demonstrated the favourable effect of maintaining and possibly increasing the rate of distribution (dividend/share) on the course of shares, namely the awareness effect on the dividend. Some researches (Walter 1996: 29-35) mainly the agent theory, demonstrated the role of dividends distribution in settling conflicts between shareholders and managers on one hand and between the groups "shareholders and managers" on one side and creditors on the other.

Since dividend policy distributes the net profit between cash flow and net profit share distribution, it affects both the firm's financing policy and, indirectly, the investment policy. Each of these policies involves certain types of decisions and, most often it is considered that the company's main financial decision is the choice of a certain financial structure (Manolescu 1997: 486). This is followed closely by three other coordinates as the dividend distribution policy, increasing the company's equity and its debt.

"The existence of a power structure - P. Conso was saying - is the support for the internal decision-making process. The decision's degree of rationality depends on the role of people and on the values system they agree to join. The nature of power is thus an important determinant of company behaviour "(Conso 1981: 159).

In our opinion, the influence of the internal power structure of a company must be analyzed in terms of number of partners / shareholders in it. Thus, an individual firm holding the power and capital monopoly will have a very simple internal structure; in the case of a company formed by association (as a society), the internal structure becomes complex and dependent on the number and diversity of partners (businesses, banks, state, citizens, etc.) leading to the phenomenon of power distribution among its shareholders.

Therefore, financial policy-making requires knowledge of business environment and anticipating its evolution, based on foundations coming from the financial information system and from power relation correlations with the help of legal norms.

Having clearly defined the coordinates of its development, the company has the necessary autonomy to decide and to choose the way to follow. But not always financial decisions taken at a microeconomic level can be accepted at the macroeconomic one, which highlights the relative character of this autonomy, suggesting the idea of a competition between the company and the state. In this sense Jean-Paul Betbeze's finding takes on a special significance: "with every business modulation the state considered that it had to sustain it and with every acceleration that it had to brake. It has also created the habit of being the judge of other's performance, measured in terms of growth, employment (labor), price or foreign exchange. This is how it turned the interests towards facing the major problems: growth, distribution, planning [...] passing over in silence the fact that it should not manage the results of the billion operations of these organic cells in the economic universe - companies "(Betbeze 1983: 3) .

Financial policy is a component of the company's management being decisive in the strategic options, which is those fundamental options that deeply engage the future as well as in the current management decisions.

The company's financial policy is called to secure answers for at least the following questions (Ana 2001: 47):

- a. resolving issues related to insufficient funds;
- b. setting destinations and rational use of funds;
- c. ensuring financial stability;
- d. price stability;
- e. the continuous cost reduction.

Another direction of the company's financial policy is the tendency to maximize the economic capital through the options related to investment and funding. The capital increase has implications related to the financing cost and at the same time, issues related to the proportion between equity and borrowed capital for financing fixed and current assets.

In relation to capital cost, practical experience shows that it lowers through a judicious use of loans and will become a burden the optimal indebtedness level is exceeded. The increase of debt ratio over an accepted optimum entails the risk of lower profitability and increases the degree of insolvency.

The role of financial policy at a microeconomic consists in selecting the investment projects that can contribute greatly to increasing the company's value in providing resources necessary for a normal activity performance with low cost, achieving optimal stock and debt management as well as establishing a consistent strategy to pay shareholders. The purpose of this policy should be represented not only by increasing the value of the company but also the harmonization of the interests of all stakeholders involved in the business (shareholders, managers, employees, lenders, state, local community). These complex interactions are expressively shown in Figure no.2:

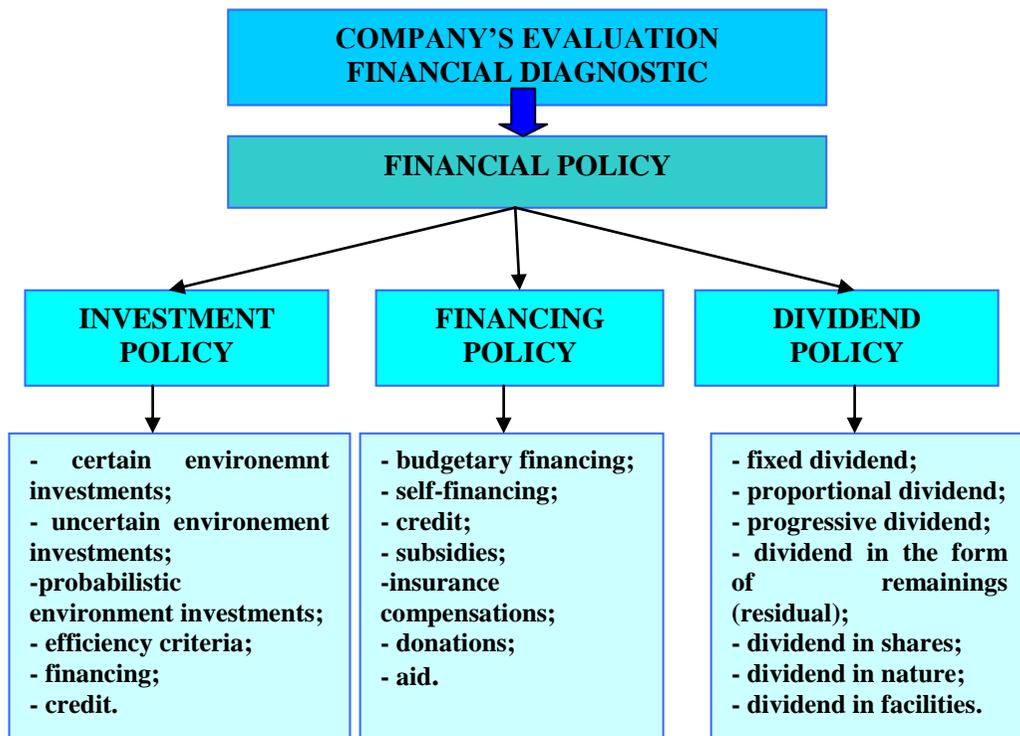

Fig.no.2. Financial policy's structure

Source: author's own conception (based on the present financial theory and practice)

Based on information provided by the financial and policy analysis we can make an assessment of the company 's patrimony assets and liabilities, an assessment of future income streams, which is expected to be released by the company or a mixed assessment of the present and future capacity of paying capital investors.

4. Conclusions

From the above we detach a first conclusion linked to the expression of the financial policy concept, namely that it is complex and controversial. It is complex and in the same time synthetic, because it reflects a variety of subsystems, already shown, in the introduction of this study. It is a controversial system, in that researching a vast literature in this field we found it difficult to find the same definition given to the concept by two or more authors. A second conclusion drawn is that a range of influences that come from both internal and external environment act upon the company's financial policy components adopted by its management. On behalf of associates and shareholders as owners of the company who are interested in at least maintaining it as well as in the consistent dividends remuneration. On behalf of the lenders either by shrinking or expansion the volume of loans or by interests charged considered by the firm as elements of cost. On behalf of the state, either by tax policies or within the general legal system, that favours or inhibits business. Besides all these there are also other factors in the company's external environment, objective or subjective, such as: market reaction, direct partnership relations, crisis phenomena, extreme natural phenomena (earthquakes, fires, floods, landslides), etc..

SMES' SECTOR ACCESS TO FINANCE: AN OVERVIEW

Roman Angela

“Alexandru Ioan Cuza” University of Iasi Faculty of Economics and Business Administration

Through their contribution to the creation of added value and new jobs, the small and medium enterprises (SMEs) have a significant role in the economic and social development of a country. However, these enterprises are facing numerous obstacles that limit their performance, growth and development. Among the difficulties faced by SMEs, the access to finance is often reported as a major obstacle to the deployment and expansion of their activity.

The paper aims to highlight the difficulties faced by SMEs in securing financing resources, emphasizing the differences between countries and also between SMEs and large enterprises. Knowing the difficulties in SMEs financing is essential for policy makers in order to design and implement appropriate measures, which will help to improve the access to financing for these enterprises. Thus, another issue addressed, synthetically, in this paper aims the measures taken by public authorities in order to support the access to financing for SMEs.

Key words: Small and Medium Enterprises, access to finance, financing constraints, bank financing, support measures

JEL code classification: G30, G32, O16

1. Introduction

In all countries, small and medium enterprises are a significant source of economic growth and jobs creation. Furthermore, these enterprises, through their dynamism and flexibility, are an engine of innovation and growth. Based on these considerations, it is easy to understand the crucial importance that the easy access to funding has, taking into account that it can support the creation of new businesses, the innovation process as well as the growth and the development of the existing businesses, which in turn boost the economic growth of a country.

The paper is structured as follows: *the first part* contains the introduction remarks regarding the importance and relevance of the approached theme; *the second part* is dedicated to a literature review which summarises the main researches undertaken so far on this theme; *the third part* highlights the major difficulties in SMEs financing, and *the fourth part* of the paper reflects, mainly, the difficulties reported by the entrepreneurs in dealing with banks and the measures that need to be taken in order to improve the access to financing for these enterprises. The study ends with conclusions.

The research methodology used in this paper starts with a literature review in order to highlight the importance of the subject addressed in our research. The analysis conducted in this paper is based on data and statistics provided mainly by the World Bank surveys, by certain empirical studies and by the National Council of Small and Medium Sized Private Enterprises in Romania. Based on the methodology used, the paper indicates the difficulties in SMEs financing and the crucial importance of enhancing the public authorities concerns regarding their alleviation, especially by adopting measures focused on increasing financial development.

The limited availability and even lack of statistical data regarding the SMEs financing situation from various countries, including Romania, impose certain limits to the researches in the field, which can be overcome as policy makers realize the vital importance of developing and monitoring specific indicators regarding the financing of this type of enterprises.

2. Literature review regarding the access to finance for SMEs

The access to finance for SMEs represents a topic of great interest for the academic literature, as witnessed by the large number of studies addressing such a problem.

Numerous studies based on various surveys highlight that access to finance is one of the most important obstacles in the way of enterprises' growth and development, especially in the case of small and medium enterprises.

The study realised by *Beck, Demirguc-Kunt, Laeven and Maksimovic* (2004) reflects, based on a survey that has included 10.000 firms from 80 countries, the fundamental factors to which depends the enterprises' access to finance. Thus, the study highlights the relationship between the access to finance for enterprises and their characteristics, such as age, size and propriety structure. From this perspective, the authors find that young firms of small size as well as national ones face greater obstacles when they seek to obtain financial resources. The study also highlights the relationship between the degree of economic and financial development of a country (expressed through the degree of financial intermediation, the level of capital market development, the efficiency of the legal framework, the GDP per capita) and the access to finance for enterprises. From this point of view, the authors demonstrate that in the financial developed countries it can be accounted a decrease of the difficulties that the firms face when they try to obtain financing resources. Furthermore, the study concludes that the institutional development is the most important feature that explains the differences between countries in terms of financing obstacles faced by enterprises.

Beck, Demirgüç-Kunt and Maksimovic (2005) point based on a survey realised on firms from 54 countries that small and medium-sized enterprises are faced with financial and legal constraints and corruption issues in a much greater degree when compared with the large firms, thus the impact of these constraints on the firm growth is inversely proportional to the size of the firm. Moreover, the authors also noted that the financial and legal system development and the process of reducing corruption help to relax the constraints faced by small and medium-sized firms.

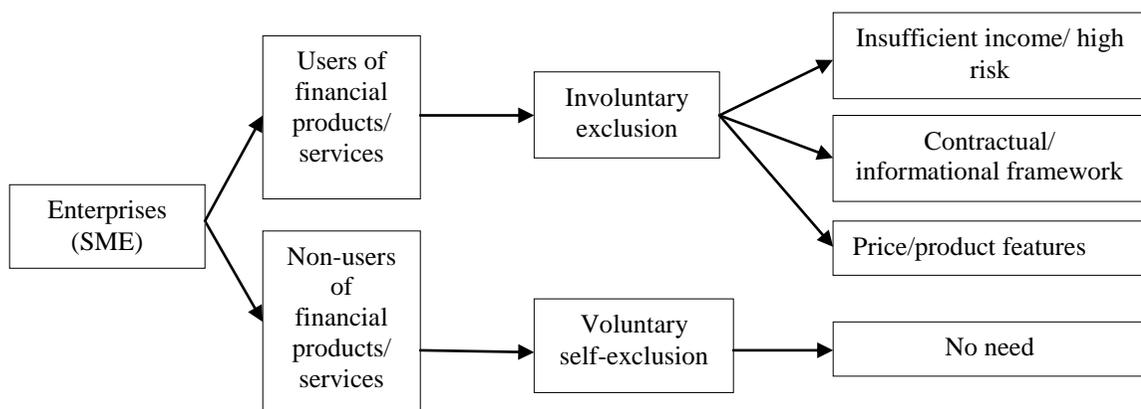

Beck and Demirguc-Kunt (2006) highlight that access to finance is an important growth constraint for SMEs that financial and legal institutions play an important role in relaxing this constraint. The authors also noted that innovative financing instruments can help facilitate SMEs' access to finance even in the absence of well developed institutions.

Ardic, Mylenko and Saltane (2011) analyze, using statistical data, the macroeconomic and institutional factors that are influencing the SMEs' financing through loans. Similar to other studies, the authors have found a positive correlation between the overall economic development (measured by income per capita) and financial development (measured by the ratio of private credit to GDP), on the one hand, and the SMEs' financing level, on the other side. Moreover, the authors demonstrate that the financing level of SMEs depends also on the legal framework and the overall business environment.

3. The general framework regarding the obstacles in the financing process of the SMEs

In general, the access to financial products/financial services or the financial inclusion assumes the absence of barriers in the way of using financial products/services, regardless of whether these obstacles are or are not related with pricing (*Demirguc-Kunt, Beck and Honohan* 2008: 2). Thus, improving this access means increasing the degree in which the financial products/financial services are available for everyone and at a fair price.

Unlike the use of financial products/services which is determined by supply and demand, the access aims at providing financial products or supplying financial services. The difference between access to financial products/services and their use is reflected in Fig. no 1.

Source: based on Demircug-Kunt, Beck and Honohan 2008: 29

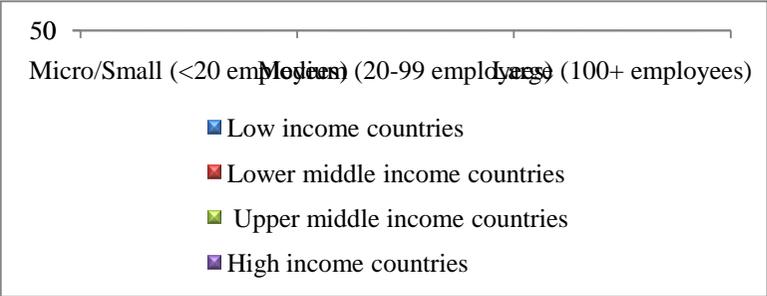

Fig. no 1: The difference between the access to finance and the use of financial products/services

Within the firms that do not use financial products/services it can be distinguished several categories, whose identification is essential for the authorities in order to adopt the necessary measures to improve their access to finance. Thus, on the one hand, there are *the firms that have access to finance*, generally to financial products and services, but do not use them because they do not have viable investment projects. On the other hand, it can be distinguished *the involuntarily excluded firms*, those firms that do not have access to finance or financial services, although they demand them. The involuntary exclusion of firms from finance/financial services appears in the situation in which some companies do not earn enough income or do not have the guarantees requested by the suppliers of capital and therefore have a high credit risk. At the same time, there are situations when some companies request funding, but the financial and banking institutions are not answering to these demands because the cost involved would be too high for them. Finally, within the category of involuntarily excluded firms appear also those for which the price of financial products/services is too high or the financial products'/services' features don't meet their needs.

The access to finance is indispensable for the efficient allocation of capital and the enterprise development. However, when compared with large enterprises, small and medium enterprises face many difficulties when pursuing to procure financial resources, which are due to several causes, including: the unstable and inadequate juridical and legislative framework, which does not support the relationship between capital providers and the enterprises that require financing; incomplete information and even lack of information from the part of both capital providers and enterprises, which prevents the development of normal and efficient relations between them; lack of a credit history and insufficient guarantees for creditors, especially in the case of the small and young firms; limited and, sometimes, inadequate range of financing products.

Numerous surveys carried out, particularly, by the World Bank highlight that the access to finance is often mentioned by the SMEs as one of the most important barriers to their well functioning and growth. For example, the surveys conducted by the World Bank, in 2006-2009, found that, worldwide, 31% of the studied firms report that the access to finance is a major

obstacle in the way of carrying out current operations, the percentage being even much higher, at 40% in the case of young firms with up to three years experience (Chavis, Klapper and Love 2010: 1). Also, a series of global surveys, including the information provided by the World Business Environment Survey, show that small and medium size enterprises report the cost of financing as the most important obstacle to their growth. The difficulties in SMEs financing are more severe in the case of developing countries, this assessment resulting from the fact that approximately 50% of the micro and small sized enterprises report the difficulties in financing as a major obstacle (see Fig. no 2).

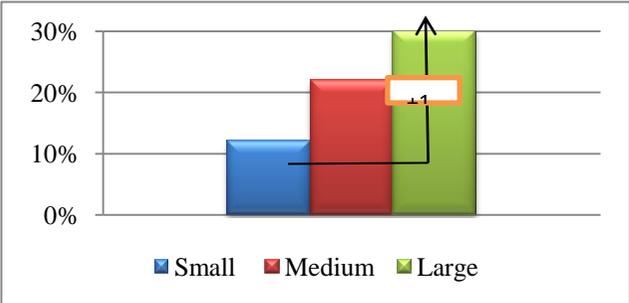

Source: International Finance Corporation 2010: 12

Fig. no 2: The average percentage of firms that have reported that the access to finance and the cost of financing represent a major constraint

As results also from Fig. no 2, regardless of the group of countries where SMEs are located, about one-third of these firms report that the access to finance is a major constraint to their current operations (International Finance Corporation 2010: 12).

4. Difficulties in SME’s banking finance access and support measures

In most countries, especially in the ones with bank-oriented financial systems, the SMEs main source of external financing is represented by the bank loan. Thus, the access to this type of loans is vital for the development of these enterprises. However, surveys show that small firms when compared with large firms are using in a much smaller degree bank financing for new investments (see Fig. no 3).

Source: Own simulation based on the data provided by International Finance Corporation 2010: 15

Fig. no 3: The percentage of firms that use bank financing for new investments

As we have mentioned within the paper, the usage of financial products is determined by supply and demand. Therefore, it is important to identify why small size firms use in a lesser extent bank financing. In this regard, some studies (Banerjee, Duflo 2004) have demonstrated that the main reason would be related to the supply, because every time when the SMEs had access to

subsidized credit, they used it to increase the production. Such a conduct of firms strengthens the assertion that the lack of access to finance is a major obstacle to their growth. Furthermore, in the context of the current global economic crisis, the limited access of SMEs to financing has been increased as a result of reduced availability of bank loans. Thus, this type of enterprises faces major difficulties.

The survey conducted by the National Council of Small and Medium Sized Private Enterprises in Romania (CNIPMMR), in the period 7 - 29 October 2010, highlights the main difficulties faced by the SMEs in their relation with the banks. Thus, 82% of the interviewed entrepreneurs considered that *the access to bank financing is very difficult*, especially because of the excessive bureaucracy, the unjustified high requirements, the high interest rates, the rigidity of the creditworthiness indicators used by banks, the numerous types of commissions and fees required. Also, over 61% of the SMEs' entrepreneurs and managers reported *banks' lack of transparency* (by charging hidden fees, ineffective communication etc.), *no real negotiation* (by using standard contracts, banks' refusal to modify or complete the credit contract, etc.) and *unjustified and abusive contractual terms practiced by banks* (such as performing unauthorized transactions in accounts and in general bank frauds). The knowledge of these difficulties has a vital importance regarding the need to adopt measures in order to support and improve the SMEs' access to finance.

Overall, the obstacles in the way of SMEs access to financing are related both to the entrepreneurs and the economic environment as well as to the institutional and regulatory framework (Nicolescu and Nicolescu 2008: 171). Among the obstacles related to entrepreneurs, a series of surveys conducted in various countries, identify: the lack of knowledge regarding the possibilities of obtaining financial resources, the lack of awareness regarding the consulting institutions, the development of business plans that do not meet the requirements of the lenders or investors, the reduced negotiating skills in relation with capital suppliers and the insufficient guarantees available. In regard to the second category of obstacles, they refer in particular to the reduced availability of funding in some cases, excessive guarantees imposed by some banks for SMEs' loans, the high cost of SMEs' financial consultancy services, corruption, bureaucracy.

Starting from the fact that the SME sector has a key role in the economic and social development of a country, in most countries supporting this sector has become a primary objective of the governments.

In order to improve the access to finance for SMEs, the public authorities from different countries have adopted a series of measures, depending on the particularities of each country, which aimed (International Finance Corporation 2010: 26) at improving the juridical and regulatory framework, developing the financing instruments for SMEs and direct interventions on the market in order to stimulate SMEs' financing (for example, by granting loans through certain state institutions, providing guarantees for loans to entrepreneurs, providing grant financial allocations etc.).

The significant importance of easy access to finance for enterprises, particularly for SMEs, and especially in the context of the current crisis, is highlighted by the fact that approximately two thirds of the EU business support measures, adopted by the European Commission and set out through the European Economic Recovery Plan aims to facilitate the access to finance (European Commission 2009: 79).

Improving the access to finance for SMEs still remains a concern and also a challenge for the authorities from the national, European and international level. For example, at EU level, through the Review of the *Small Business Act* (SBA) for Europe are set out new measures *to improve the access to finance for SMEs*, including *facilitating the access for SMEs to structural funds* through reducing reporting requirements, establishing the "*credit ombudsman*" in order to facilitate the

dialogue between SMEs and credit institutions, *avoiding double taxation through tax legislation*, that would hamper the cross-border venture capital investments, which play a significant role. A number of studies, especially the empirical ones, highlight the crucial importance of the degree of financial development of a country for SMEs' access to finance. Therefore, the measures taken by authorities in order to support the SMEs' access to finance should focus on ensuring a high degree of financial development, which would ensure a greater availability of financing for businesses. Concretely, the authorities should adopt measures aimed at the seven pillars commonly used to measure the degree of financial development, namely institutional environment, business environment, financial stability, banking financial services, non-banking financial services, financial markets and financial access (World Economic Forum 2010: 5).

Conclusions

The easy access to finance for SMEs has a significant importance for the creation of new businesses, the growth and development of already existing ones, which, in their turn, foster the economic and social development of a country. Moreover, under crisis conditions, supporting the access to finance for SMEs is vital because these firms can contribute to the recovery of the national economies. However, most surveys emphasize that SMEs report, consistently, the access to finance as one of the most important obstacles to their functioning and development.

The difficulties that SMEs face when they are seeking to obtain the necessary funding resources are related both to the entrepreneurs and the economic environment from each country, as well as to the existing regulatory and institutional framework. In order to mitigate these difficulties, the measures taken by public authorities should focus on increasing financial development, which would ensure greater availability of financing for businesses and thus economic growth.

Given the reduced availability and even lack of statistical data regarding SMEs' financing in various countries, including Romania, we consider that policy makers need to focus their efforts in order to shape and monitor a series of significant indicators, such as the share of loans granted to SMEs, based on their size, experience and sectors of activity, that would be useful for public authorities, creditors and investors.

LABOUR TAXATION IN THE EUROPEAN UNION

Sabău-Popa Claudia Diana

University of Oradea, Faculty of Economic Sciences

Kulcsar Edina

University of Oradea, Faculty of Economic Sciences

Sabău-Popa Liviu Mihai

University of Oradea, Faculty of Economic Sciences

This article proposes an analysis, which we consider extremely useful in the current economic context, of the evolution of labour income fiscality, more precisely, the effect of the public debt growth on the tax wedge for the labour income.

The share of fiscal revenues from direct taxes, indirect taxes and social contributions is relatively close in the old member states of the European Union in comparison with the new member states, which register a lower level of income from direct taxes. The low level of income from direct taxes is compensated by more significant shares of the social contributions or indirect taxes.

The main motivations of cross-border migration are: a successful career in a multinational corporation, high variations of the tax rate, of the salary income between states and, last but not least, the level of the net salary. To this day, there are no plans to harmonize across the European Union the legislation regarding the taxes wages and the social security contributions. Still, the European Union had in view the coordination of the national tax systems to make sure that the employees and the employers do not pay several times the social contributions in their movement across the community space.

Despite the fact that some states tax the labour income at a low level, the labour fiscality remains high in the European Union in comparison with other industrialized economies, probably also due to the fact that the majority of the member states have social market economies. The increase of the fiscality level for the labour income determines the decrease of the employment rate and the raise of the unemployment rate.

The solution to guarantee a higher employment rate, which is a target of the European Union Strategy „Europe 2020” could be the relaxation of the labour income fiscality by transferring the tax wedge on the labour income towards property or energy taxation.

Keywords: labour income, social contributions, tax quotas, taxes

JEL Codes: F22, G28, H2

1. Introduction

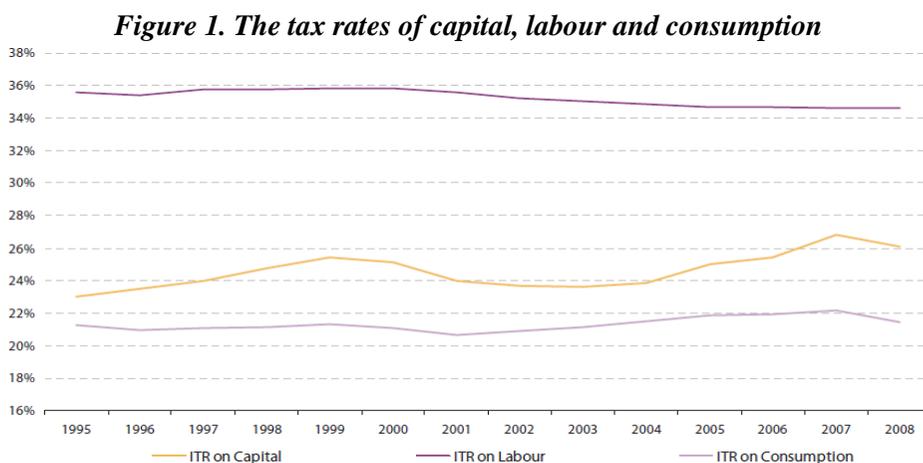

The mechanism of the Single European Market is based on the four freedoms acknowledged by the European Community legislation: the free movement of goods, people, services and capital. The main motivations of cross-border migration are: a successful career in a multinational corporation, high variations of the tax rate, of the salary income between states and, last but not least, the level of the net salary. According to some research realized in Switzerland (Kirchgassner, Pommerehne, 2001) and (Feld, Kirchgassner, 2001) we can notice that the level of payroll tax and the level of social contributions have an important influence on the dispersion of the labour force with high income (Peter Egger and Doina Maria Radulescu 2008: 2).

To this day there are no plans to harmonize across the European Union the legislation regarding the social security contributions. Still, the European Union had in view the coordination of the

national tax systems to make sure that the employees and the employers do not pay several times the social contributions in their movement across the community space.

If we analyze the structure of budgetary income collected by the European Union, according to the economic classification, the labour taxation and the compulsory social contributions are the most important source of revenue, representing an average of 50% of the budgetary income collected in the European Union. Thus, the labour taxes collected by ten member states: Hungary, Slovenia, Czech Republic, Holland, France, Belgium, Finland, Denmark, Greece and Italy represent between 50-55% of the total income; the labour taxes collected by four states: Sweden, Austria, Germany and Estonia exceed 55% of the total income.

Concerning the rates of labour taxation, the following figure proves that these are the highest of the European Union, amounting to 34%-36% in comparison with the lower rates of capital gain tax and consumption tax.

Source: Eurostat

During the period before the crisis, in the European Union, generally speaking, the tax wedge increased especially concerning the labour taxes and the social contributions as a result of the need to finance the government expenditures.

During the period after the crisis, the fiscal measures to support the employment offer adopted in the majority of the European Union states visible in the reduction of the fiscality for labour income led to a decrease of the share of the direct fiscal incomes. The tax wedge on the salary income, especially for the low incomes decreased in almost all member states. Instead, the level of social contributions, which increased during the period 2008-2009 registered an asymmetrical evolution. (European Commission, Taxation Papers, 2010: 18).

2. Aspects regarding the taxes wages in the European Union

The labour tax rates in the EU increased continually from 28% in 1970 to approximately 42% in 1997. The continual growth of labour fiscality was due to the tendency of excessive increase of the unemployment rate at the beginning of the 1990s, as a result of the recession. Thus, at the end of the 90s the concerns aiming to decrease the excessive employment costs in order to stimulate the employment rate became more important. While some measures could be generally applied like: the decrease of labour tax rates or of the social contributions rate, others aimed at certain target groups: the decrease of the contribution rates for the unskilled workers.

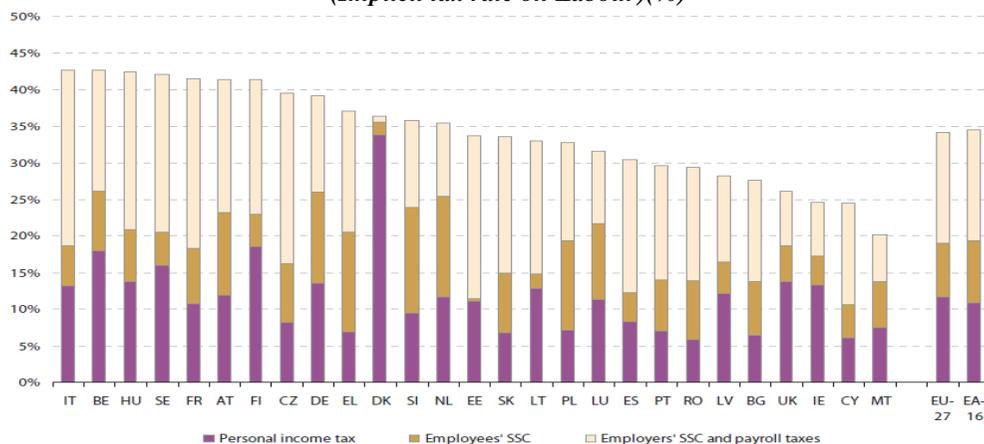

Regarding the fiscal reforms adopted by the member states, the national governments preferred measures in order to narrow the taxable base or to grant allowances for the low income households rather than to reduce the tax rate. Thus, measures meant to increase the labour tax rate were adopted by Greece, France, Latvia, Portugal, Slovenia, Great Britain, Ireland; measures meant to decrease the labour tax rates were adopted by Austria, Germany, Denmark, France, Finland, Hungary, Latvia, Lithuania, Romania. Measures meant to increase the taxable base were adopted by states such as Denmark, Greece, Estonia, Spain, Ireland, Hungary, Portugal; measures meant to decrease the taxable base were adopted by Austria, Belgium, Bulgaria, Germany, Denmark, Finland, Hungary, Luxembourg, Holland, Poland, Portugal, Romania, Sweden. Fewer fiscal measures were adopted regarding the social contributions. The states which chose to apply measures meant to increase the social contributions rates were: Cyprus, Estonia, Portugal, Slovakia, Finland; the states which chose to decrease them were: Bulgaria, Czech Republic, Sweden. The enlargement of the taxable base was adopted by the following states: Bulgaria, Czech Republic, Estonia, Latvia, Lithuania and the narrowing of the taxable base was adopted by Finland.

The series of changes occurred during the period 2000-2008 had a very different effect upon the labour fiscality in the member states. The states of Central and Eastern Europe which joined the European Union in 2004 and 2007 faced a decline stronger than 4.4% of the labour tax rates, a decrease of 4.4%, while the average decrease of tax rates in the European Union was of 1.7%. The strongest diminution of these rates, of 11.1% was registered in Bulgaria and an increase of the rates was registered in Portugal (2.4%, Greece (2.5%), Spain (1.9%), Luxembourg (1.6%), Cyprus (2.9). During the period 2000-2008, in Romania, the labour tax rates decreased by 4%. (European Commission, Taxation trends in European Union, 2010: 107).

The international economic and financial crisis did not determine a decrease of the labour fiscality. If we analyze the situation in the member states, we can notice that the most significant decrease of the labour tax rates was registered in Denmark, Estonia, Romania, Ireland, Sweden, Bulgaria, Latvia and Lithuania. We can also notice that the taxation level in the three northern states is closet o the European Union average. The labour tax rates increased significantly in Cyprus, Portugal, Greece, below the European average in the case of the first two. The lowest labour tax rates are registered in Malta (20.2%), Cyprus (24.5%), Ireland (24.6%) and the highest labour tax rates are Italy (42.8%), Belgium (42.6%) and Hungary (42.4%).

If we analyze the salary tax evolution, we can notice that the decline of the tax wedge on the labour income is due to the decrease of the social contribution rates, as well as of the tax rates of the natural persons' income. The tax wedge is calculated by dividing the payroll tax, the social contributions paid by the employee and by the employer and other taxes to the total labour cost. The tax wedge supported by the employee and bt the employer for the labour force is quite high in the European Union and this represents one of the main causes for the poor performance concerning employment in the European Union.

**Figure 2. The structure of the tax wedge – the level of labour taxation in 2008
(Implicit tax rate on Labour)(%)**

Source: European Commission, *Taxation trends in European Union, “Data for the EU member states, Iceland and Norway”, 2010, p. 110*

If we analyze the structure of labour taxation in the European Union, we can notice that its largest share is represented by the employer’s compulsory social contributions, closely followed by the payroll taxes and the employee’s social contributions.

Thus, in Denmark, Ireland and Great Britain, the largest share of the tax wedge on the labour income is represented by the payroll taxes and in states like Romania, Slovakia, Greece, the largest share is represented by the social contributions, the payroll tax representing less than 20%. The labour tax and the social contributions attenuate the economic fluctuations by decreasing the available income volatility. In many member states, the progressive character of the payroll taxes is often compensated by the regressive system of compulsory social contributions. The diminution of the tax wedge for the low wages increased the progressiveness of the tax wedge in the member states. The majority of the member states collect taxes on the natural persons progressive income. Seven member states apply progressive tax rates on the natural persons’ income: Czech Republic, Bulgaria, Estonia, Latvia, Lithuania, Romania, Slovakia.

Table 1. The tax wedge on labour income – single worker with average income (% of the labour cost) in 2009

Source: European Commission, *Taxation Papers, Monitoring tax revenues and tax reforms in EU Member States 2010, “Tax policy after the crisis”, Working Paper nr. 24, 2010, pp. 84*

A research conducted by the World Bank in eight member states: Czech Republic, Estonia, Latvia, Lithuania, Poland, Slovakia and Slovenia concerning the relationship between the tax wedge on labour income and the employment level revealed that there is an inverse relationship between the tax wedge and employment. It was also revealed that the labour force structure – with many unskilled workers, compulsory minimum wages, high level of labour taxation and progressive fiscal systems have worse effects on employment than in the rest of the European Union member states. (World Bank, EU-8 Quarterly Economic Report, 2005:12).

In the case of low-wages category, it is important to analyze the stimulants offered by the employees. In this respect, two indicators were developed: *the effective marginal tax rate* and *the effective average tax rate*, in order to study the effect of wage modifications. If the first rate takes into account the marginal modification of salary income, the second takes into account the salary changes implicit to the transition from unemployed to employed. The effective average tax rate is a specific concept of unemployment or inactivity; it is used to monitor the labour market distortions, especially regarding financial constraints in order to gain access to a job.

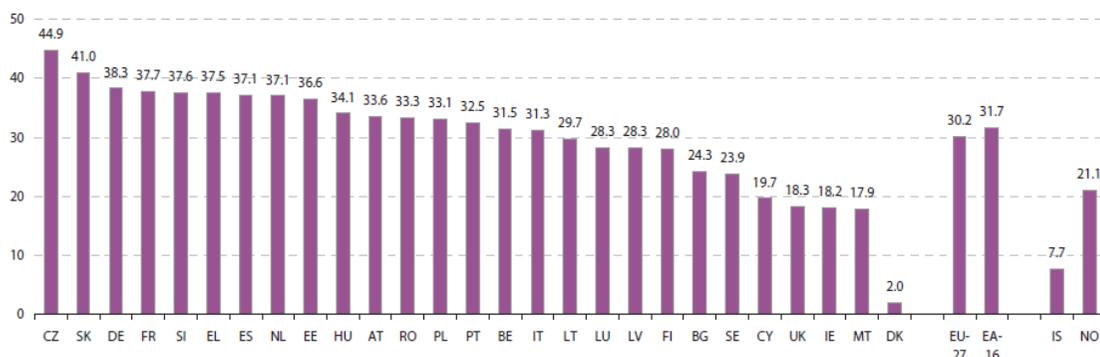

It is also obvious that an increase of the tax wedge has a stronger negative effect on the employment level in the case of workers with a lower qualification level. A research conducted in Belgium, Holland and France confirms this observation since a decrease of fiscality for the low-income workers led to a considerable increase of the employment level.

3. Aspects regarding the importance of compulsory social contributions to the formation of public income in the EU

The share of fiscal revenues from direct taxes, indirect taxes and social contributions is relatively close in the old member states of the European Union in comparison with the new member states, which register a lower level of income from direct taxes. The low level of income from direct taxes is compensated by more significant shares of the social contributions or indirect taxes. While in some states such as Bulgaria, Romania, Malta and Cyprus the most significant share of the budgetary income is represented by the income from indirect taxes, in other states like Czech Republic, Slovakia, Germany and France, the income from social contributions is high. At the opposite side are Denmark, Ireland and Great Britain, states which collect relatively low income from social contributions. The motivation for the very low level of social contributions in Denmark is the fact that its social expenditures are not financed by the social insurance budgets, but by income from general taxes. This explains the very high level of direct taxes, one of the highest in the European Union.

If we analyze the evolution of the budgetary income, we can notice that in time most of the states changed the structure of the budgetary income. For example, in case of Latvia and Slovenia, the increase of the share of the direct taxes was compensated by a decrease of the social contributions and of indirect taxes. In Sweden, the increase of the share of indirect taxes meant a decrease of the share of direct taxes and social contributions in the total income. In Greece, the decline of direct and indirect taxes was completed by an increase of the social contributions rates.

Figure 3. The share of social contributions in the total tax wedge (%) in 2008

Source: European Commission, *Taxation trends in European Union, "Data for the EU member states, Iceland and Norway"*, 2010, p. 68

In Austria, the most important share of the tax wedge is represented by the social contributions. The social contributions rate supported by the employees is approximately 18%, the social contributions rate supported by the employer is 21.5%, and in case of income earned out of independent activities, the social contribution rate is 25%.

In 2010, the total social contributions collected in Bulgaria reached almost 28.5% of the income, out of which the most important part was represented by the contributions to social insurances – pensions – which decreased in 2010 from 18% to 16%, decrease compensated by an increase of the direct tax rates.

In Czech Republic, the most important source of budgetary income is represented by the social contributions (44.9% of the total collected income). The level of income from social contributions is the highest of the European Union, followed by Slovakia and Germany. Taking into account this aspect, the income from direct and indirect taxes is under the European Union average. The social contribution rate owed by the employees is 11%, out of which 6.5% for the social insurances – pensions and 6.5% for social health insurances. The social contributions rate owed by the employer is 34% of the gross income. In Finland, the social contributions level owed by the employer is 28%.

The level of social contributions owed by the employer registered in France in 2008 was the second in the European Union after Czech Republic. The social contribution rate owed by the employer is high in France, amounting to 35%-45% of the income in comparison with the contributions owed by the employees which amounts to 14% (European Commission, *Taxation trends in European Union, 2010: p. 160-272*).

In Sweden, the social contributions have the lowest share in the total budgetary income. In Sweden, most of the social contributions is paid by the employers (31.42%). The employees pay an additional rate of 7% for the social insurances. In order to facilitate youth employment, the employers benefit from a reduced rate of social insurance for people under 26.

In Ireland, the share of social contributions to the total income is not significant – only 18.2% because of the very low level of labour taxation in comparison to the European Union average. The increase of labour tax rate starting with 2000 was balanced by the decrease of the social contributions level. The contribution paid by the employers is 10.75%, with a reduced rate of 8.5% for those with low income (lower than 352 euros per week) and the contribution supported by the employees is 4% of the gross income. Given the very low level of social contributions rate in Great Britain, the income from this source represents a small share of the total budgetary income.

In Malta, the level of social contributions is very low, much under the European Union average. The income from this source had a declining evolution during the period 2000-2008, registering

the lowest level of all the member states. The workers of Malta, the employers and the government contribute equally to the social security fund with 10% of the basic salary.

In Holland, the three important sources in the income formation have equal shares. The social security system is composed of the public insurance and the employees' insurance. The first category is financed by all the members of the society, while the second category is supported by the employers according to the economic sector in which they work. The employees' social contributions rates are identical to those of the employers.

Romania is the fourth country in terms of the importance of income from direct taxes to the total budgetary income after Bulgaria, Cyprus, Malta. In 2008, the level of budgetary income increased with almost 29% in comparison with 2007. This increase of public income came from the increase of income from: income tax -23.6%, natural persons' income tax - 27.8%, VAT - 30.8%, excises - 8.7% and social contributions - 24.7% (Mara Eugenia Ramona, Inceu Adrian, Cuceu Ionuț, Achim Monica Violeta, 2009: 3). This confirms the importance of social contributions to the formation of public income. The obligation to pay the rate of social insurance belongs to the employer (20.8%) and to the employee (10.5%) in normal working conditions. If the employee develops his activity in higher risk conditions, the contribution rate paid by the employer increases by 5%; for particular working conditions the total contributions rate is 36.3% and for special working conditions, the total contributions rate is 41.3%.

Examining in general the main sources of budgetary income formation in the European Union in 2008, we can notice a quite balanced situation, the social contributions having the smallest share in the total income (12.6% of GDP), in comparison with the direct taxes (13.5% of GDP) and the indirect taxes (31.4% of GDP).

4. Conclusions

In the current context of the financial crisis it is absolutely necessary to compare the evolution of labour fiscality and the effect of the growth of public debts on the tax wedge on labour income. In a research conducted by the European Central Bank, it was revealed that in the majority of the states which registered an increased of the public debt, the labour taxation increased - Greece, Italy and France being relevant examples in this respect.

Despite the fact that some states have low labour taxes, the labour fiscality remains high in the European Union in comparison with other industrialized economies. The increase of the fiscality level for the labour income determines the decrease of the employment rate and the raise of the unemployment rate. The solution to guarantee a higher employment rate could be the relaxation of the labour fiscality. Some specialists consider that fiscal neutrality in the field of labour fiscality could be realized by transferring the tax wedge on the labour income towards property or energy taxation.

BASES OF STATE SUPERIOR EDUCATIONAL SYSTEM FINANCING FROM ROMANIA

Schneider Suzana

West University of Timisoara Faculty of Economics and Business Administration

Cosma Dorin

West University of Timisoara Faculty of Economics and Business Administration

Bene Gheorghe Florin

West University of Timisoara, Faculty of Economics and Business Administration

This study concerning state superior educational system financing comes to emphasize the main state superior educational system financing forms from Romania, looking forward to find new future state superior educational system financing forms. Romanian educational system reduced financing imposes a special attention for educational process, concerning both quality and, especially, an appropriate financing level endowment. For the future of academic education, it is vital to be found new financing sources, because a composite, diversified financing leads to the raise of total amount of resources at the service of universities, to their freedom degree, too, making them capable to undertake the constraint imposed by the dependence of a solely financing source.

Keywords: the financing of the academic education, private funds financing, public fund financing, public funds usage surveillance.

JEL classification: I22

Introduction

According to Law of national education, no. 1 from January 5th, 2011, the state superior educational system incomes are composed by sums allocated by Education Ministry budget, according to a contract, for the basic financing, complementary and supplementary financing, investments objectives accomplishing, competition basis allocated funds for institutional development, competition basis allocated funds for inclusion, scholarships and students' social protection as well as own incomes, rates of interest, donations, sponsorships and fees legally perceived from individuals or companies, aboriginal or from above, or another sources, too. These incomes are used by superior educational system institutions, on university autonomy conditions, in order to accomplish their dedicated objectives because of the state policies on the field of education and university scientific research.

1. State superior educational system institutions public funds financing

Financing inside the superior educational institutions is accomplished in the context of university autonomy and it is also materialized in their rights of managing, according the laws, the funds allocated from the national budget or the ones coming from another sources, too, in accordance to the criteria commonly agreed with the Ministry (M.E.C.T.S.).

State superior educational system financing is ensured from public funds, according to the following requirements⁶²:

- superior educational system development to be considered as a public responsibility and the educational system, generally, to be considered as a national priority;

⁶²

- superior education quality to be ensured on the level of standards from European Space of Superior Education for human resources preparation and personal development as citizens of a democratic society based on knowledge;
- human resources to be proficient according to the labor market diversification;
- superior educational system development, scientific research and artistic university creation development for the top integration on the world scientific level.

Basic financing is to be insured according to the number of admitted students on the form of budget study, as well as according to another indicators specific to education activity, especially the one referring to the quality of performance in education. Basic financing is multi-annual, it is ensured on the entire period of a study series.

State superior educational system institutions basic financing is performed due to a *institutional contract*, agreed between the Ministry of Education, Research, Youth and Sports and the superior education institution.

The Ministry of Education, Research, Youth and Sports will ensure the basic financing for the public universities, by study grants, based on the average costs equivalent per student per domain, on study series and on teaching language. The study grants will be priority awarded to those domains that ensure the supportive and competitive society development, but, inside the domain, priority for the best placed programs o their quality hierarchy, the number of study grants assigned for a program, which vary on the position of the program in this hierarchy. The received grants will be managed by universities according to their own terms.

The national budget funds for basic financing are differentially assigned for superior educational institutions according to the following criteria:

- number of students unitary equivalents (70%);
- qualitative indicators (17 indicators structured in 5 groups) determined for each university (30%).

On the institutional contract agreed between the university and the Ministry (MECTS) there are stipulated, along with basic financing, the sums assigned from national budget for scholarships and students' social protection as well as the sums assigned for investments achievement.

The number of student unitary equivalents are calculated, for every single university and every single educational domain, as it follows::

$$SEU^U = \sum_{d=1}^D C_d * SE^U_d \quad (1)$$

where:

SEU^U = number of students unitary equivalents of the U university;

C_d = cost coefficient corresponding to educational domain d;

SE^U_d = number of students from D domain of U university;

D = total number of educational domains financed from the national budget.

The allowances from the national budget concerning basic financing are guided from the title of "Transfers"; they represent a pay form for a service performed (school-house for a number of students agreed with the MECTS).

Complementary financing is awarded by the Ministry of Education, Research, Youth and Sports by: accommodation and meal subventions, funds allowed on priorities and specific standards for endowments and another investments and capital restorations; funds allowed n competitive basis for university scientific research.

Complementary financing is awarded on competitive basis, due to a *complementary basis*, the sums are to be directed to investments and capital restorations, to cover some didactic

equipments endowment and research expenditures or some development projects (new specializations, new education forms), and also for some scientific research projects financing. *Supplementary financing* is awarded from public funds by the Ministry of Education, Research, Youth and Sports in order to stimulate the excellence of institutions or study programs from the universities. This is awarded for the universities, for a sum, on national level, of minimum 30% from the sum allowed on national level to the state universities as basic financing, upon the criteria and quality standards agreed by the National Council of Superior Education Financing and approved by the Ministry of Education, Research, Youth and Sports.

2.State superior education institutions private funds financing

Regarding to national strategies, the changes performed by the reforms from many countries have tried to increase superior education institutions autonomy concerning financial management and, especially, private funds usage and gathering.

State superior education institutions from Romania may perceive examination fees in case of the students who are not sustained by the state. The value of school-house fees is established by the university Senate, according the laws.

Besides the school-house fees, there is the alternative of a large scale of sources for state superior education institutions private financing.

The sources for private funds available for public institutions are the following ones:

- donations and legacies;
- loans;
- rents and incomes from positions sponsorships;
- usage of research results / research based on a contract;
- payments for different performed services;
- rate of interest on investments;
- private commercial companies foundation.

If there are some restrictions regarding certain financing forms (private commercial companies foundation, rate of interest on investments, loans), the Romanian state will authorize all the private income sources mentioned above.

Research contracts under she form of common research projects between superior education institutions and contractor private entities represents the most well known private financing source.

Services performing as it may be the adult permanent education, classes for the employees from different companies, consulting services and events organization, they all represent another important source of private financing.

State superior education institutions from Romania are allowed to *found commercial companies*, but didn't yet happen. Commercial spaces renting or another facilities renting represent another income source for state universities.

State universities from Romania have the right to get and to receive loans.

Partnerships with the private sector, local or regional authorities represent for the state superior education institutions from Romania an important financing source for their increasing incomes, representing a way of transfer for the research and results of academic research commercialization.

In order to encourage such partnership achievements, the state may allow certain incentives for superior education institutions and/or private cooperating entities. This kind of incentives may appear as: superior education institutions tax releases; donors, sponsors or private partners tax releases; private sectors partnership financial support or another kind of support; regulations that allow institutions to own intellectual property; budget financing influence or evaluation influence.

In Romania, there are accorded tax releases for state superior education institutions donors and sponsors. In case of research activities financed by public funds, the real owners are the superior education institutions and the Ministry of Education, Research, Youth and Sports, except for the situation when the research contract provides something different.

Private funds attracted by state superior education institutions are used in order to co-finance some objectives stipulated in the institutional strategic plan.

3.The control of superior education institutions allocated funds usage

Although the superior education institutions are autonomies, they are supposed to be controlled because they represent public services providers and they benefit from public funds.

The control represents a clear stage of budgetary process. It appears in every stage of budgetary process, especially during the process execution.

The manner of control in the specific situations when superior education institutions use the allocated funds is accomplished in order to avoid dissipations, embezzlements or peculations.

Public Finance Ministry specialized authorities are checking the way that national budget received funds have been used, the accuracy and the reality of the data in the records of public institutions and the way of funds management and usage.

The public, but especially superior education institutions financiers have their own proper interest of having knowledge about what it is happening in those institutions.

An annual report in our country is mandatory; it is usually prepared and presented to the Minister by the superior education institution Rector. Although many of the annual reports include information about institutional project, they are mainly used as a superior education institutions responsibility instrument.

Our country annual report about the activity of superior education institutions is an essential document for superior education institutions financing, which includes information about accomplished objectives, registration data, teaching and administrative positions data, institutional budget data, facilities, research projects, publications, international relations, consulting and direction, experimental units, etc..

Superior education institutions from Romania are responsible for public funds usage through a link accorded between a part of allocated funds and institutions results. It breaks consideration for performance indicators in the financing formulas used to calculate the global public subventions and/or research indicators results for certain subventions accomplished for that specific research.

Another way of superior education institutions surveillance is represented by the strategic institutional plans. These plans constitute an alternative of institutional achievements measurement. In case of a superior education institutions from Romania, the strategic plans are included in the performance contract for public funds allowance.

Conclusions

Actually, Romanian universities capacity of another financing source attraction, besides the study fees, is very reduced, meanwhile global financing system didn't solve the problem of superior education financing and it won't solve it without involvement from universities and without a performance management.

Romanian education reduced financing from private sources imposes an increased attention for educational process, as well for quality, as it is a financing proper degree insurance.

We remind here some main recommendations concerning state superior educational system financing from Romania:

- remission of the two categories of existing students in the actual state superior educational system (who are paying school-house fees or who are financed from the budget) and the

introduction of mandatory individual contribution for all the students concerning superior education costs. This new study fee system, lower, but equitably paid, by all the students, could represent a solution for the extra-budgetary financing increase. The sum representing individual contribution will be established due to the student's performance;

- achievement of some partnerships between universities and economic agents, which allow to certain companies to sustain a part of students' study fees, with the condition that the student financed by an economic agent to be employed by the financing company at the end of the studies with a lower salary than the appropriate until the student will pay the entire loaned sum and also the rate of interest for the loan awarded by the economic agent;
- partnerships between universities and economic agents agreed for human resources formation common financing, may be also achieved in cooperation with local authorities and the rooms of commerce and industry in order to sustain local economy development;
- the state will continue to finance superior education (on the form of study subventions), because individual subvention doesn't have to substitute, but to add itself to superior education subventions from the state budget;
- encouragement of university research, as a source of innovation and education financing;
- contribution of enterprises on superior education institutions financing. This embraces two forms: research contracts, services provided, material conditions insurance for training stages, donations: a legally form (based on the example of Delaure Law, from France, which forces the enterprises with a high number of employees to direction a certain percent from the salary amount to the state, with the mention *adult permanent education*).

THE FLAT TAX – A COMPARATIVE STUDY OF THE EXISTING MODELS

Tulai Ioan Constantin

Faculty of Economics and Business Administration

Schiau (Macavei) Laura - Liana

Babeş Bolyai University Cluj-Napoca

Faculty of Economics and Business Administration

In the two last decades the flat tax systems have spread all around the globe from East and Central Europe to Asia and Central America. Many specialists consider this phenomenon a real fiscal revolution, but others see it as a mistake as long as the new systems are just a feint of the true flat tax designed by the famous Stanford University professors Robert Hall and Alvin Rabushka. In this context this paper tries to determine which of the existing flat tax systems resemble the true flat tax model by comparing and contrasting their main characteristics with the features of the model proposed by Hall and Rabushka. The research also underlines the common features and the differences between the existing models. The idea of this kind of study is not really new, others have done it but the comparison was limited to one country. For example Emil Kalchev from New Bulgarian University has asses the Bulgarian income system, by comparing it with the flat tax and concluding that taxation in Bulgaria is not simple, neutral and non-distortive. Our research is based on several case studies and on compare and contrast qualitative and quantitative methods. The study starts form the fiscal design drawn by the two American professors in the book “The Flat Tax”. Four main characteristics of the flat tax system were chosen in order to build the comparison: fiscal design, simplicity, avoidance of double taxation and uniformity of the tax rates. The jurisdictions chosen for the case study are countries all around the globe with fiscal systems which are considered flat tax systems.

The results obtained show that the fiscal design of Hong Kong is the only flat tax model which is built following an economic logic and not a legal sense, being in the same time a simple and transparent system. Others countries as Slovakia, Albania, Macedonia in Central and Eastern Europe fulfill the requirement regarding the uniformity of taxation. Other jurisdictions avoid the double taxation but they have several tax rates for different types of income. Analyzing the flat tax jurisdiction we concluded that none of the existing models is a true flat tax as designed by Hall and Rabushka.

The study is important given the fact that it can provide useful information for future studies in connecting the effects generated by the adoption of flat tax with the design of the system. This can give intelligence for the exiting models in correcting and improving their features in order to become more efficient. This can also provide precious design information for the jurisdictions desirous of implementing flat tax systems.

The added value of this paperwork consists in the determination of the main features of the existing flat tax systems in relation with the theoretical system designed by Hall and Rabushka and in the fact that it provides precious structured information for future studies allowing to connect the effects of the flat fiscal model with its characteristics.

Keywords: flat tax, simplicity, uniformity, rates

JEL Codes: H20, H24, H25

1. Introduction

Over the last two decades the flat tax became a real fiscal phenomenon. Many countries in transition, but also developed jurisdictions all over the world have adopted this system in order to give their economies an impetus.

Along with the idea of a flat tax have appeared the theories which advocate this system and also the theories which show that it does not represent a viable solution. The pro and cons of the flat tax system are not yet exhausted, theorists, practitioners, politicians and even journalists worldwide try to determine the social, fiscal and economic efficiency of this construction.

The debate over the flat tax is yet concentrated on rhetoric arguments and is based on assertion rather than analysis and evidences.

The present global economic crisis has brought to viewfinder the problem of finding fiscal solutions in order to overcome the social and economic negative effects of the crisis. With this occasion the flat tax system became an important spark discussion point. Some economists blamed the flat tax idea, trying to demonstrate that these systems represent one of the indirect, yet important, causes of the international economic crisis because of their character which generates inequities and social bias. More than that, some specialists consider the flat tax is the main cause of the financial problems in the Baltic region. Yet no country which adopted a flat tax, less Iceland, has given up this fiscal construction.

In the modern world there are no perfect fiscal systems, but improving the existing ones is goal for any jurisdiction. More over, it is well known that fair taxes are not efficient and efficient taxes are not fair. Although the recipe for the perfect taxing system was not found in terms of fairness and efficiency, our study tries to bring a small contribution to the diagnosis and improvement of the existing flat tax system.

The specific objectives of this research are:

- Determining the common elements and the differences between the existing flat tax models:
- Generating research assumptions which may represent the leading point for future research studies.

2. The Flat Tax of Hall and Rabushka

We began our research from the “Bible” of the flat tax, the book “The Flat Tax” written by Robert Hall and Alvin Rabushka in 1985. In this work the two American professors define the flat tax system by drawing its main features.

The flat tax is a very simple consumption tax system. Following not a legal sense, as other tax systems, but economic logic the integrated flat tax design is utmost simple – its two tax forms fits on postcards. The income is divided in two categories: individual wage tax, which includes wages, salaries and pensions, and business income which include all other types of income. The taxation for individual wage tax is made using a single form which fits a postcard:

Form 1		Individual Wage Tax		1998
Your first name and initial (if joint return, also give spouse's name and initial)		Last name		Your social security number
Present home address (number and street including apartment number or rural route)			Spouse's social security number	
City, town, or post office, state, and ZIP code			Your occupation™	
			Spouse's occupation™	
1	Wages and salary.....	1		
2	Pension and retirement benefits.....	2		
3	Total compensation (line 1 plus line 2).....	3		
4	Personal allowance			
	(a) <input type="checkbox"/> \$16,500 for married filing jointly.....	4(a)		
	(b) <input type="checkbox"/> \$9,500 for single.....	4(b)		
	(c) <input type="checkbox"/> \$14,000 for single head of household.....	4(c)		
5	Number of dependents, not including spouse.....	5		
6	Personal allowances for dependents (line 5 multiplied by \$4,500).....	6		
7	Total personal allowances (line 4 plus line 6).....	7		
8	Taxable compensation (line 3 less line 7, if positive; otherwise zero).....	8		
9	Tax (19% of line 8).....	9		
10	Tax withheld by employer.....	10		
11	Tax due (line 9 less line 10, if positive).....	11		
12	Refund due (line 10 less line 9, if positive).....	12		

Figure 1: Individual wage – tax form

Source: Hall and Rabushka 2007: 94

The business tax is a giant, comprehensive withholding tax on all types of personal income other than wages, salaries, and pensions, but the taxation is also made using a very simple form:

Form 2		Business Tax		1998
Business name		Employer identification number		
Street address		County		
City, state, and ZIP code		Principal product		
1	Gross revenue from sales.....	1		
2	Allowable costs			
	(a) Purchases of goods, services, and materials.....	2(a)		
	(b) Wages, salaries, and pensions.....	2(b)		
	(c) Purchases of capital equipment, structures, and land.....	2(c)		
3	Total allowable costs (sum of lines 2(a), 2(b), 2(c)).....	3		
4	Taxable income (line 1 less line 3).....	4		
5	Tax (19% of line 4).....	5		
6	Carry-forward from 1997.....	6		
7	Interest on carry-forward (6% of line 6).....	7		
8	Carry-forward into 1998 (line 6 plus line 7).....	8		
9	Tax due (line 5 less line 8, if positive).....	9		
10	Carry-forward to 1999 (line 8 less line 5, if positive).....	10		

Figure 2: Business wage – tax form

Source: Hall and Rabushka 2007: 94.

Another important feature of the flat tax defined by Hall and Rabushka is that it taxes once and only once all types of income.

The flat tax also means that business income and worker income are taxed at the same single tax rate.

3. Methodology

This paper represents a scientific approach focused on relevant case studies in the area of flat tax constructions research. This systemic and comparative research starts from the theoretical flat tax model designed by Robert Hall and Alvin Rabushka in 1985.

In the research process four main characteristics of the theoretical model are selected in order to build the comparison:

- simplicity;
- fiscal design;
- avoidance of double taxation;
- tax rates uniformity.

Through these characteristics, the similarities and the differences between the flat tax systems in different jurisdictions of the world are found. For a systemic approach the jurisdictions are analyzed grouped in regions. For each region were selected the most relevant cases for our research.

In the first place the flat tax systems from Asia are analyzed. For the comparison with the theoretical model was chosen Hang Kong, taking into consideration the age and the performances of this fiscal construction.

The flat tax systems from Eastern and Central Europe are also studied. The flat tax became a part of the fiscal landscape of the ex-communist countries since 1994 when Estonia adopted a flat tax. The idea spread rapidly, countries like Lithuania, Latvia, Russia, Serbia, Slovakia, Ukraine, Georgia, Romania, Albania, Macedonia, Monte Negro, Bulgaria, Czech Republic, Slovakia and Hungary have also adopted this type of system.

The issue regarding the flat tax is also studied for Western European Countries. The fiscal design of Guernsey and Jersey, two of the oldest flat tax systems in the world, are compared with the theoretical model. In Western Europe we find the first country in the world which gave up the flat tax construction.

The American continent has also some jurisdictions with flat tax systems: Paraguay and Jamaica.

4. Results

4.1 The Flat Tax in Asia

In Asia there are six countries which have a flat tax system: Hong Kong, Mongolia, Turkmenistan, Kyrgyzstan, Kazakhstan and Iraq. Hong Kong flat tax was adopted in 1947 and is one of the most efficient fiscal systems in the world taking into consideration the fact that the budget of this jurisdiction was on surplus for decades on a row.

Comparing the flat tax constructions of these countries with the model designed by Hall and Rabushka, some differences and similarities appear.

In terms of simplicity Hong Kong is the champion. The taxpayers declare their income once a year and there is no withholding tax so the each person, business or individual has to declare his or hers income.

In the other five countries the systems are not that simple, the fiscal tasks are more complex and appear more often.

The Hong Kong fiscal design resembles the design proposed by Hall and Rabushka. The treatment of the income in this Chinese jurisdiction follows an economic logic and not a legal sense, so that income is divided in wages income and business income. The other Asian states treat the different types of income from a judicial point of view.

Avoiding double taxation is an accomplished rule in Hong Kong as long as dividends and capital gains are not taxed.

Analyzing the tax rates in Hong Kong one can see that there is a difference of 1.5% between the tax rate used for taxing business income and the tax rate for wages, salaries and pensions. There is also an important legal foresight regarding the salaries under a certain ceiling: one can choose between a progressive taxation with rates ranging from 2% to 17% and a proportional taxation. But this progressive taxation can be interpreted as a system of allowances for the poorer taxpayers.

In Mongolia the taxation is made using a uniform rate for personal income and two tax rates for the profit. In Turkmenistan, Kyrgyzstan and Kazakhstan the uniformity of the rates is verified only for personal income.

4.2 The Flat Tax in Eastern and Central Europe

In the last two decades many of the ex-communist European countries have adopted flat tax systems. The first one was Estonia in 1994 and many others follow: Lithuania in 1995, Latvia in 1997, Russia in 2001, Serbia in 2003, Slovakia and Ukraine in 2004, Georgia and Romania in 2005, Macedonia and Montenegro in 2006, Czech Republic in 2007, Belarus, Albania and Bulgaria in 2008 and Hungary in 2011.

The fiscal design of the flat tax countries in Central and Eastern Europe is still a complex one. Unlike the flat tax, the separation of both taxation structures in all the countries of this region does not follow economic logic, but a legal sense, generating complications and double regulation of business income.

In terms of avoiding double taxation there are just a few countries like Slovakia and Serbia that comply with this rule. The other countries in the region tax dividends and/or capital gains, generating double taxation. This is the case of the Czech Republic, Bulgaria, Romania, Belarus, Montenegro, Macedonia and many others.

The uniformity of the tax rates is the most important feature of a flat tax system. This characteristic is accomplished by Estonia, Slovakia, Albania, Macedonia, and Montenegro.

4.3 The Flat Tax in Western Europe

Western Europe remains an impenetrable redoubt for the flat tax. The only two jurisdictions in this region which have adopted a flat tax system are Guernsey and Jersey, also known as the Channel Islands.

The fiscal systems from the two islands are relatively simple. Their simplicity comes from the uniformity of the tax rates used for all kinds of income, but the declaration procedure is classic.

The fiscal treatment of the revenues is made by classifying the income using classic legal principles and not economic rules. For example in Guernsey the income is divided into wages and salaries, dividends, interests, income of sole proprietors and corporate income.

Double taxation is a reality in these jurisdictions, as income from dividend is taxed both in Guernsey and Jersey.

Taxing in the Channel Islands is made uniformly. There is an exception in Jersey where the income of the companies from the financial sector is taxed with a rate of 10%, while all the other types of income are taxed with 20%.

4.4 The Flat Tax on the American Continent

There are two major countries in Central and South America which have embraced the flat tax idea: Paraguay and Jamaica. Until 2010 in Paraguay the personal income was not taxed. Starting 1st January 2010 the personal income is taxed with a rate of 10%, the same tax rate used for corporate income.

Jamaica adopted a flat tax in 1986. In 2010 Jamaica introduced a progressive taxing system for personal income, but the authorities from this state readopted a fat tax in March 2011.

The Jamaican and the Paraguayan fiscal systems are far from resembling the flat tax system designed by Hall and Rabushka. These systems are not simple; their complexity is being reflected by the diversity of tax rates used for imposing different types of income. The rule regarding the avoidance of double taxation is violated by taxing the dividends in both countries. The classification of the revenues in these American jurisdictions is made following a legal logic and not an economic sense.

5. Conclusions

Analyzing the flat tax systems by comparing and contrasting them with the fiscal model designed by Hall and Rabushka, we obtained some interesting results.

The comparative study shows that the differences between the theoretical flat tax model and the existing flat tax constructions are the rule, whereas similarities are rather the exception.

The fiscal constructions became simpler by adopting the flat tax, especially because the rates become uniform for the all types of income and the taxing procedure is easier to perform. But none of the flat tax jurisdictions analyzed is as simple as the theoretical model.

The general design of the flat tax systems in Europe, Asia and America is based on legal principles and not on economic fundamentals as the flat tax of Hall and Rabushka. The exception is represented by the Hong Kong flat tax model, which is the only fiscal construction in the world following an economic logic.

Some countries have uniform tax rates for all types of income, but others use flat rates only for personal income.

Avoiding double taxation is a principle often violated by the majority of the flat tax countries, excepting Hong Kong and a few jurisdictions from Europe.

All in all we can conclude that there is no fiscal construction in the world which goes all the way with the theoretical model design by the two famous American professors. Yet the system that resembles the most the theoretical construction is the one of Hong Kong. But the questions that remain are which of the existing models are the most efficient ones and which are their characteristics generating the desired economic and social effects.

SUB-SECTION: BANKING

COMPETITION IN ROMANIAN BANKING SECTOR

Andrieş Alin Marius

„Alexandru Ioan Cuza” University of Iasi, Faculty of Economics and Business Administration

Căpraru Bogdan

„Alexandru Ioan Cuza” University of Iasi, Faculty of Economics and Business Administration

Recent turmoil in the global financial system has impacted severely on the banking sector with many banks suffering large losses and necessitating the need to raise additional capital privately or through their respective national governments. In our study we investigate the impact of structural reforms performed throughout the European Union (EU) accession process on competition and contestability of banking systems in Romania.

The literature of the measurement of competition can be divided into two major approaches: structural and non-structural. The structural approach to the assessment of competition embraces the „Structure-Conduct-Performance Hypothesis” (SCP) and the „Efficient Structure Hypothesis” (ESH). The structural approach, as the name suggests, assesses bank competition by examining measures of market structure such as concentration ratios (the share of assets held by the top 3 or 5 institutions) or indices (e.g., the Herfindhal-Hirschman index) and supposes that higher concentration in the banking market causes less competitive bank conduct and leads to higher bank profitability. The SCP model is originally developed by Bain (1956). The second approach, ESH, developed by Demsetz (1973) and Peltzmann (1977) suggests that the superior performance of the market leaders determines the market structure, implying that higher efficiency produces both higher concentration and greater profitability. The non-structural indicators of competition are mainly based on the measures of monopoly power developed by Lerner (1934). The Lerner Index suggests the mark-up of price over marginal cost. An alternative non-structural indicator of the degree of market competition is the Panzar and Rosse (1987) H-statistic. The H-statistic measures the extent to which changes in banking costs are reflected in changes in banking revenues.

In order to examine the level of competition and market power of banks in Romania for period 2003 – 2009, we estimate the non-structural indicators and compare it with the structural indicators of competition.

In particular, we measure competition using Lerner index and the H-statistic, indicators what are estimated using bank-level data and are compared with a standard market structure measure of concentration like HHI and CR5. There are no other studies that measure both structural and non-structural competition indicators for Romanian banking sector. Also, our assessment contains a period of seven years including the begging of the implications of the present international financial crises on Romanian banking sector.

The structural indicators show continuous increase of competition in the Romanian banking system. Lerner index and H statistic demonstrate that Romanian banking system is characterized by monopolistic competition and relatively competitive practices. Personnel cost, operational cost and financial cost are statistically significant at conventional levels, which imply good fit of the revenue equations. The results also demonstrate that excess fixed assets do not generate abnormal revenue.

Keywords: bank competition, Lerner index, H statistic, structural indicators, Romanian banking system

JEL classification: G21; L11

1. Introduction

In recent years due to reform process, what involved an ample process of liberalization, privatization and recapitalization of the banking sector, the analysis of the competition of banking sectors in transition countries from Central and Eastern European countries has received much consideration. In our study we investigate the impact of structural reforms performed throughout the European Union (EU) accession process on competition and contestability of banking systems in Romania. Recent turmoil in the global financial system has impacted severely on the banking sector with many banks suffering large losses and necessitating the need to raise additional capital privately or through their respective national governments. The failure of investors, depositors, and supervisors to appropriately discipline banks have led academics and policy-makers to re-consider the links between bank performance, risk and changes in the competitive environment. Moreover, in recent years, indicators of banking competition had been used by researchers to explain performance and risk differentials across banks.

2. Literature review

The literature of the measurement of competition can be divided into two major approaches: structural and non-structural. The structural approach to the assessment of competition embraces the „Structure-Conduct-Performance Hypothesis” (SCP) and the „Efficient Structure Hypothesis” (ESH). The structural approach, as the name suggests, assesses bank competition by examining measures of market structure such as concentration ratios (the share of assets held by the top 3 or 5 institutions) or indices (e.g., the Herfindhal-Hirschman index) and supposes that higher concentration in the banking market causes less competitive bank conduct and leads to higher bank profitability. The SCP model is originally developed by Bain (1956).

The second approach, ESH, developed by Demsetz (1973) and Peltzmann (1977) suggests that the superior performance of the market leaders determines the market structure, implying that higher efficiency produces both higher concentration and greater profitability. "Non-structural models" do not infer the competitive conduct of banks through the analysis of market structure. The New Empirical Industrial Organization approach rather recognizes that banks behave differently depending on the market structure in which they operate. The non-structural indicators of competition are mainly based on the measures of monopoly power developed by Lerner (1934). The Lerner Index suggests the mark-up of price over marginal cost. The higher the mark-up, the greater is the realized market power. There are a broad range of studies that use the Lerner index like Angelini. and Cetorelli (1999), Padoa-Schioppa (2001), Carbo et al., 2003, Maudos and Perez (2003), Toolsema (2003), Fernandez de Guevara and Maudos (2004), Carbo et al. (2005), Carbo´ et al. (2006); Humphrey et al. (2006), Fernandez de Guevara et al. (2007); Carbo and Rodriguez (2007), Maudos and Fernandez de Guevara (2007), Carbó et al. (2009). A number of studies have used the Lerner index to try to determine the trend in competitive behavior over time.

An alternative non-structural indicator of the degree of market competition is the Panzar and Rosse (1987) H-statistic. The H-statistic measures the extent to which changes in banking costs are reflected in changes in banking revenues. It is calculated as the sum of the ratios of the percentage change in total revenue (from all sources) to the percentage change in the three input prices (funding, labour and capital costs), holding constant total banking output (total assets), leverage, and two balance sheet composition variables (loans to assets and deposits to total liabilities). There are a various studies using H-statistic measures. Some of them examine competition on European countries like those of Shaffer (1993), Molyneux et al. (1994), Bikker and Groeneveld (2000), De Bandt and Davis (2000), Weill (2003), Boutillier et al. (2004), and Koutsomanoli-Fillipaki and Staikouras (2004), Carbó et al. (2009). Claessens and Laeven (2004), Bikker and Haaf (2002) assessed competition using H-statistic for a sample of different countries,

including European ones. There are also individual country studies: for Germany – Hempell (2002), Gischer and Stiele (2008), for Italy – Coccorese (2004), for Greece – Hondroyiannis et al. (1999), Coccorese (2005), for Spain – Maudos and Perez (2003), Carbo et al. (2003), for Finland – Vesala (1995), for Canada – Nathan and Neave (1989), for Japan – Molyneux et al (1996).

3. Methodology and data used

The purpose of this study is to analyze the competitive conditions in the banking sector of Romania, in light of the reforms implemented in this country and the immense changes in Romanian banking system using bank-level data. There are no other studies that measure both structural and non-structural indicators for Romanian banking competition.

In order to examine the level of competition and market power of banks in Romania for period 2003 – 2009, we estimate the non-structural indicators and compare it with the structural indicators of competition. In particular, we measure competition using Lerner index and the H-statistic, indicators what are estimated using bank-level data and are compared with a standard market structure measure of concentration like HHI and CR5.

We estimate the degree of bank market power using bank-level data, the approach followed is similar to that of Maudos and de Guevara (2007) and Delis and Tsionas (2009) who defined the Lerner index as:

$$L_{it} = (p_{it} - mc_{it}) / p_{it} \quad (1)$$

where p is the price of total assets computed as the ratio of total revenue to total assets; mc is the marginal cost of total assets. In particular, we opt for a modeling framework that allows mc to differ across banks and time, using a non-parametric technique to estimate observation-specific marginal costs from a cost function. In particular, here we resort to the estimation of the following Cobb-Douglas cost function:

$$\ln c_{it} = a_0 + a_1 \ln q_{it} + a_2 \ln d_{it} + a_3 \ln w_{it} + \varepsilon_{it} \quad (2)$$

where c is the total cost of bank i at time t , q is bank output (measured by total assets), d is the value of bank deposits, w are the prices of inputs and e is a stochastic disturbance. This cost function assumes that banks use inputs and deposits to produce output q (for a similar implementation, see e.g. Uchida and Tsutsui: 2005; Brissimis et al.: 2008). The marginal cost of bank output is simply a_1 .

In the case of perfect competition, $L=0$; under pure monopoly, $L = 1$; for monopolistic competition L ranges between 0 and 1; and $L < 0$, implies pricing below marginal cost and could result, for example, from a non-optimizing behavior of banks.

In our application of the Panzar–Rosse approach, the following equation is estimated to assess the H statistic from a panel dataset of banks from Romania for period 2003 – 2009:

$$\log\left(\frac{R_{it}}{TA_{it}}\right) = \alpha_0 + \sum_{k=1}^K \alpha_k \log \omega_{it}^k + x_{it} \beta + \varepsilon_{it} \quad (3)$$

where R is the revenue; TA is the total assets; w_k is the unit price of input k ; x is a vector of control variables; ε is the disturbance term; i and t denote bank and time respectively. The H statistic is the sum of α_1 to α_k in this specification.

Panzar and Rosse (1987) showed that the H statistic indicates the nature of market structure under following assumptions: a) banks are profit maximizing; b) banks produce revenue using labour, capital and intermediated funds as inputs; c) higher input prices are not associated with higher quality services that generate higher revenue.

For accurate identification of the H-statistic using an estimated revenue equation based on a static equilibrium model, it is necessary to assume that markets are in long-run equilibrium at each point in time when the data are observed. Accordingly, the equilibrium profit rate should be uncorrelated with the factor input prices. To test of the market equilibrium assumption we estimated in addition following equation:

$$\log(1 + R_{it}) = \alpha_0 + \sum_{k=1}^K \alpha_k \log \omega_{it}^k + \beta x_{it} + \beta_{TA} \log TA_{it} + \varepsilon_{it} \quad (4)$$

with the variable TA controlled as an explanatory variable.

The estimated value of H statistic ranges between $-\infty$ and 1. H statistic is smaller than 0 if the underlying market is monopoly, it ranges between 0 and 1 for monopolistic competition and an H statistic of unity indicates perfect competition.

In order to estimate the non-structural indicators of competition we used the following set of data: a) inputs: personnel expenses, fixed assets and financial capital (sum of total deposits, total money market funding, total other funding and equity); input prices: total personnel expenses over total assets, other operating expenses over fixed assets and interest expenses over financial capital; control microeconomic variables: total capital ratio, equity to total assets ratio, credit risk measured as ratio of loan-loss provisions to total loans (LLR_GL), liquidity risk measured as ratio of liquid assets to total deposits and borrowing funds (LA_TD); and control macroeconomic variables: GDP growth rate – Growth in real GDP in per cent (GDP_G), Inflation rate - change in annual average retail/consumer price level in per cent (IR), Level of financial intermediation – domestic credit provided by banking sector percentage of GDP (FIN_INT).

The empirical model specified in equation is estimated using the panel least square fixed effects methodology. A second set of models is estimated, GMM data models, to allow comparison of results, and as a robustness check. The models are estimated on a panel of 24 commercial banks from Romania for 2003 – 2009 period.

4. The results of the research

The most common structural measures of competition and concentration are the Herfindahl-Hirschman Index (HHI) and the n-bank concentration ratio (CRn). The HHI is defined as the sum of squared market share of the banks in the market. The upper bound of the HHI is 10.000, which indicates a monopoly, and the lower bound is 0 in the situation of an infinite number of banks. A market with a result of less than 1.000 is a competitive marketplace, a result of 1.000 – 1.800 indicates a moderately concentrated marketplace and a result of 1.800 or greater indicates a concentrated marketplace. The n-bank concentration ratio (CRn) is calculated as the percentage of the market controlled by the top n banks in the market, usually the first three or five banks, and the measure takes the share of deposit, loans or assets.

Table 1 Structural indicators of competition in the Romanian banking system for 2003 – 2009 period by year

Year	Herfindahl Index for credit institutions	Share of total assets of the five largest credit institutions	Number of credit institutions	Number of local units (branches)	Number of branches of credit institutions from EU countries
2003	1251	55.2	39	3387	7
2004	1111	59.5	40	3031	6
2005	1115	59.4	40	3533	5
2006	1165	60.1	39	4470	6
2007	1041	56.3	42	6340	10
2008	922	54	43	7375	10
2009	857	52.4	42	6425	10

As we can see in the Table 1, the concentration of the Romanian banking system has been decreasing continuously from 2003 to 2009. This means that the competition in the Romanian

banking system has increased yearly, especially due to diminishing of the state capital and entering of foreign capital.

Table 2 Non - structural indicators of competition in the Romanian banking system for 2003 – 2009

Model	OLS	GMM
<i>Lerner index</i>		
Lerner index	0.908022*** (0.044363)	0.842283*** (0.078149)
<i>H statistic</i>		
Personnel cost	0.357857*** (0.020786)	0.455813*** (0.107588)
Operational cost	0.033020*** (0.011901)	0.038437 (0.074553)
Financial cost	0.313549*** (0.019461)	0.445536*** (0.087971)
H statistic	0.704426	0.939786

Note: Standard deviations are presented between brackets.

*, **, *** indicates significance levels at 10%, 5% and 1%

Table 2 reports the estimates obtained from applying the methodology described above to the Romanian banking sector. Most of the input prices reported in Table 2 are statistically significant at conventional levels, which imply good fit of the revenue equations.

The both results, Lerner index and H statistic, show that Romanian banking system is characterized by monopolistic competition and relatively competitive practices.

The price of fixed assets contributes less to the equation for the H-statistic than the rest of the input prices, result in line with the literature (see Molyneux et al. 1994 and Bikker and Haaf 2002) and it means that excess fixed assets does not generate abnormal revenue.

Finally, we test for long-run equilibrium using ROA as the dependent variable as discussed above. The result (i.e. $H_n=0$) suggests that the hypothesis of equilibrium is confirmed for Romanian banking systems.

5. Conclusion

As the structural indicators show, the concentration of the Romanian banking system has been decreasing continuously from 2003 to 2009. This means that the competition in the Romanian banking system has increased yearly, especially due to diminishing of the state capital and entering of foreign capital. The Romania' accession to European Union had an active effect on these trends. The both results, Lerner index and H statistic, show that Romanian banking system is characterized by monopolistic competition and relatively competitive practices. Personnel cost, operational cost and financial cost are statistically significant at conventional levels, which imply good fit of the revenue equations. The results also demonstrate that excess fixed assets do not generate abnormal revenue. Even if some banks have extended their network aggressively for a bigger share of market, they do not account larger revenues yet. Personnel cost and financial cost higher contributions to the equation for the H-statistic comparative with operational costs could be explained by a intense competition in recruiting and maintaining the personnel (due to head hunting and personnel migration) and a high cost of financial resources, due to high cost with the minimum reserve requirements and the using of parental undertakings financing as a form of profits repatriation.

VALUE AT RISK - CORPORATE RISK MEASUREMENT

Aniș Cecilia-Nicoleta

Roth Anne-Marie

West University Timișoara Faculty of Economics and Business Administration

Apolzan (Angyal) Carmen-Maria

West University Timișoara Faculty of Economics and Business Administration

The notion of "risk" is used in a number of sciences. The Faculty of Law studies the risk depending on its legality. The Accident Theory applies this term to describe the damage and the disasters. One can find studies on the risks in the works of psychology, philosophy, medicine and within each of these areas the study of the risk is based on the given science subject and, of course, on their methods and approaches. Such a variety of risk study is explained by the diversity of this phenomenon.

Under the market economy conditions, the risk is an essential component of any economic agent management policy, of the approach developed by this one, a strategy that depends almost entirely on individual ability and capacity to anticipate his evolution and to exploit his opportunities, assuming a so-called "risk of business failure."

There are several ways to measure the risks in projects, one of the most used methods to measure this being the Value at Risk (VaR).

Value at Risk (VaR) was made famous by JP Morgan in the mid 1990s, by introducing the RiskMetrics approach, and hence, by far, has been sanctioned by several Governing Bodies throughout the world bank. In short, it measures the value of risk capital stocks in a given period at a certain probability of loss. This measurement can be modified for risk applications through, for example, the potential loss values affirmation in a certain amount of time during the economic life of the project- clearly, a project with a lower VaR is better.

It should be noted that it is not always possible or advisable for a company to limit itself to the remote analysis of each risk because the risks and their effects are interdependent and constitute a system. In addition, there are risks which, in combination with other risks, tend to produce effects which they would not have caused by themselves and risks that tend to offset and even cancel each other out.

Keywords: risk, value at risk, confidence intervals, variance, Monte Carlo simulation;

JEL Classification: M21, G30, C58;

1. Introduction

There are several ways to measure the risks in projects. These include:

- *The Probability of Occurrence.* This approach is simplistic, yet effective. As an example, there is a 10 percent probability that a project may even fail (it will restore a negative net present value indicating losses) within the next five years. Moreover, suppose two similar projects have identical implementation costs and expected returns. Based on a single-point evaluation, managing between them would be insignificant. However, if the risk analysis such as Monte Carlo simulation is carried out, the first project might indicate a 70 percent loss probability compared to only a 5 percent probability of loss of on the second project. Clearly, the second project is better when the risks are assessed.

- *Standard Deviation and Variation.* Standard Deviation is a measure of the average deviation of each data point from the mean value. This is the most popular measure of risk, where a higher standard deviation implies a wider distributional width and therefore carries a higher risk. The drawback of this measure is that both upside and downside variations are included in calculating the standard deviation. Some analysts define the risk as the potential losses or downside; thus, the standard deviation and variance will penalize both the upsides and the downsides (disadvantages).

- *Semi-Standard Deviation.* The semi-standard deviation only measures the standard deviation of risks and ignores the upside fluctuations. Modifications of the semi-standard deviation include calculating only the values below the mean or values below a threshold (e.g., negative profits or negative cash flows). This provides a better picture of the risk, but is more difficult to estimate.

- *Volatility.* The concept of volatility (change) is widely used in the applications of real options and can be briefly defined as a measure of uncertainty and risks. Volatility can be estimated using several methods, including simulation of the uncertain variables impacting a given project and estimating the standard deviation of the yields logarithmic asset over time. This concept is more difficult to define and estimate, but is more powerful than most other risk measures in that this single value includes all sources of uncertainty contained in a single value.

- *Beta.* Beta is another common measure of risk in the investment finance arena. Beta can be defined simply as the systematic market risk of a financial asset. This concept is made famous through the CAPM, where a higher beta means higher risk, which in turn requires a higher expected return on the asset.

- *Coefficient of Variation.* The coefficient of variation is simply defined as the ratio of standard deviation to the mean, which means that the risks are common-sized. For example, the distribution of a group of students' heights (measured in meters) can be compared to the distribution of students' weights (measured in kilograms). This measure of risk or dispersion is applied when the variables' estimates, measures, magnitudes, or units differ.

- *Value at Risk.* Value Risk (VaR) was made famous by JP Morgan in the mid-1990s through introducing the RiskMetrics approach, and has thus far been sanctioned by several bank governing bodies around the world. In short, it measures the amount of risk capital stocks in a given period at a particular probability of loss. This measurement can be modified to risk applications by stating, for example, the amount of potential losses a certain percent of the time during the economic life of the project- clearly, a project with a smaller VaR is better.

- *Worst-Case Scenario and Regret.* Another simple measure is the value of the worst-case scenario and catastrophic losses. Another definition is regret. That is, if a decision is made to pursue a particular project, but if the project becomes unprofitable and suffers a loss, the level of regret is simply the difference between the actual losses compared to doing nothing at all.

- *Risk-Adjusted Return on Capital.* Risk-adjusted return on capital (RAROC) is the ratio of the difference between the 50th percentile (median) return and the 5th percentile return on a project's standard deviation. This approach is used mostly by banks to assess profitability at risk by measuring only the potential negative effects and ignoring the positive gains.

In 1994 it appeared within the JP Morgan's the RiskMetrics department, led by Till Guldemann, specialized only on the risk study and analysis. The risk measure chosen by RiskMetrics was the value at risk (VaR). RiskMetrics separated from the the parent company in 1998 and became RiskMetrics Group, specialized on consulting and software. The success of the value at risk was also due to the importance attributed to it within The Group of 30 (G-30) Report (1993) and in the 1996 Amendment of the Basel Agreement, which recommends that central banks use VaR to determine the required minimum capital of commercial banks to cover their market risk to which it is exposed.

As a general definition, VaR is the maximum level of loss generated by a specific portfolio structure estimated at a certain degree of trust over a reference period. The main elements of this methodology focus on:

- the period of analysis - it is associated with holding the portfolio horizon or time required to sell it. The typical VaR application periods are from one day to one year (e.g., a 10-day period of analysis is required to compute the capital adequacy of financial intermediaries in accordance with The Basel II Capital Accord, while a period of one year may be used to estimate the credit risk);
- confidence interval – is the interval in which the VaR is expected not to exceed the maximum level of loss. Usually, the intervals used are 99% and 95% respectively.
- expressing VaR level – it is usually measured in monetary units.

2. The methodology for calculating value at risk

Value at risk meets quite several criteria. In relation to the ADEH axioms it satisfies the monotonicity axiom, positive homogeneity and the translation invariance. In addition, it also has the additivity property.

As main disadvantage, VaR does not present the sub-additivity property and thus, there is not a coherent risk measure in the general case. However, for special classes of distribution VaR is consistent, for example, for the normal distributions class.

Let z be the reference level with which the portfolio value is compared to at the end of time horizon considered. If $x < z$, then there is a loss of $z - x$. So, the portfolio loss is given by the random variable:

$$\tilde{l} = z - \tilde{x} \quad (1)$$

As reference levels can be used the x_0 baseline and $E(\tilde{x})$ the expected value. The probability of a loss less than or equal to l is given by the distribution function:

$$F_{\tilde{l}}(l) = P(\tilde{l} \leq l) = \int_{-\infty}^l f_{\tilde{l}}(t) dt \quad (2)$$

Using the loss distribution $F_{\tilde{l}}$ for a given time horizon and a particular confidence level $1 - \alpha$, we get the equation:

$$F_{\tilde{l}}(\text{VaR}) = P(\tilde{l} \leq \text{VaR}) = 1 - \alpha \quad (3)$$

Applying the inverse function $F_{\tilde{l}}^{-1}$ to the above equation we get a value at risk:

$$\text{VaR} = F_{\tilde{l}}^{-1}(1 - \alpha) \quad (4)$$

Interpreting the value at risk as the capital required to face the risk, figure(4) implies that in $100(1 - \alpha)\%$ cases, this capital will not be exhausted. Applying the concept of value at risk to $L - E(L)$ instead of L , we obtain a risk measure of the first type.

Another option for this risk measure is the conditional value at risk at confidence level α defined as:

$$\text{CVAR}_{\alpha}(L) = E[L \mid L > \text{VaR}_{\alpha}] \quad (5)$$

On the interpretation of VaR as 100 (1- α)% from the maximum loss, CVaR can be interpreted as the average maximum loss in 100% α of cases. Conditional Value at Risk defined in figure (7) is a coherent risk measure if there is a density function, but not in general. In the general case, be considered alternative measures of risk such as the expected discovery or other equivalents, when consistency is required.

Conditional value at risk allows the decomposition:

$$\text{CVAR}_\alpha(L) = \text{VAR}_\alpha(L) + E[L - \text{VaR}_\alpha \mid L > \text{VaR}_\alpha] \quad (6)$$

meaning the conditional value at risk is the sum of value at risk and the average excess value at risk if such an excess exists. So, the conditional value at risk will be at least as high as the value at risk.

3. Models for estimating the value at risk

There are a variety of methods that allow estimating VaR. Within these we can distinguish:

1. Delta-normal method (variance - covariance) implies that the variations occurring in the risk factors are always normally distributed and that variations in the portfolio value are linearly dependent on the variations of all risk factors.
2. Historical Simulation Method assumes that all the future variations will have the same distribution that they had during the previous periods;
3. Monte Carlo Simulation Method in which the variations are simulated in a (pseudo) random way.

1. The Variance-Covariance method was popularized by JP Morgan Chase in the early '90s in their own RiskMetric methodology. A simplified version of it can be built on the assumption that the only risk factor for the portfolio is induced by the variations occurring in the value of its component assets. In this situation there are the following assumptions:

The portfolio is composed of linear delta values, meaning the modifications in portfolio values (and within its returns) are linearly dependent on all the individual modifications in the assets values included in its structure;

a. The variations occurred in the portfolio assets value are normally distributed.

Based on the two assumptions, we can state that the portfolio return is normally distributed because a linear combination of normally distributed variables has itself a normal distribution.

One can make the following notations:

i - the yield on individual asset "i", an yield based exclusively on its value variation ;

ρ - the yield on the portfolio (its value variation);

N - the number of the assets in the portfolio;

μ - the expected value (average);

σ - the standard deviation;

V - the initial value (in monetary units);

$\omega_i - \frac{V_i}{V_p}$ - initial allocation of capital asset "i";

$\bar{\omega}$ - the vector of all variables ω_i ; ω^T , it is the transpose of the vector;

Σ - covariance matrix between the returns of N assets ($N \times N$ matrix);

All the assets are held throughout the period of analysis.

$$\mu_p = \sum_{i=1}^N \omega_i \mu_i \quad (7)$$

$$\sigma_p = \sqrt{\omega^T \Sigma \omega} \quad (8)$$

The main advantage of this method lies in its "compact" nature that facilitates the empirical implementation and the main disadvantage is the less plausible character of the assumption regarding the normality of the individual values modifications and of the portfolio overall value. The Historical Simulation Method is the simplest and the most transparent method of calculation. This method involves simulating a current structure portfolio based on historical data with emphasis on the distribution in its yield and the computing of a percentile. Its main advantage is that it does not require the recourse to the normal distribution assumption and the disadvantage in its empirical application being the high computational and informational requirements.

1. Conceptually, Monte Carlo Method is relatively simple, but involves a higher simulation effort than the previous methods. This method involves:

- determining the total number of iterations of the simulation N;
- for each iteration:
 - the generation of a (pseudo) random script regarding the price developments;
 - reassessing the portfolio on the basis of this scenario;
 - computing the global profit / loss per portfolio as a difference between the market current value and the calculated value in the previous stage;
- the estimation of the simulated profit / loss distribution;
- VaR for a confidence interval is calculated as a percentile.

The method is useful for estimating the VaR in case of financial asset portfolios incorporating non-linear returns.

4. Conclusions

Value at risk is one of the most modern techniques used in measuring the risks. VaR was originally used for measuring the market risks. However, the literature emphasizes that the VAR is now increasingly used for measuring other risk categories. This is due to explicit recognition of the need for an integrated risk management. In this case, the risks management focused on the financial risks will cause the financial risks to "slide" in those areas where they are not measured (Jorion, P., 2000:467).

However, extending the use of VaR has its challenges. A major difficulty is given through data availability. VaR was first used to measure the market risk of some financial institutions. In this case, VAR is simple to calculate, with high frequency data, in many cases even daily. For other categories of risks (e.g. business) or for companies working in other sectors, data availability is a problem. In most cases there are low frequency data. Using the annual frequency data would result in a VaR that for a 99% confidence interval means the maximum expected loss in one year of a hundred years. The interpretation of this result is of little relevance given the period considered plus it would take 100 years many times to validate the results, which is impossible in practice (Stulz, R., 1996:21). The second limit of VaR consists in the assumption of a normal distribution of potential gains and losses. The literature emphasizes that in reality the losses tend to be higher than those suggested by a normal distribution. Therefore, using VaR tends to underestimate the risks a company faces. Another limit concerns defining the VaR risks. VaR identifies the maximum loss that can occur with a certain probability. But a company is more interested in the cumulative loss that can occur within one year because just the cumulation of the losses for a year may result in a difficult financial situation.

The literature suggests an alternative to VaR using Monte Carlo simulation for forecasting the cash flows over a period taking into account the risks the company faces. The probability of a negative financial situation would be measured by the proportion of distributions for which the cash flow is below a set threshold. Such a technique can also be used to estimate the impact of different hedging strategies have on the probability of a negative financial situations. In addition,

such a technique would address non - normal data and other issues specific to chronological series (mainly autocorrelations), although the latter can be solved by other specific techniques.

MEASURING THE RISK OF BANKRUPTCY IN THE COMMERCIAL SECTOR IN ROMANIA

Bătrâncea Larissa

Faculty of Business Babeş-Bolyai University, Cluj-Napoca, România

In this paper, the author presents ways to evaluate the rating of commercial entities based on logit model. On this basis were determined the ranges of financial security and was set the probability of failure of these firms in Romania.

Keywords: rating, financial ratios, rating models

JEL Classification: G32

1. Introduction

Managerial or financial analysis methods of risk allow measuring past performance of the company, informing at a small extent on its future. Financial results can degrade very quickly over time. The need for more specific information about the future, about the risk of failure becomes increasingly obvious.

As a response to these practical requirements, the risk of failure diagnosis has undergone a significant development due to the use of statistical methods for analyzing the financial situation from a set of rates.

2. Knowledge Level

“Credit scoring” method aims to provide predictive models for assessing risk of failure of an enterprise. This method is based on statistical techniques of discriminant analysis of information provided by the transformation of economic and financial indicators in a score able to predict success or failure of a business.

All forecasts and predictions are based on published financial statements. Applying “credit scoring” method involves observing a set of enterprises consisting of two distinct groups: a group of enterprises with financial difficulties and a group of healthy firms. For each of the two groups is established a set of rates (5-8 financial ratios), the most relevant in terms of predictability of failure, then it’s determined the best linear combination of rates to distinguish the two groups of firms. In the failure prediction models are met the most important financial ratios such as return on assets, asset turnover rate, leverage, liquidity, interest coverage, etc.

Following the application of discriminant analysis, for each company is obtained a “Z” score, linear function of a set of rates. The obtained scoring function allows the issuance of a value judgment which estimates the likelihood of risk occurrence in the analyzed firms, allowing distinguishing the healthy firms from the ones in difficulty.

“Z” score assigned to each company is determined by the function:

$$Z = a x_1 + a x_2 + \dots + a x_n$$

(1)

where:

Z – score function;

x – represents the rates involved in the analysis;

a – is the weighting coefficient of each rate.

In an extensive research study, William H. Beaver used financial indices that are used to avoid failure. The study contains a sample of 79 relatively well-capitalized firms that went failed. For each of these firms another company which didn't go failed was selected, but which was part of that economic segment, and had approximately the same size as those that failed, in the same time period. These samples were used to test the capacity of 30 financial ratios. Average values of the indices for the two samples (failed firms and non-failed firms) were compared over a period of five years before the failure took place. An example of such a comparison, using cash flow/total debt indices is shown in the following figure (Fig. no.1). It may be noted that the average index of firms that failed differs significantly from that of firms that didn't fail.

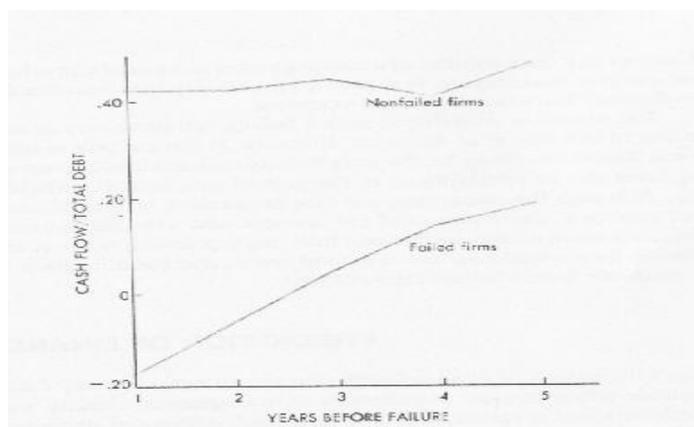

Figure no.1. Comparison between failed firms and non-failed ones

In addition to comparing average values, Beaver tested the samples, using multiple discriminant method and continued his investigations analyzing the samples using probability indices. Not all examined financial ratios predicted failure as good as others; many rates have shown a great power of prediction. In an article about comparison, Beaver investigated the ability to predict the failure in changes in stock market share prices of these companies. He established that the median price of the market shares of failed firms dropped more and more as it was closer to failure, compared to prices of the companies which didn't fail. The largest price decrease for bankrupt firms' shares took place in the final year of research. Beaver concludes that investors adjust the share price to the deterioration condition of the financial situation of companies that fail. Moreover, he identified the causes to be consistent with investors, to assess the probability of failure on the basis of financial indices.

In a similar study, Edward I. Altman went through multiple comparative analyses to prevent failure, using various financial ratios. Altman worked with a sample of 33 corporations that went bankrupt during the period 1946-1965. Like Beaver, he gathered a couple of samples of 33 companies that didn't fail, randomly chosen. He started with 22 financial indicators, selected five of them who have made a good distinction between failed firms and non-failed ones using information dating 5 years back before failure. Unsurprisingly, the prediction accuracy of the model of multiple differences decreased with the number of years before bankruptcy. However, the model could foresee failure quite quickly, up to two years before bankruptcy occurred. Altman also tested the model with a second standard of samples of non-bankrupt or bankrupt companies. Using estimative parameters derived from the original sample, he found that the model presents accurate predictions when it is used in conjunction with the second standard of samples. In Altman's investigation, like Beaver, it was established that the bankrupt firms' financial indicators have deteriorated near bankruptcy, the largest damage occurred between the

third and second year. Altman concludes that because of analysis of differences, a creditor may successfully predict a potential bankruptcy.

In a similar study with those of Altman's and Beaver's, Edward B. Deakin used two types of samples of 32 failed and non-failed companies during the years 1964-1970. Using multiple discriminant analysis based on 14 indicators, he found that bankruptcy can be predicted with great precision accuracy even three years before bankruptcy occurs. In essence, Deakin confirmed the hypothesis formulated in Beaver's method and found that multiple discriminant analysis has generated more accurate results.

Worldwide, more models of prediction of success / failure of business are therefore known and we will address the following, namely: Altman Model (1968 and 1983); Springate Model (1978); Conan&Holder Model; Chartered Accountants Model (CA Score – 1987); Fulmer Model (1984); Yves Collongues (1) and Yves Collongues (2) Models etc. All these models were built based on the analysis of a given sample of bankrupt companies and profitable for an extended period of time in which the authors of the models have studied the evolution of their results. Characteristic of all models is that they are meant to predict bankruptcy for a particular type of business in terms of size and profile of activity.

Score function values are compared with certain threshold levels, the uncertainty area being located within the two limits. The higher the score function values are, the more competitive the company is, with a good financial position and a low probability of bankruptcy. Thus, in the Altman model Z score is interpreted as follows: $Z \leq 1.8$ – bankruptcy is imminent; $Z > 3$ – good financial standing; $1.8 < Z \leq 3$ difficult financial situations, with relatively high risk of bankruptcy.

Financial models for predicting bankruptcy apply especially to large companies. Economic practice shows, however, that economic failure is a much more acute problem for small firms, where the rate of failure is very high, around 10% per year, according to studies conducted by British researchers. The need to build bankruptcy prediction models for small and medium category became imperative, but lack of financial and accounting information and their reliability has made this a difficult process. Thus, specialists in the field have developed non-financial models for predicting the bankruptcy of small firms: Cooper Model (1991); Reynolds and Miller Model (1989); Lussier Study etc.

These models are based predominantly on non-financial variables, such as managerial experience and competence, the employed personnel's qualification, business relations, marketing, product quality etc. Certain importance coefficients on which the total score function was calculated were assigned to these non-financial factors. Discriminant analysis is used not only to determine the probability of bankruptcy of companies in difficulty, but also for predicting purchases of companies. This new applicability of the discriminant technique arises on the capital market in order to establish key financial characteristics of companies targeted for acquisition or merger. Among the most popular models for the prediction of mergers and acquisitions we mention: Belkaoni Model (1978); Rege Model (1984); Wanslez and Lane Model (1983); Clayton and Fields Model (1991) etc.

Although worldwide, scoring method application had a success rate of around 75-90%, bankruptcy prediction using these models constructed by various foreign authors is difficult to accomplish in developing countries with fragile economies, such as Romania. On the other hand, building specific models to the Romanian companies is also hampered by economic instability and non application of the bankruptcy law, hence the impossibility of clear separation of the profitable and insolvent companies. However, Romanian economists work is in commendable in establishing such models as: Măneacă and Nicolae Model (1996)-model proposed for metallurgy industry; B-Băileşteanu Model (1998); Ivoniciu Model (1998); Anghel Model (2001) etc.

As a conclusion, the scoring method is only a tool to detect early the bankruptcy risk or acquisition prediction, and the information value of the score should not be overestimated. Discriminant analysis actually reduces the basic information by selecting the most significant financial ratios considered constant over time, while the firm is an economic and social system that operates in a complex environment with multiple variables to determine its health or weakness. Because of caution it is recommended to pay attention to the development of the score of the same economic sector companies, as well as to complete the diagnosis with traditional methods of analysis.

3. Methodology and Results

Bankruptcy prediction models are generally known as means of assessing the financial “risks” of the companies. In financial theory three types of evaluation of this financial issue are discussed, namely: *univariate* analysis, *multivariate* analysis and *logit* analysis. Univariate analysis assumes that a single variable can be used in the prediction of a certain objective (Cook and Nelson 1998). Univariate analysis identifies factors related to the dangers to which a company is subject undertaking. However the models in this category are assessment procedures of relevant risk (Stickney 1996: 507). Multiple discriminant analysis (MDA) is an attempt to assess the potential conflict between financial ratios using simple variables. The most common used model was proposed by Edward Altman, Professor of Finance at the Stern School of Business at New York. Starting from Altman Model, Cristine Zavgren (Zavgren 1985: 19-46) brought improvements to company’s bankruptcy prediction, model that was further developed by Andrew William Lo (Lo, 1986) and Claude Paul Stickney (Stickney, 1996: 510), which is the third way of predicting bankruptcy called the logit model.

In the 1980s and 1990s, the trend was to use the logit models against multiple discriminant analysis. More recently, logit analysis was considered to be more an advanced analytical tool like neural network, being found in recent works of Professors Eduard Altman, Giancarlo Marco and Franco Varetto (Marco and Varetto 1994: 505-530).

Applying this model implies the following four steps:

- seven financial indicators are calculated according to Table no.1:

Table no. 1 Logit Table

Financial Ratios	COEFFICIENTS
	+ 0.23883
Inventory/Turnover	- 0.108
Receivables/Inventory	- 1.583
(Cash + Short-term Investments)/Total Assets	- 10.78
Current Assets/Current Liabilities	+ 3.074
Operating Profit/(Total Assets – Current Liabilities)	+ 0.486
Long-term Liabilities/(Total Assets – Current Liabilities)	- 4.35
Turnover/(Working Capital + Fixed Assets)	+ 0.11
Y =	$\sum (\text{Coefficient} * \text{Financial Ratio})$
Bankruptcy probability =	$1/(1 + e^y)$

Source: Stickney Model

- in the second stage, each rate is multiplied by a coefficient which may take positive or negative values;

- in the third stage, partial products are summed;

- finally, the probability of bankruptcy is calculated as the inverse function $(1 + e^y)$.

For the case study we randomly selected 50 Romanian trading companies. The analyzed data is presented in Table no.2.

Table no.2 Evolution of trade balance sheet aggregates

TOTAL Trade	2005	2006	2007	2008	2009

Long-term Liabilities/(Total Assets-Current Liabilities)	0.611055	0,557904	0,421624	0,378947	0,478302
Turnover/(Working capital + Fixed Assets)	7.881801	7,989121	5,054696	5,108464	3,782613
y=	-0.71446	-0,12087	1,293386	0,484446	-0,24363
Bankruptcy probability=	0.671386	0,530182	0,21528	0,381203	0,560608

It may be noted that according to the Stickney Model the trade sector in terms of the 50 analyzed companies in the industry records a failure probability of over 60% in the first year. Probability decreases in the second year, third year records the best results, the probability of bankruptcy being much lower (21%) compared to the first year.

4. Conclusions

Business risk assessment methods are varied and complex. Currently, there are no significant differences between the methods and used risk assessment tools. The issue of risk and its approach, causes that generate it and effects it determines, are one of the most important issues in order to improve economic agents' activity for achieving high profitability. Risk is part of the daily work and its approach, the preference for risk or risk aversion is a subjective issue, which pertains to perception, analyzing decision factors, quality of management. Deficiencies in the quality of management will inevitably lead to the emergence of risk factors that cause damage to the business, bankruptcy symptoms, and finally business bankruptcy.

Expectations for future developments in the economic environment and the environment in which businesses operate are an essential coordinate in economic-financial analysis. Market players base their decisions on future expectations, which in turn are determined by the decisions they take today, decisions that may induce or not the subsequent emergence of risk factors.

Analysis of profitability of a company (profitability is in fact the purpose of carrying out business transactions) is incomplete if it does not take into account the risk, which may or may not appear until it has reached that return. Any activity involves in its conduct economic risks that economic agents are willing or not to undertake, to the extent that these risks are offset by a corresponding economic return. The risk is related to the parties who are involved in the business, the nature of business or when it comes to investment to the nature of the subject of investment, the resources involved in the conduct of business or investment, the motivations that exist for all those involved in carrying out the activity and its scope.

If the risk structure is known, the causes that have generated it and the effects, the difficulties it poses, they can be controlled, reduced or even eliminated in the process of economic activity. In an economy where competition governs economic life, one of the ways to reduce an investor's risk is to diversify the business portfolio. But business environment is seriously affected by events occurring in the political arena and therefore political instability is itself a generator factor of risk.

It can be concluded that the risk is one of the broadest concepts, difficult to define by investors and whose analysis is imperative for the purpose to ensure the investment process: ensuring a return and making a profit. Each investor is required to quantify the risk entailed in his commitment to a business once he assesses the resources because risk is equivalent to business vulnerability and can occur in all activity sectors.

A widespread concern about Basel II capital requirements is that it might amplify business cycle fluctuations, forcing banks to restrict their lending when the economy goes into recession. Under the IRB approach of Basel II, capital requirements are increasing functions of the probability of default (PD), loss given default (LGD) and exposure at default (EAD) parameters estimated for each borrower, and these inputs are likely to rise in economic downturns. In this paper, we compare two alternative procedures that are designed to somehow moderate the procyclical effects induced by Basel II - type capital regulation. The starting points of our analysis consist Jokivuolla, Kiema and Vesala (2009) and Repullo and Suarez (2009), who both examined the impact of regulatory capital's procyclical effects. It's vital to note remarks of Caprio (2009), that is, making regulatory capital levels countercyclical could worsen the state of an economy during a recession. As we do not have access to the Romanian Central Credit Register database, we compute a model-economy that stands as a proxy for the Romanian firms' sector. Our simulated Romanian economy can be characterised by all Romania-specific macroeconomic controls. Then we estimate a model of PDs during the period 2000 – 2010, and based on the estimated probabilities of default we compute the corresponding series of Basel II capital requirements. After the diagnosis of procyclicality, we analyze two procedures that try to mitigate the cyclical effects of capital regulation: smoothing the output of the Basel II formula, and smoothing the input, by construction of through-the-cycle (TTC) PDs. The comparison of the different procedures is based on the criterion of minimizing the root mean square deviations of each adjusted series. Our results show that the best ways to moderate procyclicality are either to smooth the input of the Basel II formula by using through-the-cycle PDs, or to smooth the output with a multiplier based on GDP growth. We conclude that the GDP-based smoothing may be more efficient than the use of TTC PDs in terms of simplicity and transparency. In terms of the GDP adjustment, regulatory capital levels should increase with approx. 1,31% during an economic growth period and decrease with 4,03% during a recession, in order to mitigate the cyclical effects induced by Basel II – type capital regulation.

Keywords: Basel II, procyclicality, regulatory capital, probability of default, credit-crunch.

JEL classification: G18, G17.

I. Introduction

The financial crisis proved that the capital requirements system, which is based on risk weights defined by Basel II, can't adapt to the new economic prosperity. The recession is aggravated by the fact that the banks were forced to squeeze their credits and this caused a delay in the economy's availability to grow. Several financial analysts pointed out the errors in the system,

therefore the Basel Committee on Banking Supervision must find a solution in order to develop the model.

In our paper we compute an in-depth analysis on the issue of the procyclicality, comparing two possible methods that can be used to mitigate the cyclical effects of Basel II regulatory capital. The procyclical effect can be observed in historical data from the banking sector, since the capital regulation based on risk weights is very prosperity-sensitive: in recession the credit losses consume the bank's capital, while venture capital increases. If banks aren't able to gain enough capital for credit losses in a short period of time, then credit-crunch may occur. This kind of process characterizes perfectly the financial crisis. This leads to the fact that banks can't even provide loans for customers with high ratings because of the inadequate level of capital.

The structure of our paper is the following: in the first part we compute a brief review of the literature regarding the issue of procyclicality. This will be followed by an analysis regarding the methods of reducing the procyclical effects, by the use of a logistic model containing a one-month-ahead probability of default (PD). Our goal is to find an answer to the fact that the cyclical effects can be effectively mitigated by fine-tuning of the PD indicators or by the change of the capital requirements. In the conclusion, we seek for other problems that arise when allocating regulatory capital.

II. Literature Review

We analyzed a series of different papers about procyclicality and its issues. Firstly we noticed that Jokivuolla, Kiema and Vesala (2009) and Repullo and Suarez (2009) both examined the impact of the regulatory capital's procyclical effects. Contrary to Repullo and Suarez, Jokivuolla, Kiema and Vesala created a comparison between the regulatory capital requirements of the Basel I and Basel II. Their main question was that whether the risk-based or the constant weights-based regulatory capital requirement shows less procyclical impacts on the credit market. They used a simplified model, which interprets 3 types of market participants: low-risk profile investors, high-risk profile investors and risk-free investors. Their conclusion was that the optimal risk-based capital is the least procyclical. They added that the present Basel II's necessary direction for further development is the implementation of a higher venture capital. Repullo and Suarez used a dynamic equilibrium model in which the banks can't access stock markets in any period. Their conclusion was that, in the case of Basel II Capital Requirements, capital reserves constituted by banks are higher during an economic boom than during recessions.

Secondly, we observed that Pederzoli, Toricelli and Tsomocos (2009) analyzed the problem of procyclicality with comparing two rating systems. They built up a general equilibrium model which contains 2 heterogeneous banks, 2 companies and 1 household. They found that the cyclical rating system results higher default rates and lower profit in the case of banks in recession times.

Kashyap and Stein (2004) argue that if the shadow value of bank capital is low in expansions and high in recessions, optimal capital charges for each type of risk should depend on the state of the business cycle. Without such adjustments, capital requirements would be too low in expansions, when bank capital is relatively plentiful and has a low shadow value, and too high in recessions, when the shadow value of bank capital goes up, leading to the amplification of business cycle fluctuations. Greenspan (2002) noted that "the supervisory leg of Basel II is being structured to supplement market pressures in urging banks to build capital considerably over minimum levels in expansions as a buffer that can be drawn down in adversity and still maintain adequate capital."

Lastly, Caprio (2009) studied the counter-cyclical capital requirements definition and Repullo, Saurina and Trucharte (2010) analyzed and compared the procedures which mitigate the effects of the procyclical capital. The foundation of Caprio's research was a macroeconomic data

analysis from Spain and Columbia. His conclusion was that the risk-based capital regulatory system's rectification results only short term adjustments. On the other side, Repullo, Saurina and Trucharte used data from Spanish companies and estimated a PD model. His results from this research were very complex. Adjusting the output side of the Basel II formula with a credit growth multiplier or a yield multiplier, we don't receive the optimal level of capital from the procyclical point of view. They found two possible solutions for handling the procyclicality: the first one is the input side smooth tuning, and the second one is on the output side, which can be received with the help of a multiplier based on GDP growth.

III. Cyclical adjustments of Basel II capital requirements

The recent financial crisis, with its boom and bust lending cycle, has brought to the forefront the need to address the potential procyclical effects of risk-sensitive bank capital regulation. To see how Basel II capital requirements evolve over the business cycle, we construct a model economy that is composed of one commercial bank and ten firms. The model is practically a simulation of the Romanian economy (also its banking and financial sector) over the period 2000-2010. The firms' sector is composed of 2 corporate, 4 medium and 4 small companies, whose total exposures equal the aggregate credit portfolio to companies in the respective period. Our model economy is explicitly characterised by Romanian macroeconomic data regarding the specified period.

To compute how regulatory capital levels would evolve over the business cycle, we estimate a logistic model of the one month ahead PDs of Romanian firms. The dependent variable, $DEFAULT_t$, is a binary variable that takes value 1 when a firm defaults in the course of a year on its outstanding loans at the end of the previous year, and zero otherwise. The explanatory variables comprise characteristics of the firm, characteristics of its loans, and macroeconomic variables. A borrower is considered to have defaulted if it is 90 days overdue failing to meet his financial obligations on a certain loan or if, with high probability, it is considered to be unable to meet its obligations.

The explanatory variables used in the model (dated in month t) are firm-specific variables and Romanian macroeconomic controls. COL_t represents the proportion of guarantees in a firm's borrowing, proxying the amount of collateral. Jiménez, Salas and Saurina (2006) show that banks ask for collateral to those firms that they denote as being riskier. AGE_t captures the age of each firm, with the idea that younger firms are more prone to default than older ones. $FSIZE_t$ proxies the size of a firm, it is calculated via deflating the EAD_t growth of a firm by the consumer price index; $FSIZE_t$ enters the model in logarithmic terms. $HISTDEF_t$ is considered to be the main risk profile variable that captures whether a certain borrower defaulted in the past. In each observed default event, the variable value is increased by 1. Similar to $HISTDEF_t$, we use $HISTDEL_t$, that stands for the borrowers' record of overdue loans (1). $UTIL_t$ is the ratio between the amount of credit drawn by a borrower and the credit line.

The macroeconomic explanatory variables are GDP_t , that is the rate growth of the gross domestic product, $CREDIT_t$, the rate growth of non-financial (commercial and industrial) loans over the one month period, BET_t , the monthly average return of the Romanian stock market, and $MATURITY_t$, that is the ratio between long-term exposures (2) and the total exposures in the economy. Our database contains a total number of 126 monthly observations, over the last 10 years.

Table 1 in the Appendix presents the results of the estimation of the model (all coefficients are statistically significant at the 10% level). It's interesting to note that some variables' impacts on the default condition (especially macroeconomic variables) are significant after up to 3 or 4 lags. The results show that firms that post collateral when granted a loan have higher probabilities of default. Also, firms whose exposures show a bigger growth rate than the average, have bigger

probability of default. Yet vital to notice that the coefficients of GDP and *MATURITY_4* are negative, meaning that as the growth rate of real GDP and proportion of long term exposures increase in the model economy, the PD decreases. The coefficient of variable *UTIL_3* shows that the higher the utilization of credit lines the higher the PD, so liquidity constraints also seem to play a role in a firm's default. Summing up the analysis of the logit model, we can say that firm's defaults increase during downturns and decrease during and economic upward trend.

PIT capital requirements

Based on the results in Table 1, we compute the point in time (PIT) capital requirements, k_{it} , for each borrower and month using the formula

$$k = PD * LGD * EAD * M,$$

the estimated probability of default, PD_t , and assuming a loss given default (LGD) of 45%, as in the foundation IRB approach of Basel II. The PIT capital requirements per unit of loans for each month is calculated via

$$k_t = \frac{\sum_i k_{it}}{\sum_i l_{it}},$$

where l_{it} denotes the value of the loans to firm i at the end of the month t .

Figure 1 shows how PIT capital requirements evolve among the GDP in the observed period. The cyclical effects can be easily captured by applying the Hodrick-Prescott(HP) trend to the series, with a lambda value of 500. Regarding the HP-smoothed PIT capital series, a significant cyclical variation can be observed, with a gap of 5.82% between the peak and the worst point of the business cycle.

TTC capital requirements – Adjusting the input of Basel II formula

A possible solution for mitigating the cyclical effects of regulatory capital is the use of through the cycle (TTC) capital requirements. To estimate DEFAULT by the TTC approach, we follow the idea of Saurina and Trucharte (2007), that is, replacing the current values of macroeconomic variables by their average values over the sample period. We then compute the monthly capital requirements with the Basel II foundation IRB approach. The results of the re-estimation of the logit model are found in Table 2. Comparing TTC capital requirements with the PIT values, the cyclical variability declines significantly, as it can be observed in Figure 2. The peak-low deviation in the TTC series is of 3.03%, significantly better then in the PIT capital requirements.

The business cycle multiplier - Adjusting the output of the Basel II formula

The second approach for adjusting the Basel II capital requirements is to smooth the output of the formula. Basically, we adjust the PIT-capital requirements series obtained from Table 1 with a business cycle multiplier, as it can be seen in the following formula:

$$k_{adj_t} = \mu_t * k_t.$$

The multiplier can be of various forms, but we use a simple and conventional approach:

$$\mu_t = 2N\left(\alpha * \frac{g_t - g_{avg}}{h_g}\right).$$

In the equation k_t denotes the original PIT capital series, and k_{adj_t} the adjusted series. Regarding the multiplier equation, g_t is the growth rate of one of the macroeconomic variables, g_{avg} its average over the sample period, h_g its standard deviation over the sample period. $N(x)$ is the standard normal cumulative distribution function and α is a positive constant parameter. The key features of the business cycle multiplier are: it is continuous and increasing in the proxy for the business cycle g_t , so capital requirements are increased in favourable periods and lowered during downturns or recessions. Also, μ is bounded, so capital requirements do not increase without bound or become negative. Parameter α is defined as 0.1, however, we tested various other values. The purpose of α is to minimize the root mean square deviation (RMSD) of the adjusted

series, and also to obtain a reasonable amount of capital adjustment. Summing up, we choose the value of α that is best in terms of smoothing the cyclical component of the pit capital requirements series. Figure 3 shows the μ -adjusted capital series (when $g=GDP$), together with the PIT series. Note that the adjusted series has been applied a HP-filter of $\lambda=500$, so that the cyclical-smoothing can be easily observed.

IV. Results

Taking into account the HP-filter fitted values, we compare the different smoothing procedures by computing the RMSD of each adjusted capital requirements series. The values obtained are shown in Table 3. The output-formula adjusted values show a much smaller deviation, as the TTC-series stands out with a RMSD of 0.16%. Regarding the output-smoothing procedure, a choice has to be made in order to specify the best smoothing macro-component. As the GDP and CREDIT deviations are more or less the same, we consider the amount of adjustment made during economic booms and downturns for the respective series. Results are shown in Table 4.

In terms of the GDP adjustment, regulatory capital levels should increase with approx. 1.31% during an economic growth period and decrease with 4.03% during a recession. Having a look at the CREDIT-adjustment, results say that capital levels should increase with 0.86% in case of an upward trend and decrease with 0.88% in case of a downturn in the economy. As the CREDIT variable adjustment makes no significant (reasonable) changes regarding Basel II regulatory capital, we consider the output adjustment based on GDP growth to be the best smoothing procedure. As mentioned earlier, Figure 3 shows the GDP smoothed series together with the real GDP. Note that this result is not due to the fact that GDP growth is one of the explanatory variables in our logit model.

V. Conclusions

In this paper we focused on finding the optimal method for mitigating the procyclical effects of Basel II capital regulation. We analysed two major approaches regarding the issue, which is estimating TTC PDs, and fine-tuning the output of the Basel II formula. By building up a model-economy that simulates the Romanian banking and finance sector, we observed that a GDP growth based smoothing of Basel II capital requirements would be a good solution regarding the procyclicality issue. However, we emphasize that the TTC-approach should not be “written off”, as it is clearly a simple and effective way to make a quick and basic-level fine-tunement to regulatory capital levels. We stick to our statement knowing that the use of TTC PDs has been criticized by Gordy and Howells (2006), who underline the fact that changes in a bank’s capital requirements over time would be only weakly correlated with changes in its economic capital, and there would be no means to infer economic capital from regulatory capital. Our results are similar to those of Repullo, Saurina and Trucharte (2010) agreeing that GDP growth based output adjustment of the Basel II formula is the “way to go” in terms of simplicity, transparency, low cost of implementation and even consistency with the idea of a single aggregate risk factor that underlies the capital requirements of Basel II.

Two major issues are still the purpose of our further research regarding Basel II. The first one, regulatory arbitrage, is mostly threatening safe and sound banking in the European Union, where its hazard is higher than in the countries outside the EU. To reduce this hazard, the specialists started to create a supervisory convergence. From this step, they expect that the discretionary assets will become reduced. The European Commission started a public consultation in 2010, in association with the fact that the 2009th Decree concerning the CRAs does not handle a lot of problems regarding the credit rating agencies. In this consultation document they discuss in detail the possible payment models and new measures, which prevent the potential risk of a rating arbitrage. The supervision of the rating agencies will be done by the European Securities and

Markets Authority. The second, regarding the correct estimation of PD-LGD correlation, is a vital in building up a safe and sound banking system. The model standing behind the Basel II formula is the standard one factor model developed by Vasicek (1987). Many studies argue that this method cannot capture well the correlation between PD and LGD on a large (asymptotic) portfolio. The innovative approach of Witzany (2009) proposes a two factor model. Results of testing the model prove that it is able to estimate more punctually and as realistic as possible the correlation between the two parameters, implemented on real banking data. The lack of reliable information however on public LGDs in the Romanian banking sector makes further research difficult.

VI. Notes

- (1) Overdue loans are the ones that have been paid before the 90-day threshold.
- (2) Long term exposures are the ones that exhibit 5 years.

EXTERNAL FACTORS INFLUENCE ON INFLATION: THE CASE OF ROMANIA

Căpraru Bogdan

“Al. I. Cuza” University of Iași, Romania, Faculty of Economics and Business Administration

Ihnatov Iulian

“Al. I. Cuza” University of Iași, Romania, Faculty of Economics and Business Administration

In this paper we try to assess the main external determinants of inflation dynamics in Romania. The literature in the field of measuring inflation dynamics is wealthy and various. There are many developing country - level studies that examine inflation dynamics: Blavy (2004) - Guinea, Duma (2008) - Sri Lanka, Gottschalk et al (2008) - Sierra Leone, Moriyama (2008) - Sudan, Mwase (2006) - Tanzania, Williams and Adedeji (2004) - Dominican Republic, Hossain (2005) - Indonesia, Almounsor (2010) - Yemen. The issue of Romanian inflation dynamics is present in many and various studies, like Hammermann (2007), Pelinescu and Dospinescu (2006), Budina et al (2006) etc. There are no other recent studies that analyze the external determinants on Romanian inflation dynamics.

In our paper we estimate an OLS single equation model, using a methodology derived from Almounsor (2010). The empirical analysis uses monthly data from August 2005 to January 2011. The start point of the data series is the moment of a major change in the National Bank of Romania (NBR) monetary policy: adoption of the inflation targeting regime. The independent variables used in our research are: harmonized consumer price index of EU-25 countries, EUR/RON exchange rate, crude oil price index (for analyzing the external shocks effect) and M2 monetary aggregate (intermediate money supply) as a control variable.

The outcomes suggest that inflation in Romania is driven mainly by international price shocks – harmonized consumer price index of EU-25 countries. The EUR/RON exchange rate depreciation has a small influence on domestic inflation. In the short run, the effect of the international oil price is insignificant. Money supply, used here as a control variable, is shown to have a very small effect on inflation in Romania when using OLS regressions. The results show that 66% of the domestic inflation variance is explained by the independent variables in our model.

Key words: inflation dynamics, external shock, international prices, exchange rate, Romania

JEL classification: E31, E52, E58

1. Introduction

In a world of fiat money inflation is a widely spread phenomenon that concerns both theorists and practitioners. The determinants of inflation can be split into two main categories: external and domestic factors. This paper assesses the main external determinants of inflation dynamics in Romania using an OLS single equation model. In this model, various regressions were performed to reach the benchmark regression, with the best fit and predictability. The period assessed is August 2005 – January 2011, highlighting the evolution of inflation under external shocks in a framework of inflation targeting monetary policy regime.

2. Literature Review

The literature in the field of measuring inflation dynamics is wealthy and various. Among them, there are many developing country level studies that examine inflation dynamics: Blavy (2004) - Guinea, Duma (2008) - Sri Lanka, Gottschalk et al (2008) - Sierra Leone, Moriyama (2008) - Sudan, Mwase (2006) - Tanzania, Williams and Adedeji (2004) - Dominican Republic, Hossain

(2005) - Indonesia etc. Almounsor (2010) studies the underlying determinants of inflation dynamics in Yemen using three different approaches: (i) a single equation model, (ii) a Structural Vector Autoregression Model, and (iii) a Vector Error Correction Model. The outcomes suggest that inflation dynamics in Yemen are driven by international price shocks, exchange rate depreciation, domestic demand shocks, and monetary innovations. Arratibel et al (2002) examine inflation dynamics in EU - accession countries in Central and Eastern Europe between 1990 and 2001, focusing particularly on the determinants of “dual inflation”, diverging inflation rates for tradable and non-tradable goods.

Also, there are many country level empirical studies on the effects of the exchange rate regime on inflation. Ghosh et al. (1997) conducted one of the first studies of this kind in a wide cross section of countries. Their analysis uses a tripartite classification system (“pegs”, “intermediate” and “float”) and includes the experience of 140 countries over the time period 1960 to 1990, using annual data.

The issue of Romanian inflation dynamics is also present in many and various studies. Hammermann (2007) uses panel estimation based on ten Central and Eastern European countries allowing him to decompose the inflation differential between Romania and the EU-8. The decomposition suggests that neither the revenue, nor the balance of payments, nor the financial stability motives are driving inflation; rather structural differences are at play. Pelinescu and Dospinescu (2006) focus on the short-term impact of changes in money, foreign exchange and wage policies and controlled prices, as well as the impact of the external shocks (as international price of oil) on future inflation in Romania. Their research uses VAR models to analyze the impact of factors like oil price and exchange rate on inflation and builds a model for predicting the inflation level in Romania. Budina et al (2006) demonstrate that for the period of 1992 – 2000 inflation was largely a monetary phenomenon in Romanian economy.

3. Methodology and Data

The empirical analysis uses monthly data from August 2005 to January 2011 (Appendix 1). The start point of the data series is the moment of a major change in the National Bank of Romania (NBR) monetary policy: adoption of the inflation targeting regime. This moment concur, also, with the privatization of the PETROM national oil company, at the end of 2004, when Romanian authorities quit administering the domestic fuel prices (a major determinant of domestic inflation).

We used data series from the IMF International Financial Statistics database (harmonized consumer price index in Romania (100=2005) - 96864HZF series and the M2 monetary aggregate in Romania - 96859MBZF series), from the Eurostat database (harmonized consumer price index of EU-25 countries (100=2005) and EUR/RON monthly average exchange rate series), from the Indexmundi database (crude oil price index (100=2005)) and National Statistics Institute of Romania (monthly average of the fuel price index, IPC102A series, transformed to consider 2005 the base year).

We used the EU-25 countries consumer price index as the Romanian external trade with other EU countries is prevalent (the EU27 data series already includes the Romanian price dynamics and is available only after year 2007). The EUR/RON exchange rate was also used due to the structure of the external trade of Romania; in the same time, euro is the main reserve currency of NBR. The international oil price may be relevant to the domestic inflation dynamics as most of the energy carriers in Romania are imported. To increase the robustness of our model we used the M2 monetary aggregate (intermediate money supply) as a control variable.

All data series were transformed as natural logarithms. We tested the data with the ADF unit root tests and the results showed that all the series (except the crude oil price index) are first order

integrated. Consequently we had to difference them once to obtain stationary data series (we also differenced the crude oil price index to may use the data in the regression).

The paper uses a methodology derived from the one used by Almounsor (2010). We have based our research on a single-equation model as follows:

$$\Delta p_t = \alpha + \beta_1 \Delta p_t^f + \beta_2 \Delta e_t + \beta_3 \Delta o + \beta_4 \Delta m_t + \phi z + \varepsilon_t \quad (1)$$

where Δ is the difference operator, p is the domestic HCPI, pf is the foreign (EU-25) HCPI, e is the EUR/RON exchange rate, o is the crude oil price index, m is the domestic M2 monetary aggregate (control variable), z is a set of binary variables controlling for outliers and ε is the error term.

Equation (1) states that inflation is driven by foreign inflation (pf), exchange rate (e) depreciation/appreciation, international oil prices (o) and growth of money supply (m), with the appropriate lags for the coefficients validation and AIC and SIC statistics minimization.

The model allows the analysis of the short term relationship of the variables with standard regression techniques. We tested for and eliminated the outliers (2007M8, 2007M9, 2010M1, 2010M7), based on the results of the RStudent test. To capture their impact, the paper uses four dummy variables. We tested the residuals' properties for checking the biasness, consistency and efficiency of the estimators.

As the domestic fuel price is an important component of the HCPI, we used the Johansen co-integration test for checking its long term relation with the international oil price.

4. Results

The results of equation (1) estimation are shown below:

$$\Delta p_t = 0.003 + 0.46^{***} \times \Delta p_{t-1}^f + 0.05^{**} \times \Delta e_{t-1} - 0.01^{***} \times \Delta o_{t-2} + 0.03^* \times \Delta m_{t-2} + \varepsilon_t$$

(0.00) (0.11) (0.02) (0.00) (0.01)

(2)

Note: values in parenthesis are the standard errors of the estimators; *** significant at 99%, ** significant at 95%, * significant at 90%; t-1 = one month lag, t-2 = two months lag

The outcomes of the single equation model show that Romania's inflation is driven mostly by international prices (with one month lag) and also by the exchange rate depreciation (pass-through). Empirically, a 1 percent increase in the EU-25 countries CPI amplifies the next month domestic prices by about 0.46 percent. The impact of exchange rate depreciation is significantly smaller: a 1 percent increase in the EUR/RON exchange rate is followed by a 0.05 percent increase of the next month domestic inflation.

The effect of international oil price is insignificant, a 1 percent increase driving to a decrease of about 0.01 percent of the domestic inflation (two months lagged). This result is quite surprising when observing the dynamics of the local fuel price and considering the weight of this component in the domestic HCPI. To confirm this outcome we have tested the two fuel price data series for co-integration and found out that the local fuel price is not driven by the international oil price, on a short run (Appendix 5).

Money supply, used here as a control variable, is shown to have a very small effect on inflation in Romania when using OLS regressions. Empirically, a 1 percent increase in the intermediate monetary aggregate adds two months lagged 0.03 percent to domestic inflation (however the coefficient is significant at 90% only).

The results show that 66% of the domestic inflation variance is explained by the independent variables in our model (Appendix 2).

5. Conclusions

The outcomes suggest that inflation in Romania is driven mainly by international price shocks – harmonized consumer price index of EU-25 countries. The EUR/RON exchange rate depreciation has a small influence on domestic inflation. In the short run, the effect of the international oil price is insignificant. Money supply, used here as a control variable, is shown to have a very small effect on inflation in Romania when using OLS regressions. The results show that 66% of the domestic inflation variance is explained by the independent variables in our model.

COORDINATES AND OBJECTIVES OF ROMANIAN FISCAL POLICY

Caraiman Adrian-Cosmin

Fiscal policy includes the totality of methods, means, instruments and institutions which are used for procuring financial resources necessary for financing public activities and also for influence the evolution of the economy of a certain geographic area, usually by direct reporting to a state's territory "(1)" (El-Agraa 2004: 319).

Fiscal policy is promoted in a close relationship with measures of budgetary policy, monetary policy and in interdependence with policy of prices and policy of labor occupation and other economic policies "(2)" (Voinea 2009: 75).

I consider that only an efficient coordination in fiscal and monetary policy may have as a final objective the stabilization of economy, with a high degree of labor occupation and a price stability.

A current controversy especially with Anglo-Saxons is the one according to which *fiscal policy* has the sense of *financial policy*, including, on the one side the objectives of the deciding factor of one state as regard to procuring budgetary resources by means of taxes and fees, and on the other side the objectives appearing out of the activity of making public expenses. On the opposite side are the materials in different languages of which origin is Latin, where, *fiscal policy* is seen as being state's policy that makes reference strictly at taxes, being ascertained that the part regarding the expense of the public resources makes express reference to budgetary policy.

In this sense, the author Iulian Văcărel, subscribes to the last position presented, respectively to the Latin one, and separates *fiscal policy* of *the budgetary policy*. Therefore, according to him, "Romanian language being a Latin language, has in its vocabulary, for centuries, distinct expressions for state's policy referring to taxes (fiscal policy) and the one regarding to public expenses (financial policy in matters of public expenses or simple budgetary policy)" "(3)" (Văcărel 2001: 40-41).

On my opinion, certainly, the fiscal policy is an important component of the financial policy, although there are different points of view within this approach. Thereby, there is the tendency to define fiscal policy strictly by means of collecting public financial resources under the form of taxes and fees. In this sense, according to Mr. Ioan Condor, "fiscal policy comprises the assembly of regulations regarding the establishment and charge of taxes, fees and other public incomes, that characterizes state's options in matters of taxes and fees" "(4)" (Condor 2002: 16).

In the same context, Mr. Babaita I. considers fiscal policy "a mechanism of sampling one part of the incomes made by the economic agents, households and enterprises, for constituting the funds necessary for public expenses "(5)"(Băbăiță, Silași and Duță 1999: 294).

Of course that all these definitions are heavily criticized by the supporters of the Anglo-Saxon opinions, or of the international organizations. Such, the last years witnessed to more frequent critics against the definitions presented previously, of the fiscal policy.

Paul A. Samuelson, defines fiscal policy as being "a process consisting in the manipulation of taxes and public expenses", emphasizing also that "governmental expenses and taxes have three major effects.. First of all, they are affecting the general distribution of the national product between public consumption and investments. Secondly, by means of direct expenses, indirect incentives and regulation empowerments, the government influences the production and price of the products made in different activity fields. At the end, budgetary policy influences the macroeconomic activities - the fluctuation of the aggregate production, prices and unemployment "(6)" (Samuelson 2001: 364)". Here's by consequence the relief of the tight connection between taxes and budgetary expenses. His opinion is sustained also by Richard G. Lipsey which believes

that "the ability of the government to use its power of taxation and expense for influence its national level" must be verified and followed with great care, especially in the context where "the governmental plans for taxes and expenses are defining the fiscal policy, with important effects over the level of income both on long term and also on short term. "(7)" (Lipsey, Chrystal 1999: 624) "

Leaving on one side the opinions of origin other that Romanian, there are also specialty authors in Romanian literature that subscribe to this opinion. For example Ms. Mihaela Onofrei which considers that "the main deficiency is that in the content of the fiscal policy is not made any reference to public expenses "(8)" (Onofrei 2000: 22) "

Also, the connection between the fiscal incomes and budgetary expenses is strongly emphasized also in the next definition, where fiscal policy represents the mechanism of collecting one part from the incomes that follow to represent the funds necessary for budgetary expenses. In this sense, the success of fiscal policy is conditioned by the "ration between expenses and fiscal incomes that may be delivered by the economic agents, without being discouraged in their activity. "(9)" (Băbăiță, Silași and Duță 1999: 294). "

Dan Drosu Șaguna defines fiscal policy by means of an "assembly of intervention instruments of the state, generated by financial fiscal-specific processes: forming by taxes and fees, budgetary expenses, allocating budgetary expenses, ensuring budgetary balances "(10)" (Șaguna 2001: 602) ". From my point of view, this dilemma of the fiscal policy is clearly presented by Mr. Vacarel Iulian which considers that the notion of fiscal policy makes strict reference to "taxes and fees, differentiating budgetary policy against the fiscal one." "(11)" (Văcărel 2001: 40)

For obtaining an adequate system of voluntary acceptable of the fiscal obligations by the taxpayers, exists four major ways to act, to which - within an efficient fiscal system - is necessary to have granted a permanent attention "(12)" (Mihăilescu 2002: 68):

1. the continued operation of certain programs as comprehensive for fiscal education of the taxpayers;
2. simplifying the system for declaring and paying taxes and fees;
3. detecting with promptness and forced execution of the taxpayers that are not complying with the obligations against the budget;
4. the continued improvement of the fiscal control in the purpose of identifying and fighting against fiscal evasion.

In my opinion the main objective that must become priority is the one of a good tax and fee collection for state budget and not the increase of the fiscality.

In conclusion we can say that, by fiscal policy are established, mainly, the volume and provenience of the public financial resources, methods of sampling the fiscal incomes, fiscal facilities - if they are granted, under what form, targeted finalities, global objectives of the fiscal policy, and also firm ways to achieve them.

Between the **fiscal policy coordinates** from Romania, we can remember:

- level of the public financial resources, possibilities to maintain/ ensure the budgetary balance, provenience of the public financial resources, number/ multitude of the fiscal assays, methods and techniques of fiscal assay, level of the rate of fiscal pressure, modalities for fighting against and limiting fiscal evasion, granting / not granting fiscal facilities.

The volume of the public financial resources, their quantum, is dictated in the largest part by the level of the public expenses form the considered period. In practice of public finances, from the past years is seen that there doesn't exist a total equity between public incomes of ordinary nature and public expenses within the budgetary year, which generated budgetary deficiencies of which source of finance is of public credits nature.

An important coordinate of the fiscal policy consists of the provenience of public financial resources: from ordinary or extraordinary sources, procuring the ordinary ones on way of direct or indirect taxes, from legal persons or individuals. Normally, the highest proportion must return to the ordinary financial resources, comparatively with procuring a public credit. The monetary emission without coverage represents a source of public incomes presented only on theory, because of the strong inflationist effects that it causes.

In a fully structuring economy, an important decision regarding the provenience of the public financial resources is connected to the method of taxation of the private economic agents comparatively with the companies and companies with state major capital and with autonomous administrations. The fiscal authority may promote a fiscal policy which to treat all of them in the same way or differently. As regard to the taxation of legal persons and individuals, may be considered a proportional taxation, or in simple progressive shares or composed shares. Because of certain considerations the poet establishes taxation shares depending on the activity field, geographical area or the headquarters of the economic agent.

Depending on how will answer to such aspects, the fiscal policy will choose to ensure horizontal and/ or vertical fiscal equity, so as to achieve the objective of social justice, and also the one of ensuring a decent way of living for taxpayers with small and middle incomes.

By fiscal policy are established also mandatory assays under the aspect of the number and ways of assay. Also the ones in charge from the fiscal policy field must follow permanently the evolution of the fiscal pressure in economy, at the level of the economic agent and at individual level and to correlate its level with the volume of the fiscal incomes form the budget.

Another coordinate of high importance within the frame of fiscal policy is consisting of locating, measuring, limiting and preventing the phenomenon of fiscal evasion. In this respect, a special importance returns to certain aspects, such as: level of fiscality, degree of collection of fiscal assays, degree of realism in establishing fiscal incomes in the budget, level of professionalism of the activity of fiscal inspection, duration of the sanctions provided in cases of fiscal evasion and firmness of their application, etc.

I consider that state's fiscal policy has an important role in ensuring the general economic balance, by maintaining the budgetary balance. Within this matter, the analysis must target aspects such as: the difference between the volume of public expenses and the one of public financial resources possibly to mobilize in normal conditions within the budget, the ratio between the budgetary deficiency and gross domestic product (under conditions in which must be complied with the recommendations of the international bodies in this field), sources of coverage for the budgetary deficiency, etc.

The fiscal policy acts over the consumption by modifying the solvable request of the population. Thereby, when is followed the reduction in consumption, generally, is used the increase in fiscality. Is intended the orientation of the consumption request to certain products, the instrument is represented by general consumption taxes or special consumption taxes - by selecting the subject products and differentiation of the tax rate. The public expenses are affecting directly the consumption by goods and services acquisitions and, indirectly, particular request, by social transfers and remuneration granted to public clerks. On their turn, taxes reduce the income of the legal persons and individuals, affecting, as a consequence, consumption and investments "(13)" (Cioponea 2007: 372).

For sensing the fiscal directions of the Romanian economy I consider that we must have in point a provision and an anticipation of the decision of the governmental responsible and political responsible, but which, usually, are difficult to anticipate and quantify. Must be seen some tendencies of certain general coordinates detached from a pragmatic attitude which emphasizes the efficiency of the actual system.

Fiscal system represents an instrument of assay and directing of the state's income, used with interventionist purpose in economy. It produces a conflict in modifying the price, generating re-distributions of income that may influence negatively the activity of economic agents and taxpayers, in general. The fiscal policy may therefore confront with problems connected to the optimization of the fiscal system capable to stimulate the effort to produce, to save and to invest. Romania is currently confronting with a very large number of taxes and fees and some of them are unjustified or are against the principles of taxation. For ensuring the maximization of the fiscal system flow, without the fiscal pressure to become unbearable, is imposed the rejection of the fiscal facilities that destroy neutrality and stimulate legal fiscal evasion.

The deterrence and removal of fiscal fraud asks that, together with the increase of the fiscal penalties, to be modified also the legislation of fiscal evasion, being introduced administrative and criminal penalties more drastic and more diversified. The fiscality is not neutral in relation with the investment decision, but influences the evolution or collapse of the investments in economy.

Both fiscal and monetary policy intervene over the economics flows, acting over the growth or decrease of the distributed incomes, used for consumption, saved and invested. Level and distribution of the incomes at national level influences the decisions of fiscal policy. The maximization of the national income per inhabitant must have in consideration the influence over the taxes on different incomes realized. The increase of the pressure exerted on these must be avoided for determining the decrease of the production in general. Also, the tax on salaries, on profit and on consumption reduces the incomes that may be saved and invested at individual and global level.

The increase of the profits invested is stimulating, in my opinion, the increase of the wage incomes and capital accumulation. The facilities which must be included in fiscal legislation must have in consideration the constitution of the monetary excess for new investments and increase of the computation base for future taxes.

Public authorities use the fiscal policy to achieve new non-fiscal targets, of economic order, such as: influence of economic processes, correction of the economic cycle, removal of the imbalance from economics. In this sense, following the most general directions on which sits fiscal policies, we can distinct, as global **objectives** of the fiscal policy the following:

- economic stabilization, conjunctural adjustment and re-launching the economy, economic restructuring and growth, modernization of the productive apparatus.

The main objective of the fiscal policy, in my opinion, targets the economic stability. For achieving this objective, in recession period, the fiscal policy, targets the reduction of taxes and fees concomitantly with the increase in public expenses. In the period in which the agregate request tends to become excessive generating mainly the increase of prices and budgetary deficiency, the fiscal policy uses an increase of the taxes and/ or reduction of the public expenses. The conjunctural adjustment and re-launching of the economy is tightly connected to the mix of financial - monetary policies. For achieving the objective regarding the restructuring and economic increase, the fiscal policy encourages the development of certain economic sectors or activities either by reducing tax rates, either by granting fiscal facilities. These activities are targeting among others social objectives often directed to discouraging the consumption of certain products bad for health, the stimulation of the taxpayers for charity, etc.

The modernization of the productive apparatus is an intermediary objective of the fiscal policy which is tightly connected to the development of the external trade and increase of the competiveness of the autochthonous economy on the international market. This objective is achieved, many times by reducing the tax rates for economic agents according to the profit that is invested, by granting fiscal deductions for a share of the value of the investments made, by favoring the saving, etc.

In my opinion the objectives of fiscal policy are very close correlated with the functions of the policy and with their effects over the national economy, and also with results obtained by using taxes, state loans, budgetary expenses, as intervention instruments at the disposition of the public authorities.

Conclusions:

A state's fiscal policy affects directly all the taxpayers, both legal persons and individuals. A well based fiscal policy, that considers the strict conditions of the social and economic life, the exigencies of the present and imperatives of the future, may be prove to be beneficial for the progress; in return, unless is referring them or considers them, fiscal policy may obstruct the development and may lead to recession. Therefore the fiscal policy must be approached in close connection with budgetary policy. Their objectives must support the achievement of a durable development of the entire Romanian society.

The fiscal policy must be used in favor of the economic growth, for reducing the inflation, the unemployment and deficiency of current account; the budgetary deficiency and public debt must be held under control, fiscal policy must be made so as to support the nominal and real convergence, in the same time being sufficiently flexible for alleviating the eventual internal and external shocks generated by the adhesion, regarding the successful integration in the monetary and fiscal structures of the European Union.

THE IMPACT OF THE FINANCIAL AND ECONOMIC GLOBAL CRISIS OVER THE ROMANIAN BANKING SYSTEM

Ciobanu (Sireteanu) Elena ;

„Alexandru Ioan Cuza” University of Iași Faculty of Economics and Business Administration

This paper analyzes the evolution of the Romanian banking system during 2007 - 2010 compared to the same segment of financial market dynamics in the Member States. Also seeks to detect the effects of the global financial and economic crisis on lending activity, the management of liquidity risk and thereby the effect on the profitability of the Romanian banking sector and outline the prospects of further development.

The macroeconomic and financial international background has undergone negative changes, especially in the autumn of 2008. Romania's financial system has evolved but strongly marked by the virulent manifestations of global financial and economic crisis. The banking system which is the dominant component in the financial system is well capitalized, has resisted, until now, these pressures, without recording any bankruptcy.

As a lending crunch from the increase in provision expenses, against the backdrop of bad loans it seems to be a poor performance of the banking system for the future period, taking into account the negative financial result recorded at the end of 2010.

Given the high degree of capitalization, liquidity level indicators, on this, consider that local banks are well placed to support the real economy on long-term lending conditions imposed by prudential regulations in the field.

Currently, at the level of the Romanian banking system, we consider it is necessary to continue the measures imposed by the monetary authority to ensure the reduction of uncertainty and reassure market participants in future developments, as trust is the essential factor for the crisis. In this sense, we consider very important the debate, the direct involvement of representatives of the central bank and academic themes reflecting the current state of the Romanian financial system, lessons learned from the crisis and Romania's objectives for the future - providing a sustainable process of nominal and real convergence of the Romanian economy - towards European integration in a not too distant horizon.

Keywords: financial crisis, Romanian banking system, non-performing loans, profitability

JEL classification: G01, G2, E51

Introduction

The current crisis has occasioned extensive debate on its causes and devastating effects on the banking sector, which is the largest regulated compared with other sectors of the financial market.

Comparing banking crises in the period 2008 - 2009 by the Great Depression (Richhild Moessner and William A. Allen 2010:11) shows that the size of the current crisis, commensurated with the decrease in international short-term borrowing and the amount of bank deposits was lower than the one in 1931. However, the amount of liquidity provided by central banks was higher than in 1931, when it was restricted by using the gold standard in most of the states.

The Professor (Silviu Cerna, 2010:79) notes the same thing, “the current crisis is very similar with other crises from the past”.

(Marie Stephanie Stolz and Michael Wedow 2010:7) believes that consistent public support for the financial sector was the key to managing the current financial crisis.

The literature also suggests that the recent crisis reflects not only the unsustainability of global macroeconomic imbalances, but also proliferation of toxic financial instruments, a lack of authority of supervisors and unclear demarcation of the powers of the regulator.

The factors mentioned above, according to (Ross Levine, 2010: 3,7) have played a partial part. The submission of inadequate policies has created, in fact, vicious incentives which have encouraged the financial institutions to take excessive risks, diverting the public savings to unproductive targets. He also argues that there are major contradictions between a dynamic financial system and a regulatory system that failed to properly adapt to financial innovation. Thus, failures of governance in financial regulation have supported the international financial crisis.

Measures taken by governments and central banks in the U.S. and the EU in response to the crisis have been broadly similar. Thus, firstly, there have been used broadly the same instruments such as government guarantees, capital injection of liquidity, asset protection, secondly all were in used similar scope. Also, monetary policy actions and measures to rescue banks were increasingly intertwined. But as it is highlighted by (Marie Stephanie Stolz and Michael Wedow 2010: 16) there are important differences between the measures of political support taken by the U.S. and EU. While the Fed was more expansive and focused more on the individual financial intermediaries, the Euro system's operations were limited to providing liquidity.

In Romania, the state did not have to intervene to save the banks from the global financial maelstrom, as happened in the above areas, particularly in the U.S..

In the period 2009 - 2010, additional capitalization was provided entirely by the shareholders in case of entities within the Romanian banking system.

This paper is structured so as to allow exposure of the latest developments in the Romanian banking system in the period 2007 - 2010, being strongly marked by virulent manifestations of the global crisis and to outline future trends for the future period.

1. The Characteristics of the Romanian banking sector

The effects of financial and economic global crisis have intensely impacted the first months of 2009 and the financial system in Romania, namely the banking sector which is the dominant component in it. By the time Romania joined the European Union (1st of January, 2007), the industry has come a long process of privatization which was long overdue and which resulted in a strong infusion of foreign capital. In large part, the banks in the system are majority foreign-owned (76.9%), and their share in total bank assets is (86.1%), according to the latest developments (Table no. 1).

Table no. 1. Structural indicators of the Romanian banking system

	2007	2008	2009	2010
Number of credit institutions	42	43	42	42
Number of banks with private capital majority	40	41	40	40
Number of foreign-owned majority capital banks, from which:	36	37	35	35
- Branches of foreign banks	10	10	10	9
Share in total assets of banks with majority private capital (%)	94,7	94,6	92,5	93,2
Share in total assets of banks	88	88,2	85,3	86,1

	2007	2008	2009	2010
with majority foreign capital (%)				
Share of top five banks in total assets(%)	56,3	54,3	52,4	53,1
Herfindahl – Hirschman parameter	1.046	926	857	874

Source: National Bank of Romania

As shares in the share capital of domestic banks and foreign branches in late 2009, the first three positions were occupied by Greece (26.6%) held position at the end of 2008, Austria (16.9%) and Netherlands (9.0%).

As one can see in the table above, during 2007 - 2010, the Romanian banking sector structure in terms of number of credit institutions and foreign capital share in total sector assets examined, has not encountered significant changes.

Instead, it should be noted that the degree of concentration in the Romanian banking system remains a downward trend throughout the analysis period since 2007, as we show the Herfindahl - Hirschman Index (HHI), which is calculated by:

$$IHH = \sum_{i=1}^n \left(\frac{A_i}{A} \times 100 \right)^2, i=1, \dots, n \quad (1)$$

where: A_i = corresponding to period-end balance sheet net assets of the credit institution “i”;
 A = the aggregate net level of the balance sheet asset (from the total banking system).

It should be noted that for values between 1000 and 1800, the Herfindahl - Hirschman parameter means an average concentration of the banking system. For Romania, the concentration of the banking system remains at a moderate level, which is below the EU average of 1120 points for 2008 (Mugur Isărescu, 2009: 319).

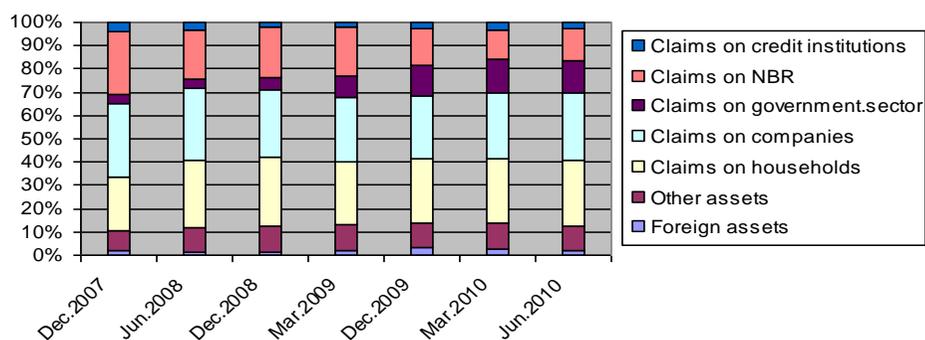

With regards to the level of financial intermediation calculated as a percentage of non-government Domestic Product (GDP), Romania remains below the EU Member States, namely below 50%, although in recent years, it has recorded a very high government credit rate, until the autumn of 2008, due to uncertainties caused by the global financial crisis.

2. The impact of the financial crisis over the lending banking sector

Since the first quarter of 2009 and so far, the international financial crisis had an impact on the Romanian banking sector, in particular over the external liquidity channel, also the macroeconomic conditions were significantly affected. Thus, the Romanian economy went into negative territory where real GDP registered a severe contraction (by 7.1% in the year 2009) and (1.3% in the year 2010) and the fiscal deficit rose to 8.3% of GDP for 2009.

Amid the problems outlined above, during 2009-2010, there were significant changes in the dynamics and structure of the Romanian banking system assets (Chart no. 1).

Chart No. 1 Structure of the Romanian banking sector assets

Source: the author

During 2009, credit released to the private sector registered a contraction for government securities, which rose 3.7 times at end 2010 compared to 2007, under the bank's risk aversion and uncertainty about future developments to maintain the domestic and financial international market.

Being noted that in June 2010 there has been noticed a return of non-governmental credit, an increase of 6.4% compared to June 2009.

It also notes that investments of domestic credit institutions had a decreasing trend over the period, the fund reserve ratio reductions level operated by the central bank. However, foreign assets have a slightly upward trend, increasing balance of loans due to non-euro residents.

3. Quality assets and significant risks

First, we deem it necessary to present, in the context of deteriorating domestic economic climate more pronounced in January 2009-September 2010 and existing liquidity problems on international markets, changing the behavior of the Romanian banking system, which is much more cautious in lending.

According to the evolution of the data in (Table no. 2), it concludes that we have overcome a well-capitalized banking system, the levels recorded at the two indicators: solvency and leverage, in the period, are maintained at an appropriate level above the regulatory minimum (8%) and harmonized with those in force in EU. The Solvency parameter is maintained at the same level in the last two years, the fund raising of capital by shareholders reduce credit and non-government credit growth.

Table No. 2. The main prudential indicators

Indicators		Dec.07	Dec.08	Dec.09	Dec.10
Capital adequacy					
1	Solvency ratio (>8%)	13,78	13,76	14,67	14,66
2	Leverage ratio (Tier 1 capital/ Total assets, average)	7,32	8,13	7,55	7,87
Asset quality					
3	Loans (gross value)/ Total assets (gross value)	59,09	62,50	59,13	58,66
4	Interbank placements and loans	29,98	26,01	23,03	19,59

	Indicators	Dec.07	Dec.08	Dec.09	Dec.10
	(gross value) / Total assets (gross value)				
5	Past-due and doubtful loans / Total loan portfolio (net value)	0,22	0,32	1,45	2,22
6	Past-due and doubtful claims / Total assets (net value)	0,17	0,29	1,01	1,49
7	Credit risk ratio	4,00	6,52	15,29	20,81
8	General risk ratio	56,94	50,73	47,29	44,56
Liquidity					
9	Cash ratio	38,70	34,43	35,28	35,9
10	Liquidity ratio (effective liquidity/ required liquidity)	2,13	2,47	1,38	1,36
11	Loans to clients / Deposits from clients	108,7	122,0	112,80	117,95
Profitability					
12	ROA (Net profit/ Total assets, average)	1,01	1,56	0,25	-0,09
13	ROE (Net profit/ Own capital, average)	9,43	17,04	2,89	-1,02

Source: National Bank of Romania

In the period 2009 - 2010, lending activity registered a downward trend, just as the indicator shows the evolution of credit extended to customers in total assets, the gross amount, from 59.13% to 58.66% in December 2009 and at the end of 2010, compared to 62.50 lei as it was before the crisis.

In this case, both supply and demand for credit continued to be influenced by several factors, such as the supply side - (i) maintaining tighter lending standards and terms, (ii) reducing the excess liquidity inside the banking system, (iii) increase of government securities held by credit institutions. At the level of loan demand inhibitors were the most important factors were: (a) maintaining the high cost of credit, (b) the volatility of currency exchange rate, (c) negative view of economic growth and unemployment and (d) the increasing inclination for people to save.

According to the unfavorable evolution of the indicators that reflect the quality of loan portfolio which has increased the vulnerability of the banking system over the period analyzed. Thus, credit risk, which is considered one of the most important risks in recent years has gained a high level in the late 2010 and 20.81% compared to the level before the crisis, 4.00%.

The results of the stress testing exercise over the credit institutions run by the NBR in July 2010 for a two-year horizon, show us that the impact on loan portfolio quality is significant. Increased costs (provisions) that the impairment of financial assets was approximated to 38% in 2010 and 21% for 2011, this trend is confirmed in practice.

In December 2009, loan portfolio quality in the banking sectors in the EU Member States had the same negative trend as in Romania, their level doubled from the previous period. In late 2008, the rate loans/ deposits reached 122%, and in February 2009 began to decline due to the concentration of the banking entities to attract deposits from customers and lending moderation. The ratio level at 31st of December 2010, of 117.8% indicates limited level of liquidity in the system.

4. Profitability of the banking system – trends

At the end of 2009, the Romanian banking system registered a net profit of 193 million euros. Compared with 2008, the aggregate profit fell more than 5 times because of bad loans and thus increased the spending provisions to cover credit risk assumed combined with low incomes.

An entirely different situation is found in the year 2010 when the Romanian banking system registered a negative financial result - an aggregate cash net loss of 71 million. The main factors affecting the profitability of the system in 2010 were: the relative lack of liquidity of foreign markets, indirectly affecting bank operations in Romania, increased risk aversion of banks and increased provision expenses.

Thus, both ROA and ROE indicators (Table No. 2) have negative values at the end of 2010 (-0.09% and -1.02%).

Here, given the current circumstances, we conclude that the profitability of the banking system will remain under pressure, given the unfavorable trend of deterioration in asset quality, which involves increasingly reserves, according to delay economic recovery, amid a recession and persistency in a limited risk appetite for banks.

Conclusions

Currently, at the level of the Romanian banking system, we consider it is necessary to continue the measures imposed by the monetary authority to ensure the reduction of uncertainty and reassure market participants in future developments, as trust is the essential factor for the crisis. In this sense, we consider very important the debate, the direct involvement of representatives of the central bank and academic themes reflecting the current state of the Romanian financial system, lessons learned from the crisis and Romania's objectives for the future - providing a sustainable process of nominal and real convergence of the Romanian economy-towards European integration in a not too distant horizon.

On international level, the economic and financial crisis has determined a diminution of the asset value of compulsory pension funds, reflecting a reallocation of funds towards alternative or low-risk investments. The present paper indicates how the net asset value of privately managed pension funds in Romania may be affected or not by certain influence factors in direct correlation with different asset allocation strategies of pension funds. In this way, on literature review there are many studies which have analyzed the fluctuation of pension funds assets and a better reallocation of their investment in order to improve their efficiency. The experience of the value fluctuation of privately administered pension fund net assets is highly important, firstly because of its effects on the increase and the decrease of invested values for the insured persons' accounts, under the circumstances of constantly maintaining their contributions and, implicitly, the results achieved through these investments. The research methodology consists in testing of five variables: currency exchange rate, credit interest rate, bank deposit interest rate, reference interest rate and value of the stock exchange market index (BET-C index), by means of the multiple linear regression method. The conclusion is that only two of these factors, namely, the currency exchange rate and the reference interest rate, influence net asset value of privately managed pension funds, the second pillar, one in direct and the other in indirect correlation. In order to neutralize the effects generated by the diminution of the net asset value of privately managed pension funds, considering a short time horizon, we shall elaborate a dynamic mix of their investments able to adapt to the fluctuations of the influence factors. Thus, new opportunities will be generated in order to achieve the efficiency of pension funds and to prevent the diminution of the value of insured individuals' contributions to these pension funds.

Keywords: privately managed pensions, net assets, investments, factors of influence, statistical correlations

1. Introduction

Internationally, there are systems of diversified pensions, which, in general, present a combination of the public and the private component. To the European Union level, there is no mutual system of pensions available for all Member States, but most of the Member States of the European Union have approached the multi-pillar pension system proposed by the World Bank. In Romania, the pension system is, as well, structured according the pattern proposed by the World Bank, thus: **-the public pension system**, which represents the **first pillar**, monitored by the National House of Public Pensions – CNPP; **-the private pension system**, under the observation of the Private Pension System Supervisory Commission – CSSPP, including its two components:

the **second pillar** – *privately managed compulsory component*, introduced in May 2008. According to the law, the designation of the pension fund includes the collocation *privately managed pension fund*; the **third pillar** – *privately managed optional component*, introduced in May 2007.

The compulsory component of private pensions, the second pillar, stirs up a series of discussions on international level, as, against the economic crisis background, certain States have no longer complied with the initial pension reform model, and we mention here countries in Central and Eastern Europe adopting certain adjustments of contributions to the pension second pillar.

Therefore, Hungary has adopted, at the end of 2010, a governmental plan for nationalization of compulsory private pension funds, the second pillar, meant to diminish the budgetary deficit. In 2009, Lithuania and Estonia have decreased the contributions to compulsory private pensions, from 5.5% to 3%, respectively, from 6% to 2%, and Latvia intends a decrease from 8% to 2%. In Slovakia, the second Pillar is no longer compulsory, and the contributions register a decrease of two thirds. In order to reduce the budgetary deficit, Poland has announced at the beginning of April 2011 the diminution of the level of contributions transferred towards the second Pillar from 7.3% to 2.3%. Romania, as well, has not succeeded in following the legal provision stipulating an annual growth of 0.5 percentage points for contributions to the second pillar. This growth was achieved only for 2009, for 2010, the contribution remained to 2.5%, and for 2011, it has increased to 3%.

The representatives of the European Commission claim that, as the States have assumed the implementation of a certain pension reform model, they should maintain the adopted system, regardless the economic context.

Considering these current issues of the system of compulsory private pensions, numerous studies and analyses were elaborated taking into account the efficiency of investments performed, their guarantee and regulation schemes and other aspects.

2. Theoretical Basis

The economic financial crisis manifested on international level has considerably reduced the asset value of pension funds, all over the world. A study undertaken in 2010, by Towers Watson (1), considering the evolution of pension fund assets on the greatest markets of pension funds in the world, has revealed the fact that the main issues disturbing their activity, as a result of the financial crisis, remain: “liquidity; the management of credit/collateral risk; asset manager underperformance; and new challenges in strategic allocation” (Watson, 2010).

The role of private pensions has great importance, particularly “...in countries that have introduced a mandatory private pillar as part of a systemic pension reform” (Tapia, 2008). For preventing “market failure” and the diversification of fund asset investments in order to reduce their risks, for most of the pension systems, on international level, diverse alternatives are established according to Pension Benefit Guarantee Schemes, as “A pension guarantee fund cannot work properly *without* adequate funding rules.” (Stewart, 2007)

In Romania, the system of privately administered pensions, for each component of private pension funds, namely, the second pillar of compulsory private pensions and the third pillar of optional private pensions, there is a pension scheme enforced by the law which provides a broad series of “risk control instruments: active dissociation, actuarial reserves, verification through depository, guarantee fund, audit, minimum rate of profitability.” (Zavoianu, 2010).

The best practices for the management of pension fund investments reveals the fact that a strategic mix of asset investments, adjustable in time, considering the situational influence factors, offers opportunities for achieving the best results. Therefore, various studies on international level, concerned with diversified ways of allocating pension fund assets show that, on the main markets, “pension funds continued to diversify into alternative assets” (Watson,

2009). As well, the economic crisis effects have determined a reallocation of pension fund asset investments from the member countries OECD towards low risk investments mainly internally oriented (Antolin and Stewart, 2009). Other countries have indicated that the appreciation of the currency exchange has determined an increase of the value of private pension fund assets (Watson, 2010).

Consequently, the insight of the value of pension fund assets becomes crucial as the diminution of their value influences, on one hand, their solvability and, on the other hand, the values accumulated in the accounts of insured individuals.

Considering numerous factors influencing private pension assets, as well as the unemployment rate, the evolution of the currency exchange rates and of the monetary policy interest rates (Mot, 2010), the present paper attempts at selecting few of them in order to determine how far they influence the net asset value of compulsory private pension funds, the second pillar.

3. Concepts and Methodology

In Romania, the system of privately administered pensions becomes a compulsory system for the individuals newly entered in the work market, below 35 years of age, and remains optional for the rest of the individuals aged under 45, who are already insured and contribute to the public pension system. The *administrators of privately administered pension funds* are represented by distinct companies, authorized by the supervisory body, the Private Pension System Supervisory Commission. The situation of authorized administrators of privately administered pension funds indicated 18 administrators at the initiation of the system (July 2007) and 14 at the end of the participant selection process (January 2008), presently, the system counts only 9 administrators (according to the last reports of CSSPP on January, 31st 2011). The *investments* deriving from the assets of these funds are controlled, monitored and undertaken according to the risk range specific to each fund, in an efficient and prudential manner. Except for one single pension fund administered by Generali, registering a high level of risk, the other 8 pension funds indicate an average level of risk.

In Romania, the main indices of privately administered pension funds, the second pillar, at the end of the year 2010, according to CSSPP reports, are as it follows (the indices are indicated by the Newsheet, CSSPP, 3rd year no 12/2010):

- the presence of 9 active pension funds, divided into two risk categories according to the investments performed: average risk funds (8 funds) and high risk funds (a single fund);
- the number of participants to privately administered pension funds is 5,186.37 thousand indicating an increase of 5.6% reported to the end of the year 2009 (December). From the total number of participants, 59% are aged under 35 (for this category, the adhesion is compulsory) and 41% are aged over 35 (for this group, the adhesion is optional). The coverage rate of number of participants in total employees of Romania reached 80% of the total number of employees (Newsheet, CSSPP, page 10);
- the involvement level related to the number of participants reached 67% for the first three privately administered pension funds, which belong to the following pension administrators: ING, Allianz-Țiriac și Generali, and 81% for the first five pension funds;
- the net assets estimated to 1,010.9 million euros (4,331.9 million lei) registered an increase of almost 82% as compared to December 2009 and of 4.3% compared to the previous month;
- from the total of net assets of privately administered funds, 86.3% have been invested on national level, and the rest of 13.7%, abroad.

The evolution of net assets of privately administered pension funds during the entire period of their collection, since their settlement to the present, is illustrated in Figure no. 1, Annex no. 1.

The investments of net assets of privately administered pension funds, in Romania, on investment categories agreed by the law, are presented in Figure no 2, Annex no. 1, from what it can observe

that, the investments of privately administered pension funds are mostly oriented towards *State bonds, shares and corporate bonds*, registering about 90% of their total.

We may notice a slightly gradual decrease of the active total value owned by bank deposits from the moment of the system settlement till present, namely, from 43.44% in June 2008, to 7.18% in December 2010.

Considering the structure of the privately administered pension fund investments, we will test the level to which **certain factors influence the evolution of the assets managed by privately administered pension funds, the second pillar**. Thus, we will mention certain factors of influence determining the evolution of privately administered pension fund assets:

-the level of interests, which may influence the transaction value of instruments with fixed income backward the evolution of interests. For the analysis, we consider the interest rates for credits and deposits, as well as the reference interest rate;

-the exchange rate, which influences the value of foreign currency denominated assets at the moment of their evaluation. Generally, a depreciation exchange rate of the national currency reported to the euro exchange rate determines a value increase of these assets;

-the stock market and its evolution influence, as well, the value of assets included by the pension funds. The value of investments in shares, for the second pillar, represented at the end of December 2010, 12.2% of the total of fund assets. The investments in shares rated on stock markets from the Member States of the European Union indicated 3.2% of the total of privately administered pension fund assets.

For the analysis, we use monthly data provided by the Private Pension System Supervisory Commission, the National Bank of Romania and Bucharest Stock Exchange, for the period May 2008 - December 2010 (the research is applied for a number of 32 monthly observations).

According to these factors of influence, the following variables have been applied for testing statistical correlations:

-the net asset of privately administered pension funds, as a dependent variable (its values during the studied period, May 2008 – December 2010, are outlined in Figure no 1, Annex no 1);

-the currency exchange lei/euro, the credit interest rate, the deposit interest rate, the reference interest rate and the value of the BET-C index, as independent variables (values which are pointed out in Figures no 3-7 from Annex no 1).

4. Results and discussions

The analysis of the correlation between the dependent variable and the five independent variables already identified may be achieved either separately, using the correlation coefficient, analyzing the correlations between the dependent variable and one independent variable selected among the group of studied variables, or globally, applying the linear regression.

Concerning the analysis of the correlation between the dependent variable, the value of the net asset of privately administered pension funds, the second pillar, and independent variables: the currency exchange lei/euro, the credit interest rate, the deposit interest rate, the reference interest rate and the value of the BET-C index, the Table no 1, Annex no 2, illustrates for each regression model the value of the correlation coefficient (R), the value of the determination report (R Square) and the standard error.

As we may notice in table no 1, Annex no 2, the first independent variable introduced in the model is “reference interest rate”, which exercises the greatest influence over the value of the net asset of the pension second pillar. The second stage introduces the second independent variable, namely “the currency exchange lei/euro”. The value of the correlation coefficient “R” is significant, which implies the presence of a very strong correlation according to the model.

Model no 1 presents the reliance between “net assets of privately administered pension funds” and the “reference interest rate”, achieving a correlation coefficient of 0.950 and a determination

report of 0.903, which suggests the existence of a correlation between the two variables, highly important due to the fact that 90.3% of the fluctuation of “net assets of privately administered pension funds” is determined by the modification of the “reference interest rate”.

Model no 2 introduces the second independent variable “the currency exchange lei/euro”, resulting a correlation coefficient of 0.978 and a determination report of 0.956. This implies the fact that 95.6% of the fluctuation of “net assets of privately administered pension funds” is explained by the fluctuation of the “reference interest rate”, respectively, of “the currency exchange lei/euro”. Moreover, by introducing the second independent variable into the regression model, the standard error of the estimate significantly decreases from 390.75 to 266.86.

According to table no 2, it becomes obvious that the other three independent variables studied, namely, the credit interest rate, the deposit interest rate and the BET-C index, are not considered in the model, because of their insignificant level of influence over the value of the net asset of privately administered pension funds.

The test t and the value Sig. serve for testing the regression coefficients, meaning the hypothesis according to which there is no significant correlation between the dependent variable and the independent variable. One may notice that, for the resulting model no 2, considered as the final alternative for the analysis, the significance threshold, Sig., takes higher values than those allowed, namely, the value of 0.05, which rejects the hypothesis according to which there is a significant correlation between analyzed variables, they being excluded from the model.

The regression coefficients calculated for each of the two models of the variables included here are illustrated in Table no 3, Annex no 2.

According to this study, the test t assumes high values for each variable, and the significance threshold, Sig., takes very low values (inferior to 0.05), which allows us to reject the hypothesis indicating a significant correlation between the analyzed variables, meaning slight errors determined by certain random measurements.

We observe that, the influence of the two selected variables over the net asset of privately administered pension funds, the second pillar, is optimum (Sig. <0.05), and the tolerance is higher than $1 - Adjusted R square$ ($1 - 0.953 = 0.047$) for each dependent variable which *eliminates the risk of non-collinearity*. VIF (Variance Inflation Factor = $1/Tolerance$) supports the collinearity analysis, being able to express a non-collinearity if it exceeds the value of 10.

In our case, for the two variables included in the model, the value of VIF is lower than 10, which confirms the lack of non-collinearity for these variables.

Considering the calculated coefficients expressed in the column B of the Table no 3, Annex no 2, the equation no 1 presents the linear model of multiple regression identified for the studied variable:

$$Y = 1659,258 - 619,85 \cdot X_1 + 1376,999 \cdot X_2 \quad (1)$$

where: Y – net asset of privately administered pension funds, the second pillar;

X_1 – reference interest rate;

X_2 – currency exchange lei/euro.

5. Conclusions

The present paper aims at providing an evaluation of the impact generated by certain factors of influence on the value of compulsory private pension fund assets, based on statistical methods and on a series of data on a gap of 32 months. This goal is achieved by means of the multiple linear regression equation which allows the estimate of the value of total net asset of privately administered pension funds according to two variables selected in the model.

The interpretation of the coefficients achieved from the equation (equation no 1) reveals that, according to data analyzed for the period of May 2008 – December 2010, on a short time horizon, the following correlations are manifested:

-if the value of the currency exchange lei/euro increases with one point, the value of the net asset increases with 1,376 million lei;
-if the reference interest rate increases with one percentage, the value of the total net asset decreases with 0.619 million lei.

The experience of the value fluctuation of privately administered pension fund net assets is highly important, firstly because of its effects on the increase and the decrease of invested values for the insured persons' accounts, under the circumstances of constantly maintaining their contributions and, implicitly, the results achieved through these investments.

Thus, the evolution of the currency exchange rate and of the monetary policy interest rate (reference interest rate) highly influences the assets of privately administered pension funds.

According to the achieved analysis, we should consider that, on a short time horizon, an increase of the reference interest rate will determine a slight decrease of the net asset of privately administered pension funds, an effect which has to be counter-balanced by a potential reallocation of pension funds towards investments providing better results. The analysis reveals the fact that, the evolution of the credit interest rate and of the deposit interest rate does not affect privately administered pension fund assets, while we have already pointed out, in a previous study, that it influences the optional pension fund assets, the third pillar. As well, the stock market index BET-C does not influence privately administered pension fund assets, although, shares register a significant value, of 12% of the total investments of privately administered pension fund assets.

Therefore, in order to counter-balance the effects determined by the diminution of the net asset value of privately administered pension funds, we should elaborate, on a short time horizon, a dynamic mix of their investments able to adapt to the fluctuations of their influence factors. Thus, new opportunities will be generated in order to achieve the efficiency of pension funds and to prevent the diminution of the value of insured individuals' contributions to these pension funds.

CENTRAL BANK INDEPENDENCE AND MACROECONOMIC PERFORMANCES – AN EMPIRICAL APPROACH

Dumiter Florin Cornel

Vasile Goldiș Western University of Arad Faculty of Economic Sciences

Coroiu (Petriș) Sorina

University of Oradea Faculty of Economic Sciences

The empirical evidence upon the macroeconomic performances of the independent central banks do not always have been successfully. In some cases, the consistency of the indices based on the interpretation of central banks statues used for measuring the degree of central bank independence is controversial, particularly for some of the indices. Moreover, the correlations between central bank independence and macroeconomic performance variables are not always confirmed, the causal relationship between central bank independence and inflation is controversial, and the higher disinflation costs, as a result of a higher sacrifice ratio correlated with the degree of independence is controversial, too. The effects of central bank independence upon macroeconomic performances focalized upon the empirical evidence of inflation, output or economic growth and the disinflation costs. This is due to the lack of studies vis – á – vis of relationship between central bank independence and macroeconomic performances regarding some variables like interest rates and budgetary deficits. Specialists consider inflation and output as the main determinants of the social welfare. The economic literature regarding this fact suggests that the central bank is seen as a free lunch institution. This hypothesis sustains that independent central banks will have social benefits in terms of lower inflation rates, but without any costs in terms of the real macroeconomic performances as a higher output volatility or a lower economic growth. In this article we provide a qualitative analyses regarding the relationship between central bank independence and macroeconomic performances. For this purpose the authors' used the new index for measuring central bank independence and inflation targeting based on three pillars: political and legal central bank independence, central bank governance and conduct of monetary policy, central bank transparency and accountability. For estimating the connections between the evolution of central bank independence and macroeconomic performances we used five macroeconomic variables: GDP in constant prices, Harmonised Price Consumer Index, unemployment rate, budgetary deficit and current account deficit. Both measuring the degree of central bank independence and evaluating the average levels of the macroeconomic variables were analysed in the period 1990 – 2009, within 20 less developing countries. The final results will help clarify the complex relationship between central bank independence and macroeconomic performances in countries who fostered a large amount of institutional shift in recent years.

Keywords central bank transparency, central bank accountability, inflation targeting, macroeconomic outcomes, free lunch hypothesis

JEL Classification E50, E52, E58

I. Introduction

In the past, most central banks around the world had functioned as departments of the Finance Ministers. These institutions were obliged by law, by custom or by both to dispose of the monetary policy instruments for attaining a large number of objectives, including high levels of economic growth and employment, to finance the public spending of the governments by getting

funds and solving problems related to the payment balance. Today, contrary to what happened twenty five years ago most central banks around the world gain high levels of legal and actual central bank independence. Central bank independence and institutional arrangement like inflation targeting have become largely accepted mechanisms by many specialists. In this sense, the prior responsibility of the central bank is attaining and maintaining price stability and financial stability.

The reasons behind this institutional shift in the structure of the central banks differ from country to country. In the European Union, some amendments brought to the central banks statutes imposed in order to accomplish legal convergence imposed by the Maastricht Treaty and the European System of Central Banks Statute. An example in this sense is the amendments brought to law no. 22 of December 1997 of the German central bank who raised the tenure of the Governing Board members from two to five years, abolishing government the veto right. Moreover, price stability has been established as the primary objective of monetary policy. Once European Central Bank was established, the monetary policy in the member countries is delegated to one supranational institution, with a high degree of legal independence from the national governments interests.

In this paper we focused upon the degree of central bank independence of twenty less developing countries and their institutional evolution since 1990 by testing a new index for measuring central bank independence and inflation targeting. Moreover, we analyze the compliance between the degree of central bank independence and five important macroeconomic variables: GDP, inflation, unemployment rate, budgetary deficit and current account deficit in these twenty less developing countries in the period 1990 – 2009.

II. Track recorded of the relationship between central bank independence and macroeconomic performances

One of the most important studies dealing with the relationship between central bank independence and macroeconomic performances suggests that monetary discipline associated with central bank independence reduces the level and variability of inflation but does not have either large benefits or costs in terms of macroeconomic performance. This observation represents at least a fragment of evidence in support of theories emphasizing the neutrality of money (Alesina and Summers 1993: 159).

Some other studies find a negative correlation between central bank independence and long-average inflation. They show a negative correlation between independence and long-run average government deficits as a percent of GDP. In general they find no evidence of a possible correlation between output growth and central bank independence (Pollard 2003: 34).

Better macroeconomic performance and more efficient policy are present in more credible and, to some extent, more transparent central banks. Independence and accountability, to the extent that we are able to measure them, do not seem to explain much of the cross-country variation in macroeconomic outcomes, either individually or in conjunction with other variables (Cecchetti and Krause 2002: 56).

To examine the links between central bank independence and economic performance it is necessary to devise appropriate criteria for measuring central bank independence. In the industrialized countries, measures of central bank independence are based mainly on the interpretation of central bank laws and therefore concern legal independence only. The construction of so-called legal indices is done by structuring those criteria regarded as relevant and assigning them a value on the same numerical scale of independence (Healey and Harrison 2004: 109; Touffut 2008: 9; Laurens, Arnone, Segalotto 2009: 24).

The correlation between central bank independence and inflation rate in the developed and emerging countries is a positive one; this fact can be justified by the Philips curve, in which

governments prefer a decrease in the unemployment rate and an increase in wages, and consequently an automatic increase in the inflation rate (Dumiter 2010a: 185).

Summarizing, the most important fact is that the different indices used by one or another author distorted the accuracy of the empirical results because of the gap between *de jure* and *de facto* independence. In this study, we want to eliminate those problems by analyzing central bank independence and macroeconomic performances through the new index for central bank independence and inflation targeting.

III. Estimating the connections and correlations between central bank independence and macroeconomic performance in less developing countries

In order to evaluate and assess the impact of central bank independence regarding the macroeconomic performances we have considered appropriate to use a new index. The new index for central bank independence and inflation targeting (ICBIIT) has three main pillars: political and legal central bank independence (PLBCI), central bank governance and conduct of monetary policy (CBGCM), central bank transparency and accountability (CBTA) (Dumiter 2009a: 39-42). The new index for central bank independence and inflation targeting is constructed as a sum of thirty eight institutional arrangements both in law and practice of the central banks: nine attributed to political and legal central bank independence, regarding variables like turnover rate of central bank Governor and political vulnerability, tenures of central bank Governor and the members of the Governing Board, the appointment and dismissal procedures of the Governor and the members of the governing board; fifteen attributed to central bank governance and conduct of monetary policy regarding aspects as: price stability, the central bank pre-eminence over government in case of policy conflicts, the authority in managing the exchange and interest rates, granting direct and indirect credit to the government, the degree of central bank independence in setting the monetary policy objectives, targets and instruments; fourteen attributed to central bank transparency and accountability: disclosing time series for the main economic variables and the macroeconomic models used for policy analyses, communicating with the public and the media, announcing the current and future paths of monetary policy, auditing central bank activities.

The index is better called as a *de facto* or actual index rather than a *de jure* one, because the aggregated value is based on the actual institutional practices or norms of the central banks and not necessarily what is written in the central bank laws (Dumiter 2009b: 87). However, the new index for central bank independence and inflation targeting is an interpretation based on these laws, which are put into actual practice and those practices that are not stipulated by law.

In order to evaluate the soundness of the index for measuring central bank independence and inflation targeting (ICBIIT) it is very important to measure this index in the less developing countries. For this purpose we have considered for our study a less developing group formed by twenty countries: Argentina, Botswana, Brazil, Chile, Ghana, Jamaica, Jordan, Malaysia, Mexico, Namibia, Nepal, Philippines, Rwanda, Saudi Arabia, South Africa, Sri Lanka, Tanzania, Thailand, Trinidad Tobago, Zambia, in order to evaluate the degree of central bank independence and its evolution in countries with many institutional shifts. The measure was made by analyzing central banks laws and statutes, norms, regulations, publications, studies and other important material regarding institutional matters and actual practices of the central banks according to their websites in the period 1990 – 2009.

Given the lack of studies dealing with the relationship between central bank independence and macroeconomic performances in the less developing countries we have been focusing upon this country group. Measuring central bank independence was made by using the index for central bank independence and inflation targeting (Dumiter 2010b: 102-106). The analyses was made by comparing the levels of central bank independence and the average of five macroeconomic

variables in the period 1990 – 2009, as: GDP in constant prices, Harmonized Price Consumer Index (HPCI), unemployment rate (UR), budgetary deficit as a percent of GDP (BG) and current account deficit as a percent of GDP(CAD); they were extracted of the International Monetary Fund website, *World Economic Outlook Database*.

IV. Results of measuring central bank independence and their correlation with the macroeconomic performances in less developing countries

Measuring central bank independence according to the index of central bank independence and inflation targeting in the less developing country group (Fig. no. 1) has emerged with the following results: regarding the first pillar, central bank political and legal independence only a few countries: Mexico, Philippines and Tanzania exhibit higher levels, whereas the rest of the countries have lower scores; this is due to the government active participation in the appointment and dismissal procedures of the Governor and the members of the Board, the political vulnerability and the higher turnover rate of the central bank Governor. Moreover, the tenures of the central bank Governor and the members of the Board are beneath the length of the political cycle.

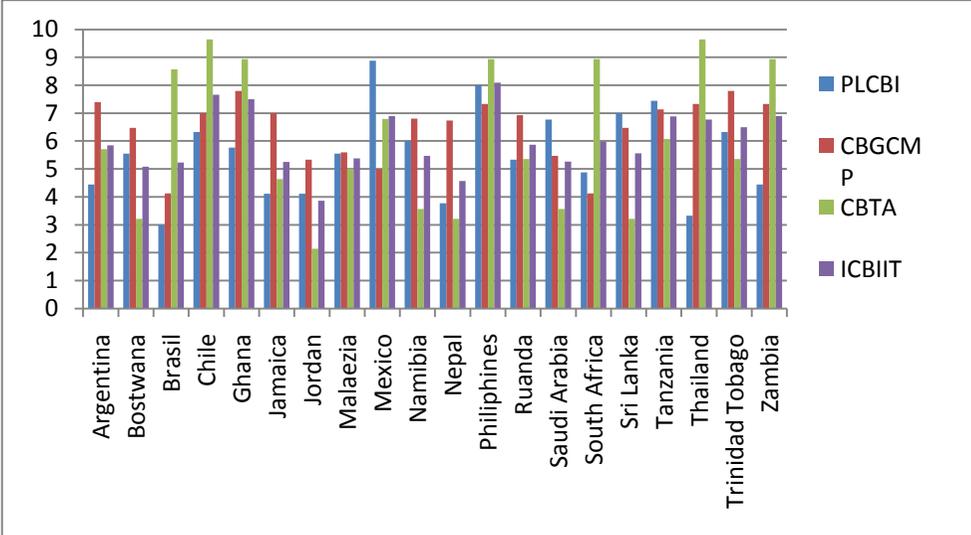

Fig. no. 1 Measuring central bank independence according to the Index for central bank independence and inflation targeting in twenty less developing countries
Source: realized by authors'

The second pillar of the index, central bank governance and conduct of monetary policy, measured in the less developing country group reveals in the majority of the countries medium to low scores due to some factors as: government prevaillace over the central bank in case of policy conflicts, multiple objectives of monetary policy without any prioritisation of one or another, financing government deficits in direct and indirect manners, government interference in establishing and managing the interest rate and exchange rate, government active implication in establishing and applying monetary policy objectives, targets and instruments.

With the exception of Chile, country that has adopted the inflation targeting as monetary policy strategy, countries in the less developing country group attain lower levels of central bank transparency and accountability pillar, due to some factors as: an unclear process of communicating and debating with the public and media regarding the monetary policy stance,

lack of time series for the main economic variables and the macroeconomic models used for policy analyses, lack of forecasts regarding inflation and output paths, lack of transparency in modifying the path and course of present and future monetary policy.

Regarding the correlation between the degree of central bank independence and macroeconomic performances in the less developing country group, the results are the following (Fig. no. 2): between central bank independence, using the index for central bank independence and inflation targeting and GDP countries as: Chile, Phillippines, Ghana and Zambia foster medium levels of central bank independence associated with good track record in terms of economic growth, while the rest of the countries gathered in this group exhibit lower levels of central bank independence and satisfactory levels of GDP.

Central bank independence and average inflation in the less developing country group are inverse correlated in countries as: Argentina, Brasil and Zambia, countries who foster lower levels of central bank independence and higher average inflation rates. Other countries as: Phillippines, Ghana, Thailand register acceptable levels of central bank independence and lower levels of inflation, while the rest of the countries exhibit lower levels both of central bank independence and inflation rates.

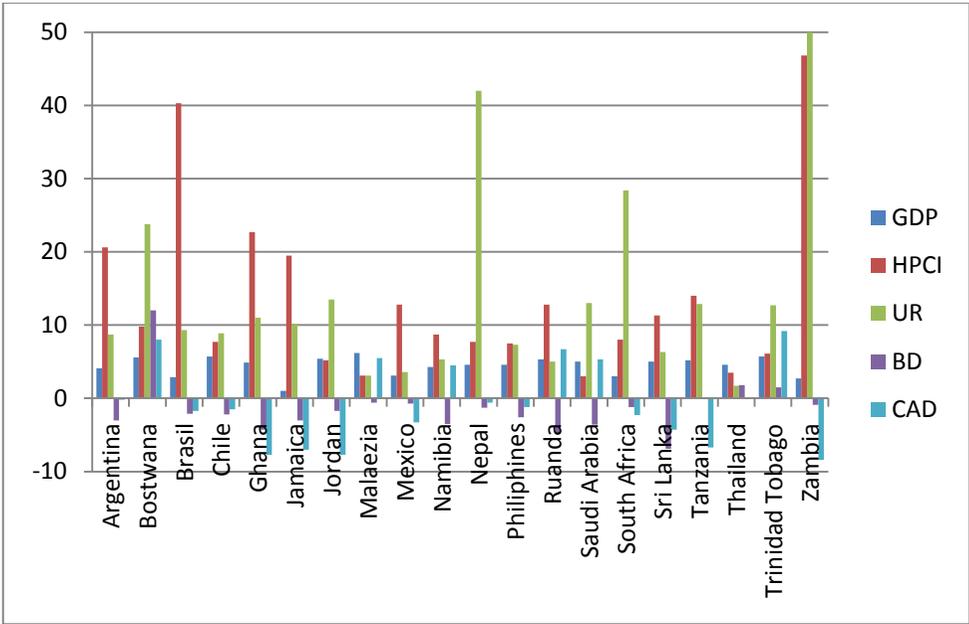

Fig. no. 2 Central banks’ macroeconomic performances average in twenty less developing countries between 1990 – 2009
Source: realized by authors’

For the relationship between central bank independence and average unemployment rate in the less developing country group, South Africa, Saudi Arabia, Bostwana, Jordan, Jamaica, Nepal, Tanzania, Trinidad Tobago and Zambia, countries who gain lower levels of central bank independence and higher average levels of the unemployment rate. At the opposite side we can remark Argentina, Brasil, Chile, Malaezia, Mexico, Namibia, Ruanda, Sri Lanka and Thailand, countries characterized by lower levels of central bank independence and of the unemployment rate.

The relationship between central bank independence and bugdetary deficit in less developing countries is split in two parts: in the first one, countries as Trinidad Tobago, Thailand, Bostwana

exhibit medium levels of central bank independence and positive budgetary deficits, while for the rest of the countries we can identify an inverse relationship between central bank independence and budgetary deficits.

Finally, the correlation of central bank independence with the current account deficit is a positive one in countries as: Saudi Arabia, Botswana, Malaysia, Namibia, Rwanda and Trinidad Tobago, while for the rest of the countries of the less developed group we can identify an inverse correlation between central bank independence and current account balance.

V. Conclusions

The vast empirical studies dealing with the relationship between central bank independence and macroeconomic performance identify a problem around the construction of the indices regarding measuring central bank independence. This situation leads to an inadequate measure of the degree of central bank independence in developed and developing countries, results which distort the connections with the macroeconomic performances.

In this article we have used the new index for measuring central bank independence and inflation targeting in order to eliminate the differences between *de jure* and *de facto* independence to a more accurate perception of central bank independence. Moreover, we focused upon several macroeconomic indicators as the average over a twenty years time horizon. The sample that we have constructed consists in twenty less developed countries that have evolved in recent years both economically and socially.

The result of our analyses suggests that central bank independence is positively correlated with the economic growth in the vast majority of countries, meaning that an increase in the degree of independence will improve the economic growth. Regarding the inflation and employment performances and the degree of central bank independence the results are very interesting: some countries with relatively independent central banks exhibit higher levels of inflation and employment, meanwhile other countries with politically dependent central banks gather lower levels of inflation and employment. This means that in less developed countries central bank independence is not an important factor to explain the inflationary trends and the unemployment rate movements.

Finally, the relationship between both current account balance and budgetary deficits are emerging: in some countries there is a positive relationship between central bank independence and budgetary deficit and current account balance, meanwhile in other countries we can identify an inverse relationship between these two variables.

COMPETITION IN THE BANKING SYSTEM OF REPUBLIC OF MOLDOVA

Enicov Igor

Universitatea de Stat din Moldova, Facultatea Științe Economice

Chetraru Aliona

Universitatea de Stat din Moldova, Facultatea Științe Economice

The banking system is one of the financial market segments which plays an important role in the financial circuit both at the country level and as a component of the international financial system. Developing a competitive banking system allows to avoid monopoly situations creating the possibility for each bank to be oriented to a certain range of services and products provided willing to increase continuously their quality and attractiveness. The dynamic analysis of effective competition in the domestic banking system would allow determination of factors with negative influence on the rate of participation of each bank in the total bank portfolio items, and also the possibility of reviewing the financial policies pursued in the banking sector. Study of bank system competition is a topic of interest both for financial analysts, and for authorities, given the opportunities arising: qualitative assessment of competition in the banking sector, verifying in which way the regulations in force have influenced the dynamics of competition, measuring the intensity of competition in the banking sector, detection, based on statistical analysis of competitive situation, of the main qualitative types (categories) of financial institutions active in the financial market. Moldova's banking system, according to the results obtained by analyzing the competition, has a moderate competition, even if it is obvious its increasing trend. Banking policies, trends in international financial markets, internationalization of capital markets affect the position of the banking system on domestic financial market, implicitly calculating the contribution of each bank in the formation of the portfolio: bank assets, total regulatory capital, the volume of loans and deposits.

Keywords: banking system, competition, Gini coefficient, Herfindahl–Hirschman, Lorentz distribution.

Study of bank system competition is a topic of interest both for financial analysts, and for monetary authorities. Main concerns regarded qualitative assessment of financial-banking sector competition, verifying the degree in which way the regulations in force have influenced the dynamics of competition, measuring the intensity of competition in the banking sector and qualitative appreciation of competitions' dynamics, detection, based on statistical analysis of competitive situation, of the main qualitative types (categories) of financial institutions etc. It is important for Republic of Moldova to know how did the banking system evolve, in time, what measures and actions were taken and what other measures are necessary to be implemented. Or, it is absolutely necessary to know, pertinently and reliably, main force relations of the financial-banking actors of the market and their evolution in time. The article presents the results of some instruments and mathematical-statistical methods used in worldwide theory and practice for qualitative appreciation of the level and dynamics (changes) of competition in the banking sector of Republic of Moldova.

Statistical data used in this article include the years 1999-2010, on portfolio elements, mentioning the following categories: total assets of the commercial bank, normative capital, amount of credits and deposits for 15 banks that activate (as an exception, in 2008 the number of commercial banks equaled to 16).

The methodology of analysis and appreciation is as plentiful and various, as well as complex. The theory proposes a wide range of procedures and graphical and numeric instruments to

measure the level and dynamics of competition, and for interpretation of the obtained results. Among them, the mostly used, worldwide, are those from the domain of study and analysis of units' concentration in a statistical collectivity, in our case, statistical collectivity being the banking system, and the units – commercial banks.

The analysis of concentration in the banking system regards the assessment of the concentration degree of diverse elements from a commercial bank portfolio (assets, deposits, credits, ATMs, released cards, clients, etc.) and, on this base, of the level of competition and the main force ratios between commercial banks in Republic of Moldova.

Also, the assessment of concentration is used for market structure reference (credit market, deposit market, etc.). In this case, the concentration study might be supplemented with diversification assessment.

Concentration study is applicable just for positive value variables; with values that are susceptible to addition (addition of values makes economic sense!).

Statistical characterization of concentration can be achieved by two categories of procedures: numeric procedures (computation) and graphical procedures.

Assessment of the concentration degree through numeric procedures consists of computing some concentration indicators, such as the coefficients of the concentration degree:

- Gini concentration indicator
- Herfindahl–Hirschman indicator

Assessment of the concentration through graphical way consists in putting up the concentration curve — Lorentz–Gini curve.

The concentration curve

The graphical procedure for concentration reference was belabored by Corrado Gini (Italy) and Lorentz (USA) for the study of income disparity. In our days, this procedure has numerous applications, inclusively in illustration and concentration assessment of sundries portfolio elements in the banking sector.

Graphical determination of concentration assumes putting up the concentration curve, also named Lorentz–Gini curve. For competition analysis in the banking system, the Lorentz curve is applied for graphical representation of percentage distribution of a variable (portfolio elements: assets, normative capital, credits, deposits etc.) in every commercial bank of a banking system. Generally, the curve is represented as cumulated values of the variable (on the ordinate), in percentage, as a function of relative effectives (in percentage) cumulated of commercial banks (on the abscissa).

The concentration curve is a graphical representation of q variable as a function of p variable. The values of the two variables are defined by the relations:

$$p_i = \frac{n_i}{N}, i = 1 \dots N, n_0 = 0, n_i = n_{i-1} + 1 \quad (1)$$

$$q_i = \frac{x_i}{\sum_{j=1}^i x_j}, i = 1 \dots N, L_0 = 0, L_i = L_{i-1} + x_j \quad (2)$$

The values of p_i and q_i variables vary between 0 and 1. If the values of characteristics is totally and equally distributed, the Gini indicator equals to zero, expressing a perfect equality in the banking system, namely every commercial bank has the same level of the characteristic (which states for a high competition level between commercial banks). If the indicator is equal to 1, the situation states for maximum inequality, because just one bank has entirely the studied characteristic (a situation with minimum competition and monopoly of a bank). The more the concentration curve is closer to the diagonal, the stronger the concentration is.

Numeric procedures for concentration assessment

From the category of numeric procedures, the following two will be treated: Gini concentration indicator and Herfindahl–Hirschman indicator.

Gini concentration indicator - i_G - is a concentration synthetic indicator of distributions, defined as a ratio between two surfaces: concentration surface S_c and half of square surface (Gini), as given below:

$$i_G = \frac{\text{Concentration_Surface}}{\frac{\text{Square_Surface}}{2}} \quad (3)$$

Because the surface of the square equals to 1, the concentration indicator i_G is twice the surface between the concentration curve and the first diagonal of Gini square, which is the double of the concentration surface:

$$i_G = 2 \times S_c \quad (4)$$

The value of the concentration indicator is always between 0 and 1, respectively between 0 and 100%, reflecting the variation from the null concentration to a maximum concentration.

Herfindahl–Hirschman indicator

Herfindahl–Hirschman indicator expresses the concentration degree of a market (e.g. credits market, deposits market etc.) taking into account the dispersion (distribution inequalities) existing between the biggest commercial banks. It's being defined as the sum of squares of market shares held by commercial banks.

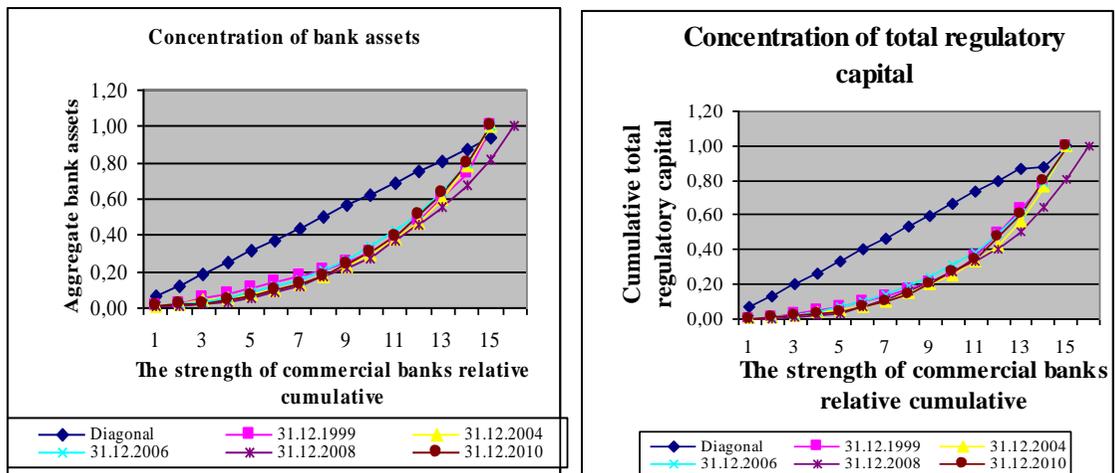

$$H = \sum_{i=1}^N (s_i)^2 \quad (5)$$

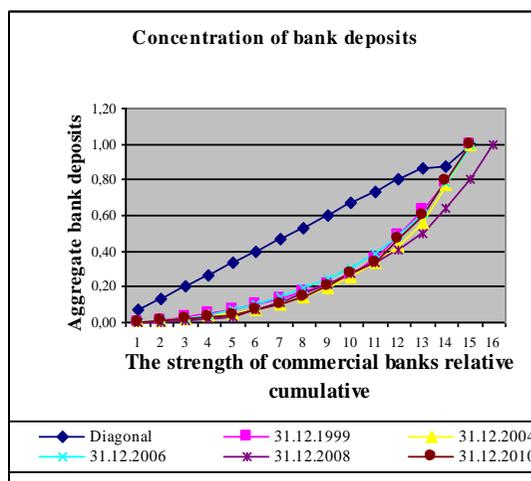

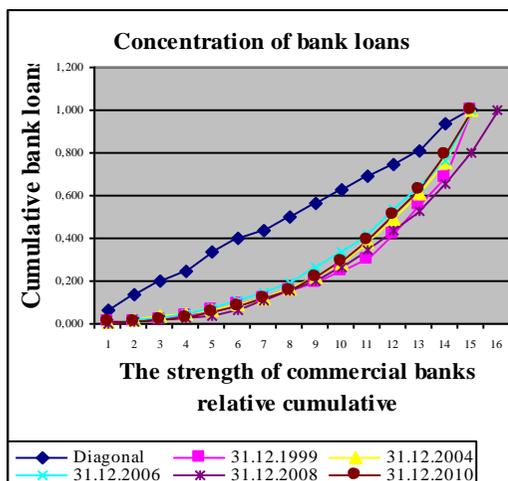

- where s_i represents market shares of all commercial banks.

The market shares are expressed in percent. The value of Herfindahl–Hirschman indicator varies between 0 and 10000. The bigger the value of Herfindahl–Hirschman indicator is, the more concentrated the market is. In case of monopoly (maximum concentration), the indicator is equal to 10000, but in case of a competition market, with an infinite number of participants (the perfect situation), the indicator approximates to zero.

The graphics of concentration curves, on portfolio elements, are presented below.

Analyzing the presented graphics, as well as the numeric values of concentration indicators (Gini and Herfindahl–Hirschman), authors conclude that:

The concentration of all portfolio elements analyzed is stressed (the Gini indicator is between 0.316 and 0.546). For the analyzed period (years 1999 to 2010), the competition between commercial banks intensified (decrease of the concentration degree of portfolio elements and of diverse financial market segments). The competition in the banking system is determined, inclusively, by foreign banks' penetration in the inland market, connection of activity standards to international standards, extension of proposed services and performed operations.

Concentration curves' graphics have underlined the main qualitative types of commercial banks, traced by the individual concentration degree of portfolio elements, by the position on the market and by the main relations between commercial banks from Republic of Moldova. Based on the results of the statistical analysis, there were defined three main categories of commercial banks:

- 1ST TYPE — *Moldova-Agroindbank*, which is detaching from the other commercial banks of Republic of Moldova's banking system, due to important market shares (app. 20% out of every portfolio element)

- 2ND TYPE — *Four big commercial banks*: Victoriabank, Banca de Economii, Moldindconbank and Eximbank.

- 3RD TYPE — *Next ten commercial banks*.

In numeric expression, the main relations between commercial banks (stressed out by concentration curves), are presented as follows:

- first 10 commercial banks (3rd type) hold approximately 30% of total bank assets, the rest of 70% is hold by the five big commercial banks (1st and 2nd type)

- first 10 commercial banks (3rd type) hold approximately 37% of total normative capital, the rest of 63% is hold by the five big commercial banks (1st and 2nd type)

- first 10 commercial banks (3rd type) hold approximately 40% of total bank deposits, the rest of 60% is hold by the five big commercial banks (1st and 2nd type)

- first 10 commercial banks (3rd type) hold approximately 29% of total bank credits, the rest of 71% is hold by the five big commercial banks (1st and 2nd type)

- 1ST TYPE *Moldova-Agroindbank*, at the end of 2010, for the first time in the analyzed period, conceded the position of market leader on attracted deposits, for Victoriabank, registering a drop of 0,8 p.p.

It was observed that the group of ten 3rd type banks, in analyzed period, had increased their contribution to every portfolio element, in average with 2-4%, the market share of 1st and 2nd type banks being decline.

In the 2nd type group of banks, repeated reshufflings have been registered, determined by evolution trends of national banking segment, as well as by financial market in general, Mobiasbancă and Banca Socială conceded their positions.

In respect to Republic of Moldova, combined analyses are preferred, both in real terms, and in nominals.

Although the analysis of indicators' dynamics (Gini, Herfindahl-Hirschman), stress out the tendency of competition intensification in the national bank system, however, the analyzed portfolio elements are concentrated by three banks: *Moldova-Agroindbank*, *Victoriabank* and *Banca de Economii* in direct ratio of 50%. Financial crisis from 2007-2008 had reduced the concentration movement of the portfolio elements, increasing the market share of banks with a significant weight on the market, simultaneously, decreasing the influence of small banks.

"Babes-Bolyai" University, Cluj-Napoca, Romania*

Exchange rates forecasting is, and has been a challenging task in finance. Statistical and econometrical models are widely used in analysis and forecasting of foreign exchange rates. This paper investigates the behavior of daily exchange rates of the Romanian Leu against the Euro, United States Dollar, British Pound, Japanese Yen, Chinese Renminbi and the Russian Ruble. Smoothing techniques are generated and compared with each other. These models include the Simple Exponential Smoothing technique, as the Double Exponential Smoothing technique, the Simple Holt-Winters, the Additive Holt-Winters, namely the Autoregressive Integrated Moving Average model.

Keywords: Forecasting, Simple Exponential Smoothing, Double Exponential Smoothing, Holt-Winters Additive, Holt-Winters Multiplicative.

JEL clasification: G17, F31, F47.

I. Introduction

The exchange rate reflects the ratio at which one currency can be exchanged with another currency, namely the ratio of currency prices. The relevant literature implies, by the purchasing power parity theory, that in the long-run exchange rates converge to an equilibrium level. The question that arises is related to the behavior in the short-term of the exchange rates, and how these fluctuations might affect the financial market players, the investors as well as those directly influenced by changes in the exchange rate. To forecast exchange rates there are numerous models, which are more or less complicated for modeling the relationship between currencies, but those interested do not always have the resources needed to fully benefit from them, or as suggested by the literature, most of exchange rate models based on macro economic data are considered outperformed. So prediction methods based on the random walk models and exponential smoothing techniques can be used in capturing the fluctuations the short-run. The main goal of this study is to present the performance of methods for the task of exchange rate forecasting, using the exchange rates of Romanian Leu versus the most important currencies in terms of international trade, namely the Euro, United States Dollar, British Pound, Japanese Yen, Chinese Renminbi and the Russian Ruble.

II. Literature Review

The efficiency of exchange rate predictability by models based on past information in time series is the main question raised. The relevant literature on currency forecasting issues includes a wide range of methods. (Meese and Rogof: 1983) have shown that models that are based on the random walk hypothesis in forecasting exchange rates outperform those based on macroeconomic indicators. But when the time horizon is extended past 12 months, the same

authors, together with (Chinn and Meese: 1995), respectively (Mark: 1995) argue that this efficiency is lost. (Mark: 1995) investigates the movements of the U.S Dollar against four major currencies in a time period of 18 years, his findings indicating that exchange-rate models based on macroeconomic fundamentals have a higher forecast ability than those based on random walk. (Chinn and Meese: 1995) using non-parametric and parametric models examine the predictive performance of both types of models, using the exchange rate of U.S Dollar against four currencies, over a time horizon of 17 years. They reach to the conclusion that random walk models outperform the models based on fundamentals, but only in the short-term, when it comes to larger periods of time, more than 36 months, this superiority is lost. (Marsh and Power: 1996) use 22 forecasters to predict movements in three major currencies against the U.S. Dollar, including the random walk estimators. (Andreou, Georgpoulus and Likothanassis: 2002) employ neural networks to predict four currency movements against the Greek Drachma, using information about macroeconomic factors from the point of view of the market participants, concluding that the greatest impact have those information which correspond to the trend of the time series. (Goldberg and Frydman: 1996), testing a time period over 15-years the exchange rate of the U.S. Dollar against German Mark, found that all structural exchange rate models are outperformed by the random walk model. They consider that the failure of empirical exchange rate models is largely due to periodic shifts in the long-run relationship governing the exchange rate and macroeconomic fundamentals, due to an instable monetary-policy, which in turn produces shifts in the cointegrating vector. However (Hwang: 2001) finds long-term cointegrating relationships between exchange rate and macroeconomic factors in some of the analyzed series, but in the short-term two random walk models are found to exceed the traditional models. (Kilian and Taylor: 2001) try to combine the models based on macroeconomic indicators with those on random walk, considering that in the long-run these models are optimal. It is apparent that in the related literature both types of models are used, but the ones using macroeconomic indicators are efficient in the long-run, while predictability in the short-term is ensured by models based on random walk.

III. Methodology

A. Single Exponential Smoothing Technique (MNES)

To forecast the exchange rates in the first step the single exponential smoothing procedure is applied, this model assuming that the series is stationary, without a trend. Simple exponential smoothing is used for short-range forecasting, usually just one month into the future. The relationship which characterizes the the single exponential smoothing procedure is:

$$Y_n = a + \varepsilon_n \quad (1)$$

Where a represents the constant, while ε_n stands for the residuals. To forecast the $n+1$ moment in the moment n , the following series is computed recursively :

$$\hat{Y}_{n+1} = \alpha \cdot Y_n + (1-\alpha) \cdot \hat{Y}_n, \text{ where } n = \overline{1, t+k}; \quad (2)$$

The number of available observations is shown by t , where k stands for the time horizon for which forecasts is made. α is the smoothing factor, which can take values between 0 and 1, a close value to 0 means that the expected values for $n+1$ are equal to the prior forecast, and a value close to 1 suggests that the forecasts are equal to the previous observation. The value of α is usually determined by minimizing the sum of squares of the forecast errors:

$$\frac{1}{n} \sum_{i=0}^{n-1} (y_{n+1} - \hat{Y}_{n+1})^2 = \frac{1}{n} \sum_{i=0}^{n-1} e_{n+1}^2 \quad (3)$$

The (2) relationship is applied recursively for each observation from the series, each new smoothed value \hat{Y}_{n+1} is computed as the weighted average of the current observation, Y_n and the previous smoothed observation, \hat{Y}_n . Thus each smoothed value \hat{Y}_{n+1} is the weighted average of the previous a n observations, the weights of these decrease exponentially in the past, so Y_1 has a weight of $\alpha \cdot (1-\alpha)^{n-1}$, Y_2 a weight of $\alpha \cdot (1-\alpha)^{n-2}$, Y_{n-1} being weighted with $\alpha \cdot (1-\alpha)$. So equation (2) can be written as:

$$\hat{Y}_{n+1} = \alpha \cdot \sum_{i=1}^n (1-\alpha)^i \cdot \hat{Y}_{n+1-i} \quad (4)$$

The initial value of \hat{Y}_1 is usually equal to Y_1 , or with the average of the initial values of the series.

B. Double Exponential Smoothing Technique (MNED)

This method applies two equations recursively for the Y_n , namely:

$$S_n = \alpha \cdot Y_n + (1-\alpha) \cdot S_{n-1} \quad (5)$$

$$D_n = \alpha \cdot S_n + (1-\alpha) \cdot D_{n-1} \quad (6)$$

where S_n is the single smoothed series and D_n is the double smoothed series. α stands for the smoothing parameter, between $0 < \alpha \leq 1$. This method is appropriate for series with a linear trend, the forecasts from double smoothing are computed as:

$$\hat{Y}_{n+h} = \left(2 + \frac{\alpha \cdot k}{1-\alpha}\right) \cdot S_n - \left(1 + \frac{\alpha \cdot k}{1-\alpha}\right) \cdot D_n = \left(2S_n - D_n + \frac{\alpha}{1-\alpha} \cdot (S_n - D_n) \cdot k\right) \quad (7)$$

Expression (7) can be interpreted as an equation with intercept $2S_n - D_n$ and slope $\frac{\alpha}{1-\alpha} \cdot (S_n - D_n)$. The initial values for S_1 , respectively D_1 are usually set to be equal with Y_1 , or with the average of the initial values of the series.

C. Holt –Winters Simple Exponential Smoothing Technique (MHWES)

This method is appropriate for series with a linear trend and no seasonal variations. This technique is using two recursions, the forecasted series being:

$$Y_{n+k} = a + b \cdot k \quad (8)$$

Where a is the intercept, while b, stands for the slope, which are computed recursively:

$$a_n = \alpha \cdot Y_n + (1-\alpha) \cdot (a_{n-1} + b_{n-1}) \quad (9)$$

$$b_n = \beta \cdot (a_n - a_{n-1}) + (1-\beta) \cdot b_{n-1} \quad (10)$$

α and β are smoothing factors, where these can be found within the interval $\alpha, \beta \in [0,1]$, being determined by minimizing the sum of squares of the forecast errors. Each prediction is computed based on the previous one, so the slope b_n of the series is multiplied by the forecast horizon, k,

and this will be added with the intercept of the series, a_n the estimated values of the series will be determined by the relationship:

$$\hat{Y}_{n+k} = \hat{a}_n + \hat{b}_n \cdot k \quad (11)$$

The initial value of a_1 , is usually Y_1 , while b_1 is general set to be equal with 0, or with the average of the initial values of the series, or with the difference of the initial observations.

D. Holt –Winters Multiplicative Exponential Smoothing Technique (MHWEM)

This method is appropriate for series with a linear trend and multiplicative seasonal variation, the smoothed series is given by:

$$\hat{Y}_{n+k} = (a + b \cdot k) \cdot c_{n+k} \quad (12)$$

Where a_n a is the intercept, while b_n is the trend of the series and c_n the multiplicative seasonal factor, each of these three coefficients are defined by the following recursions:

$$a_n = \alpha \cdot \frac{Y_n}{c_{n-s}} + (1 - \alpha) \cdot (a_{n-1} + b_{n-1}) \quad (13)$$

$$b_n = \beta \cdot (a_n - a_{n-1}) + (1 - \beta) \cdot b_{n-1} \quad (14)$$

$$c_n = \gamma \cdot \frac{Y_n}{a_n} + (1 - \gamma) c_{n-s} \quad (15)$$

Where α, β and γ are smoothing factors, where these can be found within the interval $\alpha, \beta, \gamma \in [0,1]$, and are determined by minimizing the sum of squares of the forecast errors while s is the seasonal frequency component. The forecasts are computed as:

$$\hat{Y}_{n+k} = (\hat{a}_n + \hat{b}_n \cdot k) \cdot \hat{c}_{n-s+k} \quad (16)$$

The initial value of a_s are equal with the average of the initial values of the series from the first

seasonal cycle, $a_s = \frac{1}{s} \cdot \sum_{i=1}^s Y_i$, while b_s is given by $b_s = \frac{1}{s} \cdot \left(\frac{Y_{s+1} - Y_1}{s} + \frac{Y_{s+2} - Y_1}{s} + \dots + \frac{Y_{2s} - Y_s}{s} \right)$,

and the the multiplicative seasonal component is estimated by $c_1 = \frac{Y_1}{a_s}; c_2 = \frac{Y_2}{a_s}, \dots, c_s = \frac{Y_s}{a_s}$.

E. Holt –Winters Additive Exponential Smoothing Technique (MHWEA)

This method is appropriate for series with a linear trend and additive seasonal variation, the smoothed series is given by:

$$\hat{Y}_{n+k} = a + b \cdot k + c_{n+k} \quad (17)$$

Where a_n, b_n and c_n are defined as in the previous model, only this time c_n is the additive seasonal factor, each of these three coefficients are defined by the following recursions:

$$a_n = \alpha \cdot (Y_n - c_{n-s}) + (1 - \alpha) \cdot (a_{n-1} + b_{n-1}) \quad (18)$$

$$b_n = \beta \cdot (a_n - a_{n-1}) + (1 - \beta) \cdot b_{n-1} \quad (19)$$

$$c_n = \gamma \cdot (Y_n - a_n) + (1 - \gamma) c_{n-s} \quad (20)$$

Where α, β and γ are smoothing factors, within the interval $\alpha, \beta, \gamma \in [0,1]$, and are determined by minimizing the sum of squares of the forecast errors, while s is the seasonal frequency component. The forecasts are computed as:

$$\hat{Y}_{n+k} = \hat{a}_n + \hat{b}_n \cdot k + \hat{c}_{n-s+k} \quad (21)$$

The initial values of the additive seasonal factor are estimated by: $c_1 = Y_1 - a_s$; $c_2 = Y_2 - a_s$, ..., $c_s = Y_s - a_s$.

F. ARIMA Models

Autoregressive moving average models -ARMA(p,q)- are recommended to be based on stationary series, with the form:

$$Y_n = a_1 Y_{n-1} + a_2 Y_{n-2} + \dots + a_p Y_{n-p} - b_1 \varepsilon_{n-1} - b_2 \varepsilon_{n-2} - \dots - b_q \varepsilon_{n-q} + \varepsilon_n \quad (22)$$

$$\rightarrow Y_n - a_1 Y_{n-1} - a_2 Y_{n-2} - \dots - a_p Y_{n-p} = \varepsilon_n - b_1 \varepsilon_{n-1} - b_2 \varepsilon_{n-2} - \dots - b_q \varepsilon_{n-q} \quad (23)$$

$$\rightarrow (1 - a_1 L - a_2 L^2 - \dots - a_p L^p) Y_n = (1 - b_1 L - \dots - b_q L^q) \varepsilon_n \quad (24)$$

$$\rightarrow \phi(L) Y_n = \theta(L) \varepsilon_n \quad (25)$$

Where p is the order of the autoregressive part, while q is the order of the moving average part, and ε_n represents the white noise. Validation of ARMA (p,q) models is based on minimizing the AIC and BIC criterias, also by verifying the correlation of the error terms of the model, finally measuring the departure from normality of these. The ARMA models, as stated, can only be used on stationary series. A series is stationary if its values oscillate around a reference level. In the terminology of time series analysis, if a time series is stationary it is said to be integrated of order zero, or I(0) for short. If a time series needs one differential operation to achieve stationarity, it is an I(1) series, and a time series is I(n) if it is to be differenced for n times to achieve stationarity. So for nonstationary series the ARIMA (p,d,q) models will be used, namely the autoregressive integrated moving average models, where d is the order of differentiation for the series to become stationary. So an ARIMA (p,d,q) model can be rewritten as:

$$\phi(L)(1-L)^d Y_n = \theta(L) \varepsilon_n \quad (26)$$

Where L is the lag operator, and the order of differentiation is equal to: $\Delta^d Y_n = (1-L)^d Y_n$ (27)

E. Forecasting results:

The forecasting results are measured by the following indicators:

$$\text{Sum of squared errors: } SPE = \sum_1^{n+k} e_{n+1}^2 = \sum_1^{n+k} (\hat{Y}_n - Y_n)^2 \quad (28)$$

$$\text{Root mean squared error: } RME = \sqrt{\sum_1^{n+k} (\hat{Y}_n - Y_n)^2 / (n+k)} \quad (29)$$

$$\text{Mean absolute error: } MAE = \sum_1^{n+k} |\hat{Y}_n - Y_n| / (n+k) \quad (30)$$

$$\text{Bias Proportion: } DM = \left(\left(\sum_1^{n+k} \hat{Y}_n / (n+k) \right) - \bar{Y} \right)^2 / \sum_1^{n+k} (\hat{Y}_n - Y_n)^2 / (n+k) \quad (31)$$

Shows how far the mean of the forecast is from the mean of the actual series.

$$\text{Variance Proportion: } DV = (\sigma_{\bar{Y}} - \sigma_Y)^2 / \sum_1^{n+k} (\hat{Y}_n - Y_n)^2 / (n+k) \quad (32)$$

Where $\sigma_{\bar{Y}}$, σ_Y represent the standard deviation of the series \hat{Y}_n respectively Y_n , indicating how far the variation of the forecast is from the variation of the actual series Y_n .

$$\text{Covariance Proportion: } DCOV = 2(1 - \text{cov}(\hat{Y}_n, Y_n)) \cdot \sigma_{\hat{Y}} \cdot \sigma_Y / \sum_1^{n+k} (\hat{Y}_n - Y_n)^2 / (n+k) \quad (33)$$

Where $\text{cov}(\hat{Y}_n, Y_n)$ represents the relationship between the forecasted series \hat{Y}_n , and the actual series Y_n ; the proportion measuring the remaining unsystematic forecasting errors.

Theil Inequality Coefficient:

$$CT = \sqrt{\sum_1^{n+k} (\hat{Y}_n - Y_n)^2 / (n+k)} / \sqrt{\sum_1^{n+k} \hat{Y}_n^2 / (n+k)} + \sqrt{\sum_1^{n+k} Y_n^2 / (n+k)} \quad (34)$$

This coefficient lies between $[0;1]$, where a value close to 0 indicates a perfect fit of the forecasted series, \hat{Y}_n to the actual one Y_n .

IV. Empirical findings

The statistical data used in this study consist of daily exchange rate between 6 currencies, which were extracted from <http://bnr.ro/>. The sample period is from 03 January, 2011 to 22 April, 2011; totalling 80 daily observations for each series, on 16 weeks. The exchange rates are: EUR/RON, USD/RON, GBP/RON, JPY/RON, CNY/RON, RUB/RON.

These exchange rates were selected because of their role in international transactions of Romania. The results of the first five models are compressed in (Table 1), namely in (Table 2), together with the forecast evaluation coefficients.

To identify the adequate $ARIMA(p, d, q)$ model, the stationarity of the series was tested, by applying the *testele ADF-Augmented Dickey-Fuller* and *PP-Phillips-Perron* unit root tests. At these tests the results regarding the stationarity of the indices are the same, namely the series EUR/RON, USD/RON, JPY/RON, CNY/RON are stationary, in the case in which the observed series has no intercept and no trend, $\Delta y_t = \theta y_{t-1} + \sum_{i=1}^p \phi_i \Delta y_{t-1} + \varepsilon_t$, with a probability of 95%, so $d=0$.

The other series, GBP/RON și RUB/RON, are nonstationary, at first differentiation they become stationary, so they are $I(1)$, and $d=1$.

To determine the autoregressive order, namely the moving average order the PAC- partial autocorrelation coefficients and the AC- autocorrelation coefficients were evaluated. To validate the obtained models the significance of the coefficients was tested, all the parameters of the model are significant with a probability of 95%. The second set of tests was applied to the residuals, to establish if they follow a white noise process. So the autocorrelation of the residuals was tested by the Q Statistics, at Q(10), Q(15) and Q(30), all indicating that the first 30 correlations between the residual are insignificant. To investigate the normality of the residuals the Jarque-Bera test was applied, which indicates that they are normally distributed. The final results of ARIMA models (p, d, q) can be found in (Table 3) while the forecast coefficients indicators are in (Table 4.).

V. Conclusions

All the results indicate the appreciation of the Romanian Leu against the other currencies. In the case of the first five forecast techniques the results are similar, from the point of view of the forecast coefficients, which points out that the optimal models were found. The exponential smoothing techniques in some cases outperform the ARIMA models, because of the speed with which they adapt to the smallest changes to the market conditions. In addition, the ARIMA models present some difficulties in estimating and validating the model, are more effective in rendering the medium-term trend, in our case 4 months. So these models show the changes in trend, while the forecasting models based on exponential smoothing techniques are an effective tool for those interested in the evolution of the exchange rate.

This work was possible with the financial support of the Sectoral Operational Programme for Human Resources Development 2007-2013, co-financed by the European Social Fund, under the

project number POSDRU/107/1.5/S/77946 with the title „Doctorate: an Attractive Research Career ”.

MEASURES AND INSTRUMENTS USED AS A RESPONSE TO CRISES IN EUROPEAN UNION – AN OVERVIEW

Fîrțescu Bogdan

Faculty of Economics and Business Administration (FEAA), Iasi

During latest times, financial crises have been a common occurrence in emerging market (and transition) countries with negative influence for the economies. Financial crises have had negative effects on real output, work force, poverty and political instability. Latest crises (2008) that struck US become international, its consequence being received in European countries too. This paper wants to discuss some intervention measures taken in the European Union Area and some important funds used as tools for crises fighting. The European Economic Recovery Plan and EU funding mechanisms (The European Social Fund (ESF) and The European Globalization Adjustment Fund (EGF)) are taken into discussion.

Key words: crises prevention instruments , financial system, The European Economic Recovery Plan and EU funding mechanisms (The European Social Fund (ESF) and The European Globalization Adjustment Fund (EGF))

JEL classification: G10, G20

This paper / article received financial support through the project „Studii Post-Doctorale în Economie: program de formare continuă a cercetătorilor de elită – SPODE”, finance contract POSDRU/89/1.5/S/61755, European Social Fund, project funded by Human Resources Development Operational Programme 2007-2013

Actual crises (started in summer 2007) is considered to be without precedent in post-war economies related to its size and extend, but also has many common features with recessions in the past. The crises was headed, in an international approach, by a rapid credit growth, availability of liquidity at a low price, low risk premiums, strong leveraging, development of bubbles in real estate sector (US subprime market). In Romania, the crises was preceded by easy credit access (so called “creditul cu buletinul”), rising prices in real estate sector explained by trouble-free admission to credit, growth in imports and consumption, growing wedges (in some sectors). These factors contribute to vulnerable financial institutions that jeopardize the entire system. Such occurrences happened before (Japan and the Nordic countries in the early 1990s, the Asian crisis in the late-1990s), but this time, the crisis became global.

In its early stages, the crisis manifested with an heightened liquidity shortage among financial institutions, rising the concerns about solvency of financial institutions, and culminating with the default of Lehman Brothers. After that, confidence collapsed, investors considerable liquidate their positions, and stockmarket went into crisis. Related to EU economy, this downturn was compared to facts happened during the Great Depression of the 30’s.

International background

Crises in statistic data- an overview

The world economy faced during latest period severe stress tests and criticisms of the authorities and civil society around the world, the banks being made responsible for the financial crisis started in 2008. Recently, the Basel Committee on Banking Supervision, the agency to monitor international banking activity, said the world's largest banks have a cash deficit of 1.730 trillion

Euros (2.287 trillion U.S. dollars), a problem are required to solve in the next three years. Also, the 91 largest banks and a capital deficit of 577 billion Euros compared to 7% level that you must meet to enter into class I, a measure of financial stability. Although markets were ready to hear capital deficit, and the reduction of liquidity shock could be more difficult to repair, since the euro area faced market dysfunctions.

For the first time since 1980, world economic growth fell into negative trend (-0.6%), with the euro area economy declining 4.1 %. Trade has been adversely affected, dropping more than 20% at global level and 16% at European level.. It is estimated that the performance of EU Member States will be among the weakest, with a growth of 1 % against 4.6%, on average, at world level. Government stimulus was significant in 2009: average fiscal deficit at EU level reached almost 7% of GDP and public debt as a share in GDP increased by 12 %age points (and an additional rise by around 6 %age points is foreseen for 2010). These developments are not sustainable and therefore call for fiscal consolidation measures in most European economies. The withdrawal of fiscal stimuli may hamper the resumption of economic growth in Romania's main trading partners and could adversely affect demand for Romanian exports in the future. The international financial system received a strong support from monetary and fiscal authorities in 2009. Central banks in many developed economies resorted to extraordinary policy measures to provide liquidity². Monetary policy rates dropped to historical lows (1 % in the case of the single European currency and near 0 % in the case of the US dollar). Given that the standard monetary policy easing measures have been almost exhausted, some central banks switched from the yield-based approach to a quantitative one.

The central banks of those advanced economies saw a significant increase in the size of their balance sheets and in the maturities of their asset holdings. Most major global banks meet minimum capital requirements, but many would be forced to restrict the payment of bonuses and dividends, if the new rules of Basel III (which regulates banking activity) should be applied immediately. That is why, according to the agreement, the requirements will be met by one, over eight years. It is believed that new regulations, much tougher to maintain a capital "healthy" for at least 7% (compared to 4.5% as it was before), will have a modest impact on the overall economy, despite business feared a negative impact on output and unemployment (see below - 1.4. Basel Accords requirements). Basel Committee said that if measures are implemented over a period of eight years, as is planned, would result in a maximum decline of 0.22% of global GDP. In addition, given that Basel III will be introduced between 2013 and 2019, the maximum impact on GDP would not be seen only in nine years. These new regulations could "cut" 3% of economic growth over the next five years in the U.S., Euro zone and Japan could eliminate 10 million jobs.

The debt crisis emerged in the Euro area , where banks are deeply involved. German banks have borrowed amount equivalent to 6% of GDP in Germany to Ireland and another 6.2% to Spain. Thus, over 12% of the GDP of most powerful countries in the European Union is in the hands of two countries with the highest risk. Also, British banks such as Barclays and HSBC should be to recover loans to Ireland, which is equivalent to 9.4 per cent of UK GDP. Amounts equivalent to 5.7% of British GDP is in the form of bank loans in Spain.

Dutch banks appear to be located in the worst case, the amount representing 16.4% of GDP of the country borrowed Spain. Amounts due to banks equivalent are closed to 13% of GDP in Portugal, and 8.9% of GDP in France. Ireland, which just received a loan of around EUR 85 billion from the IMF and the EU. Irish banks have lost a third of deposits due to fears of bankruptcies and, moreover, have borrowed amount equivalent to 14.5% of GDP. American banks are not better from this point of view, borrowing, together, 353 billion dollars to Portugal, Ireland, Greece and Spain. To prevent a real disaster, Ireland is already the fourth nationalization of the banks, Allient Irish Banks (AIB), which offered 3.7 billion Euros. (all data is in

concordance with). The world economy deteriorated significantly in 2009 (down 0.6 %), its first contraction in 30 years, while the EU economy saw a sharper fall (more than 4 %), the important government stimulus packages notwithstanding.

The Romanian economy followed a similar trend as the other countries in Central and Eastern Europe, except Poland. The economic contraction was sharp (7.1%) and the fiscal deficit widened substantially (to 7.4 % of GDP) (according to European economic statistics, Eurostat, 2010, accessed on epp.eurostat.ec.europa.eu/cache/ITY.../KS-GK.../KS-GK-10-001-EN.PDF: 1-7).

Global crises and effects on EU

Some authors suggests that actual crises has three phases:

The first phase – so called “toxic securities” – began in the United States, than spread to Europe through the banking systems in which these high-yield and financial instruments with high-risk accounted for large intermediation.

The second phase of the crisis was marked by the reduction of the economic activity in 2009. To combat the effects of the crises, the ECB adopted a expansion monetary policy, and fiscal stimulus was introduced in almost all EU countries.

The third phase of the crisis, that is typically assigned to EU, began with the “discovery” of the critical state of the public finances in Greece in early 2010 (other countries faced the same situation e.g. Portugal) and the rapid contagion of most of the European sovereign debt market.(Saccomani, 2001: 3)

In response to downturn of the European economy, EU took a series of actions, most important of the measures for crises fighting being as follows:

- the stimulus package – the European Economic Recovery Plan (EERP)
- EU funding mechanisms: The European Social Fund (ESF) and the European Globalization Adjustment Fund (EGF).
- Europe 2020 strategy – New skills for new jobs.

The European Economic Recovery Plan

Objectives, major pillars and key principle of the EERP

As a response to crises, a European Economic Recovery Plan (EERP) was proposed by the Commission in a communication to Parliament in November 2008, with the declared goal of crises fighting. The EERP had two major pillars and one key principle. The first pillar was aiming the boost of economic demand and stimulation of consumer s confidence. The second pillar referred the competitiveness in the long term. The underlying principle was solidarity and social justice. Regarding the first pillar the Commission’ proposal was that Member States and the EU to agree a budgetary impulse amounting 200 billion Euros (1.5% of EU GDP) in order to boost demand. The second pillar proposed “smart” investments for tomorrow needs: investing in energy efficiency to create jobs and save energy; investing in infrastructure and inter-connection; investing in clean technology to boost construction and automobiles sectors for preceding the low-carbon future market. As regards of the challenges the EERP was to open up new finances for SMEs, cut administrative burdens and start investments to modernize infrastructure (Barroso 2008: 3).

The strategic aims of the EERP were: stimulate demand and boost confidence of the consumers; lessen the human cost of economic crises; tune the economy for future needs as Lisbon Strategy for Growth and Jobs statutes by structural reforms, innovation and building knowledge economy; speed up shifts to low carbon economy through new technologies, new green collar jobs, open up new opportunities in fast growing world markets.

For achieving tactical aims the EERP proposed to exploit the synergies and avoid spillover effects, use all available policies, focusing on fiscal policies, structural and financial market reform, also ensuring coherence between strategic and tactical aims.

Actions for supporting real economy in boosting confidence

In order to achieve this goal, taken actions had to combine monetary and credit aspects, budgetary policies and actions in Lisbon strategy for growth and jobs. Even if all actions are important, our paper focuses on budgetary policy actions. Even though some monetary and credit conditions are taken into discussion. In this approach, it become important to emphasize the role of the European Central Bank and other central banks, the role of national banks, and the role of European Investment Bank and the European Bank for Reconstruction and Development.

Role of ECB, central banks, EU banks, EIB and EBRD

In time of crises, it is considered that monetary policy has a crucial role in order to achieve the reduction of inflation over the medium-term. Some actions had been done; ECB along with other EU central banks had been already cut interest rates, being a scope for further reductions. The objective was to the stabilization of markets and contribution to liquidity.

Reliable and well function financial system (primarily the financial sector) is a premise to a healthy, growing economy, so stabilizing the banking system becomes an important step for promoting a sustainable recovery. The Commission proposal refers to major financial support provided by the Member States to the banking sector for encouraging normal lending activities and boost investments. Related to EIB and EBRD, current crises reinforced interventions, EIB was expected to increase its early intervention with 15 billions Euro, to incorporate reserves to reinforce its capital base (60 billions Euro), and EBRD was also supposed to add 500 millions Euro per year to its level of financing (according to *Communication from the Commission to the European Council – A European Recovery Plan*, COM (2008) 800, 2008: 7, presented on the official website of the European Commission).

Proposals related to Budgetary Policy

In time of crises budgetary policy has an even important role in stabilization of the economy and sustain demand. The Commission recommended a co-ordinated policy in the Member States, focused on budgetary stimulation packages. The proposals for 2009 Related to national budgets included an budgetary impulse of 170 billions Euro (1.2% of Union's GDP) in order to achieve the growth of the European economy and lower the unemployment. Growing expenditures and/or reductions of taxation were also proposed. The budgetary stimulation should have taken account of the starting position of the states. For states, particularly those from outside the Euro area, which were facing significant external and internal imbalances, policy had to essentially target the correction of such imbalances.

The budgetary stimulation was designed to respect the following principles:

- should be co-ordinated and used temporarily;
- should use revenue and expenditure as budgetary instruments;
- Stability and Growth Pact should be respected;
- should be accompanied by other structural reforms in order to grow the demand.

Conclusions of the EERP

The European Economic Recovery Plan was designed to impulse Europe's economy. It was proposed for achieving the following targets:

- European Commission and the Council should work together to ensure that national and EU measures would amount 1.5% of GDP;

- make use of impulse measures respecting the flexibility in accordance with the Stability and Growth Pact;
- accelerate the proposed actions outlined in the European Economic Recovery Plan by legislative activity needed for implementing these measures;
- identify any further measures necessary at EU and Member State level to stimulate the recovery;
- work together with international partners to implement global solutions to strengthen global governance and achieve the economic recovery.

EU funding mechanisms

The European Social Fund (ESF)

The Fund is considered to be the EU's largest instrument for intervention on labour markets and for investing in people. The amount of money spending is more than €10 billion per year. The goal is to give support for Member States to reform labour markets and their institutions. The crises intervention through this instruments consisted in €19 billion of the ESF's operations in 2009-2010 targeted to assist Member States for "rapid reaction packages" together with social partners.

Related to Fund management during crises, the rules were simplified, in order to achieve the following goals:

- guidance on good practices to foster implementation;
- interventions for targeted employment services with upskilling and training measures;
- mobility and entrepreneurship incentives,
- support for those in particularly difficult situations, such as young people or older workers.
- training measures focused on the shift towards a green economy.

The European Globalization Adjustment Fund (EGF)

The Fund was created to support workers who lose their jobs in cases where enterprises shut down, factories are relocated to a country outside the EU, or a sector loses many jobs in a regio., The EGF can help workers to find new jobs . The intervention is set to maximum annual amount of €500 million. The EGF provides one-off, time limited individual support through active measures as follows:

- job search assistance, occupational guidance, tailor-made training and retraining, including IT skills and certification of acquired experience, outplacement assistance and entrepreneurship promotion or aid for self-employment;
- special time-limited measures, such as job search allowances, mobility allowances or allowances to individuals participating in lifelong learning and training activities.

In order to fight the crises, some amendments were introduced for simplifying the Fund procedures. Some major changes are presented below:

- the redundancy threshold was lowered to a ceiling of 0.35 % of the annual maximum amount of the EGF, used to finance administrative and technical assistance
- co-financing rate was increased.
- indirect costs of Grants (declared on a flat-rate basis) became eligible for a contribution from the EGF of up to 20 % of the direct costs of an operation.
- period for the eligible actions was extended. (***, EU's Response to the Crisis:2)

Conclusions

The EU recession recovery is proving to be slow and fragile, with lots of disparities through European countries. The growth was modest in some Member States, and other are still in recession. Given the future economic growth foreseen for 2011, unemployment is likely to begin

declining this year. Future challenges for the EU and its Member States are related to the balance and measures to fight crisis, called crises exit strategies. The main objective is to support further economic growth and employment, the minimization of difficult labor market conditions during the recovery and beyond. This increase is needed for labor market policies. Those are aimed at preventing long-term unemployment, helping peoples to maintain or find a job.

Since the beginning of the financial and economic crises many news came to light which discussed the increasing number of non-performing loans, and the fact that as a result of the company break-downs, the bank portfolios have also gone worse and worse. In this paper our goal is to find out which internal factors influence the solvency of a company, therefore, to point out the weaknesses of the current Romanian rating systems, which as we will see, do not take into only relevant criteria when according a loan to a company. In order to conduct this study, we choose 18 indicators from several categories to predict bankruptcy. Some of the indicators mentioned above are really common in the international and the Romanian literature (e.g. ROA, ROE, ROS, assets turnover ratio), some of them are less. On a sample of 3000 Romanian companies we use the T-test statistical method to find out if an indicator is significant or not. The sample consists of companies (defaulted and non-defaulted as well) which have presented their financial statements (balance, profit and loss account between 1999 and 2008). For each company a set of 18 financial indicators was calculated, but the results obtained show that only 8 of them is significant in predicting bankruptcy: ROA, assets turnover ratio, equity/total assets, general leverage, current assets to total assets, cash to total assets, total assets and sales. In the next step, by analyzing the obligatory forms used in credit lending, we conclude which indicators are used by different Romanian commercial banks. We found that only four out of seven banks calculate all of the significant indicators identified in the first part of the paper. Finally, we made a proposal about which quantitative indicators should the banks use to minimize the credit losses and to avoid the overdue payments. In addition, we consider that the banks should pay attention to the qualitative factors as well to effectively filter out non-performing loans.

Keywords: corporate failure, default, risk, financial ratios, rating systems, Romania

JEL-codes: G32, G33, D22

I. Introduction

The subject of our paper is a typical bank management issue whose importance is standing out now more than ever due to the financial crisis of the present days. As we know, because of the influence of the declining economy, many banks face the problem of late payments (1) and non

performing credits. This trend is also true for the corporate credit portfolios of the Romanian commercial banks (2). In this paper we try to reveal those deficiencies of the rating systems used in the Romanian bank sector which result in the erroneous consideration of the credit applies. We want to know what kind of economic and financial indexes are used by banks during the consideration of a credit apply, and which are significant in the prediction of the solvency of companies according to the relevant literature in the domain. Having studied the literature, we choose 18 relevant indexes that we calculate afterwards for more than 3000 companies from the county of Maros in the period of 1999-2008. Firstly, we determine the average of the indexes in the case of solvent and non-solvent companies, searching for significant differences. Secondly, we make a research to find out which are the indexes used by some Romanian banks (3). In the conclusion we offer a recommendation referring to the indexes which should be used to increase the commercial banks' rating system's efficiency.

II. Literature review

Both the national and the international literature are dealing with the topic of the non-solvency prognosis. In our project we are searching for the explanatory indexes which are significant and relevant in analyzing the solvency of the Romanian companies. The relevant indexes, their definition and empirical support are presented in the table below. In the last column we mention the name of the author in whose work the respective indicator was used.

Table 1: Name, definition and empirical support of indicators

Indicator	Name	Definition	Empirical Support
ROE	Return on equity	Net Income/ Equity	Malcom, S. & Dah, K. (2007); Andreica, M. et all (2008); Mazilescu, V. et all (2010); Barbuța-Mișa, N. (2010)
ROA	Return on assets	Net income/Total assets	Malcom, S. & Dah, K. (2007); Bonfim, D. (2007); Andreica, M. et al. (2008); Trenca, I. & Benyovszki, A. (2009);
ROS	Return on sales	Net income (before interest and tax)/ Sales	Cielien, A. et al(2004); Malcom, S. & Dah, K. (2007); Trenca, I. & Benyovszki, A. (2009);
Costumer rotation speed	Costumer rotation speed	Net tincome/ Number of costumer	
Costumer rotation time	Consumer rotation time	365/ Costumer rotation speed	
Assets rotation speed	Assets rotation speed	Net income/ Total assets	Malcom, S. & Dah, K. (2007); Trenca, I. & Benyovszki, A. (2009)
Equity ratio	Equity ratio	Equity/Total assets	Clien, A. Et al (2004); Bonfim, D. (2007); Trenca, I. & Benyovszki, A. (2009); Mazilescu, V. et al. (2010)
Indeptedness	Debt ratios	Total debt/ Total assets	Laitinen, E & Laitinen, T. (2000); Kenneth, C. et al (2004); Trenca, I. & Benyovszki, A. (2009); Barbuta-Misa, N. (2010); Abbas, Q. & Abdul,R. (2011)
Solvency	Solvency	Liabilities/ Own equity	Trenca, I. & Benyovszki, A. (2009); Laitinen, E. & Laitinen, T. (2000)
Liabilities cover	Liabilities cover	Number of costumer/ Liabilities	
Fixed assets cover	Fixed assets cover	Own equity/ Fixed assets	
Capital ratio	Capital index	(Fixed asset+ Stocks)/ Own equity	

Indicator	Name	Definition	Empirical Support
Current assets ratio	Current assets ratio	Current assets/ Total assets	Abbas, Q. & Abdul, R., (2011)
Liquid assets	Liquid assets ratio	Liquid assets/ Current assets	Trenca, I. & Benyovszki, A. (2009)
Total Balance Sheet	Total Balance Sheet	Log (Balance Sheet)	
Net income	Net income	Log (Net income)	Kenneth, C. et al. (2004); Bonfim, D. (2007)
Fixed assets return	Fixed assets return	Net income/ Fixed assets	
Short term cover	Short term cover	(Liquid assets+ Accounts receivable)/ Fixed assets	

Source: Own editing

The outcomes of the researches are different, depending on the corporate structure of the countries and the industries examined. Malcom S. and Dah, K (2007) considered to be relevant the ROA, ROS and assets rotation speed, indicators also examined by us. In addition to those listed above, Trenca, I. and Benyovszki, A. (2009) consider that the proportion of the own capital, the indebtedness, the solvency and the proportion of the funds are also important factors. According to the research of Bonfim, D. (2007) the ROA, the own equity and net income are significant. The following authors consider significant variables in predicting the bankruptcy: Andreica, M. et al. (2008) ROA and ROE, Mazilescu, V. et al (2010) ROE and the own equity ratio, Barbuta-Misa, N. (2010) ROE and debt ratio, Clie, A. et al. (2004) ROS and own equity ratio, Laitinen, E & Laitinen, T. (2000) debt ratio and solvency, Kenneth, C. et al. (2004) debt ratio, Abbas, Q. & Abdul, R., (2011) current assets ratio.

III. Methodology

We test 18 indexes (4) of around 3000 companies in county Mures, based on their financial statements in the period 1999-2008. In the examined period different number of solvent and non-solvent company data was processed. These numbers are specified in the next table by their dummy variable (5). The ratio presented shows the percentage of the defaulted companies in the current year.

Table 2: Sample composition

	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008
Defaulted companies	52	60	68	50	105	131	147	151	111	72
Non-defaulted companies	963	1093	1206	705	1738	2087	2389	2732	3236	3618
Total	1015	1153	1274	755	1843	2218	2536	2883	3347	3690
Ratio	5,12%	5,20%	5,34%	6,62%	5,70%	5,91%	5,80%	5,24%	3,32%	1,95%

Source: Own editing

We use the T-test method (6) to choose the significantly determining factors of the solvency of the companies. The applicability criteria of the test is the matching of the standard deviations, which we test using the F-test (7). We work with a 5% significance level. The Independent Samples T Test compares the mean scores of two groups on a given variable.

Furthermore, based on the forms used, and the requested documents in the event of a loan request we examine seven Romanian commercial banks (Banca Transilvania, Bancpost, BCR, BRD,

CEC Bank, OTP Raiffeisen Bank, Volksbank) which are considering the above mentioned indexes in their evaluation process. We try to guess which indicators of those found significant are used by them.

IV. Results

The T-test (6) data from Table 3. (see Appendix) are used as the main criteria in our way to choosing the significantly determining factors of the solvency of the companies. The applicability criteria of the test is the matching of the standard deviations, which we test using the F-test (7). Table 3 contains the results of the T-test (8).

The data from the table shows, that during the ten years, different variables proved to be significant (in total 8 indices): the **ROA** eight times, the **assets rotation speed** nine times, **own equity ratio** five times, **debt rate** six times, **current asset ratio** five times, **liquid assets** five times as well, **total balance sheet** eight times, and **net income** was significant only in one year. None of the other ten variables can be used in order to predict bankruptcy.

In addition, we analyzed the forms of the commercial banks, which are used in the landing process. The required documents at OTP bank include the yearly balance sheets for the last ten years and a monthly balance sheet from the last 3 months. The bank also requires information about the business activity. Thus, in the case of the OTP bank all of the data is available from the documents to calculate the eight indicators, that were found significant in our study. Just like for the OTP bank, we found that for the BCR, Banca Transilvania and BRD the relevant data are obtainable, and thus they shouldn't find it difficult to assess which companies will be able to pay back their loans and which not.

At the Raiffeisen Bank, CEC Bank and Volksbank among the two yearly balance sheets, the form only asks about the structure of the own equity. Using these documents only the ROA, the own equity ratio, debt rate, current assets ratio, liquid assets, total balance sheet can be calculated. However the rotation speed of assets and net income, which proved to be significant nine times, cannot be calculated.

V. Conclusions

This work focused on identifying the financial indicators which are significant in the prediction of the solvency of companies. The research was elaborated with the use of a sample containing about 3000 companies having their financial statements in the period of 1999-2008. For each company 18 financial indicators were calculated (ROE, ROA, ROS, Costumer rotation speed, Costumer rotation time, Assets rotation speed, Equity ratio, Indepthedness, Solvency, Liabilities cover, Fixed assets cover, Capital ratio, Current assets ratio, Liquid assets, Total Balance Sheet, Net income, Fixed assets return, Short term cover), but the results obtained show that only 8 variables influence significantly the probabilities of default of the companies. the ROA eight times, the assets rotation speed nine times, own equity ratio five times, debt rate six times, current asset ratio five times, liquid assets five times as well, total balance sheet eight times, and net income was significant only in one year. None of the other ten variables can be used in order to predict bankruptcy.

However, all of these variables are quantitative indicators, but we consider that the qualitative factors have a key role in predicting bankruptcy and the banks should develop a more quantifiable, integrated system for measuring them. We believe that the economic sector, the industry have a major importance as well in the prediction of the solvency of the firms, aswell as the management, partners, and other elements, as well. In the future we intend to analyse these variables, too.

VI. Notes

1. According to the reports of the National Bank of Romania the number of loans rated as bad loans were triple in 2010 compared to 2008
2. According to the reports of the National Bank of Romania around 1% of the loans granted to SMEs in 2008 were delayed, while in 2010 this reached 10%. At large companies this rate raised from 0.3% to 3.2%
3. Banca Transilvania, Bancpost, BCR, BRD, CEC Bank, OTP, Raiffeisen Bank, Volksbank
4. Return on equity, Return on assets, Return on sales, Costumer rotation speed, Costumer rotation time, Equity ratio, Assets rotation speed, Indeptedness, Solvency, Liabilities cover, Fixed assets cover, Capital ratio, Current assets ratio, Liquid assets, Total Balance Sheet, Net income, Fixed assets return, Short term cover
5. Dummy variable: 0 value, if the company defaulted and 1 value, if the company didn't default
6. Independent sample T - test
7. The hypotheses: a H0: the standard deviations do not differ significantly in case of the two samples (defaulted and non-defaulted companies); H1: significantly differ
8. The hypotheses: a H0: the means do not differ significantly in case of the two samples (defaulted and non-defaulted companies); H1: significantly differ

THE RISK OF FAILURE - CAUSES AND CONSEQUENCES OF THE IT INDUSTRY

Moscviciov Andrei

Faculty of Economics and Business Administration Babeş-Bolyai University, Cluj-Napoca, Romania

In this paper the author shows the ways to assess the bankruptcy risk using a related system of methods: economic, managerial, banking and statistics. At the end of this paper is addressed this issue with the help of Robertson Model.

Keywords: bankruptcy risk, economic risk, financial risk

JEL Classification: G32

1. Introduction

Business activity is subject to risk at any time. In general, it is considered that risk is the probability that an undesired event occurs.

Depending on its market position, economic and financial situation, economic environment, respectively the climate in which it operates, a company can support more difficult or easier the risks it is subject to. Basically there is no economic activity in which risk does not interfere at a certain time. But its intensity may be different depending on the field, market trends, image of the country in the global context, etc.

2. Method and Results

Companies are usually subject to the following types of risk: economic, financial and bankruptcy. Financial welfare diagnosis is a means of obtaining accurate and qualitative information about the real possibilities of the company at the beginning stage of the economic crisis. A company with a serious analytical system is able to recognize in time the approaching crisis. With the help of financial analysis can be found vulnerable spots in the company's economy and can be proposed efficient solutions for the company to get out of the difficult situation.

In our opinion, *bankruptcy risk* can be defined as the inability of firms to cope with a financial-banking transaction, namely their inability to reimburse in time the sums borrowed under the conditions agreed with the banks in the credit contracts. The risk of bankruptcy can be the result of difficulties showing up that initially, at the analysis stage and also credit evaluation and approval stage could not be identified, but occurred during the contract. Therefore, the diagnosis process of failure risk is to assess the firm's ability to meet commitments to others, therefore in the assessment of company's solvency.

With the purpose of analyzing risk, experts rely on the financial theory that provides a series of concepts that have enabled the recent opening of the financial analysis of the company. The traditional approach of financial diagnosis, widely inspired by the concerns of bankers, the risk was perceived as a risk of insolvency. From this point of view the customer's financial analysis is divided into several stages: working capital cycle analysis; analysis of performance indicators; analysis of capital structure, indebtedness; liquidity analysis.

In the area of risk in lending, financial analysis was focused mainly on critical assessment of credit records, ran from a banking point of view. Its analytical scheme could be therefore summarized to two basic points:

- companies address to banks or other financial institutions a credit application, in general conditions of excess of demand over supply;
- financial diagnosis should allow the selection of applications, eliminating those with very high probability of non-recovery (i.e. those with high risk) and thus making the adjustment between demand and credit offer.

As in the financial theory is prevalent the concept which defines risk through the variability of results and increasing instability of company's performance, now found worldwide, it can not remain unexplained, financial analysis has widen the risk concept linking it first to the notion of financial flexibility, namely the ability of companies to adapt financially to environmental change. This is because the risk is seen now by the outcome variability, variability that is better controlled by the company as it has a high degree of flexibility.

The analysis (diagnosis) of risk perceived by the company can go along with the company capacity analysis to cope with this risk (i.e. the flexibility analysis), the two analyses are not totally identical; a true analysis of financial flexibility is needed more to a strategic diagnosis than a financial one. Secondly, broadening the concept of risk of financial analysis was done by deepening companies' difficulties study and by the more elaborate analysis of the risk of bankruptcy. Financial diagnosis received these new tools in its efforts, aspect reflected by the use of the notions: "financial leverage effect", "operating leverage effect", "scores" or "ranks". The rank consists in grading or classifying securities, being subject to transactions on a capital market, using a synthetic indicator in the study of results and cash flows that generate problems to the companies and bankruptcy risk analysis.

Even though statistically it was found that the frequency of strictly financial difficulties is limited, financial analysis comes with important contributions in studying and treating the companies' difficulties as all causes of degradation ultimately have a direct impact on performance or financial position.

Traditional contributions of financial analysis to detect "risk businesses" are related to the use of its instruments: balances, rates, flow panels, etc. The multitude of indicators provided by these tools has made necessary the search for global notation (SCOR), allowing taking into account only significant indicators and highlighting the interdependences of different features that they translate. One can thus achieve empirical or statistical risk detection.

Credibility represents the material and moral support, the essential element without which a credit may not be granted. Gaining trust requires knowing the customer which is produced by an activity of analysis and documentation, so that an assessment as close to the real asset and financial situation is done, recognition of manufactured products and services, relationships with partners, professionalism of management. When lending, the bank takes a credit risk, reduced by a careful evaluation of the borrowers, establishing exposure limits and implementing a prudent provisioning policy when there is danger of loss.

Investigation of customer activity in order to know him is pursued and completed by the analysis of creditworthiness, which allows on the one hand reducing the credit risk and on the other hand establishing an image of the client and the uncertainty degree incurred by the bank in order to make the decision to continue the customer's analysis for credit approval.

The risk of the requested loan default is generated by:

- borrower's inability to generate adequate cash flows as a result of adverse events in business activity due to economic and political environment;
- uncertainty about future value and quality, the liquidity degree and the market value of debtor's collateral materials;
- borrower's business deterioration.

For this, through the financial analysis the bank seeks to identify and quantify the risk of client's performance, liquidity risk and the risk of capital structure and financing. Customer creditworthiness is ascertained using the indicators that define it and express his ability to pay his obligations about to assume by signing the credit agreement. Bankruptcy risk analysis can be achieved using some methods, which in terms of the form of the link between phenomenon (the company's solvency) and its influence factors can be grouped in my opinion into four categories (Fig. no.1) (management methods, economic methods, statistical methods and banking methods), which will be discussed below.

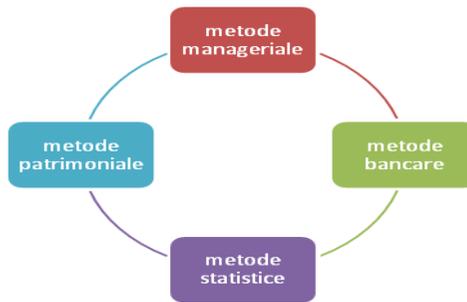

Figure no.1 Methods of analyzing the bankruptcy risk

Professor Robertson identified four elements that produce changes in the firm's financial health, namely: market stability, lower profits, lower working capital, and loan growth. Professor Robertson scoring function is as follows:

$$Z = 3,0 X1 + 3,0 X2 + 0,6 X3 + 0,3 X4 + 0,3 X5$$

in which:

$$X1 = \frac{(Turnover - TotalAssets)}{Turnover}$$

$$X2 = \frac{GrossResult.of.the.Financial.Exercise}{Total.Assets}$$

$$X3 = \frac{Current.Assets - Total.Liabilitie\ s}{Total.Liabilitie\ s}$$

$$X4 = \frac{Equity - Loans}{Total.Liabilitie\ s}$$

$$X5 = \frac{Liquid\ assets - Overdraft}{Loans}$$

Z function aims to the changes that occur in the firm's financial situation from one period to another. If the Z score depreciates by 40% or more than 40% in one year, automatically the analysis should identify the causes of Z score reduction. If the score is 40% or over 40% in two consecutive years, then the company cannot survive because of its financial instability.

An alternative to the scoring method, practiced in particular by banks is "normative comparison", the creditworthiness of traders who use credit, which is shown below (Stănescu, Ișfănescu and Băicuși 1996: 250).

Source: Author's calculation.

The data analysis shows that except for 2009, IT companies in Romania have not had financial problems.

3. Causes of Bankruptcy

The causes generating difficulty for the company have different origins. From statistical studies done over longer periods of time was found that about 51% of the causes generating bankruptcy are those from socio-economic and competitive environment in which the company works:

- increasing national and international competition;
- emergence of substitute products;
- loss of a major customer or his bankruptcy;
- bankruptcy of an important supplier that provides certain materials, parts, components essential for the continuation of the company's work;
- bankruptcy of a bank with which the company had prevailed relationships;
- the emergence of more stringent regulations on safety line and environmental protection;
- continuous drop in the stock market quotation for listed companies.

In another order of ideas one should also consider domestic nature causes which led to at least half of the bankruptcies according to statistics. These causes are overwhelmingly related to poor management:

- stock and customer rotation lower than the rules of the sector;
- the practice of lower margin than similar businesses;
- repeated losses from operations;

- inability of credit renewal.

An attempt to systematize the many causes generating difficulty states or even bankruptcy may take into account the following grouping criteria:

a. Causes related to the reduction of activity:

- the downward trend in demand for products made by the company;
- loss of key customers;
- declining competitiveness of the company's products;
- low degree of renewal of products, respectively adapting to needs;
- conjectural decrease in demand;
- enhanced national and international competition;
- bankruptcy of major suppliers.

b. Cases related to reducing margins and profitability:

- inadequate strategic decisions;
- selling price rigidity;
- too high staff costs;
- the existence of fixed assets technically obsolete;
- the large share of financial charges;
- unexpected increases in raw material prices.

c. Specific cases related to company's treasury:

- difficulties in getting loans to finance;
- long term stock rotation;
- term extension of clients' credit;
- term reduction of supplier's loan

d. Specific causes to the management system:

- managers' inadequate training and inability to adapt to new market conditions;
- misunderstandings between members of management;
- poor analytical accounting and failing to recognize the full cost;
- lack of substitutes for current leaders;
- excessive compensation of managers.

e. Accidental causes:

- misappropriation of funds;
- natural disasters;
- internal social problems.

From the above mentioned factors, it can be concluded that among the causes of bankruptcy the following prevail:

- *poor management*, which seems to be the basis of over 50% of all bankruptcies. Key management errors are: bad financial advice, lack of communication with employees, loss of control over costs, inadequate marketing policies, production overcapacity etc.
- *internal problems*: unskilled labor, loss of important projects, image degradation, fraud, waste above the maximum allowed level;
- *external factors*: competition, company's life cycle; it is known that all products, services and even companies have a limited life; economic recession, disasters etc.

4. Conclusions

Bankruptcy risk and investor presents interest both to an investor and to a company's manager. Many researchers and financial institutions were and are concerned with developing *a method for predicting the risk of bankruptcy* starting from a group of rates closely related with companies' health or weakness. This is why many researchers found that measuring bankruptcy risk can be established through an empirical function which allows estimating the probability for a company to record losses and therefore be unable to honor its obligations to customers and to the banks which provided loans.

The main hypothesis of the classical fundamental analysis is to continue the company's future activity. When this probability to continue the activity falls significantly, investors are interested in estimating it in order to mitigate potential losses.

It seems absurd considering the bankruptcy of companies listed on the stock market, as it's generally known that the stringent criteria for admission to be listed on the stock market, regarding certain high levels of profitability and capitalization over the last 2-3 years, allow listing on the capital market only to very competitive and with a strong financial position companies.

But famous cases of sudden bankruptcy of companies listed on international capital markets is no longer news to investors. Thus, rapid degradation of financial performance, coupled with managers' talent to "cover up" the actual results of listed companies, have imposed the need to elaborate some models of quick prediction of their success or failure.

The importance of estimation of a firm's probability of default increased significantly during the economic and financial crisis for financial institutions, which can be explained by the fact that the share of nonperforming loans increased in this period. The probability of default can be estimated with structural models, which have on base the methodology developed by Merton (1974), methodology used by Moody's Corporation (known as KMV Merton model).

The aim of this study is to estimate the probability of default of companies listed on Bucharest Stock Exchange using this methodology.

This approach was widely used in the literature by many researchers (i.e., Kealhofer and Kurbat (2000), Crosbie and Bohn (2002), Duffie and Wang (2004), Bharath and Shumway (2004, 2008)). In Romania this methodology was empirically tested by Codirlaşu (2007), who estimated using Merton's methodology the probability of default of companies listed on the Bucharest Stock Exchange, respectively by Bobircă et al. (2008), where the probabilities of default were estimated in case of 42 companies listed on the Bucharest Stock Exchange for 2000-2008 time period.

In this paper we used Merton's model, which assumes that a company defaults if the value of its assets is less than the promised debt repayment at time T . The process of estimating the probability of default starts from the following firm specific variables: the market value of the firm's assets, the share prices, the value of the liabilities and the risk-free rate. The analyzed period is 2003-2010, containing the economic and financial crisis period, too. Analyzing the financial statements of the companies listed on the Bucharest Stock Exchange, we determined the input parameters of the model and calculated the quarterly probabilities of default of each analyzed company. According to our results the probabilities of default have a reduced value in the majority of the cases.

Keywords: Merton model, probability of default, credit risk, structural models, companies listed on the stock exchange.

JEL codes: G12, G17, G32, G33

I. Introduction

The importance of estimation of a firm's probability of default increased significantly during the economic and financial crisis for financial institutions, which can be explained by the fact that the share of nonperforming loans increased in this period. Nowadays, the question for the credit institutions and investors is not about to use statistic forecasting methods to estimate the default risk or not, it's rather about which method should be chosen. The purpose of this paper is to

estimate the probability of default in case of companies listed on the Bucharest Stock Exchange by using the Merton model, which is often used in the literature. This method can determine the probability that in subsequent period company will go bankrupt or not, based on the financial statements of each company. The Merton model prices the companies' assets and liabilities according to the theory of options. According to this model, a company goes bankrupt when the value of its liabilities exceeds the market value of its assets. The indicators used in the model are the market value of the assets, the share prices, the value of the liabilities and the risk-free rate. The investigated period is 2003-2010.

II. Literature review

The methodology developed by Merton was widely used in the literature by many researchers (for example Kealhofer and Kurbat (2000), Crosbie and Bohn (2002), Duffie and Wang (2004), Bharath and Shumway (2004, 2008)).

Duffie and Wang (2004) showed that the KMV Merton model can be used for the estimation of probability of default having a good predictive power. Tudela and Young (2003) investigated the probability of default (PD) of the companies from United Kingdom by using the Merton model. After the estimation of the probabilities of default the companies were divided into groups of defaulting and non-defaulting companies. An estimation of probability of default for the group of non-default companies was also made, with the purpose of controlling. To evaluate the results of the estimation made by the Merton model in relation with the companies' accounting information Probit-regression was used.

Erken (2008) studied that the Merton model is valid for the Dutch companies. He examined the KPN Company, which is the biggest Dutch company. The year 2000 was very instable for the firm, this way the examined period is from January 1st 2000 till December 31st 2000. The purpose is to show how this unfortunate year is reflected in the Merton model. The variables as financial information used in the model are the value of the firm namely the market value of the assets, the liabilities from the balance sheet, the risk free rate. Three steps were necessary to determine the probability of default: the estimation of the value of assets and volatility of assets, which was made by the Black-Scholes model, the calculation of the distance to default and the estimation of the probability default. Based on the case study and empirical research of KPN, as the result of the paper was established that the Merton model is appropriate for the estimation of the KPN company's probability of default, because in the examined unfortunate period the PD was 28.7%, while the volatility of assets 49.83%.

In Romania the model was tested empirically by Codirlasu (2007), who examined the probability of default (PD) for companies listed on the Bucharest Stock Exchange using the Merton model and its extension. The author analyzes 7 listed companies, and 5 investment funds between 1998 and 2006. As a conclusion he established that investment funds have the lowest (near zero) probability of default because of their diversified portfolios. From the companies, the SNP Petrom had the lowest PD, while the Oltchim had the highest PD between 2001 and 2004.

Bobircă et al. (2008) examined the probability of default for 42 companies listed on the stock market in the period of 2000 to 2008 by using Merton model. The results of their analysis show that nearly 20% of examined companies have probability of bankruptcy close to zero during the examined period, while the another 20% of companies have default probability of 50%. Between the two extreme values there were only a few companies.

III. Methodology

Merton in 1974 developed a model which prices the credits and liabilities of a company according to the theory of options.

Taking a company which finances the bought of (risky) assets (V) from two sources: the equity (E) granted by the shareholders and issuing a zero coupon bond (the nominal value of it is F , the maturity T and the market value B). The company is exposed to credit risk because of the loan, which means that in the moment T the value of the assets (V_T) is less than the nominal value of the liabilities (F).

The credit risk is present till the probability of default of the company is greater than zero (i.e., $P(V_T < F)$). In conclusion, at moment t_0 , we have that $B_0 < F \cdot e^{-rT}$, namely the yield of bond (y_T) is bigger than the risk free rate (r), furthermore the spread (π), a compensation for the assumption if the risk of the owners of the bond, can be stated as:

$$\pi = y_T - r.$$

If in the market there are no frictions, transaction expenses or expenses that appear if the company defaults, then the market value of the company's asset is equal with the sum of the equity and the value of the loan, that is:

$$V_0 = E_0 + B_0.$$

As a conclusion, the credit risk is the function of the company's financial structure:

- the leverage ratio, $LR = \frac{F \cdot e^{-rT}}{V_0}$;

- the volatility of the asset yield, σ_V ;

- the maturity of liabilities, T .

The basic idea of Merton (1974) is that if at moment T we have that $V_T < F$, then the company defaults and the value of its equity is 0. While if at moment T we have that $V_T > F$, then the firm is able to pay its liabilities and its capital values ($V_T - F$). Thus, at moment T the value of this company's capital is:

$$E_T = \max(V_T - F, 0).$$

Consequently, the value of a company's capital (E_t) can be seen as a call option on the market value of the firm's assets (V_t) and the trading price (F). So, E_t can be written as the following function $E_t = f(V_t, F, \sigma_V, r, T - t)$.

Using Black-Scholes's (1973) option pricing formula we get:

$$E_0 = V_0 \cdot N(d_1) - F \cdot e^{-rT} \cdot N(d_2),$$

where

$$d_1 = \frac{\ln \frac{V_0}{F} + \left(r + \frac{\sigma_V^2}{2} \right) \cdot T}{\sigma_V \cdot \sqrt{T}},$$

$$d_2 = d_1 - \sigma_V \cdot T.$$

The market value of the loan is $V_0 - E_0$.

The probability that a company goes bankrupt is $N(-d_2)$, and for the calculation of this, it is necessary to calculate the V_0 and σ_0 , but they are not directly observed. For companies that are listed on the stock exchange the value of the equity (E_0) can be estimated. Using Ito's lemma the equity volatility can be calculated:

$$\sigma_E \cdot E_0 = N(d_1) \cdot \sigma_V \cdot V_0.$$

Building a two-equation system on these relationships, we can estimate the values of V_0 and σ_0 .

IV. Main results

Our research includes 21 companies listed on the Bucharest Stock Exchange. We selected those companies, which have fulfilled our predefined criteria for liquidity. Under the liquidity criterion a company was analyzed, if the company's the annual number of transactions exceeded the 0.5% threshold for the total annual transactions of listed companies. The following companies were included in our sample:

- Financial intermediaries: SIF1, SIF2, SIF3, SIF4, SIF5, BRK.
- Extractive industry: SNP, DAFR, PTR.
- Processing industry: AMO, AZO, OLT, ATB, BIO, ALR, EPT, CMP, -TBM, RRC.
- Heat and electric energy: TEL.
- Transport and storage: OIL.

We collected the data of these companies for the period of 2003. IV. – 2010. III. The input data are the followings:

- accounting value of the assets of the company;
- accounting value of the company's short / long-term obligations;
- market value of the company's capital, which is calculated as the product of the value of issued shares by the company and the market price of shares;
- volatility of the annual stock price (as a proxy variable for the market value of equity), which is based on the calculation of the $\sigma \cdot \sqrt{t}$ formula, where the daily volatility is σ and the number of days(250) is t ;
- average of the monetary market rate as a proxy variable for risk-free rate.

In order to determine the probability of default, it is necessary for a hypothesis regarding the volatility of the assets of the company. We assumed that this value ranks between 20% and 40%. The model was estimated using the Matlab program.

Appendix 1 summarizes the results of Merton model, the probabilities of default of the 6 companies operating as financial intermediaries. It can be seen that the values are very low, almost 0 %. Higher values may be noticed only in the case of the BRK Company in the first three quarters of 2005, but it can be seen that the following periods have more reduced probabilities of the default.

In *Appendix 2* we summarized the results of the Merton model estimation of 5 companies, which carry out their activities in the following 3 areas of activity: extractive industry, heat and electric energy, transport and storage. It can be seen that the values in many cases remains low, which means that it is almost 0% the probability that any of the companies defaults next year. We can observe a few higher values of estimated probabilities, which mean that the probability for a company to become insolvent in the subsequent period is higher.

The *Appendix 3* contains the results of the Merton model regarding the probabilities of default of some of the companies operating in manufacturing sector. We can observe that the values can vary from a minimum value of 0.00% to a maximum value 95.87%. The high values can also indicate that the share price of the company dropped considerably in the examined period.

V. Conclusions

In this article we analyzed the probability of default of 21 companies listed on the Bucharest Stock Exchange, using the Merton methodology in 2003-2010 time periods. The results show that this methodology can be used for the estimation of probability of default in case of Romanian listed companies. Our results are in accordance with the earlier studies. The estimated probabilities of default are higher in the economic and financial crisis period. As further research can be concern the comparison of the prediction power of the structural models with other

models used for the estimation of the probability of default (such as: discriminant analyses, logit regression, neural networks) in case of Romanian companies.

THE IMPLICATIONS OF VARYING EXCHANGE RATES FOR THE INTERNATIONAL TRADE

Sandu Carmen

„Al. I. Cuza” University of Iași Faculty of Economics and Business Administration Adress: B-dul Carol I, nr. 22, Iași 700505 E-mail: sandu_carmen@yahoo.com Telephone: 0740/852.842

The benefit of international trade is a more efficient employment of the productive forces of the world.

(John Stuart Mill)

The exchange rate is a primary factor that influences economy. This instrument is used by some countries in order to improve the lack of balance caused as a result of the financial crisis felt in many countries considered by then infallible. The negative effects of the financial crisis can also be found in the decreased volume of commodities involved in international trade exchanges, as a consequence of modified prices and decreased offer. The globalizing trend leads to a constant expansion of exchanges between countries and to the consolidation of international cooperation. Except that economic interdependence generates an increased risk under the influence of economic, financial, monetary or political factors. The currency risk can generate either a gain or loss during foreign trade operations. The long period of RON depreciation made possible the entry of Romanian products on the international markets due to their prices. Sheltered by the gain generated by the evolution of the exchange rate, most of the exporters were not concerned by the increase of product competitiveness or by avoiding the currency risk. The fact that, for many years, the evolution of the exchange rate generated substantial losses for the exporters shows that risk coverage in Romania is, in most cases, a purely theoretical concept.

Key words: exchange rate, currency, depreciation, appreciation, J Curve.

Jel Clasification: F31, G15

1. The depreciation and its effect on the international trade exchanges

Generally, by depreciation we understand any decrease of the exchange rate on the currency market. Taking this into consideration, a clear differentiation has to be made between two different circumstances:

- one in which the depreciation phenomenon manifests itself unintentionally, involuntarily or, in other words, without acting in an administrative manner towards deliberate depreciation;
- the second situation, where the depreciation phenomenon is a direct consequence of some actions undertaken by the monetary authority itself in this regard, and which is a voluntary, deliberate depreciation by the monetary authority. As regards the first situation, depreciation can be caused by – as a main element – the lack of equilibrium of the balance of payments, meaning that the level of imports frontloads the level of exports as opposed to a previous time, an element that is usually combined with: the weak competitiveness of domestic products on foreign markets and the diminished purchasing power of the domestic currency caused by inflationary phenomena.

However, studies have been made and practice has shown that choosing voluntary currency depreciation can constitute a monetary policy for using the exchange rate in order to balance the country's trade balance. This monetary policy option was based on a scheme of set foreign exchange rates, especially where depreciation could be established through administrative means, but was also applicable in the case of exchange rate schemes with managed floating.

The monetary authority can act deliberately upon the national currency exchange rate by buying foreign currency, so as to determine an increase in the exchange rate compared to other currencies, and thus, a depreciation of the currency. The direct consequence is the stimulation of exports which, according to the new terms, become more attractive and, on the other side, the inhibition of imports which, although there might be demand, are more expensive, and as the importer's profit margins are getting thinner, it is possible that his activity will be performed at the limits of return of profit, thus causing him to give up.

Under these conditions, the impact of deliberate depreciation on international exchange becomes a way of shifting the demand for goods and services from one country to another instead of changing the international demand level. (Rădulescu Magdalena 2005:64):

internally, depreciation will move the demand from imported goods towards the domestic ones; externally, deliberate depreciation of an exporting country's national currency will move the demand of another importing country from the area of domestic goods to the one of imported goods, made by the first country.

In general, it has been noticed that, if a country depreciates its exchange rate, it will then succeed, in fact, in attracting a more significant amount of the international demand to its own products and, accordingly, the domestic production will be stimulated, since under the new conditions, it will have to adapt to a developing level of demand (the export component).

The national currency depreciation (Ghe. M. Voinea 2007: 99) stimulates the exports of that country because the exporters cash a higher amount in national currency and impedes imports, since the importers spend a higher amount in order to pay for the goods obtained on the external market. Also, the currency depreciation gives advantages to the debtor because they are paying their debts in a depreciated currency, and disadvantages the creditors because they collect the debts in a weaker currency.

A country depreciates its currency in order to improve the price competitiveness of the products made by its companies, so as to increase exports, to reduce imports and, therefore, to rebalance the external balance of payments.

The success of depreciation is not guaranteed because its immediate effects are negative. The positive effects are visible only when exports and imports are flexible enough in comparison with the costs, i.e. the volume of exports increases as the prices of exported goods on external markets are falling, and the volume of imports is falling as the prices of imported goods are increasing.

3. The “J curve” and the impact of depreciation

In economic theory, the effect of national currency depreciation is described based on the pattern of the “J curve”. So, the pattern was based on the regime of set rates, but can also be applied to the exchange rate scheme with managed floating. In both cases, a significant amount of foreign currency will be used as backup for the central bank interventions on the currency exchange market. This system is very expensive, but can affect net exports in the desired way by appreciation or depreciation of the national currency.

Paul Krugman and Richard Baldwin introduced the J curve in specialised theory (Krugman Paul, Baldwin Richard 1987:11-56). Their research uses data specific to the European and American economies and shows that a negative monetary shock reduces GDP for almost half a year, generating the currency appreciation for the same period. The trade balance achieves a surplus for one year and a half, followed by a trade deficit.

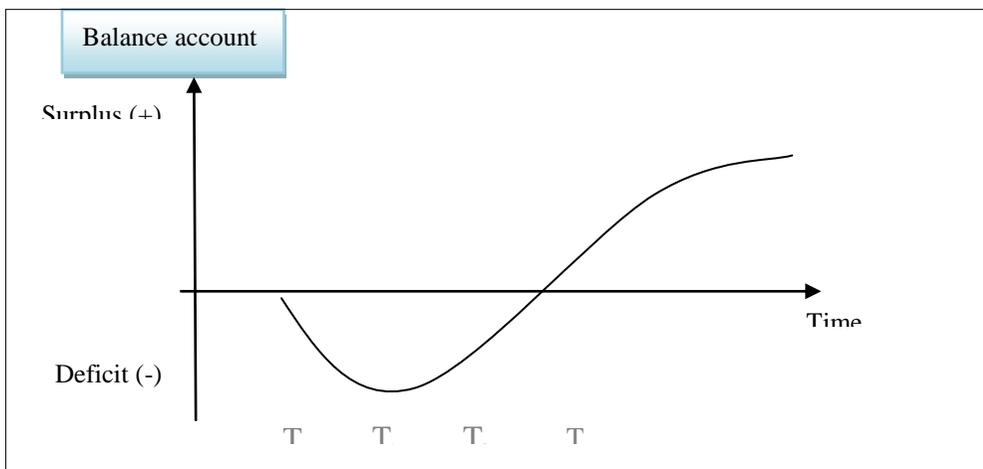

The J curve theory assumes that the positive effects of currency devaluation on the equilibrium of the foreign balance of payments is not visible immediately, but only after a certain a period of time. According to the J curve, if national currency depreciates, then imports rise due to the influence of import prices, even if the quality remains unchanged. In time, imports fall and exports rise, contributing to the equilibrium of the trade balance.

These positive effects can only exist under certain conditions (Ghe. M. Voinea 2007: 99), such as: increasing the competitiveness of goods, expanding trade relations with other partners, developing the production capacity for transport, the transfer of product offer from one market to another.

The pattern of the J curve underlines the fact that a deliberate decision for the depreciation of the national currency can stimulate exports so as to equilibrate the trade balance within certain limits, but the positive effect will occur with some delay.

The impact of national currency depreciation on the external balance of payments, when the positive effect does not occur immediately, is represented graphically as follows:

Chart no. 1: The effects of foreign currency depreciation in a “J curve”

Source: Ghe. M. Voinea - "Relații valutare-financiare internaționale", Ed. Universității "Al. I. Cuza" Iași, p.99

Therefore, *the immediate or the short-time effect of depreciation* (T_0 and T_1 moments) show the worsening of the balance of trade deficit due to the increase of imports as a consequence of the influence of import prices (the prices of foreign commodities in the national currency are higher), although, as regards quantity, there is no change. In this situation, the so-called *price-effect of depreciation* can be noticed.

In the next period (T_2 and T_3 moments), depreciation has positive effect on the trade balance because the country considerably reduces its imports as they are more expensive, and increases the exports, these being cheaper on foreign markets. In this situation, there is the so-called *volume-effect of depreciation* which progressively compensates and surpasses the price effect.

However, the national currency depreciation also has some negative effects:

the growth of inflation even if only through the growth of prices for imported products, which reflects on the prices of domestic products (imported inflation);

foreign currency inflows into the country (through exports) lead to increasing money supply and bank liquidities, which favour the growth of credit, lower rates, thus increasing domestic demand; although depreciation can improve the price competitiveness of products, it does not solve the structural competitiveness problems such as insufficient quality of products.

In order to limit those unfavourable effects, depreciation must be accompanied by programs of internal recovery of the economy which aim at reducing domestic demand, stopping the increase of nominal costs and stimulating exports.

Essentially, it must be underlined that deliberate national currency depreciation policy, which openly stated the aim of stimulating exports, and thus, rebalancing the balance of payments, can have temporarily unfavourable effects, and the efficiency of such a policy on a longer term is tightly connected to the determinant factor – economic competitiveness – in which productivity plays a crucial role.

As the depreciation of the currency does not stimulate the export increase and restricts and discourages imports that maintain or increase, the country finds itself in a “*vicious circle*”. Structural imbalances in the economy and consumptions larger than resources contribute to forming the vicious circle between depreciation and the lack of equilibrium in the balance of payments which extends through inflation.

Professor Anghel Rugină (Anghel Rugină 1992:67) considered that the depreciation of a currency cuts both ways. “On the one side, it appears that it would actually help increase exports and bring in foreign currency which would improve the international balance of payments. But in fact, shortly after, the situation turns around, and a new inflation wave stops the export increase and encourages imports, thus eliminating every advantage and, moreover, it generates budget deficiencies and unemployment”.

4. Currency appreciation and its impact on international economic exchange

The appreciation of a currency is the process of increasing the national currency’s value in comparison with other currencies. The cause of currency appreciation resides in the persistence of surplus in the balance of payments. This leads to the diminishing (cheapening) of prices on imported foreign commodities in the national market and the simultaneous increase of prices for internal commodities intended for export. Thus, the effects of the appreciation are the opposite of those of depreciation, and are in fact the stimulation of imports and discouragement of exports, which lead to a decrease in payment surplus in current operations.

Under the provisions of the IMF statute, the supervision of exchange rate formation and movement as well as reference currencies or the reference according to which the states establish their national currencies still fall under the competences of the International Monetary Fund.

In case of a repreciation of the national currency, a state’s monetary authority principally accepts it for two reasons, and those are:

an underrated currency generates inflationist pressures, on the one side due to the imbalance between the offer and the internal demand which induce an increase in exports (stimulated by the underrating of the national currency), and, on the other side, due to the increase of the internal monetary mass generated by capital inputs.

the country with a price competitiveness which seems too big for the trade partners is subject to international pressures for the repreciation of its national currency.

Contrary to the depreciation of the national currency, *the repreciation of the national currency impedes imports* (foreign products seem cheaper in the national market). The decrease of prices for imported products helps fight inflation.

On the short term, a considerable repreciation of the national currency deteriorates price competitiveness of national products, because these are expensive in the external markets. Thus, national companies are being forced to comply with a structural competitiveness (outside the price), through (Jacques, Généreux 1997:59):

improving the quality of products in order to attract customers less aware of the price;

a new specialisation concerning products for which the demand on the external market is less sensible to the selling price;

technical innovation or innovation in work management and production so that productivity would increase and the production costs would decrease; these will allow, in turn, to increase the profit without increasing prices or to maintain the profit when prices fall.

All three of the aspects mentioned above aim at consolidating the structural competitiveness of national products which would allow an increase of exports and, therefore, even up the external balance of payments or obtaining a surplus for the latter.

As far as the *appreciation of the national currency* is concerned, it limits exports because exporters cash a smaller amount in the national currency, and stimulates imports because importers spend a smaller amount in view of paying for the commodities purchased on the external market. The appreciation of the currency is a disadvantage for the debtors, because they pay their debts in a stronger currency, and an advantage for the lenders.

If the appreciation of the currency determines a moderate restriction of exports and a maintaining or an increase of imports within controllable limits, the balance of payments is kept in equilibrium and the country thus enters into a "*virtuous circle*".

The increased interdependence of international markets, the rush for resources and the increasing complexity of financial markets determined the emergence of new models and practices in international trade. In this context, Romania's place and role in the new global economical order has been determined by a series of events (primarily political) with a major impact on economic policies, especially on those related to international trade.

Romania's accession to the European Union on the 1st of January 2007 involved a succession of economical and political changes, having a direct impact on the foreign trade. This way, Romania had to withdraw itself from any kind of agreement outside the EU from which it was part, and from the application of the common legal framework of the EU for external trade relations, including for the common import trade scheme, this causing changes in the structure of the trade balance for each country (i.e. before 2007, the Republic of Moldova used to export products in Romania without customs duties; starting from 2007, the same customs duties that apply for a third country also apply for the Moldavian goods). Romania must also withdraw its list of commitments agreed with the World Trade Organisation, following the renegotiation, together with all the members of the enlarged EU (27 countries – including Romania and Bulgaria), of new agreements regarding economic and trade cooperation.

Romania's accession to the EU coincided with a period of economic growth without precedent (in 2008 the GDP grew by 7,1 %), the statistic data for 2008 showing that the share of trade in GDP was higher by 23,3% than that of industrial production (22,9%).

The global financial crisis progressively affected Romania beginning with the fourth trimester of 2008 (when there was a decrease in GDP), causing gloomy predictions concerning economic growth, taking into account a decrease of the real GDP in the second trimester of 2009 by 8,7% over the same period in 2008, according to the data published by the National Institute of Statistic (Press Release no. 168 of 01.09.2009). Data from 2010 reveal a shy growth in the second trimester, but no optimistic outlook regarding the official exit out of the recession.

Finally, in a regional and international context, redefining the trade relations with former important trade partners (the Russian Federation) should be mentioned, as statistic data show a constant worsening of Romania's trade deficit in relation to Russia, mainly because of energy imports. However, Russia remained a significant trade partner for Romania, being the second in place in 2007 in Romania's external trade (with countries outside the EU), and the main non-EU exporter in the Romanian market (also due to energy imports).

According to the data published by the Directorate for external trade, the year 2009 marked a very sudden decrease of trade exchanges with countries from the former soviet area, with over 45% in the first seven months, as opposed to the same period in 2008. Among the products exported to the Russian market, a significant amount is represented by automobile components, electrical devices, chemical industry products, glass and glass items.

Romania's external trade will increase by 15% in 2011 to 91 billion EUR, reaching 105 billion EUR in 2012, with an export rate maintained at 54%. Romania followed the pattern of

Central and Eastern Europe states as far as exports and imports are concerned, a phenomenon which also applies to its trade relationships, concentrated in the area of ten important partners, among which we find Germany, Italy, Poland and Russia.

The value of Romania's external trade has risen to 79 billion EUR in 2010, below the level registered in 2008 of 85 billion EUR, but with a 20% increase from 2009, when it had a total of 65 billion EUR.

The Romanian external trade will continue its positive development, reaching 91 billion EUR in 2011 and 105 billion EUR in 2012. Exports will cover 54% and imports 46%. The main countries in which Romania exported last year were Germany, Italy and France, and these partners are the same for imports.

The driving force of the Romanian external trade was the automobile industry, which covered 29% of the imports and 27% of the exports. The transportation and textile segments also had a positive development, while the chemical products sector registered the greatest deficit, covering 17% of the imports and 10% of the exports.

At a regional level, Romania is on the second place regarding the average annual growth of the external trade between 1999 and 2009, although the market share in Central and Eastern Europe was of 4%.

Conclusions:

Therefore, establishing an optimal level for the foreign exchange which would support exports, but also discourage imports, and allow maintaining equilibrium for the balance of payments is a very difficult undertaking. The choice between the policy of the strong currency as opposed to the weak one depends on a country's economic and social structures and on the degree of technical ability. Unless the production structures are adequate and the capacity of entering new markets consolidated, a strong currency policy cannot be achieved. This will lead to a loss of traditional markets, because business competitiveness will decrease, making companies less adaptable and less profitable.

THE IMPACT OF FINANCIAL INNOVATION ON THE DEVELOPMENT OF THE CURRENT FINANCIAL SYSTEMS

Șargu Alina Camelia

“Alexandru Ioan Cuza” University of Iasi Faculty of Economics and Business Administration

Over the past few decades, the financial innovation has become a defining characteristic of financial systems, contributing to the major structural changes underwent by international and domestic financial markets.

The aim of this paper is to analyse the contribution that financial innovation might have to two key issues in the financial system: its efficiency and its stability and to discuss the various ways in which financial innovation has the potential to enhance the efficiency of the financial system and also its implications for systemic stability.

In order to achieve this, the methodological approach used starts with a literature review which highlights the main academic literature on the subject. Then, in order to analyse the problems regarding the trade-off which often exists between the efficiency and stability characteristics of the financial system, we have used systematisation techniques and also a series of tables and graphics.

In general, the results of our paper highlight that there is a need for caution, because the abusively use of some new financial instruments on a larger scale or on a different background compared with the original one, without proper regulation and supervision, can generate instability. Also our paper emphasizes that there are relatively few studies undertaken on the subject of financial innovation, at both theoretical and empirical level, in comparison with the abundance of researches undertaken on the innovation from other sectors of the economy (e.g. industrial innovation). Thus, we consider that this research can represent an initial step towards the possibility of filling this gap, taking into consideration the importance of the financial innovation subject, that should be studied continually in order to improve its comprehension for the benefit of those who produce it, use it and eventually who regulate it.

Key words: financial innovation, financial system, financial stability, efficiency

JEL code classification: G01, G14, G15, G32

1. Introduction

The dynamic and development of the financial systems presents a real interest for both policy makers and participants from various financial markets, whether we are talking about investors, financial intermediaries or end-users of financial services. In the last decades, the main feature of the European financial sector has been represented by the financial integration process, the deepening of this process taken place in the light of certain profound structural changes emerged as a result of the manifestation of a series of complex processes and phenomena, among which it can be noted ***the process of financial innovation***. This process ***is influencing directly two key components of the financial sector, namely: its stability and efficiency***. Considering the characteristics of the financial sector, it can be seen that financial innovation has a strong influence exactly on the components that, the European Union, through the process of financial integration, is attempting to improve.

In this context, ***the purpose*** of this paper is represented by the study of the financial innovation and of its implications on the financial systems development, highlighting both the positive and negative effects that the financial innovation has on its efficiency and stability. Thus, taking into

consideration that all financial innovations encompass advantages as well as risks, ***the core question*** that arises refers to under what circumstances financial innovations enhance the efficiency and the stability of financial systems, and, under what circumstances do they threaten their stability?

In order to achieve this purpose the research is structured in ***five parts***: *the first part* contains introduction remarks regarding the field of research and the importance of the approached theme; *the second part* is dedicated to a literature review which identifies the main researches undertaken so far on this subject; *the third part* highlights the key role played by financial innovation in increasing the efficiency and the stability of the financial systems, and *the fourth part* of the paper reflects, mainly, the negative impact that the financial innovation may have, in certain circumstances, on the stability of the financial systems; while *part five* provides the concluding remarks of the research.

The ***methodological approach*** used starts with a literature review, which is useful because, on one side, it helped us to familiarise with the main studies from this field and, on the other hand, we were able to underline the way in which our research will cover the least approached areas of this field, especially the problems regarding the trade-off which often exists between the efficiency and stability characteristics of the financial system. As a method of data analysis we have used systematisation techniques and also a series of comparative tables and graphics. In order to obtain our data, we have used mediate techniques for data gathering, like official statistics of the Bank for International Settlements (BIS), different reports, studies and researches.

2. Financial innovation – a literature review

Financial innovation has been considered to be one of the major causes of the radical changes that took place in the financial systems, both at the national and international level, over the last decades. However, taking into consideration its' dynamic and complexity, even after a quarter of century, the academic literature has not reached a consensus regarding the concept of "*financial innovation*". Anyway, one of the most widely and frequently used definition is that offered by Frame and White (2004, p. 118), which after having analyzed the basic functions of the financial system, considered financial innovation as "something new that reduces costs, reduces risks, or provides an improved product/service/instrument that better satisfies participants' demands".

In general, it is considered that financial innovation has a direct effect on reducing the negative elements (such as costs and risks) as well as on increasing the positive ones (through development of products, services or instruments that would better meet market's needs). Hence, Van Horne (1985) highlights in his paper that a real financial innovation helps to increase market efficiency and completes the range of products and services. Also, Llewellyn (1992) argues that financial innovation refers to the creation of new financial instruments, techniques and markets as well as to the separation of different characteristics and risks of individual financial instruments, followed by their combination in various new ways. The author emphasizes also that the financial innovation helps to increase the overall efficiency of the financial system.

Considering this, financial innovation can be classified into the following two categories (Anderloni et al., 2009): *product innovation* - which leads to the emergence of new financial instruments, new types of contracts and new markets and *process innovation* - resulting the emergence of new financial techniques (e.g. new techniques of distributing securities, processing transactions or pricing transactions).

Summarizing, ***the researches undertaken so far regarding the subject of financial innovation are still in an early stage***, when compared with the abundance of researches undertaken on the innovation from other sectors of the economy (like the industrial innovation), and we can observe also a lack of systematic empirical researches with unique and unanimously accepted results. Thus, we consider that ***this research can represent a relevant response to this very important***

subject, that should be studied continuously in order to improve its comprehension for the benefit of those who produce it, use it and eventually who regulate it.

3. Financial innovation – key factor for the development of financial systems

The process of financial innovation is one of the key factors for the development of financial systems because it contributes to the achievement of five basic functions of a financial system: (1) it increases the variety of the financial spectrum by combining the characteristics of various financial instruments in order for the advantages of one instrument to alleviate the disadvantages of another; (2) it enables various types of risk to be more efficiently managed and shifted to those who have a greater ability and willingness to absorb risk; (3) it increases the liquidity of assets and markets; (4) it allocates funds to their most efficient use and (5) it may give investors access to new markets from which they were previously excluded. Based on these functions we consider that the *various forms of financial innovation* can be grouped as in Table no. 1.

Table no. 1 – The taxonomy of financial innovation

Types of financial innovation	Examples
■ Instruments/processes that ensure the transfer of price risk	Swaps, forward, futures and options contracts
■ Instruments/processes that ensure the transfer of credit risk	Securitisation, collateralized debt obligations - CDOs, credit default swaps - CDSs
■ Instruments/processes that allow the growth and development of firms and corporations	Bonds
■ Instruments/processes that contribute to the liquidity enhancement	Securitisation, Direct access trading (DAT)
■ Instruments/processes that ensure the financial services modernisation	ATMs, internet banking, Target 2 Securities
■ Instruments/processes that ensure the substitutability between different financial instruments	Debt equity swaps

Source: realised by the author

The scientific studies from the academic literature regarding the effects, both positive and negative, generated by the different types of financial innovation on the stability and efficiency of the financial systems are varied.

Thus, on the one hand, there are a series of studies that highlight how financial innovation help to increase the efficiency and stability of financial systems. In this respect, Greenspan (2004, p. 4) argued that: “credit derivatives and other complex financial instruments have contributed to the development of a far more flexible, efficient and hence resilient financial system”.

In general, the main benefits of the financial innovation (although not the only ones) regarding the increase of the financial sectors efficiency are related to **the possibility of innovative instruments to reduce the financial intermediation costs** (basically this can be achieved in two ways, either by facilitating borrowers the access to a wider range of financial markets which are providing additional lending facilities, or, in some cases, by creating the necessary conditions so that the financial institutions would be able to obtain scale economies which will reduce the costs of the services that they provide), **to enhance the liquidity** (e.g. CDOs enable banks to create liquidity based on their loans, which traditionally represent an illiquid component of their portfolio) **and, most important, to enable risks to be dispersed optimally throughout the financial system** (for instance, a bank could maintain a relationship with a client over an

extended period of time without incurring an excessive credit-risk exposure to the customer, in this respect, credit derivatives providing an attractive mechanism for managing risk exposure). However, we must take into account that one of the financial systems characteristics is represented by the trade-off which often exists between its efficiency and stability (more precisely, the impossibility to obtain them both at the same time). Extrapolating this situation, some analysts considered that this is true also in the case of financial innovation, particularly with respect to credit derivatives. In this context, **the impact of financial innovation on the financial system stability represents a controversial issue**. Thus, on the one side, because the financial innovation enables risks to be dispersed optimally throughout the financial system, it increases its stability, but, on the other side, because, in certain conditions, it allows the accumulation and proliferation of risks, it can have a deleterious impact on the financial system stability.

Hence, there are a number of ways through which financial innovation can enhance financial system stability, giving it a higher resistance to shocks:

- innovative instruments spread risks more widely within the financial system, in this way the risks being absorbed by those who are more willing and more able to deal with them, thus emphasizing the stabilizing role of financial innovation.

- in many respects, this type of instruments enable banks to respond more easily to certain types of shocks. Greenspan suggested that “[the stability that has characterized the financial systems until 2007] suggest a marked increase over the two or three decades in the ability of modern economies to absorb unanticipated shocks...this has doubtless been materially assisted by the recent financial innovations that have afforded lenders the opportunity to become considerably more diversified and borrowers to become far less dependent on specific institutions or markets for funds” (Greenspan, 2002, p. 6).

- another dimension to these issues is provided by the Bank for International Settlements, which considers that “The ability to switch smoothly between balance sheet financing and market-based financing contributes to the robustness of a financial system and improves its ability to deal with strain” (Knight, 2004, p. 6).

In conclusion, we can state that ***the benefits driven from the development and use of financial innovations are manifold***. Hence, the cost of financial intermediation may be reduced due to the use of financial innovations, offering the entities which seek financing the possibility to enter different markets and allowing different actors from these markets to effectively exploit their competitive advantages. Also, new instruments enable arbitrage between markets in different countries, which lead to the decrease of pricing anomalies, and implicitly to the reduction of market imperfections. Moreover, a number of financial instruments allows the use of diverse hedging options enabling the increase of protection vis-à-vis risk, while another series of innovative financial instruments facilitate the risk assessment, transferring it to those entities that are more capable to manage it efficiently. Nevertheless, these instruments enable different risks to be divided and then separately priced and “sold”. Thus, we can assert that if these processes are carried out in a correct and professional way, then these innovative financial instruments will have a direct effect of increasing the efficiency of resources’ allocation in the economy.

4. Controversies regarding the effects of financial innovation on the stability of financial systems

The manifestation of the financial crisis which started in 2007 highlighted the existence of a high number of opaque financial products in the international markets, such as: credit default swaps, mortgage-backed securities or collateralized debt obligations. The role that these financial products have had within the financial crisis has triggered a heated debate regarding the value that they bring to the international financial system as well as regarding which would be the correct response from the authorities in charge with the regulation and supervision of these

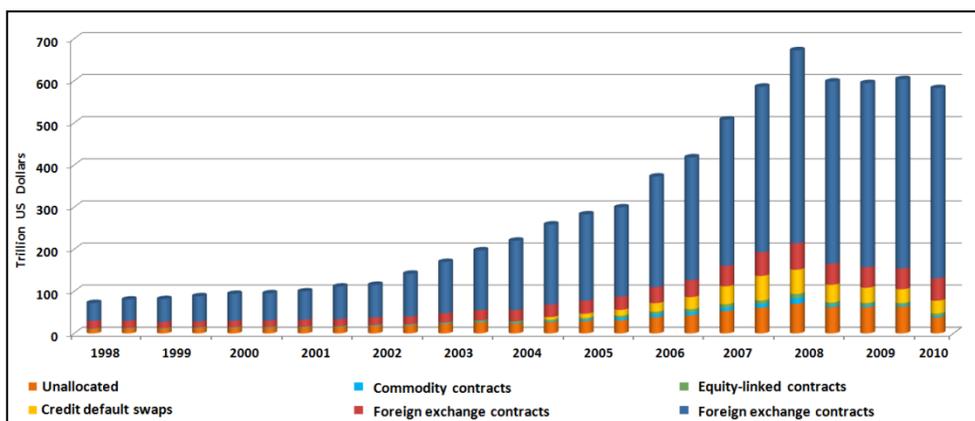

innovative instruments. It is already obvious that from the debate around this subject have emerged two streams of opinion, on the one hand, are those who believe that financial innovation is largely unnecessary (e.g. Krugman (2008): „It's hard to think of any major recent financial innovations that actually aided society, as opposed to being new, improved ways to blow bubbles, evade regulations and implement de facto Ponzi schemes”) and on the other hand are those who believe that financial innovation has both positive and negative parts (e.g. Levine (2010): „Even if the last few years demonstrate that financial innovations can be used as tools of economic destruction, the last few centuries demonstrate that financial innovation is crucial, indeed indispensable, for sustained economic growth and prosperity”).

Thus, there is the possibility that the financial instruments that should increase efficiency, instead, in certain circumstances, may threaten the financial stability. These instruments can as well increase or reduce financial stability, enabling these fluctuations to put into question the overall financial innovation capacity to generate financial stability. For instance, the credit derivatives (one of the most invoked examples of financial innovation over the last years), allow the banks to improve their image, similar to the process of "window dressing", but this arrangement could hide the reality (Stoica, 2010).

These considerations lead to a preliminary conclusion related to the implications of financial innovation on the stability of a modern financial system. It would seem that *the financial instruments that allow better dispersion of risk and that emphasize the role of markets in financial systems are also reducing the vulnerability of the financial systems to small shocks*, allowing a more effective management of these events. Hence, the capacity of financial systems to stabilize is enhanced by the financial innovation. On the other hand, *the financial innovation can lead to the exposure of financial systems to major and systemic shocks*, enabling the management of this type of shocks to be more difficult. An example in this respect may be represented by the systemic liquidity shock, generated by the decrease of the liquidity from the global financial markets, experienced in 2007. Thus, Rajan (2005, p. 16), for instance, concludes that: “[while] the financial system is more stable most of the time, we may also have the possibility of excessive instability in really bad times (as well as higher probability of such tail events)”.

Thus, despite the fact that the derivative products have been created to help dissipate the credit risk of the issuers, they hide a number of risks that have facilitated the emergence and expansion of the financial crisis. This was due to, on the one hand, the lack of transparency and the extremely high complexity of these financial instruments, and, on the other hand, the fact that many of the financial entities involved in the transactions with such type of financial instruments didn't fully understand the risks associated with these transactions.

Basically, *we can state that there was a tendency of proliferation of derivative instruments with a high degree of complexity and opacity, as well as of trading such instruments through certain financial entities equally opaque*, such as the so-called Structured Investment Vehicles (SIV). Thus, chart no. 1 highlights the proliferation of financial derivatives at the global level, the total value of the swap contracts on the interest rate and of the other types of derivatives reaching in 2008 the amount of 672 trillion dollars, equivalent to 11 times the global GDP, according to the estimations made by the Bank for International Settlements (2010). Just ten years previous, in 1998, the value of these financial derivatives was only 75 trillion dollars, equivalent to 2 ½ times the global GDP. Thus, the global derivatives market has simply exploded in the period 2007-2008, registering an annual increase of about 50%.

Source: realised by the author based on the data provided by the Bank for International Settlements (BIS) (<http://www.bis.org/statistics/otcder/dt1920a.csv>)

Chart no. 1 - The evolution of the total value of various types of financial derivatives issued in the period 1998 - 2010 at the global level (biannual values, trillion U.S.A. dollars)

The British Financial Services Authority argued that the manner in which financial intermediaries have used the associated financial entities, such as the SIVs, represented the main cause of the financial markets negative developments from the end of 2007. During that period, the liquidity of the securities market has mostly disappeared, after a period of several years during which there were significant increases in this market. The lack of liquidity has created major problems especially to certain types of financial derivatives, such as: collateralized debt obligations - CDOs or collateralized loan obligations – CLOs. In general, all the financial markets that have allowed the trading of such financial instruments have been hit hard by the financial crisis.

Despite the issues presented and the fact that the current financial crisis which started in 2007 has seriously affected the international financial system, the opinion of the economists and government representatives present at the G20 meetings in 2009 and 2010 was that the financial markets will continue to be interconnected and with a strong tendency of globalization, while the financial innovation will continue to play a key role in the process of economic development (G20, 2009a, p. 5). This vision is not only declarative, because the majority of the legislative changes made during this period within the G20 economies in order re-regulate the financial sector were taking into account these considerations. In this context, the president of the Financial Stability Council, Mario Draghi, stressed that regulations should not inhibit financial innovation, because it represents on the one hand the element that its needed in order provide to consumers diversified solutions of financing and on the other hand it's the element through which the lending process can be extended (Tonveronachi, 2010, p. 131).

Thus, we consider that the objectives of the re-regulation process should be represented by the strengthening of the financial system, without affecting the process of markets self-regulation and the process of financial innovation, because they represent some of the main advantages offered by this sector.

Also, we can say that ***the fragility of the financial systems is not given by the widespread use of innovative financial products, but rather by the excesses of the financial markets***, excesses that the regulations in force and the existing supervisory systems were not able or did not wanted to inhibit at the right time. Thus, we can consider that the current international financial system is based on correct and solid principles, which make unnecessary its entire redesigning and rather requires a readjustment of the supervision and regulatory framework in order for it to be able to cover the issues highlighted by the financial crisis, thereby increasing the stability of the entire international financial system.

Conclusions

The process of financial innovation is influencing directly two key components of the financial sector, namely: its stability and efficiency. If regarding the positive impact that the financial innovation has on the financial system efficiency there is a general consensus, regarding the financial innovation implications on the stability of the financial system, two visions have been crystallized. One of them argues that because the financial innovation enables risks to be dispersed optimally throughout the financial system, it increases the financial system stability. In contrast with this vision, the other view highlights that, because, in certain conditions, it also allows the accumulation and proliferation of risks, the financial innovation can have a deleterious impact on the financial system stability. A possible theory concerning the dual effect of financial innovation takes into account the nature of shocks, starting from the idea that on the one hand, in the case when minor shocks are manifesting, that are less correlated, the use of for example derivative instruments (with particular reference to those who spread risk) may increase the stability of the financial system and on the other hand, in the case when large systemic shocks are manifesting, accompanied by a reduction of the liquidity at the international level (as was the case in the summer of 2007), their use may increase the vulnerability of the financial system.

Under these conditions, *there is a need for caution, because the use of some new financial instruments on a larger scale or on a different background compared with the original one, without proper regulation and supervision, could generate instability.* Thus, the ideal policy approach is in our opinion to find an appropriate balance between preserving safety and soundness of the system and allowing financial authorities and markets to perform their intended functions, by ensuring, firstly, that the necessary market-framing is in place and, secondly, by establishing a proper method for reviewing financial innovations.

The consequence of the economic crisis, the access of the external financing resources was narrowed significantly and lenders had become more cautious. This meant that the external source providers analyze more thoroughly the source claimants, and they also need to be more aware of their situation, to submit well founded loan applications to financial institutions. However, analysts should be aware of which are the ratios which should be paid a special attention and which ones are essential to assess a given situation, knowing them they can properly inform the leaders as well as to give an appropriate help to the decision makers. Liquidity measures are designed to provide information about the solvency and financial flexibility of the business enterprise. The traditional liquidity measures has been criticized because it mixes assets and liabilities that are quite different in terms of their maturity time. The problem with the traditional current ratio is that it treats all assets and liabilities as being of equal degree of liquidity. Similar problems were experienced in relation to the cash conversion cycle, which is also an important measure of the company's payment capability. This paper describes how should be modified these indicators in order to the decision makers able to draw correct conclusions.

Keywords liquidity management, liquidity ratios, modified liquidity ratio, modified cash conversion cycle

JEL code: G30, G32

1. Corporate liquidity risk

Volatile global markets, changing regulatory environments, and the improvement of new financial products have made the management of liabilities and of assets in the balance sheet a critical task. Today tools such as simulation, experimentation, and real-time financial reporting help in fulfilling this responsibility, but the whole assets and liabilities management strategy is changing under the weight of a fast-growing amount of debt. (*Charafas, 2002*)

The problems of last period caused in global finance markets have yielded new evidence for the importance of liquidity risk management as a sound business practice. A phenomenon that started as a narrow-minded financial market innovation regarding to increased riskiness in the subprime segment of real estate mortgage lending has since widened its effects to result in a worldwide liquidity crisis. As the Financial Stability Forum puts it, "The turmoil has brought to light interactions between credit, market liquidity, and funding liquidity risks that many regulated financial institutions did not anticipate." (*Preliminary Report to the G7 Finance Ministers and Central Bank Governors, 15 October 2007*)

The consequence of the economic crisis, the access of the external financing resources was narrowed significantly and lenders had become more cautious. The aspect is why the ratios presented in the study, the firms should be addressed much more thoroughly than ever before to have a much better understanding their situation, to recognize the sources of internal funding opportunities, and to use more efficiently the available internal resources. However, analysts should be aware of which are the ratios which should be paid a special attention and which ones

are essential to assess a given situation, knowing them they can properly inform the leaders as well as to give an appropriate help to the decision makers.

Liquidity is a complex concept defined by multiple factors, which are used by different ways. *Andrew Crockett (2009)* wrote in his study: „Liquidity is easier to recognize than to define.” Basically, the terms of liquidity means how easy we can generate cash from assets. Cash may be generated either by using creditworthiness to obtain external funds, or by the sale of owned assets in the market. Liquidity is not depending on simply on objective, exogenous factors, but it is crucially influenced by endogenous ones, especially the reactions in contrast to uncertainty and asset value changes.

However, analysts need to know the relationships which are among the ratios to provide accurate information for the leaders of the firm. In each case the information communication must be such as to enhance the company's knowledge of firms' leaders and to contribute to the increasing of organizational knowledge. (*Palepu et al., 2004*)

Liquidity risk management is addressed through strategic and operational considerations. The strategic framework must create the corporate target for liquidity risk. This includes the extent how the corporation wishes to protect from a liquidity crisis. The operational consideration means that certain constraints could be imposed on short-term borrowings or asset mix to ensure the company is adequately protected. The asset/liability management must work closely with the cash management to define the short- and medium-term cash needs, the possible impacts of various liquidity scenarios, and determine actions required to address these issues.

The liquidity ratios, net working capital, cash flow analysis and the cash conversion cycle are the basis for liquidity risk measurement.

2. Working capital management

Many companies still underestimate the importance of working capital management. To ensure the appropriate level of internal resources the company's activity is continuous financing closely related to the working capital management. The other reason is why the working capital management coming into view - which is linked to the previous one - that longer and longer payment periods have emerged in the corporate sales, in point of fact there is a significant increase in commercial lending period, the companies must be able to finance this period. The working capital is essential for companies to determine their short-term financial positions. (*Preve-Sarria-Allende, 2010*). A significant change in working capital provides important information to the company's various stakeholders, and this is especially true for the net working capital. The working capital analysis is one way the company's creditability evaluation, and helps also to better understand the company's normal business cycle.

The term **working capital** (gross working capital) refers to a firm's short-term assets, ie current assets. Managing the firm's working capital is a day-to-day activity that ensures that the firm has sufficient resources to continue its operations. This involves a number of activities related to the firm's receipt and disbursement of cash. (*Ross et al., 2007*)

Net working capital is equal current assets less current liabilities. Thus, net working capital compares the amount of current assets (assets that should convert into cash within the next 12 months) to the current liabilities (debt that will be due within 12 months). (*Keown et al., 2005*)

Working capital management involves the relationship between a firm's short-term assets and its short-term liabilities. The goal of working capital management is to ensure that a firm is able to continue its operations and that it has sufficient ability to satisfy both maturing short-term debt and upcoming operational expenses.

Implementing an effective working capital management system is an excellent way for many companies to improve their earnings. The two main aspects of working capital management are ratio analysis and management of individual components of working capital.

3. Modified liquidity ratios (comprehensive liquidity index)

In finance, this term is used in respect to several assets that can be converted into cash at fair market price without loss. A good liquidity depends on the ability to instantly and easily trade assets. (Chofaras, 2002)

Liquidity analysis is the process of measuring a company's ability to meet its maturing obligations. Sometimes, a firm having difficulty paying off its current obligations is unlikely to be able to convert its accounts receivable or inventory quickly into cash without loss of value. Liquidity measurements are designed to provide information about the paying ability and financial flexibility of the firms. In particular, the firm's creditors are interested in the ability of the company to pay off its short-term obligations until their maturity. Also, these traditional measures fail to consider the cash flow generating ability of the firm's operations.

The traditional liquidity ratios do not sufficiently take into account that how long the assets or liabilities are hold in firm's operations. However, the length of holding or turnover period has a significant impact on how quickly the company can meet the payment obligations, or changes the value of liquidity ratios. To solve this problem will be adjusted certain components of the current assets and current liabilities, and we determine the liquidity ratios using these adjusted values. The balance sheet items used to the liquidity calculation are adjusted to take account, in the case of current assets and current liabilities how much time spend the given assets in the company's operating cycle, what is ignored by traditional liquidity ratios. (Gangadhar, 2003) In case of each adjusted assets and liabilities we have to calculate the correction factors:

$$\text{correction factor} = 1 - \frac{1}{\text{turnover ratio of assets or liabilities}} \quad (1)$$

The appropriate balance sheet item must be multiplied by the calculated factors, and so we get the adjusted liquidity values. The inventories and receivables will be only adjusted amongst the current assets. The bill (trade acceptance) obligations and the long-term debt part reclassified for the current year should not be adjusted amongst the short-term liabilities. After completing the corrections, the adjusted liquidity ratios are calculated using the adjusted values of current assets and current liabilities:

$$\text{adjusted current ratio} = \frac{\text{adjusted current assets}}{\text{adjusted current liabilities}} \quad (2)$$

The company can increase the value of its liquidity ratio to achieve a growth in receivables and inventories, and to reduce the turnover ratio of its current liabilities, ie to improve an efficiency of its asset and resource management. The value of adjusted current ratio can be higher or lower than the traditional current ratio. However, if the company effectively manages its current assets and current liabilities, then the adjusted current ratio value will be higher than the traditional current ratio. (Gangadhar, 2003)

Using the adjusted current assets and current liabilities we can calculate the other liquidity ratios such as quick ratio and cash ratio. However, it should also be noted that these ratios are statics and they do not measure the company's cash flow generating capability.

The calculations were performed for a number of companies, but we present only two extreme examples in details. The most of the cases examined the direction of changes is very different, there are years with an increasing values and there are years with decreasing ones.

We present the changes of an agricultural enterprise's liquidity ratios in Table 1. The Table 1 shows that the values of liquidity ratios have improved in case of this agricultural company every year. There is a significant improvement in the level of cash ratio which is similar for all

companies with relatively high levels of cash and/or short-term securities, because they are not adjusted.

In Table 2 the liquidity ratios were calculated using data of an industrial manufacturing company. In this case, the values of liquidity ratios were decreased in all cases except the value of cash ratio. The value of cash ratios was improved by non-adjusted cash and near-cash assets in this case, but it was to a lesser extent due their lower rate.

3. Modified cash conversion cycle

The liquidity ratios are very closely related to the cash conversion cycle, since its main components are the inventory turnover period (inventory days), the receivable turnover period (receivable days) and the payable turnover period (payable days):

Title	2007	2008	2009
Inventory turnover ratio	2,34	2,36	2,91
Adjusting factor	0,5732	0,5763	0,6564
Receivables turnover ratio	6,95	8,39	3,97
Adjusting factor	0,8561	0,8809	0,7479
Turnover ratio of current liabilities	2,93	1,87	2,17
Adjusting factor	0,6584	0,4665	0,5393
Current assets	1 101 777	1 328 662	1 150 028
<i>Adjusted current assets</i>	<i>749 084</i>	<i>963 321</i>	<i>843 551</i>
Current liabilities	593 861	1 005 973	777 497
<i>Adjusted current liabilities</i>	<i>391 020</i>	<i>469 308</i>	<i>419 267</i>
Current ratio	1,8553	1,3208	1,4791
Adjusted current ratio	1,9157	2,0526	2,0120
Quick ratio	0,6058	0,5265	0,7333
Adjusted quick ratio	0,8279	1,0715	1,1042
Cash ratio	0,1844	0,3032	0,1863
Adjusted cash ratio	1,1821	1,4283	1,0764

Table 1.: Changing of liquidity ratios due the adjusting in case of an agricultural enterprise

Title	2005	2006	2007	2008	2009
Inventory turnover ratio	131,78	69,72	70,65	32,52	9,03
Adjusting factor	0,9924	0,9857	0,9858	0,9692	0,8892
Receivables turnover ratio	3,57	5,09	4,61	5,83	2,99
Adjusting factor	0,7197	0,8037	0,7832	0,8285	0,6660
Turnover ratio of current liabilities	3,64	7,09	4,04	4,43	1,48
Adjusting factor	0,7255	0,8590	0,7522	0,7745	0,3244
Current assets	1 438 871	1 130 508	1 295 583	1 313 677	979 278
<i>Adjusted current assets</i>	<i>1 046 781</i>	<i>923 978</i>	<i>1 038 178</i>	<i>1 125 999</i>	<i>732 959</i>
Current liabilities	1 368 439	751 736	1 350 702	1 394 371	1 343 994
<i>Adjusted current liabilities</i>	<i>998 115</i>	<i>653 932</i>	<i>1 026 578</i>	<i>1 089 531</i>	<i>466 294</i>
Current ratio	1,0515	1,5039	0,9592	0,9421	0,7286
Adjusted current ratio	0,7649	1,2291	0,7686	0,8075	0,5454
Quick ratio	1,0238	1,4021	0,9021	0,8058	0,5646
Adjusted quick ratio	0,7375	1,1288	0,7123	0,6754	0,3995
Cash ratio	0,0025	0,0098	0,0269	0,0454	0,0703
Adjusted cash ratio	0,2890	0,2845	0,2175	0,1800	0,2536

Table 2.: Changing of liquidity ratios due the adjusting in case of an industrial manufacturing company

$$\text{cash cycle} = \text{operating cycle} - \text{payable turnover period} \quad (3)$$

$$\text{operating cycle} = \text{inventory turnover period} + \text{receivable turnover period} \quad (4)$$

Based on the above relationships [(3)-(4)] it is also determinable that an increase in adjusted current ratio will reduce the cash conversion cycle to lead to more efficient cash management.

The cash conversion cycle is the number of days negotiated financing is needed to support the operating cycle of a business. The cash conversion cycle then is a measure of how efficiently a company operates. But more importantly, it's a measure of cash creation efficiency in the business. Calculating the cash conversion cycle, sometimes called the asset conversion cycle, tells you a lot more about ability to pay than the current or quick ratio. The cash conversion cycle, while a relatively new metric, is widely used in corporate finance.

It is the weakness of the traditional cash conversion cycle not to be adequately express the conversion period days in the net working capital requirement given in cash. In addition, it does not adequately distinguish between cash and credit sales, which can cause problems, ie. if two companies have the same receivable period, but they have different proportions of credit sales. In the traditional model, both companies will have the same cash conversion cycle, while the company with higher cash sales will be a better placed to fulfill its obligations on time. This is so, because it will have able quickly and safely to collect a greater portion of sales. The traditional cash conversion cycle model does not deal the profitability impact on the liquidity. Because the profit is a surplus resource what covers the liabilities therefore the profitability takes actually as a support factor of corporate liquidity. To determine the net working capital given in cash to be build in the „gross return on sales” and the "credit sales/total sales" ratios in the cash conversion cycle model. The net working capital what was determined in this way is necessary to the firm's operation.

The determination of the modified ratios

$$\text{modified inventory turnover period} = \text{inventory turnover period} * (1 - \text{gross return on sales}) \quad (5)$$

$$\text{modified receivable turnover period} = \text{receivable turnover period} * \text{proportion of credit sales} \quad (6)$$

As the gross return on sales is increasing, so is decreasing the operating working capital requirement. The cash flow difference between the beginning and end of the cash conversion cycle is the direct link to the profitability. This means that the more profitable business creates more cash flow from its operations.

We can see in Table 3 that both operating and cash cycle are decreased, for example there was a more than 20% decreasing in 2008. A high scale of change has already altered the position of the company's judgement. The cash conversion cycle was negative in 2008, which means that the firm's payable turnover period is greater than its operating cycle, ie the firm has its suppliers and creditors to finance himself. Whereas the company's short-term loans make up 40 % of current liabilities, therefore the firm was financed by its suppliers.

Title	2007	2008	2009
Inventory turnover period	156	155	125
Receivable turnover period	53	43	92
Operating cycle	209	198	217
Payable turnover period	125	195	168
Cash cycle	84	3	49
Gross return on sales	2,63%	8,63%	2,53%
Modified inventory turnover period	152	141	122
Credit sales ratio	85%	78%	83%
Modified receivable turnover period	45	34	76
Modified operating cycle	196	175	199
Modified cash cycle	71	-20	31

Table 3.: Modified cash conversion cycle of an agricultural company

We can see in Table 4 that the changes are to a lesser extents, however, the table also shows that the cash conversion cycle contains a fairly high negative values in 2009. The negative value of 2009 year can not be sure to derive from the fact that the firm is well able to enforce its interests, but rather it is an indicator of firm's payment problems. In this case the high negative value of the cash conversion cycle shows an increase in debt financing. The credit ratio inside the current liabilities is around 40% in the first year what started to increase in the next years and it was exceed more than 90% in 2009.

Title	2005	2006	2007	2008	2009
Inventory turnover period	2,8	5,2	5,2	11,2	40,4
Receivable turnover period	102,3	71,6	79,1	62,6	121,9
Operating cycle	105,1	76,9	84,3	73,8	162,3
Payable turnover period	100,2	51,5	90,4	82,3	246,6
Cash cycle	4,9	25,4	-6,1	-8,5	-84,2
Gross return on sales	6,10%	5,14%	4,40%	8,94%	-0,88%
Modified inventory turnover period	2,6	5,0	4,9	10,2	40,8
Credit sales ratio	100%	99%	100%	100%	100%
Modified receivable turnover period	102,3	70,9	79,1	62,6	121,9
Modified operating cycle	104,9	75,9	84,1	72,8	162,7
Modified cash cycle	4,7	24,4	-6,4	-9,5	-83,9

Table 4.: Modified cash conversion cycle of an industrial manufacturing company

4. Conclusions

Working capital management almost always determines the ability of a firm to earn profit. Efficiency with which a firm handles working capital ensures prosperity while neglect would spell danger for the survival of the firm. The managerial decision-making is needed to accurate ratios what describe the current situation of the firm, and they are also suitable for forecasting.

The traditional liquidity ratios, if we do not take into account the turnover periods, under- or overestimate the actual payment capability of the company. Incorrect liquidity values may lead to inappropriate management decisions. A similar situation exists in relation to the cash conversion cycle as well. The cash conversion cycle is the net time interval between the expenditure of cash in paying the liabilities and the receipt of cash from collection of receivables. It is often a more accurate measure of overall liquidity than current ratio. The modified cash conversion cycle also shows that more resources will be used for enterprises non-operational purposes as if we make the calculation with the traditional cash conversion cycle. It is also shown that the increase in "credit sales proportion ratio" results an additional increase in net working capital demand, which is clearly follows from the fact that the ratio represents an increasing debt and sales levels. With the application of the presented ratios we get more opportunity to explore and analyze the financial situation.

ASSETS' STRUCTURE AT CREDIT UNIONS

Tiplea Augustin Liviu⁶³

Babes- Bolyai University Faculty of Economic Sciences and Business Management

Balance is a static tool for assessing the entity's position, profit and loss on one hand and cash flow statement on the other hand. These are dynamic situations on one hand showing the effectiveness or ineffectiveness of the total consumption of resources (profit and loss) and on the other hand entity's business viability (by cash flows).

As reflection of financial position, the balance, established at the end of the reporting period (called a financial year), describes separately items of assets, liabilities and equity of the company.

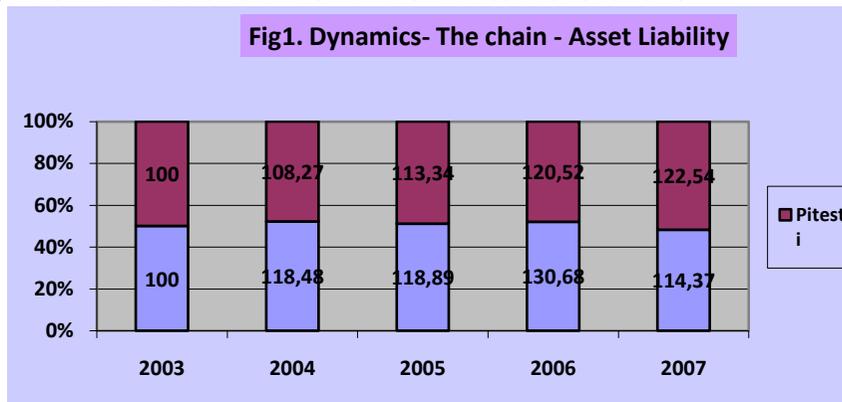

Assets are resources controlled by the enterprise as a result of past events and from which is expected to generate future economic benefits for the enterprise. The economic benefits correspond to a production potential, a possibility for conversion into cash or a reduction in output capacity of funds (cost reduction) that an asset contributes, directly or indirectly to a company-specific cash flow.

JEL classification: G2

1. Analysis of credit unions assets

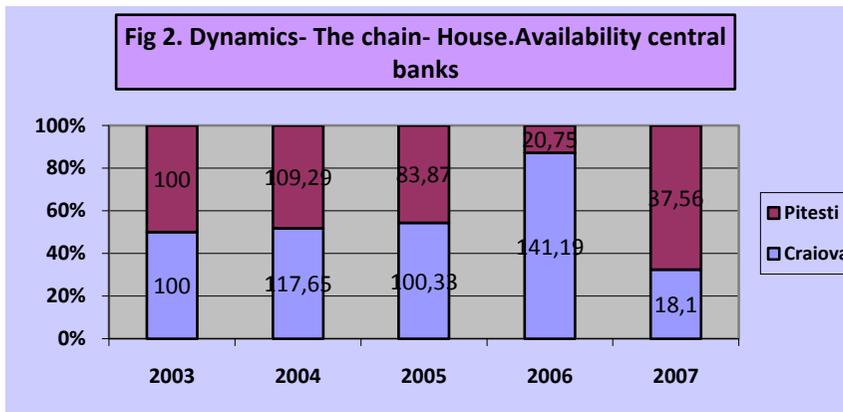

Graphically, the same evolution of the balance sheet asset is as follows:

Source: Own calculations based on the aggregated financial statements

The above graphic shows that the current credit unions in Craiova and Pitesti have had an upward trend (annual growth stood at a level above 10%) during 2003 and 2007, except during 2006-2007 when the Credit Union from Craiova has a slowdown in the growth rate from 30.68% in 2006 to 14.37% in 2007.

⁶³ This paper is part of the doctoral research project "Contributions to improve analysis and management of assets and liabilities in units of Credit Unions in Romania" under the guidance of Ph.D. Professor Ioan Batrancea, Babes Bolyai University of Cluj Napoca, Faculty of Economic Sciences and Business Administration, the 2007-2011

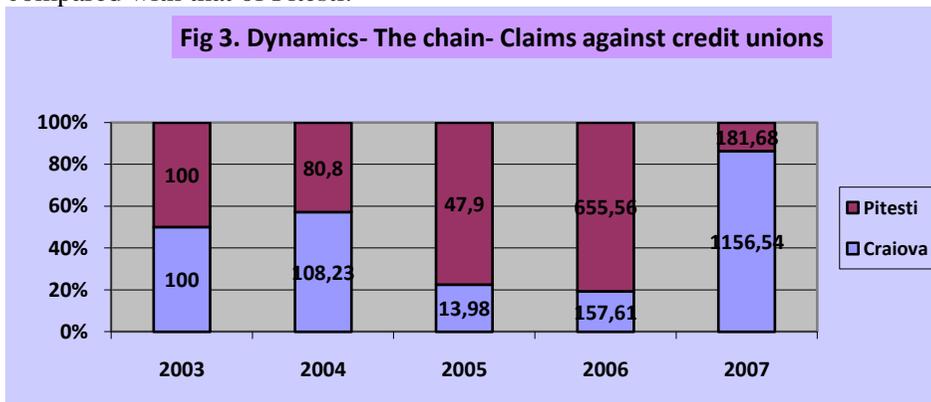

Source: Own calculations based on the aggregated financial statements

The data presented in Figure 2 produces two liquidity developments of the two credit unions, as follows: - at Credit Union in Craiova, annual trend shows a favorable liquidity during 2003 - 2006, when they recorded annual average growth rates, as follows: 17.65% in 2004, 0.33% in year 2005, 41.19% in 2006. The year 2007 saw a drastic reduction in credit union's liquidity to a level of 18.10% from that recorded in 2007;

- at Muntenia Credit Union from Pitesti, liquidity was following developments: 109.29% in 2004, 83.87% in 2005, 20.75% in 2006 and 37.56% in 2007;

- from these two developments, results a better state in terms of liquidity in the credit union from Craiova, compared with that of Pitesti.

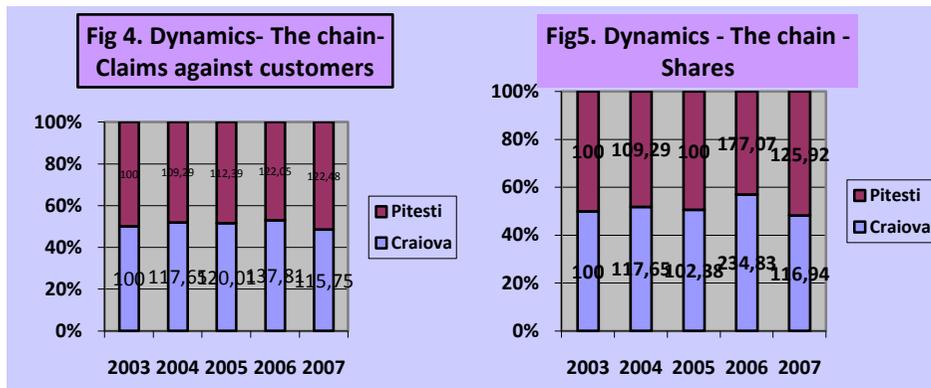

Source: Own calculations based on the aggregated financial statements

Another important element that can be identified in the evolution of balance sheet assets refers to "Claims on credit institutions." The chart above show the following aspects:

- to Credit Union in Craiova, on the interval time between 2003 and 2005, the indicator showed an upward trend from 108.23% in 2004, followed by a downward trend from 13.98% in 2005, and again an upward trend during 2006 to 157.61% 1156.54% in 2006 and in 2007;

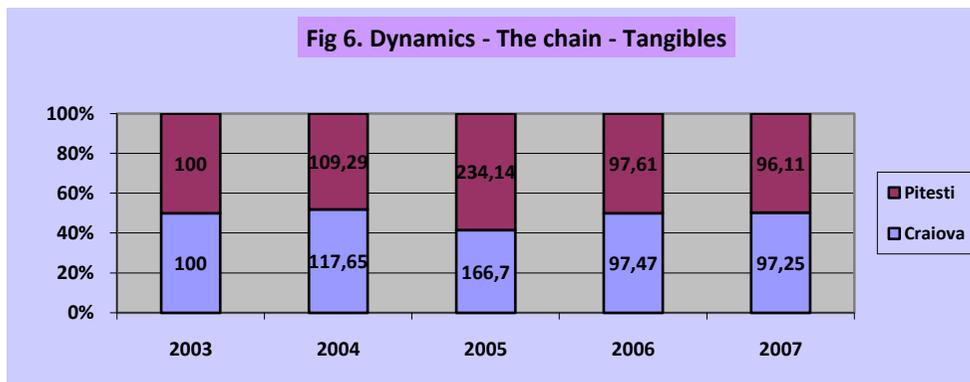

- to Credit Union Muntenia in Pitesti, there is a reduction in the level indicator for the period 2003 - 2005, followed by an increase in the indicator up to 655.56% in 2006, after which the indicator is reduced to 181.68% compared with past performance.

Following the evolution of claims against customers, we observe that in both cases are recorded annual growth rates throughout the period analyzed. In Credit Union of Craiova's case, the indicator is reduced by 12% compared with the rate recorded in the previous year.

Source: Own calculations based on the aggregated financial statements
 The annual rate of shares of the two credit unions was considered an upward for the duration, but different time intervals, as follows:

- at Credit Union in Craiova, the indicator has evolved to the level of 117.65% since 2004 to a level of 234.83% in 2006 and 116.94% in 2007;
- the evolution to CreditUnion from Pitesti is similar: 109.29% in 2004, 177.07% and 125.92% in 2006 to 2007;
- in 2005, the indicator was identical to that recorded in 2004, for both credit unions.

Finally the last important item in the balance sheet asset of the two unions is the tangible. The data presented in the above chart results in a symmetrical evolution of the level of this indicator, the entire period analyzed. Thus, the indicator in Craiova Credit Unions' case has evolved from 117.65% in 2004 to 166.70% in 2005 to 97.47% in 2006 and 97.25% in 2007. To Credit Union from Pitesti, indicator;s progress was: 109.29% in 2004, 234.14% in 2005, 97.61% in 2006 and 96.11% in 2007.

2. Analysis of balance sheet asset structure of credit unions

This analysis is required in diagnosis of the condition of performance, because it reveals the extent to which credit cooperative's assets participate at the institution's financial cycle.

Rate structure of assets are grouped into:

- The rate of cash - reveals their share in the total banking transactions reflected in the balance)
- The rate of claims on bank customers - reveals the share of claims against banking customers in total assets

- c) The rate of claims against customers - highlights the non-banking credits to customers's share in total banking assets
- d) The rate of investment in securities and financial assets - reveals that the share of external economic and financial relations hold in total bank assets.
- e) Equity ratio - is determined as a percentage ratio between bank holdings of capital of other companies and total bank assets
- f) Rates of intangible assets - which expresses the share of this category of assets held in total assets
- g) Ratio of tangible assets - shows the share of net book value of this category held in total assets
- h) Other assets ratio - is calculated as a percentage between other assets and the bank's assets from the end of the period under review.
- i) The rate of expenditure in advance - is determined as a percentage ratio between the balance of costs in advance and the bank's assets from the end of the period under review.

Table 1. Active structure diagram

	Craiova 2003	Pitesti 2003	Craiova 2004	Pitesti 2004	Craiova 2005	Pitesti 2005	Craiova 2006	Pitesti 2006	Craiova 2007	Pitesti 2007
Expenditure in advance	0.01	1.32	1.21	1.34	0.78	1.05	0.68	0.71	0.58	0.63
Other assets	0.24	0.36	0.24	0.36	0.22	0.55	0.14	0.36	0.08	0.12
Tangible assets	15.80	5.61	15.69	5.67	22.00	11.94	16.41	9.67	13.96	7.59
Intangible assets	0	0	0	0.03	0.05	0.02	0.03	0.01	0.02	0
Shares	2.09	3.28	2.07	3.31	1.78	2.87	3.21	4.22	3.28	4.34
Claims against customers	67.96	78.16	67.49	78.89	68.13	76.87	71.84	77.85	72.71	77.81
Claims against credit unions	6.32	3.69	5.77	2.75	0.68	1.14	0.82	6.22	8.28	9.22
House, availability to central banks	7.58	7.58	7.53	7.65	6.36	5.56	6.87	0.96	1.09	0.29

Source: Own calculations based on the aggregated financial statements

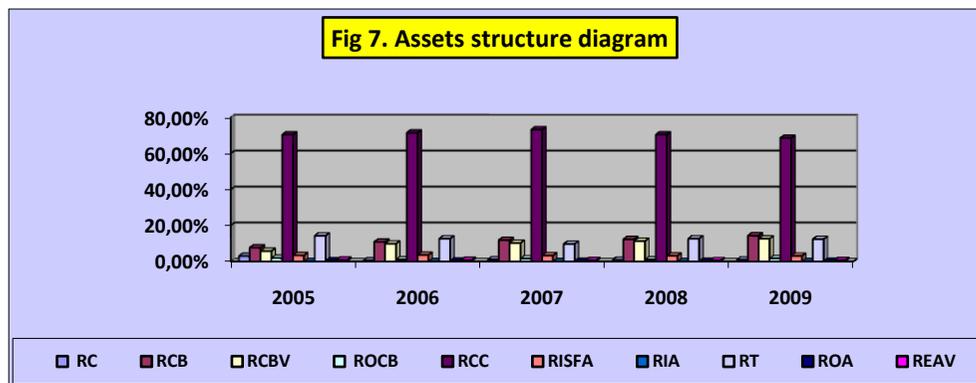

The data presented above shows that throughout the period under review, both the credit union in Craiova and Pitesti have the share in total assets (65%) owned by claims on non-bank customers, due to the subject business credit institution.

Tangible assets have a 9% share over the entire period analyzed, and claims on bank customers have weights ranging between 0.68% and 9.22%.

Finally, the funds of the two credit unions are evolving at a level between 0.29% and 7.65%.

This analysis is required because diagnosis of the condition of performance reveals the extent to which current credit cooperative financial institution participate in the credit cycle. The research I have undertaken has been based on data from a group of banks within Creditcoop. Further research results will be displayed based on data taken from published financial statements.

Evolution rates credit unions' assets considered are shown below.

Source: own illustration based on the aggregated financial statements

The data presented above show that throughout the period under review, the share of total assets (over 68%) is owned by claims on non-bank customers, due to the subject business credit institution.

Tangible assets are weighted more than 9% throughout the period under review, and claims on bank customers have weights ranging from 7.64% and 14.32%.

The funds of the two credit unions are evolving at a level between 0.92% and 2.96%.

Conclusions and suggestions

Property assets are represented in the current accounting rules as economic resources resulting from the investment of financial resources obtained by the entity from its owners and creditors.

If we consider a different approach, we appreciate that heritage assets include the specific property of the entity, representing the physical form of the Heritage Assets by nature is ordered in the balance sheet and liquidity, and debt and equity, by nature, and enforceability.

According to International Financial Reporting Standards asset is a resource controlled by the enterprise as a result of past events and from which is expected to generate future economic benefits.

To be classified as an element of balance sheet, asset must meet three cumulative conditions:

- asset must generate probable future economic benefits in an enterprise, which will result in net cash inflows;
- entity is able to use benefits and to restrict others entities' access to that benefit;
- event that generated the benefit must have occurred.

THE CREDIT RISK- COMPONENT OF THE BANKING RISKS

Țirlea Mariana Rodica

*Faculty Of Economical Sciences Cluj-Napoca Christian University “Dimitrie Cantemir”
Bucharest*

Abstract: The risk management means the risk identification, evaluation, quantification and the strategy to counter and to find solutions and levers which can abate or even eliminate the possibility to appear of the probable consequences if they have place. The credit generates risks. The inadequate financial state of the companies plus the economic conjuncture and the absence of the surveillance are the principal causes of the risks. From the bank perspective, the effects are materialized in total or partial losses of the borrowed capital.

As consequence, to avoid these risks or to diminish it, the banks proceed to the carefully analyze of the authorized limits to offer credits, to create immobile and mobile guaranties, the carefully surveillance of the clients activity during all the time of the credit.

JEL Classification: G32- Financing Policy; Financial Risk and Risk Management;

Key words: Credit, risk, risk management, risk assumption, financial risk, corporation risk, bad credits.

1.Introduction

The banking risks management, as a basic element of the banking management, follows to diminish as possible the negative influences of the risk elements, to minimize the loss by reducing the expenditures and to maximize the direct and transferred incomes, to modify the employers' behavior and to improve the bank image.

As a component in the banking risks, the credit risk is the risk assumed by the bank in case of failure of one of its clients. A bank which is strong employed in a company, by the participants to its capital and by the credit offered, will confront with this risk in the case of failure. The cause of the credit risk is the bad financial state of the companies and the term economical aspects.

Depending of the guaranties natures and the capitalization possibility, the risks that a bank exposes are: partial and total risks.

The protection of a bank against the risk means to create immobile and mobile guaranties, the carefully surveillance of the authorized limits in offering credits; the surveillance of the clients activity during the credits, in the situations of payment delay the bank must action to find the causes which have generated the delay, the payment possibilities and the recovery of the remaining rates.

2.The literature and the practice in the domain

The French Rauch and Gerard Nauller, in their book “Le control de gestion bancaire et financiere” define the risk as a commitment having an incertitude, having a win or prejudice probability, as abasement or loss.

The International regulations Bank of Basel presents one of the most complex classifications of the banking risks and their issues.

The practice in the domain of a bank against the risk means to create and to respect the procedures against the risks. The procedures regarding the credit risk must regard all the activities and to see the credits at the individually level and at the level of whole portfolio. These procedures must be established by the commercial banks in the function to assure the identification possibility since the analysis level of the bad credits, presenting evident signals

regarding the impossibility to repay in the future the terms establishes for the rates and the interests, the evaluation of new business opportunities, the credits according, the maintain of solid standards of credit, the monitoring and the control of the risk control, the BANKING RISK.

3.The banking risk. Concept and classification.

Etymological, the concept comes from the Latin “re-secare”, which means a fissure in a balance. In the banking activity, the risk assumption can be investigated for its probable future advantages, as for example the speculative operations on the finance market, but also of the probable loss.

In generally, the risk assumption is related to the basic function of the economy, the investment function. Because the risk is an attribute of the investments in generally, the risk assumption becomes inevitably and justifies the banks existence.

The banking risk can be considered a phenomenon which appear during the ongoing of the banking operations and creates negative effects over the activities, by damaging the business qualities, diminish the profit and even record loss, affecting the bank function. The banking risk can be created into it, by its clients, because of the extern competitive average.

To treat the complex subject of the risks in the banking activity, it is necessary first a clear and coherent definition of it.

The banking risk can be defined as:

- a complex of events with adverse consequences for the bank;
- an uncertain event possible and future which can affect the whole activity of a banking company;
- the probability to not get the profit expected or even to have a loss during a transaction.

The credit activity of the banks confronts with the following types of risks:

- 1.Finance risks
- 2.Intermediation risks
- 3.Banking risks.

1.The finance risks are assumed in the process of adjustment of the patrimonial structures according the accountant balance.

In this case we can find:

-The solvency risk comes as a consequence of the non-fulfillment of the credit contract clauses by the client. The failure of the conditions can be lead to a definitive loss of capital for the bank or, in the best case, it can be recovered partially or delayed, of a part of the credit.

“It must be also noted that an uncontrolled growth of the interest rate can bring to the multiplication of the insolvency cases of bank debtors, because the growth of their liabilities generates, usually, beneficiary liabilities of credits unpaid on time. From the banking practice, it results that the most important aspect is the accent which must be put on the risk evaluation when offering credits and on the definition of the current risk interval.” [1]

-The liquidity risk indicates the potentially incapacity of the bank to finance and to honor the own obligations on short time. “This type of credit corresponds to the treasury risk, which doesn’t always put the problem to realize the demanded liquidity, but the price which must be paid to get it. From this reason, the banks, using specifically processes, must permanently study and maintain an adequate level of liquidity” [2]

As the bad credits level increase, the bank gets a reduction of the clients capacity to sustain the due service.

The prognosis of the financial needs diminish the exposure to the bank.

The risk of the interest rate or the market risk means the probable negative effect of changing the interest rate, which actions over the cash flow, but also over the value of the actives and passives banking. It is possible to get often an emergent banking market. As a consequence of the increase rates development, the banks profits are diminished because of the high cost of the financial

resources purchasing. If the costs of the resources purchasing increase faster than the gain from clients:

-it can result the registration of negative gains, the fall of the net value and even the possibility to appear the insolvency bank danger.”

2.The intermediation risk of the banks in their quality of suppliers of banking services are:

-The efficient operating risk, which means the capacity of the bank to provide the maximum of services in a profitable manner.

-The technological risk express the possibility that certain banking companies become inefficient because of the distribution system of the banking services. The incorrect choice of the moment to put on the market a new product or the moment to introduce the new one can create significant loss and there is the risk that the moment be not the best from their point of view of the banking profit maximization.

-The risk of the new product is associated with the introduction and the diversification of the products offer at new banking services. It shows the cumulated probability to produce many adverse effects, as: the demand location under the anticipated level of the overcome of the planned level of the specific costs, the lack of professionalism of the managing team etc.

-The strategy risk represents the bank capacity to select the geographical and operating areas which will be profitable on the future for the bank. It express the probability to not choose the best strategy in the given conditions.

-The fraud risk regards the theft and the distortion of funds by the banking functionary.

-The operational risk express the possibility to make mistakes in the correct ongoing of the banking operations, material implications and implications which affect the society prestige and it's position on the market. It express the probability that the bank become unable to assure the serving of the clients in a profitable way. In this context, the important things are the services offered and also the capacity of the direction to evaluate and to control the expenditures generated by the services provide.

3.The banking risks that the bank must assume in its quality of banking enterprise, having the activity regulated by the Central Bank.

Here we have:

-The economical risk is bound of national and regional economical factors, which can significantly and negatively affect the banks activity.

-The competitiveness risk appears because the majority of the bank services and products can be offered, especially in the developed economies, by a big number and variety of banking societies.

-The regulatory risk or the legislation risk means to apply regulations that can put the bank in an advantageous position on the competitive plan and to accept the fact that the legislator can modify the regulations in a measure unfavorable to the bank.

-The system risk is the danger that a bank failure entrain a chain if similar collapse in the whole financial system.

3.The risk classification- general aspect regarding the foresights of the Basel II Agreement in the domain of the credit risk

One of the most complex classifications was elaborated by the International Bank of Regulations from Basel. Conform to this classification, the banking risks are:

A.Financial risks:

-the risk of the interest rate

-the risk on the rate of exchange

-the risk of liquidity

-the risk of the titles with variable income

B.Risk related to partners:

- the customer risk
- the risk appeared on the interchange market
- the country risk
- the credit risk
- C.The commercial risk
 - the products risk
 - the services risk
 - the market risk
 - the image risk
- D.Risk related to the workforce
- E.Operational and technical risks:
 - the operations quality
 - the level of computerization and telecommunication
- F.The risk of the internal management
 - the regulation risk
 - the ethics risk
 - the strategy risk
 - the risk of functional failure
 - the risk of human resources
 - the communication risk
 - the total financial internal control risk

The committee of banking surveillance from Basel:

-is an international organism created by the ambassadors of the banking surveillance authorities and of the central banks from the principally industrialized countries.

-acts in periodical meetings (at every 3 months) at the headquarters on the International Bank of Regulations from Basel (Switzerland): Belgium, Canada, France, Germany, Italy, Japan, Luxembourg, Holland, Sweden, England and USA.

-the agreement from 1988 has established a minimum limit of the capital because of the credit risk- the most important risk for the banks- even if it was presupposed that the whole capital offered (minimum level 8%) covers also other types of risks, by including it in the credit risk.

-from 1996, the market risk was separate and, for its cover, it was allocated a level of the capital. The majority of the first class banks offer in present more than 20% from their capital to the operative risks.

-in 2001, the Committee of Basel has elaborated the project of a new agreement regarding the minimum capital of the banking enterprises, necessary to cover minimum 8% of the bank exposure to the principal risks- risks of credit, of market and operational risk, and it was revised after the consultation of the ambassadors of the banking sector and of the surveillance authorities from all the world, the last form being issued in April 2003.

4.THE CONCEPT OF CREDIT AND CREDIT RISK

4.1.The credit concept

According to the explanatory dictionary of Romanian language, the credit is defined as “an economical monetary relation who is created between a physical or a juridical person (creditor), which grant a loan of money or send goods and services on debt, and an another physical or juridical person (debtor), which receives the loan or buy on debt” [3]. Simple said, the credit is “a good or a service given to a person, with the obligation to return, replace or pay it after a time, usually with an addition named interest.

The credit content can be seen from more points of view. We can remember two ideas, to points of view, “the credit as a social relation and the credit as an object of a social relation”. In the first

case, it defines a change relation or a repartition relation. As a change relation, we can define the credit as “a veritable change of present goods in exchange of future goods”. Other authors define it as “an economical category which shows relations of repartition of a part from the national gross product or from the national income, by who the availabilities existing in economy are redistributed, and the control over these sides is assured, in order to satisfy some objective needs of capital and to realize some economical political objectives”.

Regarding the monetary circulation and the money in 1821, Davis Ricardo affirms that: “the assignments of loan made for the issuant bank depend of the comparison between the profit rate that can be obtained bay using the sum and the rate that the bank can offer. When the market rate of the interest is more than 5%, that the England Bank use to offer, the discount service is assaulted from the loan demands; when the market rate is even temporary less than 5%, the functionaries from this service have nothing to work”.

Regarding the public credit system, system of the state dues, which started in the Middle Ages in Geneva and in Venice, “it take over the whole Europe, during the manufacturing period. It result the idea that a nation becomes rich if he has more dues. The public credit becomes the capitalism creed.

The credit was and still is considered “the life nerve of the production”. Starting from the theory of the tree factors of J.B.Say, a Romanian economist said that “the production is created from tree producer factors: the land, the work and the credit. But the must important element is the credit, because it can buy the land and the work, and the production is only a credit problem, where the credit is organized and simple it produce the surplus and the prosperity, where it is expensive, it eats all the income, where it produces stagnation and consume from the whole, as it happened to us, there it produces equalize”.

The credit is a relation with a special character, which appears between the sender and the buyer, when they transfer money in exchange of a prices named interest. From the point of view of the theory, but also of the practice, the credit needs a double approach. In the juridical assumption, for example, the credit is considered a convention between a creditor and a debt, usually materialized in a contract, regarding the production, the delivery and the payment of the value of some utilities. In the economical theory, the credit means the relations into the economical mechanism of a country, that mobilize the resources of temporary capital available, after well defined rules, to satisfy the financing need of the entrepreneurs.

Specifically to the credit relations is that they define a value transfer repayable, for a limited time horizon and with the obligation to pay the interest, as a price of the capital borrowed.

4.2.The concept of credit risk

The credit risk is defined as the probability that the debtor or the issuer of the financial instrument can not pay the interest or to repay the capital according to the conditions from the credit contract- it is an inherent problem of the banking activity. The credit risk means that the payments can be delayed or even not made, and this will implicit cause problems on the cash-flows and will affect the liquidity of the bank. The credit risk rests the uncial principally cause of the banks failure. The reason is that more than 80% from the bank balance refers in generally to this aspect of the risk management. The principally 3 classes of credit risk are:

- the consumers risk
- the company risk
- the country risk

4.3.The management of the credit risk

The management of the credit risk principally concentrates on the credits portfolio.

The appearance of the banking risks is determined by a complex of factors, that depend of the generally evolution of the economy, changes related to the bank organization, the financial decisions, the political and economical conditions.

The economy evolution can be seen the dynamic of PIB, the inflation evolution and the monetary stability.

The banks depend of the economical state of a country at a given moment, because in upstream the decisions of monetary politic taken by the central bank are applied by the banks, and in downstream the banks get their resources and make placements from and over the non-banking average, which generates macro-economical results and, in the same time, affected by the general evolution of the economy.

The activity of surveillance of the credits offered has as end the knowledge and the action to limit/ diminish the risks that the bank supports as a consequence of the activity of credit, including the fulfillment of the contractual obligations that result from the assurance contract of the financial risk, in the case of the credits offered.

The objectives of the surveillance activity are:

- the prevention of the non-payment risk for the credits offered to physical persons by watching the delay data
- the avoidance of the residuals accidentally registered because of the absence of time, on the ignorance of the delay data or the inadmissibility of the account balance, in case of DAC (discovered account authorized);
- the identification of clients with degradation perspectives of the economical-financial state, in order to take good measures;
- the recovery of the clients residuals;
- the rehabilitation of the problematical credits.

During all the period of credit, the bank will watch in permanence the way in which the client uses the credit, if he uses for the end that he declared and if he respects all the contractually conditions.

The payments or the credits offered are made only after signing the credit contract, the drawing of all the legal documents regarding the creation of assurance guarantees accepted by the bank and the assurance polices presentation, issues from the enterprises of assurance-reassurance agreed by the bank.

The credit moderator is responsible to verify the use of the credit for the end approved and he has the obligation to approve all the payment documents presented by the client.

The payments from the credit account will be made on the measure of recessions, with the sums demanded by the clients and accepted by the credit moderator, including the commissions afferent to these payments. The payment documents rest to the bank to make the payment, they a copied and put into the file of client.

The credit moderator will watch the process of the economical agent activity, the capital movement by the bank, the way of paying on time the rates and the interests. If a discrepancy comes, he will make an analyze of the causes and he will identify with the client the solutions.

If by approving the credit it is mentioned a term of employment of the credit, but until that data the client don't use or uses only a part of the credit, the moderator has two possibilities:

- he asks to the organisms which approved the credit to carry-over the employ term, mentioned in an additional act;
- he makes an additional act to diminish the credit at the level of the credit already used, by an express acceptance from the Committee of credit and risk.

In this send situation, it is made a new amortization graphic, here every rate will be smaller that the rate from the month of that graphic.

If it is seen that the credit beneficiary used the credit for other destinations than those that they established in the credit contract, the credit moderator has the professional obligation to inform immediately the direction of the bank, who will take the following measures:

- the ceasing of the using of the accorded and unused credit and of the acceptance of other credits;
- the pass of the credit to the remaining and measures to recuperate the credit and its costs;
- the sanction against the bank employs guilty of the non-respect of the credit destination, by respecting the Working Code.

The attentive and responsible surveillance of the credits use presuppose also periodical visits of the credit moderator at the economical agent, where he will pass to the economical-finance analyze using the last balance of check, the effective control of the guaranties from the point of existence, integrity and conservation, the investigation of their causes and the consequences that the probable modifications in the activity or in the management of the enterprise can have over the relation of the client with the bank.

The surveillance of the credit has place during all the ongoing, to prevent the default.

5.The research methodology

The credit risk, as a component of the banking risk, is a problem often considered at the last time, so the theme chosen is very actual and in concordance with the most recently studies and steps made in the banking system regarding the new management demands of the risk and of approach conform to Basell 2.

We proposed to make an analyze regarding the banking performance of the credit risk management and measures regarding the diminish of the elimination of it, starting from the risk management, which means the identification, the evaluation, the quantification and the strategy to counteract, to find solutions, to find ways to simplify or to eliminate the possibility of appearance and the consequences in case of appearance.

6.Conclusions

To eliminate totally or partially the credit risks and to get the financial performance, the banks should consider the following aspects:

- an adequate banking prudence, to manage a credit portfolio of quality, with a good capacity and an assumed risk;
- the knowledge of the client, knowledge that must consider:
 - the client character
 - the client competence
 - the client capital
 - the quality of the relations with the business average
 - the quality of the credit guarantee
 - the knowledge and the better selection of the clients and their business
 - the identification and the evaluation of the payment capacity of the clients
 - the adequately guarantee and the consolidation of the credits offered
 - the reimbursement on time of the credits, the surveillance and the recuperation of the difficult debt
- periodical visits to the client
- economical-financial analyzes over the client activity
- the creation of a general reserve for credit risks and for risk provisions;
- the credits must be guaranteed in all the cases, they must strictly respect the intern norms of credit;

MODELING ROMANIAN EXCHANGE RATE EVOLUTION WITH GARCH, TGARCH, GARCH- IN MEAN MODELS

Trenca Ioan

Babes-Bolyai University, Faculty of Economics and Business Administration

Cociuba Mihail Ioan

Babes-Bolyai University, Faculty of Economics and Business Administration

In this paper we analyze the return of exchange rate in order to test and analyze the best models which are capable of forecasting accurately there evolution. We apply the GARCH family models on the exchange rate return in order to obtain the best models for there volatility. Financial time series often exhibit abnormal characteristics, such as: serial correlation, non-stationarity, heteroskedasticity, asymmetric and are leptokurtic. Due to these characteristics autoregressive models such as autoregressive (AR), moving average (MA) and autoregressive integrated moving-average (ARIMA) are unable to capture the evolution of financial series, to represent the special characteristic of financial a hole new range of models where developed : generalized autoregressive conditional heteroskedasticity (GARCH), which are taking into account the heteroskedasticity of the errors term. The GARCH model allows for lags in the autoregressive term and in the variance term incorporates lags of the previous variance and also for the errors. The GARCH family has expanded in the last years in order to incorporate for asymmetry (Threshold GARCH, TGARCH) and risk (GARCH -in Mean).

We analyze the evolution of exchange rate for: Euro/RON, dollar/RON, yen/RON, British pound/RON, Swiss franc/RON for a period of five years from 2005 till 2011, we observe that in the analyzed period there are 2 sub-periods: 2005-2007 in which the RON appreciated constantly, and 2007-2011 in which the trend is depreciation for RON in respect to all the five currencies and the volatility was sensible higher than in the previous period. We obtain the returns on exchange rate by using the following transformation $r = \log(\text{curs}_t) - \log(\text{curs}_{t-1})$; the five analyzed series display an leptokurtic and asymmetric behavioral. Using the GARCH, TGARCH and GARCH-in Mean models, we explicit the evolution of volatility throw this period, choosing the best model using the following : minimizing the value of the sum of squared errors, Akaike and Bayesian Information Criterion.

Keywords: exchange rate, GARCH, TGARCH, AIC, BIC.

JEL Classification: G01, G21

1. Introduction

The evolution of Romanian exchange rate represent an important factor for a hole range of economic actors: banks, governmental agencies, companies and households, so the fluctuations of exchange rate and the ability to forecast her evolution is very important. For banks which must comply to the recommendation of the Basel Committee and which are ,usually, having open position on different currencies it is vital that they can understand and prognoses the future exchanges rates in order to minimize the risk of losses; for governmental agencies (especially the Romanian IRS) the evolution of Euro/Ron is important due to the fact that some of the taxes are expressed in Euro; exchange rate fluctuation can have a great on companies if there debts is in foreign currency or if the export/import; for households which in Romania are in debt especially in foreign currency the devaluation of Ron can lead to bankruptcy. Over 60 percent of loans are

denominated in foreign currency in Romania which makes our economy very sensitive to the fluctuations in exchange rates (especially Euro, dollar, yen, swiss franc). All of these reason makes important the study of exchange rates evolution.

The evaluation or devaluation of currency is not a bad think per se, what raises difficulties is their volatility because in general financial time series, including exchange rate, often exhibit abnormal characteristics, such as: serial correlation, non-stationarity, heteroskedasticity, asymmetric and are leptokurtic.

2. Literature review

The theory of purchasing power parity (PPP) was the first which managed to explain the fluctuations in exchange rate values in real terms , but there are limits of this theory [Guglielmo&Luis,2010] because it cannot explain the volatility, the main critics brought to this theory being given by the reduced relevance of the obtained methods and the necessity to use large amount of data series. If analyzing the exchange rate evolution from a nominal point there are problems for the researchers, for eg. the structure of the data series on the financial markets (because these are generally leptokurtic, the moment of the order 3 of the series is much bigger than in the case of normal distribution), leading to an increase of the probability of the appearance of extreme phenomena, also if the series are stationary or there is any evidence for structural breaks.

The best models used for modeling the volatility are the ARCH models [Engel, 1982] and then the GARCH generalization [Bollerslev, 1986] which lead to the appearance of some instruments advanced enough to model the financial series. The appearance of the GARCH models lead to a better understanding and a modeling of the evolution of the financial series, these models developing both in univariate and multivariate models [Bauwens, 2006]. The evolution of the Romanian exchange rate has been analyzed being used the GARCH modeling by Codirlasu [2001] on the series ROL/EURO and ROL/DOLAR for the period 2000-2001, being remarked the fact that the series follow an asymmetric ARCH process. Using series available during the period 1999-2003, Necula [2008] applies the GARCH and the Copula-GARCH modeling, concluding that the dynamic models of the type Copula-GARCH bring more information and stability concerning the obtained results.

3. Data used and methodology

The analyzed series are 5 currencies: Euro, dollar, British pound , Japanese yen and Swiss franc, the analyzed period is between January 3, 2005 and April 29, 2011, daily series; the date are obtained from Romanian National Bank official site www.bnro.ro and the econometrics software packaged used is GRETL, in order to obtain returns from the daily series we apply the following transformation:

$$r = \log(\text{curs}_t) - \log(\text{curs}_{t-1}) .$$

The ARCH models developed by Engel [1982] have the following equations:

$$y_t = B_0 + e_t \quad (1)$$

$$e_t | I_{t-1} \sim N(0, h_t) \quad (2)$$

$$h_t = \hat{\alpha}_0 + \hat{\alpha}_1 * e_{t-1}^2, \hat{\alpha}_0 > 0, \quad 0 \leq \hat{\alpha}_1 < 1 \quad (3)$$

The equation(1) expresses the series evolution, a following a normal distribution law of conditional equations (2) and (3). Equations 2 and 3 express the ARCH type models, autoregressive models with different time variance, residuals follow a normal law of 0 mean and h_t variance. The value of $\hat{\alpha}_0$ and $\hat{\alpha}_1$ must be positive, and $\hat{\alpha}_1$ has a value between [0,1] in order to avoid an explosive processes, also errors(residuals) follow a normal distribution law.

ARCH models have been developed later in the GARCH (Generalized autoregressive

conditional heteroskedasticity) by Bollerslev [1986], which bring the use of lags as an innovation in equation variance, equations in the GARCH (1,1) case are:

$$y_t = \beta_0 + e_t \quad (4)$$

$$e_t | I_{t-1} \sim N(0, h_t) \quad (5)$$

$$h_t = \alpha_0 + \alpha_1 * e_{t-1}^2 + \beta_1 * h_{t-1}, \quad \alpha_0 > 0, \quad 0 \leq \alpha_1 < 1 \quad (6)$$

It have been observed that on the financial markets the assets prices are influenced by the news (also called innovation) , so that a bad news generates more volatility than a good news. A GARCH model which treats differently the bad-good news was proposed by Zakoian [1993] – Threshold GARCH. It is an asymmetric model in which the conditional volatility is:

$$h_t = \alpha_0 + \alpha_1 e_{t-1}^2 + \gamma * d_{t-1} * e_{t-1}^2 + \beta_1 * h_{t-1} \quad (7)$$

where: $d_t = 1$ if $e_t < 0$ or $d_t = 0$ if $e_t > 0$.

Also in order to reflect the relation between risk and return another models where proposed in order to incorporate this characteristics [Engle,1987], GARCH in mean model have the following characteristic:

$$y_t = \beta_0 + e_t + \theta * h_t \quad (8)$$

$$e_t | I_{t-1} \sim N(0, h_t) \quad (9)$$

$$h_t = \alpha_0 + \alpha_1 * e_{t-1}^2 + \beta_1 * h_{t-1}, \quad \alpha_0 > 0, \quad 0 \leq \alpha_1 < 1 \quad (10)$$

In this model as the volatility rises the return are rising too, this models are useful in order to capture the risk of the assets.

4. Exchange rate models: GARCH, TGARCH and GARCH in Mean

Using the return $r = \log(\text{curs}_t) - \log(\text{curs}_{t-1})$, we obtain the following evolution of the series:

	R_DOLAR	R_EURO	R_FRANC	R_LIRA	R_YEN
Mean	-0.003560	0.002223	0.013383	-0.012068	0.010834
Median	-0.048804	-0.017661	-0.020991	-0.038889	-0.091837
Maximum	4.434815	3.385650	5.223699	4.018345	10.80639
Minimum	-4.968370	-5.106356	-5.027989	-4.838047	-7.547544
Std. Dev.	0.874067	0.487860	0.702979	0.746555	1.133958
Skewness	0.277802	0.050525	0.290114	0.072925	0.678837
Kurtosis	6.729989	16.06188	9.472018	7.815664	11.90174
Jarque-Bera	955.2118	11460.17	2836.024	1559.066	5446.158
Probability	0.000000	0.000000	0.000000	0.000000	0.000000
Sum	-5.739149	3.582965	21.57408	-19.45334	17.46505
Sum Sq. Dev.	1230.792	383.4293	796.1225	897.8817	2071.521
Observations	1612	1612	1612	1612	1612

The return of the series are different from zero for all the return, the highest return is obtain for the Swiss franc 1.33% and the lowest for the British pound – 1.20%; from the 5 currency two have negative return: the British pound -1.20% and the American dollar -0.3%. The standard deviation which measures the risk associated with these currency are the highest for Yen 1.13 and the lowest for EURO 0.48, also all the currency are asymmetric and leptokurtic. All the series where tested for stationarity using the ADF test and also for the ARCH effect: the series are stationary and the ARCH effect is present.

The evolution of the return (Fig.1) are having the characteristic of an GARCH model with periods of high volatility followed by periods of low volatility, also we can observe that the highest volatility is in 2008-2009 when the financial crisis hit the markets.

Fig.1. Evolution of return 2005 -2011

Sum squared resid	1212.071	Schwarz criterion	2.374433	
Log likelihood	-1884.389	Durbin-Watson stat	1.918963	

For the GARCH in Mean model we used for quantifying the risk in the mean equations after testing the model with a variance that the best way to integrate risk is using the logarithm of variance.

Fig.2 The evolution of conditional variance for dollar in a TGARC model

5. Conclusion

The purpose of using TGARCH and GARCH in Mean models is to offer a better understanding of the volatility which is found on financial markets, because financial assets have some abnormal characteristics, such as: serial correlation, non-stationarity, heteroskedasticity, asymmetric and are leptokurtic it is important to take into account them. GARCH asymmetric models, like TGARCH and GARCH in Mean, are offering the possibility for better forecasting on these assets. In these models we postulated that the error term is following a normal distribution: $\epsilon_t | I_{t-1} \sim N(0, h_t)$ but there are other possibilities: student, Generalized Error Distribution, student skewed and skewed Generalized Error Distribution. Another factor which we need to take into the consideration is the possibility of structural breaks in the series.

THE POLITICS OF THE NATIONAL BANK OF ROMANIA TO DEAL WITH CREDITING RISK

The market economy refers to the implicit presence of a banking system which could ensure the mobilization of all the monetary resources of the respective economy and their temporary orientation towards the development of efficient economic activities.

A significant aspect of the bank performance refers to the measurement of risks with the aim to diminish them. If the bank management is poor and the risks are not taken into consideration, it will be possible that the earning capacity to be reduced and to lead even to the bankruptcy. Due to the fact that the banks are lending, they assume risks which are determined by the doubtful debtor (it appears the insolvency), or by the general economic evolution (which involves interest and exchange rate risks), or by the financial structure of the bank (financing long-term credits from short or sight deposits).

The bank risk can be determined by external or internal factors of the bank due to the competitive environment.

In the professional literature, the methodology used for the risk management involves several steps: the risk identification and analysis; the risk elimination and control; the risk assessment and assuming; the risk financing by debiting the general or specific reserves or by transfer which means the insurance of the bank company.

For those banks operating in Romania, the risks are even more evident due to the hostile environment in which they operate, but also due to the specificity of the Romanian banking system which is still evolving and adapting to the competitive stringencies of the market economy.

This paper is trying to follow the risk involvement towards the bank activity taking into account its importance and role in order to ensure the increase of the bank earning capacity.

Keywords: crisis, credit risk, bad loans, banking supervision

JEL classification: G21

Introduction

The financial risks originate in the impossibility of foreseeing the evolution of the variation of the financial and banking risks. When employing their resources, the banks are confronted with a series of risks determined either by the quality of the organization providing the loan or by the general economic evolution or by the general structure of the bank.

The bank risk can be defined as a phenomenon which appears along with the bank activities and which determines negative effects towards the specific activity by damaging the business quality, diminishing the profit or even registering losses affecting the bank functionality.

By means of their activity of collecting financial resources and at the same time investing them in those institutions which have temporary supplementary needs, the banks fulfil an important role

acting as an intermediary. In this respect, the credit becomes an active instrument in the stimulation of economic development since it encourages the emergence of certain phenomena according to the objectives that are to be followed in perspective.

Detecting the potential banking risks presupposes familiarity with the emergence and evolution of the release factors. The quantification of their manifestation parameters and the tracking down of those indicators which can lead to their identification are very important.

Due to the authentication and prudential monitoring norms of The National Bank of Romania, the **credit risk** is defined as “the risk of recording losses or of not making the estimate profits as a consequence of the inobservance of the promissory notes.”

From an economic agent’s point of view, the *credit risk* is defined by means of the losses registered because the advance cash flow was not collected till due as a result of the degradation of the *debtor’s crediting quality*. From this perspective, the credit risk has two coordinates: rating the risk and its quality.

Rating the risk shows the kind of loss the creditor has suffered as a consequence of the debtor’s inability to refund the credit whereas *the quality of the risk* results from both the possibility that the payment may take place and from the guarantees which can cut down losses in case of non-payment. The impossibility of refunding a debt represents an insecure event. In addition, the future exposures are not known for a fact till due because crediting on the basis of refunding programs established according to solid contract clauses is to be applied only in a limited number of situations. The advance refunding of the outstanding loans displays a credit risk because in this situation the bank has to ensure a refinancing of the unattainable income and to cover the expenses generated by the credit granting.

Starting from these assumptions, the credit risk could be divided into three types of risk: *default risk, exposure risk and recovery risk*.

The Default Risk

This risk resides in the probability of non-payment of an outstanding debt. There are several possible definitions for *non-payment*: failure to keep to a payment bond, violation of a convention or economic non-payment. The default risk is proclaimed when the scheduled payment has not been carried through in a minimum period of time from the due date. *The economic non-payment* takes place when the economic value of the debtor’s assets decreases beyond the value of the outstanding liabilities, a situation which can stop the debt repayment.

The deterioration of some economic and financial indicators as compared to the assumed level at the credit contracting date could be associated with *technical non-payment*. This non-payment usually triggers negotiations even if the failure to reimburse the credits till due does not jeopardize the debtor’s creditworthiness. In certain situations, the bank can even make use its right to ask for a prompt reimbursement of all outstanding debts.

The probability of non-payment cannot be directly measured but one can use the historical statistics of internal non-payment, of the rating agencies and of the central authorities. The most representative types of ratings are: the rating of the current debts, the emitter’s rating and the industry rating. In most of the cases, the rating agencies assess the quality risk of a debt which is conditioned both by the probability of non-payment and by the possible recovery in case of non-payment.

The Exposure Risk

The exposure risk quantifies the degree of uncertainty regarding the borrowed sums. If the credit is reimbursed according to a firm contract program the exposure risk could be considered reduced or insignificant. Unfortunately, this thing does not hold valid for all crediting lines. If the crediting lines allow the debtor to access them whenever he wishes according to his needs and a maximum limit established by the bank, then the bank’s risk of exposure is considerable.

The Recovery Risk

In case of non-payment, the recovery is not predictable. It depends on the type of non-payment and other factors such as: the debtor's guarantees and the type of these guarantees which can be correlated with those of a third party. A non-payment does not mean that the debtor will never pay but draws the initiation of certain actions such as renegotiation or the incumbency to reimburse the outstanding loans. If no corrective action is to be taken into consideration then legal procedures step in: the legal instrumentation of the guarantees (which differ according to the type of guarantee accepted) and the foreclosure of the guarantees.

The experience of the banks in Romania has proven that in time, the credit risk has represented the main risk which the Romanian banking system faced against the expansion of the crediting activity since approximately half of the assets are concentrated in credits.

The global financial and economic crisis has strongly influenced the evolutions from the manufacturing and financial sectors in Romania especially during 2009 and 2010.

This interval has reconfirmed the depression tendency of the non-governmental credit starting in the first trimester of the 2008 in spite of some stimulating measures adopted by the central bank. This is an ongoing phenomenon on the credit market and represents a serious challenge for both the banks and the authorities.

A growing vulnerability of the Romanian banking system is represented by the decrease of the credit portfolio quality which has fully manifested itself in 2009 and 2010 and still persists at present against the background of the economic recession. One can add the supplementary burden which the debtors who have contracted currency credits and are not ensured against the currency risk have to support. Even if the outstanding debts are at a manageable level, their growing rate constitutes a reason of worry for the financial stability.

Non-governmental credit contraction in the period 2009-2010 occurred on reducing both the fund supply and demand for loans. In relation to the supply of credit, the determining factor has been represented by the perpetuation of the banks' aversion to risk, despite the measures adopted by the central bank in order to encourage sustainable restart of crediting (reducing the rates of minimum compulsory reserves applicable to the credit institutions' liabilities in lei and in foreign currency, reducing the monetary policy interest rate, amending some stipulations of the bank prudence rules). In the context of these measures, to which one can add the exposure of the main foreign capital Romanian banks, the market has received sufficient liquidity.

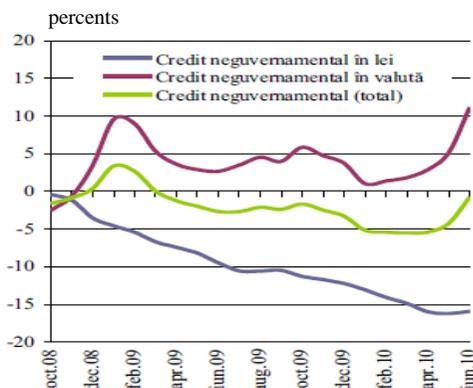

The analysis of the monthly developments of the non-governmental credit, in real terms (having as a reference point 30 September 2008 – a moment when the effects of the international economic crisis started to be felt by the banking system in Romania) reveals credit contraction starting with April 2009 (Chart no. 1).

The lending decrease for the private sector was also determined in 2010 by the cumulative action of the following factors: (i) maintaining the economic decline in 2010 and worsening the financial forecast for the population and companies; (ii) the increase of the unsatisfying credits. The credits demand has maintained the cautious character throughout the period and it has registered a relative decrease demand of new credits and an increase demand for refinancing – due to the factors related to the supply-side (interest decrease, reduce or elimination of the commissions). As regards the credit supply it was registered a slight improvement toward the year end reflected by the relative flexibility of the credit standards and terms or by the initiation of the promotion campaign of the credit cards.

The sectoral analysis demonstrates different intensity of the credit tightening during 2010. The decrease of the credit for the population was exclusively caused by the severe tightening of the consumer credit (-18,3% real annual fluctuation), its weight was diminished with approx. 10% of the total retail credit (until 62,9%). The descending trend of those credits has been emphasized in the second part of the year induced by the enhanced decrease rhythm of the population available income caused also by the 25%

decrease of the salaries in public sector beginning with July. Concerning the mortgage credit, the annual dynamic had a positive trend being maintained at 10,6% due to the flexibility of the credit standards and terms, an important contribution having the increase competition between banks.

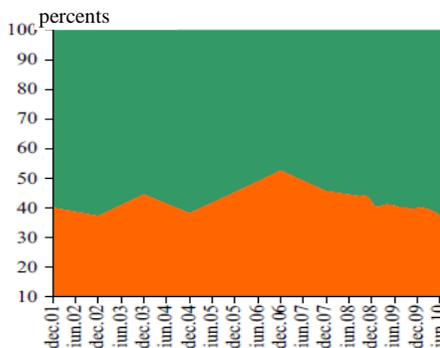

From the perspective of denomination, trends were similar, but the amplitude of movements was different. Thus, the credit in lei has witnessed a relative decrease since May 2009, the phenomenon being gradually widespread. As regards the component in currency (expressed in lei), the values have maintained positive values during 2009 (a situation mainly occurring due to differences in the exchange rate), but have followed a strong descendent trend. The first months of 2010 have marked the start of the contraction of credit granted in foreign currency, which became positive again only in May 2010.

Chart no. 3 Non-governmental credit - types of currency- mld. RON; end of the periode

In the context of the present economic crisis, according to the data of the National Bank of Romania the analysis of the credit sector of the counties in Romania indicates the fact that in just one year the Romanians' ability to pay their bank credits has considerably decreased. The increment of the arrears is caused by the clients' excessive crediting in relationship with the present income decrease.

Bankers have more and more problems with the non-performing loans, although they have reported reduced levels of delayed credit payment for each county between 2009 and 2010. There are multiple causes, both the surface ones such as salary decrease, job losses, interest increase and the case when clients have defrauded the banks, especially by using false papers. At the same time, if we take into consideration the fact that most of those who have arrears come from the private environment, the only sector that has known an adjustment at the beginning of the crisis, but we should not forget the state employees will have a diminished income and, thus, the non-performing loans will continue to increase.

The different rhythms of credit contraction have caused changes in the market share of the counties after the balance of granted loans. Bucharest-Ilfov preserves its leading position, with an amount of 38% of the total financing (77.54 billion) followed by the North-West region, with a financing balance at a less than third of the capital's balance (25.5 billion). The third place is occupied by two regions, Centre and North-East, which each had 9.4% of the total loans (19.2 billion). However, one can say that the North-East region has a slight advance, as the credit contraction has been lower.

Chart no. 4. The Credit Intensity on Regions

According to the destination of credits (for small operators, consumer and mortgage credits) one can observe that in some counties discrepancies among these segments emphasize differences in development among the administrative territorial units of the country. Nationally, the balance of the credits for legal persons registered a total of over 100 billion at the end of May 2010, increasing by 4.4% compared with the same period of 2009.

In the total portfolio of loans the share of the outstanding and uncertain loans granted to the customers has increased from 0.32% to 1.5%, while in the total banking assets the intensity of delays in payment registered a growth from 0.29% to 1.01%. At the same time, the unadjusted exposure regarding loans and interest classified in the categories "uncertain" and "loss", including items out of the balance sheet, has increased from 5.95% to 13.52% by the end of 2010, in the context of aggravation of the financial situation of people and companies, but also in the context of increased volatility of the exchange rate of domestic currency.

The reports elaborated by the Romanian National Bank indicates that the banking system has maintained in 2010 an adequate level of capitalization, the solvency rate being of 14.4% as a result of the banks capital injections made in order to counter the effects of the credits portfolio quality deterioration. This phenomenon is reflected by the evolution of the risk credit indicators, by the risk credit rate which reached 20,8% at the end of 2010 in comparison with 15,3% in 2009.

The banks choice for the less risky investments (public securities) is reflected by the improvement of the general risk rate (until 44,6%).

As it is written in the table below, year 2010 marked the entrance in the negative field of the profit indicators for the Romanian banking system, as a result of the provisions expenses increase, of the unsatisfying assets increase and of the efficiency decrease obtained from the investments in public securities.

Table no. 1. The main indicators of banking caution

	Dec. 2009	Dec. 2010
Capital risk		
Solvability rate ($\geq 8\%$)	14,67	14,66
Leverage ¹	7,55	7,87
Credit risk		
Overdue and doubtful credits (net) / Total credits (net)	1,45	2,22
Overdue and doubtful debts (net) / Total assets (net)	1,01	1,49
Credit risk rate ²	15,29	20,81
General risk rate	47,29	44,56
Liquidity risk		
Liquidity indicator ³	1,38	1,36
Profitabilitate⁴		
ROA (Net profit/Total assets)	0,25	-0,09
ROE (Net profit/Own capitals)	2,89	-1,02
1) Own funds of 1st level/Total average assets;		
2) Unadjusted exposure for the credits and interests classified in doubtful and loss /Total credits and interests classified without the elements outside the balance-sheet;		
3) Actual liquidity/Necessary liquidity;		
4) Starting with 2008, ROA and ROE are calculated taking into account the average levels of the assets and own capital		

After the National Bank of Romania has checked the commercial banks, it has also submitted a report which stipulates a series of measures that refer to: managing risks and establishing the thresholds at which risks are considered significant; reviewing policies regarding management of liquidity risk by improving the control strategies for liquidity crisis; reviewing credit policy by setting the limits of concentration on types of credit facilities; banning the grant of unsecured consumer loans; improving the process of monitoring and implementation of safeguards reevaluation; assessing the credit risk according to alternative scenarios for conditions of crisis; complying with the maximum admissible limits for large exposure.

In conclusion, the evolution of the banking system has proven that bank monitoring remains an activity required to ensure financial stability, and the future will bring even more challenges for the competent authorities. The risks associated with the banking system are in a dynamic process, and the monitoring activity should be improved so as to counteract the functioning problems of the crediting institutions.

The study uses a linear model that reviews the connection between inflation rate and a few macroeconomic indicators: Harmonized Index of Consumer Prices (HICP), Gross Domestic Product (GDP) and unemployment (Unempl). The purpose of this study is to discover the influence of these macroeconomic indicators on the inflation rate, taking into consideration a period of ten years: 2000-2010. The analysis approaches this issue from the perspective of two EU member countries: Bulgaria, Romania, and another two countries - EU candidates: Turkey and Croatia.

Although the tradeoff between inflation and unemployment has been long discussed, starting with the famous idea of the Phillips curve that has evolved during time (M.Friedman, E.Phelps), economists are still studying this theme in order to find satisfactory explanation for it. In this paper we have tried to find out whether, in the analyzed countries, there is a strong tradeoff between inflation and unemployment, but we also added other variables that influence inflation: the gross domestic product and the previous values of inflation.

Our paper started with a study of the economic background of each analyzed country then, we have collected quarterly data from the period of 2000-2010, that we processed using the econometric software Gretl. After building several models for each country we concluded that inflation in Romania and Croatia are influenced by the following variables: GDP and previous HICP, while the values of inflation in the other two countries are affected by more diverse range of independent variables.

Keywords: Inflation, Harmonized Index of Consumer Prices, Gross Domestic Product, Unemployment, Monetary policy

JEL Classification: E24, E31, E52

1. Introduction

The inflation phenomenon

As a phenomenon, inflation appeared at the same time with the development of money in the market economy and has manifested during the centuries reaching historic highs in the Twentieth Century, in which national monetary systems have abandoned the gold standard due to the economic, political and social crises. Many specialists (economists and not only) have tried to define the phenomenon, to explain its causes and the impact that it has on the standard of living.

Mishkin F. (2004:10) defines inflation as a *continual increase in the price level* that affects individuals, businesses and the government. In recent years it has taken the place of one of the most important concern of the politicians and policymakers, many Central Banks have chosen the

mandate of achieving and maintaining price stability, which in turn provides an economic environment that is conducive to growth in savings and investment.

Overview of the macroeconomic background of Romania

Considering the fact that Romania has fought three digits inflation during the transition period from a centralised economy to a market one, it took almost a decade to get one digit inflation and obtain a sustainable decrease of the level of inflation rate. As stated by the Governor of Romanian National Bank, Mugur Isărescu (2008:20) between the years 2000-2007 Romania has managed to obtain an annual average 5,8 % disinflation rate in parallel with the maintaining of the financial stability through appropriate mix of economic policies.

Romania is one of the many developing countries that has adopted inflation targeting. The successful transition to the new monetary regime, made in 2005, was due to the independence of the central bank which has the sole goal of achieving and maintaining price stability.

Overview of the macroeconomic background of Turkey

Turkey is a developing country, that has joined the European Community (EC) as an associate member in 1963 on the signing of the Ankara Agreement, and in 1999 it gains the status of candidate member during the European Council of Helsinki.

Starting with December 1999 Turkey committed to program with the International Monetary Fund that sets the economic policy agenda; it consisted of two pillars that oblige the Turkish government to maintain dual targets (Telli, Voyvoda and Yeldan, 2009:203): a primary surplus target in fiscal balances and price stability via inflation targeting. This program was though for the reason of enhancing the countries credibility, eventually leading to reductions in the rate of interest that would stimulate private consumption and fixed investments. The Central Bank of Turkey was granted independence in 2001 having to follow disguised inflation targeting until conditions were ready for full targeting. Finally on January 2006 the Central Bank adopted full-fledged inflation targeting.

Overview of the macroeconomic background of Bulgaria

During 1996, Bulgaria faced with the economy collapse due to the Bulgarian Socialist Party's slow and mismanaged economic reforms and an unstable and decentralized banking system, which led to an inflation rate of 311% and the collapse of the lev. The economic situation started to change in the spring 1997, when the currency board regime was introduced. These brought growth and stability to the Bulgarian economy. The currency board contained inflationary pressures and the three-digit inflation in 1997 was cut to only 1% in 1998. Supported by a well functioning currency board and by sound income and fiscal policies, until mid 2007 the disinflation process progressed well, even in the presence of strong growth of domestic credit and of the accession related excise tax rate increases. Bulgaria's entry into the EU in January 2007 is having a significant impact on the macroeconomic situation.

Overview of the macroeconomic background of Croatia

While the political life was changing in the 90's, on the economic front, Croatia experimented macroeconomic instability, manifested through hyperinflation. At the end of 1993, Croatia introduced the Stabilization Program, based on a nominal exchange rate anchor, that has successfully achieved its main aim: in the last 13 years (from 1994 to 2006) Croatia has enjoyed a stable inflation rate (Vizek, Broz, 2007:8).

Having inflation 2% higher than majority of high income EU Countries, Croatia should be compared to newly members of EU such as Bulgaria and Romania, which both have a much higher inflation of 6%. Since the introduction of the Stabilization program in 1993, the Croatian

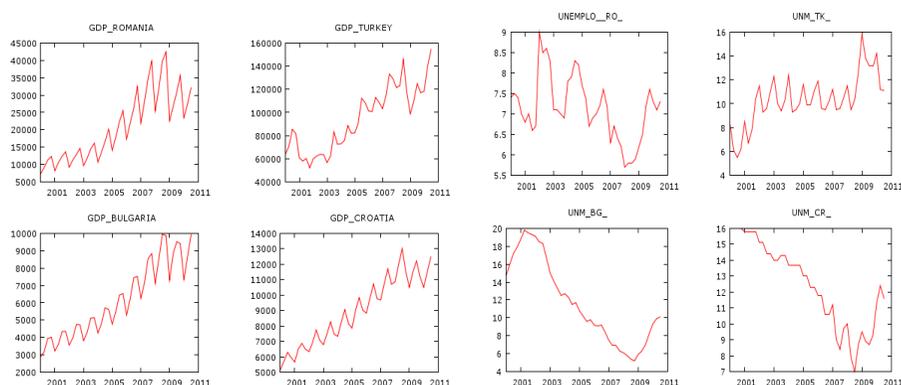

National Bank has been following the monetary strategy of exchange rate anchor. During the first several years (from 1993 to 1997) this monetary strategy achieved acceptable results, accompanied with a low inflation rate and high GDP growth rates.

2. Model

Data used and the methodology of research

Starting from the connection between the macroeconomic indicators: inflation rate, gross domestic product and unemployment rate, as shown in the economic reality, and after studying the national and international economic literature we gathered up the necessary data for a study case on Romania, Turkey, Bulgaria and Croatia in order to understand and verify the connection between the mentioned indicators.

We have collected quarterly data for the period of 2000-2010 using as sources: Eurostat (GDP and HICP, unemployment rate - Bulgaria and Romania), Turkstat (unemployment rate for Turkey) and the Institute of Economics Zagreb (unemployment rate for Croatia). In the research it has been used the open source software for econometric analysis Gretl.

Graphical analysis of time series GDP, HICP, unemployment

Figure 1: Quarterly Gross Domestic Product -millions of euro

Figure 2: Quarterly Harmonised Index of Consumer Prices –percentage

At the first view of Figure 1 it is noticeable that the basis trend line is ascending, even though during the analysed period the GDP has a fluctuating evolution, recording low values at the beginning of a year compared with the values recorded at the end of the year. Between the four analysed countries we notice that Turkey's GDP is highly over the other countries GDP's, meanwhile Bulgaria is situated at the opposite side-the lowest GDP. Until 2007 a slow growth rate of the GDP was recorded in all analysed countries, but since that point on the variation of the growth rate has substantially fluctuated. While the graphs for Romania, Bulgaria and Croatia show the seasonality of the GDP, the evolution of Turkey's GDP stands out because the seasonality is not so obvious.

The values of the Harmonised Indices of Consumer Prices between 2000 and 2010 (Figure 2) show a normal increasing evolution due to the rising prices of the goods and services in the economy, in all analysed countries. Turkey and Croatia has a smoother curve than the other two countries, indicating a continuous rise in prices without any significant decrease in prices level. On the other hand, Romania and Bulgaria experienced more sudden price change which made the curve of HICP to be more sinuous.

The country which registers the highest values of unemployment (Figure 3) rate is Bulgaria, followed by Croatia. However the unemployment rate has a sustained decrease since 2001 until 2009 in these countries. Although the other two countries Romania and Turkey registered relative

low unemployment rate, the evolution is highly fluctuating. In the case of Romania, the graphic presents dramatic changes of the unemployment rate from one year to another. Regarding Turkey, the changes are not so dramatic and seem to focus around the values of 10-12 percentages between 2002 and 2009. The effects of the economic crisis of 2008 on the labour market caused an increase of the unemployment rate from this date forward in all analysed countries.

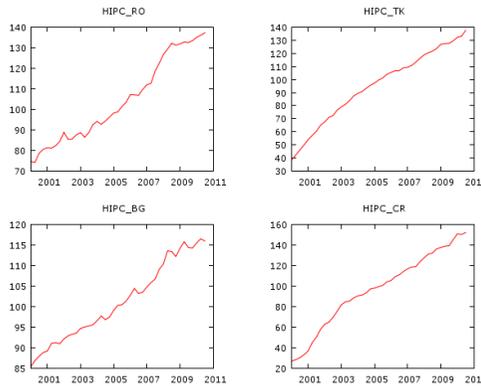

Figure 3: Quarterly unemployment rate-percentage

Adjusting the time series of GDP by removing its seasonality

Representation of data series in Fig. 1 shows that GDP has a strong seasonality, which will be removed using the X-12 ARIMA methodology⁶⁴ used by the U. S. Bureau of Statistics; in order to make them stationary they need to be differentiated.

The econometric model

Through the development of this econometric model we aim to verify the possible correlation between inflation, gross domestic product and unemployment. We have chosen the following model:

$$y_{(t)} = a \cdot y_{(t-1)} + b \cdot \frac{1}{x_{1'(t)}} + c \cdot x_{2(t)} + \varepsilon_{(t)} \quad (1)$$

where:

- $y_{(t)}$ = Current HICP (quarter t)
- $y_{(t-1)}$ = Previous HICP (quarter t-1)
- $x_{1(t)}$ = Current unemployment rate (quarter t)
- $x_{2(t)}$ = Current GDP (quarter t)
- $\varepsilon_{(t)}$ = residual variable

Being a non linear model, it is liniarised through the introduction of the variable $x_{1(t)}=1/x'_{1(t)}$, leading to the following equation:

$$y_{(t)} = a \cdot y_{(t-1)} + b \cdot x_{1(t)} + c \cdot x_{2(t)} + \varepsilon_{(t)} \quad (2)$$

After eliminating the seasonality of the GDP using the X-12 ARIMA, we have looked up for its logarithm; we have also looked up for the logarithm of the previous HICP. Using the method of Ordinary Least Squares we have obtained the two models for each country.

Romania

⁶⁴ For a broader discussion on the use of X-12 ARIMA: <http://www.census.gov/srd/www/x12a/>

In the case of Romania, current value of HICP is influenced by the values of GDP and the HICP values of the previous quarter. The constant and the unemployment rate are not representative -do not pass the student t-test, they are not relevant at the level of the population- in the first model, therefore we consider as a more relevant model, the second one.

The equations would be:

For the first model:

$$1) \text{I_HICP} = 0.08391 * \text{const} + 0.06027 * \text{I_GDP_d11} + 0.09335 * \text{inv_unempl} + 0.8535 * \text{I_HICP_1}$$

For the second model:

$$2) \text{I_HICP} = 0.06149 * \text{I_GDP_d11} + 0.8719 * \text{I_HICP_1}$$

The results of the model reveal that in the case of Romania the current HICP is directly influenced by the I_GDP and the previous I_HICP_1. The other two variables-constant and unemployment- are not representative for the evolution of current HICP.

The evolution of the current month inflation rate, shown by the HICP, is conditioned by the evolution of the HICP of the previous period (quarter) and by the evolution of the GDP.

Bulgaria

The results shown by the analysis of Bulgaria data using the model has revealed the HICP is influenced by the values of the constant, GDP and the HICP values of the previous quarter, and the values of (t-3) quarter. Due to the fact that the unemployment rate is not representative (does not pass the student t-test) in the first model we consider as a more relevant model, the second one.

The equations would be:

For the first model:

$$1) \text{I_HICP} = 0.7404 * \text{const} + 0.09624 * \text{I_GDP_d11} - 0.03088 * \text{inv_unempl} + 0.4448 * \text{I_HICP_1} + 0.2163 * \text{I_HICP_3}$$

For the second model:

$$2) \text{I_HICP} = 0.7210 * \text{const} + 0.08656 * \text{I_GDP_d11} + 0.4511 * \text{I_HICP_1} + 0.2319 * \text{I_HICP_3}$$

The results of the model reveal that in the case of Bulgaria the current HICP is directly influenced by the constant, I_GDP and the I_HICP_1 values of the previous quarter and I_HICP_3-the values of (t-3) quarter, therefore by the most diverse number of independent variables among the four analyzed countries.

Turkey

For Turkey, HICP is influenced by the values of GDP, the unemployment and the values of the previous quarter of HICP. We consider as a more relevant model the second one because the constant is not representative (does not pass the student t-test) in the first model.

The equations would be:

For the first model:

$$1) \text{I_HICP} = 0.07963 * \text{const} + 0.04119 * \text{I_GDP_d11} - 0.2778 * \text{inv_unempl} + 0.8906 * \text{I_HICP_1}$$

For the second model

$$2) \text{I_HICP} = 0.05178 * \text{I_GDP_d11} - 0.3134 * \text{inv_unp} + 0.8822 * \text{I_HICP_1}$$

From the results we can conclude that I_GDP and the I_HICP values of the previous quarter, influences directly the dependent variable: current I_HICP. The one variable that influences in an indirect way the HICP, is the unemployment rate.

Therefore after the analysis we consider that in the case of Turkey there is a significant connection between the HICP and the unemployment rate. This situation can be attributed to the fact that the unemployment rate has a highly fluctuating evolution from one year to another during the analyzed period.

Croatia

For Croatia, the first model shows that the only independent variable that is representative for the population is the previous value of HICP, therefore we generated a second model. This revealed that with the new calculated coefficients there is also a correlation between current HICP and I_GDP , besides the HICP values of previous quarter. The influence of unemployment in both models is indirect but not representative. The final model, which we consider the most relevant, because the variables are representative, shows the connection between current GDP and previous quarter HICP.

The equations are:

For the first model:

$$1) I_HICP = -0.3575 * const + 0.09323 * I_GDP_d11 - 0.4089 * inv_unempl + 0.9074 * I_HICP_1$$

For the second model:

$$2) I_HICP = 0.04429 * I_GDP_d11 - 0.1868 * inv_unp + 0.9227 * I_HICP_1$$

For the third model:

$$3) I_HICP = 0.04541 * I_GDP_d11 + 0.9168 * I_HICP_1$$

The data that we generated shows that Croatia has a similar situation to Romania's, meaning in both countries, the current value of the HICP is directly influenced by the values of the previous quarter HICP and the values of the current GDP, the other two independent variables not having a relevant influence on the dependent variable.

Conclusion

In this study we aimed to analyse the connection between inflation and some macroeconomic indicators in Romania, Bulgaria, Turkey and Croatia, therefore we first started with a short study of the economic background of each country in order to be able to build and explain the model. Following the analysis of the macroeconomic situation of each country mentioned above we conclude the following things:

Romania, which is now part of the European Union, has a short history of market economy-two decades-period in which the economy has struggled with high levels of inflation, public deficit, high rates of unemployment. Beginning with the year 2000 it was obvious a sustained economic growth which made possible the implementation of reforms.

The case of Turkey is not much different from the one of Romania, it struggled also with centralised economy, but the demographic aspects made the situation different. After some reforms the economy started to grow but in 2001 it is hit by a crisis. A special aspect of Turkey's economic policies is that during a few years it pursued two contradictory targets.

Another analysed country, Bulgaria, faced with the transition from the centralised economy to the market one had fought high economic imbalances during many years. After 1997 when it adopted a currency board regime, the economy began to stabilize. The 2000's saw a steady pace of growth and budget surpluses but shaky inflation.

With a dramatic history of the 1990's, Croatia begins to show stabilization in the macroeconomic situation until 2006, because of the introduction of the Stabilization Program. Since this year forward the macroeconomic indicators show a dramatic decrease also influenced by the 2008 crisis. From February 2005 Croatia is advancing to full EU membership.

Based on the analysis of the collected data and after processing them in order to eliminate the seasonality using X-12 ARIMA, and looking up for the logarithm for the GDP and HICP, we generated a series of equations from which we chose the most representative at the level of the population, after taking the student t-test. We generated two models for Romania, Turkey and Bulgaria and three for Croatia because we wanted to eliminate the non representative variables.

We observed that the only country in which unemployment has a relevant influence over the HICP is Turkey (and it is an indirect influence), meanwhile the previous values of HICP and

current values of GDP have a direct influence in all analysed countries over the studied period. Bulgaria's situation is a bit different from all the other analyzed countries: the value of current HICP is also influenced by the constant and by the values of (t-3) quarter HICP. Through this paper we tried a simplistic way of analyzing the influence of a few macroeconomic indicators over inflation; therefore this is a basic model that can be significantly improved through the introduction of more complex variables. The results, the similarities and differences between the countries, arise many questions that will be answered through a deeper research and improvement of the model.

MONEY: FROM STATISTICAL DEFINITION TO MONETARY POLICY FOR ADOPTING EURO.

Zăpodeanu Daniela

University of Oradea Faculty of Economics

The evolution of monetary aggregates is closely related to the economic cycle, especially the evolution of GDP. The study aims to analyse the primary monetary aggregates (M1), the secondary (M2) and the tertiary (M3) in three Central and Eastern European countries: Romania, Bulgaria and Poland. The countries were chosen as follows: Romania and Bulgaria on the basis of the economic and geographical closeness and Poland as a benchmark for the first group. The data used are money supply, monetary aggregates: primary, secondary and tertiary, in Romania, Poland and Bulgaria, for the period January 2004 - March 2011, the monthly series are obtained from central bank websites, Poland's Central Bank and Bulgarian National Statistical Institute. The evolution of monetary aggregates of the three countries was compared with the Euro area and it was noticed a high degree of similarity between countries more developed economically as compared to less developed countries. From the viewpoint of optimum currency areas, it is necessary that the countries that adopt the Euro would respond symmetrically to external shocks and also have similar economic behaviour. Our study aims, in this respect, to analyse the components and the characteristics of the monetary aggregates, as well as the trends existing within them. The analysis of the correlation between monetary aggregates will show how the way in which the monetary mass and aggregates behave and which the sense of connection established between these countries is. We find that Romania and Bulgaria have a similar comportment, the correlation between these being the highest, we observe some differences between Romania and Bulgaria versus Poland.

Keywords: Monetary Aggregate, Gross Domestic Product, Monetary policy, Euro Zone

JEL Classification: E42, E52

1. Introductory notions

The evolution of monetary aggregates is closely related to the economic cycle, especially the evolution of GDP [Fagan, Henry, 1998]. The study aims to analyse the primary monetary aggregates (M1), the secondary (M2) and the tertiary (M3) in three Central and Eastern European countries: Romania, Bulgaria and Poland. The countries were chosen as follows: Romania and Bulgaria on the basis of the economic and geographical closeness, and Poland as a benchmark. The study aims to observe the similarities concerning money supply that exist between these countries and the importance of monetary aggregates as an instrument of monetary policy in these countries. Following the EU accession, these countries will adopt the euro, the forecasts being: Romania - 2015, Bulgaria - 2013, Poland 2012 (2013); The theory of optimal currency areas shows how important is the economic synchronization for countries with a single currency. Within the Economic Monetary Union, the definition of monetary aggregates is stated, since 2007, according to the methodology of the European Central Bank (NBR Monthly Report, 2009):

1. Narrow money supply (M1) includes currency in circulation (banknotes and coins) and deposits readily convertible into cash or used for payment by bank transfer called overnight deposits.

2. Intermediate money supply (M2) includes narrow money (M1) plus time deposits with maturity of up to two years and adding deposits redeemable at a period of notice of up to 3

months. The definition of M2 mirrors the interest in analyzing and monitoring a monetary aggregate which, apart from cash, includes deposits with a high degree of liquidity.

3. Broad money supply (M3) comprises intermediate money (M2), and marketable instruments issued by the monetary financial institutions sector; money market instruments, especially money market fund shares/units and repurchase agreements are included in the aggregate (a high degree of liquidity makes these instruments close substitutes for deposits).

The way of defining monetary aggregates in Romania and Bulgaria before the harmonization with the European Central Bank requirements was:

- M_1 - Narrow money supply, which comprises: currency outside the banking system, sight deposits (until December 1991 time deposits of economic agents as well);
- Quasi-money – which, together with M_1 , form M_2 (broad money) and which comprises: household savings, term or restricted deposits in Lei, foreign currency deposits of residents.

2. Literature Review

The monetary union (or currency union) - means adopting the same currency in neighbouring countries or that of the most important commercial partner; we witness the dollarization in Latin America (Ecuador, Peru) and the euro area. For Romania an important significance has been given by the "euro zone"; now that our country is a EU member, it should focus on continuing the process of integration into European economic and monetary union and the next step is to adopt the euro. Establishing the euro area was a long process that had as its starting point the Delors report of 1989, which proposed a realization of monetary union in three steps. The benefits of achieving a monetary union are related to the existence of an optimal currency areas, optimum currency area is defined as a geographical region in which the member states must use fixed exchange rates or a single currency, while there are also criteria that a country must satisfy to be part of an optimal currency area (Mundell, 1961):

- high degree of labour mobility;
- diversified production;
- degree of openness of the economy;
- symmetry of external shocks.

From this point of view, the European Union is not entirely an optimum currency area, there are differences in labour mobility (in particular because of language barriers). However, joining an economic union and then a monetary union, with the implementation of EU acquis and the liberalization of the movement of labour force showed that the level of integration in the euro area is increasing (Bîtcă et al, 2007), and also that the euro zone economies become integrated as a result of monetary union[Baldwin, 2006].

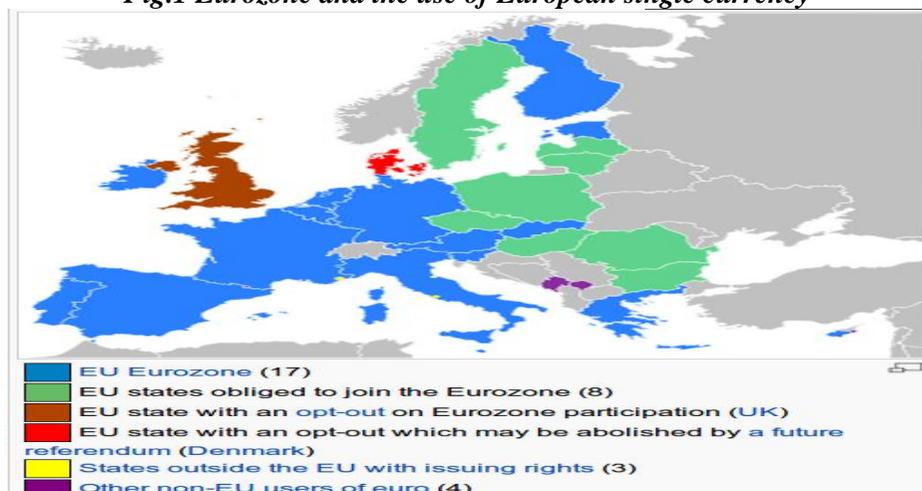

A preliminary stage of adopting the euro is compliance with the provision of the Maastricht Treaty (1992):

- the average inflation rate should not exceed with more than 1.5 percentage points the average of the most performant three members
- the long-term interest rates should not exceed with more than two percentage points the average of the top performing members
- consolidated budget deficit should be less than 3% of GDP
- public debt should be below 60% of GDP
- exchange rate fluctuations against the euro should fall within a corridor of + / - 15% of the average level.

Bulgaria: in 1997, as a result of excessive borrowing, Bulgaria became insolvent, the establishment of Monetary Council was decided in July 1997, the exchange rate level was fixed at 1000 leva for a German mark. The establishment of the Monetary Council has been beneficial in terms of controlling inflation, thus, from the peak of 1044% in 1997, the inflation was reduced

to 18.7% in 1998, 2.6% in 1999, 10.3% in 2000, 7.4% in 2001, 5.8% in 2002 and in the EU pre-accession period (2003-2007) it fluctuated between a minimum of 2.3% and a maximum of 7.3%. Getting over the critical period, which was caused by entering into insolvency in 2000s, by structural reforms and by EU accession in 2007, made Bulgaria to fix its target of joining the euro zone as 2012.

Fig.1 Eurozone and the use of European single currency

(Source: <http://en.wikipedia.org/wiki/Euro>)

Poland: After 2000, the Polish Central Bank will focus on inflation targeting, and is due to adopt the euro by 2014, which supposes compliance with ERM II requirements two years before acceding to the euro area. Poland is a success story, managing the performance to continue its growth even during the crisis.

Romania: After accession to the EU, Romania must abide by the obligations of EU membership and will have to join the euro zone, the time horizon forecast is after 2015, with a period of at least two years preceding that, during which it will comply with the regulations of exchange mechanism of ERM II, which involves a controlled national currency fluctuations against the euro within a deviation band of +/- 15%. Romania meets only one of the provisions of the Maastricht Treaty, namely the public debt and, on the edge, the exchange rate fluctuation. Through the reforms and agreements with International bodies, it is aimed at the reduction of the budget deficit below 3%, while the central bank aims to control inflation, although this year's inflation target will be exceeded.

3. Data used and methodology

The data used are money supply, monetary aggregates: primary, secondary and tertiary, in Romania, Poland and Bulgaria, for the period January 2004 - March 2011, the monthly series are obtained from central bank websites, Poland's Central Bank and Bulgarian National Statistical Institute.

To analyse the evolution of money supply and monetary aggregates in the three countries, we shall calculate the correlation that exists between the evolution of M1, M2 and M3, so the correlation is defined as:

$$\rho = \text{corr}(x, y) = \text{cov}(x, y) / \sigma_x \sigma_y = E[(X - X_m)(Y - Y_m)] / \sigma_x \sigma_y,$$

- where X_m, Y_m represent the mean of X, respectively Y,

- and σ_x, σ_y represent the mean squared deviation of X, respectively Y.

The analysis of the correlation between monetary aggregates will show how the way in which the monetary mass and aggregates behave and which the sense of connection established between these countries is.

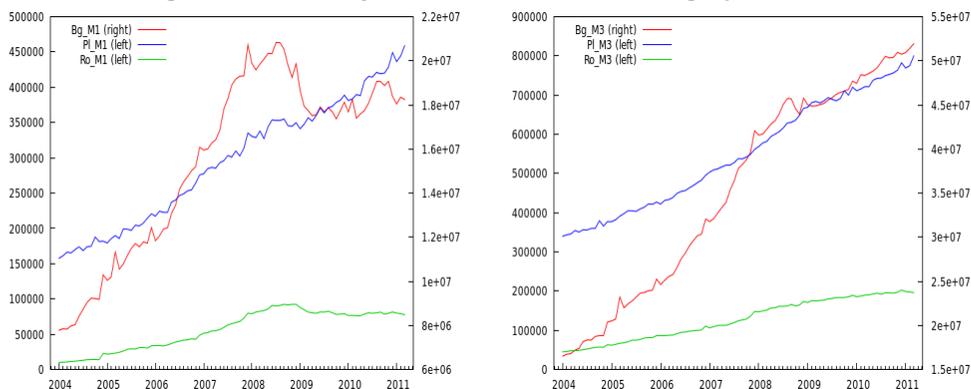

4. The analysis of monetary aggregates (M1, M2, M3) in Romania, Bulgaria, Poland

For these countries, the period analysed is related to two major events:

- European Union adhesion.
- economic crisis.

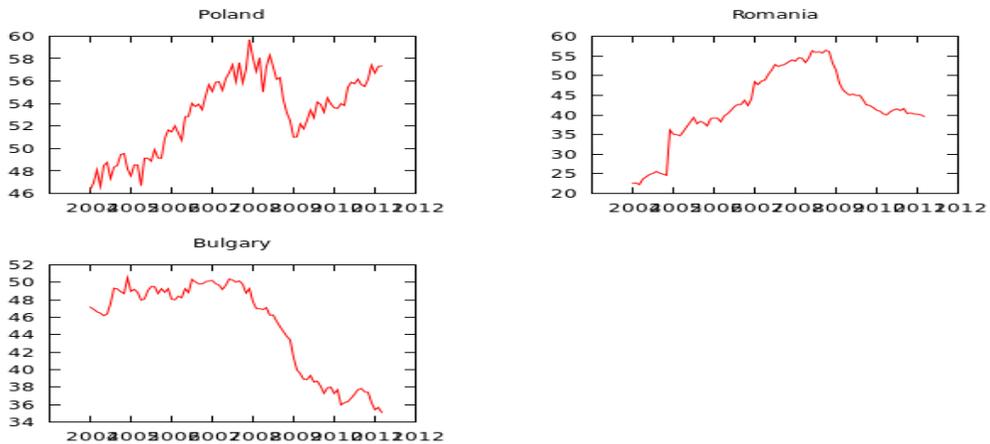

Fig.2 shows the evolution of money supply (M3) and primary aggregate (M1); the money supply in the period under analysis has a growth tendency, consistent with the economic growth witnessed by these countries in the pre-crisis period, except in the case of Bulgaria where from mid-2008 to 2009 the money supply (M3) shrinks due to the decrease in GDP.

Fig. 2. Evolution of M1, M3 in Romania, Bulgaria, Poland 2004-2011

The primary aggregate (M1) has a much more volatile evolution, this being also due to the fact that the assets constituting the aggregate are of the most liquid type, and thus, particularly sensitive to changes in economic climate; with Romania and Bulgaria, M1 decreases, during 2008 for Bulgaria and the at beginning of 2009 for Romania, while Poland is the only country in which M1 growth continues. The evolution of money supply, being closely related to GDP trend, the conclusions drawn show that in both Romania and Bulgaria the money supply growth rate has slowed down due to the downturn. However, the fact the trend is nevertheless positive raises questions about monetary policies in both countries because the excess of money can turn into inflation.

Fig. 3. Primary component of aggregate money supply M1 in total

In terms of the component of the money supply, it is seen in Fig.3 that, for both Romania and Bulgaria, the primary aggregate (most liquid) is below 45% for Romania and under 38% for Bulgaria, much less than in the pre-crisis period (over 50% for both countries) which shows that the economic crisis has manifested itself at the level of non-bank agents, as well, by lowering the amount of cash and the value of sight accounts. While with Romania and Bulgaria M1 is still decreasing, in Poland, after a period of decline of a similar magnitude to that in the other countries analysed, it recovered to levels comparable to those in the pre-crisis period.

The correlation between the monetary mass and the aggregates in Romania, Poland and Bulgaria

To analyse the evolution of money supply and monetary aggregates in the three countries, we calculate the correlation that exists between the evolution of M1, M2 and M3; so the correlation is defined as:

$$\rho = \text{corr}(x, y) = \text{cov}(x, y) / \sigma_x \sigma_y = E [(X - X_m)(Y - Y_m)] / \sigma_x \sigma_y,$$

- where X_m, Y_m represent the mean of X, respectively Y,

- and σ_x, σ_y represent the mean squared deviation of X, respectively Y.

Table 1. Correlation matrix of Monetary aggregates

M1	Pl_M1	Ro_M1	M1
	0.88	0.97	Bg_M1
	1	0.93	Pl_M1
M2	Pl_M2	Ro_M2	M2
	0.98	0.98	Bg_M2
	1	0.96	Pl_M2
M3	Pl_M3	Ro_M3	M2
	0.98	0.99	Bg_M3
	1	0.99	Pl_M3

Based on monetary value and monetary aggregates M1 and M2 between January 2004 and March 2011, their correlation matrix was calculated. Statistically, the correlation of the results of the secondary aggregate (M2) and the tertiary one (M3) shows a close link between the

developments in the case of Romania, Bulgaria and Poland. With the secondary aggregate, the highest correlation is between Romania and Bulgaria or, respectively, Romania and Poland, this showing that the evolution of money supply in our country, on one hand, presents the features of an underdeveloped economy (such as Bulgaria) and, on the other hand, is similar to Poland - a country with a large population.

The most noticeable differences are found with the primary aggregate, the highest correlation is observed for Romania and Bulgaria which shows that these countries have been equally affected by the economic crisis and the behaviour of non-bank agents in these countries was similar, namely a decrease in cash holdings and short-term deposits. The lowest level of correlation is remarked between Bulgaria and Poland which is due to the fact that after the first effects of the economic crisis in Poland, the primary aggregate returned to levels comparable to the pre-crisis period, while in the case of Bulgaria the decline of this aggregate continues.

Conclusions

Explaining money through the statistical definition of money aggregates is, obviously, more than presenting the static situation of monetary aggregates because the level of them is an important objective of the monetary policy, the main criteria which are followed in determining the main monetary aggregates are: the efficacy of the aggregates to be set as an intermediate target for the monetary policy, the controllability that can be exercised by the central bank authority on its growth, the possibility to allow the monetary authority to react quickly entitles us to say that pursuit of monetary aggregates is required for fulfilling the criteria for euro adoption.

The tertiary aggregates are usually more difficult to calculate and also are too narrow to supervise by the central bank so in practice usually its used the secondary aggregate targeting

The biggest differences are found within the primary aggregate, the highest correlation is observed between Romania and Bulgaria; this shows that these countries have been equally affected by the economic crisis and the behaviour of non-bank agents in these countries was similar, namely a decrease in cash holdings and short-term deposits. The lowest level of correlation is remarked between Bulgaria and Poland which is due to the fact that after the first effects of the economic crisis in Poland, the primary aggregate returned to levels comparable to the pre-crisis period, while in the case of Bulgaria the decline of this aggregate continues.

SUB-SECTION: ACCOUNTING

EXAMINE THE PAST FOR GOING FURTHER: A LITERATURE REVIEW IN THE FIELD OF FAIR VALUE

Andreicovici Ionela-Irina

Babes-Bolyai University Cluj-Napoca Faculty of Economics and Business Administration

The current study is part of the scientific approach being assumed at the beginning of the Ph.D. as the theme "New valence of evaluation in accounting" under the guidance of prof. univ. dr. Dumitru Matis. This article aims to realize a more comprehensive study of relevant literature in accounting with fair value as the main subject. We have built our study attempting to answer the following research questions: How much "fair value activity" has there been since 2008? What research topics are being addressed? Who is leading fair value research? What are the limitations of current research? To achieve our proposed objectives we analyzed two databases (Science Direct and Business Source Premier) during 2008-2011, analyzing in detail a total of 22 articles divided into five specific research directions: international regulations on fair value accounting, fair Value Accounting and Financial Crisis, financial reporting at fair value, the relevance of fair value and fair value versus historical cost.

With this research we try to see "what is known" in the field of fair value so far . In addition to qualitative analysis which we performed to discover the interest of researchers in this field, we conducted a quantitative analysis concerning the reported studies , being divided into research themes, research methodology and year of the article publication. Quantitative research results are those anticipated, that the most "fair value activity " took place in 2008 and 2009, surveys having as main research theme international regulations on fair value accounting.

Keywords: fair value, literature review, research direction, databases

Cod JEL: M41

1. Introduction

Fair value accounting has become a crucial principle of measurement in international accounting, considered by the International Accounting Standard Board and the Financial Accounting Standard Board as the primary basis for assessing future (IASB:2006, FASB: 2008). The debate on fair value, are centered around the trade-off between relevance and reliability.

The ICAEW (2006) recently argued that 'Given the importance of the subject, it has not attracted the interest it deserves'. So we try to improve the literature on this topic by conducting a review of the current state of knowledge of the fair value. Consider to be important such research because it can be a source of ideas, hunches and to explore research question. That is, through finding exemplars of well-executed research, interesting ideas that are not particularly well executed, or gaps in the body of knowledge in a discipline, we can identify possibilities for future research. Literature reviews also help us to avoid "reinventing the wheel" by enabling them to build on what others have done. (Ted Zorn , Nittaya Campbell:). Through this research we try to see "what is known" in the field of fair value so far. In addition to qualitative analysis that we intend to achieve a breakthrough for research in this field, we perform a quantitative analysis of these studies.

2. Research methodology

To perform this synthesis and to achieve the objectives that we propose, we follow **eight steps** that we will describe in the following:

The **first step** we consider the need for proper identification of a specialized literature in this field. The best way to initiate the descriptive analysis of the specialized literature, making reference to what is generating the development of a given research area, in fact the existing application to achieve fair value of research on the industry. (Bonaci C., 2009:39). We consider the large number of articles published in international journals regarding this domain a testament to that claim.

The **second step** of this research, we have formulated specific questions for this approach. So we built the following article following four research article questions: RQ1. How much “fair value activity” has there been since 2008? RQ2. What research topics are being addressed? RQ3. Who is leading fair value research? RQ4. What are the limitations of current research?

The **third step** will be the selection of two databases included in this study (ScienceDirect and Business Source Premier).

The **fourth step** is the selection of articles published in the two databases in the period 2008 - 2011. This period was chosen because in our opinion, the scientific development of fair value gained from the beginning of the financial crisis and implicit with actions undertaken by the committees of international standards regarding this domain. Research was done by the keywords "fair value", being limited to the appearance of these words in the title. We were limited only to those keywords that are directly related to the theme of our research. Even with these limitations, we identified a total of 39 articles that we have introduced in our initial database.

The next step, **fifth**, I have devoted it to the removal of articles. So I have kept only those articles published in academic journals, eliminating those published in magazines. We also eliminated items with the subject accounting in education and debate articles at other articles (paper discussion). After this stage, our sample was reduced to a total of 22 remaining articles.

In the **sixth step**, we analyzed the articles in detail, trying to identify the main directions of research which they pursue. Thus, we have grouped the articles in the research topics listed below. To make this classification we followed the main problems addressed in each item, some items which may be classified in several directions of research. Also within this stage we determined the type of research used.

The **seventh step** is a qualitative analysis of articles selected to be researched. We consider this step as the most laborious and requires a high capacity for synthesis. At this step we assign to the four previously established themes and we made a brief presentation of the aspects reviewed in each article and the conclusions reached by the authors.

The **last step** is the quantitative study on data collected before and after the characteristics that we have proposed to analyze them. Also at this stage we have outlined and conclusions on this study.

3. The main research directions in the sphere of fair value

We consider the most important characteristic examined in this study to be the themes of each article analyzed separately. Thus, the study in detail of the articles contained in this approach, we identified five scientific directions for the research: international regulations on fair value accounting, fair value accounting and financial crisis, financial reporting, fair value relevance and fair value versus historical cost. The objective of this qualitative study, is to achieve a review of the main directions of the research in the field of fair value, highlighting the main aspects reviewed and the results obtained under each theme. We will try, in what follows, treating them with equal importance, the study hoping to fill a gap in the scientific literature and to create the possibility of identifying new research leads.

3.1 International regulations regarding fair value accounting

We accept the idea that expanding the use of fair value is correlated with of the widespread application of IFRS, either through convergence of national accounting systems, either by explicit requirements for listed entities. A rich academic literature has treated the subject of fair value accounting from diverse perspectives, conceptual or empirical approaches, especially in fair value accounting under international standards.

Using cash flows as a proxy for managers expectations, having as sample, all firms listed on the New York (NYSE), American (AMEX), and NASDAQ markets, for which financial requisite and return data are available over the period 2002–2006. Henry Jarva demonstrated that goodwill write-offs under Statement of Financial Accounting Standards No. 142 (SFAS 142) are associated with future expected cash flows as mandated by the standard. Additional analysis reveals that the association between goodwill write-offs and future cash flows is insignificant for firms with contemporaneous restructuring.

Various studies shows skepticism regarding the benefits of using fair value. The main reserves result from volatility and risk that it induces in relevant decisions by stakeholders. It is known that the evaluation has no guarantee period, has an extremely limited validity, given the volatility of market information. Thus, Peter Fiechter, using a sample of 222 international banks from 41 countries, conducted a study that examines whether the fair value option affects earnings volatility. In contrast to other studies that associate higher levels of earnings volatility with fair value accounting, this article has led to the conclusion that banks using fair value option accounting mismatches exhibit lower earnings volatility than other banks. Peter Fiechter stated that "Purpose of this paper is to provide further insights regarding the determinants of the decision to apply the FVO under IAS 39, and the effects of optional fair value accounting on the volatility of bank earnings around the world."

Geoffrey Whittington considered fair value having a central place in the conceptual content. Thus, in his article analyzed the controversy raised by IASB and FASB project by creating a conceptual framework for financial reporting concerning fair value. He raised specific issues, namely the fair value determined by the definition, recognition and measurement of it. In individual case, George J. Benston the deficiencies treated in fair value within SFAS 157.

FASB, through the Statement of Financial Accounting Concepts (SFAC), No.2 "Qualitative Characteristics of Accounting Information " (1980), indicate that relevance and reliability are primary Qualities of accounting information. Thus, Preeti Choudhary investigates reliability differences across recognition and disclosure regimes to shed light on differing incentives and reporting of employee stock option fair values . He concluded that different companies treat employee stock entry and exit, with a tendency to decrease the value of the input.

David Cairns et al. tested by using the fair value on 228 firms listed in the UK and Australia, around the Adoption of IFRS from 1 January 2005. The results are not surprising, concluding that fair value is not used in areas where its use is optional.

3.2 The relevance of fair value

Barth claimed that value-relevance tests are usually joint tests of relevance and reliability, where reliability is more than an agreement about the measure (measurement verifiability), but also involves the correspondence between description, classification and presentation (representation faithfulness), of the phenomenon it propose to represents.

Chang Joon Song, Wayne B. Thomas and Han Yi tested the relevance of fair value to all its levels, as presented in SFAS 157. The results are those expected, namely, in level 3, fair value is less relevant than the other two levels.

Stella So and Malcolm Smith have tested the relevance of HKAS 40 (2004) 'Investment Property' on the presentation of changes in the fair value of investment properties and the results of this

study show a significantly higher market price reaction and returns association when changes in fair value of investment properties are presented in the income statement.

3.3 Fair value and financial crises

Along with the awareness that the global financial crisis is going through, there are more intense discussions about role of financial information and in particular about financial reporting, taking into account to fair value. Questions arise concerning the role previously played by fair value triggering the crisis and then during its fall on market values, or concerning how it can reflect the performance management and can benefit the relationship between the manager and users of accounting information

The first reaction in current crisis is to blame fair value, which essentially is just a messenger, like Paul Andre et al. said. Indeed, it is easy to say as because using a of fair value basis of valuation, real estate prices artificially increased, banks giving mortgages easier. Among proponents of fair value, including Nicolas Veron, says that fair value is the wrong scapegoat for this crisis.

3.4 Financial reporting on fair value

The concept of fair value accounting is supposed to improve the quality of financial reporting. We emphasize the size, direction and significantly influenced in the fair value over financial reporting and decision-users.

Taking into consideration that fair value reporting influence investors' decisions, managers are tempted that when there is no active market for an asset to intentionally deform information concerning assessment of the assets, which leads to a deformed evaluation of the asset value, as demonstrated by Ruth Ann McEwen, Cheri R. Mazza and James E. Hunton through a survey-questionnaire. Same influence over analysts' managers in determining the value of assets is proved by Karl J. Wang in his study.

4. The quantitative analysis of the studies

Distribution of articles included in the sample analyzed on research topics, namely, the years in which were published, identified in the field of fair value, are shown in these figures:

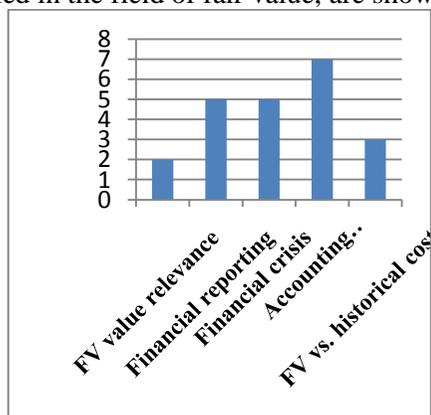

Figure 1:

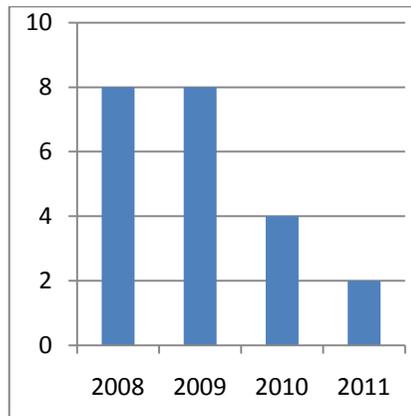

Figure 2:

Distribution of articles on research themes

Distribution of articles by year

Looking at Figure 1 above, we can see a high interest of researchers for "international regulations concerning fair value accounting, which is not surprising considering that extend use of fair value is correlated with the widespread application of IFRS. Looking at Figure 2, we see that in the years 2008 and 2009, this situation can be explained through an increase desire to adopt, both, internationally and nationally a modern accounting system, characterized by increasing concept of "fair value". Also the large number of articles published in 2008 and 2009 can be explained by the economic crisis, which has increased the "popularity" of "fair value".

Regarding the distribution of articles on research methodology, this is equivalent, and namely 11 articles are quantitative, and 11 articles are qualitative .

5. Limitations of research

The study conducted is not without bounds, and we consider to be the limits of our present approach: the extent of the analyzed period of only four years, the sample included only two databases, and it was limited to those items that were selected on the basis keyword "fair value", a greater number of keywords resulting in an extremely comprehensive and difficult sample to be analyzed.

6. Conclusions

Given that, with our knowledge, a study on literature review does not exist in the field of fair value accounting, we believe we have brought a contribution to improving the literature in this field. Considering all aspects examined, we believe we can answer questions addressed at the beginning of the paper, namely: starting with 2008 we can state that the field of fair value has grown pretty much, mainly focused in five directions of research: international regulations on fair value accounting, fair value accounting and financial crisis, financial reporting, fair value relevance and fair value versus historical cost. Given the research findings and conclusions based on them, which we have presented above, we consider that the objectives we set at the beginning of this paper were carried out.

ACCOUNTING AND CREATIVITY: A SOCIOLOGICAL AND PSYCHOLOGICAL APPROACH

Balaciu Diana

University of Oradea Faculty of Economics

This article presents aspects related to creativity in accounting. In our approach we started from theoretical aspects regarding the position of accounting in the field of scientific knowledge. The paper aims to justify these positions (as a language of communication, communication tool, social game), and from there to mirror the way of expressing creativity in accounting.

In terms of research methodology, we have appealed to a qualitative research inspired by sociology and psychology.

The sociological survey shows the vision of society related to creators, the way in which it admits or rejects them. The sociological approach allows us to understand the importance of collective consciousness in assessing and maintaining the creation.

The psychological study regarding the creator describes a creature endowed with an excessive sensitivity, accompanied by a worker with permanent activity, but who is constantly gripped by an "existential doubt". In conclusion, the consultant or the researcher will have to recognise the creator's right to be wrong and surround him with a climate of confidence.

This paper shows that there is a path where the one who talks to numbers (and does not have the skill of words) and those who possess the mastery of words actually meet.

This paper is part of the PhD research entitled: Identifying and motivation of creative accounting practices – the case of Romanian listed companies, carried out under the guidance of PhD Prof. Feleaga Liliana, research carried out within the framework of the Bucharest Academy of Economic Studies.

Keywords : language figures, social game, creative approach, creative accounting, human capital

JEL Classification : M 41

1. Introduction

This paper is part of the PhD research entitled: Identifying and motivation of creative accounting practices – the case of Romanian listed companies, carried out under the guidance of PhD Prof. Feleaga Liliana, research carried out within the framework of the Bucharest Academy of Economic Studies. The research theme approached in this article makes reference to the existence and the manifestation forms of creation within a company. Lately, a series of companies have asked the question regarding creation within organisation and tried first to identify and manage creation through intangible capital. However, in real life, creation seems to be excluded from the accounting and the control system of the enterprise. But can it be excluded within the enterprise? Apparently the answer is yes. However, the industrial revolution and the enterprise were the first to give a particular status to creation and creator.

Research methodology

In drafting this paper we have appealed to a qualitative research inspired by sociology and psychology. The sociological approach allows us to understand the importance of collective consciousness in assessing and maintaining the creation.

The psychological study regarding the creator describes a creature endowed with an excessive sensitivity, accompanied by a worker with permanent activity, but who is constantly gripped by an “existential doubt”.

Whereas one of the characteristics of the late twentieth century is precisely the worldwide dissemination of information, the distribution and access to information implies strategic and organisational changes. These changes have caused an increase of the share of immaterial. Through this work we tried to show that there is a path where the one who talks to numbers (and does not have the skill of words) and those who possess the mastery of words actually meet.

2. From numbers and communication language towards the information system

Accounting is the main source of information available to enterprises. It is required both for local enterprises as well as for those that operate on multiple continents. This universality of needing the accounting act calls for the universality of another system, that of communication language.

Language is not required by a decree, it bursts spontaneously, develops in small steps and is progressively structured, managing to establish a logical coherence that can be understood, explained and taught a posteriori. This is the case of accounting, within which has developed an accounting process (this explains why the accounting process is inductive rather than deductive.)

On one hand, just like any idiom, accounting has its own language and is subject to principles, regulations and standards. These principles underlie the accounting system in all countries. However, interpreting and transposing them into regulations and standards may constitute an approach that varies from one country to another. For example, the principle of prudence depends on the social and cultural context which can lead to incomparable results between a French company and a British one of the same size and belonging to the same business segment. Thus, one might ask, is it really necessary a single language with the same principles, regulations and standards, or is it possible for multiple languages to coexist? These questions were put forward regarding the international normalization and thus, a common language was chosen.

On the other hand, just like any type of language, accounting is a communication tool.

First, both at national and international level, accounting favours a form of expression (a conceptual framework), according to its speakers. In the U.S., the information is aimed at investors and the conceptual framework is an economic one. Secondly, accounting favours a form of expression that takes into account regulatory constraints, shaping the content or the form of financial statements within the target of a particular outcome (reducing losses, increasing the results - this technique is called “window-dressing” or “creative accounting”).

What is the purpose of accounting? Colasse (1996) defines accounting stressing that it “is not a simple technique for recording facts in the process of the enterprise, the accountants get involved, are invested and bring their own interpretation of reality and vision in what concerns the enterprise. They offer that vision they appreciate as compliant with defending their interests in the context of relationships they maintain with other economic and social actors.” By taking part in building a reality, accounting creates an image of the enterprise, while still being aware there are several interpretations.

Accounting is language and due to this language it projects a picture of the economic reality. This image is built by taking into account events (Lambert and Sponem, 2005) or taking the events into consideration, in terms of accounting, invests it with an economic existence

Within a company, “the management tools”, especially accounting, are not considered to be noble, but because the figures may be placed in the center of any organisation, this results in changes made within the organisation, even within the company.

According to Supiot, expert in labour rights, “the reign of figures has come to replace the authority of law” : “Even the States have come to obey the same operation regulations followed by the enterprises that operate on competitive markets. I mean they have to respond to encrypted

signals, which, just like market prices, would represent a true picture of the world in which it operates. This doctrine has strongly influenced the reforms adopted over the last ten years within the public segment, in the name of “governance”, management.” (Supiot, 2010:83)

Supiot draws attention that “measuring” should not be mistaken for “evaluation” as this could lead to “a loss of the sense of measure.”

The fact that a lawyer is interested in managing numbers and accounting issues shows that figures are placed in the centre of any organization. Although management sciences are still in an early stage, they are interacting with other social sciences (sociology, economics, law), paradoxically influencing these other sciences.

This “language of numbers” can lead us towards a financial heritage to the disadvantage of a cultural one. But managers’ paths often meet other paths, resulting in alternatives to the “language of numbers” which may inspire some people to use it as other possible resources.

The language of numbers requires a person to “listen”, an interlocutor; it makes no sense only if “the Other” is there. Often while handling management issues it is said that sensitivity does not belong there. However, we have to think using all sensitivity we can get in any event to listen, to see, to feel the presence of “the Other”. Just like a human adventure, the scientific adventure feeds on emotions, metaphors, philosophical, cultural and metaphysical references. This way it can be noticed the essential role played by this emotional part in elaborating, accepting or rejecting new ideas, in indifference or enthusiasm evoked by their implications. “As an accountant, the author states, numbers are talking to me, but I need to translate them into words and phrases.

Making reference to the pragmatic side of accounting, it is seen as an information system that favours the production and dissemination of information while making a decision. At the level of an organisation, according to Ionaşcu (2003:33), accounting is the most important element of the information system, because: i) most microeconomic decisions are taken based on information provided by accounting, ii) it allows managers and external users of information to get a picture of the whole organisation, iii) connects with other components of the enterprise information system by integrating information regarding these activities in a common data base.

3. Accounting – a social game

Certainly, accounting is the product of social history. Is it possible to have an impact on social history? Taking into account that there are several images of economic representation, accounting evokes revealing items, especially in its moments of silence or when it does not take into consideration the events in question.

Starting from the definition of social sciences as cultural sciences that deal with a person’s activities as member of a group, accounting is a scientific discipline in the field of social sciences because: i) it is a creation of the human being as a response to certain practical needs; ii) reflects events, activities and social actions; iii) it sets as target different groups of users that are part of society; iv) produces financial statements that provide information for making decisions which have an impact on individual behaviour; v) it is influenced by the economic, social, legal and political environment, i.e. social phenomena.

The accounting model that reflects a social organisation is part of the current created by Hopwood, along with the magazine “Accounting, Organizations and Society”. For them, analysing accounting means understanding its share of social vision: What is the role of accounting in achieving what the participants within an organisation consider to be necessary and possible? Can it take part in creating particular concepts of organisational time? If the answer is positive, then what are the effects? How and when does the accounting of organisational performance give rise to action? How does accounting contribute to the establishment of an organisational mission and by which means the partial and private schemes of organisational

visibility that it creates facilitate the taking over of control within the organisation, in technical or social terms? In what way does the information provided by accounting in an ordinary (routine) manner stay in contact with the multitude of information fields at decision-making level that characterizes the life of the organisation? In other words, is it possible for accounting to gain significant organisational valences? (Richard, 2005: 259).

Hopwood proposes analysing accounting from organisational and social point of view. In his case as well as in that of other researchers, accounting is a social and organisational phenomenon. It interacts with the historical, social and organisational framework so that nature can be defined only in relation to this framework.

The social role of accounting is given by the fact that based on accounting information which is the most important element of the organisation's information system, decisions are taken and they affect the wealth of individuals and social groups. Thus, accounting has become a "social game", involving many participants (managers of enterprises, financial intermediaries, shareholders, creditors, etc.). Also within it, rules are distinguished (imposed by the courts of accounting normalization that exist on a national and international level) and a stake, represented by wealth. The winners of this game are those who are better informed and possess relevant and reliable accounting information.

4. What is creativity in accounting?

To meditate on the relationship between management and creation means working on paradoxes because it is hard to value immaterial and the one who takes the risk of doing it does not know if the investment brings the expected result. Is it true that in accounting the number is the center of any decision, but can we depreciate the value of a creation due to the fact that it does not produce any financial value? In the field of creation, the managers are in a difficult position, that of justifying the choices they make (does a certain author deserve to be published, do we continue to publish his books? etc.), thus the manager finds himself in the position of a "creation guide".

Because accounting encounters difficulties in valorising creation, the manager asks questions on this tool. He is forced to make up, to give a value to a certain extent. He becomes aware of the valorising impact when he communicates it. After this first stage of valorising, the manager is able to present the situation to the management, employees, and shareholders. Next is the third stage; here the manager knows that through accounting he can speak the language of employees, shareholders and owners. He realizes that management provides an image to organisation, but meanwhile it also gives value to the participating parties. He understands that in order to invest, he must "believe" beyond the barriers of logic and he realizes that accounting tools offer a social vision with the ability to build. Focusing on creation means to become aware as an artist, scientist, that they may have an innovative idea which, even when it is materialised, it needs "the Other" who will support his project by presenting it to the organisation or the outlet. It is a cooperation assembly.

However, creation belongs to this invisible part, inaccessible to accounting, which may create a conflict of non-commercial values; that is why the manager's role as "creation guide" becomes important, being able to promote creations on the commercial market, even if these do not make profit in the sense of the market. These managers are necessary to create a cultural field, relying on the financial segment. All of these supports the idea of creating other possibilities of expressing the language of numbers, supporting the creative act which aims to awake the human conscience. In this context, management appears as a pertinent way allowing us the access to this "essential", currently in creation. Management shapes a social and economic model.

In accounting, creativity has been locked, from legal perspective, as in the case of patents (inventions), but on the other hand, the creative aspect of accounting is strongly emphasized, being identified and evaluated in the case of information systems. In France, the activities that are

related to creation are either registered as sales services rendered "Charges" or as intangible assets (paying rent, research and development costs, concessions, licenses, trademarks, software, similar rights and assets, goodwill). Research and development costs are included exceptionally in the balance sheet of the enterprise or organisation.

The costs involved by the project may be recorded in accounting on the assets level, if they refer to net individualised projects which clearly show the guaranteed success in the commercial and technical profitability. Costs related to research are recorded in sales services rendered.

However, paradoxically, the more a company is investing in internal development of creation, the faster it decreases its potential in terms of accounting.

If in what concerns accounting, it is a language, could it be possible to take into account this intangible process that contains a grain of creation? Indeed, generally speaking, one of the characteristics of the late twentieth century is precisely the worldwide dissemination of information. The distribution and access to information implies strategic and organisational changes. These changes cause an increase of the share of immaterial. "Immaterial" may take different shapes: the intangible immaterial as "brand", quasi-tangible as software, formal reproducible as "logo" which can be reproducible, in the patent case between sustainable and instantly and audience fee or the market, science, expertise, skill, professional training and creation share.

All members, clerks and managers of a company may be appointed by the term "human capital", but this capital is more important than the sum of all these elements. The notion of "human capital" needs to define the intelligence and dynamics of an organisation located in an environment that is in constant evolution. Human capital also means the creation and innovation of the organisation. Structural capital of enterprise is simultaneously the expression of human capital and its infrastructure. It can be breakdown into three categories: organisational capital, innovation capital and process-capital. Intangible capital may be detailed in the appendix which is part of the synthesis documents that form a unit, together with balance sheet and income statement.

Accounting generally remains very discreet in terms of creation. However, a number of companies have asked the question regarding creation within the enterprise and have tried, first of all, to identify and manage creation by means of intangible capital. However, in real life, creation seems to be excluded from accounting and control system within the enterprise. Can it be excluded within the enterprise? Apparently the answer is yes. However, the industrial revolution and the enterprise were the first to give a particular status to creation and creator.

One of the major criteria of intangible capital and, especially, that of creation, is to be regarded as unsafe, difficult to quantify and assess.

There are researchers who describe the "need to believe", especially in those decisions related to investments in the intangible capital area. "The analysis of investment logic in terms of innovation leads to a paradoxical finding. Economic constraints restrain the enterprise's actors (decision makers) from implementing resources that will allow them to put activities to some efficiency tests (tests, barriers): cost-effectiveness and profit are the purpose of the capitalist enterprise. But treating constraints implies in the dynamics of innovation a large part of beliefs, "magical thinking" (Alter 2000:35)

How much can someone interfere with the creativity management? What attitude may be taken towards creators? The two stories that are presented below, seen by Le Theule (2010:81), will help us give an answer to these questions:

"To have one's head in the clouds" or how came to life the chaos theory?

Who has not walked besides a person that looks at the clouds, that he felt like floating in another world, different from the one we call "real"?

Who has not walked besides a human being, a woman, a child, who bends to pick a thrown piece of paper shouting: "It's going to be a wonderful postcard!" When we are able to manage to get out of the daily routine chain and have a look at this piece of paper, meant to be thrown, as a possible postcard, it is only then that we can feel this object is truly unique and special.

Creator is precisely this person "outside the world", who lives without sensing that he chisels the regulations in force. It is revealing the case of Feigenbaum, the physicist who invented the chaos theory. He walked by starlight and meditated on the clouds he saw from an airplane window, creating real scientific corridors above the laboratory and, while meditating on these matters considered to be unproductive, actually he was about to develop the chaos theory.

"An eccentric people" or how can we favour random growth?

It's about the experience lived in the 1950s, within the "acquiring human brains" enterprise in U.S. Air Force, reported by Nasar, the main protagonist of this experiment. He devised a plan which favoured "casual, accidental encounters". He believed that people, scientists, mathematicians, had to be left to work quietly, without external constraints and he completely believed in the basic research. People around him had the impression that this section of the enterprise was populated by eccentric creatures who acted freely, without being controlled in any way, without formal approval to publish a memoir.

Taking these two examples as point of departure, can be underline the importance of the role that a consultant and other decision actors within the company have in connection with the promotion of creators and creative organisations.

5. Conclusions

Philosophical, psychological and sociological research on creation, that were discussed previously, allows us to elaborate a more specific study on the role played by the researcher compared to creators, to perform a symbolic recognition of creators and to accompany them step by step on this complex path of creation and innovation.

The sociological survey shows the vision of society related to creators, the way in which it admits or rejects them. One of the first roles of the consultant and researcher is to symbolically acknowledge the creators, to stop labelling them as "dreamers". This will allow them to gradually be accepted by the social body of the enterprise. The psychological study regarding the creator describes a creature endowed with an excessive sensitivity, accompanied by a worker with permanent activity, but who is constantly gripped by an "existential doubt". In conclusion, the consultant or the researcher will have to recognise the creator's right to be wrong and surround him with a climate of confidence.

The sociological approach allows us to understand the importance of collective consciousness in assessing and maintaining the creation, therefore, the consultant has also the role to create a link between company and creator, to cause, even generate empathy from society. The role of the creator's companion possessed by other actors of the organisation approaches a form of control, but it should be viewed in a different aspect from the classic one. (that of result standardisation). It is about a "laxative" control, based on confidence in the creator's self-control ability.

Paradoxically, the creator needs complete freedom, but at the same time he needs support from society. On the other hand, accounting is a complex pattern of representation, a social object, but at the same time, taking into account Foucault's analysis (1969), on this pattern, he invites us to take a look at those issues that are hidden by the pattern, made invisible. According to researchers, such as T. Porter, objectivity defined by numbers tends to impose over the objectivity determined by a person's intrinsic qualities. Let us meditate upon Antoine de Saint-Exupéry's *Little Prince* (1946): "I have serious reason to believe that the planet from which the Little Prince came is the asteroid B 612 ... If I have given you this number, I did it because of the grown ups. Grown ups like numbers."

CHALLENGES OF ENVIRONMENTAL ACCOUNTING AND TAXATION IN ROMANIA

Blidisel Rodica Gabriela

West University of Timisoara, Faculty of Economics and Business Administration

Popa Adina Simona

University "Eftimie Murgu" of Resita, Engineering Faculty

Farcane Nicoleta

West University of Timisoara, Faculty of Economics and Business Administration

Environmental problems that have arisen all over the world are concerning many controversial aspects that were created due to the advance of industrialization in tandem with scientific and technological development. For solving these problems, in the past 40 years many international and national organizations have adopted a substantial and diverse range of environmental measures aimed to improving the quality of the environment. Our research aims to highlight how Romanian authorities face the problems regarding environment. To accomplish our objective we trace two main directions of the study, firstly we conduct an analytical investigation of green accounting regulations and secondly we describe the environmental fiscal policy at national level and their impact on Romanian companies.

Keywords: environment, green accounting, fiscal policy, regulations

JEL code: M41

1 Introduction

The correlation between accounting regulations and the taxation system is well known and a matter of common knowledge: accounting must reflect tax obligations and, conversely, tax regulations refer to book profit when defining the taxable portion of a company's income and to report the financial statements. Always for accounting there was a problem regarding its conciliation with taxation. The tax principles aim to stimulate or inhibit certain activities. Directive IV of the Economic European Community (EEC) established interaction between the accounting and the fiscal right. This is achieved through fiscal management of the company (Stoian, 2001).

In this context of interdependence, a more profound study of new accounting practices and tax incentives beneficial to the environment is required, and this analysis forms the basis of this article.

2 Brief framework and literature review

Many internal and external users present an increased interest from the environmental performance of organizations, particularly companies in the private sector (e.g. employees). The types and intensity of pressures on the environment varies from country to country and between different economic sectors. Pressures on the environment concerned organizations seeking new ways, creative and efficient in terms of cost, to manage and minimize environmental impact.

Environmental accounting is a concept often used in different contexts:

-evaluation and presentation of financial information about the environment in the context of financial accounting and financial reporting;

-evaluation and use of monetary and physical information about the environment in the context of Environmental Management Accounting;

- estimating the costs and impact of the external environment when reference is made to Full Cost Accounting;
- accounting for stock and flow of natural resources in the context of Natural Resource Accounting;
- aggregation and reporting of accounting information from the organizations in order to draw up national accounts;
- monetary and physical information on the environmental context in diversity of accounting.

Environmental values are beginning to be reflected in business accounting. A lot of papers developed the environmental accounting, as a real challenge of each country regulations (Jao, 2000, Yonkova, 2008, Caraiani et al. 2001, Blidisel et al. 2009). The Romanian literature points out the new tool in environmental management – the Environmental Managerial Accounting, defined as the identification, collection, estimation, analysis, internal reporting, and use of materials and energy flow information, environmental cost information for both conventional and environmental decision-making within an organization (Sendroiu, Roman and Chitu, 2006). Also, another literature emphasizes the integration of the environment in national accounts (Dachin et al., 2005).

4 Research development and methodology

The research is based on the environmental accounting and economic environmental protection methods debated on the European Union regulations.

4.1 Environmental accounting

Environmental accounting is already becoming part of the business strategy of companies with advanced environmental policies, with the objective of promoting transparency and providing the investor with a greater quantity of relevant information. The international literature conducted in European Community stays that it is not yet obligatory to disclose this sort of accounting information in all fields, binding agreements existing only in certain sectors, such as the electrical industry, where all parties are obliged to make provision for environmental risks and the impact of investments relevant to the protection of the environment are recorded in the annual report.

The European Union recommend to encourage business to publish environmental information, many countries making a step forward to approve regulations for recognizing, assessing and making public elements relevant to the environment in annual accounts (e.g. Spain).

4.2 Economic environmental protection measures

Public initiatives on the environment have been created in many different areas across the diverse world of finance, as: environmental taxation, emission permits and green certificates. Apart from their environmental objectives, they are all economic measures.

Starting from the international approach regarding the environmental accounting and economic environmental protection measures, we want to research the implementation of the Romanian environmental regulations both in accounting and in tax field. Therefore, we want to stay the impact and the most important measures taken by Romanian companies in order to divulge the environmental indicators.

The research methodology is based on a qualitative approach, pointing out the most important Romanian regulations and the impact upon companies that are active in the oil gas, pharmacy and minerals industry, as well as ecological education starts made by Romanian companies.

The main research directions are:

1. The relationship between accounting and environmental protection economic measures;
2. The influence of environmental accounting on the amount of corporation tax paid by companies;

3. The importance of environmental taxation in accounting practices and environmental accounting;
4. The importance of other economic measures in accounting;
5. Corporate change brought about by new accounting and tax-based measures of environmental protection;

5. Research findings and discussions

In Romania, the incorporation of an environmental protection policy was a fact of the discussions for Romania's integration in the European Union. The policy of environmental protection was forecast in Chapter 22- Environmental Protection; this document was approved by the Romanian Government on 18.10.2001. Through The Treaty of Romania's Adherence to the European Union there was planned the implementation of a communitarian acquis in the field of environmental protection until the date of adherence with some exceptions for which there was requested a transition period.

The Environmental Protection Law, modified and completed in 2002, states the way on how the assessment of the environment must be made, the regime of chemical substances and dangerous chemical compounds; the toxic wastes; the pesticides; nuclear activity; etc.

Romania joined the common objective of the European Union on sustainable development, purposing in this respect to achieve goals that will lead to pollution limiting and the effects of climate change on environment, such as a reduction of 8% of greenhouse gas until 2012, compared with 1989, and achieving a progressive reduction of emissions of sulfur dioxide, nitrogen dioxide and volatile compounds.

In the sectors of activity that generates pollution, the transport sector is the most evident. The auto park age (which, as is known in Romania is an average of 13 years) influence the emissions. Therefore, there are adopted the most effective instruments to stimulate the renewal. Considered appropriate to the other Member States (Netherlands, Greece, Hungary, Denmark, Finland, Portugal, etc.), Romania has established a system of charging vehicles during the first registration of its territory, in order to encourage purchases of machines with its latest manufacturing and less polluting.

5.1 The relationship between accounting and environmental protection economic measures

The correlation between accounting regulations and tax rules is well known: the accounts of businesses must reflect tax obligations, and fiscal regulations refer to companies' book profit - with certain modifications - in calculating the amount of corporation tax to be paid. New accounting techniques also respect this parallel relationship.

Environmental accounting is still barely represented in accounting regulations, but International Accounting Standards have already laid down some indirect guidelines which "will have an effect on the payable amount of corporation tax". In Romania, the National Accounting Regulations, adopted through the Ministry of Public Finance Order no. 1752/2005 for the approval of accounting rules in accordance with European directives does not contain any information regarding the reporting of the environmental protection costs. According to the GO no. 25/2008, the ordinance amending and supplementing Government Emergency Ordinance no. 196/2005 on the environmental fund, starting from 1 January 2009 every trade company that distributes plastic bags will have to pay an amount for each distribute bag, even for the free bags. New bag tax that applies only to bags made of non-biodegradable material, will be shown separately on the sale documents and should be declared and paid monthly by traders to the Environment Fund. Moreover, the Ministry of Environment will check how the commercials display in visible places the amount of tax.

The objective of introducing new eco-tax is mainly to discourage the free distribution of bags, which usually leads to waste and environmental pollution, excessive consumers using this type of packaging. Also, several problems related to the assets, the liabilities and the environmental costs are treated in IAS/IFRS and by analogy, could be implemented by Romanian companies.

5.2 The influence of environmental accounting on the amount of corporation tax paid by companies

As in the case in many of European countries, like Romania, the corporation tax calculates the taxable portion of corporation tax by referring to the book profit (as a difference between total income and total expenses, subject to certain alterations arising from temporary and permanent differences. In Romanian regulations the accounting profit is decreased by the non-taxable income and is supplemented by non-deductible expenses (according to the Tax Law no. 571/2003).

The influence on the amount paid by companies in corporation tax permits in Romania, according to the current regulations (Fiscal Code from 2003) the deduction of expenses incurred for the purpose of taxable income, including those regulated by normative acts in force. Through the expenses incurred for the purpose of income are also the expenses for environmental protection and conservation. Also, according to Fiscal Code "Tax payers authorized to conduct business exploitation of natural deposits are required to record in the accounts and deduct provisions for the affected land restoration and to reintegrate them into the economic, forestry or agriculture, to a rate of 1% applied on the difference between income and operating expenses, throughout the duration of the exploitation of natural deposits. For holders of petroleum agreements, conducting oil transactions in perimeters which include marine areas with water depth greater than 100 m, the rate established for the provision of decommissioning probe, demobilization installations of annexes, and to rehabilitate the environment, is of 10% applied on the difference between revenues and expenditures recorded for the petroleum exploitation period."

Furthermore, the development of environmental accounting will enable the genuine useful lifespan of initiatives intended to protect the environment and so that its amortisation can be realised in a manner appropriate to the current conditions, which often do not correspond with the criteria quoted in the "amortisation index chart" that appears in the Romanian tax regulations.

5.3 The importance of environmental taxation in accounting practices and environmental accounting

The importance of environmental taxation in accounting is limited, an example of this is to be found in article 4.6 (g) of the EC Recommendation of 30 May 2001, "the following disclosures should be provided in the notes: [...] government incentives related to environmental protection received or entitled to by the company. The accounting treatment adopted should also be disclosed."

It seems clear that the payment of environmental taxes reveals information of great importance in awareness of the situation in which business finds itself regarding environmental questions (and the further economic implications of this situation). Moreover, in some cases the payment of environmental taxes may be related to the existence of public services whose use reduces environmental damage (circumstances which may be considered on calculation of certain provisions for environmental risks).

At the end of December 2008 in Romania a new legislation applied regarding the environment (GO 1607/December 2008 amending and supplementing the Order of the Minister of Environment and Water Management no. 578/2006 approving the methodology for calculating contributions and taxes due to the environment fund).

5.4 The importance of other economic measures in accounting

Both greenhouse gas emission permits and green certificates that are bought and sold by businesses will be reflected in accounting. On this point it is important to note that these certificates have a bipolar economic nature. On one side they represent productive contributions in that in both cases they endorse raw materials used in the production processes; in the case of greenhouse gas emission certificates, they endorse the combustion of fossil fuels; in the case of green certificates, they endorse use of energy in such processes, regardless of its source, for the value authorised by the certificate. And what is more, both are commodities negotiable on the secondary market or, what effectively amounts to the same thing, financial assets which can be used to underwrite investments. All in all, both aspects must be taken into consideration when calculating their effect on business accounting.

The accounting implications of such certificates, when bought by companies with regard to the environmental impact of their actions, is discussed in the aforementioned EC Recommendation of 30, consideration 18, which states, if "they have been acquired for valuable consideration and, in addition, they meet the criteria for recognition as an asset laid down in paragraphs 12 and 13, they must be capitalised and amortised systematically over their expected useful economic lives. If not, they should be charged to the profit and loss account as occurred".

5.5 Corporate change brought about by new accounting and tax-based measures of environmental protection

Environmental accounting is beginning to be used as a key instrument in managing corporate resources as it gives businesses more complete information on the genuine cost of their activities, including as it does in its estimate models of sustainability. A short term ignorance of the environmental consequences of cost cutting measures can get to a longer term faced with the obligation of paying considerable sums of money to repair the resulting environmental damage. Furthermore, would result more responsible management of environmental issues not only in avoiding environmental damage, but also in more efficient management, optimising use of resources, with the resultant savings in costs.

6 Conclusions

Environmental values are starting to be reflected in corporate accounting, creating a new network of relationships developed between environmental accounting and economic measures of environmental protection. Putting together these relationships and external consequences, starting with discussion of the correlation between green accounting and environmental taxation permits to analyse the influence of new economic environmental protection measures - namely emission permits and green certificates - on corporate accounting.

Environmental responsibility, whether required by law, contracts, or self-imposed, should appear on the balance sheet, as recommended by the corresponding regulations. Environmental expenditure should be, according to circumstance, capitalised and amortised within the period of their useful life when certain criteria are met (essentially if they form a permanent part of the company's activities, if they are concerned with the gaining of future profits or reduce environmental damage within their useful life) or written off directly in the profit and loss account. Conversely, according to IAS 41, "biological assets" should be entered into the account at their "fair value", except when this cannot be reliably measured. Profits and losses derived from variations in the fair value of biological assets should be recorded in the corresponding year's results. It is possible that this regulation will affect taxation once if it is adopted into Romanian accounting regulations.

Despite the fact that the corporate environmental expenses increase not only in importance but also in monetary units, several enterprises continue to underestimate and enter environmental costs in accounts as general expenses. However, some companies try to connect environmental costs with products or services but the methods of allocation cost used are inappropriate. When no proper allocation method, is used, the manager of an enterprise do not receive reliable information with regard to the real costs and profits in order to maintain or change the products and/or processes. But, green accounting still faces a number of problems, such as, the lack of support of information, specialised personnel as well as the absence of proportional international accounting models.

Environmental issues are still very challenging for Romanian regulators and practitioners, also. As we have mentioned above only a few domestic companies have disclosed environmental items through their annual reports and/or on their own websites. The mentioned practices concerning green accounting in our opinion are asking for certain regulations in order to support the sustainable development of domestic companies and allow certain cost-benefit analysis.

The identification and interpretation of environmental problems and risk will continue to challenge the accounting profession. Accounting standard setters are actively evaluating approaches that may improve the reporting of the problems. However, realistically, we can hope that, in the course of time, general principles may be agreed upon and agreements arrived at with regard to cooperation in financial reporting for external users. An international agreement on general principles may facilitate the efficiency of international cooperation, boosting this effective cooperation. The added value of the paper and the authors' contribution is the presentation and the conciliation of the environmental aspects both from accounting and taxation point of view at the European and national level. This aspect it was not studied yet in national and international literature.

INTELLECTUAL CAPITAL REPORTING AND DISCLOSURE IN THE ANNUAL REPORTS OF ROMANIAN MANUFACTURING LISTED COMPANIES – THEORETICAL FRAMEWORK

Bogdan Victoria

University of Oradea, Faculty of Economics

Balint Platon Judit

University of Oradea, Faculty of Economics

Farcaș Mariana

University of Oradea, Faculty of Economics

One of the most researched topic regarding financial reporting and disclosure of today is the way intellectual capital or knowledge assets contributes to the improving of the quality of information disclosed and create or add value to business performance. Also, it is acknowledged that a company has access to a variety of tools for disclosing information on intellectual capital. In our study we have decided to investigate the concept, the measurement models and the intellectual capital disclosure practices using as the source of our documentation books, articles, working papers and online publications. So, in the first part of our research we have presented several points of view in respect to the concept of knowledge assets or intellectual capital and in the second part we have reviewed the literature on the topic highlighting several scholars opinion on reporting and disclosure issues.

Key words: knowledge, intellectual capital, reporting practices, disclosure, annual reports

JEL codes: M41, M10, G14, D83

1. Introduction

In knowledge based economy value is the result of knowledge and information. Moreover, business organizations can not generate profits without ideas, skills talent and intelligence of humans. As Depres and Chauvel (2000) observed beside it's concentration on intangibles, knowledge economy is characterized by networked, digital, virtual and extremely fast moving businesses, better performing, the primary factor of production is knowledge. The three pillars of knowledge economy according to Stewart (2001) are:

- knowledge as the most important factor of production; creating value through knowledge economy is the process of creating value from information;
- knowledge assets; intellectual capital has become the most important knowledge assets embedded in talent, skills, know-how, know-what, relationships and other human values that can be used to create value;
- adaption to knowledge economy in terms of adopting new business language, new management techniques, new corporate governance practices, new technologies and strategies and why not, new accounting.

Studying the literature written on the topic we have found as Tseng and Goo (2005) underlined that there is a common lack of a clear definition that would appropriately describe the concept of intellectual capital. Also, regarding intellectual capital components we have found in the studied literature that intellectual capital is not detached. As Maditinos, Sevic and Tsaidiris (2009) pointed out several scholars grouped intellectual capital in four categories: human capital; structural capital; customer capital and innovation capital (Edvinsson and Malone, 1997; Ross et al., 1997; Stewart, 1997, Sveiby, 1997; Chen et al., 2004, Tseng and Goo, 2005).

Our paper is organized as follows. The next section objective is to underline the differences between classical assets and knowledge based assets focusing on definition and recognition of intellectual capital. The literature review section is concentrated on intellectual capital measurement models and also reporting issues. In the last section we have drawn the conclusions and the limits of our study.

2. From classical assets to knowledge based assets

Companies, regardless of their size, in order to undertake their activity and create value, own both tangible and intangible assets. Buildings, work equipments and instalations, computers are, of course, tangible assets, and the ways in which these generate value for a company and affect performance have been the subject of theoretical and practical speculations in economic literature in past centuries. On the other hand, the considerable growth in the diversity of intangible assets has reoriented, in the last few decades, the focus of researchers from tangible to knowledge based assets. But, what are knowledge based assets? In contrast with tangible assets, these are more difficult to identify, to clasify, to asses and highlight in the structures of financial situations. Yet, in a knowledge based economy, it is imperatively important to understand which activity generates real added value and to adapt contemporary financial reporting to this economic reality. Knowledge based assets or intangible assets have existed for a very long time. As Cohen (2008) so vividly remarked, the first caveman to light a fire knew that he held valuable information. This ability of his represented an intangible asset. Expanding on this reasoning, Cohen underscored the fact that the people who invented the alphabet or the ones who created the calendar or the numeral system were early inventors of extremely important intangible assets. It's a pity they did not know how to patent their inventions or protect their works through copyright (Cohen, 2008:25). It is vital to keep in mind that the terms of knowledge, intangibles and intellectual capital are usually used interchangeably. As Mansour et al. (2008) emphasize the terms of intangibles in accounting literature, knowledge assets by economist and intellectual capital in the management and legal literature are refer essentially to the same thing: a nonphysical claim to future benefits. Unlike the physical or classical assets, the knowledge assets are characterized by increasing return on scale. Return is the outcome of value generated by innovation (discovery), unique organizational designs or human resources practice (Mansour et al., 2008).

An interesting point of view is of Bontis (1998). He emphasized that intellectual capital has been considered by many, defined by some, understood by a select few and formally valued by practically no one. Most of the literature written on intellectual capital, according to Bontis (1998) makes a set of claims that are related to the value and intangible nature of this resource. As Bontis (1998) noticed the concept of intellectual capital was first introduced by Kenneth Galbraith in 1969, who believed that intellectual capital was more than pure intellect but included "intellectual action". It is the move from "having" knowledge and skills to "using" the knowledge and skills that is captured in a numerous way in the literature. The management literature shows two main streams that discuss knowledge assets, in opinion of Marr et al. (2004). One of them, taking an epistemological approach, interprets knowledge as an entity and discusses the differences between information and knowledge and the implications for knowledge management, whereas the other stream of literature discusses knowledge as an organizational asset that has to be managed in order to improve organizational performance. The later stream of research seeks to help managers in managing and evaluating the company performance (Teece, 2000; Roos et al, 1997; Stewart, 1997). In Marr et al. vision a major contribution provided by this research stream is the concept of intellectual capital, which help managers to identify and classify the knowledge components of an organization. The authors also considered that intellectual capital contributed to a better understanding of knowledge assets and was a first step towards a less abstract and more operative conceptualizing of knowledge.

As Abeysekera (2007) noticed several authors have taken a long-term view in defining and analyzing the nature of intellectual capital, though their definitions have varied significantly (Edvinsson and Sullivan, 1996; Brooking, 1997; Edvinsson, 1997; Edvinsson and Malone, 1998; Klein, 1998; Knight, 1999). Because in our paper we are analysing mainly intellectual capital reporting and disclosure, we are interested in the definition of Edvinsson and Sullivan (1996). In their opinion intellectual capital can be defined as knowledge that can be converted into value. Buck et al. (2001) consider that the expression “intellectual capital statement” refers to “capital”, emphasizing the accounting value. While some authors use the concept of intellectual capital while referring to the knowledge of a social community, such as an organization or professional practice groups (Nahapiet and Ghoshal, 1998), other scholars interpret intellectual capital as a human resource (Boudreau and Ramstad, 1997; Liebowitz and Wright, 1999) or associate it with information technology (Davenport and Prusak, 1998). Abeysekera and Guthrie (2002) consider there is considerable ambiguity as to what constitutes intellectual assets, some scholars including all intangibles (Ross et al., 1997; Knight, 1999) but others do not recognize intangibles in the financial statements (Caddy, 2000; Edvinsson and Sullivan, 1996). Abeysekera and Guthrie (2002) also point out the fact that most of the definitions of intellectual capital are based on recognizing knowledge or intellectual assets only. They have ignored the possibility of existence of intellectual liabilities in the concept of intellectual capital (Harvey and Lusch, 1999; Caddy 2000) and external intellectual liabilities (Dzinkowski, 2000). But Abeysekera (2001) suggests that if knowledge is well managed then value is added via intellectual capital and if it is badly managed, this may lead to intellectual liabilities. According to Tseng and Goo (2005) there is a common lack of a clear definition that would appropriately describe the concept of intellectual capital. However, they seem to adopt Stewart’s (1997) definition, also widely, recognized, that intellectual capital has been formalized, captured and enforced so as to generate an advanced value to the organization. Regarding intellectual capital components we have found in the studied literature that intellectual capital is not detached. As Maditinos, Sevic and Tsaidiris (2009) pointed out several scholars grouped intellectual capital in four categories: human capital; structural capital; customer capital and innovation capital (Edvinsson and Malone, 1997; Ross et al., 1997; Stewart, 1997, Sveiby, 1997; Chen et al., 2004, Tseng and Goo, 2005).

3. Literature review on intellectual capital measurement models

As reflected in the various studies conducted by different scholars found in the literature, measuring intellectual capital is not a science as “exact” as mathematics or accounting. According to CEN (2004) (1), there are many interdependencies with other activities and quite often the context in which value is created is not the same as the one in which some of the knowledge efforts take place. And as noted by Iske and Boekhoff (2001) value is not an “intrinsic” property of knowledge: the value of knowledge fully depends on how knowledge is being used. Some knowledge can have a lot of value in one situation but be worthless in another. As we can see in the figure bellow, value can be added in five dimensions:

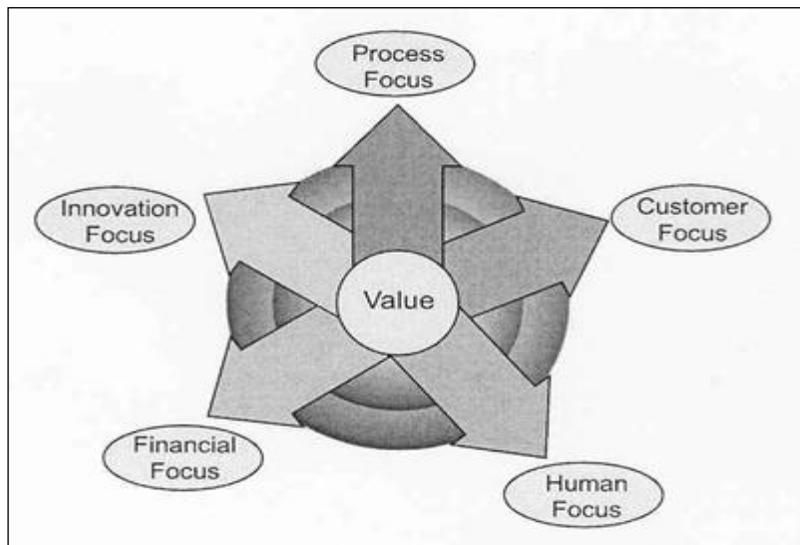

Fig 1.

Source: CEN (2004), European Guide to good Practice in Knowledge Management – Part 4: Guidelines for Measuring Knowledge Management, pg. 7

Many approaches to the measurement of intellectual capital can be identified in the literature. In Sveiby's (2) view the measuring approaches for intangibles fall into at least four categories of measurement approaches.

Direct Intellectual Capital methods (DIC) estimates the value of intangible assets by identifying its various components. Once these components are identified, they can be directly evaluated, either individually or as an aggregated coefficient. **Market Capitalization Methods (MCM)** calculates the difference between a company's market capitalization and its stockholders' equity as the value of its intellectual capital or intangible assets. **Return on Assets methods (ROA)** - average pre-tax earnings of a company for a period of time are divided by the average tangible assets of the company. The result is a company ROA that is then compared with its industry average. The difference is multiplied by the company's average tangible assets to calculate the average annual earnings from the intangibles. Dividing the above-average earnings by the company's average cost of capital or an interest rate, one can derive an estimate of the value of its intangible assets or intellectual capital. **Scorecard Methods (SC)** - the various components of intangible assets or intellectual capital are identified and indicators and indices are generated and reported in scorecards or as graphs. SC methods are similar to DIC methods, expect that no estimate is made of the value of the intangible assets. A composite index may or may not be produced. The figure bellow highlights the four above mentioned well known measurement approaches and shows that one may consider various facets, such as financial valuation, or high levels of evaluation that measure the effect of a knowledge management implementation in terms of macroelements or at a lower level, that is at the organizational component level.

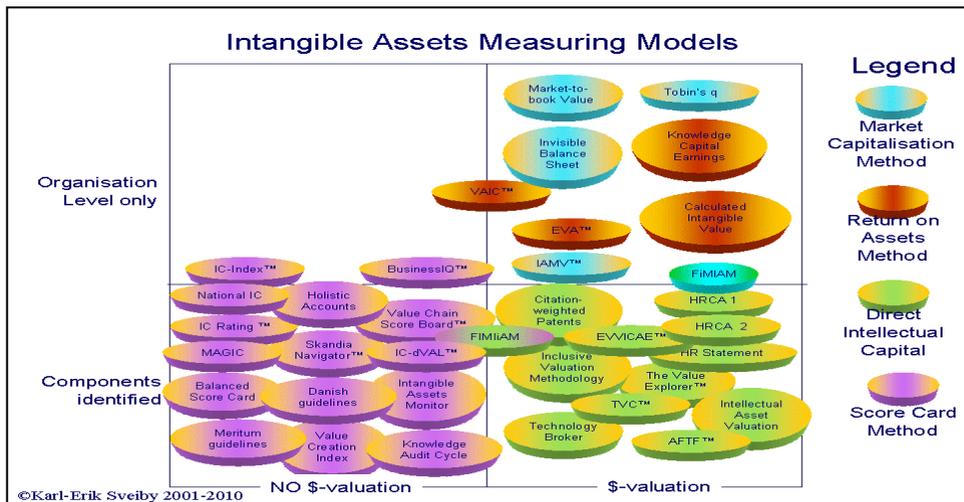

Fig. 2
 Source: Karl-Erik Sveiby, *Methods for Measuring Intangible Assets*, 2001, updated 27.04.2010

As we have found in the studied literature **Skandia** is considered the first large company to have made a truly coherent effort at measuring knowledge assets (Bontis 1996; Huseman & Goodman, 1999). In 1985 Skandia developed the first internally intellectual capital report and became the first company to issue an intellectual capital addendum accompanying its traditional financial report to shareholders in 1994. Leif Edvinsson, the chief architect behind Skandia’s initiatives, developed a dynamic and holistic intellectual capital reporting model called the Navigator with five areas of focus: financial, customer, process, renewal and development and human capital (Bontis, 2001). According to Edvinsson and Malone (1997) the new accounting taxonomy sought to identify the roots of a company’s value by measuring hidden dynamic factors that underlie the visible company of buildings and products. As Bontis (2001) noticed Skandia’s value scheme contains both financial and non-financial building blocks that combine to estimate the company’s market value. This conceptualization achieved a balance for Skandia in trying to represent both financial and non-financial reporting, uncovering and visualizing its intellectual capital, tying its strategic vision to the company’s core competencies reflecting knowledge sharing technology and knowledge assets beyond intellectual property and reflecting its market value better.

The **Intangible Assets Monitor** (Sveiby, 1997) is a method for measuring intellectual capital and a presentation format that displays a number of relevant indicators for measuring intellectual capital in a simple fashion. The choice of indicators depends on the organizational strategy. On the surface, the Intangible Assets Monitor looks similar to the Kaplan Norton Balanced Score Card, however there are significant differences. The Intangible Assets Monitor can be integrated into management information systems and it should be accompanied by a number of comments. Only a few of the suggested indicators should be selected and designed the main purpose to achieve is to get a broad picture. So, essentially management selects indicators, based on the strategic objectives of the firm, to measure four aspects of creating value from three classes of intellectual capital labeled: people’s competence, internal structure, external structure and value creation ways are: growth, renewal, utilization/efficiency and risk reduction/stability.

Intellectual Capital-Index is an example of “second generation” practices that attempt to consolidate all the different individual indicators into a single index, and to correlate the changes in intellectual capital with changes in the market (Roos et al., 1997). The concept of an IC-Index was first advanced by Goran Roos and his colleagues at Intellectual Capital Services Ltd., and was first used by Skandia in its IC supplement to the annual report. According to Roos et al.

(1997) the IC-Index has several distinct features: it is an idiosyncratic measure; it focuses on the monitoring of the dynamics of IC; it is capable of taken into account performance from prior periods; it shed light on a company different from an external view typically based on an examination of physical assets; it is a self-correcting index meaning that if performance of the IC-index does not reflect changes of the market value of the company, then the choice of capital forms, weights and/or indicators is flawed. Like most other measures of tangible assets, an IC-index does depend on value judgements, in the choice of weights, indicators and even the assumption that intellectual capital is present and important in company operations. Also, Roos et al. (1997) argue that intellectual capital measurement and especially a consolidated measure such as the IC-index makes a larger part of the organization visible and open to valuation.

According to Bontis et al. (1999), **Economic Value Added (EVA)** was introduced by Stern Stewart as a comprehensive performance measure that uses the variables of capital budgeting, financial planning, goal setting, performance measurement, shareholder communication and incentive compensation to account properly for all ways in which corporate value can be added or lost. While several scholars consider that economic value added is the net result of all managerial activities, Bontis et al (1999) described EVA as providing a common language and benchmark for managers to discuss value creation and also can increase the legitimacy of a company in the eyes of financial markets. EVA is intended to offer improvements to market value added calculation. Similar to EVA, MVA method derives from the Alfred Marshall concept of „economic profit“. MVA is the difference between actual market value of the company (invested capital) and the present value of invested capital. In other words MVA is the difference between cash out or what investors could get by selling at the present conditions of firm and market and cash in or what investors contributed over the years from the beginning of the firm.

Tobin's Q ratio named Q ratio or q, is the market value of invested capital relative to assets replacement cost (Tobin, 1969). The Q is the ratio of the stock market value of the firm divided by the replacement cost of its assets and changes in Q provide a proxy for measuring effective performance or not of a firm's intellectual capital. Tobin developed the Q ratio as a measure to help predict investment decision independent on macroeconomic factors such as interest rate. In Stewart's (1997) opinion Tobin's Q ratio was not developed as a measure of intellectual capital, but former Federal Reserve chairman Alan Greenspan has noted that high Q and market to book ratios reflect the value of investments in technology and human capital. Norton and Kaplan's **Balance Score Card** was created to help managers to transform organization's strategy into a reliable set of performances that will provide framework for a strategic measurement and management system (Anghel, 2008). A company's performance is measured by indicators covering four major focus perspectives: financial perspective, customer perspective, internal process perspective and learning perspective (Kaplan and Norton, 1996). Balance Score Card indicators are based on the strategic objectives of the firm. This measurement model of intangible assets was developed considering the ability of a company to exploit and develop its intangible assets. The **Value Added Intellectual Coefficient™ (VAIC™)** methodology, developed by Ante Pulic (1998), is an analytical procedure designed to enable management, shareholders and other relevant stakeholders to effectively monitor and evaluate the efficiency of VA by a firm's total resources and each major resource component. Pulic (1998) states the higher the VAIC™ coefficient, the better the efficiency of VA by a firm's total resources. Formally, VAIC™ is a composite sum of three indicators: (1) Value Added Capital Coefficient (VACA) – indicator of VA efficiency of capital employed; Value Added Human Capital (VAHU) – indicator of VA efficiency of human capital; and (3) Structural Capital Value Added (STVA) – indicator of VA efficiency of structural capital.

Baruch Lev's model (1999), knowledge capital earnings, reveals a way to measure assets, intellectual earnings and knowledge earnings. As Lev's describe his model in an interview taken

by Alan Webber in 1999 (3), „it’s a computation that starts with what I call normalized earnings – a measure that’s based on past and future earnings...My approach looks at the past. Based on those forecast, I create an average and I call that average normalized earnings. From those normalized earnings, I then subtract an average return on physical and financial assets, based on the theory that these are substitutable assets...when I subtract from the total normalised earnings a reasonable return on the physical and financial assets I define what remains as the *knowledge earnings*”. Further on in the same interview Baruch Lev mention that technological capabilities index is based on measures of inputs, such as investment in R&D, investment in product development, investment in information systems; on measures of intermediate outputs, such as patents and trademarks; on measures of competitive position such as the number of people who access a particular web site and on measures based on the ultimate output – commercialization.

These were some of the models that over the past years were developed to measure intellectual capital or in general intangible or knowledge assets.

4. Literature review on intellectual capital reporting practices

Several scholars have concentrated their efforts toward understanding and analyzing intellectual capital reporting practices. For instance, Abeysekera and Guthrie (2006) identify the following categories of intellectual capital reporting: ratios and values; reporting intellectual capital via intellectual capital statements; theoretical models. Concerning reporting intellectual capital as ratios and values Roos et al. (1997) states that intellectual capital is by definition intangibles and therefore the only possible way to measure them is by proxy variables or indicators. Authors like Abeysekera and Guthrie (2006) considered that these techniques could be classified into two broader sub-categories: the firm macro level for inter-firm comparisons; and of measuring and reporting within firm level (micro) for interdivisional comparisons. In regard to reporting intellectual capital through intellectual capital statements, empirical models have been proposed to measure intellectual capital items (Leibowitz & Wright, 1999; Decker & Hoog, 2000). Some models used activity based costing to determinate cost and market value to determine revenue. In Abeysekera’s vision (2001) another conceptual approach is to report intellectual capital in relation to the “fair value” of the firm and to recognize intellectual revenue or intellectual expense as the difference of fair value between two periods within the traditional accounting system. Also, Abeysekera and Guthrie (2006) identified five major frameworks of intellectual capital reporting: structures holding intellectual assets, developed by Sveiby (1997), focused on intellectual assets; capital holding intellectual items, that analysis intellectual capital in relation to intellectual assets (Edvinsson, 1997; Edvinsson and Malone, 1998; Roos et al., 1997); assets representing intellectual capital, that focused on intellectual assets and was in Brooking (1999) interest; strategic and measurement root focused on the role of intellectual capital, that was in attention of Roos et al. (1997) research and a combination of assets and capital representing intellectual capital, developed by IFAC in 1998 and Dzikowski (2000).

As Abeysekera (2001) noted annual reports are an ideal research location for applying the intellectual capital framework because they provide a good proxy with which to measure the comparative positions and trends of intellectual capital between firms, industries and countries. Several papers and studies that we have found in the literature concerning intellectual capital issues has used annual reports as source documents to discover the status of intellectual capital of companies (Abeysekera and Guthrie, 2005; Brennan, 2001; Guthrie and Petty, 2000; Vergauwen and van Alem, 2005). The value-creation capabilities of different organizations and entities are studied in the last decade by several authors like Edvinsson (2002), Bontis (2004), Tallman et al. (2004), Bonfour and Edvinsson (2005), Schiuma et al. (2005). Also, several theoretical contributions have underlined the strategic importance of intangible resources for the value

creation capabilities, some of them tried to build approaches and tools more oriented towards project and management processes or analyzed the relationship between knowledge resources, value creation capabilities and competitiveness (Bontis, 2004; Bonfour and Edvinsson, 2005; Pulic, 2005). Lev and Sougiannis (1996) valued and calculated intangibles and then correlated those values with financial measures while Edvinsson (1997) identified the so called “hidden values” of a company and developed an intellectual capital management model. Also, various prior studies have suggested that the level of intellectual capital disclosure in annual reports is relatively low.

5. Conclusions and limits of the research

As it can be understood from the above presented issues concerning the intellectual capital concept, measurement models and reporting practices we did not find in the studied literature on the topic much homogeneity and uniform views. Also, our work was a difficult one taking into account the very rich and diverse literature. However, we consider that we have synthesized the main or important aspects regarding the definition, the measurement and reporting of knowledge assets. But, there are a few aspects that were not discussed and this is surely one of the limits of our study. Another limit refers to the fact that we have not pointed out separately the contributions of domestic authors interested in this subject.

INTELLECTUAL CAPITAL REPORTING AND DISCLOSURE IN THE ANNUAL REPORTS OF ROMANIAN MANUFACTURING LISTED COMPANIES – METHODOLOGY AND DISCUSSION OF RESULTS

Bogdan Victoria

University of Oradea, Faculty of Economics

Platon Judit

University of Oradea, Faculty of Economics

Popa Dorina Nicoleta

University of Oradea, Faculty of Economics

In our study we have proposed to measure the extent of intellectual capital disclosure using annual reports as the source of our documentation. The empirical analysis is twofold: firstly we are interested in analyzing the value of intellectual capital using a value-based approach, through the evolution of market to book value ratio over the selected period and secondly we carry out a content-based analysis of the complete annual reports of the selected companies over the five year period and calculate an intellectual capital disclosure index. Looking at the figures we can conclude that only 50% of Romanian manufacturing companies hold intellectual capital assets for the period analysed and also they are mostly disclose information that refers to relational capital. The intellectual capital voluntary disclosure index for the 2005-2009 years for the sampled companies is on average almost 19%, considered very low.

Key words: knowledge, intellectual capital reporting, annual reports, listed companies, disclosure

JEL codes: M41, M10, G14, D83

1. Introduction

This study main objective is to highlight several aspects in regard to intellectual capital components reported voluntarily by Romanian manufacturing listed companies in their annual reports and to investigate, by following the evolution of market to book value ratio, the tendency of the companies surveyed to create value through their knowledge assets. Motivation in selecting this topic of research lies in our interest in financial reporting of today, especially in voluntary disclosure practices of domestic listed companies. In our approach that mainly focused on analyzing the annual reports of selected listed companies we have proposed two sections of the research and three research questions.

Voluntary reporting activities of several important European firms have generated in the last decades a rethinking of the traditional financial accounting practice and disclosure. Taking into account the results of different studies found in the literature and the trends in financial reporting of today, we consider that our study contributes to understanding intellectual capital reporting practice of Romanian listed companies, revealing the fact that despite the very low disclosure index of knowledge assets it can be recognized an increasing interest of these entities in the last three years in disclosing information regarding this kind of hidden values. As Petty et al. (2009) suggests the greatest obstacles for firms wishing to adopt intellectual capital reporting are: the lack of consistency in methodologies for disclosure and the difficulties in assigning meaningful and reliable quantitative values to components of knowledge assets. We agree with the above mentioned authors which considered that while these obstacles persist, it is likely that few

companies will see any benefits accruing to them as a reward for their efforts in extending voluntary disclosures of hidden values.

In the next sections of our work we have presented the research methodology and design, the questions we have formulated, the discussion and analysis of the obtained results and finally we mentioned the conclusions of our investigative study and the limitations of the research.

2. Methodology and research design

Our paper analysis the evolution of market to book value ratio for the sampled companies in the period 2005-2009 and the voluntary disclosure of intellectual capital in the same period. First we have to mention that we have selected our sample companies looking for such industries that are consistent in intellectual capital and actually we have searched for information regarding intangible assets disclosed in the annual reports. Our study has two major objectives. First to investigate the evolution of market to book value ratio and secondly to analyze what information about intellectual capital are voluntarily disclosed through annual reports by sample Romanian listed companies.

In the present paper we have used content analysis for investigating annual reports of the nineteen companies listed on Bucharest Stock Exchange (BSE), first, second and third tier, selected after we have established the main criteria for sampling. We have chosen our sampling criteria starting from the hypothesis already tested in previous research that companies' size is an important predictor of corporate disclosure behaviour (Buzby, 1975; Raffournier, 1995; Graven and Marston, 1999; Stolowy and Ding, 2003) and large companies traded on a capital market should have the most complete annual reports and a larger range of voluntary information disclosed. Out of the total listed companies on BSE we selected those who do business in the manufacturing industry relying on the assumption that companies that activate in IT and manufacturing industry are more likely to disclose information about intellectual capital and corporate value. We have found forty-four companies in the manufacturing industry listed on the first, second and third category, out of which we have selected our sample according to the following criteria: market capitalization, own web-site, annual reports and audit reports. Thus, our sample consists of nineteen companies from manufacturing industry, most of them doing business in the chemical industry. Companies in the sample were selected on the bases of their knowledge-based assets and incentives to report on intellectual capital. For measuring the intellectual capital index we have analysed the content of annual reports of sample companies. The empirical analysis is twofold: firstly we are interested in analyzing the value of intellectual capital using a value-based approach, through the evolution of market to book value ratio over the selected period and secondly we carry out a content-based analysis of the complete annual reports of the companies over the five year period and calculate an intellectual capital disclosure index inspired by the model of Li, Pike and Haniffa (2007). Annual reports are the main annual source of communication between the company and its external investors through these means the company publishes investment related information. The annual reports examined in this paper are based on the 2005, 2006, 2007, 2008 and 2009 fiscal years.

Companies were surveyed between July 2010 and March 2011 to find out whether they have voluntarily disclosed information about intellectual capital or knowledge assets. Data was gathered from the following sources: www.bvb.ro, www.cnvm.ro, www.ktd.ro, and www.kmarket.ro, sites providing stock exchange information and own web-sites of companies listed on first and second and third tiers at BSE; we have collected the data for determining the market capitalization of the companies listed on BSE and also a part of the accounting and financial information regarding the financial statements and annual reports for the years 2005, 2006, 2007, 2008 and 2009; the accounting and financial information obtained from the site of the Romanian Ministry of Economy and Finance.

10	ROCE	ROMCARBON SA			

Our research is a quantitative study organized in two main sections. In the first section we tried to identify which firms in the sample shows a market to book value ratio near or greater than 1 assuming that those companies have greater intellectual capital compared to other sampled companies. On the second level of our investigative study we have constructed an intellectual capital disclosure index based on a content analysis of annual reports and the research methodology found in Li, Pike and Haniffa (2007). The research instrument adopted by the mentioned authors grouped the intellectual capital items into three categories: human capital items, relational intellectual capital items and structural intellectual capital items. Our approach in scoring the items can be found in the research methodology of Li, Pike and Haniffa (2007) and essentially consists in assigning the score 1 if the information is disclosed in the annual report or the score 0 if the information is not disclosed. The scores for each item were then added and equally weighted to derive a final score for each company. The intellectual capital disclosure index (ICD) for each company is calculated as follows:

$$ICD_j = \frac{\sum_{i=1}^{n_j} X_{ij}}{n_j} * 100$$

Where n_j = number of items (61) for j company (19), found in the annual reports of each company, for the period between 2005 and 2009 fiscal years;

X_{ij} = 1 if the i item is disclosed

0 if the i item is not disclosed

The table bellow presents the items scored for each year disclosed in the annual reports of the sampled companies.

Information categories regarding intellectual capital disclosure

3. Research questions

As it is well known the most popular indicator to measure knowledge assets at organizational level is the comparison between the market price and the book value. It had been shown that if the market value is higher than the book value then the company hold intellectual assets not presented in the financial statements but if the book value is higher than the market value the company has intellectual liabilities. Although, these measures had been severely criticized for its simplicity, it remains useful to illustrate the value of the company which is not reflected in the accounts (Oliveras and Kasperskaya, 2004). So, starting from this simple fact we have formulated our first research question: *Romanian manufacturing companies hold “hidden values” not reported in the financial statements?*

Also, because we were interested in analysing what information is disclosed about intellectual capital in the annual reports of the sampled companies, our second and third research questions are considering this issue of voluntary disclosure of intellectual capital. After the delimitation of the research instrument and scoring the items disclosed in the annual reports we tried to seek answer to the following questions: *what information regarding intellectual capital are voluntary disclosed by the Romanian manufacturing companies through annual reports?* and *which is the general score of intellectual capital disclosure for these companies?*

4. Discussion of results

As we have mentioned above our work is divided in two main sections. Therefore, we would present and discuss the obtained results and trying to answer the research questions. As regard to the first section of our research we have calculated the market to book value ratio for each sampled company, for the period from 2005 to 2009 and then compared the obtained results to discover those companies which are hold hidden values, meaning intellectual capital or knowledge assets but they do not report this in the financial statements.

In the table bellow can be seen the values of the indicator for each selected company.

	2005	2006	2007	2008	2009	Average
AMO	94,06%	127,49%	93,63%	73,51%	22,46%	82,23%
AZO	60,00%	39,00%	30,00%	51,00%	33,00%	42,60%
OLT	340,00%	422,00%	100,00%	-82,00%	-18,00%	112,40%

PPL	1,58%	20,44%	50,14%	38,96%	35,84%	29,39%
ROCE	53,74%	76,45%	163,27%	106,22%	61,89%	92,31%
TRP	8,43%	6,88%	34,08%	123,51%	81,31%	50,84%
PREH	63,08%	318,04%	459,34%	95,67%	33,91%	194,01%
CBC	58,60%	46,64%	102,39%	90,91%	22,18%	64,14%
CEON	0,07%	0,03%	0,17%	82,01%	29,25%	22,31%
CMCM	0,20%	0,01%	0,32%	24,95%	23,00%	9,70%
ALR	214,66%	174,13%	395,96%	262,67%	90,97%	227,68%
COS	36,57%	57,33%	233,85%	122,43%	56,18%	101,27%
ART	6,81%	13,12%	62,16%	36,99%	62,15%	36,25%

	2005	2006	2007	2008	2009	Average
ZIM	32,63%	31,17%	58,97%	60,04%	24,84%	41,53%
Average	85,88%	117,62%	137,04%	101,43%	59,15%	100,22%
Standard deviation	0,937314	1,279155	1,451932	0,914754	0,573473	0,77486

Source: authors working

Comparing the results we can see that out of the nineteen selected companies only nine reveal the average of market to book value ratio between 80% and 300%. We are presenting the developments of market to book value ratio in the selected period only for those nine companies.

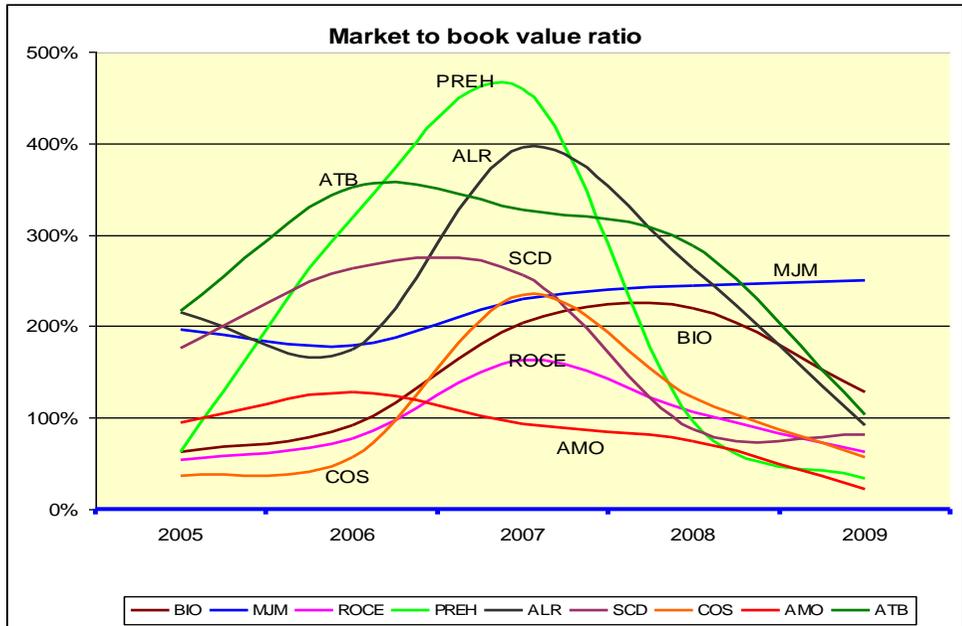

Chart 1 - Market to book ratio for nine companies, on average > 100%

Source: authors working

Looking at the figures we can conclude that only 50% of Romanian manufacturing companies hold intellectual capital assets for the period analysed and also as shown in the chart above for the nine companies that are in “good position” regarding the studied indicator the financial and economic crisis significantly affected the evolution of the “hidden values”. In respect to the intellectual capital disclosure through annual reports we have found that Romanian manufacturing companies mostly disclose information that refers to relational capital gathering aspects mainly about market presence, brands, suppliers and distribution channels.

Table no. 4 presents the descriptive statistics for the extent of human, relational and structural capital information disclosed in the companies’ annual reports. The broadened information disclosed targets the relational capital aspects of the firms.

The descriptive statistic for intellectual capital disclosure index is presented in *table no. 5*

Intellectual capital disclosure (ICD) statistics **Table no. 5**

Year	2005	2006	2007	2008	2009	Average
Score ICD (%)	16,39%	18,21%	19,33%	19,84%	19,93%	18,74%
ICD Standard deviation	9,87%	8,69%	9,46%	8,53%	8,49%	8,32%
ICD Minimum Score	0,00%	6,56%	4,92%	6,56%	8,20%	6,56%
ICD Maximum Score	40,98%	42,62%	44,26%	40,98%	47,54%	43,28%

Source: authors working

As can be easily seen in the chart below the ICD index in average is between 20 and 45% for only six companies from the sample.

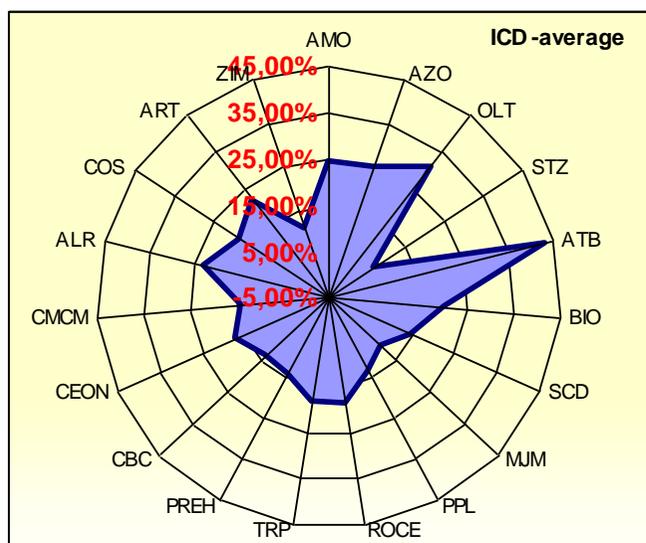

Chart 2 - Companies' ICD index related to ICD average
 Source: authors working

The preliminary findings of the content based analysis of the complete annual reports of the selected Romanian manufacturing companies over the five year period seem to suggest that although the level of disclosure has in average increased over time, this is mainly in a descriptive or narrative way. Also, as it can be observed from the table no. 5 the level of intellectual capital disclosure remains still low. However, it is worth mentioning that ICD in 2009 almost covers the voluntary disclosure index of all previous years. Arguments for this fact lies in general trend of growth of ICD for all selected companies because of the improved communication related to non-financial intellectual capital information. The chart bellow captures this trend of ICD for the sampled companies.

5. Conclusions, practical implications and research limitations

This paper seeks to identify if Romanian manufacturing companies are interested in reporting intellectual capital information and focuses on analyzing which aspects concerning intellectual capital are voluntarily reported by these firms in annual reports. In order to capture the ways in

which knowledge assets or hidden values are reported by these firms we performed a review on the measurement models of intellectual capital found in the literature. Then we analyzed the value of intellectual capital using market to book value ratio evolution over the considered period for the sampled companies. Our results showed an interesting trend, meaning after an increase by 2007 was recorded a general decrease in the "hidden value" of selected companies, probably due to the financial crisis and general trends in stock market. Regarding the practical implications of our approach in respect to measure the intellectual capital over the five considered years, financial analysts and other experts in our opinion will be able to understand better the way firms create added value and how this value can be related to business performance and a modern financial reporting.

This study also focuses on the analysis of annual reports from 19 listed Romanian manufacturing companies over a five year period, from 2005 to 2009. Our goal was to construct an intellectual capital disclosure index based on the content-analysis of the annual reports. We found that in average the voluntary intellectual capital disclosure index had increased for the selected companies from year to year, what we believe that is a positive signal to stakeholders. However, the level of disclosure of hidden values remains still low. This behavior towards low voluntary disclosure can be explained in our vision by the fact that Romanian market is an emerging small market in which capital market fund raising is not regarded to be important source of financing and there is poor enthusiasm from companies for modern, transparent reporting and permanently seeking to satisfy the various information needs of different users. As a major conclusion of our research emerges the fact that Romanian manufacturing companies show low interest for reporting intellectual capital with few exceptions.

Our paper based provides insights to the components of intellectual capital voluntarily disclosed through annual reports and the conducted analysis of the items disclosed is cross-sectional. As a limit of our research we consider is the small sample size but it is unavoidable because the small Romanian capital market. Another limit that can be overcome in future studies is concerning the factors that influence the level of voluntary disclosure of intellectual capital information in annual reports of Romanian manufacturing listed companies. We are motivated to continue this research by the recent recommendations of international regulators and researchers that are encouraging companies to improve their business reporting by making extensive voluntary disclosures of information about knowledge assets.

THE PROFIT TARGET IN A RESTAURATION UNIT

Briciu Sorin

University 1 Decembrie 1918 Alba Iulia, Faculty of Science

Scorțe Carmen Mihaela

University of Oradea, Faculty of Economic Science

PhD Student of The University 1 Decembrie 1918 Alba Iulia, Faculty of Science, Scientific coordinator Prof. Briciu Sorin, PhD

The hospitality industry represents one of the most dynamic sectors of the contemporary society, with an emphasised role in the process of globalization. Currently, the hospitality industry does not only face the challenges of the economic crisis but the changes in the market, the consumers' behaviour and the technological trends, too. That is why, in this time, it is extremely important to apply the management accounting and the cost calculation in any entity in the hospitality industry in order to cope with the market challenges.

The main services are performed through the hospitality industry: the accommodation and the restauration. These services satisfy the vital needs of the tourists, but this industry must meet other needs or requests such as the acknowledgement of the social status, the desire to know other cultures or traditions, to spend free time in a pleasant manner etc.

Our intention and goal in the current article is to approach an image of the CVP analysis in the decision making process with an emphasis on the restauration in the hospitality industry. In order to cope with this critical time, the competition and to achieve the profits estimated, the managers in the hospitality industry can apply the CVP analysis, one of the simplest and most useful analytical instruments.

The paper will tackle with the problem of the break even point in a restaurant, one of the main indicators of the CVP model and also the possibility of the decision making process orientation.

Introduction

Tourism represents an economic-social phenomenon characteristic to the modern civilization, well grounded in the life of the society and, therefore, strongly influenced by its evolution. Addressing large social segments and meeting their needs, tourism is by far the sector characterised by an accentuated dynamism, both nationally and internationally. Tourism involves a vast human and material potential due to its complex content and its mass character which has important implications on the evolution of the national economies and that of the society.

The tourism is a strategic economic activity in Romania, its importance in the national economy being likely to increase in the next years. Tourism contains a large variety of products and destinations and it involves many interested parties both from the public sector and from the private sector and has as main activity subfields the accommodation and the restauration. The tourism has a great potential regarding the contribution to the achievement of Romania's several major objectives such as the sustainability, the economic growth, the employment and the economic-social cohesion as well.

The term of public food service is more and more replaced, lately with the simple one of nourishment and as the most representative type of entity is the restaurant, especially for denoting the activities performed in superior categories entities, the last years and a series of authors imposed the term "restoration" with its variant "restoration".

Public food service/nourishment/restauration contains the entire production and distribution of foods and drinks, respectively, and, according to case, the preparation of culinary dishes and pastry-confectionary products, the goods supply, the consumerism of products inside or outside the entities and the creation of an environment favourable to the clients' relaxation and entertainment (Radu Nicolescu,1999: 12).

The modern life, the specialization of the individuals and the rise in the profits of a certain part of the population in the urban areas as well as the more stringent time crisis make that, nowadays, in the world each third meal is served outside the household”(Nicolae Lupu 1998: 40). It is obvious that apart from the latter's touristic or collateral motivations, the restauration is motivated by other *four functions of consumerism in public food entities*, and respectively by: *nourishment, loisir, conviviality, businesses*.

Starting from the importance of the hospitality industry, from the perspectives of this sector's evolution but also taking into account the current conjuncture of the national economies seriously hit by the world economic crisis, the maintenance and development of the activity of an entity in tourism, the restauration industry implies the harmonization of the market opportunities with own resources and abilities, the capitalization of strategies based on information regarding the costs of the touristic products and of the complementary services, based on the financial-accounting information. The lack of a coherent management strategy implies an inherent weakness for the cost management system. Becoming aware of the benefits provided by the supply of quality services connected to a fair level of prices does not represent a common practice in the present. (Larisa Dragolea, Radu Matei Todoran, 2009)

At the level of touristic sector, generally, but also in what the restaurants are concerned, the key factors of success are:

- the differentiation of own touristic products compared to those of the competition through a plus of attractiveness provided both by the environment and not in the last by the own offer at a competitive quality-price rate;
- the diversification of own products and services provided as well as the presentation of some integrated products meant to ensure all the facilities in the same package (meals, entertainment etc.);
- the flexibility and adaptability of the offer to the demand's tendencies;
- the constant and sustained promotion of the products on the market, emphasising the defining characteristics which differentiate them from the competition..

Theoretical frame regarding the CVP model – a step further from the Direct

Costing method

In the hospitality industry the method of cost calculation can be applied with the best results is the Direct Costing method and the Cost Volume Profit model.

The Direct Costing method is based on the principle of separating the variable expenses from the fixed expenses according to the behaviour of expenditure compared to the volume of production and it consists in charging on the products only the variable expenses either fixed or indirect.

Direct costing gives the managerial team relevant information regarding the wording out of the decisions for the activity of the economic entity in the following period.

Direct costing gives the managerial team relevant information regarding the wording out of the decisions for the activity of the economic entity in the following period. This method will provide a basis for the cost forecasts, for the study of the effects of planned changes in the volume of the production, determined by the change of the economic conditions or the management's certain open actions, as for example the changes in price, the increase or the decrease of the stock or the special promotional activity. (Sorin Briciu 2006: 223)

The method emphasises the quickening of sales due to the fact that the size of the fixed costs is not distributed on the stocks (of unfinished products, of finished products), but it must be covered from the period's sales. Also, the emphasis is on the analysis of variable costs and the charging of fixed costs on the (gross) margin on variable costs. The manager of any entity has the break even obligation to maximize the margin on variable costs on which the fixed expenses will be charged. Getting the maximum financial and economic results requires optimizing the correlation of price-cost-volume manufactured products, respectively sold.

This correlation is expressed by means of indicators such as the balance point, the coverage factor, the dynamic safety factor and the safety period . (Sorin Briciu et al 2010: 359). The Cost-Volume-Profit analysis examines the behaviour of total revenues, total costs and the result from operation under the influence of the changes in the volume of production, of the sale price, of the fixed expenses or of the variable expenses.

The managers frequently use the CVP analysis to answer questions of the type: How will the total costs and the total revenues are influenced if we sell with 1,000 units more? How will the level of production be affected if we increase or decrease the sale prices? All these questions have a common subject: What if...? (Charles T Horngren et al 2006: 68)

That amount of production sold for which the total revenues equal the total costs is called the break even point; in other words, it reflects the amount of production sold for which the operating profit is zero. The managers are interested in the level of the break even point as it tells them what the minimum amount of production that must be sold not to record losses is.

In the speciality literature there are three methods to determine the break even point: the equation method, the marginal contribution method, and the graphic method.

In order to use the equation method (arithmetic calculus) in order to determine the break even point, the operating profit (the gross operating outcome) is expressed:

$$PE = CA - CV - CF \text{ sau } PE = (PV_u \times Q) - (CV_u \times Q) - CF$$

$$PE = Q \times (PV_u - CV_u) - CF$$

The marginal contribution method is a variant of the equation method mentioned earlier and it considers that the balance point is that value of the turnover for which the fixed costs equal the total contribution margin on the variable expenses (Mv).

The unit variant of this margin (the unit margin on the variable expenses) expresses the increase of the profit with each supplementary unit of product sold. Thus, it will contribute to cover the losses undertaken by the enterprise until the break even point is reached. From that moment on, each extra unit sold will determine an increase in profit.

This statement hold true as long as it does not exceed the value of the floor for which the fixed expenses were determined (Nadia Albu și Cătălin Albu 2003: 206).

$$Q \times (PV_u - CV_u) = CF + PE$$

In other words

$$M_v \times Q = CF + PE$$

$$Q = \frac{CF + PE}{M_v}$$

At the level of the break even point the operating profit is by definition zero. If $PE = 0$ the previous equation becomes:

$$\text{The breakeven point expressed in units} = \frac{CF}{M_v}$$

To calculate the break even point in terms of revenues

$$M_v \% = \frac{M_v}{PV_u}$$

To reach the break even point the marginal contribution must be equal with the fixed costs, therefore:

$$\text{The breakeven point expressed in revenue} = \frac{CF}{M_v \%}$$

The break even point can be used also to determine the physical volume of the activity so that a certain profit is obtained (P) (Chirata Caraiani și Mihaela Dumitrana 2004 : 161). The calculus relations are :

$$\text{In physical units } Pr_p = \frac{CF + P}{Ca^*}$$

where : Pr_p = break even point to reach the profit P

$$\text{In monetary units } CA_p = \frac{CF + P}{Rc}$$

where : CA_p – the necessary turnover to obtain the profit P

R_c - the rate of global contribution

With the help of the equilibrium point or the break even point the necessary turnover to reach a certain rate of return (profit/sales) can be computed. If the managerial team of an economic entity decides to reach and maintain the enterprise at a certain rate of return, they can find with the help of the break even point what volume of activity ensures this target. The calculus relation is

$$CA_{RP} = \frac{CF}{Rc - R_p}$$

where: CA_{RP} – the necessary turnover to reach a certain rate of return

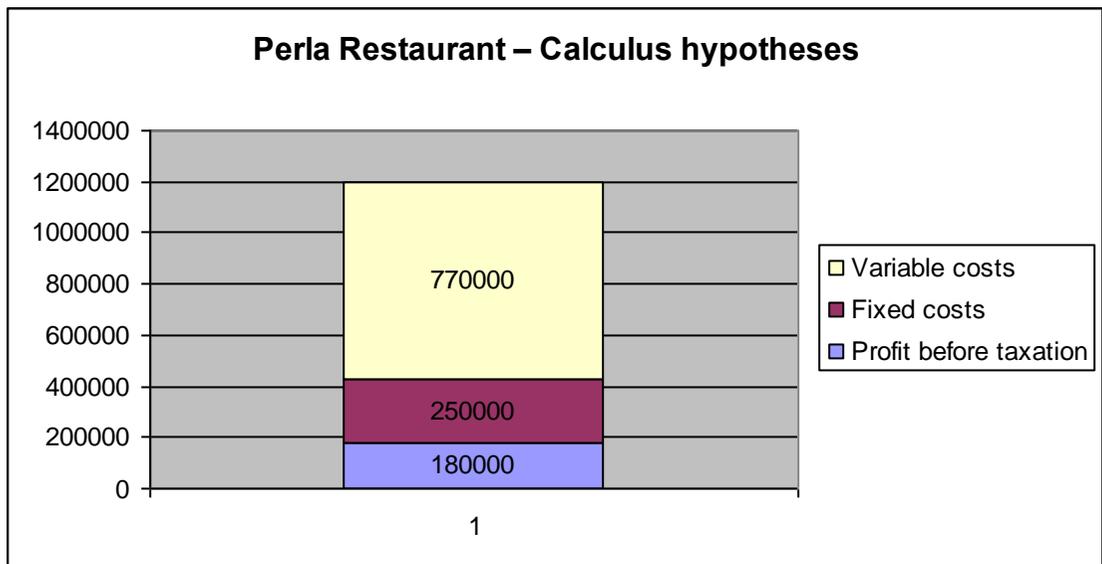

R_p – rate of return

The equilibrium point and the foreseen profit in a restaurant

From a restaurant owner or a restauration entity manager's perspective the problems are:

1. How many clients should I serve on average in a month to wholly cover the expenses?
2. Starting from a certain level of return that I target or it is imposed on me, how many clients should I serve in a month on average?
3. Suddenly some fixed costs rose, as well as the cost of utilities or the level of rent. What is the impact on the number of clients that I should serve so that I do not reduce the business' profitability?

To answer these questions, some simple calculus can be made for the last year activity of Perla Restaurant, a category I restaurant, about which we know that it had a turnover of 1,200,000 RON, it had approximately 20,000 clients in a year, had a gross profit before taxation of 180,000 RON and the fixed expenses for the year reached the value of 250,000 RON.

With the help of these figures we can calculate how much a client on average for the meal served in Perla Restaurant that is 60 lei.

If the profit of the restaurant was of 180,000 lei, knowing that the value of the fixed expenses is of 250,000, it means that the difference to the turnover is the variable costs of this restaurant which amount to 770,000 lei. If the number of clients is of 20,000 it means that the value of the variable cost on the client is of 38.5 lei.

Using the Cost-Volume-Profit analysis we can answer the most interesting questions with the help of the instruments available to us:

1. The number of clients absolutely necessary to cover all the expenses (this point is called in the Anglo-Saxon system Break Even Point):

$$\text{Break even point number of clients} = \frac{\text{Total fixed costs}}{\text{Average bill} - \text{Variable cost on the client}}$$

$$\text{Break even point number of clients} = \frac{250,000}{(60 - 38.5)} = 11,628$$

Therefore the entity analysed needs 11,628 clients to cover all the costs, this means on average 969 clients a month or 32 clients a day. Any supplementary client served over this point starts to build the profile of the Perla Restaurant.

The main problem of the restoration that is trying to be solved through marketing is maximizing the capture rate, an indicator similar to a hotel occupancy rate, defined as the ratio between the number of seats filled and the number of available seats in a restaurant. This goal translates into an attempt to attract more customers in the restaurant or retain current customers. (Puiu Nistoreanu 2005).

2. How many extra clients should have come in Perla Restaurant for the profit to be 200,000 lei?

$$\text{Number of clients} = \frac{\text{Total fixed costs} + \text{Desired profit level}}{\text{Average bill} - \text{Variable cost on the client}}$$

Adding in the previous formula the value of the desired profit, the result becomes 20,930, that is 9,302 clients extra a year, or an average of 25 clients a day. How do we bring these extra clients in Perla Restaurant, what promotion campaigns should we initiate, what changes are required,

can we do anything in this view? It results from here, from these dry figures a series of problems occur related to the management of the restaurant, the concept of the restaurant, the planning of the menu, the constant analysis of sales using well known instruments such as “Menu Engineering”, the measures taken in the menu as a result of each analysis, the promotion actions etc.

3. Let us assume that Perla Restaurant has a period of negotiations with the owner of the location regarding the rent. The fixed costs will increase with 10% if the restaurant’s operator accepts this increase.

$$\text{Number of necessary supplementary clients} = \frac{\text{Supplementary fixed costs}}{\text{Average bill} - \text{Variable cost on the client}}$$

The increase in rent will bring supplementary fixed costs of 25,000 RON and the impact on this rise in the supplementary number of clients rises to 1,163.

These are only some of the questions that can be answered with the instruments of the Cost-Volume-Profit analysis. The principles according to which these formulas are build and changed in order to find the necessary answers are sufficient and they represent the basis for the solving of the problems regarding the reaching the profit targets not only in the restaurant but also in the accommodation division or another centre of profit important for a business entity in the hospitality industry.

The use of these formulas is not very complicated but as it can be seen there is a need for healthy financial information to be able to work with accurate figures. To get here, if we are talking about a hotel, its financial statements must suffer a series of operations. A separation of revenues and expenses of each profit centre must be made and once this operation is achieved, in the concrete case of the restaurant, in most cases there occurs a supplementary problem because it obtains the turnover from several types of activities than the sale in a la carte system.

If in the restauration sector there are revenues even from the event organization, breakfast is served, half-board or full-board meals are organized etc., then it is necessary supplementary work to delimitate these activities. By correctly organizing the informational system, through a correct implementation of the restaurant software, a large part of these activities can be made yet automatically. It is up to the financial service or an expert in the field to find the best way to reduce the complexity of the case for the formulas of the type exemplified to be applied.

The Cost-Volume-Profit is one of the main instruments in the administration of any business in the hospitality industry. Adopting these work methods represents a huge step forward compared to the pub system well spread in Romania.

Conclusions

To cope with the current conditions in the national economy, the service supply firms and the restaurants generally can take precautions in order to avoid quality variations, which have an impact on the number of clients, on the turnover, on the profit, too:

- careful personnel selection, hiring and training;
- incentives for the employees meant to emphasize the importance of their work’s quality, for example, rewards of the “the employee of the month” type;
- freedom for the employees to see and talk to the client in order to particularize the offer;
- the improvement of the employees’ work by installing helping technology (professional equipment).

The service suppliers must make efforts to refresh the identity of the goods in the relation with the consumers as the services have as a characteristic the lack of ownership (an exquisite dinner in a restaurant providing a pleasant environment is just an impression as compared to a good which you use for a long time). This can be achieved through the following methods:

- Stimulants for the consumers frequently using their services (discounts for the clients of the restaurant);
- Creation of special events for the clients, a type of exclusive club.

The Cost Volume Profit model, as it has been mentioned before, can be the main key for an efficient management of a business in the hospitality industry, due to the fact that it allows the calculus of some indicators with decisional valences, and not only, indicators which will provide information regarding the production, sales and short-term promotion decisions.

The break even point represents that degree of the production capacity usage (accommodation, production section) where the costs are fully recovered without obtaining a profit. For the culinary dishes the calculus of the break even point can be done on each sort or group of dishes. Thus, those dishes requiring a high consumption of work and which do not bring profit can be eliminated from the production.

Each of these indicators have a special importance in capitalizing the short-term decisions, that is why we intend to analyse them and the influences that they have, in our future scientific approaches.

HOW ROMANIAN FINANCIAL AND INTERNAL AUDITORS ACQUIRE ACCOUNTING INFORMATION SYSTEMS KNOWLEDGE AND COMPETENCES?

Cardoş Vasile-Daniel

Babeş-Bolyai University, Cluj-Napoca Faculty of Economics and Business Administration

Research theme – in this article we investigate how Romanian financial and internal auditors acquire accounting information systems knowledge and competences and how they use this knowledge to improve their activity in order to fulfill their mission as required by the professional standards.

Objectives – our main purpose is to establish through what type of courses Romanian financial and internal auditors acquiring accounting information systems knowledge and competences and how useful these courses are perceived by the auditors.

Prior work – audit professional organizations prescribed that auditors must acquire, maintain and develop their knowledge and competences. Information technology and information systems are considered to be a main knowledge component of professional development programs. The scientific literature indicates that auditors have to enhance their information systems knowledge in order to cope with the increasing complexity of the client's entities accounting information systems. We consider that our article embraces Curtis et al. (2009) call for research on how auditors obtain information systems knowledge.

Methodology – an electronic questionnaire was created and sent to Romanian financial and internal auditors, which were required to indicate the number of accounting information systems course they attended and how the knowledge gained improved their activity.

Results – We concluded that financial auditors acquire accounting information systems knowledge mainly by attending the courses organized by the Chamber of Financial Auditors of Romanian, while internal auditors by attending the course organized by the companies they are working with.

Implications - The results of this study might be used by Romanian professional audit organizations in reconsidering their priorities regarding the accounting information systems knowledge and competence needs of their constituents.

Originality/Contribution – Our study is the first one to investigate how financial and internal auditors acquire accounting information systems knowledge.

Keywords: accounting information systems, auditors, knowledge

JEL Classification: M42

Introduction

Auditors, both financial and internal, have to acquire and develop their skills and competences in order to be able to fulfill their mission in a professional manner as required by their professional organizations. One of the major, and growing, domains of the skill and competence requirements consists of information technology [IT].

In this respect, The International Federation of Accountants (IFAC) issued the International Education Standard (IES) 8 *Competence Requirements for Audit Professionals* which indicates that the knowledge content of the education and development programs should include information technology (IES8, 2010: par.32). Further, the International Education Practice Statement (IEPS) 2 *Information Technology for Professional Accountants* indicates the IT knowledge and competence requirements in the pre- and post-qualification stages of candidates

and of audit professional. The Institute of Internal Auditors (IIA) issued the *Internal Auditor Competency Framework*, a work-in-progress document which indicates the minimum level of knowledge and skills needed by internal auditors in accordance to their position and experience in the audit function. The framework consists of four so called “buckets”, one of which is entitled “Knowledge Areas” and prescribes the level of IT knowledge internal auditors should possess.

Literature review

The issue of what IT skills and competences should an auditor possess have long been debated in the scientific and professional literature. Cutting *et al.* (1971: 76-77) considers that auditors should: understand and analyze the concentration of controls in an electronic environment; understand information systems and understand the use of computer auditing software. The authors also stressed the idea that the knowledge acquired should be differentiated depending on the job requirements and the complexity of tasks. Further, Jancura (1975: 59) extended the knowledge requirements of auditors by considering that they should: have sufficient knowledge of information systems to develop the audit plan. Borthick *et al.* (2006) indicated that “accelerating the acquisition of expertise in auditor’s careers is desirable because of increasing demands for audit efficiency and effectiveness, growing sophistication of accounting systems” Borthick *et al.* (2006: 338). The main result of this article is that there is a correlation between structured training and the competences of auditors.

Brazel (2004) suggest that accounting information systems [AIS] expertise is a separate competence domain from that of general audit experience. Such knowledge may affect audit planning judgments and audit quality (Brazel and Agoglia, 2004). The authors indicated that “auditors with higher AIS expertise assessed inherent and control risk as higher than auditors with lower AIS expertise” (Brazel and Agoglia, 2004: 16).

In complex accounting information systems such as Enterprise Resource Planning [ERP] systems, auditors are faced with a greater challenge than in less complex one. Hunton *et al.* (2004) found that auditors are highly confident in their ability to assess risks in ERP systems and less complex systems and they don’t indicate a greater need to consult IT specialists or computer assurance specialists in complex environment.

For the internal audit profession and function, Kim *et al.* (2009) indicated several intra-organizational and extra-organizational factors which influence technology acceptance and use. Among these factors the authors identified internal and external training is more influential on technology acceptance for internal auditors as they consider that such knowledge would have a beneficial effect on their job (Kim *et al.* 2009, citing Braun and Davis, 2003).

Curtis *et al.* (2009: 79) presents a review of the existing literature examining auditor’s knowledge and training in information systems. The authors covered aspects such as: the environment of information systems in financial reporting and assurance; how financial statements auditors acquire and use information systems knowledge and finally, the interaction between financial statements auditors and information systems auditors. We consider that our article embraces Curtis *et al.* (2009) call for research on how auditors obtain information systems knowledge.

Research questions and methodology

Based on the requirements of the professional standards and the supporting scientific literature, we identified that internal and financial auditors must acquire and develop their information technology and information systems knowledge and competences. Professional organizations require that such knowledge to be acquired by candidate auditors and professional ones to, during development programs. Further, professional auditors are required by their organizations or by the complexity of their client’s information systems to expand their competence and knowledge.

For the purpose of this article we intend to investigate how Romanian financial and internal auditors acquire accounting information systems knowledge by attending courses: held by the professional organizations they adhered to, held by the organizations they work with; or from their own initiative. We consider that these forms of training are the most suitable way in which auditors can acquire accounting information systems knowledge and competences. Based on the aim of this article, stated above, we formulated the following research questions.

RQ1: Through what type of courses are Romanian financial and internal auditors acquiring accounting information systems knowledge and competences?

RQ2: How useful these courses are perceived by Romanian financial and internal auditors?

To answer these questions an electronic questionnaire was created and sent to financial auditors, members of the Chamber of Financial Auditors of Romania, and internal auditors, members of the Association of Internal Auditors of Romania. The questionnaire was sent to 1.288 valid e-mail addresses of financial auditors, receiving 97 valid answers (answer rate: 7,53%). To contact the internal auditors, the representative of the Association of Internal Auditors of Romania sent the questionnaire to 567 members and we received 38 valid answers (answer rate: 6,70%) (Cardoş, 2010). Although the answer rate are relatively low, they still allow us to draw our conclusions regarding the way in which auditors attended accounting information courses and the perceived improvement of their activity after attending these courses.

The questionnaire covered several aspects, amongst which we mention: the educational profile and background of auditors, the perceived importance of the accounting information systems impact on their mission and audit opinion, the perceived importance of several IT-related activities an auditor should perform during an audit mission, the perceived influence of ERP systems on the audit opinion.

For the purpose of this article we present the questions inserted in the questionnaire, based on which we try to answer the stated research questions.

How many courses in auditing information systems have you attended in the last three years?

- (1) Held by the professional organization of which you are a member of;*
- (2) Held by the organization/company you are working with;*
- (3) On your own initiative;*

To what extent do you consider that these courses concurred to the improvement of your activity in the audit mission you were participated in?

- (1) to a very little extent;*
- (2) to a little extent;*
- (3) to some extent;*
- (4) to a great extent*
- (5) to a very great extent*

Results

Because between the aspects covered by these questions there is a strong correlation we will analyze them in correlation and will focus only on the answers regarding the perceived influence of the accounting information systems courses of those respondents who indicated they participated in at least one course.

We begin our analysis by focusing on the answers provided by financial auditors. We present below (Table 1) a cross-tabulation between the extent to which attending accounting information

systems courses improved the auditors' activity. By this we filter the respondents which answered both questions indicated above.

Table 1: Cross-tabulation (attended courses x improved activity) – financial auditors

Financial auditors		Valid		Missing		Total	
		No.	%	No.	%	No.	%
(1)	Improved activity X courses organized by professional organizations	61	62,9%	36	37,1%	97	100,0%
(2)	Improved activity X courses organized by organizations auditors work with	24	24,7%	73	75,3%	97	100,0%
(3)	Improved activity X courses attended on own initiative	19	19,6%	78	80,4%	97	100,0%

(Source: Cardoso, 2010: 184)

From the Table 1 we can conclude that of the 97 respondents only 61 of them (62,9%) attended professional development courses in accounting information systems organized by the Chamber of Financial Auditors of Romanian, 24 respondents (24,7%) attended accounting information systems courses organized by the organizations they are working with and only 19 of them (19,6%) attended such courses on their own initiative. A first conclusion we can draw is that Romanian financial auditors acquire AIS knowledge and competence primarily from the courses organized by the professional organizations they adhered to. This is not surprising as to fulfill their continuous development program requirements they have to attend several courses at their choice. As many auditors chose to attend AIS courses it's a sign that they are aware of the importance of such knowledge in their work.

In Table 2, presented below, we can observe the extent to which the courses attended by financial auditors improved their activity.

Table 2: The extent to which attending AIS courses improved the financial auditors' activity

Type of courses Level of improv.	(1)		(2)		(3)	
	No.	%	No.	%	No.	%
to a very little extent	1	1,64	0	0,00	0	0,00
to a little extent	5	8,20	0	0,00	1	5,26
to some extent	19	31,15	3	12,50	2	10,53
to a great extent	25	40,98	14	58,33	9	47,37
to a very great extent	11	18,03	7	29,17	7	36,84
TOTAL	61	100,00	24	100,00	19	100,00

(Source: Cardoso, 2010: 184)

Even though most of the financial auditors attended AIS course organized by the Camber of Financial Auditors of Romania we can observe from Table 2 that they considered the course organized by their organizations or attended on their own initiative to improve to a great or even very great extend their activity during the audit mission they were engaged in. This situation reveals that financial organizations employing financial auditors or financial auditors themselves are more aware of the AIS knowledge needs then the Camber of Financial Auditors of Romania.

We continue our analysis by focusing on the answers provided by internal auditors. We present below (Table 3) a cross-tabulation between the extent to which attending accounting information systems courses improved the auditors' activity. By this we filter the respondents which answered both questions indicated above.

Table 3: Cross-tabulation (attended courses x improved activity) – internal auditors

Internal Auditors	Valid		Valid		Valid	
	No.	No.	No.	No.	No.	No.
Improved activity X courses organized by professional organizations	14	36,8%	24	63,2%	38	100,0%
Improved activity X courses organized by organizations auditors work with	17	44,7%	21	55,3%	38	100,0%
Improved activity X courses attended on own initiative	21	55,3%	17	44,7%	38	100,0%

(Source: Cardoso, 2010: 186)

Based on Table 3 we can conclude that Romanian internal auditors acquire their AIS knowledge mainly from courses attended on their own initiative (55,3%). This might be a consequence of the fact that the Association of Internal Auditors of Romania is a relatively new professional organization in the Romanian audit environment and internal auditors had to rely on the course offered by the organization they were working with or on their own initiative.

Further, in Table 4, we present the extent to which the courses attended by internal auditors contributed to the improvement of their activity.

Table 4: The extent to which attending AIS courses improved the internal auditors' activity

Type of courses Level of improv.	(1)		(2)		(3)	
	No.	%	No.	%	No.	%
to a very little extent	0	0,00	0	0,00	0	0,00
to a little extent	1	7,14	0	0,00	1	4,76
to some extent	2	14,29	6	35,29	7	33,33
to a great extent	7	50,00	7	41,18	6	28,57
to a very great extent	4	28,57	4	23,53	7	33,33
TOTAL	14	100,00	17	100,00	21	100,00

(Source: Cardoso, 2010: 186)

In the case of internal auditors we can observe that they consider the AIS courses organized by their professional organization as improving their activity to a great and even very great extent. This suggests that the Association of Internal Auditors of Romania gives a greater importance to AIS knowledge and competences that an internal auditor should possess. Still, the AIS courses offered by organizations employing internal auditors or the internal auditors themselves influenced to at least some extent the improvement of the auditors' activity during their mission.

Conclusions

Regarding the first research question stated, we conclude that Romanian financial and internal auditors are acquiring AIS knowledge and competences needed to perform their mission in a professional manner in a differentiated way. Financial auditors gain such knowledge by attending AIS courses organized by their professional organizations, while internal auditors by attending such courses on their own initiative.

As for the second research question we have to differentiate again between financial and internal auditors. The first group of audit professionals indicated that the courses organized by the organizations they work with contributed to a great or very great extent to the improvement of their activity, followed by the courses attended on their own initiative. In the case of internal auditors, the courses organized by the professional organizations they are members of, proved to influence to a great or even very great extent the improvement of their activity followed by the courses organized by the organizations they are working with.

A limitation to this study might be posed by the fact that the answer rate to the questionnaire was relatively low and that we included in our study only the internal auditors members of the Association of Internal Auditors of Romania, neglecting the internal auditors adhered to the Central Harmonization Unit for Public Internal Audit.

We consider that the results of this study might be used by Romanian professional audit organizations in reconsidering their priorities regarding the accounting information systems knowledge and competence needs of their constituents.

MANAGERIAL AND COST ACCOUNTING PRACTICES – A ROMANIAN OVERVIEW

Cardoş Ildikó Réka

Babes-Bolyai University, Faculty of Economics and Business Administration, Cluj-Napoca

Pete Ştefan

Babes-Bolyai University, Faculty of Economics and Business Administration, Cluj-Napoca

Research theme – Globalization and technological changes generates complexity both in the business environment and the accounting systems. Under these conditions managerial accounting needs to learn new practices in order to become an active consultant of management.

Objectives – The main objective of this paper is to present how managerial accounting changed over the years in Romania. We intend to present how the managerial accounting system is implemented within Romanian organizations, to report the level of adoption of traditional practices, tools and techniques, to identify to what extent contemporary managerial accounting practices are implemented and used, and finally to identify whether managerial accounting information is useful for business decisions.

Prior works – Over the years researchers from all over the world were interested in managerial accounting changes and innovations, in managerial accounting practices, tools and techniques adopted by organizations. On international level the study made by Pavlatos and Paggios (2009) and on national level the study made by Jinga et al (2010) represents the starting point of our study. Both research team conducted a study on managerial accounting practices and the utility of managerial accounting information and found out that managerial accounting information is useful for managers in the decision making process but traditional practices, tools and techniques are used to “produce” this type of information.

Design/methodology – An empirical study was conducted in 2010 within Romanian accounting professionals. A questionnaire was sent to a number of 1871 professionals members of The Body of Expert and Licensed Accountants of Romania regarding managerial accounting practices, tools and techniques adopted and implemented. Data obtained was processed and analyzed with the help of descriptive statistics.

Results/findings – Romanian professionals consider that managerial accounting information is useful for management in the decision making process but these information are “produced” using traditional managerial accounting practices, tools and techniques are preferred by Romanian organizations in the detriment of modern practices like activity based-costing or target costing.

Implications – The results of our study represents a reference point for both researchers and practitioners who are willing to carry on future research in the field of managerial accounting.

Originality/Value – This paper tries to fill a gap in the literature related to the Romanian managerial accounting systems and practices. Moreover, it present an overview of managerial accounting practices within Romanian companies giving the possibility to formulate suggestions and proposals for its future development and evolution.

Keywords: managerial accounting, cost systems, practices, empirical survey, Romania

JEL classification: M41- Accounting and Auditing

1. Introduction

In today's fast changing business environment, where knowing more and knowing it faster than the competition is often the difference between surviving and not surviving, organizational learning and knowledge management becomes a crucial organizational function (Huber 1998:1). This organizational function leads to rethinking managerial practices and tightly related to this reshaping the existing accounting systems especially the managerial accounting systems.

At international level there is an intensive debate on the changing role of managerial accounting and managerial accounting professionals (Jarvenpa 2007). Researchers believe that managerial accounting is being oriented from being a scorekeeper or a bean counter towards an increasingly business oriented role (Burns and Baldvinsdottir 2005; Jarvenpaa 2007; Warren and Parker 2009). Moreover, they consider that new managerial accounting techniques like strategic cost management, activity based costing, balanced scorecard or customer relationship management enhance the business orientation of managerial accounting.

On national level, changes generated by globalization, intensive competition, the automation of production processes penetrated more slowly, especially because of the political, social and economical context of our country. That is why managerial accounting in Romania has had a different evolution, has met different approaches, goals and objectives (Cardos et al 2010:58). Anyway, managerial accounting information is essential in gaining competitive advantages, is an indispensable instrument for the decision making and that is why, in order to survive, Romanian companies are being forced to align to the new tendencies and technologies, to reinvent their activity in accordance with market and customer needs (Jinga et al 2010).

These changes identified on international and national level encouraged us to do research in the field of managerial accounting. Our objective is to present an overview of Romanian managerial accounting in practice. We try to find answers to the following questions: How managerial accounting evolved in Romania over the years? What kind of managerial accounting practices, tools and techniques are preferred by Romanian practitioners? Is managerial accounting an active advisor of the management in Romanian organizations? To what extent are managerial accounting information used in the decision making?

2. Studies made in the field of managerial accounting – literature review

At international level there has been an intense debate on the role of managerial accounting in recent years. Accountants, researchers and consultants have sought to develop different kinds of advanced managerial accounting innovations and systems in order to cope with the needs of today's turbulent, global and technology-driven world (Jarvenpaa 2009). Because of these changes researchers from all over the world tried to evaluate how managerial accounting research developed (Hopper et al 2008); to identify how traditional or new managerial accounting practices and techniques were adopted and implemented within organizations (Falconer 2002; Gupta and Gunasekaran 2005; Hopper and Major 2009; Pavlatos and Paggios 2009).

A relevant study and starting point for our study was the one Pavlatos and Paggios made in 2009. They tried to identify the managerial accounting practices implemented in the Greek hospitality industry, especially to report the level of adoption and the benefits derived from traditional and contemporary methods and techniques. Their findings show that traditional managerial accounting is "very much alive and well" (Pavlatos and Paggios 2009:81). Traditional techniques, such as standard costing, budgeting, are still widely adopted than recently developed tools.

In Romania managerial accounting had a different and slower evolution; it was strongly influenced by political and social regimes and by the development of the Romanian economy and business environment. For many years managerial accounting was associated with cost accounting and its main objective was to calculate, monitor, analyze and control production cost;

to plan and control the process of resource allocation through budgets and other management tools (Cardos et al 2010). At the beginning of '90 managerial accounting was reconsidered, we witnessed a separation of the two components of the accounting system (financial and managerial accounting). After 2000, influenced by the international literature, managerial accounting experienced a modern approach. New functions and roles like providing relevant financial and non-financial information to management, analyzing and monitoring internal business processes, were associated to managerial accounting.

Over the years Romanian researchers tried to present the evolution of managerial accounting and the managerial accounting profession in Romania (Albu 2006); tried to identify how managerial accounting was perceived by researchers and practitioners (Cardos et al 2010); tried to establish the level of adoption of traditional and contemporary managerial accounting tools and techniques (Jinga et al 2010) and finally tried to evaluate the utility and usage of the managerial accounting information (Glavan et al 2007; Jinga et al 2010).

The study made by Jinga et al in 2010 is similar with our study. They tried: (1) to establish the attitude of the managers within Romanian companies towards the information generated by managerial accounting; (2) to evaluate the utility and usage of managerial accounting information in the decision making process; (3) to identify the specific instruments, tools and techniques used for collecting and analyzing managerial accounting information. Their main conclusion is that managerial accounting information is very useful for business development, for monitoring and lowering costs or to increase the products quality. As for managerial accounting practices the main conclusion is that within Romanian organizations traditional tools and techniques are still used. Managers seems to prefer methods like global absorption method, job costing, direct costing instead of activity based costing or target costing.

We can observe that the Romanian managerial accounting literature is poor, little is known regarding the managerial accounting practice in Romania; there are only a few studies about the role and function of managerial accounting, about the managerial accounting practices, tools and techniques adopted by Romanian organizations in today's changing environment, in the era of globalization and technological change. That is why through our study we intend to fill in a gap in the European and international literature. Moreover, our findings could give us the possibility to formulate suggestions and proposals for the progression and evolution of Romanian managerial accounting.

3. Managerial accounting practices and cost accounting tools and techniques in Romania

Research methodology

The main objective of this paper is to present how managerial accounting is perceived by Romanian practitioners, to report the managerial accounting practices and cost calculation techniques and systems adopted by Romanian organizations and to report if and how managerial accounting information is used by managers. In order to find an answer to these questions we conducted an empirical survey, via questionnaire, among Romanian accounting professionals members of The Body of Expert and Licensed Accountants of Romania. The respondents were asked to indicate: (1) the way managerial accounting is organized; (2) the objectives and functions of managerial accounting; (3) the applied practices, techniques and cost systems; (4) the utility of managerial and cost accounting information in the decision making process.

The questionnaire and a covering letter explaining the purpose of the study and presenting the instructions needed to fill the questionnaire was sent to a sample of 1871 certified accounting professionals. Finally, we received 178 responses, generating a response rate of 9.52%. Of the 178 responses 32 were eliminated, remaining 146 valid responses. The collected data was processed using SPSS and was analyzed and explained with the help of descriptive statistics.

Research findings

After processing the data obtained we found out that the respondents came from various industries. Services were represented by 53.4% of the respondents, followed by the manufacturing industry with 26% and trading with 13.7%. Besides these industries other activity sectors like public and local administration, banking or healthcare was represented by 6.8% of the respondents.

Romanian organizations seems to recognize the importance, necessity and utility of managerial accounting as they implement a managerial accounting system but they do not rely very much on current regulation preferring to develop their own systems and techniques in accordance with their specific activity. The results shows that 9.6% of the respondents developed a separate managerial accounting system considering the actual regulations; 43.2% of the respondents are using an integrated accounting information system; while 39% developed a specific managerial accounting systems and adopted specific methods and techniques in accordance to their activity and internal processes (Table nr. 1).

Table nr. 1 – The development of managerial accounting systems

Adoption and implementation of managerial accounting systems		Frequency	Percent	Cumulative percent
Valid	Development of a separate managerial accounting system	14	9.6	9.6
	Integrated accounting systems (for financial and managerial accounting)	63	43.20	52.80
	Development of specific managerial accounting systems in accordance with activity	57	39.00	91.80
	Non respondent	12	8.2	100.0
Total		146	100	

Source: author's projection

As for the objectives and functions of managerial accounting reducing and optimizing costs, cost calculation of products and services, budgeting or providing cost type of information for the decision making is considered to be a top priority of managerial accounting within Romanian companies. On the other hand objectives like identifying and eliminating activities which doesn't add value or control and improvement of internal business processes are considered to be not so important (Fig. nr. 1).

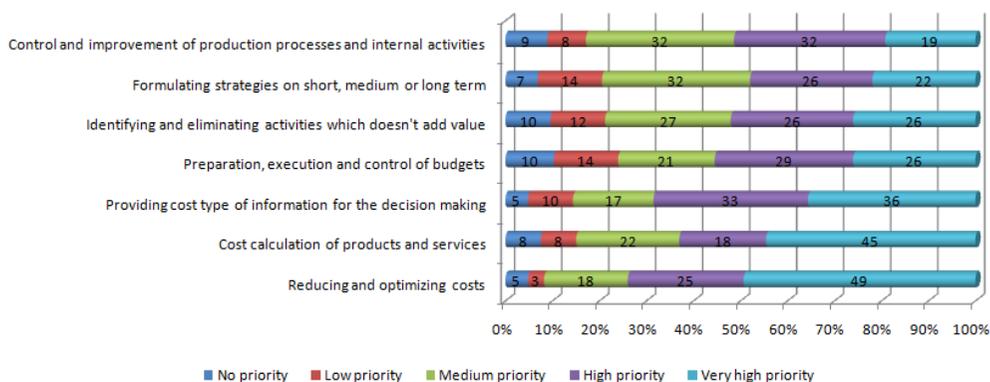

Fig. nr. 1 – Objectives and functions of managerial accounting in Romania

Source: author's projection

An other objective of our study was to found out what are the managerial and cost accounting tools and techniques used by Romanian practitioners. After analyzing the data collected we found out that (Fig. nr. 2) traditional managerial accounting practices like global method, job-order or process costing, standard costing are widely adopted and implemented by Romanian companies. They do not place great emphasis on more recently developed tools and techniques like activity based costing or target costing. The figure below shows that only 6.2% of the respondents implemented successfully activity based costing method and 3.42% implemented target costing while the majority has heard about these methods but never considered implementing them or abandoned the implementation process.

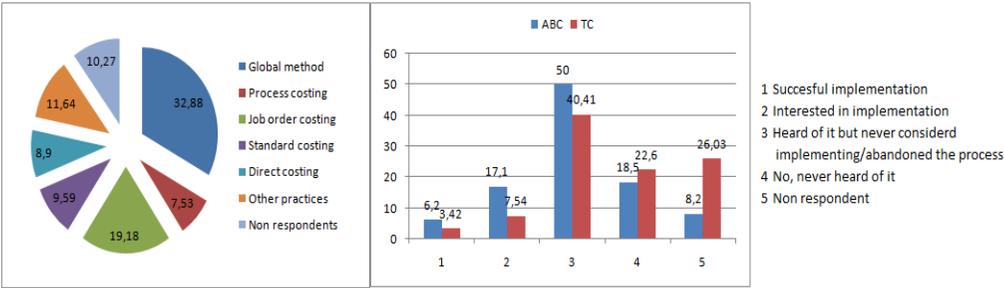

Fig. nr. 2 – Managerial and cost accounting practices, tools and techniques
Source: author’s projection

Romanian practitioners seem to be pleased by traditional managerial and cost accounting practices and techniques and with the results obtained. They consider that contemporary tools and techniques require high implementation and maintenance costs; complex and complicated design and work processes.

After presenting the main aspects regarding managerial accounting practices within Romania companies the final objective of our study was to present to what extent managerial accounting and cost type of information is used in the decision making process. Our results indicates that managerial accounting is an advisor of management, the respondents considering that the information provided are useful for business development; in operational, tactical or strategic decision making. Moreover, based on cost type of information managers can take decisions regarding the improvement and design of internal production and business processes; the distribution and trade of products and services; performance measurement; investments or finances (Fig. nr. 3).

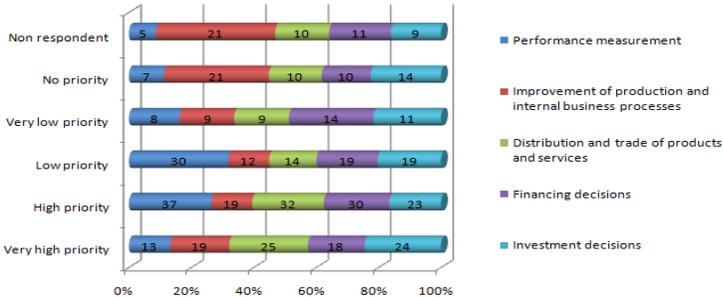

Fig. nr. 3 – The utility of managerial and cost type of information in decision making
Source: author’s projection

4. Conclusions

With our study we tried to find out the way managerial accounting is organized within Romanian companies; the objectives and functions of managerial accounting; the managerial and cost accounting practices; and whether managerial and cost type of information is useful or not in the decision making process.

Our results are in line with the conclusions drawn by Pavlatos and Paggios (2009), Albu (2006) or Jinga et la (2010). Romanian companies seem to recognize the importance and utility of managerial and cost accounting as they are implementing managerial accounting systems integrated or separated by the financial accounting system. However, in this implementation process they do not rely on current regulations, rather preferring to develop their own methods, tools and techniques adapted to their specific activity. Despite these concerns we consider that Romanian companies rely mostly on traditional practices and techniques neglecting contemporary and recently developed tools.

Our results indicate that managerial accounting is closely related and tied up with cost accounting. This strong connection between them derives from the use of contemporary managerial and cost accounting practices and techniques which are not adapted enough to face new production and market conditions or the needs of competition. Romanian companies are too preoccupied with cost calculation and management, with budgeting or with the improvement of internal production and business processes and in the same time they tend to neglect the customer's needs, market conditions and intensive competition.

We consider that in a world of globalization and intensive competition; in the era of automated and advanced production processes and technologies more attention should be given to the orientation towards market and customers, along with attention given to customer behavior, buying behavior patterns and customer profitability. Under these conditions Romanian companies will be forced to implement advanced managerial accounting practices, tools and techniques in order to improve their cost control and cost management systems; to improve the performance indicators; to realize an accurate analysis of customer profitability analysis and performance measurement.

PROFESSOR I.N. EVIAN-PRECURSOR OF ACCOUNTING SCHOOL FROM CLUJ

Crișan Teodora Viorica

Facultatea de Științe Economice și Gestiunea Afacerilor Universitatea Babeș-Bolyai Cluj-Napoca

Tiron Tudor Adriana

Facultatea de Științe Economice și Gestiunea Afacerilor Universitatea Babeș-Bolyai Cluj-Napoca

Our paper is about the history of accountancy in Romania, in Transylvania. We develop this subject because we consider that is very important to know about the history of your own country, and from our point of view about the history of accounting, which is a very important component of nowadays life. This work paper presents the history of the accountancy through the study of biography. So by describing the work of professor I.N. Evian, who was an important personality for the accounting history in Romania, we want to find historical elements that are not so able to see otherwise. The article wants to highlight the impact that the work of professor Evian had in the history of accounting in Romania. Also, by presenting the work of professor I.N. Evian in the context of the Academy of High Commercial and Industrial Studies from Cluj, we want to prove that this institution was the first form of higher education in Transylvania in the accountancy field.

Key Words: accountancy, personalities, accounting theories

Cod JEL: M41, B10

I. Introduction

The history of accounting is largely the history of civilization (Woolf, 1986). Professor Nicolas Feleaga supports this assertion, stating that, "It is easy to understand that one's negligence to study the past, to know one's history, amputates one's means of developing the country economically, socially or in a field less enviable as accounting". Accounting is a human construct. In the present context, accounting cannot be understood without reference to the key personalities who have contributed to its development. (Parker, 1993) That is why this article aims to present the scientific work of one of the professors of the Academy of High Commercial and Industrial Studies in Cluj-Napoca, considered the first form of higher economic education in Transylvania.

The importance of Professor I.N. Evian's activity in the field of accounting, at the Academy of High Commercial and Industrial Studies in Cluj, supports the affirmation that this institution was the first form of higher education in the field of accounting, and that the work of the Professors of the Accounting Academy (and beyond) are the landmarks for today's accounting. The focusing of attention on the Academy of High Commercial and Industrial Studies in Cluj is due to the historical particularities that this area of Romania experienced thanks to the Habsburg rule, which left its mark on accounting reasoning. The organization of higher education in Romanian, in Transylvania, more specifically in Cluj-Napoca, had innumerable trials and obstacles, but eventually succeeded in establishing a form of higher economic education, which is today the precursor of the largest Faculty of Economic Sciences in Romania.

Early accounting literature in Romania has its origins in the second half of the nineteenth century, in Transylvania. The first book in Romanian was written and published here, and here Professor Evian, from the Academy of High Commercial and Industrial Studies would publish a book considered the root of the accounting literature in Romania. The works written in the nineteenth century and then, in the time of the Academy of High Commercial Studies, in the field of accounting can be regarded as landmarks in the Romanian accounting of today. This paper is a description and a qualitative analysis of Professor Evian's activity. It aims to identify the Professor's concerns at the Academy, in the field of accounting and journalism.

This article is a part of and supports the paper that will discuss the beginning of the Accounting School of Cluj. The article is structured in three parts. The first part presents the methodology used in the approach and writing this paper. The second part is the content of the article, which presents Professor Evian's work, and a brief presentation of his work "Theory of accounts". Finally, we present the conclusions on the theme discussed.

II. Literature review

This work paper it can be placed together with the ones written in the history of accounting. Writings on this subject were written by few other authors from our country: C.G. Demetrescu (1930), Daniela Artemisa Calu (2005), Dana Pop (2005), Adriana Tiron Tudor și Dumitru Matis (2010). C.G. Demetrescu (1930) wrote „ *The History of the Accountancy*”, a book in which the author presents the development of the accountancy in the world from the very first beginnings till the second half of the 20th century. In his book he included a little part about the development of the accountancy in Romania, too.

Daniela Artemisa Calu and Dana Pop, are two authors that concentrated their work on the history of accounting in Romania. The first author wrote the book „The history and development in the accountancy field in Romania”. In this book she developed the evolution of the Romanian accountancy, referring also to the international context. In her book, the author, presents few elements about the work and the theory developed by professor Evian. Dana Pop, with her PhD thesis, brings new elements in the literature about the Academy of High commercial and Industrial Studies from Cluj and about the activity of the professors that activated here. From the title of the book we notice that it is especially a work in the field of economic history, but we discover that there is a lot of accounting history, too.

Adriana Tiron Tudor and Dumitru Matis were interested in the accounting history in Transylvania. For this reason some of the elements presented in their article, could be useful for the writing of this paper. So, the literature which supported the writing of this article was, mostly Romanian, but there were... international authors, like: A. Munslow (2001), MacDonald (1984) or Chua and Poullaos (1993), for the writing of the methodology.

III. Methodology

This paper falls into the category of those that choose to explain the history of accounting in terms of biographical investigations. Such studies propose various decisive factors as determiners accounting personification - social class (MacDonald, 1984), gender (Kirkham and Loft, 1993), political adherence (Willmott, 1986), the relationship with the state (Chua and Poullaos, 1993) and the relation with other professions. (MacDonald, 1984)

In this paper, we have developed a qualitative study of Professor Evian's activity, describing the events as they happened, in order to obtain a better picture of the past. The methodology used is the historiography and study of literature in terms of quality. The qualitative study, as stated by John W. Creswell, quoted by Septimiu Chelcea (2007), "is an approach based on distinct methodological tradition, which analyzes a social or human problem". The aim of our historical work is to

- tell the story of something of the past (Munslow, 2001)
- become aware, assess and judge, and analyze the perspective of others who wrote about the same subject.

In our study, we consulted the latest books and but also older ones, related to the activity of the Professor and that of the Academy of High Commercial and Industrial Studies of Cluj. In these works, we have found paragraphs about the Professor's work. Our contribution is to give more details about the work of Professor I.N. Evian in a single work and to show the connection between this character and the importance of the Accounting School of Cluj.

IV. PROFESSOR EVIAN'S SCIENTIFIC ACTIVITY

IV.1. The contemporaries and the subjects approached by them

As we have already mentioned, the accounting is the result of human actions. Man created it to satisfy various needs; therefore, the human factor is very important for the study of accounting history. Accounting reasoning cannot be otherwise identified, but by studying the works and activities of those who took an interest in this area.

The accounting department was founded at the Academy of High Commercial and Industrial Studies of Cluj. I. Evian was a member of this department, among other professors.

Table 1: The accounting professors from the Academy of High Commercial and Industrial Studies of Cluj

Ion Evian	Accounting
Dumitru Voina	General accounting
Iosif Ioan Gârbacea	General accounting
Ioan Tarța	Financial accounting
Dumitru Hașiegan	Statistics
Octavian Lungu	Accounting

Personal raport

These professors had a rich activity, analyzing various accounting issues, analyzing various studies of foreign authors or were preoccupied with developing theories, such as Professor Evian. The work of these professors was published in the journal of the Academy, „Observatorul social-economic” [*The Social – Economic Observer*].

A contemporary of Professor Evian and a leading figure, was Professor Dumitru Voina. In 1932, he published the book “Stages in the evolution of accountancy”. This book is very important historically because, based on this book; the author structures the accounting for the first time at an international level, over time. However, this Professor also developed the legal - economic theory. I. Tarta was a contemporary with Evian, and also his student. He prepared his doctoral thesis in 1940, "Industrial Costs and their calculation", under the guidance of Professor Evian, who considered this work as being “*the first Romanian scientific work on industrial costs*”.

Iosif Gârbacea was concerned with the study of foreign influences in the field of accounting, so that he wrote two papers that reflect the Italian influence, and one related to the accounting regulations in Germany ("Italian Influence in Accounting", "German accounting rules") and Dumitru Hașiegan and Octavian Lungu were concerned with the study of double entries and trial balance. Along with these professors from the Academy of High Commercial and Industrial Studies, C.G. Demetrescu, Spiridon Iacobescu și Alexandru Sorescu, I.C. Panțu, V.M. Ioachim, professors at the Academy of Bucharest and Iasi, were contemporaries with Ion Evian. (Pop, D, 2005)

IV. 2. Scientific work and activity

The specialty literature considers Ioan Evian a Luca Paciolo for the Romanian accounting history. He developed a theory that finds its sustainability even today, that is why we considered that it the most representative model of personality of the Academy of High Commercial and Industrial Studies of Cluj. Professor Evian was born in Bucharest, where he attended middle school, high school and college. After graduation, he took his doctorate in Leipzig and became a Ph.D. in economic and financial sciences.

Besides with his duties as Professor, Evian had various executive positions. Thus, before the establishment of the Academy of High Commercial and Industrial Studies in Cluj, he had the following positions (Pop, D., 2005):

Director of the State Fisheries (1914-1920)

General Secretary for Transylvania, at the Industrial Affairs Department at the Ruling Council (1919-1920)

Manager of the General Bank, of Tara Romaneasca, Cluj branch

President of the Chamber of Commerce of Cluj (1920-1921)

As of 1922 to 1943, he was a professor of the Academy of High Commercial and Industrial Studies in Cluj, but continued to have other positions, too:

Member of the Supreme Council of National Economy (1922-1928)

Director of the summer courses of "N. Iorga" People's University in Valenii Mountain

Chairman of the Body of authorized and expert accountants in Romania (1942-1947)

Founder and Chairman of the Accounting Research and Business Economy Institute (1943-1947)

Ion Evian published numerous studies and articles in various periodicals, he wrote courses and published books. Of the courses he wrote for Academy students, we mention:

Comerț exterior și legislație vamală”, [External commerce and customs legislation] 1924

„Studiul practic al întreprinderilor comerciale și industriale” [Practical study of the commercial and industrial enterprises], 1927

„Economia întreprinderilor” [Economy of enterprises], 1939

Among the books published by John Evian, "Theory of accounts" is his masterpiece. Besides this book, he also wrote, "Double Accounting", Bucharest 1946, "Industrial Accounting", Bucharest, 1947. These books are not his only books, but they are the most representative ones.

"Theory of accounts", was published in Cluj in 1940. Based on this book, I.N. Evian draws a line between the accounting theories and the theories of accounts. According to the author's theories, the accounts represent "the attempt to explain and demonstrate the double formalism, meaning the registration of any accounting transactions twice on opposite sides of the accounts" (Evian, IN, 1940:7), while accounting theories "aim at systematic and main treatment of the entire area of accounting" (Evian, IN, 1940:8). Contemporary with Evian's theory, the patrimony theory was developed by the Sp. Iacobescu and Al. Sorescu. So, Evian's work represents the competing theory to the patrimony theory. Ch Cristea, quoted by D. Calu (2005), believes that, "if we take into consideration the keen spirit and the logic of explaining the economic phenomena, shown in Evian's work on most issues, the denial of accounting as independent science can be made only by the fact that in our country, the main exponent of the economic theory related to *double entry* was blinded by the passion of the controversy with the representatives of the patrimony school".

In his study, Ion Evian started from the German accounting literature, and then he told his own opinion. His theory is purely economic and categorically rejects the scientific nature of accounting, which he thinks to be just a technique for completing the enterprise economy.

In the preparation of his theory, the author starts from the static theory on the balance. Thus, the company's asset is represented by the estate, which, in his view, is made of all elements that help the company to achieve its goals, and that can be measured in money. Evian explains the *debtors* account, represented by receivable rights, not by tangible assets, as "an element of the assets that takes only a temporary form of impalpable wealth". (Calu, DA, 2005:110).

Professor Evian explains the *liability* as "the adjective *liability* describes the capacity of a person or a thing to be non-active, so it means to stay still. In this static situation, we may find the first explanation, adequate to characterize the total capital of the company by classifying it as *liability*." (Calu, DA, 2005:110)

Evian presents the equality of the assets with liabilities by the following formula

Total Assets = Total capital.

The theory developed by Professor Evian was proved wrong (C.G. Demetrescu, Gr. Trâncu), but also supported (D. Voina).

V. Conclusions

The approach of accounting history from the point of view of personalities who distinguished themselves over time in this area is something increasingly common in the literature. Biographical references often help us to capture certain aspects of accounting history that would otherwise be unnoticed. So, to capture that Professor Evian is a leading figure in the accounting history of Romania, and that he represents the School of Accounting of Cluj, we tried to present his scientific work.

Evian's theory is one of the most representative and current theories of Romanian accounting, so that this professor may be considered Luca Paciolo for the accounting history in Romania. Ion Evian is considered a historical personality in accounting. Besides being a professor, he was a practitioner and a representative of the accounting profession in Cluj-Napoca. Besides the presentation Professor Evian's work and activity, our study may continue with the activity of the other professors of the Academy of High Commercial and Industrial Studies in Cluj.

ACCOUNTING FOR SUSTAINABILITY: WHAT NEXT? A RESEARCH AGENDA

Cunningham M. Gary

Jönköping International Business School Jönköping, Sweden

Arne Fagerström

Jönköping International Business School Jönköping Sweden

Lars G. Hassel

Åbo Akademi University Åbo, Finland

This working paper responds to increasing calls for more and different forms of accounting research involvement in accounting for sustainability. It seeks to provide background, clarify the accounting research issues, and suggest research methods. The background analysis indicates that accounting for sustainability must go beyond supplemental reporting of ecological and social information to include such emerging issues as integrated reporting of sustainability information along with financial reporting. Additional emerging issues are needs of users of sustainability reports, auditing and other assurance of sustainability information, and sustainability implications of financial failure, accounting and auditing failures, and lack of enforcement. Analysis of integrated reporting against traditional financial accounting theory concepts of the purpose of financial reporting and the postulates of going concern, reporting entity, monetary unit, and time period, indicates a need for substantial changes in the traditional financial accounting model if sustainability issues are to be integrated. The agenda concludes with five research issues and methods:

An accounting research framework for sustainability using general systems theory approaches that have been useful for similar emerging issues.

Reporting of sustainability information which has been the focus of most research to date, and the emerging important topic of integrated reporting.

Users of sustainable information, their uses and perceived needs, an area that has been largely neglected in research to date.

Auditing and assurance issues that are taking on greater importance as more users demand assurance for sustainability information. Issues include standards to be used and users' expectations and reactions.

Financial distress and sustainability consequences of accounting and enforcement failures that are just now being recognized as sustainability issues.

Key words: accounting for sustainability, integrated reporting, needs of users, audit, assurance

JEL codes: M41, O16, M42

1. Introduction

In recent months, calls for more accounting involvement in sustainability issues have become stronger, more frequent, and more urgent. As discussed below, though, there is no common notion of sustainability, especially in an accounting context. For this research agenda, we tentatively, as a starting point, draw upon the classic economist Sir John Hicks who developed the concept of consumption being what would leave a person as well off at the end of the period as at the beginning of the period. Our working notion of sustainability is that a sustainable entity is one that is as well off at the end of a period as at the beginning with respect to use of all resources: e.g. environmental, human, ecological, social, financial, and technological.

Much of the previous research has used the definition of sustainability developed by Buntland (1987) over 25 years ago for the World Commission of Environment and Development of the United Nations. Buntland's definition focuses on sustainable development ensuring that it meets current needs without sacrificing needs of future generations (quoted and cited by Kasperiet, 2011). Buntland's definition while innovative and ground-breaking for the time, can be seen as somewhat obsolete for the current era of research into accounting for sustainability. Among other things, it focuses on external sustainability, i.e. sustainability of ecological and social systems, while the current focus of research into accounting for sustainability is on sustainability of an entity, usually sustainability. As the research agenda progresses, especially with the development of a research framework, a more comprehensive definition of sustainability is expected.

Despite no common notion, the terms "sustainability" and "accountability", usually in environmental and social contexts, are being used widely. New journals are being launched to publish research exclusively or primarily on accounting for sustainability, e.g. *Social and Environmental Accountability Journal* and *Sustainability Accounting, Management, and Policy Journal*. A recent major international academic accounting conference of the International Association for Accounting Education & Research (IAAER) held in Singapore in November, 2010, featured panel discussions of practitioners and academics that called clearly for more involvement of academics to do research in accounting for sustainability, notably in auditing, but also in other accounting roles. At another recent international academic accounting conference, Asian Pacific Conference on International Accounting Issues held in Australia in November 2010, a speaker from a governmental pension fund agency in Australia was somewhat critical of academic accountants' lack of involvement in accounting for sustainability; she indicated that if the academic accountants did not get more involved soon, some other groups would.

Thomas L. Friedman, a *New York Times* columnist and award-winning author, in his recent book on sustainability, *Hot Flat and Crowded*, Release 2.0 (2009), has explicitly used accounting terminology (discussed in more detail below) to describe inadequacies of current accounting practice for sustainability. Major international business-oriented newspapers write about essentially the same issues. Dedicated research in sustainable investing has been ongoing for some five years. Notably, the Sustainability Investment Research Platform (SIRP) (www.sirp.se) in Sweden has been a world leader in such research. It is now recognized by SIRP and others that accounting for sustainability is the ongoing next major research area.

The Principles of Responsible Investment (PRI) Academic Network of the UN (<http://academic.unpri.org/>), among other things, publishes the RI Digest of academic research articles in sustainability. Increasingly, the RI digest has been reviewing accounting research articles, notably about disclosures, e.g. Solomon and Solomon, (2006), reported and reviewed in December 2010. The Centre for Social and Environmental Accounting Research, Accountability, Transparency, Sustainability (CSEAR) (<http://www.st-andrews.ac.uk/~csearweb/>) has been created at the University of St. Andrews in the UK to provide information resources, sponsor workshops, and other activities to help researchers and scholars exploring social, environmental, and sustainability accounting, auditing and reporting and related topics.

In the immediate Middle Eastern revolutionary activity, the terms "sustainable", "accountability", "transparency", and the like are being spoken casually and loosely. The Kuwait Fund in its paid advertisements touts investments in sustainable ventures. News commentators talk about sustainable regimes as opposed to stable regimes. Opposition protestors demand transparency and accountability. It is obviously *much* too soon to develop research implications for accounting for sustainability for these activities. Nonetheless, the increasing use of the jargon of accounting for sustainability cannot be ignored.

One of the major issues in accounting for sustainability it is the lack of a common notion of accounting roles in sustainability, nor even what constitutes sustainability in an accounting

context. The various notions of sustainability and accounting for sustainability, while not conflicting, and indeed complementary, reflect a need for a more detailed accounting research agenda to identify research issues, establish more precise concepts, definitions, and notions to provide near-term future directions. This paper and the agenda it presents are intended to represent a first step in that direction by giving structure to identifying and discussing specific groups of research issues for accounting for sustainability, along with possible methodologies and data sources. The remainder of this paper is organized as follows:

Section 2 presents background information underlying the groups of research issues that are identified.

Section 3 analyzes issues in accounting for sustainability with respect to traditional accounting practice, notably the four postulates of accounting.

Section 4 Presents specific research issue along with research methods and sources. Some of these issues are better developed than others.

Section 5 gives a concluding discussion including identifying contributions of the research.

2.0. Background

During the past few years, many accounting academics, and indeed many accounting practitioners, have viewed sustainability almost exclusively as representing environmental, i.e. ecological, and sometimes social issues, and sustainability reporting as telling how 'green' and socially responsible a company has been. This view of sustainability reflects a common view developed over 25 years ago by the Brundtland commission of the United Nations (UN) that sustainability is meeting needs of current generations without sacrificing future generations' needs (Brundtland 1987). A large number of academic publications reflects this view (e.g. Adams 2010, Gray 2010, and sources cited by them). Panelists at the IAAER conference (2010), however, were clear that current approaches to sustainability reporting are too narrow and inadequate for many reasons; especially the notion of accounting for sustainability is much broader than mere environmental (ecological) and social reporting and the role of accounting involvement must be much broader to include such activities as risk assessment and providing assurance including auditing.

It is now widely recognized, but not well documented in academic publications, that sustainability goes beyond mere environmental (ecological) and social issues, and includes sustainability of an enterprise as a business involving production, sales, and marketing, as well as being sustainable financially, legally, and in other similar ways. Poor environmental (ecological) and social performance can indeed lead to unsustainable business activity as evidenced by such phenomena as consumer boycotts of some large retail enterprises that were viewed as selling products made by suppliers using child labor and other socially and environmentally unacceptable practices. Users of financial information consistently indicate a desire to have more information to allow them to assess sustainability and risk related to sustainability. Thomas L. Friedman (2009), the award winning author mentioned in the introduction, links both financial sustainability in the recent financial crisis and environmental sustainability as being part of the same phenomenon: inadequate accounting that does not adequately consider risk: If the true risks involved in these subprime mortgages or default insurance had been priced into these products, they would never have been rated the way they were. Investors would have been much more wary and demanded much higher yields before buying them, which would have forced the mortgage brokers to be more careful in deciding to whom to give these mortgages and the banks to be more careful in choosing which ones to bundle. (Friedman 2009, pg. 15).

While pricing of products might be viewed as a marketing issue, under IFRS and accounting standards of most industrialized countries, valuation of the cost of the products sold and the

inventory of buyers would require an adequate risk assessment to measure amounts in financial statements of both sellers and buyers. Furthermore, the principle of going concern applies to all valuations in financial statements and underpricing of financial risk raises serious issues of going concern. The going concern principle is essentially the same as sustainability when making financial accounting valuations. (Going concern issues are discussed in more detail shortly.) As a result, sustainability failures in the recent financial crisis related to inadequate pricing of risk in products are indeed issues of accounting for sustainability. Then, when writing about environmental issues discussing a 2005 report of the Millennium Ecosystem Assessment of the United Nations, Friedman comments:

Yet because most nations do not put a price on [the natural resources consumed] they too are ‘underpriced’ and therefore overexploited—with the profits privatized and the losses socialized. (Friedman 2009 pg. 25)

Then quoting the World Wild Life Fund’s Living Planet 2008 Report:

‘The world is currently struggling with the consequences of over-valuing its financial assets, but a more fundamental crisis looms ahead—an ecological credit crunch caused by undervaluing the environmental assets that are the basis of all life and prosperity.’ (Friedman 2009 pg. 25).

Under current accounting standards, the value of ecological resources used would not normally be used to measure product prices or report values in financial reports; thus Friedman seems to advocate a new accounting paradigm for accounting for sustainability that incorporates use of environmental and social resources in accounting measurements. In both of these situations, as well as throughout the book, Friedman, a well read, literate, and articulate writer, but a non-accountant, uses accounting terminology to link both financial and ecological sustainability failures and attribute the cause of both to the same phenomenon, underpricing of assets and products sold due to failure to consider sustainability risk. Similar calls for a new accounting model to incorporate external costs have been made by others, e.g. the Accounting for Sustainability Group (2006) and Epstein (2008).

Recent attention to so-called integrated reporting has come from the Accounting for Sustainability Project (www.accountingforsustainability.org) among other places. As discussed in more detail shortly, this project includes initiatives of the International Integrated Reporting Committee (IIRC) (<http://www.integratedreporting.org/>) to develop a new reporting model that will better reflect the interconnected impact of financial, environmental, social and governance factors. There is, however, no common notion of what constitutes integrated reporting. Many believe that ‘integrated’ is merely including environmental and social information along with financial information, while others view ‘integrated’ as incorporating sustainability factors within accounting measurements.

3.0. Accounting for sustainability with Respect to Traditional Accounting

When environmental (ecological), social, and other social issues reporting are viewed from the perspective of accounting for sustainability, many issues emerge that have not yet been addressed and now need to be examined from the perspective of traditional accounting and financial reporting practice.

3.1. Integrated reporting

The recent call for integrated reporting involves reporting sustainability issues in parallel with financial reports, incorporating sustainability issues in accounting measurements in financial reports, or both. Many inconsistencies arise, though, that have not been considered and should be analyzed along with respect to traditional financial reporting theory and concepts. Among the inconsistencies that arise, in Anglo-Saxon countries, the purpose of financial reporting is expressed as assessing the likelihood and timing of future cash flows, thus implying that

accounting measurements should be ultimately related to cash flow. The theory adds, though that future cash flows are best assessed by accrual accounting. Many of the suggestions about including sustainability into accounting measurements would not involve direct future cash flows, such as use of environmental resources, unless for circumstances when a carbon tax or carbon permits might be assessed. Therefore, it would be very difficult to include such measurements without changing a major aspect of traditional financial reporting theory that exists in most countries. Also, the conceptual framework of the IFRS, US GAAP, and similar concepts of accounting principles in many countries contain the following four fundamental postulates, although these concepts predate both IFRS and the US GAAP conceptual frameworks, and terminology varies.

- Going concern
- Reporting entity
- Monetary unit
- Time period

The **going concern** concept assumes that an entity will be in business for the foreseeable future and will be able to realize its assets and complete its obligations. This concept affects valuation bases for measurements of many items on financial reports. It is also the basis for auditors' reports on financial statements. Sustainability is essentially the same concept as going concern because lack of sustainability implies lack of a going concern, and a sustainable entity must necessarily be a going concern. As discussed in more detail shortly, well-known going-concern failures such as Enron and sub-prime mortgage collapses have resulted massive social costs and clearly represent lack of sustainability. The **reporting entity** concept defines the entity for which financial reports are prepared. Traditionally, financial reports are prepared for an economic entity, usually defined in legal terms as being a consolidated group in which one dominant entity controls of the group. With integrated financial reporting, the appropriate reporting entity for sustainability reporting may differ considerably from the reporting entity for financial reporting purposes. As two examples: First, recent publicity about retail companies that sell clothes made by child labor, and similar situations in other industries, indicate that transparent and informative reporting should include the entire supply chain in an entity's sustainability reporting. Second, as has been discussed recently, the environmental impact of a company's products is also a significant element to be considered in assessing a company's sustainability so the reporting entity for integrated reporting might consider customers or other users of a company's products. Traditional financial reporting is based on **monetary units** in which all non-monetary items are reported as an equivalent monetary amount. Almost all environmental and social information in reports to date are in narrative non-monetary terms. Under some notions of integrated reporting, environmental and social information would be incorporated into accounting measurements. Also as discussed above, Friedman (2009) and others imply a new accounting in which environmental risk, which included financial risk, is incorporated into product pricing. Under the costs attach principle of traditional financial accounting, costs are included in product prices and similar measurements if there is a payment (or similar actual use of resources owned); there has been no measurement method to incorporate use of "free" environmental resources nor potentially damaging environmental resources through emissions of such things as carbon dioxide and other greenhouse gases. Carbon trading schemes are in their earliest stages of development in Europe and some other places, but so far no accounting measurement has been proposed to include the cost of carbon emission purchases into products and similar accounting measurements. Figge and Hahn (2004) in their Advance project have developed the Advance Model (see also <http://advance-project.org>) in which, among other things, sustainable value added is computed in monetary terms for various types of emissions. These sustainable values, though, are not incorporated into accounting measurements, but could conceivably be reported in integrated

reports. Sustainable values as now computed are more suitable for management control and management accounting purposes.

Under the **time period** concept, traditional financial reporting is based on specific time periods, almost always one year, based on perceived users' needs for timely information covering discreet time periods of optimal length to make meaningful decisions. Two approaches have traditionally been used although with variations among countries: First the revenue-expense approach measures revenues earned during a year to derive a profit for the year; assets and liabilities are residuals. Second, the asset-liability approach measures assets and liabilities at the end and the beginning and of a year, subtracting the difference as profit for the year divided into revenues and expenses. The asset-liability approach has been adopted by IFRS and US GAAP, but the revenue-expense approach remains in some countries, notably Finland. The asset-liability approach is clearly more compatible with sustainability accounting as indicated in the introduction because it focuses on consumption of resources that would leave a company as sustainable at the beginning as at the end. Nonetheless, both approaches are problematic for integrated reporting because of the rigid notion of financial reporting that occurs in annual increments. Many issues of sustainability relate to long term consequences for the environment, for example from past environmental damage as in the oil fields of Nigeria and coal mining regions of the U.S, and damage from emissions over the life cycle of products like automobiles.

3.2. Auditing and other assurance

The panel discussion at the IAAER conference (November 2010) clearly contained a call for accounting researchers to be involved in additional roles in accounting for sustainability, notably auditing. Users of financial information, notably investors, it is claimed, need, almost demand, increasing levels of assurance on sustainability information, notably assurance of information in management commentaries and environmental reports. The anecdotal statements claim that investors require such assurance in order to make proper risk assessments of sustainability, especially because of documented false environmental statements presented in annual reports. In the Massey Coal case in the US, as part of a legal settlement, Massey agreed to provide audited statements of workplace safety and protections of the environment (Harris 2011). The call for more auditor assurance of environmental reports is also reflected in personal interviews with international accounting firms. Some countries, e.g. Sweden, allow auditors to offer both positive and negative assurance on environmental reports, i.e. positive assurance in which auditors examine evidence as in a financial audit and give a professional opinion about its reliability, and negative assurance in which the auditor states there is no reason to suspect the information is not reliable. Companies choose to provide environmental and social information, it is claimed, to obtain reputational benefits not necessarily related to risk. Assurance, if any, would be used to achieve greater reputational benefits; few companies are willing to pay for positive assurance because of limited perceived benefits. Calls for greater assurance of sustainability information, however defined, are based on anecdotes, assertion, conjecture, etc. It seems fairly certain, though, that interests of investors and creditors in assessing sustainability risk in making decisions have been largely ignored and are just now being realized. As a result there is a current need for accounting research to assess investors' and creditors' perceived needs for assured sustainability information, how they use it, market reaction to the information, etc.

3.3. Financial failures, Reporting and Auditing failures, and Enforcement

Yet another set of accounting-for-sustainability situations within the past few years are the well-known financial sustainability failures and near failures of companies like Enron, WorldCom, Parmalat, and Ahold and financial institution failures in due to sub-prime mortgages. These financial sustainability failures resulted not only in investor and creditor losses but also massive

losses for society and are clearly social and environmental sustainability issues as well. The sustainability failures were directly related to non-compliance with accounting standards, audit failures, and enforcement failures. In addition, the going concern concept implies financial sustainability and these organizations clearly were not going concerns. While there have been extensive research and publication about the high-profile cases, little research has been conducted in the context of accounting for sustainability. Research has shown, however, continued lack of compliance with accounting standards and apparent lack of enforcement, especially in Europe (e.g. Carrara et al. 2010; Fagerström et al. 2009, 2007a, 2007b). It is also recognized that lack of adequate enforcement of accounting standards within in the EU is contributing to lack of reliability of published accounting reports and thus the ability of users of financial reports to assess sustainability risks. As widely reported in the business media, in October 2010, the European Commission announced its intention to examine compliance with accounting standards, the role of auditors, and enforcement. It is too soon to assess the consequences of this action by the European Commission, but it is clearly an issue within accounting for sustainability.

4. Research Issues

With the analysis above of accounting for sustainability in the context of traditional accounting theory and practice, and recent events, this agenda now develops some specific research issues along with research methods and data sources.

4.1. A Research Framework for Accounting for Sustainability

A conceptual framework to guide researchers and practitioners in accounting for sustainability is an essential first step in this research agenda because of various notions of sustainability and the roles of accounting in accounting for sustainability that exist at the moment, and lack of a common language. Such frameworks have been successful in guiding emerging areas of accounting research in the past. In the 1970s, as the phenomena of multinational companies became sufficiently large to warrant ongoing accounting research, a seminal study, *An Accounting Research Framework for Multinational Enterprises* (Cunningham 1978) facilitated accounting research for multinational enterprises for coming decades. A similar but less elaborate framework also facilitated research into accounting research for performance reporting and accountability in governmental entities (Cunningham and Harris 2005) when this issue emerged as an issue for accounting research. Such a framework in accounting for sustainability would, among other things, identify, explore, and analyze systematically:

- Various notions of sustainability to assess which ones represent roles for accounting, and to what extent.
- Groups and individuals who have or potentially could have an involvement in accounting for sustainability, including Assistant Lecturers of reports; users of such information, e.g. banks and investment analysts; assurers of such information, i.e. auditors or similar groups; regulators; other organizations, e.g. the United Nations and its PRI academic network, who have taken a direct interest and action in the issue; and policy makers such as the European Commission.
- Different forms and levels of accountability, e.g. financial reporting and assurance thereof; integrated reporting of financial and other sustainability accounting information; reporting sustainability information outside the financial reports and assurance thereof; incorporating sustainability risk and use of resources in accounting measurements; other elements of accountability for sustainability risks; managerial accounting; management control systems; etc.
- Identifying and describing various notions of a sustainable entity that would be the object of accountability.

-Matching the interests of groups and individuals with regard to sustainability with different forms and levels of accountability.

-Developing a common language to discuss and guide future research.

Similar to *An Accounting Research Framework for Multinational Enterprises* (Cunningham 1978, pg. 1), this research framework seeks to facilitate continuing research in accounting for sustainability by describing in detail gaps in current knowledge, specific issues that require research, factors that should be considered when conducting the research, and suggesting research approaches. One important aspect is to identify failures in past research and means to overcome the failures. It also provides a common taxonomy and language for continuing research. Following Cunningham (1976, pp. 31-61) and sources cited by him, this part of the research agenda uses a general systems theory approach as the primary methodological and analytical tool (described in more detail shortly). General systems theory is especially well suited to develop conceptual frameworks in business contexts and especially for accounting research because it allows researchers to explore such relevant aspects as:

-The scope of the agenda and which systems are included in this scope.

-System boundaries, i.e. what is included in a system and what remains outside in the environment. **It is important to note (as discussed below) that the word “environment” has a different meaning than is commonly used in the literature on accounting for sustainability so far.** For this framework, boundary considerations are important for such issues as defining sustainability in accounting contexts; what is inside systems of accounting for sustainability, and what remains outside in the environment; and whether sustainability reporting and financial reporting are separate systems or can become integrated into a single reporting system.

-System regulation and control. For this framework, regulation and control factors deal not only with such obvious issues as standards and enforcement, but also what type of outputs from accounting for sustainability are to be produced and for whom.

4.1.1. Methodology

This part of the research agenda uses the general systems methodology discussed in Cunningham (1978 Chapter two). General systems theory is not a theory per se but instead an approach to guide analysis and development of more specific research approaches. It is also a first step in grounded theory approaches which represent back and forth analyses of a system and its environment to build a theory.

-Under general systems theory, each system is viewed as part of a larger system and each system can be viewed as having one or more subsystems. The issue is to identify the system of interest for the research issue at hand, and the boundaries of that system. Thus, the system of interest can be defined in different ways for different research purposes. As discussed above, from a sustainability perspective, the system of interest can include a company and its supply chain as well as users of its products during the product life cycle. In defining the boundary of the system of interest, everything that remains outside the boundary is considered to be the environment. **As noted above, this definition of “environment” is different from the term “environment” used in the research literature to date which typically views environment as representing ecological resources.** Among other things, the analysis considers properties of the system of interest, properties of subsystems, and properties of the environment, including influences of each on the other.

Other important aspects of general systems theory are the notions of regulation and control. Control is generally defined as setting expectations, monitoring outcomes against those expectations, and taking actions if necessary to make necessary changes to achieve desired outcomes. Thus control typically occurs outside a system in the environment, depending on how the boundary between a system and its environment is defined. Regulation represents activities

and subsystems designed within a system to achieve the desired outcomes somewhat automatically without explicit intervention. Notions of what constitutes regulation and control differ depending on how the system of interest and the environment is defined. The concepts of regulation and control have obvious implications for accounting for sustainability. One example is establishing standards for sustainability reporting, a control function, and the steps taken by an entity to assure compliance with standards.

4.2. Reporting Sustainability Information

In some countries, e.g. Sweden, a form of integrated reporting is required for certain companies, e.g. those with state ownership, following the triple bottom line of the Global Reporting Initiative (GRI) (www.globalreporting.org/Home). In addition, several other companies have been voluntarily reporting environmental and social information for some years. Recent attention to so-called integrated reporting has come from the Accounting for Sustainability Project (www.accountingforsustainability.org). This project includes initiatives of the International Integrated Reporting Committee (IIRC) (<http://www.integratedreporting.org/>) to develop a new reporting model that will better reflect the interconnected impact of financial, environmental, social and governance factors. The IIRC includes, among others, representatives from the major international accounting firms, securities exchanges, the Financial Accounting Standards Board (FASB) of the US, and the International Accounting Standards Board (IASB). As mentioned above, though, there is, however, no common notion of what constitutes integrated reporting.

Also as mentioned above, anecdotally, companies report such so-called sustainability information and sometimes seek assurance of such to achieve reputational benefits. Research is needed to identify what type of reputational benefits companies expect to achieve. A further issue is establishing standards for sustainability reporting. The Global Reporting Initiative (GRI) (www.globalreporting.org/Home), a network-based organization based in the Netherlands, provides standards for voluntary reporting of supplemental sustainability disclosures. GRI reporting standards are required in Sweden for the companies that are required to report the so-called triple bottom line. The IIRC as part of the UN PRI is also establishing reporting standards. Research could be useful to determine the criteria by which companies, accounting firms and others choose reporting standards.

4.2.1. Research Methods

The primary research methods for this set of issues would be content analysis and field studies. With respect to content analysis, because of different notions of what represents integrated reporting, it would be useful to examine actual reports under the different approaches to learn differences and their impacts. Content analysis might also be used to examine reports of different companies that use different types of reporting standards to assess different impacts. A further analysis of the groups promulgating the standards to determine their intentions and desired results can be useful. Such content analyses can be complimented by field studies of the companies that currently report sustainability information to determine the difficulty or ease of implementation and extent of compliance. Field studies represent a form of grounded theory in which researchers engage with the field to discover phenomena of interest to be used to develop a theory. Field studies by Fagerström et al. (2009, 2007a, 2007b) have examined similar issues in implementation and compliance with reporting standards and provide a model for this research agenda. Field studies can be useful to assess the reputational benefits companies attempt to achieve from reporting environmental and social information. Field study research by Cunningham and Harris (2005) on a similar topic about performance reporting of governmental entities was a significant contribution to accountability research for such entities and can also be used as a model in this research.

4.3. Users of Sustainability Information.

As mentioned in the background, research and discussion in accounting for sustainability so far have almost exclusively focused on companies that prepare and present sustainability information. There is very recent recognition that the needs of users of the information must be considered as well. The research framework for accounting for sustainability as described in 4.1 would necessarily address some of these issues. Research is also needed to address directly users' perceived needs and reactions to them. Anecdotal evidence suggests that financial analysts, one major user group, routinely discard supplemental environmental disclosures. Instead, anecdotally, analysts want information that allows assessment of risk. Somewhat contradictory prior research has shown that financial analysts, do consider sustainability risk information when making recommendations to their clients (H. Nilsson, et al. 2008). Other research reported by the SIRP (www.sirp.se) indicates a market reaction to sustainability risk under certain situations thus suggesting that some users of sustainability information do use such information. Research is needed not only to assess whether sustainability risk information is desired and used, but the form in which sustainability risk incorporated in accounting reports, e.g. in integrated reports, in product prices according to as suggested by Friedman (2009), and in other accounting measurements.

4.3.1. Research methods

Field study research methods similar to those discussed above (Fagerström et al. 2009, 2007a, 2007b) are useful to learn more about potential users of integrated reports, what they expect, different formats they prefer, and similar items. The primary research method for this issue could be experimental research along the lines used by Baker and Cunningham (1993) when assessing the perceptions of bankers about different sets of assurance standards on their loan decisions is a model for this analysis. With respect to experiments, persons in each treatment group would be *a priori* viewed as essentially identical and making the same types of decisions following the approach of Cunningham and Baker (1992). In their study, subjects of experiments were attending training and education classes sponsored by a professional bankers' association; the association supported the type of research and virtually all participants voluntarily chose to participate. The subjects for this and similar issues in this research agenda could be similar, not necessarily in educational classes, but groups of professionals who use reports of sustainability information. In addition, or alternatively, students could be used as surrogates for users of sustainability accounting information. Numerous accounting-related experiments using students as surrogates have been conducted and published by Michael Shields and Graeme Harrison, among others; these studies are too numerous to cite here, but can be readily located and examined. Similarly, experimental studies in sustainability under the auspices of the SIRP (www.sirp.se) have used students as surrogates for professionals who use sustainability information. These studies cite evidence that students perform as well as actual subjects in these types of experiments.

4.4. Auditing and Other Assurance of Sustainability Information

As mentioned in the introduction, background, and discussions above, a major emerging issue is the extent to which users of sustainability information expect assurance; at what level, negative or positive; and in what form, supplemental or incorporated in financial measurements. A further issue within this agenda issue is establishing both standards for sustainability reporting and standards against which assurance is given. As mentioned above, the Global Reporting Initiative (GRI), a network-based organization based in the Netherlands, provides standards for voluntary reporting of supplemental sustainability disclosures. The IIRC as part of the UN PRI is also

establishing reporting standards. For assurance, as one example, major accounting firms in Sweden use assurance standards published by Föreningen Auktoriserade Revisorer (FAR) (www.far.se) in FAR RevR6 (http://www.far.se/pls/portal/docs/PAGE/FAR_2010/FAR_TYCKER/INFORMATIONSMATERIAL/GRANSKNINGAVHALLBARHETSREDOVISNING.PDF), although use of such standards is apparently voluntary. FAR RevR6 is taken from (essentially a translation of) the International Standard on Assurance Engagements 3000 (ISAE 3000) (http://www.accountability21.net/uploadedFiles/Issues/ISAE_3000.pdf) developed in the Netherlands. A competing set of assurance standards, though, has been developed by AccountAbility (<http://www.accountability.org/>) in its AA1000 AS. Despite the organization's claim of wide-spread acceptance, there is no indication that such standards are used in Nordic countries. Yet another set of standards is incorporated in the Greenhouse Gas Protocol Initiative (<http://www.ghgprotocol.org/>).

These sets of assurance standards, while not always in direct competition because they relate to different types of sustainability information, overlap sufficiently to create uncertainty and complexity in accountants' roles of providing assurance. Because of multiple sets of standards for both reporting and assurance, yet another set of issues to be addressed in this research agenda is the criteria by which companies and organizations providing assurance voluntarily choose standards to use in reporting and in assurance engagements. When sustainability information is included in accounting measurements, e.g. pricing products to include external resource costs and including sustainability risk in financial products, additional issues of reporting standards and assurance standards are presented. Similar issues are presented in integrated reporting when environmental and social concerns would be included in accounting measurements. Current accounting standards in almost every country, including Nordic countries, do not permit such accounting measurements; likewise auditing standards for such measurements are not available.

4.4.1. Research Methods

The previous research by Baker and Cunningham (1993) discussed above, is an ideal model for the type of research on assurance levels in this research agenda. In that experiment, bank loan officers were asked to make decisions based on financial statements prepared using, among other things, different levels of audit assurance and different accounting standards. Field studies like Fagerström et al. (2009, 2007a, 2007b) and Cunningham and Harris (2005) are a grounded theory approach useful models to examine auditors' perceptions of different levels of assurance and standards.

4.5. Financial Distress, Non-compliance with Financial Reporting Standards, and Lack of Enforcement

Despite the fact that past financial failures, notably Enron and sub-prime mortgage crises, have resulted in massive social costs, there is only recent recognition that financial distress, often related to failure to consider different types of sustainability risk, non-compliance with financial reporting standards, and enforcement of accounting standards, is an issue of accounting for sustainability. As discussed in the introduction and background, though, Friedman (2009) views ecological risk and financial distress to be integrally related through inadequate accounting for risks. Even though financial and other sustainability risks are recently receiving attention, the going concern concept has been an essential concept in financial reporting and auditing for many years. Research would be useful to assess the extent to which users of financial information, notably banks, investment analysts, and financial analysts, view the link between financial distress risk and ecological risk as being integrally related as does Friedman (2009).

Non-compliance with financial reporting standards has been an accounting research topic for at least the last 10 years in which wide-spread non-compliance was discovered, and by implication apparent lack of enforcement (e.g. Carrara, et al. 2010, Fagerström et al. 2009, 2007a, 2007b; and sources cited by them). Such research, though, focused on detecting non-compliance without implications for sustainability. As indicated in these studies, non-compliance with accounting standards and lack of enforcement are readily apparent and should be apparent to users of financial reports. Research could assess the impact on apparent non-compliance with accounting standards on users of the information, notably bankers and bank investment analysts.

A very recent study by the publishers of the Asset 4 data base has indicated that companies that report sustainable information also have abnormal returns, suggesting that investors and/or analysts do not consider sustainability information in their decisions. By implication, failure to consider sustainability risk could lead to abnormally low returns or loss through financial failure. Research is useful to assess any relation of negative or lack of reported sustainability information on low returns or failure.

4.5.1. Research Methods

This line of research could follow an approach by Baboukardos (2011, 2010). The research would involve content analysis of publicly listed European companies to identify lack of compliance. Examination of stock market reaction to the lack of compliance and other faulty financial information could then use the well-known value relevance model and other well known models that assess market reactions to accounting information. Among others outputs, the well known measurement of Tobin's Q gives an indicator of risk. Similar research methods can be used to assess the value relevance of negative sustainability information. In addition, the well known bankruptcy prediction models can be used to assess the ability of negative sustainability information to signal financial failure. The existence of the Asset 4 data base now facilitates research methods using large samples and more sophisticated quantitative methods.

5.0. Concluding discussion

This purpose of this paper has been to give structure to the diverse, disjointed area of research into accounting for sustainability, providing background, including identifying research issues, and possible research methods. In introduction and background discussions, it was apparent that the focus to date on reporting environmental, i.e. ecological, and sometimes social and governance information is narrow and inadequate. Instead, new additional research areas are emerging and some traditional research areas are taking on new perspectives. These include:

- A call for integrated reporting that integrates environmental (ecological), social, and governance information along with financial reports. Differing notions of what represents integration exist, however.
- Interests of users of sustainability information, including integrated reports, must be considered.
- Calls for expanded roles of auditors and other assurers.
- Expanding research issues of financial failures, accounting and auditing failures, and lack of enforcement to recognize an essential sustainability component.

After presenting background, the paper analyzes the emerging issues against traditional accounting concepts, notably the postulates of going concern, entity, monetary unit and time period, the paper identified many research issues that need to be resolved. These were presented in five sets of research issues for accounting for sustainability

In the process, the paper presented background material and then identified five sets of research issues in accounting for sustainability along with methods and data sources for each:

- An accounting research framework for sustainability to be based on similar frameworks for other emerging accounting research issues using general systems theory approaches. This framework identifies systems of interest and the environment and necessarily challenges the traditional notions of reporting entity and time period, among others.
- Reporting of sustainability information which has been the focus of most research to date, and the emerging important topic of integrated reporting. The analysis challenges entity, monetary unit, and time period concepts as well as addresses which standards are to be used and how to incorporate environmental and social issues into accounting measurements.
- Users of sustainable information, their uses and perceived needs. This is an area that has been largely neglected in research to date. Research using field studies and experiments is needed to assess users' needs and expectations.
- Auditing and assurance issues that are taking on greater importance as more users demand assurance for the sustainability information. Issues of which standards to be used can be explored and experiments would be used to assess users' expectations and how they react to different types and levels of assurance.
- Financial distress and sustainability consequences of accounting and enforcement failures that are just now being recognized as sustainability issues. Research using traditional market methods, notably the value relevance model and bankruptcy prediction models

This agenda while ambitious gives definite structure and clearly indicates a substantial change in traditional view of accounting, reporting, and auditing in a new era of sustainability.

Babes-Bolyai University, Cluj-Napoca Faculty of Economics and Business Administration

The study conducted a longitudinal analysis regarding Romanian profit tax regulations. Beginning with the first profit tax regulation implemented in 1991 and until now, we analyzed based on a empirical approach all changes that have occurred over time in the Romanian accounting environment. The motivation of the study conducted was based on the strong relationship between accounting and taxation in the Romanian accounting environment over time, the profit tax being one of the main items of this relation. This particular study is divided into five sections. After a short introduction and presenting the motivation of the study (section 1), in section 2 we conducted the literature review based on international and national studies regarding the profit tax regulations through the relationship between accounting and taxation. Section 3 presents a brief review of the main Romanian regulations that concerned the profit tax and the most important changes that have occurred over time. In section 4 we conducted the empirical analysis. In this section is realized a series of analysis, aiming the following: (1) the total number of regulations that have amend the main regulations presented in the previous section; (2) the type of amendments implemented over regulations (abolishment, text amendment, adding new articles or alignments); (3) the total number of amendments approved by law without modifications, respectively the total number of amendments approved on the Official Journal through Government Ordinance or Emergency Ordinance and unapproved by law. The empirical analysis conducted documented that the main shortcoming associated with the profit tax regulation is due by the multiple changes which have been subject of the 5 main profit tax regulations. The last section (section 5) consists in presenting the conclusions of the study. As main conclusion, the profit tax regulation is stable only in terms of the small number of main regulations, the large number of amendments creating difficulties in the understanding and application by practitioners.

Keywords: profit tax regulations, longitudinal analysis, Romania

JEL Classification: H25, H29, M40, M41

1. Introduction

The relationship between accounting and taxation is a much disputed subject in the literature and in practice. In the literature, the central point of this relationship is represented by the profit tax, in the next section being realized a brief overview of this aspect.

To may conduct a study regarding the relationship between accounting and taxation is important to know and understand the tax regulation and also the accounting regulation, and in particular the profit tax regulation.

The present study aims to be a starting point for further research regarding the relationship between accounting and taxation in Romania. In this respect, the study conducted a longitudinal analysis regarding the evolution of Romanian profit tax regulation, being conducted an empirical analysis regarding the amendments which have occurred over time. For this reason, a series of analysis was conducted for capture the evolution of the multiple amendments of profit tax regulations.

Section 2 is dedicated to the international and national literature review. This section captures that studies which were conducted in the literature in terms of relationship between accounting and taxation the central point being represented by profit tax. Section 3 presents a brief overview of the Romanian profit tax regulation and their main changes over time. In section 4 is conducted the empirical analysis in order to realize the main objective of the study: *the longitudinal analysis regarding the evolution of Romanian profit tax regulations*. Section 5 concludes the study.

2. Literature review

No study was conducted until now regarding the longitudinal analysis of profit tax regulations. As we mentioned above, the profit tax is one of the main item of the relationship between accounting and taxation. Thus, in the next paragraphs of this section we will analyze such paper which has captured this aspect based on international and national studies.

Hoogendoorn (1996) conducted a study which realized an overview of 13 EU Countries regarding the relationship between accounting and taxation, based on the distinction between those 2 Accounting Systems (Anglo-Saxon and Continental accounting systems), as well as, the connection and disconnection between accounting and taxation regarding deferred tax as part of profit tax. The conclusion of the study was that there are significant differences between countries from this point of view.

Lamb *et al.* (1998) identified 5 possible cases of the relationship between accounting and taxation. These cases were tested on 4 countries (Germany, France, UK and US), using 13 factors which had a different behavior depending by the type of accounting system of each country. These factors (such as: depreciation, adjustments, fixed assets recognition and evaluation, etc.) have different behavior in the determination of the tax base for profit tax. Based on this study, Nobes *et al.* (2004) realized a comparison between Spain and countries included in the study conducted by Lamb *et al.* (1998). Nobes and Schwencke (2006) conducted the same analysis on Norway case and Gee *et al.* (2010) conducted a comparative analysis between Germany and UK. In Romania, Fekete *et al.* (2009) and Cuzdriorean *et al.* (2010) have been realized an empirical analysis of the relationship between accounting and taxation. In their analysis they included the profit tax as tax factor that influence the turnover as accounting factor. Based on those studies, Fekete *et al.* (2010) tested the empirical model on SMEs cases using the same items (profit tax and turnover). These papers found a relationship between profit tax and turnover, but the model show that a lot of other factors influence the accounting. In this respect, we conclude that it would be necessary if we would find the individual factors which influence the tax base of profit tax (based on study conducted by Lamb *et al.* (1998), plus other specific factors for Romanian environment). Thus, as we mention in the previous section, this paper may be a step of other research regarding the relationship between accounting and taxation, as well as for the measuring the influence of taxation over accounting or accounting over taxation.

3. Brief review of the profit tax regulations in Romania

The starting point for the term of profit and also for profit tax in Romania was year 1990. Through The Government Decision no. 741/1990 was introduced the term of *tax benefit*. Thus, for the first time in Romania, after the communism era, based on article no. 2 from the present Decision:

“The tax benefit is due by economic entities, and also by centrals, big entities, trusts, small companies and other assimilated entities ...”

The same Decision, affirm that:

“The entities provided on article no. 2 from the present Decision not perform payments from their benefits to the State budget” (article no. 3)

The term of *tax benefit* was changed through the Law no. 12/1991, when appear for the first time the term *profit tax*. From 1991 until now, the main profit tax regulation was amended by other 3 times (**Figure 1**). These regulations were also amended by a lot of other regulations, the empirical analysis of this situation being realized in the next section.

Figure 1. The main profit tax regulations in Romania

Regulation	Government Decision No. 704/1991	Law no. 12/1991	Government Ordinance no. 70/1994	Law no. 414/2002	Law no. 571/2003
Period	1990	1991-1994	1995-2002	2002-2003	2004-present

Source: Authors projection

From 1991, the year of appearance of profit tax regulation, a lot of amendments have been produced over the regulations. **Table 1** illustrates a brief overview of the main important amendments that were produced over time.

Table 1. Evolution of the main profit tax regulations in Romania

Period	Tax Regulation	Effective date	Main changes introduced
1991-1994	Law No. 12 / 30.01.1991 on the profit tax	January 1, 1991	Progressive tax was applied, with a total of 67 tax cuts Tax cuts were between 2.5% and 77%, with a profit of 25,000 lei, relieved from duty Taxable profit was calculated as the difference between revenue received and expenditure provided by law
	Government Decision No. 804 / 30.11.1991 on the profit tax	January 1, 1992	Progressive rates were reduced to two rates, as follows: 30% for a taxable profit under 1 million lei 45% for a taxable profit over 1 million lei
1995-2002	Government Ordinance No. 70 / 29.08.1994 on the profit tax	January 1, 1995	Profit tax rate was set at 38% Differential tax rates were applied for certain categories of taxable persons A distinction between small and large taxpayers is made; the tax base was established depending on the category of taxpayer Concepts of tax-free income and non-deductible expenses are introduced; unclear setting conditions were established for tax-free revenue For certain expenses partial deduction was applied (e.g. for gifts and subsidies granted were established tax-deductible limit set by law)
	Government Ordinance No.	January 1,	Elimination of the distinction between small and

	70 / 29.08.1994 on the profit tax, republished	1997	large taxpayers Elimination of the distinction between accounting depreciation and tax depreciation
	Government Emergency Ordinance No. 217 /29.12.1999	January 1, 2000	Profit tax rate was set at 25% Explanations were provided for the total deduction or partial deduction of expenditure included in the calculation of taxable income. The concept of taxable income is reintroduced; it may occur for property revaluation
2002-2003	Law No. 414 / 26.06.2002 on the profit tax, 1994 ⁽²⁾	July 1, 2002	Taxable profit = total revenue - total expenses – tax-free revenue + non-deductible expenses The categories of free-tax revenue were defined
2004 - present	Law No. 571 / 22.12.2003 on the Fiscal Code	January 1, 2004	Taxes and fees due to the state budget and local budgets are regulated, income taxes being regulated under Chapter II of this Law The categories of free-tax revenue, deductible expenses, partially deductible expenses, and fully non-deductible expenses are distinctly regulated Distinction between accounting depreciation and tax depreciation The amount of reserves that can be deducted in the determination of taxable income and tax deductible provisions is distinctly regulated The determination of the deductibility of interest expenses and the foreign exchange losses is distinctly regulated Tax credit concept is introduced; the most common tax credit is represented by the deduction of the gifts and subsidies expense from profit tax, granted in the amount according to law
	Government Emergency Ordinance No. 138 /29.12.2004	January 1, 2005	Profit tax rate was set at 16%
	Government Emergency Ordinance No. 34 / 11.04.2009	May 1, 2009	Introduction of the minimum tax which is applied on companies revenues obtained in the previous year, whether or not they obtain profit The deductibility of expenses for certain sectors, such as fuel expenditure, value added tax related to the purchase of cars, was eliminated The tax measures apply until 31.12.2010

Source: Authors projections based on Fekete *et al.* (2010)

4. Empirical analysis regarding the amendments of the profit tax regulations

The methodology that we used in the empirical analysis is based on the longitudinal view regarding the total number of amendments which were produced over time in terms of profit tax regulations.

The information's regarding the profit tax regulations were obtained from the Official Journal of Romania (www.moficial.ro), and from the official site of the Chamber of Deputies, (www.cdep.ro).

In this respect, to obtain the answer to this problem, we conducted an analysis that consisted in the counting of the regulations that have amended the main profit tax regulations. The answer of the main problem of our research, was obtain based on the following research questions:

Q1: Which is the total number of regulations that have amended the main profit tax regulations?

Table 2. The number of regulations which amended or proposed amendments of the main profit tax regulations

	Total, that comprised	Government regulations approved by law without amendments	Government regulations approved by law with amendments	Laws which amended the Government regulations	Regulations that have a direct amendment*	Government regulations rejected by law	Government regulations which are not yet adopted
Law no. 12/1991	5	0	0	0	5	0	0
Government Ordinance no. 70/1994	5	3	0	0	2	0	0
Government Ordinance no. 70/1994, republished	23	7	4	4	4	4	0
Law no. 414/2002	3	1	1	1	0	0	0
Law no. 571/2003	21	10	4	4	2	0	1
TOTAL	57	21	9	9	13	4	1

Source: Authors projections

Table 2 shows that a total number of 57 regulations amended or proposed amendments of the main profit tax regulations. The highest percentages are represented by the Government regulations (Government Ordinance or Emergency Ordinance) (21 regulations), respectively 13 regulations that have a direct amendment (* there are included those regulations which did not approve the amendments made by other regulations). There is also, an approval amendment of Law no. 571/2003 (Emergency Ordinance no. 117/2010) which is not net adopted.

Q2: Which is the type of amendments implemented over regulations (abolishment, text amendment, adding new articles or alignments)?

Table 3 illustrates that a number of 168 proposals of amendments were made over the 3 main regulations (over Law no.12/1991 no amendment proposal was made). A percentage of 50% (84 of 168 proposals) of the total proposals represents the articles amendments (change the existing text articles of the main regulations). The gray part of **Table 4** illustrates that a total number of 43 amendments approve without proposals (Regulations that have a direct amendment); in this case, 70% of amendments are represented by articles amendments (30 of 43 amendments).

Table 3. The total proposal of amendments

Q3: Which is the total number of amendments approved by law without modifications, respectively the total number of amendments approved on the Official Journal through Government Ordinance or Emergency Ordinance and unapproved by law?

The answer of this question is received from data collected in **Table 2**. Thus, a total number of 21 Government regulations approved by law without amendments which amended a total number of 133 through proposals, which represent 61,29% from the total proposals (based on **Table 4**). **Table 4** contains also the amendments to the proposals (23 amendments) and the completion to the proposals (10 regulations completion, 5 regulations amendments and 3 repelling (abolish). These were made by 9 Government regulations approved by law with amendments, plus 9 Laws which amended the Government regulations.

Table 4. The total approvals amended by regulations

5. Conclusions

As a result of the analysis conducted, we can conclude that the profit tax regulation is stable only in terms of the small number of main regulations (5 regulations over time), the large number of amendments creating difficulties in the understanding and application by practitioners. During the 20 years of the analysis, a total number of 217 approvals were amended the profit tax regulations, which were made by 57 regulations (56 which were adopted, and 1 which were not yet adopted). As a weight of the amendments, around 11 amendments were approved each year, this showing that the profit tax regulations are dominated by instability.

As further research, we will analysis the types of the amendments, based on 3 directions: (1) the direct influence analysis (amendments with effect over all type of taxpayers) and indirect influence; (2) the text analysis of amendments, in this respect being conducted other statistical analysis, based on the social impact produces by regulations (e.g. the effects of crisis in terms of regulations); (3) the type of amendments (e.g. the tax base, the tax rate, etc.).

ENHANCING ASSETS' PROTECTION THROUGH AN ADEQUATE MONITORING OF INTERNAL CONTROL SYSTEM BY INTERNAL AUDIT

Dan Eugen Cosmin

Universitatea "Babeş Bolyai" Cluj-Napoca Facultatea de Ştiinţe Economice şi Gestiunea Afacerilor

The assets are established into a company as very important and strategic resources that are contributing at the creation of the needed premises to conduct the daily-basis activity and also to reach present and future planned objectives. Recent studies like COSO's Fraudulent Financial Reporting 1998-2007 have highlighted an increasing fraudulent activity against assets therefore the efforts of fighting against fraud must be supplemented in order to preserve the existence and value of those resources. Internal controls are processes implemented in order to give a reasonable assurance that the company will not become a fraud victim. Even so, a lot of internal controls are paying a heavy tribute to their lack of efficiency and update. Thus, for a correct functioning, internal controls must be monitored and assessed permanently in order to preserve their strength and ability to fulfill their mission. This approach will deliver more added value because rather than being corrected after they have already occurred, the frauds related with the assets will be prevented, detected and reported at a timely moment, thereby the incidence and value of those criminal activities will decrease significantly. Furthermore, because not only the process of monitoring is important but even the entity conducting this activity we believe that internal audit is the most appropriate to undertake this responsibility. Thus, through this material we opened a discussion about how important permanent monitored and updated internal controls are in order to assure a proper assets protection and why internal audit, rather than the management, should be the most eligible to undertake this responsibility. Also we provided some suggestions regarding the main activities that must be taken into consideration by an internal audit professional when is being involved in a monitoring process of internal control system. We do believe that this paper will be the starting point for new discussions about the future activities and resources that must be invested in order to assure that internal audit's independence, objectiveness and professionalism will deliver a proper degree of security against frauds.

Keywords: internal audit, monitoring, internal control, assets, fraud

JEL: M42

Introduction

Because of the current difficult economic circumstances caused by the global recession, the assets are becoming scarce considering the fact that sometimes are more expensive to purchase and much difficult to be obtained and/or replaced. Unfortunately, preserving the value and the existence of the assets often involves fighting against fraud or conducting activities to prevent fraud from occurring. Those activities are neither cheap nor a downhill job, on contrary sometimes undertaking such a responsibility might look like as a preparation for a Sisif's work. Therefore a well-balanced management and an efficient control of the assets is imperative to assure the capability of the company to operate not only in near but also in the remote future. In order to fulfill its mission, internal audit will have to develop new and efficient ways to fight effectively against fraud and preserve the value and existence of company's assets. One starting point could be the assessment and monitoring of internal control system, an activity meant to give assurance that internal controls are in place and are not deteriorated.

Previous Studies in the literature

The internal control system is necessary to provide a reasonable assurance regarding the company's capacity to achieve its objectives. Nevertheless, a function more independent and objective must be implemented in order to provide a satisfactory level of safety and surveillance of the already existing control system. Thus internal audit adds value through improving the control and monitoring environment within organizations to detect fraud (Coram, Ferguson and Moroney 2006: 2).

Because of its key role in corporate governance new challenges are arising related with the potential of internal audit to assure an adequate assets protection and to detect, prevent and deter fraud in comparison with the solution provided by the outsourcing of this activity.

Some scholars found out that financial statements users do not perceive a difference between internal audit insourcing and outsourcing (Lowe, Geiger and Pany 2001: 4) while others stated that companies that outsource believe that an external provider is technically more competent (Carey, Subramanian and Ching 2006: 5). Even so, it is recommended not to exclude totally the internal audit function in the benefit of outsourcing. A good advice is to strengthen the internal audit or to use a partial insourced audit because there is a significant positive relation between an organization having an internal audit function and the number of value of self-reported frauds. For those organizations with internal audit, partial or full insourcing increased the likelihood of fraud detection when compared with organizations that outsource the entire function (Coram, Ferguson, Moroney 2006: 3).

It is obvious that internal audit is imperative to assure that the company will operate properly but in the same time the quality of internal audit and its ability to reach its objectives are close related with the quality of internal control system. Thereby, the viability of internal control system must be assessed, tested and monitored permanently in order to identify and change the obsolete components with new and genuine internal control procedures that are delivering the expected results.

Methodology

Through this paper we intend to propose a discussion on the theme of how important the activity of monitoring the internal control system through internal audit is in order to assure a proper assets' protection. First we will circumscribe the relation between internal control and internal audit and also explain why, in our opinion, internal audit should be the first choice to be considered when deciding whom is going to monitor the internal control system. Furthermore we will provide an insight regarding the nature and evolution of the main fraud techniques used against assets in accordance with the information from COSO's 1987-1997 and 1998-2007 Fraudulent Financial Reporting. Nevertheless, based on the suggestions from COSO's Guidance on Monitoring Internal Control Systems issued in 2009 and our previous research, we will provide some ideas regarding the main activities that should be considered by an internal auditor when deciding to monitor the internal control system within a company.

The role, importance and the relation between internal control and internal audit

The vast majority of the companies have already implemented internal control systems and still cases of misappropriation of the assets are discovered each year. Therefore, a question arise if the internal controls are indeed effective activities providing a reasonable assurance regarding companies' potential to reach their objectives or if companies can get "clean" attestations on their internal controls without in fact having effective control structures, much the same way companies like Kimm or WorldCom could get "clean" opinions on financial statements that turned out to have glaring errors (Locatelli 2004: 13).

During the years, internal control has gradually evolved from traditional meaning of an activity of verifying and inspecting a certain objective to a modern sense of: to master, to govern, to lead (Lenghel, Popa, Oprean: 11). Therefore for all members of a company is very important to have guidelines in order to understand the importance and the way an efficient internal control system should be accomplished. Thus organizations like COSO (The Committee of Sponsoring Organizations of the Treadway Commission) play a very important role in providing to executive management and governance entities on critical aspects of organizational governance, business ethics, internal control, enterprise risk management, fraud, and financial reporting.

According with COSO, internal control is a process effected by an organization's structure, work and authority flows, people and management information systems, designed to help the organization accomplish specific goals or objectives. Thus, internal control should yield the premises to optimize the allocation and usage of resources through an efficient management, to assure the assets' security, to survey the way the laws and regulations are being respected, to supervise the implementation of an accounting system in agreement with regulation, to prevent and identify frauds and nevertheless to produce, organize and provide relevant and useful information at timely moment.

COSO's internal controls pattern is build considering 5 components: control environment, risk assessment, control activities, information and communication and monitoring.

Even if is the last one listed, monitoring is essential in order to design and implement a genuine internal control system able to satisfy the existing requirements. Truth is that unmonitored internal controls tend to become anachronistic over time because are not updated, revised and implicitly connected to the existing circumstances and activities conducted within the company. An appropriate monitoring will enhance the chances to identify and correct internal control deficiencies on a timely basis, addressing them in a proactive, rather than reactive manner and also it will produce more accurate and reliable information.

Internal controls are critical but their performance and quality must be monitored and assessed by an entity more independent and objective. As a natural consequence, internal audit, a superior level of examination and surveillance must be developed. According to the definition provided by IIA (The Institute of Internal Auditors) internal auditing is an independent, objective assurance and consulting activity designed to add value and improve an organization's operations. It helps an organization accomplish its objectives by bringing a systematic, disciplined approach to evaluate and improve the effectiveness of risk management, control, and governance processes. From the definition issued by IIA it is obvious that internal audit is close related with internal control and in one stage internal control becomes the object of an internal audit.

Nevertheless, internal audit depends of the quality and the way internal controls are being respected and conducted in the company because when it comes to start an internal audit, the auditor has 2 main choices: either to test and verify directly a large amount of transactions and operations, which could be very costly and time consuming, or to assess the potential of internal control system and according to that to decrease the work volume. If this is the case, internal auditing can rely on the controls to reduce the amount of direct testing it would otherwise be required to perform (Locatelli 2004: 14). In addition, because of the increasing size of the operations of a business it became increasingly difficult for auditors to efficiently rely only on direct and substantive testing. As a result, understanding and defying internal controls look on increasingly greater importance (Locatelli 2004: 14).

Therefore internal audit must be directly involved in the activity of assessing and monitoring internal controls because an efficient internal control system has a positive impact on internal audit's work.

The number and nature of frauds related with assets

The cases of frauds related with assets have increased, according to COSO's Fraudulent Financial Reporting, from the period of 1987-1997 to 1998-2007. Thereby, from 1987 to 1997 the overstatement of the assets (excluding accounts receivable overstatements due to revenue fraud) was noticed in half of the 204 sample companies. At the same chapter, at the end of 2007 an increase was recorded, with 51% of the 347 selected companies. Also, a growth was identified considering only the overstating of existing assets or capitalizing the expenses. Thus in 2007 this fraud technique was used in 46% of the fraud related companies while at the end of 1997 only 43% of the companies using fraud had this problem. Nevertheless, the occurrence of misappropriated assets rose with 2%, from 12% at the end of 1997 to 14% in 2007.

Thus, the most common fraud related with the assets is the misstatement of asset accounts. Furthermore we will present the numbers of the main techniques used to misstate the asset accounts as they were enumerated in COSO's survey. In addition to the information provided by COSO we will also explain the way each of those frauds might occur.

The most encountered fraud scheme, regarding the misstatement of asset accounts, was **inventory** with a total of 51 of 173 cases (29%). Inventory is one of the most common methods used by the employees to remove assets from accounting books before or after they are stolen. Some inventory fraud schemes may include: counting nonexistent inventory or sold merchandise that is being warehoused for customers, ignoring the value of obsolete, damaged or slow moving inventory, operating changes in inventory's accounting methods or overvaluing existing inventory.

Accounts/Receivable frauds with 43 cases (25%) were mentioned on the second place. This fraud scheme usually appears when the perpetrator is adjusting the entry to a perpetual inventory and cost of sales accounts even if there is no sales transaction in the accounting records to prove those entries. As a consequence, the perpetrator is "fixing" the problem by entering a debit to accounts receivable and also a corresponding credit to the sales account in order to be sure that the missing goods appeared as they were been sold.

Property/ Plant and Equipment (PP&E) were signalized in 24 cases (14%). This fraudulent approach may imply the recognition of expenses as acquisition of PP&E with the main purpose of delaying the entire immediate expense. Other techniques may include the reducing or delaying of the depreciation or overrate PP&E's value.

In 19 cases (11%) the fraudsters appealed to **cash/ marketable securities** schemes. Those assets are susceptible to be stolen because of their intrinsic features including a high rate of liquidity, marketable securities are extremely liquid as they tend to have maturities of less than a year. As for the cash the most common frauds include skimming schemes, attacking the receipts process, in which money is stolen before it is recorded in the victim organization's accounts and billing schemes, attacking the payments process comprising methods like false invoicing via shell companies, false invoicing via non-accomplice vendors and personal purchases made with company funds.

Loans/ Notes Receivable/ Mortgages were identified in 13 cases (8%). Those techniques include actions meant to deliberately omit relevant information regarding a mortgage loan application with the purpose of obtaining a loan or a larger loan that would have been obtained if the lender or borrower knew the truth.

Investments problems were also noticed in 12 cases (7%). For example, a common used scheme is overvaluing the investments when there isn't any readily available market or in the case of transactions made with related parties.

And nevertheless not listing **prepaid expenses** with a purpose of making a company's profit performance look better than it actually is, was used in 11 cases (6%).

Monitoring the quality of internal control system through internal audit

It is obvious that in compliance with the information provided by COSO, fraud not only continues to exist but is starting to become a more complex and worsen phenomenon. This is a signal of how important control systems are in order to prevent fraud from occurring. As it was stated before not the mere existence but the performance and viability of internal control matters and those are given by a suitable activity of updating through constant monitoring.

Furthermore we will discuss about the main concerns that should be taken into consideration by internal audit during a monitor activity in order to strengthen the internal control system and implicitly to protect the existence and value of the assets.

Assess the level of involvement manifested by the managers regarding the implementation of internal controls. The purpose of this activity is to identify if there is an established foundation for the activity of monitoring and if not to create the needed monitoring awareness among managers. The integrity starts at the top and the integrity of the managers is an essential factor in establishing strong internal controls. The managers at all levels of the company must lead the way to ensure internal controls are updated and respected. Also, a critical element is the attitude of managers regarding the way they cooperate and work with the subordinates. The relationship between management and employees must be professional and correct. Managers must impose to all of their subordinates to apply the procedures of internal control and are forbidden to implement a control based only on blind trust. In addition, managers are not allowed to hide any criminal activity of their subordinates. Every manager must be aware that any hidden fraudulent activity can become in a long run a festering wound for the company affecting not only its image but also its capacity to exist and to function effectively.

Identify the factors of pressure that can lead to fraud. Pressure is the factor that is engaging an individual to commit fraud. This can comprise almost everything starting from medical bills, expensive tastes to addiction problems but the core issue comes always from a significant financial need or problem. Even so, there are cases in which fraud is committed simply out of greed. Regarding the thinking of a fraudster, one will always believe that his problem must be solved in secret and even if he considers or not that his crime is justified there will be few cases of self-denunciation. This is not only because the perpetrator knows he could be punished but also because fraud is seen as a crime of betrayal and often goes underreported precisely because it is so personal and embarrassing. Furthermore both managers and employees can become fraudsters if there is the rationalization, opportunity and pressure to perpetrate fraud. According with COSO's Fraudulent Financial Reporting 1998-2007, the high leadership of a company was directly involved in fraudulent activity: in 72% of the cases the CEO, in 65% the CFO and in 83% of cases either the CEO or CFO. In comparison, the lower level employees were engaged in only 10% of frauds and the controllers in 21%. For the normal employees common source of pressure may come from medical problems, drug or alcohol addiction, civil lawsuit, criminal conviction, dissatisfaction at the working place or simply greed. In addition with those, the high percentage of executives involved in fraud cases is explained by the fact that often managers and executives hold on their shoulders a lot of pressure that is constraining them to commit frauds. In their case the motivation for perpetrating fraudulent activities might be given by several reasons such as: the need to meet internal and external earning, the attempt to conceal the company's deteriorating financial condition, the need to increase stock price and nevertheless the desire to increase management compensation based on financial results.

Build relevant scenarios that could potentially occur resulting in a material impact on assets. This implies a more proactive rather than reactive approach of the risk of fraud existing within the company. Internal auditors should create a database containing the most eligible fraud scenarios that could take place considering the existing conditions created by the managers' attitude and behavior and also by the pressure factors. For each fraud scenario there must be a

description of the way it could be perpetrated within the company, the individuals that might be involved and the types of assets that might be affected.

Test, assess and improve the capacity of internal control system. According with the level of involvement proved by the managers and the existing pressure-factors the internal control system must be assessed and his potential diagnosed. Based on the previous documented fraud scenarios, any internal controls that could prevent or deter the fraud related with the assets must be updated or created in order to satisfy the existing requirements. Nevertheless when updating or creating internal controls one should not forget that the driving principle behind strong internal controls is segregation of labor. In any given situation, the more record keeping duties that can be segregated the better. If one person is responsible for both maintaining the record and the asset, there are many opportunities for procrastination, abdication of the task and theft (Heinke 2010: 52).

Assessing the results of the new and/or updated internal controls procedures and correct the anachronisms. The purpose of monitoring is to improve and update continuously the internal controls. There is no point in conducting a monitoring activity if is not continuing and with the purpose of constantly improving the already existing control system. Thus a permanent oversight and diagnose of the way updated or new internal controls are running and behaving is imperative in order to test the effectiveness of changes made according to monitor's findings. Nevertheless the controls that are not delivering the expected results must be reassessed and strengthen in order to make them eligible for achieving their purpose.

Conclusions and further research

The war against fraud is becoming sharper as the limited resources and a possible lack of credibility from stakeholders, employees and general public caused by potential fraud scandals may affect the image, performance and financial position of the company. As frauds against assets multiply, internal audit will be demanded to expand its objectives comprising also activities that could deter fraud. Because of this for the internal audit of tomorrow it will be impossible to ignore the value of any instruments or processes that can streamline its work reducing the total amount of cost and raising the benefits. Therefore the activity of monitoring and updating the control system will be imperative in order to help internal audit give a proper answer to the future requirements. As we stated in this paper we recommend internal audit to undertake the monitoring quest due to its objectiveness, independence and professionalism. Still there are at least 2 things that impose further research. Fraud is not an accounting problem but a social phenomenon. Even if internal audit function has the privilege of being subordinate to the highest management level in an organization as it was shown in COSO's surveys in the majority of cases the high leadership was involved in fraud schemes therefore the potential of internal audit to apply the needed measures in order to update and strengthen the internal control can be affected. Further research regarding the way the independence of internal audit can be enhanced is needed. On the second place, as any other activity, internal audit is hamstrung by a limited budget. The total amount of money invested in an audit function varies according with company size, industry type, inventory, operating flows and nevertheless the audit committee review regarding internal audit work and budget. Thus, a balance between the costs involved in a monitoring activity and the benefits from providing a continuous internal control monitor must be achieved in order to raise the effectiveness of the overall controlling effort conducted in the company.

ISSUES RELATED TO THE ACCOUNTING TREATMENT OF THE TANGIBLE AND INTANGIBLE ASSETS DEPRECIATION

The issue of accounting depreciation is an older concern of this study's authors on the incidence over the true and fair view of the earning and the net value of the non-current assets. Proceeding from the consideration that the present depreciation methods, acknowledged by the accounting standards and regulations are not sufficient to render the reality of the irreversible impairment of the fixed assets nor that of the material and immaterial investment recovery we performed a research on the indicators reported by 20 companies in Cluj county and we applied a questionnaire to each entity on the depreciation methods used, their incidence on the true and fair view and their proposals for the completion of the depreciation methods.

The objective of the research is to identify the most appropriate depreciation methods, truthfully illustrating the effects of the irreversible impairment on the net asset and on the earning, to introduce the excluded assets in the category of the non-current assets (like property and plant, goodwill, intangible assets created with ones own strengths) and the enforcement of appropriate treatments to the revaluation differences and their own overhead investments.

The International Accounting Standard IAS 16 – Property, plant and equipment refers to three depreciation methods: the straightline method, the diminishing balance method and the technical depreciation method (units of production method). In Romania only two of these methods are accepted: the straightline method, the diminishing balance method and the accelerated method was additionally instilled, which is used internationally in exceptional situations and not currently.

The results of the research led us to the following conclusions:

- for the depreciation of the machinery, facilities and technological equipments it is recommended to use the technical depreciation method or the units of production method;*
- taking into consideration the financial conception on the non-current assets the depreciation of all categories of tangible and intangible assets is recommended, the purpose being the gradual recovery of the investment in these assets and not the covering of the wear and tear or obsolescence;*
- the surplus value resulted from the revaluation of the tangible assets musn't be depreciated because it generates in fictional expenses;*
- the depreciation of the overhead assets musn't be acknowledged as an expense but it should be treated as a reduction in the income resulting from fixed assets;*
- the completion of the depreciation concept with its financial meaning, namely the process of recovering the investments in tangible and intangible assets;*

The application of the research results leads to correcting the image provided by financial reportings on the tangible and intangible assets contribution to the income, the depreciation's reflection in the expenses and the net value of these assets.

The contribution of the authors consists in interceding to ensure the application of the research results by modifying and completing the national accounting rules in order to achieve accounting's consecrated objective: reproducing a true and fair view on the financial position

and performances. These issues have not been addressed in other specialty studies in the country or abroad.

Key words : irreversible depreciation, accounting depreciation, technical depreciation depreciation, provision for positive reevaluation differences.

JEL Codes : M41, M42

I. Introduction

The tangible and intangible assets are material and value investments with the period of usage exceeding the length of a financial year. As these assets do not run to waste after their first usage, the depreciation process is used to consign that part of the value which is transmitted on, to the goods, workings and services. In the literature there are three depreciation concepts that stand out, namely:

- The economic concept according to which depreciation is the process whereby the value equivalent of an asset's irreversible impairment, due to the use of the natural factor's action, the technical progress or other reasons, is transmitted on, to the value of the goods, workings and services.
- The financial concept according to which depreciation is the process of gradually recovering the investments in tangible and intangible assets as a result of the contribution of these goods to achieving the added value.
- The accounting concept according to which depreciations is the systematic allocation of an asset's depreciable amount along its useful life, by recognizing as an expense in accordance with the asset's contribution at the achieved economic earnings ;

Summarizing the above three concepts one can conclude that depreciation is the process of systematically assigning the depreciable amount of an asset along its useful life with the purpose of ensuring the investment's recovery and/or the compensation of the irreversible impairment, as a result of the usage, the action of the natural factors, the technical progress, etc. In accounting terms, the value calculated as the share to be allocated is subject to depreciation and is called redemption. The depreciable amount of tangible and intangible assets is represented by the accounting value diminished with the residual value (recoverable amount at the end of the useful life). In Romania, according to the consecrated practices the residual value is considered to be void. The useful life according to international accounting standards is defined based on company's estimated utility for the concerned asset, based on the experience with other similar assets.

There are three variables standing at the basis of establishing the redemption:

- asset's depreciable amount
- useful life
- depreciation method.

These three variables define the size of the redemption and in give in the end an image on the activity's earnings and the net value of the assets.

Starting from these premises we initiated the reasearch on the way of establishing the redemption as well as on its accounting treatment taking into account its effects on the results and on the net asset but also a reasearch on the capitalization/de-capitalization of the economic entities.

The research goals are focused on the following directions:

- a. establishing the size of the redemption with the purpose of objectively reflecting an economic reality, including the acceptance of new depreciation methods
- b. changing the accounting treatment applied to the fixed assets which do not suffer from physical and moral wear, but are investments to be recovered over the business's lifetime

- c. applying accounting treatments which are appropriate for the depreciation of the revaluation differences and of investments made with ones own strengths

The questions that the present research is answering at have also been subject of the questionnaires applied in 20 companies in Cluj County, and they refer to:

1. What depreciation method do you apply?
2. Does the used depreciation method reflect the economic reality of the irreversible impairment and of the investment recovery? In the case of technological equipments would you choose the technical depreciation method provided by the international accounting standards?
3. Is the useful life of the depreciable assets established based on the Tangible assets Catalogue issued by the Ministry of Finance or by a technical committee which reviews the asset's operating conditions and the economic benefits the asset is expected to produce ?
4. Do you consider that the exclusion of some assets from the amortization- land, goodwill, etc. – generates overated results?
5. Does including the positive revaluation differences in the expenses as the asset is being depreciated, represent an artificial increase of losses
6. Does the inclusion of one's own investmens in the expenses as the depreciation is in progress represent a reduplication of the expenses?

II. Literature analyses, previous researches and field practices

Being a regulated industry the literature is insufficient, the existing one being limited to promoting the actual rules and very little to analyzing the incidence on the fair view. The Romanian literature partially accepts the depreciation methods under the international accounting standards and the european accounting regulations which does not ensure the convergence with the international depreciation meanings. The foreign literature promotes diversified depreciation methods in order to provide a sufficient basis for the real systematic allocation of the fixed assets shares on the expenses against the benefits from these assets. The international accounting standards IAS 16 – Property, plant and equipment, IAS 38 – Intangible Assets and IAS 36 – Impairment of assets are the starting point in achieving this research. In addition we relied on the european and national accounting regulations and on the accounting studies (books, manuals, articles, etc.) published in Romania in the last two years.

III. Research methodology

The present study is an applied research having the purpose of correcting and addressing weaknesses in the approach of the fixed assets depreciation process and in treating the accounting information. The research was based on the study and the interpretation of the international accounting standards, the European reglementations, the national accounting rules and on the application, processing and analysis of the 20 questionnaires containing the questions to be answered by this research. The use of the study, surveys and observation is relevant to see the option of improving some accounting regulations which in some cases do not reflect the economic reality when being applied. In regard to the 20 sample companies we consider to have chosen important businesses, involving the management of fixed assets with a significant share in the total assets of the chosen companies, being part of the large (8) and medium (12) companies.

IV. Research's results

After the questionnaire processing the research results on the addressed topics were the following:

- With regard to the applied depreciation method 87% use the straightline method for all the tangible assets, 9% the straightline and the diminishing balance method and 4% the straightline, the diminishing balance and the accelerated method

- The used depreciation method reflects the economic reality of irreversible impairment, respectively of investment recovery in the cases of constructions, furniture and intangible assets. All the respondents felt that in case of technological equipments these methods do not reflect the economic reality and that the technical depreciation should be accepted by the regulations
- Regarding the useful life of depreciable assets 82% responded that it is established by the Tangible assets catalogue issued by the Ministry of Finance and only 18% established a technical committee to review the asset's conditions of operation and the economic benefits this asset is expected to produce
- Excluding some assets from depreciation is considered an error because the investment in land contributes to future economic benefits and the built land doesn't have the same value as the open one. For any other investments in intangible assets it is considered that they should be depreciated if they produce future economic benefits, otherwise being considered a waste. The overvaluation of the results as a result of not depreciating the lands and other assets leads to false profit declaration and business decapitalization by paying taxes on income and dividend distribution.
- Including positive revaluation differences in the expenses as the asset's depreciation is in progress is considered by 64% as being an artificial increase of the losses, trying to force an equity increase on the behalf of the expenses.
- All the respondents agreed upon the fact that including one's own investments in the expenses as the depreciation is in progress is a mistake, the option being the reduction of revenues coming from fixed assets production.

The conclusions this research is conducting are:

- for the depreciation of machinery, facilities and technological equipments the use of the technical or the units of production method is recommended. This method ensures the recognition of the amortization as an expense in regard to the use of machinery, facilities and technological equipments for achieving future economic benefits.
- starting from the financial conception on fixed assets and their capacity to produce a profit the armonization of all asset categories, tangible and intangible, is recommended, the purpose being the gradual recovery of the investment in these assets and not only the covering of the physical and moral
- the ups in value resulting from the revaluation of tangible assets do not have to be depreciated because they generate fictitious expenses. If one wants capitalization at the level of revaluated value for the positive revaluation differences we consider the creation of a provision for positive evaluation differences as being indicated. Even more since these positive revaluation differences can be reversible and they can diminish at a further assessment.
- the depreciation of assets achieved on its own account shouldn't be recognized as an expense but it should be treated as a diminishing in the income coming from fixed assets.

The results of this research are supported by the answers to the applied questions and from our estimations they reflect the conceptions of the majority of business manager which are interested in the true and fair view of the business administration and not due to regulations that are not based on a minimum of applied research.

V. Conclusions

The application of this research's results will lead to the normalization of the image offered by the financial reporting of tangible and intangible asset's contribution to the income, the depreciation's reflection in expenditures and the net value of these assets. Acceptance and implementation of the technical depreciation method will lead to recognising the redemption for

using the asset and also the depreciation of land and other assets excluded so far, will be the basis for achieving the real economic benefits. All those majoring in accounting, who will apply the knowledge gained from this research's results will see a profound change in the economic activity's outcome and will understand that the accounting judgment should be based on capturing and reproducing economic realities, using numbers and not blindly applying accounting regulations which leave aside the international accounting standards.

The contribution of the authors consists in interceding to ensure the application of the research results by modifying and completing the national accounting rules, as well as the alignment with international accounting standards, in order to achieve accounting's consecrated objective: reproducing a true and fair view on the company's financial position and performances. The study is unique as these issues have not been directly addressed before in other specialty studies in the country and abroad.

STAGES OF DEVELOPMENT WITHIN THE ROMANIAN FINANCIAL ACCOUNTING SYSTEM IN TERMS OF LABOUR PROTECTION FOR THE EMPLOYED WORKERS IN ROMANIA AND IN OTHER EUROPEAN COUNTRIES

David Delia

Vasile Goldis West University of Arad Faculty of Economics Science

Pojar Daniela

Babes Bolyai University of Cluj Napoca The Doctoral School within Faculty of Economics and Business Administration

This paper aims to highlight the main stages of development within the financial accounting system for the protection of the personnel engaged in Romania and at the same time, to compare it with the one of other European countries. The importance of the work consists in identifying forms of social protection through the legislative framework in order to achieve a diagnosis of Romanian social welfare. As a research model used in a particular study, the methodology includes information accompanying theoretical basis and methods for it. This paper contains a positivist tinge and it's constructive, going with the research's mainstream. Of course, one aspect is not left out: the critical approaches to the accounting referential standard concerning the protection of the staff in Romania as well as in Europe.

The foundation of the research is represented by the last decades' economic reality. The work tries to find answers to the question: "How did the Romanian social protection develop and which was its legal framework?" The research type is a deductive one which means that there's a way crossed from the general to the particular, starting from a theory which has as purpose applying the prediction itself and, at the same time, assuring a wider range of knowledge and being more operative. Information gathering was done through various methods such as quantitative and qualitative research and the pieces of information presented in this paper were collected from various sources such as published articles, books, legal documents, all from the economical field. Afterwards, the collection of the pieces of information was followed by data analysis. Having this as purpose, the following research methods and techniques have been applied: cross-section (analysis protection staff at a time) and longitudinal (protection of staff development in Romania), survey (protection of staff is described, compared and explained in Romania and the European context), non-participating observation (as statistical data) and analysis (collection, sorting and interpreting the information in the protection of staff in Romania). Research results and general conclusions concerning the information system for the protection of staff are listed at the end of the paper.

JEL Code: M41, G01, K31

1. Introduction:

The social protection manifests itself by a series of measures more or less material, which follow practical, compelling and action-oriented ways and which vary according to the covered population segment which they refer to. Also, it has to do with different branches and the intensity and diversity of the measures vary according to these branches.

The social protection systems can be divided into two categories: (Buzducea, 2009:17):

- the universal system type which provides fixed indemnities for the permanent citizens or for the ones who have been a number of years without reliable income. Usually, this system is funded

annually from the state budget and it includes pensions, pensions for workers with disability, widows and orphans, and family allowances. Some of these systems are partially funded from contributions given by employees and employers.

- the mandatory or voluntary system type: social insurances guarantee for the protection of people who were named insured against certain situations that may arise and are related to the worker's income before the loss of working capacity. It is funded in whole or in part by special contributions - a percentage of revenue – by the one who respects the conditions. In some countries, social protection is ensured either by choosing one or another of these types of systems or by using both types. At the same time it should be noted that in most countries, some categories of employed (military, civil servants, miners, teachers, lawyers, artists) fit special types of insurance systems.

2. Social Protection Reform in Romania compared to other European countries

Along with the transition to market economy was implemented the policy of social insurance, the most important role was played by the Minister of Labor and Social Welfare, which, since 1968, took over the management of the state social insurances from the General Union of Trade Unions being in accordance with the 783/1969 Decree on the organization and functioning of the Ministry of Labor. As a consequence of the transition to a market economy, after 1990, the existing social security system was updated and modified its permanent adaptation to new economic conditions being a must. Thus, new demands for expansion and improvement of the social insurance system arise, expanding social insurances inevitably and perfecting the existing ones. (Calu, 2005:21). Thus, the State Social Insurance Law 49/1992 shall be drawn amending and supplementing certain provisions of social security legislation. This law amended the 389/1972 Decree on social insurance contribution, so that the contribution of the legal and natural persons having paid employee can be determined differently. Since 1990, the legislative staff protection system has undergone many changes. A comparative study on the evolution of social protection in Romania is presented in the following table:

Table number 1.A comparative study on the evolution of social protection in Romania

Before 1990	After 1990
- the social-insurance contributions - differentiated rates on branches and sub-branches of the economy within the payroll (14%, 25%, 15%)	- social security contributions - undifferentiated rates on the payroll (the social insurance budget law)
-the amount of aid materials for temporary disability is calculated in accordance with the length of uninterrupted work, the tariff wage in the month of calculation(monthly average number of working days = 25.5%) * the percentage commensurate with the seniority.	-the calculus basis consists in the salary average for the last six months, the condition to receive indemnities being provided by the existence of a minimum contribution period.
-the percentages for calculating the material aid are 90% for an over 8 years seniority or 12 months in case of maternity	- the percentages used to calculate indemnities for temporary disability are lower, which means 85% for over 8 years seniority or 12 months in case of maternity.
-the pensions calculated as the average of basic pay and permanent bonuses over the past five years of continuous work, taken by choice	- the pension system reformed and becomes a public system of modern pensions, expanding the categories of participants required to insure (including those who

from the last 10 years of activity	work under an exclusive contract for civil convention); terms specific for the insurance system are released (insured risks, contribution internship, assimilated internship, pension point value, the insured, employer, etc.)
- existence of the 3% pension contribution for the extra pension on the basic salary plus permanent bonuses	- the employee's individual contribution
- the total payroll tax paid by the economic entity	- individual wage tax paid by the employee

Source: made by the author

Before 1990, safety at work was provided by pensions and other rights for social assistance and health. The weaknesses of the social protection system during communism can be summarized as it follows:

- the unemployment was poorly addressed;
- there was a low migration of the international labor;
- the salaries were not correlated with labor productivity.

Best parts of the communist welfare system are considered to be the following:

- establishing the first legislative measures;
- the system was improved and reformed commensurately with the developed European countries (the french and the german models).

In Romania, after 1990, the changes in the system of social protection generated changes in the accounting system and the appearance of different accounts. After 1990, social welfare developed and modernized in harmony with the EU. Specialized institutions have emerged as well: The public system of pensions and other social security rights, the health insurance system, the social protection of maternity in the workplace, the insurance system for work accidents and occupational diseases, the unemployment insurance and the boosting work system.

This social system has been enriched with new forms of protection:

- The Maternity Protection at work by measures capable of preventing the women's exposure to risk:
- the right to leave for maternal risk (the 423 account "Other social benefits granted to employees");
- the right to child allowance until the age of 2 years.
- The contributions paid by employers responsible for health and safety measures at work;
- prevention of occupational accidents and occupational diseases (2002);
- rehabilitation and compensation.
- Social protection done through social health insurances in order to implement national health programs through: preventive medical assistance services, medical services and hospital outpatient services, dental care, emergency medical services, medical services for rehabilitation, medical care, pre, intra and postnatal care, nursing home, medicines, medical supplies, prosthesis and other special services.
- The social protection of the unemployed through the unemployment insurance system and stimulation of employment.

1. Active measures:

- regarding the employers: information and counseling, work mediation, professional training programs, consulting and support in order to start a new business, supplementing the earnings of employees, encouraging labor mobility;

- regarding the insured: subsidized employment, loans on favorable terms to create new jobs, other benefits.

2. Passive measures: offering the unemployment aid. From an accounting perspective, the 437 account "Unemployment fund" hasn't changed over the years.

Social Protection in Romania was placed on a new basis once with the transition to the market sector. It evolved and changed constantly, adapting to the needs of the Romanian economy, to the requirements of practice as well as those imposed by the political manifestation. Health insurance is the main health care system. It is mandatory and offers a free choice entitlement regarding the doctor of the insured, as well as of the health unit and of the Health Insurance Company. The main source of income for the state social insurance budget is represented by the contribution to the social security fund and it is calculated by applying percentage rates on the salary payroll, rates which are differentiated by branches and sub-branches of national economy.

A new report released by the World Bank Group and PricewaterhouseCoopers show that 45 countries around the world have simplified procedures for the payment of fees, with 25% more than in 2009. Despite this, our country hasn't taken a step forward and the payment of taxes and contributions in the local economy hasn't been eased. Romania ranks as the 149th country out of 183 countries, in terms of ease of payment of taxes and contributions and as the 182nd economy out of the 183 analyzed economies concerning the number of required payments (4 times more payments of taxes and contributions in comparison with the global average number of payments). Since January 1990, once with the transition to the market economy, in Romania, the possibility to stop activity has been obvious, the reasons being beyond the work of staff. This fact was not acknowledged, even though it appeared in the socialist economy. Thus, from 1st of May 1990, all business units and the state budget, private establishments, cooperatives, and individuals who use salary work will contribute to the establishment of a fund which will be managed centrally by the Ministry of Labor.

Today, in crisis, an evolution of the unemployment rate rose to 8.1% in January 2010, the maximum unemployment rate not being reached yet.

The private health insurance is an operation whereby an insurer is, on the principle of mutuality, an insurance fund, by the contribution of a number of policyholders exposed to production risks and compensate the people who call them to use extra care package on the account of the fund established the earned bonuses and other income due to the resulting activity. In Romania, the private health insurance for payment of medical services is an additional voluntary system of compulsory health insurance (which covers a basic package of services) and it covers an additional package of services. Given that in 2009, the budget for social health insurance system for laboratory investigations has been halved compared to 2008, more and more patients will use private services, if their "pocket" allows it. The budget crisis affected the whole market of private medical services, the negative effects being felt especially among the insured patients who could not benefit from security deductions from the Health Insurance Company because of the lack of state funds. Thus, private health care services gained more ground, fact which made the players in the industry to predict for 2011 an increased turnover, by 10-20%. In Europe, the social protection principles are roughly the same, social insurance system having as purpose the protection of workers against risks of loss of income during unemployment, illness or disability, and to carry out parental duties until a certain age. The employers calculate and retain the contributions from employees. The Labor Code is the one governing the rights and obligations of employees and employers and the management of the human resources implies the compliance with social norms, such as the principle of discrimination, gender equality and health and safety at work. Within the EU, the citizens of our country and the one of the Union have the same access to employment. There are, however, some countries such as Austria, where foreign workers can access the labor market only under certain circumstances. Most European states have

established a minimum monthly salary (somewhere between 120 Euro and 1400 Euro), but there are countries where it is not established by law, but by collective agreements (Denmark, Finland, Italy, Sweden). In 2009, 350.000 romanian people went to work abroad, most preferring to engage in agriculture, hotels, restaurants or medical field, according to NEA. Although the living standards and the foreign earnings of the Romanian employees have been changed under the imprint of the global economic crisis, few have opted to return to the country and the exodus of the Romanian will continue in 2011, mainly due to lack of job offers on the local market and job insecurity or low remuneration in comparison with European employers offer. We present below a comparative study of the social protection system between Romania and another European countries:

Table number 2 . Comparative study of the social protection system between Romania and another European countries:

Criteria/ Country	1	2	3	4	5	The national minimum salary in 2010
The United Kingdom	X	X	X	X		5,8 pounds/month
Austria	X	X	X	X	The foreign workers can access the labor market under limited circumstances	1014 Euros/month
Bulgaria	In 2010 the report of the social insurance payments done the employee and the employer was: 50:50	X	X	X		123 euros/month (240 leva /month)
Danmark	X	X	X	X	X	Established by collective agreements
Switzerland	X	X	X	X	X	There's no minimum salary guaranteed by the Swiss legislation
Finland	X	X	X	X	X	Established through collective agreements
France	X	X	X	X	X	1343,77 Euros/month
Germany		X	X	X	X	4 Euros/hour(it is established through law just in branches)
Greece	X	X	X	X	X	740 Euros/month
Italy						Established through collective agreements
Hollanda						1407 Euros/month
Poland						300 Euros/month (1317 zloti /month)
România	X	X	X	X	X	Aproximately 145 Euro/month (600 de lei)
Russia						120 Euros/month (4330 Russian rubles/month)
Spain						633,3 Euros/month

Criteria/Country	1	2	3	4	5	The national minimum salary in 2010
Sweden						Established by collective agreements
Turkey	He made little progress in bringing its legislation in line with the Community acquis			He made little progress in bringing its legislation in line with the Community acquis		390 Euros/month (729 Turkish pound /month)
Hungary						280 Euros/month (73.500 HUF/month)

- 1 - Social Security System aims to protect workers against risks of loss of income during unemployment, disability and carrying parental duties until a certain age
- 2 – Employers calculate and withhold the employee contributions
- 3 – The Labor Code regulates the rights and obligations of employees and employers
- 4 - The existence of discrimination, equality among sexes and health and safety at work
- 5 - Equality between nationals and EU citizens

Source:

www.ec.europa.eu

From the perspective of the accounting, in all these countries, the mentioned forms of social protection are recorded through the duty accounts (Class number 4) and expense accounts (class number 6).

Conclusions:

Whether or not EU member states, the goal of all countries is to protect workers against risks of loss of income during unemployment, illness or disability, as well as to help them to perform parental duties until a certain age. Regulation, rights and obligations of employers and employees are made by the Labor Code. Romania stands in the last place among the countries of Europe, as more and more studies show it nowadays. This situation is obvious from the stage of development of the country until the national minimum wage / salary.

Therefore, it is no surprise that many Romanian people prefer to go to work abroad, even working in the field in which they have expertise, earning a 15 times higher payment than in the country. If many of the developed countries, focused globally and increasingly on private pension funds (70% of GDP in 2010), releasing pressure on the state budget in Romania, they represented only 0.5% of GDP 2010 burdening the state budget.

The World Bank has already announced that the public spending on pensions (state) will increase on average across the EU, from 10,2% of GDP (in 2010) to 12,5% (2060) because of the reduction of the birth rate, aging and reduction amid population, while in Romania, by 2060, this would double. A unanimous opinion is that the Romanian public pension system has to be reformed quickly and efficiently by the acceleration of private pensions.

PRINCIPLES- AND RULES-BASED ACCOUNTING DEBATE. IMPLICATIONS FOR AN EMERGENT COUNTRY

Deaconu Adela

Babes-Bolyai University, Faculty of Economics and Business Administration, Cluj-Napoca, Romania

By a qualitative analysis, this research observes whether a principles-based system or a mixed version of it with the rules-based system, applied in Romania - an emergent country - is appropriate taking into account the mentalities, the traditions, and other cultural elements that were typical of a rules-based system. We support the statement that, even if certain contextual variables are common to other developed countries, their environments significantly differ. To be effective, financial reporting must reflect the firm's context in which it is functioning. The research has a deductive approach based on the analysis of the cultural factors and their influence in the last years. For Romania it is argue a lower accounting professionalism associated with a low level of ambiguity tolerance. For the stage analysed in this study (after the year 2005) the professional reasoning - a proxy for the accounting professional behaviour - took into consideration the fiscal and legal requirements rather than the accounting principles and judgments. The research suggest that the Romanian accounting practice and the professionals are not fully prepared for a principles-based system environment, associated with the ability to find undisclosed events, facing ambiguity, identifying inferred relationships and using intuition, respectively working with uncertainty. We therefore reach the conclusion that in Romania institutional amendments affecting the professional expertise would be needed. The accounting regulations must be chosen with great caution and they must answer and/ or be adjusted, even if the process would be delayed, to national values, behaviour of companies and individual expertise and beliefs. Secondly, the benefits of applying accounting reasoning in this country may be enhanced through a better understanding of their content and through practical exercise. Here regulatory bodies may intervene for organizing professional training programs and acting towards the improvement of the codes of conduct's effectiveness.

Keywords: emergent countries, rules or principles-based system, IFRS.

JEL: M41, M48

1. Introduction

The study investigates on the relevance of the principles-based/ rules-based debate for the current accounting period and for an emergent country. By a qualitative analysis, this research observes whether a principles-based system (hereafter PBS) or a mixed version of it with the rules-based system (hereafter RBS), applied in Romania - an emergent country – is appropriate taking into account the mentalities, the traditions, and the cultural elements that are typical of a RBS. Particularly, it investigate, comparing to the accounting regulations for which it argue that, in Romania, are currently a mix of principles and rules, the extent to which principles- characteristic of the International Financial Accounting Standards (IFRS) that influenced financial reporting in this country- are applied at the practice level, which has been traditionally rules-based.

It starts from the PBS system versus the RBS system debate. This is related to the accounting systems classification. A review of the extremely rich literature on accounting systems classification is beyond the aim of this study restricted to reminding some of these valuable studies: Nair and Frank 1980; Nobes 1983; Joos and Lang 1994; Nobes 1998; Alexander and Archer 2001; D'Arcy 2001; Nobes 2004; Sellhorn and Gornik-Tomaszewski 2006; Rossignol

and Walliser 2007. Historically speaking the established groups of accounting systems were: Anglo-Saxon or Anglo-American (AS)- Continental-European (CE); common law- code law; principles based system (PBS)- rules based system (RBS); shareholder-oriented - stakeholder-oriented; investor- creditor protection. Between the above criteria, this study focused on PBS, respectively RBS.

The remainder of the paper is organized as follows: Section 2 presents reference to the items important for this research in the literature, Section 3 develop the qualitative analysis, and the final section comments on the compliance between accounting rules and accounting environment and concludes on the accounting perspectives for an emergent economy.

2. Principles- and rules-based accounting debate – a literature review

Rating an accounting system as a principle- based or rules- based has become again topical after the financial scandals from the beginning of the 21st century, the most famous one being the Enron case, that have generated a crisis of confidence in financial reporting practice and regulation (McKernon and Kosmala 2007) mainly due to some companies that have followed the letter and not the spirit of the laws (Ball 2009). These scandals were the most impacting warning signals as to the need of changing the accounting environment from a rules - based one into a principles- based one in USA and from here in the entire world.

The PBS- RBS controversy features the Financial Accounting Standards Board (FASB), United States Security Exchange Commission (SEC) and the critics of standards or their actions. Being advocated the need to move towards a more principle-based financial reporting system, the FASB and the International Accounting Standard Board (IASB) signed the 'Norwalk agreement' (2004) aimed at the alignment of US GAAP and IFRS. It was agreed in this way that the American Standards are rather RBS, as opposed to IFRS that pertain to PBS. Therefore, the IASB conceptual framework is perceived as a guideline for both normalization and practice, whereas the FASB framework is just a guide for drawing up standards, the practice being dominated by rules (Feleagă 1999). However, there are opinions according to which the US GAAP are rules-based solely on the surface (due to their scope and treatment exceptions and detailed implementation guidance), de facto acting as a PBS (Schipper 2003; Ball 2009). Irrespective of these discussions regarding the American accounting system type, there certainly are difference between the US GAAP and IFRS and these should disappear with the purpose of converging the two sets of standards.

The descriptors of PBS are the fundamentals of accounting such as decision usefulness, true and fair view, going concern or substance over form. The system allows extensive opportunities for professional reasoning taking into consideration that specific requirements are kept to a minimum. This is also the talking point of the advocates of PBS which are scholars as well as standard setters from Anglo-Saxon countries. They also support the utility of this system which, having a deductive-normative approach, potentially gives more room for freedom of judgment to the practitioner (Feleagă 1999; Schipper 2003; McKernon and Kosmala 2007). Instead, a point is made on the laws and regulations (RBS) potentially affecting the degree of freedom and responsibility given to the accountant depriving the professional of bringing new interpretation and freshness of judgment to accounting decision-making. The Institute of Chartered Accountants of Scotland (ICAS 2006) argues that this system provides a comprehensive base and has flexibility to solve new test cases. The skeptics of PBS blame this flexibility that can be used to distort accounting information through earnings management (Nobes 2005). Finally, we note that the PBS, especially a genuine one (type A as per Alexander and Jermakowicz 2006) is supported by the concept of 'true and fair view' that in its turn raised an ongoing debate that will not be detailed in this study.

RBS is based on detailed provisions of solutions for most accounting cases, for which is unambiguously clear how and when it is to be applied. This system mentions and details what is or not is allowed. The main acknowledged advantage of RBS is that it increases financial information comparability facilitating auditors work in verifying the accounts (Schipper 2003). Even so, there are opinions that do not generalize the comparability advantage provided by RBS, suggesting that even such a system applied to various situations may lead to disclosure that causes confusions (Alexander and Jermakowicz 2006). Due to its stringency, in a RBS the professional have limited choices compared to PBS who give them latitude in accounting judgments (Feleagă 1999).

The main trend at this hour is the turn from rules to principles. His supporters argues for focusing attention on practice rather than on stipulated rules, that is what the companies are actually reporting (Ball 2009). It is asserted that this would enhance the professional, even moral judgment and as a consequence the truthfulness of financial reporting practices (McKernon and Kosmala 2007). The authors admit though that PBS is not infallible either, being prone, as well as its rival, to abuses. Pleading for recognizing the proper role of judgment in accounting practice, McKernan and Kosmala (2007) provides us with the solution of a gradual institutional change that includes a progressive relaxation of rules-dependency.

Within this frame of the current stage of the ongoing principles- and rules- based accounting debate, the present research singularizes the PBS- RBS typology to an emergent country, in the light of the IFRS tendency to spread worldwide (over 100 countries at this date, with plans for adoption by a number of others including United States by 2014). In order to analyze the Romanian accounting's evolution it is useful to mention that in literature, PBS is associated with a normalization based on conceptual framework, whereas RBS is associated with a normalization based on the chart of accounts. Also, generally speaking, PBS is superposed on the AS type accounting system and RBS is assimilated to an EC type.

3. Accounting in an economic emergent context – a qualitative analysis

Aiming to discover whether a principles-based system or a mixed version of it with the rules-based system is appropriate to the accounting environment specific to the current stage in Romania, we investigated the potential to integrate the views in the literature on financial reporting differentiation, specifically on the PBS-RBS debate with the economic context of the emergent countries and the orientation of this countries over the IFRS. The research has a deductive approach based on the analysis of the cultural factors and their influence in the last years.

If we refer to developing and emergent countries, out of which many adopted the IFRS, we support the statement that, even if certain contextual variables are common to other developed countries, their environments significantly differ (Hoarau 1995; Mir and Rahaman 2005). To be effective, financial reporting must reflect the firm's context in which it is functioning. Moreover, choosing a set of accounting rules under the influence of the political factors, either external or internal, might prove to be inappropriate to the market's development level, the firms' incentives, or the evolution of the accounting profession, all of these being the drivers of the economic, legal and cultural factors. A significant discrepancy between rules and the environment which persists in time or a significant fluctuation of the accounting rules diminishes the role of financial reporting.

The research looks at the tendency towards PBS showed worldwide and assumes that the tendency is not suitable to any context. Particularly, it is preoccupied by IFRS spread across the world. It sets forth the question of whether this single set of high-quality global accounting standards, IFRS- supported as rules based on demonstrations that compare them to US GAAP or UK GAAP- bring real economical and social benefits due to the accountancy of developing and

emergent countries with traditionally rules- based accounting systems. Is it not that ‘creative compliance’ with IFRS, observable in some countries as a result of enforcing international standards, especially in developing and emergent countries, covers up a diminishing role of an accounting not harmonized with environmental factors? The present study sets out proof for this assertion first of all through the example offered by Eastern European countries today members of the European Community like Romania. During communism these countries had accounting systems that represented adjustments of the Soviet accounting system (RBS type) (Bailey 1995; Richard 1995); afterwards, in the post-communism pre-adherence to the European Union (EU) period they adopted the accounting systems of the EU members from Continental Europe with which they had cultural affinities and/ or that had economical influences on these countries (European-Continental accounting system type- thus RBS, as the case of Romania and its connections to the French system as elaborated in studies like Matis 2001; Feleagă and Ionaşcu 1993; Ionaşcu et al. 2007). In some cases IFRS were adopted by obtaining endorsed-IFRS (the case of Hungary brought into discussion in Fekete’s 2009 study). The same countries adopted IFRS for the consolidated accounts of the listed entities and they harmonized their national regulations with the Fourth European Directive, in the post-communism EU post- adherence period, resulting in- if we would like to quote Romania again- a mix of European recommendations, respectively of concepts and treatments extracted from IFRS. Along with the Eastern European countries, other studies offer examples of transition from RBS to IFRS (PBS), studies containing historiographies of some developing countries- e.g. Ong et al. (2004) for Taiwan- China that assert the difficulty of using the IFRS in the Far East’s practice, this one being anchored on rules; Mir and Rahaman (2005) for Bangladesh, country for which a very low compliance with IFRS is observed due to the pressure exerted by international lending institution considered an undemocratic process of adoption; Hassan (2008), who taking Egypt as a case study shows that new financial accounting rules need to be implemented after a deep investigation of the complexity of the social, political and economic context, especially for less developed country in transition; his findings suggest that Egyptian regulations harmonized with IFRS are not entirely to meet user’s needs. As similarities of these studies we may notice the caution even the suspicions with which either accounting professionals or users of financial reporting regard national regulations change over the IFRS.

Bringing the discussion on the Romanian context, it is firstly important to define the actual accounting system. In the current period, that can be localized after the year 2006, OMFP no.1752/2005 for approving Accounting Rules Harmonized with the European Directives is adopted, which requires all entities to apply accounting rules aligned with the European rules, starting with January 1st, 2006. This act was replaced in 2009 by OMFP no. 3055 on January 1st, 2010, which brings some updating in compliance with IFRS. The action of the Ministry of Public Finances is justified by Romania’s imminent integration with full rights in the EU, integration that materialized at the beginning of the following year. The entities formerly considered ‘large’ applying in the previous stage rules complying with IFRS (PBS type), had to adopt in the current stage the new rules of RBS essence. In this stage IFRS are mandatory for the credit institutions and optional for the other entities considered publicly accountable. The movement in circle (from a RBS system to a PBS system and back) continues for some entities – namely listed entities – together with the compulsory adoption of IFRS for their consolidated accounts on January 1st, 2007.

With respect to the appropriateness of the current accounting system for the Romanian environment, critics regarding the adaptation of IFRS are based on the insufficient education in Romania, from a cultural point of view (the mentality), technical (needed knowledge, practical experience of Romanian professionals), and legal (accounting was strongly anchored in fiscal rules). Ionaşcu et al. (2007) quotes Roberts (2000) when he states, regarding the East European

countries, that the mixture of accounting philosophies through superposing of an Anglo-Saxon accounting system on a legalistic one is a cultural intrusion. In the same manner, Nobes (1998) shows that the introduction of a system of class A (AS type) in former communist countries might be inappropriate; except for the case in which a development of the capital market associated with the AS system is observed, like in the case of large or listed entities. Certain studies (Bailey 1995; Ionaşcu et al. 2007) show that cost-effectiveness of the respective changes was insignificant for the developing and emergent countries, at least during the implementation period. The difficult adjustment to the new accounting rules of emergent countries (mainly to IFRS) is confirmed by other studies as well, for example Bailey (1995), Ong et al. (2004), Ionaşcu et al. (2007), Fekete (2009).

Discussion and conclusions

At this time the views of most specialists on the prevalence of principles on the rules or, at most, a mix up of rules and principles. Rules should reinforce a principle rather than pre-empting or rendering it meaningless. For example, ICAS proposes a high level principle with a minimum of guidance. This should be associated with institutional and legal changes for reducing the number of rules and establishing guides, respectively with the development of accounting professional as expertise and ethics (ICAS 2006). It is also pointed out that RBS-PBS debate was based rather on political and polemical concerns than on conceptual ones (Alexander and Jermakowicz 2006). The same authors assert that the human behaviour is decisive for quality assurance of the financial reporting and for reflecting a fair image of the economic sphere. This viewpoint is also shared by Quinn (2003) who emphasizes that the most important aspect is honesty without which any system is vulnerable, including a PBS type. Good ethics and a good governance system would be needed. We notice the focus on people, on the personal behaviour, on the expertise and expert. These ideas are linked to the findings of studies focusing on the social character of the accounting that depict the movement towards a society increasingly populated by experts (Lowe 2004).

Based on these assertions, as concern the accounting Romanian future, it is to ask if the environmental factors, which we titled accounting environment, can support a PBS system.

Therefore, we will discuss on the Romanian environmental factors, stopping on the cultural ones. The cultural factors are implicit in the choice for accounting rules and within the accounting environment. Thus, we assert that choosing a RBS or a PBS accounting system (rules level) bears the print of cultural domination and cultural affinities of the country, together with the political choices. If we refer to this first dimension of the problem, as being the choice of accounting system – more rules or more principles based – we note the use of IFRS for a limited number of companies, respectively interferences of IFRS – PBS system on the rules applicable to other companies. That means that the European Directive, on which was ensured compliance of Romanian regulations, is influenced as well by IFRS and the PBS model.

Concerns the influence of the cultural factors on the accounting environment, we consider Hofstede's (1983) values discussed by Littrell and Lapadus (2005) for Romania, namely low individualism, uncertainty avoidance and high power distance. Gray (1988), while converting Hofstede's cultural values in accounting values, defines accounting professionalism in relation to the extent of individual professional reasoning in uncertainty accounting tasks. For Romania this means a lower accounting professionalism associated with a low level of ambiguity tolerance, argued also by Harding and Ming-Chuan's (2007) for China as a developing country, focusing on the cultural and social influential factors. If we also look to the accounting practice, we conclude that (also) in this stage, the professional reasoning - a proxy for the accounting professional behaviour - took into consideration the fiscal and legal requirements rather than the accounting

principles and judgments, assessment confirmed by the empirical study conducted by Buiga et al. (2010).

Finally, this synthetic qualitative analysis suggest that, related to a mix RBS-PBS accounting system, the Romanian accounting practice and the professionals are not fully prepared for a principles-based system environment. As Stevenson and Berger (2009) suggest, this kind of environment is associated with the ability to find undisclosed events, facing ambiguity, identifying inferred relationships and using intuition, respectively working with uncertainty, all these being closely related to the enforcement of the ethical behaviour. We therefore reach the conclusion that in Romania institutional amendments affecting the professional expertise would be needed. The accounting regulations must be chosen with great caution and they must answer and/ or be adjusted, even if the process would be delayed, to national values, behaviour of companies and individual expertise and beliefs. Secondly, the benefits of applying accounting reasoning in this country may be enhanced through a better understanding of their content and through practical exercise. Here regulatory bodies may intervene for organizing professional training programs and acting towards the improvement of the codes of conduct's effectiveness. The limits of the study are related to a certain themes which were not investigated enough in this space. Therefore, a future research can develop a description of the current Romanian accounting context, both in terms of rules, as well as practical level. Also, judging that the cultural dimension of the Romanian accounting presented above may not be completely verifiable at this date, it is recommended to extend this short study to the evolution of the profession in Romania, and to retesting of the cultural factors dimension.

THE TRANSPARENCY IN THE REPORTING OF INTELLECTUAL CAPITAL: BETWEEN THE MANAGEMENT RESPONSIBILITY AND THE STAKEHOLDERS' REQUIREMENTS

Dicu Roxana-Manuela

“Alexandru Ioan Cuza” University of Iasi Faculty of Economics and Business Administration

The increasingly ample orientation of the companies towards the intellectual capital is based on the rediscovery of this resource with (almost) unlimited potential, generating economic benefits for a company. Given its importance, the information needs of stakeholders on this line have increased. Thus, in this context, it was put the issue of reporting information related to intellectual capital and the transparency of information published by companies, given that its reporting is not currently regulated. The objective of this paper is to establish an answer to a question: Up to what limit should be made public information related to this capital, given that stakeholders want as much information, and managers only publish information that favors the company's image? In addressing this issue, the point of departure is the intellectual capital structure, most commonly found in the literature, namely human capital, structural capital and relational capital. With this structure, the paper establishes, as a first step, a series of relevant indicators relating to the three components from three different perspectives: resources, management achievements and future expectations. At first observation, the indicators are divided into two categories: financial and non-financial, the first ones targeting the company's performance in relation to the components of intellectual capital, and the latter ones having a pronounced social touch. Based on these indicators, the paper analyses whether a company is willing to publish information, particularly those with social influence, especially in the current conditions of intensely requested social responsibility. In addition to documentary research, we also consider the most important findings based on existing reporting arrangements of the companies, especially from the reports published by them, depending on different criteria, such as social engagement, financial and accounting criteria etc. Given the lack of clear regulations in this respect, it is up to the companies the amount of information publicly provided about this topic, although the benefits of social responsibility have an important impact on the intellectual capital and its components. In this context, accounting helps stakeholders by proposing a valuation model of intellectual capital, based on accounting figures. This financial assessment of intellectual capital, although very useful, is limited and not sufficient in reflecting the image of a company in public reports. This paper aims to present intellectual capital reporting valences, its two sides, financial (which includes the performance of the intellectual capital) and non-financial, including scoring the issues that underline the importance of such reports, from the perspective of the stakeholders and the accountability of the managers in relation to them.

Keywords: intellectual capital, transparency, stakeholders, human capital, intangible assets

JEL Codes: M11, M14, M41

I. The intellectual capital – the 21st century's resource

Bringing in front the intellectual capital in the 21st century companies was a direct consequence of the attitude towards the resources. The theory of resource-based company specifies that company is a collection of material, financial and intellectual resources, the development and the performance of a business being ensured by their use (Neagu 2007: 164). Judging in terms of traditional accounting and directly related to the problem, intellectual capital is generally treated

as intellectual property, plus those unspecified resources, grouped under the specific designation of intangible assets. A composition of intellectual capital is presented as follows:

One is people or *human capital*. We can define human capital as the amount of skills, abilities, talent, knowledge and expertise of employees (Arsene 2010: 158). Another component is what is surrounding people in an organization and that is *structural capital* – all those intangibles left behind, when people go home, internal processes and structures, patents, databases, all documents certifying the know-how of a company. As third part, there are external processes and relations, customer relationships and company's image, called *social (relational) capital*.

A closer analysis reveals though the necessity to include in the definition above any type or transformation of any intangible assets which are under some control of an organization and contribute to the general process of creating added value for that organization. So, from this point of view, intellectual capital must be more than pure intellect, but include intellectual action. It is the move from “having” knowledge and skills to “using” them (Swart 2005: 3). The “using” of knowledge implies that relationships (social capital) and intangible assets and processes (structural capital) are needed to transform knowledge, abilities, skills and expertise (which are owned by the employees – human capital) into a product or service that is of value to the firm and its stockholders.

Analyzing the intellectual capital through *the input-process-output relationship*, we may consider that the input is the knowledge, expertise and skills of the employees. This input is transformed by the processes reflected in the structural and social capital (the know-how of a company combined with its image and relationships with the economic and social environment). The output is the added value for the stakeholders and the company itself.

Related to this matter, there are two different discourses of transparency, namely one discourse based on generic reporting versus a second discourse based on management driven information. In other words, one discourse highlights as much information to stakeholders as possible, but seems to be in the process of being substituted by another, which emphasizes reporting what is seen from the perspective of management, namely the “right” information. The value of the product provided by a company for its stakeholders – the information – should be the result of demand and supply. But that does not happen just so, sometimes the offer of information appears to be a response to stakeholders' demand, but it turns out to be a handled one.

II. The need for transparency in companies' reporting

Transparency considers two categories of information: one related to financial aspects of a company's life and one which takes into account the non-financial life of a company, in terms of relations with stakeholders, environment and society as a whole.

Starting from this general view on transparency of public information of a company, we consider some aspects related to the transparency of the information related to the intellectual capital.

In practice, there can be two different opinions: the application of non-financial indicators provides interesting new angles and are of great value to investors, while identifying important performance indicators aims at informing both managers and investors. In the 21st century, we may affirm is a general consensus that by applying many new non-financial measures, e.g. sustainability measures and social responsibilities (Global Reporting Initiative), companies can strengthen their external communications, thereby achieving greater transparency. *The term transparency becomes equivalent to disclosing non-financial information and information relating to the company's value creation.*

A characteristic of all information, not just those related to intellectual capital, the manipulation at the limit of legality actually allows changing the image to promote the enterprise on the market, being considered, to one point, as “creative”. But as in any other case, the demarcation between opportunity and opportunism is sensitive, and the creativity can become fraud.

Development of creative side of the information publicly provided by the companies, driven by gaps in laws and regulations, makes it difficult or even impossible to assessing the actual situation of the company and causes serious degradation in the truth, putting into question both the responsibility of information producers and their level of transparency. The reporting of intellectual capital, not being regulated, imposes questions about the limits of information publicly offered to the stakeholders, in relation to the transparency required by the responsibility of the information producers.

From these specifications, two partial conclusions can be drawn. First, transparency in terms of providing sufficient information for stakeholders in order for them to be able to evaluate the activities of corporations must be directed towards society as a whole. Second, transparency is mobilized as a means and not a goal in itself, because in this case, it is seen as a characteristic of the information publicly offered to the stakeholders. The more complete information is, the better informed are the decisions makers.

Additional, it has been discussed that a dilemma exists between minimizing information asymmetry and the costs of disclosure, both from a cost/benefit perspective, but more importantly also with regard to the sensitivity of the information disclosed (Nielsen and Madsen 2009: 849-851).

III. The relationship between the intellectual capital and the social responsibility: from internal reporting to accountability and transparency

Production and dissemination of information by a firm is nothing but simply the result of human will and consciousness and it is in fact a social phenomenon. For these reasons, it must be characterized by accountability and transparency. Interests of users of information are different, which causes some, such as managers, to intervene in the application of companies' policies and methods so as to be benefited. Then, position occupied by some users is that they have a privileged status in terms of information (the investors or the banks).

Before trying to find a financial value of the intellectual capital, first we propose an internal representation of the three main components, each considered briefly from three different, but connected, points of view: as company's resources – these can be measured and reported ("what there is"), as a representation of how the intellectual capital management system works ("what is done"), and whether the use of intellectual capital is leading to efficient products and services requested by customers ("what should happen") (Brennan and Connell 2000: 206-240). Are the components of intellectual capital increasing the flow of benefits for the company?

Table no 1 Indicators for reporting the three components of intellectual capital

Category	What there is	What is done	What should happen
<i>Human capital</i>	Seniority	Share of employees with development plan	Employee satisfaction and fidelity
	Education	Number of training days per employee	Human resource turnover and other financial ratios
	Value-added per employee	Report between the profit plus pay and the number of employees	Employee competency and abilities; increase of the expertise
	Education costs	Education/training costs	Value per employee
<i>Relational capital</i>	Distribution of turnover on markets/products	Customers per employee	Customer satisfaction; customers' rating Annual sales per customer
	Market share	Company's policy related to customers; Share of	Lost customers, new customers

Category	What there is	What is done	What should happen
		turnover related to existing customers	
	Marketing expenses	Marketing expenses over net turnover Administration costs per marketing	Medium size of customers; medium time of the company-customers relationship; customers database; brand image
<i>Structural capital</i>	Investments in R&D IT investments	Product development time – intellectual assets generation; brands, know-how, licenses; PCs per employees; IT expenses per employee	Quality Low error rate IT literacy
	Organizational culture	Quality improvements Management philosophy	Reputation inside the company and on the market
	Risk management	Corporate governance	Increased level of transparency
	Knowledge-based infrastructure	Laboratories; databases; distribution channels	

Source: Adapted from Brennan and Connell 2000.

As we can see, the columns for what there is and what is done can be publicly presented, in our opinion. But the third column is usually related to internal issues, and the probability for a company to unconditionally present this information is very low. The third column has a strong social component, so we may consider it is a part of corporate social responsibility and all the indicators should be presented in a social report, as part of the non-financial reporting of a company.

Starting from the indicators presented above, we can find connections between the benefits of corporate social responsibility and the main components of the intellectual capital, pointing out the impact on the latter. Thus, the social responsibility can contribute to the increase of company's intangibles and intellectual capital (especially, of human and relational capital) even if in some cases the effects are embedded in the nature of social responsibility and appear not so evident (Table no 2). The disclosure is essential because it signals the value of investment in intangibles, otherwise unrealized by stakeholders. Therefore stakeholders become aware about social responsibility and this enhances the visibility, legitimacy and reputation of the company itself. In this perspective, corporate social activity is a resource that can be leveraged also by an informative disclosure that reinforces the company capabilities to gain a competitive advantage (Emilio Pasetti et al. 2009: 5). In the last few years, the attitude of the companies is opened to transparency in presenting the information about their social attitude and preoccupations.

Table no 2 Corporate Social Responsibility and intellectual capital

Corporate Social Responsibility Benefits	Impact on intellectual capital
Human capital	
Increasing motivation; improvement of skills and competences through training activities	Employee training
Increasing loyalty, employee safety and health, employee benefits; attract qualified personnel	Employee wellness

Corporate Social Responsibility Benefits	Impact on intellectual capital
Structural capital	
Improvement of voluntary disclosure, of quality of processes, and of internal communication system	Management Process
Proactive risk management; increasing the level of company transparency	Corporate governance
Repositioning of brand name; rethinking competitive strategies; management of stakeholders' relationships	Strategy
Changing in corporate culture; improving commitment	Culture
Improvement of environmental R&D activities	R&D
Relational capital	
Improve company reputation (social, financial, etc.)	Brand image
Acquire new clients, increase client loyalty	Customers
Strengthen co-operation, improvement of supplier ethical and social profile and performance	Suppliers
Increasing investors attention, and financial analysts attention, better market trust, access to ethical indices	Financial relationships

IV. An accounting model for the financial assessment of intellectual capital

The financial overview of intellectual capital imposes a review of the most common financial reporting, which is represented by the differences, sometimes substantial, between company book values and market values, and of the transparency of the accounting information related to that. Together, these indicate the presence of assets not recognized and measured in company balance-sheets. Usually, the intellectual capital accounts for a substantial proportion of this discrepancy.

At present, companies are not required to report on intellectual capital assets, which leave the traditional accounting system ineffective for measuring the true impact of such intangibles.

If the report of intellectual capital would become mandatory in the explanatory notes to the financial statements, the form of the financial overview of intellectual capital is as follows (Hoogendoorn et.al 1999: 4):

Fair value of the company (A) - The fair value of the tangible and monetary assets, after deduction of debts and provisions (B) - The fair value of the identifiable and separable intangible assets (C) = The fair value of the remaining intellectual capital (D)

This overview is drawn up on the basis of the idea that the value of the intellectual capital equals the difference between the fair value of the company (or the shareholders' value) and the book value of the tangible and financial assets less debts and provisions. In order to realize an accurate valuation of the intellectual capital, which equals the sum of C and D, we take the view that the fair value of the company should be deducted from the fair value of the tangible and monetary assets, less the fair value of the debts and provisions. If, for example, the cost of property would be used instead of the fair value, the difference between fair value and historical cost would improperly be attributed to the valuation of the intellectual capital.

In case of reporting for intellectual capital, the distinction between elements C and D is important for the assessment of the company's financial position by stakeholders. The better a company is able to translate its intellectual capital into identifiable and separable intangible assets, the less dependent the value becomes on future profit expectations: after all, identifiable and separable intangible assets can be traded independently and can therefore generate earnings independently, regardless of movements in the profitability of the organization as a whole.

This accounting model does not pose the problem of transparency, but it answers partially to the information needs of stakeholders, providing information about the aggregate value of

intellectual capital. In this case, we have to mention that, in our opinion, the financial reporting (mainly related to performance indicators calculated in relation to intellectual capital and the valuation model) must combine with a non-financial, social reporting.

V. Conclusions

This paper is an overview of financial and non-financial indicators relating to the intellectual capital, which should be reported by companies, in order for them to answer to informational needs of their stakeholders. The impact of non-financial reporting of intellectual capital, as part of the corporate social responsibility, is a strong argument in this direction. Of course, the reporting may include a way to commensurate it using the accounting data.

Yet, regardless of the nature of information, for it to be included in external reports, it imposes restrictions: the question of which level of aggregation of information can still provide meaningful and useful information for the stakeholders. A financial amount is enough or it must be completed by non-financial aspects, which determined that amount? The question of whether information included in reviews intended for internal corporate control, in the form of performance indicators, qualifies for publication in external reports must also be answered. Clearly, confidential information and information of strategic importance to competitors cannot be disclosed, despite the fact that stakeholders are seen as privileged users. This last point poses the problem of transparency. *Where the confidentiality ends and transparency starts? Because, in the case of intellectual capital, transparency is not regulated, it became a matter of responsibility and professional reasoning of the management?*

Arguing the need for transparency in financial and non-financial reporting of intellectual capital is defining in presenting a company as a sum of tangible and intangible resources. Limiting the transparency and awareness of users can affect the quality of decisions and their degree of confidence in decision making. Promoting this concept and its influence on the materiality of disclosed information can improve the quality of financial and non-financial reporting of economic entities.

THE BUDGETARY POLITICS ON THE MANAGEMENT OF THE PUBLIC RESOURCES THROUGH THE STATE TREASURY

Ionescu (Eftene) Nicoleta
Valahia University of Targoviste

Mihai (Andreescu) Gabriela
Valahia University of Targoviste,

The birth of State Treasury facilitated the creation of better conditions and possibilities for the organization of cash register execution accountancy of consolidated general budget components, especially regarding the watching over collecting incomes, a better control on payments and also to increase effectiveness and the accuracy of received information. The treasury must become a leading institution on the financial line, through which it can administrate and manage the public funds better.

Keywords: State Treasury, public institutions, public resources, consolidated general budget, budgetary execution

JEL Classification: M41

1. Introduction

The concept of public treasury is an old concept, having its genealogy in antiquity, when, in order to fulfill diversified public needs, there were formed and administrated funds within special institutions and these institutions have become with time what we call today treasury.

Public treasury, as a concept and trends in its evolution regarding organization, running and attributions in different phases of its history, has closely followed the development course of the social-economical society. That is why, the level of development and the complexity of financial operations that are performed by the public treasuries in different countries of the world depend, overwhelmingly, on the level of development for that country's economy, the ratio of state's intervention in that economy and the abundance or the poorness of resources in public finances that they have to manage.

The organization of State Treasury in Romania, starting in 1993, was based on the background of profound transformations in political, economical and social layouts, determined by the transition of Romanian economy towards the competitive market economy.

According to Government Emergency Ordinance no 146 from November 2002, State Treasury is defined as being "an unitary and integrated system through which the state assures the execution of collections and payments regarding public funds, including the ones regarding public debt, and for other operations of the state, in safety conditions in accordance with the effectual legal dispositions".

In modern economy, respecting the autonomy and organizational unification principles, and the liability of operations through the detachment of rights and responsibilities for credit's sequencers and the accountants, during the process of diversifying the function and attributions of the Treasury, the state has entrusted to it duties and particular actions regarding its intervention in economy.

According to Ordinance no 1235 from September 19th 2003, "public institutions, regardless the financing and subordination, performs the operations of collections and payments through State Treasury units where they are fiscally registered". Accordingly, for local and central public

institutions, the State Treasury effectuates operations of offsets with and without cash in case of constitution and use of public resources.

In practicing these basic attributions, State Treasury must ensure a fiscal and operative control on collecting incomes and a precautionary control regarding the abidance of payments disposed by credit's sequencers, in the limits imposed by legal stipulations and according to the destinations approved within each budget.

Considering the main characteristics of fiscal-budgetary politics that are subordinated to the objectives of sustaining the growing of the economy and of reducing the inflation, aligning us to the opinions and recommendations of the European Commission, but also to the rating agencies appeared along with the seasonal evaluations, regarding the reducing of budgetary expenses, hence it results that, for avoiding the noted risks and, implicit the risk of starting the procedure of excessive deficit, it is necessary the embracement of a policy of limiting budgetary expenses and a more careful approach of the budgetary deficit, in consideration of the fact that these elements regard the public's general interest.

In these conditions, State Treasury is called to exercise one of its functions, that of administrator of public funds, function that assumes that all public financial resources to be collected, centralized and used through this financial institution, under a strict supervision and control.

2. The functions of State Treasury

This function assumes that, permanently and at any time of the year, the report between collecting funds, on one hand, and the use of these under the form of cash payments on the other hand, to have a greater value, or in the worst case to be equal. In case that the degree of collecting public funds don't cover the payments and these are urgent, the treasury is obliged, invariable, to contract public loans without having the necessary rest, in many cases, to choose the most convenient version regarding the „cost” of this operation (rate of interest). Maintaining a suitable report in favour of collecting public funds is a real difficult problem during a construction of a budget with deficit, reason for which the public Treasury is obliged, almost permanently, to borrow funds for short term from the money market and for medium or long term from the financial market. In other words, the accomplishment of this function obliges the public Treasury to, on the ensemble of the circuit, the outcomes of funds for each action to be covered, compensated at any times with the entrances of funds, no matter their provenience: collection from taxes and fees, credit loans/bank loans (Central Bank), cash of its correspondents, internal or external public loans. To this end, the public Treasury must always „keep up”, from the point of view of funds' constitution, with the rhythm of effectuating the payments that have a greater regularity then collections.

Therewith, the State Treasury ensures the total correlation of incomes and expenses with the budget to whom they belong, which dictates that the collected incomes to be totally infused in the budget where they belong and the expenses, also, in their entirety to be supported by the budget where they have been prefigured, the general rule being that an expense can be financed by only one budget. Also, the credit sequences to not make payments directly from the incomes in order to not eliminate the possibility of fiscal control on collecting incomes and the preventive control on making the payments through the compulsoriness of registering entirely the collections and payments. This principle is not working properly in the case of special funds budgets and own incomes of public institution, being able to make expenses only after there have been previously constituted the necessary funds.

Regarding the collections of income, especially the making of payments from the budget must always be done only with the respecting of legal stipulations, the treasury's units wouldn't release the sums unless there were respected all the procedures regarding the commitment, liquidation and the ordering of the sums. The budgetary expenses have a precise and limited

destination and they are determined by the authorization contained in the specific laws and in the yearly budgetary laws. Also, no expense can be included in public budgets, nor committed or made by these budgets if there is no legal base for that certain expense.

Regarding the making of the payments, the public institutions, regardless of their financing system and subordination are obliged to present to the State Treasury where they have opened the accounts, the approved income and expenses budget, distributed in trimesters under law conditions.

In deducting the sums cash or through transfer from the public institution's accounts for effectuating the expenses, State Treasury units verify the existence of income and expenses budget for that certain institution and the list of investments, approved under law condition, following the honoring of open or divided budgetary credits limits or of the funds availability, as is by case, and their destination, like some other objectives settled through methodological norms by the Ministry of Public Finances.

3. The features of fiscal policy

Taking into account the current international context, the main features of fiscal policy in the period ahead, which will be subordinated to the objectives of sustaining economic growth and reduce inflation and achieve a budget deficit at a level correlated with macroeconomic objectives, regarding to the opinions and recommendations of European Commission and international financial organizations, regarding the reducing of public expenses for the purpose of diminishing current administration expenditures and the priority allocation of the resources towards projects with multiplying effect in economy that represents the main way of limiting the economical decrease rhythm and for partial compensation of activity reduction from the private sector, for maintaining the budgetary balances, there are necessary some measures meant to reduce the volume of budgetary expenditures to a level that permits the honoring of internal and international commitments assumed by Romania's Government, including the ones regarding the level of budgetary deficit.

According to Government Emergency Ordinance no 34/2009, the authorities and public institutions are prohibited from purchasing, leasing or rental of:

- cars, as defined in par. (1) of art. 3 of Government Emergency Ordinance no. 109/2005 regarding road transport, approved with amendments by Law no. 102/2006, with later changes and completion.
- Furniture and office equipment, as provided in subgroup 3.1 "Furniture" and 3.2. "Office equipment" in Group 3 "furniture, office equipment, protective systems of human values and materials and other tangible assets" of the Government Decision no. 2.139/2004 for approving the Catalogue regarding classification and the useful life of fixed assets, as amended, and the nature of their inventory intended to equip the office space.

Ensuring supply needs will be possible only through redeployment of the same institution or other public institutions.

Exceptions to the above stipulations:

- new public authorities and institutions established after the effective date of this ordinance, only in the first year of operation, if they do not come from the restructuring and / or reorganization of public institutions already existent;
- acquisitions for projects financed by loans, foreign funds grants and related mutual financing and previous financing funds and funds from donations and sponsorships;
- investment objectives implemented after the effective date of this ordinance, provided that in the general estimate of the work has been provided as an initial endowment;

- renting cars by the Ministry of Foreign Affairs for ensuring the logistics necessary to the organization of foreign politics events, only in the situation that the vehicles from the institution park do not correspond to the objectives that must be accomplished.

Also, the payment of the invoices representing the value of purchased goods, performed services or effectuated works is made by the public institutions between 24-31 of each month.

In order to carry out the equilibrium conditions of public sector expenditures, the public institutions have the obligation to program its payments through transfer or cash, (according to the methodological norms approved by order of the Minister of Public Finance). Within three months from the date of entry into force of this ordinance, the payment terms associated with the closed legal commitments are correlated with the payment terms set out above.

Although the making of the payments is in the credit's sequencer's responsibility, treasuries operative bodies are obliged to exercise preventively a financial control on these, meaning they can not accept for pay the payment orders that have as object of payment material expenses forbidden to be made in the Government Emergency Ordinance 34/2009. Also, if the public institutions don't have forecasted the payments according to the valid legislation, or if the payments representing material expenses are realized until 24 of each month, these are rejected from payment from the operative treasury.

The way these measurements are applied and respected by the public institution is the responsibility of State Treasury units, these being called to ensure the proper compliance of the measures taken by the Government.

In case of failure for the Government Emergency Ordinance no 34/2009, the Minister of Public Finance is authorized to take the following measures:

- blocking the appropriations of budgetary credits for the main credit sequencers of state's budget, the budget of state's social insurance, the budget of unemployment insurance, the budget of single national fund health insurance and local budgets;
- the blocking of accounts opened of behalf of State Treasury units of public institutions funded partially or totally from their own income;
- in case of not honoring the term of payment or the announced graphic of payments, the Minister of Public Finance reserves the right of removing from deduction the unannounced sums, and the responsibility for not deducting the order of payments presented to the territorial units of State Treasury is totally of the credit sequencers.

Considering the big volume of remaining payments registered by the administrative-territorial units towards the economic operators that perform services and works of locally public interest, also the debts that these register towards the state's budget, the budget of state's social insurance and the budget of special funds and also the stipulations of the stand-by arrangement between Romania and the International Monetary Fund regarding the remaining payments, that all these aspects target the public interest and constitutes extraordinary and emergency situations whose regulation can not be postponed, according to the Emergency Ordinance no 51/2010. In the year 2010, the Minister of Public Finances grants to the administrative-territorial units loans from incomes obtained through privatization, registered in the general current account of State Treasury, with an interest of 6,25%, with a reimbursement term of maximum 5 years, with a grace period of one year to pay outstanding liabilities recorded by them on December 31, 2009 towards the economic operators that are suppliers of goods, services and works, including towards the economic operators that performs the public service of producing, transportation and distribution of heat in centralized system, outstanding at the date of requesting the loan. The period of granting the loan is settled in the loan conventions closed with the administrative-territorial units.

The sums granted to the administrative-territorial units on loan from the proceeds from privatization will be used exclusively for:

- to settle outstanding tax obligations of economic operators, suppliers of goods, services or works of administrative-territorial units, including public service operators providing generation, transmission and distribution of heat in a centralized system;
- to settle outstanding tax obligations of economic operators who have outstanding amounts of receivable sums from the public service operators providing generation, transmission and distribution of heat in a centralized system.

For requesting the loan from the Ministry of Public Finances, the administrative-territorial unit, through the main credit sequencer, prepares the application for requesting granting a loan from privatization incomes in accordance with the stipulations of Government Emergency Ordinance no. 51/2010, to which they attach the list of economic operators whose remaining obligations are extinguished within the requested loan and the copy of the local or county council resolution, by case, in which is approved the contract of the loan from privatization incomes registered in the general current account of State Treasury, stamped and signed, in accordance with the original.

The value of the loan requested by the administrative-territorial unit can not overcome the value of the smallest from the total of the obligations of outstanding payments registered by this on December 31, 2009 towards the economic operators providers of goods, services and works, including towards the economic operators that perform the service of providing, transportation and distribution of heat in centralized system, outstanding at the date of requesting the loan, and the total of outstanding tax obligations.

The sums granted as loan to the administrative-territorial units are transferred by the Ministry of Public Finance, from the incomes of privatization registered in the current general account of State Treasury, in account 50.02.44 “ Available from loans granted from incomes of privatization according to Government Emergency Ordinance no 51/2010”, opened at the territorial units of National Tax Administration Agency will communicate electronically to the competent tax authorities the list of economic operators suppliers of goods, services and works for the public service of providing, transportation and distribution of heat in centralized system and for the economic operators that have to receive outstanding sums from these ones, under their administration and also the allocated sums for the administrative-territorial units with the purpose of extinguishing the tax obligations registered by them.

The competent fiscal body, through the service/department responsible for analytical evidence per payers, prepares the transfer notes of sums destined for extinguishing these obligations and sends them to the units of operative treasury.

The units of State Treasury have the obligation that within 5 days from receiving transfer notes send by tax authorities, to transfer the sums destined for the extinguishing of tax obligations from account 50.02.44 “Available from loans granted from privatization incomes according to Government Emergency Ordinance no 51/2010” in accounts of proper budgetary incomes, opened on fiscal identity codes of economic operators suppliers of goods, services and works of administrative-territorial units and respectively, of economic operators that performs public service of providing, transportation and distribution of heat in centralized system.

Also, the sums received in the account 50.70.34 “Available of economic operators from collected sums according to art 4, par. (2) from Government Emergency Ordinance no 51/2010” are transferred by the State Treasury units within 5 days from receiving the transfer notes made by tax authorities in accounts of budgetary incomes opened on fiscal identity codes of economic operators suppliers of goods, services and works of economic operators who perform the public service of providing, transport and distribution of heat in centralized system.

The above operations will be made by State Treasury units only if the sums included in the transfer notes are equal or inferior to those communicated in electronically system by the General Direction of Treasury and Public Accountancy. Contrary, the transfer notes will be refunded to the tax authorities for making the necessary corrections.

For the performed operations, State Treasury units issue statements for accountant holders, to which they will attach copies of the transfer notes made by tax authorities, afferent for the extinguishing operations of tax debt.

Another measure took by Romania's Government to restore budget balance is to reduce the wages of the staff of public institutions, according to Law 118/2010 with 25%. The sums resulted from the decrease with 25% of the gross amount of salary rights is transferred by the employers in the accounts of incomes of state's budget 20.36.01.20 "State's budget incomes - Payments from reducing the wages according to Law no. 118/2010", opened to the units of State Treasury in the area where employers are taking the tax records. The sums are transferred to the state's budget and then it is declared to the competent tax authority, by completing and filing Form 100 "Statement on payment obligations to the state budget", until 25 of next month following that for which it shall pay the salary.

4. Conclusions

Through the Treasury, the Ministry of Public Finances disposes of specific analysis instruments in all the steps of elaborating, approving and implementing the state's budget, the budget of social state insurances and the local budget in order to maintain the financial, monetary, currency balance overall, and proper management of internal and external public debt of the state. Through this system there have been created the necessary conditions that the competent state authority to oversee the establishment of public financial resources and their use in the purpose for which they were assigned.

The public treasury can be considered a state service that ensures the great monetary and financial balances of the state, through the cash , banking and public accountancy operations, and also through its work of guardianship, funding and boost the economic and financial field.

It should be brought to attention the activity of numerous anonymous public clerks that activate in the units of State Treasury, which, because of their personal responsibilities, bring up a very effective defense wall if not against abuses of all kinds, at least against diversion and theft of public funds. In the exercise of authorities, they watch over the integrity of public funds, their function remaining one of the most important wheels of state.

As it is mentioned in his work "La direction du Tresor", the French author, Francois Eck, the general treasurer-cashier, helped by history-stratified administration, devoted to public service, preoccupied with competence and discipline, copes with missions that request a very high degree of effectiveness and takes responsibility of the function of repressed financial circuits of the state, of local communities and public institutions.

CORPORATE GOVERNANCE—THE ROLE AND APPLICATION OF THE PRINCIPLE OF TRANSPARENCY

Fülöp Melinda Timea

Universitatea Babeş Bolyai din Cluj-Napoca Facultatea de Ştiinţe Economice şi Gestiunea Afacerilor, Cluj-Napoca, România

The aim of the current research is to clarify the concept of ‘corporate governance’ as we believe it is a relatively new concept at national level. At the same time, our analysis focused on the manner in which the principle of transparency has been incorporated into the recommendations and regulations/provisions of the Bucharest Stock Exchange (Romanian: BVB) and how this principle has been applied by the companies listed with the BVB. In order to accomplish the objectives of our research, we adopted a deductive approach, from general to specific, by means of which we were able to combine qualitative with quantitative studies. Therefore, our approach started from the definition found within the principles of OECD according to which ‘corporate governance’ is the system by which companies are run and controlled. In Romania, the concept of ‘corporate governance’ was first advanced in 1999 by the Strategic Alliance of the Business Associations (Romanian: ASAA), which drew up a “Voluntary code of corporate governance” in association with the Confederation of Private Entrepreneurs in Timiş county and the Chamber of Commerce and Industry of Romania and Bucharest. Another facet of our research is the principle of transparency and the manner in which entities should put it to practice in order to ensure efficient corporate governance. To this effect, since the beginning of 2009 the entities listed with the BVB have been under obligation to report which recommendations of the new Corporate Governance Code have actually been implemented by the company in the current financial year by disclosing to BVB the “Comply or Explain” Statement. The findings of our research show that the concept of ‘corporate governance’ has lately been a matter for intense debate due to the famous financial failures in recent years. In 2009, Transelectrica was the only company in tier I of the BVB which filled in and submitted the “Comply or Explain” Statement. Therefore, we believe that Transelectrica should serve as a fine example for the entities listed with the BVB as regards the filling in and submitting of the said Statement.

Keywords: corporate governance, transparency, efficiency, recommendations, regulations M42, M48

1. Introduction

As framework for the operation of the external audit, corporate governance has been conceptually analyzed starting from the universally acknowledged definition found in the principles of OECD, then in terms of its attributes by taking into account its underlying principles. Therefore, we believe that efficiency may be a defining attribute for corporate governance on condition that all recommendations and principles of OECD issued in this regard are strictly followed. Our purpose has been to deal at great length with the principle of transparency, as it is closely related to the topic being researched. To this effect, we studied the manner in which the principle of transparency has been incorporated into the recommendations and regulations of the BVB. In order to conclude our theoretical study we analyzed the manner in which this principle is applied by the Romanian societies/companies listed with BVB in tier I, and then we made a detailed presentation of an example of good practice and conducted a case study focused on Transelectrica society.

In the final part of our scientific endeavour we present the main conclusions which highlight the findings of the research conducted.

2. Research methodology

In order to accomplish the objectives of our research, our scientific endeavour adopted a deductive approach, from general to specific, which combines qualitative with quantitative studies. The starting point of our research is based on the current level of knowledge of the key concept „corporate governance”.

The concept of governance has been approached in terms of the Principles of Corporate Governance issued by OECD as well as the degree to which these principles have been incorporated at national level and the role they play in developing efficient corporate governance. Going from synthesis to analysis, we continued by stressing the importance of observing the principle of transparency and conducted a case study about the observance of the said principle by the Romanian entities.

In conducting our case study on the practices of efficient corporate governance adopted by the societies listed with the Bucharest Stock Exchange, we made use of the non-participant observation method which, according to Krüger (1988), gives a series of advantages because the information can be obtained easily and at little expense when the respondents are not willing to impart it. Thus, we were able to obtain in-depth, direct information which has not been processed or interpreted.

3. Defining the concept of corporate governance

The concept of corporate governance was first introduced in 1999 by the Organization for Economic Co-operation and Development (OECD). OECD defines ‘corporate governance’ as the system by which companies are run and controlled as well as the manner in which liabilities and rights are shared by the main actors (shareholders) of an entity. Of these, OECD mentions the Board of Directors, who has a substantial decision-making role to play in a company, followed by managers, shareholders and other stakeholders. In order to support entities to apply the principles of corporate governance, OECD published a guide to corporate governance describing the principles underlying an efficient corporate governance.

The OECD principles describe the manner in which decisions should be taken within an entity, starting from the definition of the strategic objectives, the proper means to achieve them and the monitoring of the financial performance. Managers occupy the leading role in bringing more efficiency to the corporate governance. Therefore, a good corporate governance must provide managers with adequate incentives in order to motivate them to run the entity properly and pursue the accomplishment of the entity’s and shareholders’ objectives (OECD, 2004).

The concept of corporate governance could be well summarized as being a set of processes, customs, policies, laws and institutions affecting the way an entity is administered and controlled, with a view to increasing its performance and value. It actually refers to enhancing the efficiency of the management systems, with special emphasis on the role of the Board of Directors, the responsibility and remuneration of its members, the credibility of the financial situation/standing and the efficiency of the risk management systems.

In Romania, the concept of corporate governance was first advanced in 1999 by the Strategic Alliance of the Business Associations (Romanian: ASAA), which drew up a “Voluntary code of corporate governance” in association with the Confederation of Private Entrepreneurs in Timiș county and the Chamber of Commerce and Industry of Romania and Bucharest. The Code’s purpose is to draw the attention of the business environments, the Boards of Directors and CEOs of the incorporated enterprises to the experience of the OECD countries and the principles they adopted in the field of corporate governance.

On the other hand, the Bucharest Stock Exchange is actively engaged in promoting the principles of corporate governance issued by the OECD. One of the first steps in this regard was the establishment in 2001 of a Corporate Governance Code which the entities trading on the market of the BVB should apply in whole or in part. In 2008, the Code was amended in order to be harmonized with the principles of corporate governance issued by OECD. The Code, taking effect from the beginning of 2009, contains certain recommendations on the transparency of the obligation toward the BVB and investors to submit the Annual Report. The Code contains 11 articles structured by the principles of OECD. One or more of the 19 principles are explained in each article and for each principle the Code elaborates recommendations for its application so that the Code comprises a total of 41 recommendations. In order to help the issuers apply the recommendations of the Code, in March 2010 the Bucharest Stock Exchange published 'Implementation Guidelines for the Corporate Governance Code' which provides details on the implementation of certain recommendations.

4. Efficient corporate governance

It is necessary to strictly observe each and every principle so that corporate governance may properly be termed "efficient".

a) The role of observing the principle of transparency in developing efficient corporate governance.

Below we shall deal exclusively with the principle of transparency and the manner in which the entities must put it to practice to ensure efficient corporate governance, as the said principle is directly related to the purpose of our research.

An important role within corporate governance is occupied by the transparent information of shareholders and other stakeholder categories. In order to build up their trust in the financial and non-financial information provided by the entity, the information must be audited. As the financial auditor is an independent professional whose activity is carried out in the public interest, his opinion expressed in the audit report contributes to the increase of all stakeholders' trust in the accuracy of information provided by the entity.

The range of reports made up of balance sheet, profit and loss account, cash flow, capital inflow and outflow along with guidance notes and accounting policies are the main financial information provided to stakeholders.

The data contained in the range of financial reports are the product of accounting at organizational level and of the external reporting systems, which provide data on the entities' financial standing and performance.

In order to observe the principle of transparent information/informing of all stakeholders, equal importance must be attached to financial and non-financial information. This requirement is also emphasized in the study conducted by the McKinsey (2001) consultancy firm regarding the opinion of institutional investors from emergent countries (Asia, Southeastern Europe and Latin America) about corporate governance. The study shows that, when taking investment decisions, investors attach equal, if not more, importance to non-financial information on corporate governance as they do to financial information (Robu et.al., 2004).

Providing transparent information may contribute to efficient corporate governance through the improvement of the quality of information. The demand for information on the part of investors, financiers and financial analysts has increased considerably over the last years, as did the competition. This aspect, in corroboration with the international financial scandals, required that entities pay increased attention to the quality of information provided, especially in the case of listed companies, as well as the active involvement of security regulators and international accounting bodies.

As shown in the studies conducted by DeZoort et al., (2002) and Porter (2009), at entity level an important role in observing the principle of transparency for the information provided is occupied by the triad internal audit—audit committee—external audit.

Taking these aspects into consideration, the Corporate Governance Code issued by the BVB deals with transparency, financial reporting, internal control and risk management within the same article, that is, Article 7.

b) Incorporation of the principle of transparency in the BVB's recommendations and regulations

Starting with 2009, the entities trading on the BVB market are under obligation to report which recommendations of the new Corporate Governance Code have been concretely implemented during the current financial year by submitting the “Comply or Explain” Statement.

In the “Comply or Explain” Statement, a set of questions were framed for each principle, concerning which recommendations should be adopted. Of the total number of recommendations published in the Code, the Statement only took 28 of them, framed as questions which can be answered by YES, NO and IF NOT, PLEASE EXPLAIN. The recommendations taken in the Statement focus on the following aspects: definite transparency structures, recommendations on the respect for and active and effective communication with stakeholders, choosing, structure and efficiency of the Board of Directors, establishment of the nomination committee, remuneration of the Board of Directors and various committees and governance structures, the protection of the entity's interests and not somebody's personal interests.

The recommendations which were not directly taken into the “Comply or Explain” Statement complete and provide details about those explicitly found in the Statement. In order to give an overall picture, below we specify those recommendations that were not taken in the Statement: participation of shareholders to the Shareholders General Meetings as well as using the best efforts to facilitate their participation, recommendation on the privilege-based transaction, responsibility and the balanced social structure of the Board of Directors, forwarding the list with the candidates to the office of administrator/director, coordination, appointing and evaluation of the members of the Board of Directors by the Nomination Council/Committee, if any, submitting to the Board of Directors the proposals on remuneration drafted by the Remuneration Council, if any, and last but not least, the modifications regarding the new management system (adopting the dualist system) and the application of the governance codes.

5. Transelectrica case study on the application of the principle of transparency by the Romanian societies

After we analyzed the annual reports of the 21 entities listed with the BVB in tier I, we found out, to our great disappointment, that only one of the 21 entities submitted the “Comply or Explain” Statement for 2009. Transelectrica is the only entity which disclosed to BVB the “Comply or Explain” Statement for 2009 in the Annual Report of Directors.

From the statement made by Transelectrica “Although the ‘Comply or Explain’ Statement is not compulsory for the current Annual Report, the company has decided to submit it as a token of respect for shareholders and investors” we can notice their keen interest in the corporate governance as well as in the participants to the capital market. The analysis of the statement filled in by the entity reveals a small number of negative answers (9) out of the 28 recommendations. Some negative answers were given for Principle XI “*The company will secure the services of good quality directors and executive managers by means of a suitable remuneration policy that is compatible with the long-term interests of the company*”. Of the negative answers, we would like to present the one given to the question “*Does the Board of Directors analyze at least once a year the need to register a remuneration Committee/policy for the directors and members of the executive management?*”. According to the negative answer provided, the company complies with the requirements of the Statement and offers a plausible explanation “*Not applicable. The*

Remuneration Committee was set up as of 2007”, which proves the entity’s interest in adopting the principles of corporate governance. The answer to the recommendation on the company’s remuneration policy is also negative, the explanation being *“Applicable legal provisions and decision of the majority shareholder are enforced”*. This explanation is offered for most of the negative answers.

Although one third of the answers provided by Transelectrica are negative, we would like to also pinpoint the great number of positive answers. Thus, the entity provides positive answers to two thirds of the questions framed according to the recommendations of the BVB’s Corporate Governance Code. Mention must be made of the fact that explanations are also provided in the case of some recommendations for which the entity gives positive answers, thus giving further details about that particular answer. The first explanation given for one of the positive answers was indeed enjoyable to read *“Are the corporate governance structures, positions, competences and liabilities of the Administration Board and of executive management defined in the Corporate governance best practices/regulation? These are defined in the Transelectrica Corporate Governance Regulation as well as in the supporting documents published”* because we could see the entity’s interest in obtaining information and in elaborating corporate governance regulations. Another positive answer whose explanation was worthy to notice is the one related to the audit committees *“Is there an Audit Committee within the company? The Audit Committee was set up as of 2007. Update of appointment currently in progress”* thus proving that the audit committees were set up on the initiative of the company and not under any legal constraints.

6. Conclusions

Our research focused on corporate governance, a topic of intense debate over the last years due to the failure of some famous international companies. One can develop efficient corporate governance only if all OECD principles in this regard are observed. Our research focused mainly on the manner in which the principle of transparency must be put to practice in order to ensure efficient corporate governance. To this effect, we studied the manner in which the principle of transparency has been incorporated into the recommendations and regulations of the BVB. In order to conclude our theoretical study we analyzed the manner in which this principle is applied by the Romanian societies/companies listed with BVB in tier I, and then we made a detailed presentation of an example of good practice and conducted a case study focused on Transelectrica society. By filling in and submitting the “Comply or Explain” Statement, we believe that Transelectrica should serve as a fine example for the entities listed with the Bucharest Stock Exchange. This Statement is a good means to provide the shareholders and potential investors with information on the structure and organization of the entity.

The present research aims to highlight the importance of the external auditing in supporting corporate governance and the preference of the listed entities to be audited by the big audit companies. Given the proposed objectives of the research, our scientific method is based on a deductive approach from general to particular that combines quantitative and qualitative studies. The role of the external audit was analyzed by conducting a study of literature on two levels: a theoretical–conceptual level in terms of economic theories and an empirical-practical level based on literature from which we extracted through a content analysis the defining elements of the audit work quality. Falling within the scope of the study, we evaluated the preference of the listed entities to be audited by the Big Four. To this end we used the content analysis of the publicly posted audit reports for the period 2005-2009. Our research results show that although we are a country with an emerging capital market development, the entities in the I-st category on the Bucharest Stock Exchange tend to an audit conducted by one of the big audit companies. Another result arising from our study is that the entities of the I-st category on the Bucharest Stock Exchange become more transparent from a year to another. Whether for the year 2005 we find only 12 audit reports publicly posted, in 2007 we can find 21 audit reports publicly posted. The trend of the large entities audited shows that the preference of the entities to be audited by one of the Big Four is higher from a year to another. The preparation of the financial statements and their audit must be done according to regulations for the currently period. The presumption found in the literature according to which the large entities are audited by the big audit companies which provide higher audit quality is confirmed in the case of our national country as well.

*Keywords: external audit, audit report, opinion, listed companies, Big Four
M42, M48*

1.Introduction

One of the prevalent ideas in the literature supports the preference of the large entities to be audited by the big audit firms, and the most common argument to support this preference is the quality of their audit services (Moizer 1997, Francis 2004, and Barton 2005).

Starting from this hypothesis we wanted to study its validity on the Romanian capital market and we studied whether this preference also applies to the entities listed on the I-st category of the BSE, knowing the fact that Romania is an emerging country and its market capital is being developed. According to the analysis we can conclude that Romanian entities listed on the BSE follow the same preference as the companies listed on international markets.

In the Regulation no.1/2006 regarding the issuers and securities transactions the art.b227-(1) states that the companies admitted to trading on a regulated market will prepare, will make available to the public and send to CNVM and to the market operator their quarterly, biannual and annual financial reports accompanied by the full comments (Regulation no.1/2006, Title IV, Chapter III). The auditor's report deals with both the consolidated and individual financial statements. The annual report is made publicly available in writing, on request, and in electronic form on the website of the issuer. Annual reports remain available to the public at least for five years.

The paper is structured in three sections. In the first section is presented the actual stage of knowledge regarding the role of the external audit. This objective is achieved through a theoretical and conceptual approach on the role of audit, followed by a practical and empirical approach. In this approach we focused our attention on the quality of the services offered by the audit firms. In the second section we made a case study on the entities pertaining to the I-st category of BSE, through which we want to reflect the preference of the large entities to be audited by a big audit company. The third section of the paper contains the conclusions of our study.

2. Research methodology

Our study refers to the listed entities as they are prone to voluntarily apply the Code of Corporate Governance and thus the audit requirements regarding the transparency of the financial and non-financial statements. We analyzed only the audit reports of the individual financial statements as they can be found on the Bucharest Stock Exchange in greater numbers than those consolidated.

We analyzed the reports from 2005 to 2009, because only for this period we could find the complete information posted on the CNVM in order to compare it with data found on the websites of companies or on the BSE website.

In order to conduct the case study we used a deductive approach, through a content analysis of the audit reports publicly posted on the website of the Stock Exchange, National Securities Commission or on the entity's website. To reach that goal we followed the next steps: we analyzed the regulations concerning the preparation of the audit reports and the financial statements, we selected the necessary dates from the audit reports, and we selected the entities to be analyzed. Then we collected the information, we defined the analysis methodology, we made the proper analysis and, at the end, we interpreted the obtained results. The data analysis was made with the statistical program SPSS 16.

3. Actual stage of knowledge regarding the role of the external audit in corporate governance

Theoretical and conceptual approach

External audit has an undeniable role when stakeholders or interested third parties may trust the financial information provided by an entity. The auditor is the specialist that, through his opinion, confirms the fidelity/accuracy/reality of the financial statements, as they are legally able to verify such data. When the audit report contains an unqualified opinion, the users of the financial statements offer a deeply trust in the accuracy of the financial information.

Motivational theory

The motivational theory explains the audit process through a superior qualitative professional judgment of those who bear responsibility for the preparation and presentation of the financial statements to be audited (Dobroțeanu and Dobroțeanu 2002, Ball 2003, Woodbine and Gordon

2010). Moreover, the motivational theory considers that the audit process must be performed by the best prepared professionals which occupy the superior level position including the responsibility for expressing their opinions.

Agency theory

Agency theory developed by Berle and Means (1932) leads to the dissociation of the administration and control department. As stated Jensen and Meckling (1976) the principal which is not a shareholder is interested on his personal benefits and not on the interests of the shareholders. Thus, "the company is a legal fiction which serves as a focal point for a complex process in which conflicts between individuals are resolved by implementing a network of contractual relationship" (Jensen and Meckling, 1976).

Insurance theory

Insurance theory is based on two principles: the principle of ensuring according to which the audited information has a certain degree of assurance and the principle of information according to which the investors, managers have greater confidence in the audited information when making their decision. The importance of the financial audit explained by the theory of insurance, reduce the risk of presenting incorrect information. Information risk differs from the risk of business bankruptcy, although the information was properly presented. Business risk may occur as a result of events that cannot be anticipated.

Using financial statements may incur loss due to misstatements. The probability of recovery the loss becomes higher when the company has an auditor and is directly proportional to the size and reputation of the auditor. Important auditors, so-called "deep pockets" assure investors against the consequences of inaccurate financial statements (Simunic and Stein, 1995).

Theory of interested parties (stakeholders)

Individualistic approach of the economic, financial and political interdependences from nowadays when speaking of globalization, no longer finds relevance, so far the model becomes complex and the theory of stakeholders (theory) meets the information needs of all the stakeholders.

Stakeholder theory has gained momentum in 1970, but in 1984 was conducted the first research on stakeholder theory in management. Generally, the theory can be applied to all of the entities, while the management of the entities is required to provide information to all the stakeholders. The theory was also developed in other disciplines (Donaldson and Preston, 1995), given the role of the entities on the capital market which becomes increasingly important.

Practical and empirical approach

A number of researchers which examined the role of the external audit in corporate governance have focused on the study of the audit quality. From the 19th century, many countries have tried to improve the audit quality through regulation, laws or by creating rules regarding the auditor's independence, or regarding the public oversight. All such modifications and improvements have helped to improve the audit quality (Baker et al., 2010). Some of them consider that audit quality can be measured by the risk reduction, by the reputation of the auditors (Brian et al., 2007, Lennox 1999) and others through the power and independence of auditors (Knechel 2000, Herrbach 2001, Lowensohn et al. 2007, Watkins et al., 2004).

Authors such as Moizer (1997), Francis (2004) and Barton (2005) analyzed the quality of the audit and concluded that the quality of the audit service is immeasurable. Thus it remains the duty of auditors to add credibility to the corporate financial reports through their examination and expressing of a true and correct opinion as required in IAPS 1004. The financial statements auditing provides confidence when the users are satisfied with the results of the process.

Francis (2004) supports the idea that audits conducted by one of the Big Four are of a higher quality than those made by an individual auditor. He made an empirical research analysis over

the past 25 years, especially in the United States, to assess the knowledge regarding the audit quality of the listed companies. His conclusions showed that the audit failure rate is low, much less of 1% per year, while the audit fees are quite small, less than 0.1% of the global sales of the customers. All these results show that the audit acceptable level of quality is achieved at low cost. Another finding of the mentioned study shows that the low quality audits in 1990 had a major contribution to the onset of the financial failures, and implicitly as a measure against them, the initiation of recent reforms, such as the elaboration of Sarbanes-Oxley Act 2002 in the U.S. Even though there have developed a series of laws and recommendations, the literature does not define an optimal level of audit quality, so it cannot be answered the question whether the level of audit quality is "too low" or "too high".

We can conclude that it is difficult to determine an optimal level of audit quality, but we also support the idea found in the literature that the audit conducted by one of the biggest firms is higher qualitatively than the audit performed by an individual auditor.

Lennox (1999) considers that the big audit firms are more stringent than the small firms. To demonstrate this statement he makes two assumptions: Hypothesis 1: reputation hypothesis according to which the big auditors have a greater interest in providing high quality services as they don't want to lose their reputation (DeAngelo, 1981) and Hypothesis 2: "deep pockets" hypothesis which mentions that big auditors should be more rigorous, because they have greater experience on the entities with litigation risk. The results show preference on the "deep pockets" hypothesis than on the reputation hypothesis as regards the size of the auditor and the litigation risk.

4. Study regarding the preference of the entities to be audited by one of the Big Four

Through this study we want to test if the hypothesis regarding the big entities' preference to be audited by the big audit companies is confirmed, taking into account that Romania is a country with an emerging capital market development.

The table below presents an overview of the number of companies audited by the Big Four and those audited by the other audit firms.

Tab.1. The number of companies audited by the audit companies

Analysis results

a. General trend of the publication of audit reports

As can be seen in the table above, from a year to another, the numbers of entities that publicly post their audit report increases. In 2005 from 21 entities considered in our analysis only 12 of them publicly posted their audit reports. Later, in 2009, there are 21 entities which made public their audit reports. We also note that in 2005 there were 20 entities listed on the stock market.

The constant increase of the entities that have publicly posted their audit reports and financial statements is a good thing. We consider that the publication of the audit reports and financial statements is a relevant indicator of effective corporate governance. Transparency of the financial

statements and audit reports due to their electronic publication and the unfettered public access represents the premises of effective corporate governance.

b. The number of entities audited by one of the Big Four

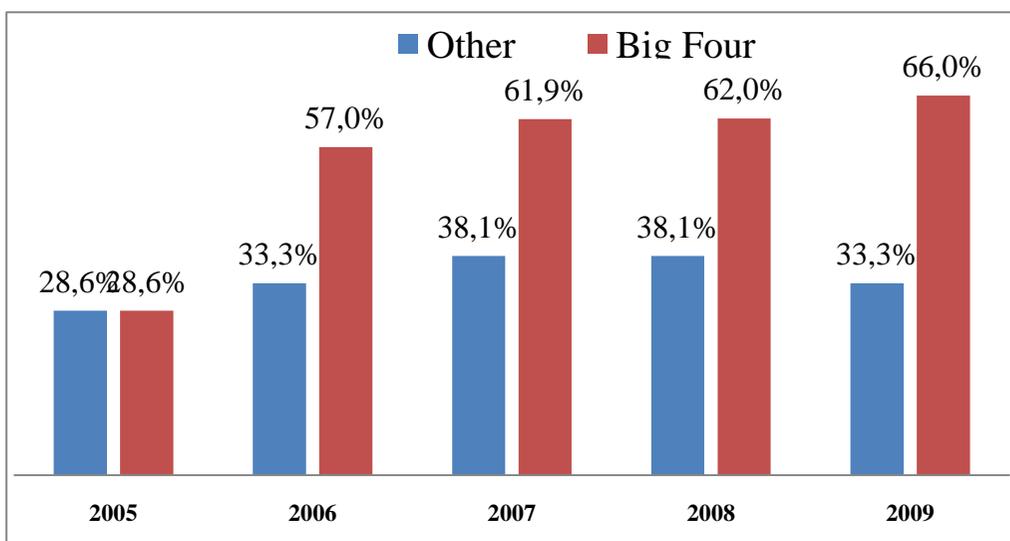

From the above analysis it can be seen the upward trend of the entities audited by one of the Big Four. The explanation of this trend refers to the fact that these companies perform high level of analysis when auditing the financial statements and their knowledge regarding the international accounting and auditing standards is superior.

In 2005 from the 12 entities that have publicly posted their audit report on the website of the BSE, CNVM or on its own website, six of the entities were audited by one of the Big Four audit company. One year later, in December 2006 there are already 12 entities audited by one of the Big Four of a total of 19 entities on the Bucharest Stock Exchange that had their financial statements audited.

c. The popularity of the big audit companies

In order to determine the popularity of the most important audit companies and their evolution over the last five years we have determined the annual total number of the audited entities, followed by the determination of the number of entities audited by one of the Big Four. In the figure below it can be observed the evolution of popularity of the audit firms during 2005-2009.

Fig.1. The popularity of the big audit companies from 2005 to 2009

Source: projection made by the authors

As can be seen in the figure above, even though we are a country with an emerging capital market development, the entities in the I-st category of the Bucharest Stock Exchange tend to an audit conducted by one of the big audit companies. In 2005 half of the entities were audited by one of the big audit companies and the other half by the other audit entities. Moreover, in 2009 the situation shows that from the 21 audit reports of the listed entities 66 % were audited by one of the Big Four.

A first conclusion arising from our study is that the I-st category entities from the Bucharest Stock Exchange become more transparent from a year to another. In 2005 we find only 12 audit reports which were publicly posted, while in 2007 all of the 21 entities electronically published their audit reports.

A second conclusion would be the ascending trend of the entities audited by one of the Big Four. Also the preparation of the financial statements and their auditing is done according to the specific regulations of the current period. Therefore, the evolution of the qualified or unqualified opinion is not constant and has no different upward or downward trend from a year to another. The modification in the auditor's opinion may be due to the fact that auditor changes from year to year, and most often when the auditor changes the opinion issued could be different.

In conclusion, the presumption found in the literature, namely: the big entities are audited by the big audit companies because they provide higher audit quality is also confirmed in the case of the Romanian emerging countries with capital market development.

5. Conclusions

In this paper we approached the external audit role in achieving effective corporate governance from two perspectives: a theoretical-conceptual approach in terms of an economic theory and a practical-empirical approach in terms of specific literature. External audit has an undeniable role on the trust of the stakeholders in the financial information provided by an entity. The auditor is responsible in the issuance of an audit opinion in order to confirm to the interested parties the fidelity/accuracy/reality of the financial statements. The preparation and publication of the standard audit report provides greater confidence in the entity's financial statements and reports.

One of the common ideas in the literature supports the preference of the big entities to be audited by the most important audit firms, as it is considered the superior quality of their audit services. Falling within the scope of our concerns and being strictly related to our research, we investigated whether this preference also applies to the I-st category entities listed on the BSE, knowing the fact that Romania is an emerging country and its capital market it is in a continuous development. At the end of the study we can conclude that Romanian entities listed on the BSE show the same preferences as those listed on the international markets. In addition, on the basis of the collected data we were able to draw several conclusions that define the audit market in Romania with examples on the entities listed on Bucharest Stock Exchange.

AUDIT EXPECTATION GAP IN THE PUBLIC SECTOR IN ROMANIA

Gherai Dana

University of Oradea, Faculty of Economics

Theme – It is known that the large public and auditors hold different beliefs about the auditors' duties and responsibilities. In these conditions the audit expectation gap represents that level of expectation that remains uncovered. In this study paper, the audit expectation gap represents the difference between the achievements of public auditors and the expectations that the general public (students) have beyond those responsibilities.

Purpose – The evolution of the audit expectation gap has been examined in various countries, but the extent of the concept has not been investigated so much in the public area. This study attempts to assess the perceptions of possible future auditors, students, regarding the existence of the expectation gap in the public area.

Literature review – A review of the literature identifies many researchers who define the concept since it was given the first definition of the audit expectation gap as the difference between the levels of expected performance and the results that auditors give, but just a few analyses of the public area using students' knowledge to understand the perception of future users of accounting information or potential bidders of accounting information.

Methodology – This paper represents the beginning of a broader study that will be part of the doctoral thesis entitled "Organization and exercise of public audit in Romania", started in 2009 at the University Babeş-Bolyai from Cluj-Napoca, coordinated by PhD Professor Matis Dumitru. The aim of this paper is to explore the findings of an empirical study, made on 352 students, where the primary data used were obtained through a questionnaire technique regarding the audit expectation gap in the public sector in Romania, looking into the future to obtain responses using a larger respondent group.

Findings – A reasonableness gap was uncovered, there is a gap between the expectation of students regarding the public auditors' profession and their results and there are differences between the level of knowledge of the students regarding the statements in audit and the expectation gap. Also, there is a significant difference in perceptions of the role of the public auditor in respect of fraud detection. The research will be extended to other users of accounting information (accountants, executives, managers, bankers) to see their understanding of the role of external public auditors, this we consider

Originality/value – This paper adds evidence to the important debate about the expectation gap from a region that has had little coverage. In Romania, there is just a few pieces of information regarding the importance of education in reducing the audit expectation gap in the public area. We try to draw attention to two sectors that are left on one side, education and the public domain. A correlation between these two, in the context of the audit expectation gap, will give some answers absolutely necessary.

Keywords: audit, audit expectation gap, expected performance, education.

JEL: M42

Introduction.

Financial scandals that took place both in the 90s as well as in the contemporary period have led to a decline of trust in bankers, managers, professionals and institutions responsible for supervising and regulating the economic activity. The growing demands of the market determine

the regulatory bodies to find ways of improving the economic activity and performance so as to enhance the lost confidence in the professional accountants as a consequence of the economic collapse. The risk, the error or bad performance should be minimised to ensure a fast and sustainable growth. Porter (1993, p.50) argues that the recent increase in criticism of against auditors is due to the failure of auditors to meet society's expectations. The failure of living up to societal expectations has implicated the notion of "audit expectation gap". Reforms have been established in the auditing, accountability and the field of expectation gap, substantial efforts have been made to complete the guiding methodologies and procedures in order to support the professional accountants and empirical research has been also conducted trying to improve the activity, but, little attention has been given to public sector.

Public institutions are important because they give credibility to the government and a reasonable assurance that the assets of the government are protected; the reporting is transparent and the financial operations comply with the ethical characteristic. Taking responsibility, establishing priorities, an achieving and efficient use of resources, all these are necessary, while a way of implementing theme is represented by the decentralization of the control activity so as the managers of departments to be held responsible for the management of allocated funds.

External public auditor shall define a person employed with the Court of Accounts who carries out specific audit activities in the public sector and shall refer to the specific position as external public auditor. The position of external public auditor shall be a public interest one and has a special status due to the assignments and competences, responsibilities, complexity, risks, incompatibilities and interdictions that arise in the enforcement of the law and of the regulations of the Court of Accounts, drawn up in accordance with the law.

What does it mean in this conditions audit expectation gap? In the context of crisis represents the difference between what auditors should have done and the consequences that we are living. In the context of companies is the difference between the expectation of the managers and the result of audit report, and in our paper represents the antithesis between the results from "The Public Report of the Court of Accounts" that we have found on the website of Court of Accounts, the expectation that we have from external public auditors and the expectations results of the future users of accounting information, the students from University of Oradea.

Literature Review .

The **concept** "Audit Expectation Gap" was defined into literature by Liggio (1974, p.27) as the difference between the level of expected performance "as envisioned by the independent accountant and by the user of financial statements." Going further in 1978 the Cohen Commission extended the definition taking into account if a gap may exist between what the public needs or expects and what auditors are expected to accomplish. Porter (1993, p.50) defined the concept like: "the gap between society's expectations of auditors and auditor's performance, as perceived by society." He divides the audit expectation-performance gap in two major components:

- Reasonable gap, represents the difference ("between what society expects auditors to achieve and what they can reasonably be expected to accomplish") and
- Performance gap, represents the difference ("between what society can reasonably expect auditors to accomplish and what they are perceived to achieve").

Performance gap is also subdivided into deficient standards gap, and represents the difference ("between the duties which can reasonably be expected of auditors and auditors' existing duties as defined by the law and professional promulgations") and deficient performance gap represents the difference ("between the expected standard of performance of auditors' existing duties and auditors' perceived performance, as expected and perceived by society").

Regarding the **existence and the evolution** of audit expectation gap a series number of studies reported it, but few were done relating the development in public sector examining the students' perception. Some relevant papers about audit expectation gap with the implication of students are:

Baron et al (1977) investigated in USA the differences between auditors and users of accounting information regarding the perceptions in auditor's fraud detection duties and the study revealed significant difference between the perceptions.

In UK Humphrey et al (1992, 1993) examined the audit expectation gap regarding the role of auditors revealed a significant difference between auditors and respondents regarding their perceptions on the role of auditors, indicating the presence of an expectation gap. Also Dewing and Russel (2002) found presence of an audit expectation gap.

Monroe and Woodliff (1994) examined the effect of education on students' perceptions of audit reports in Australia and they found that auditing students' beliefs regarding the responsibility of auditors, the reliability of financial information and assurance about the future prospects of the company changed significantly with knowledge. It was found that more knowledgeable students assume a much lower level of responsibility of the auditor, less confidence on the reliability of financial statements and assurance over the future prospects of the company.

Pierce and Kilcommis (1996) addressed the effect of auditing education over reduction of the expectation gap. A questionnaire survey was conducted with undergraduate students in Ireland. The study suggested a significant reduction in the misunderstanding of audit regulations by students who have studied at least a single course on auditing.

Frank et al (2001) investigated the perceptual differences between auditors, jurors and students. Results revealed a large divergence in perceptions of auditors and jurors regarding their expectations of the auditing profession. However, the accounting students responded in a manner consistent with the practitioners. From this, the study concluded that accounting students had apparently adopted many of the views of the profession and considered themselves as members of the profession.

The above discussions portray that the prior studies emphasized on the expectation gap among the users of accounting information, managers, officials, jurors and students etc. Different studies were conducted in USA, UK, Ireland, Singapore, Saudi Arabia, Bangladesh etc. This study has focused on the present gap between the auditors' performance and the students' expectations regarding this and whether there is role of auditing education in lessening this gap.

In 2009 Javed Siddiqui investigates the effect of audit education in reducing the audit expectations gap in an emerging economy, and finds evidence that audit education significantly reduces the AEG, especially in the area of audit reliability.

Gary S. Monroe in 1993 examines the effect of education on students' perceptions of the meaning of audit reports and the responsibilities and duties of auditors and the results of the study suggest that education may be an effective approach to narrowing or eliminating the audit expectation gap.

Rehana Fowzia in 2010 makes an empirical study on audit expectation gap: role of auditing education in Bangladesh and investigate whether there is evidence that the provision of auditing subject as part of business degree programmes contributes to narrowing that part of the audit expectation gap which results from a misunderstanding of audit regulations.

Methodology of the study

To achieve the objective of the study we have selected 352 students (license program, master and distance learning) from Faculty of Economics, University of Oradea, divided into three groups. In the **first group** were included students from license and distance learning that **have finished the audit course** last semester, into **second group** there are students from same programs of study

which are **still studying** in the moment of writing but they will finish soon, and the **third group**, consist in master students which **completed advanced audit classes**.

We have choose among from final year students to obtain representative results. Student from distance learning were choose because the most have a higher level of employment 10 years, in this case practical experience is relevant, and the average age is 35 years. The master students have high level of knowledge in audit, also some work experience, they are final year students in master. And the last group, the students from license programe were choose to avoid subjectivity and because they have made an intensive course in audit.

The data used were obtained through a questionnaire technique formed from 10 questions regarding the auditor’s independence, auditor’s responsibilities and the credibility (useful) of the audit report. To provide relevant information to the public sector, and to achieve our objective, in classes was analyzed “The Public Report of the Court of Accounts” for 2009 which provided all the necessary information and related results in public sector. According to the 2009 Activity Plan of the Court of Accounts 1,924 cases were settled, of which 1,267 financial audit missions, 246 performance audit missions and 411 control activities. Also the public entities which the Court of Accounts exercises its competence on by specific activities amount to 10.639, and 1,778 of such entities, that is 17% of the total number, were audited in 2009.

A 7 point Likert scale has been used, ranging from:1 = Strongly agree to 7 = Strongly disagree. The questions were designed based on a detailed review of data based, regarding the findings from another papers (Barron et al, 1977 in USA; Humphrey et al, 1992, 1993 in UK; Schelluch, 1996 in Singapore; Stirbu Dan, 2010 et al in Romania).

Data were collected throughout all the students, the questionnaire were given to classes, in the second semester of the universal year and the response rate was on averaged 67%, because not all the students were in class at the moment of survey, or they didn’t want to take part on survey.

Table 1 Situation of responses

Students categories	Sample sent	Answers received	% response rate
Master (1)	174	101	58.04%
License (2)	200	153	76.5%
Distance learning (3)	150	98	65,53%

The responses, in terms of percentage, have a high rate, the highest percentage is at license, 76.5% but for us the most representative are those from master 58.04 % because they have completed advanced audit classes and distance learning because the level of employment and the experience in labor is much higher.

Findings and discussions

The questionnaire consists of 10 statements regarding the auditor’s independence, responsibilities and the credibility of the audit report. For the selected statements we reviewed international published articles, audit standards and manuals and the information that we found on website of “Romanian Court of Accounts” which helped us to give some expected values to identify the gap between our expected value and those that we received from the survey.

Table 2 Perceptions of Students regarding the statements

Statements	Mean values 1	E.G	Mean values 2	E.G	Mean values 3	E.G
Public auditor's independence						
The public auditors' interest might impact on the activities they conduct.	2,33	1,33	3,42	3,58	1,75	0,75
The public auditor can be involved in the activity of the entity.	6,14	0,86	4,36	2,64	6,32	0,68
The audit team shall consist of one external public auditor.	5,12	1,88	4,36	2,64	5,65	1,35
Public auditor's responsibility						
The public auditor is responsible to report deliberate distortion of financial information.	5,76	1,24	4,76	2,24	5,65	1,35
The public auditor is responsible for directing the internal control system.	6,14	0,86	5,25	1,75	6,32	0,68
The public auditor is responsible for development of the financial statements of the company.	6,14	0,86	5,25	1,75	6,32	0,68
The public auditor has the responsibility to detect all fraud and error in the financial statements.	5,65	1,35	3,42	3,58	5,70	1,30
Credibility in public audit report						
The audited financial statements provide an assurance about the performance of the entity.	3,45	3,55	2,55	4,45	4,65	2,35
Users can have absolute assurance that the entity is free from fraud and error.	5,65	1,35	4,04	2,94	6,32	0,68
The public auditors have to ensure that accounting standards are met.	6,03	0,97	4,36	2,64	6,15	0,85
E.G – expectation gap						

Table 1 provides details of the results of the mean responses concerning the ten statements associated with the independence, responsibility of external public auditors and the credibility in public report. In this table, an audit expectation gap (indicated by significant differences) was detected between the second group and the other two in relation to the auditor's independence, responsibility and audit report. Expectation gap is found for detection of fraud (statement 7), the auditor's responsibility for reporting deliberate distortion of financial information. (statement 4), the auditor's assurance that the entity is free from fraud and error (statement 9) and the auditor's experience of ensure that accounting standards are met (statement 10). The results indicate that the students have more higher expectation on the work of auditors, and also indicate difference between the understanding of activity.

Table 3 Descriptive Statistics on Expectation Gap among three groups

	N	Minimum	Maximum	Sum	Mean	Std. Deviation
Expected score	10	1.00	7.00	58	5.8000	2.5298
1st group	10	2,33	6,14	47.41	4.7410	1.8244
2nd group	10	2,55	5,25	41.77	4.1770	0.8534
3rd group	10	0,68	2,35	54.83	5.4830	1.4134

On average the expected score about public auditor's independence, responsibility and credibility in public audit report according to us is 5.80 with standard deviation being about 2.53. The first group who finished the audit subject obtained mean score 4.74 and it means the expectation gap is 1.06. The second group who did not finish audit subject has got 4.17 mean score; it means the expectation gap is 1.63. The third group who has learned both audit and advanced audit subjects achieved mean score 5.48; it means the expectation gap is 0.32. It is apparent that the expectation gap among the groups exist and also is becoming significant according to the role of audit education.

This study suffers from several **limitations**. The scope of the study was limited to only 352 potential respondents. More compelling evidence may have been obtained using a larger respondent group.

Conclusions

The audit expectation gap is detrimental to the auditing profession as it has negative influences on the value of auditing and the reputation of auditors in the modern society. Regarding the nature and scope of audit practices there has been considerable debate about audit expectation gap, define like the differences between what auditors actually do and what third parties think auditors do or should do in conducting the audit practice. According to some researchers, the nature of the expectation gap may be reduced but never eliminated. This paper focuses on the expectation gap from public sector and demonstrates the existence of it, also believes that for reducing such a gap a possible way is audit education, as we have seen that the gap is smaller for group who finished advanced audit classes. The audit expectation gap needs to be addressed from a number of different perspectives in order to eliminate deficient performance by auditors to widen the scope to encompass reasonable expectations and reduce expectations where they are deemed to be unreasonable.

THE ROLE OF THE ACCOUNTANCY PROFESSIONAL BODIES IN DEVELOPING SOCIAL AND ENVIRONMENTAL REPORTING⁶⁵

Gîrbină Mădălina

Academy of Economic Studies, Bucharest, România

Albu Nadia

Academy of Economic Studies, Bucharest, România

Albu Cătălin

Academy of Economic Studies, Bucharest, România

In March 2010, the European Commission renewed its strategy to promote Corporate Social Responsibility in order to ensure long term employee and consumer trust. Corporate Social Responsibility is considered more relevant in the context of the economic crisis because it can help to build (and rebuild) trust in business and to identify new forms of value creation based on addressing societal challenges, which may represent a way out of the crisis. A priority area is represented by companies' transparency on environmental and social issues.

This research aims to assess the involvement of the professional accountancy bodies in the development of social and environmental reporting. After a review of research studies on corporate social and environmental disclosure and the role of the accounting profession in this context, the research identifies the strategies, policies and actions taken by the International Federation of Accountants (IFAC) and of the Federation of European Expert Accountants (FEE) based on content analysis of public documents issued by the two bodies. The cases were selected having the influence exerted by the two organisms on other professional bodies and their ability to trace the strategic lines of the accounting profession at the international and European level.

The basis upon which the accounting profession was founded and continues to exist is public trust, which is the degree to which the public has confidence in the services provided by the accounting profession. Society is currently expressing high demands on the discipline of accounting and therefore the profession is under pressure to expand its horizons to better reflect these demands.

The research revealed that both accounting bodies had an intense activity and initiated political actions in the corporate social and environmental reporting field including sustainability in their strategic objectives. The following areas of involvement have been identified: issuance of assurance, education and ethics standards (in the case of IFAC which is also regulator), educational and web materials, participation in working parties, cooperation with other organisations in the development of reporting and assurance standards, research projects to support decision making, encouraging member bodies to develop similar policies, public statements inviting responsible parties to act. Based on its conclusions the study identifies some research directions to be developed. Academic and professional curricula of Romanian accountants could be analysed in order to determine how they could be improved in order to respond better to these societal requirements. This study identifies the political actions of main professional bodies (IFAC and FEE) that might influence the actions of other bodies and future profile of accountants.

Keywords: Social and environmental reporting, accountancy profession, professional bodies

1.INTRODUCTION

Corporate social responsibility becomes more important in the context of the global financial and economic crises because public confidence in the social and environmental responsibility of businesses has been shaken. Accounting has traditionally focused on an organisation's financial aspects, with a particular emphasis on the reporting of this information to shareholders and management. Lately, there has been growing condemnation of the insufficiency of this kind of information. The primacy of shareholders as owners and maximizing wealth creation for this constituency is being challenged, particularly because has become evident that their short-term financial interests can be incompatible with the long-term viability. Long-term sustainable value creation requires responsible organizations, capable to direct their strategies and operations to achieving sustainable economic, social, and environmental performance. It also requires incorporating wider stakeholder perspectives into decision making. The financial crisis has created widespread scepticism about whether and how business contributes to the wider interests of society. Ensuring that organizations pursue sustainable business models and development practices will require radical changes in the way they do business. Professional accountants need to adapt to a world in which sustainability is the key to long-term business performance, and need to understand how, in their diverse roles in organizations, they play a significant role. The professional accountancy associations are an integral component of the operation of the accounting profession. They represent a link between business enterprise, the state and the (increasingly global) society (Burchell et al. 1980: 5-27). Traditionally, professional accountancy associations have been promoters of regulation and codification of practices. Additionally, the objective which legitimizes them consists in satisfying the 'public interest'. As such, it is justifiable to assume that the professional accountancy associations could have an interest in the social and environmental reporting field. Within this context we purpose identify the challenges raised by social and environmental reporting for the accounting profession and the strategies, policies and actions taken by the International Federation of Accountants (IFAC) and by the Federation of European Expert Accountants (FEE) within social and environmental reporting field based on a content analysis of public documents issued by the two bodies to answer to these challenges. The two cases were selected because of the ability of the two bodies to influence other accountancy bodies and the accounting practice at the international and European level.

2. CORPORATE ENVIRONMENTAL AND SOCIAL DISCLOSURE AND THE ROLE OF ACCOUNTANTS -LITERATURE REVIEW

Corporate environmental and social disclosure practices were explained within the theoretical framework of political economy, legitimacy, institutional and stakeholder theories. The nature and extent of corporate social reporting vary over time and between countries and related to both company size and industry (Adams et al. 1998: 1-21; Cowen et al. 1987: 111-122; Hackston and Milne 1996:77-108; Trotman and Bradley 1981:355-362; Deegan and Gordon, 1996:282-312; Roberts 1991:62-71). Researchers in the voluntary disclosure also reported that corporate governance influences accounting disclosure (Chen and Jaggi 2000:285-312; Eng and Mak, 2003:325-345). Good governance strengthens the quality and comprehensiveness of corporate report. The existence of a specialised committee on the board is also considered important in explaining the quality of this kind of disclosure across countries.

In the last period there has been a proliferation of standards at the global and the european level in the sustainability area. The Global Reporting Initiative (GRI) provides the most recognised global standard with its framework for sustainability reporting.

Within EU were approved Directives requiring social and environmental reporting. The Directive 2003/51 (the 'Modernisation Directive') amended the Accounting Directives and added that European companies are required to include non-financial information in their annual and

consolidated reports if it is necessary for an understanding of the company's development, performance or position. Another amendment of the Accounting Directives (Directive 2006/46) introduced an obligation for listed companies to include a corporate governance statement in their annual report. Both directives were implemented in Romania.

The EU Eco-Management and Audit Scheme (EMAS) is a management tool for companies requiring them to evaluate, report and improve their environmental performance. It states that organisations should make periodic environmental statements publicly available and in order to ensure relevance and comparability of the information, reporting on the organisations' environmental performance should be on the basis of generic and sector specific performance indicators (European Commission)

Recent years have witnessed a continual growth in the number of companies reporting publicly on various aspects of their environmental and social performance. Accountants are now involved in reporting on corporate environmental issues, particularly evaluating contingent liabilities, accounting for emission trading schemes or providing decision-makers with quantitative information on environmental performance (Elkington and Jennings 1991:8-12). Daykin (2006) identifies the role of the internal auditor in corporate responsibility reporting. The objective of the internal auditing function is to improve any process within the organization that will result in improved revenue and reduced risk. Corporate responsibility reporting is varied and has not yet been standardized at the global level. Regardless of the content or format, any company that intends to report on corporate social responsibility issues must first evaluate and determine the values and goals that are to be discussed and reflected in that report. Internal auditors have the responsibility of understanding the stated values and goals of the company. As performance targets and goals are established and distributed among the company and the public execution plans must also be created. The role of internal auditing with respect to corporate governance and their performance goals is to observe and examine the implementation of related execution plans as well as the outcomes of those plans. Corporate management and leadership must be held accountable for all actions within the corporation. Internal auditors must evaluate goals to ensure that reported results are truly accurate as stated and communicated internally as well as externally in either an annual report or separate corporate responsibility report.

An increasing number of sustainability reports worldwide are being assured by a financial auditor. Power (1997:123-146) observes that accountants have begun to compete for work in the environmental auditing field, such as the verification and development of Eco-Management and Audit Scheme (EMAS).

The management accountant has a significant role to play in both the ex-ante area of integrating strategic corporate responsibility thinking in organisations and the ex-post role of generating the corporate responsibility reports. Management accounting professionals are also trained in evaluating investment decisions regarding the future, and thus would be ideal professionals to support the independent assurance process.

3. RESEARCH METHODOLOGY

After a literature review inventorying the challenges raised by social and environmental reporting for the accounting profession our research will concentrate on analysing the policies and actions of main accountancy professional bodies at the international and European level to answer to these challenges.

This research aims to provide insights into the involvement of two leading professional accountancy associations (the International Federation of Accountants and the Federation of Expert Accountants) in the development of corporate social and environmental reporting. The two cases were selected because of the ability of the two bodies to influence other accountancy bodies and the accounting practice at the international and European level. The research design

comprises content analysis of public documents describing actions taken by the two professional bodies and statements of their policies and strategies. The main information source was represented by their web sites.

3. 1. THE INTERNATIONAL FEDERATION OF ACCOUNTANTS (IFAC)

IFAC is the global organization for the accountancy profession having 159 members and associates in 124 countries and jurisdictions. Its declared mission is to “strengthen the worldwide accountancy profession and contribute to the development of strong international economies by establishing and promoting adherence to high-quality professional standards, furthering the international convergence of such standards and speaking out on public interest issues where the profession's expertise is most relevant. IFAC develops reports, policy position papers and comment letters on topics and issues of relevance to the global accountancy profession. IFAC communications activities support IFAC’s overall strategy by increasing awareness of the accountancy profession’s many roles and, particularly, of its contributions to sustained and sustainable economic growth and development.

One initiative in this direction is the development of a web-based tool (IFAC Sustainability Framework) that targets professional accountants who can influence the way organizations integrate sustainability into strategy, planning, enterprise risk management, and operations. It highlights the issues that organizations must address to make sustainability an integral part of their business model. The Framework addresses four perspectives in bringing together all the critical areas required to successfully manage a sustainable organization. These perspectives are: business strategy, internal management, relationship with investors and other stakeholders.

In the same direction IFAC signed a Memorandum of Understanding with the Prince of Wales's Accounting for Sustainability (A4S) Project covering three major initiatives that support the work of professional accountants in embedding sustainable practices in organizations: the creation of a community website to help business leaders, finance professionals, academics, professional accountancy bodies and others exchange ideas and share good practice on how environmental and social performance can be better connected with strategy and financial performance, and embedded into day-to-day operations and decision-making, the establishment of the International Integrated Reporting Committee (IIRC) having as objective the creation of a framework which brings together financial, environmental, social and governance information in a clear, concise, consistent and comparable format, and participating in an Accounting for Sustainability (A4S) Accounting Bodies Network research project in the area of integrating sustainability issues in investment appraisal.

IFAC is represented on the Climate Disclosure Standards Board (CDSB) Technical Working Group which aims to develop standardized reporting guidelines on the inclusion of climate change information in mainstream reports.

IFAC is also standard setter developing auditing and assurance standards, educational ethics standards and standards for the public sector.

Assurance standards evolved as a reflection of the changing landscape and the increasing importance of social and environmental reporting and related assurance services. An increasing number of sustainability reports worldwide are being assured by a financial auditor. International Auditing and Assurance Standards Board (IAASB) of IFAC issued ISAE 3000 “Assurance Engagements”. The importance of reliable data on carbon emissions has also been recognized by the IAASB, which recently set up a working group to look at developing a specialized accounting standard. Due to the increasing need to ensure the reliability of greenhouse gas data in connection with emission trading schemes, the International Auditing and Assurance Standards Board (IAASB) issued a consultation paper “Assurance on a Greenhouse Gas Statement” in October 2009 which may develop into an international standard in this field.

The sustainability aspects need specific competencies in addition to those traditionally acquired by accountants and auditors. The integration of ethical and social aspects in accounting education is very important to the qualification of accountants and auditors who should be able to deal with new professional challenges.

The Professional Accountants in Business (PAIB) Committee of IFAC has as strategic direction to enhance the profile, influence, and relevance of professional accountants in business and issued several research papers related to the role of accountants within sustainability.

The International Federation of Accountants (IFAC) commissioned also a guidance document (*“International Guidance Document: Environmental Management Accounting”*) bringing together some of the best experiences on Environmental Management Accounting (EMA).

3.2. THE FEDERATION OF EUROPEAN EXPERT ACCOUNTANTS (FEE)

Federation of European Expert Accountants (FEE) is a representative organization of the accounting and auditing profession in Europe consisting of 43 institutes from 32 European countries. FEE has released numerous policy statements on sustainability, the most important of which are *“Shaping a sustainable economy”* (July 2009), *“Towards a sustainable economy: the contribution of assurance”* (July 2009), *“Carbon emissions Information”* (July 2009), *“Embedding sustainability into corporate governance”* (July 2009), *“The contribution of the accountancy profession”* (January 2009), *“Cost internalisation”* (January 2009), *“Non-financial information”* (January 2009), *“Multi-Stakeholders: the essence of multidisciplinary teams”* (January 2009).

These policy statements state FEE’s strategy on sustainability issues including the relationship between sustainability and the accounting profession. Each policy statement describes the importance of the issue and its impact on the accounting profession. FEE calls on the International Federation of Accountants (IFAC) to develop a general standard on assurance on sustainability reporting and makes an appeal to regulators to acknowledge that assurance has a role in reinforcing the trust and integrity around sustainability information. According to FEE, the measurement, disclosure and assurance aspects of the carbon emissions will affect the accountants. Carbon emissions data is not yet the subject of formal and generally accepted accounting and reporting standards. Likewise, assurance procedures in respect of carbon disclosures are not yet standardised. FEE stressed the importance of a multi-disciplinary approach in this area and the need for training of accountants in these new techniques.

FEE published also Call for action papers communicating important messages for actions needed to be taken such as: *“Sustainability Disclosures in Financial Information Can Be Improved”*, *“Need to Increase Education in Sustainability for Accountants and Management!”*, *“Enhance Sustainability in the Public Sector”*, *“FEE calls on accountants in organisations of all kinds and sizes to acknowledge their role in embedding sustainability as a core part of strategy and decision-making”*, *“The Federation of European Accountants (FEE) calls for unified global standards to mitigate climate change, integrating sustainability at the heart of policymaking, society and markets”*.

FEE Sustainability Working Party developed Discussion Papers treating technical themes such as: the review of International Accounting Standards for environmental issues, providing assurance on environmental reports, creation of a generally accepted framework for environmental reporting, sustainability information in annual reports - building on implementation of the Modernisation Directive.

CONCLUSIONS

Examination of communication by IFAC and FEE indicates a commitment of the two bodies to the concept of social and environmental reporting. As we could notice the role of the professional accountancy associations is multi-dimensional. The following areas of involvement have been identified: issuance of assurance, education and ethics standards (in the case of IFAC which is also regulator), educational and web materials, participation in working parties, cooperation with other organisations in the development of reporting and assurance standards, research projects to support decision making, encouraging member bodies to develop similar policies, public statements inviting responsible parties to act. Within sustainability reporting, both bodies identify new areas in which accountants should apply their skills to answer societal needs. Accountants are required to understand the regulatory and voluntary reporting environment in which businesses operate and respond to new demands, to advise on risk management and the implications of entering into voluntary reporting mechanisms, to develop frameworks which allow the efficient measurement of financial and non-financial information and either maintain or assure the collection of information, to advise on the development of policies for determining the „necessity to report” decisions (where they exist), to help identify what to include in the report, to provide clear, reliable information and, where required, assurance of it, to advise organisations on the limitations of corporate decisions based on economic grounds, and suggest how externalities can be internalised. Because accountants have a role to play in this field their educational curricula should be developed with environment and sustainability related issues. FEE identified the following themes as necessary to be addressed in the basic and continuing education of accountants: company and business strategy, business ethics and integrity, management (including management accounting), stakeholder awareness, internal controls in relation to non-financial information, management accounting techniques on environmentally sensitive and operations, knowledge about accounting for externalities (“full cost accounting principles”), selection and measurement of KPIs, accounting for emission rights/trading schemes and financial reporting implications, risk approach integrating sustainability issues, sources and techniques of assurance. Future research could test the extent of the integration of these recommendations within the academic and professional curricula of Romanian accountants and establish actions for the Romanian accounting bodies and business universities.

IMPLICATIONS OF THE APPLICATION OF IFRS FOR SMES IN ROMANIA ON TAXABLE AND DISTRIBUTABLE PROFIT ⁶⁶

Gîrbină Mădălina

Academy of Economic Studies, Bucharest, România

Albu Cătălin

Academy of Economic Studies, Bucharest, România

Albu Nadia

Academy of Economic Studies, Bucharest, România

On 9 July 2009, the International Accounting Standards Board (IASB) issued the International Financial Reporting Standard for Small and Medium Sized Entities („IFRS for SMEs”) which aims to provide a financial reporting framework for SMEs falling within its scope. It is a matter for authorities in each jurisdiction to decide which entities are permitted or required to apply IFRS for SMEs. Because of the connection between accounting and taxation certain european countries had a reluctant position related to the application of IFRS for SMEs. Opponents focused on the incompatibility between IFRS for SMEs framework and the principles commonly accepted for tax purposes.

As the individual financial statements drawn up in compliance with IFRS for SMEs will serve for profit distribution under the 2nd European Directive the question arises weather the profits determined under these accounting rules can be considered as realized for distribution purposes. In order to mitigate the mismatch between accounting and distributable profits, Member States will need to reconsider the circumstances in which gains and losses arising from re-measurement at fair value through profit and loss should be considered as realized.

In this scenario, two important questions arise: What are the potential tax effects of the application of IFRS for SMEs? Is the profit determined under IFRS for SMEs available for distribution or some adjustments are necessary? The paper addresses these issues in the context of the Romanian accounting and taxation systems. Romania represents a relevant case study, as it is one of the European countries with a close linkage between financial and tax, where the fiscal profit is dependent on the accounting profit (currently determined under domestic regulations).

The methodology consists in a comparative analysis of the recognition and measurement rules between national accounting regulations and IFRS for SMEs in order to identify the differences with possible consequences on taxable and distributable profit.

The comparative analysis identified tensions between accounting and taxation that should be solved and new accounting policies with impact on taxable and distributable profit. Under these circumstances regulators should analyse if new policies proposed by IFRS for SMEs are acceptable considering the purpose of specific regulations and modify the legal framework.

Keywords: IFRS for SMEs, taxable profit, distributable profit

JEL classification: M 40, M 41, M 48

1.INTRODUCTION

According to IASB, IFRS for SMEs is intended to apply to the general purpose financial statements of entities that do not have public accountability and present general purpose financial statements for external users. EU countries use quantitative thresholds for reporting requirements of companies. It is a metter of each jurisdiction to identify which entities wil be placed within the scope of IFRS for SMEs.

⁽⁶⁶⁾ This research was financed from the project CNC SIS –UEFISCSU PN II-RU TE_341/2010

In Romania it is the Order of the Minister of Public Finance no. 3.055/2009 (further referred as OMFP 3055), which currently foresees accounting principles and rules to be applied in recognizing, measuring, derecognizing and presenting the elements of annual financial statements. OMFP 3055 contains accounting regulations in conformity with the Fourth and Seventh Accounting Directives. The IFRS are mandatory only for listed companies in their consolidated accounts starting January 1st 2007 (OMFP no. 1221/2006) (while the national regulation needs to be applied for their individual accounts), as well as for all financial institutions. An option to choose between the 7th ED and IFRS is available for public interest entities in their consolidated accounts. Starting 2012 IFRS will become mandatory for the individual financial statements of financial institutions.

A number of papers on the Romanian case advocate for a difficult *de facto* and *de jure* harmonization between the regulatory and practical aspects of Romanian accounting and IAS/IFRS. For example, concerning the initial phase of implementation of IASs in Romania, Țogoe (2003, cited in Ionașcu, 2007: 118) noted that there is “a local method, rather brief, of understanding and application of IASs”. On the other hand, Petre and Lazăr (2006:5-6) consider that the regulation of accounting is not connected to taxation. In practice entities might use fiscal instead of accounting rules, but this pertains to practice and not regulation, “there is no subordination of accounting to taxation and accounting rules are not harmonized with fiscal rules” (Petre and Lazăr 2006: 6). They consider that “such an opinion that accounting serves fiscal interests represents at least not knowing the current Romanian reality” (Petre and Lazăr 2006: 6). Bunea (2006: 143) shows that 80% of the sample he studied upon felt the need of detailed regulations, and only 20% agreed with the principle-based regulations. 59% consider that OMFP 1752 is not sufficiently detailed, and this might be an explanation for the use of the same (previous) accounting practices (Bunea, 2006: 144). Also, 97% noted that in the absence of a detailed rule in OMFP 1752, they choose the fiscal solution.

From the perspective of the implementation of IFRS for SMEs, Romanian authors generally agree that implementing such a referential would lead to significant improvement of financial communication by Romanian entities: higher quality of the reported accounting information, homogeneous accounting rules (there would be no requirement to follow Directives vs. IFRS), better understandability and comparability.

As literature reveals that tax accounting relationship rises problems even under current accounting framework it is reasonable to conclude that these tensions will be encountered if IFRS for SMEs is to be applied.

The main arguments advanced in the literature against IFRS relates to the investor focus and information orientation, along with its tendency towards fair value accounting. Critics are concerned that these aspects of IFRS will lead to the distribution of “unrealized” profits, making IFRS inadequate as a basis for calculating distributable income. The introduction of IFRS as a potential basis for profit distribution poses a definite challenge for the European Union as a legislator and it can be questioned whether the 2nd Directive in its current format is sufficiently prepared for this challenge. Even if fair value is used less in IFRS for SMEs national regulator will have to analyze if the new accounting profit is available for distributions.

2. Literature review

Literature agrees on three aspects of IFRS that make controversial their concrete application in the modern tax systems: the balance sheet approach, the use of fair value accounting and the substance over form principle (Shön 2004: 426-440; Jacobs et al. 2005; Eberhartinger and Klostermann 2007:141-168). Although their influence is smaller under IFRS for SMEs they are still issued to be solved. In most European countries, including Romania the accounting income is the base for the calculation of corporate taxation with limited adjustments required by tax law.

This form of the relationship between accounting and taxation is referred to as “quasi-dependent approach”. Under the quasi-dependent approach the shift to new accounting standard is expected to have effects on the tax regulations.

The European Commission, having indicated in its recent Communication that it had no plans to change the 2nd Directive. Besides the political decision, further research is needed to investigate whether there is a need for an alternative capital maintenance regime. The following research questions should receive a documented answer in the context of the application of IFRS for SMEs: Why most EU Member States do not allow IFRS for SMEs? Does dividend distribution play a role?

3. RESEARCH METHODOLOGY

The methodology involves the comparative analysis of IFRS for SMEs and current accounting regulations on one side and of fiscal and company law legislation on the other side in order to identify the differences that might have an impact on taxable and distributable profit.

3.1. Tax Implications Of Ifrs For Smes In Romania

We propose within this section to illustrate the fiscal implications of the application of IFRS for SMEs in Romania. Our analysis will aim the provisions of the Fiscal Code and current accounting regulations (OMFP 3055/2009 as amended by OMFP 2869/2010 and 2870/2010). The main connection between tax and accounting is related to the calculation of the income tax. In Romania there is a direct relationship between financial accounting and tax, involving a “quasi-dependent approach”. Taxable income is computed on the basis of the accounting results, with specific adjustments required by tax law when accounting criteria are not suitable for tax purposes

According to the Declaration for the calculation of tax on profit (101) taxable profit is determined after the following formula:

Fiscal profit = Accounting profit (gross result) + Elements assimilated to income- Elements assimilated to expenses- fiscal deductions- non-taxable income+ non-deductible expenses- fiscal loss to be recovered

Revaluation reserves and gains related to the sale and cancellation of own participating titles are assimilated to income while losses from the sale of own participating titles are assimilated to expenses. The following incomes are not taxable: dividends received from a Romanian legal person or from a EU legal person in certain circumstances, favourable differences of value for participation titles that are recorded as the result of the incorporation of reserves, benefits or issuance premiums by the legal persons where the participation titles are held, as well as valuation differences for long-term participating titles and bonds issued (such differences are taxable on the date of their transfer for free, assignment, withdrawal of the participation titles as well as on the date of the withdrawal of the social capital in the legal person in which the participation titles are held), incomes from the cancellation of expenses for which no deduction was allowed, incomes from the reduction or cancellation of provisions for which no deduction was allowed and incomes from the recovery of non-deductible expenses, non-taxable incomes expressly provided in accordance with memoranda approved by normative acts.

The fiscal treatment of fixed assets is described by the fiscal code and it is not dependent on their accounting treatment. The normal period of use and depreciation methods applicable from a fiscal point of view are described by the fiscal legislation. The accounting regulation defines separately the accounting useful life and acceptable depreciation methods. Cost formulas (FIFO, LIFO, WAC) used for accounting purposes are recognised also for tax purposes. The fiscal treatment of research and development costs follows the current accounting treatment. Special

conditions are prescribed for the deduction of interest and foreign exchange losses but they do not concern valuation (accounting valuations are recognised for fiscal purposes).

As a general rule all accounting incomes *are taxable* excepting when they are explicitly non taxable by law. Because of this connection any change of the accounting framework has consequences on taxable income if no change is operated to the Fiscal Code. Because an accounting income is implicitly taxable it must be certain as each tax payer to know the amounts payable and avoid a different interpretation by the fiscal authority. It means that revenue recognition methods involving estimates are not acceptable from a fiscal point of view and adjustments will be necessary. Recognition of gains based on fair values would bring more volatility to taxable profit calculation which is not desirable if the fiscal authority wants a reliable projection of fiscal income. A solution would be as the fiscal authority to establish different tax bases for assets valued at fair value. According to the general tax deductibility principle, expenses are deductible only if they are incurred with a view to generating taxable income. An expense is deductible if it fulfils the following conditions: a causal relationship exists between the expense and a taxable income, the expense is properly backed-up by supporting documents, the expense is not explicitly non deductible by law or it doesn't have a limited deductibility by law.

Under current circumstances even if companies would generally be in favour of an introduction of a more relevant financial reporting framework they would oppose it because of expected tax effects especially if the consequence would be an increase of taxable profit. Impairments of tangible and intangible assets and write downs of inventories are not deductible for tax purposes. Write downs of trade receivables and provisions are deductible within the limits describes in the Fiscal Code.

For cases where Romanian tax calculations follow financial reporting rules the tax authorities would need to establish new tax rules that would have to be much the same as the existing Romanian financial reporting rules but different from IFRS for SMEs. These, could lead to new adjustments from accounting profit to taxable income. The application of IFRS for the individual accounts of banks starting 2012 will require a fiscal solution and other entities willing to adopt an IFRS based framework could benefit from it.

We present below the possible effects of adopting IFRS for SMEs on accounting profit and implicitly to the taxable profit if no change is made to current Fiscal Code.

Table no 1. Effects of adopting IFRS for SMEs on accounting profit

Accounting policy in compliance with IFRS for SMEs	Possible effect on accounting profit
No LIFO (assuming increasing prices)	+
Profit on uncompleted contracts based estimated percentage of completion	+
Development cost expensed	-
Losses recognised for derivatives	-
Gains recognised for derivatives	+
Losses on biological assets at fair value	-
Gains on biological assets at fair value	+
Gains on investment property	+
Losses on investment profit	-
Abandonment of matching approach for grants –recognition of grant income	+
No capitalisation option for borrowing costs	-

- realised by the authors-

Key:

+ = more or faster recognition of profit

- = less or slower recognition of profit

In IFRS for SMEs set up cost research and development costs are expensed. According to OMFP 3055 development costs are capitalized if they meet conditions similar to those prescribed by IAS 38 and fiscal rules are based on current accounting rules. According to IFRS for SMEs investment property is carried at fair value if fair value can be measured without undue cost or effort with pluses and minuses in the income statement. OMPF no. 3.055/2009 does not define specific accounting policies for investment property. The accounting policies specific to PPE are applied. The percentage of completion method is not accepted by OMFP 3055 for construction contracts. The revenue is recognized when the reception document for the outcome completed is signed by the beneficiary. Costs incurred for the contract but not yet accepted by the beneficiary should be recognized as work in progress (within inventories category). The accounting treatment is recognised from the fiscal point of view. The use of LIFO is allowed by OMF 3055/2009. The accounting policies specific to inventories or tangible fixed assets are applied for biological assets and agricultural produce. Valuation at fair value less cost to sell is not allowed under national regulation. The prescriptions of OMFP 3055/2009 for government grants are in line with IAS 20 while section 24 of IFRS for SMES does not allow an entity to match the grant with the expenses for which it is intended to compensate or the cost of the asset that it is used to finance. Discounting of revenues is not required by OMFP 3055. For customer loyalty programmes the sellers recognise under OMFP 3055 a revenue for the gross amount and a non deductible provision for their obligation to provide free or discounted goods or services. According to OMFP 3055/2009 borrowing costs *may* be capitalized for assets that necessarily take a substantial period of time to get ready for its intended use or sale. Capitalization is prohibited by IFRS for SMEs. Fair value is not used for derivatives under OMFP 3055.

In order to determine taxable profit tax payers should draw up the Register of Fiscal Records (the use of this register is regulated by OMFP no 870/2005 modified by OMFP no 1857/2006 and OMFP no 949/2005). This register reflects all information relevant for the calculation of taxable profit and income tax. The filling procedure will be defined by each taxpayer considering the specificity of its activity and its own needs. This Register will be used more if IFRS for SMEs is adopted.

3.2 Effects on distributable profit

The accounting profit is implicitly distributable after deductions prescribed by the Company Law and OMFP 3055/2009. Dividends may be distributed only from real profits. Companies are required to set up a legal reserve which is calculated as 5% of the gross accounting profit until this reserve reaches 20% of the paid in share capital. If the correction of an error generates a loss carried forward it must be covered before any distribution. The unrealised revaluation reserve is not distributable. In so far as formation expenses have not been completely written off, no distribution of profits shall take place unless the amount of the reserves available for distribution and profits brought forward is at least equal to that of the expenses not written off. In so far as development costs have not been completely written off, no distribution of profits shall take place unless the amount of the reserves available for distribution and profits brought forward is at least equal to that of the expenses not written off. Any change made to the accounting profit will affect distributable profit. The use of fair value will bring volatility in distributable profit which could affect the ability of the company to pay dividends. The changes that will affect the accounting profit identified above will affect also distributable profit.

CONCLUSIONS

Being inspired from IFRS, IFRS for SMEs focuses on the financial position of a company rather than to the historical performance shown by the income statement. This contrasts with tax principles requiring the tax base to be computed by with reference to the past results (Freedman, 2004:71-79). The fair value accounting conflicts with other tax principles, such as ability to pay, enforceability and tax revenues stability. The use of fair value will bring volatility in distributable profit also which could affect the ability of the company to pay dividends. Including or deducting any unrealized gains or losses may imply, for the taxpayer, liquidity constraints to pay taxes and, for tax authorities, a fall in the ability to raise revenues. Any income or expense involving a certain degree of subjectivity will conflict with the need of certainty and gives a boost to tax avoidance. It results that the fiscal authority will have to define fiscal treatments different from those of IFRS for SMEs. Fair value accounting increases the volatility of profits and, hence, does not match with the need to rise revenues with sufficient stability over the fiscal years (Freedman, 2004:71-79). The fiscal authority will have to define tax bases for assets and liabilities diferent from their fair value. The substance over form principle is also problematic. Tax system is based on the legal form of transactions and, only with the aim to contrast avoidance attitude, specific exceptions are introduced. The application of substance over form in its accounting understanding is not acceptable from the fiscal point of view in all cases. The comparative analysis above releals that the application of IFRS for SMEs will have an impact on taxable profit and distributable profit as defined by current legislations. Under these circumstances regulators should analyse if changes are acceptable considering the purpose of specific regulations and modify where is the case the legal framework.

STUDY REGARDING THE INFLUENCE OF ROMANIAN ACCOUNTING REGULATIONS ON CREATIVE ACCOUNTING TECHNIQUES

Groșanu Adrian

Universitatea Babeș-Bolyai din Cluj-Napoca, Romania, Facultatea de Științe Economice și Gestiunea Afacerilor

Răchișan Paula Ramona

Universitatea Babeș-Bolyai din Cluj-Napoca, Romania, Facultatea de Business

Berinde Sorin Romulus

Universitatea Babeș-Bolyai din Cluj-Napoca, Romania, Facultatea de Business

The main objective of this paper is the analysis of Romanian accounting regulations and the identification of the impact they have on creative accounting techniques. Also, we shall investigate the influence some of these creative accounting techniques have on the true and fair value. Basically, we desire to answer the question: to what extent is being affected the true and fair value reflected within the financial statements of a certain entity by appealing to creative accounting. At international level there are several papers having as subject creative accounting, most of them emphasizing the negative role it has upon achieving the true and fair view. The papers that analyze creative accounting techniques in Romania are rather few, reason to start studying the extent to which Romanian accounting regulations allow the use of creative accounting techniques. We shall use the experience comprised within papers published at international level in order to substantiate an objective analysis of creative accounting techniques in Romania and of the impact they have on true and fair view. Being familiar with the creative accounting techniques is equally useful to the entire palette of accounting information users, including the researchers, for one can quantify the positive or negative impact they have on the true and fair value. One can bring suggestions to modify the accounting regulations, if some creative accounting techniques affect the legitimate interests of certain accounting information users. Also, one can perform analyses regarding the situation of this field in Romania in comparison with the existent situation in other countries. The paper's originality is given by the study on the impact of applicable accounting regulations in Romania on creative accounting techniques. There are very few studies in this field in our country and we appreciate that it would be a useful source for the accounting information users. Also, the usefulness of this study is given by the suggestions concerning the instruments to identify the creative accounting techniques that have a negative role on financial statements, so that they would keep their relevance and credibility for the users of accounting information.

Key words: creative accounting, true and fair value, regulations, corporate governance, financial statements, flexibility

JEL CODE: Accounting and Auditing: General M40; Government Policy and Regulation M48

I. Introduction

Specialty literature presents several factors liable to stimulate managers in using creative accounting techniques.

A first hypothesis is the situation in which managers' salaries are calculated according to the accounting result. In this situation they will be tempted to have an opportunist behavior, choosing those creative accounting artifices which allow them to keep these rights to a high level. Therefore, one can meet two situations:

when the results exceed the maximum limit established by means of contract, the surplus will not be registered within current period, but it will be used in the subsequent period when it will be remunerated;

when managers will confront with the opposite situation, finding themselves in the situation of registering great losses, they will apply the method of increasing those losses by including all future probable losses, which will have as a result future superior profits.

According to the creative accounting theories there is a connection between the use of creative accounting techniques and managers' incompetence. A company that has reached an unstable situation will undoubtedly begin to use creative accounting techniques in order to artificially increase profit, and thus, the financial situation to be temporarily concealed. The advantages would be to maintain the suppliers' credibility in order to avoid their refusal regarding the grant of commercial credit or the decrease of credits' refunding period towards financial creditors.

The extremely diverse character of economic activities involves resorting to certain particularities concerning their evaluation, particularities that allow a specific reflection of that certain economic event. The existence of this possibility implies using options for evaluation. Choosing one option or another sometimes relies on professional judgment; therefore, different financial results are obtained according to every accounting specialist's opinion.

Inevitably, the requirement itself of providing the true and fair view can lead to creative accounting, starting from the premise that in order to achieve the true and fair view it is necessary an honest applying of accounting regulations. Sometimes, though, compliance with rules is not enough. Rules cannot be considered a complete code of inflexible rules, replacement of professional judgment. In this sense, the IV Directive explicitly mentions that "when applying an accounting foreclosure is not enough to provide a true and fair view, within annexes one must furnish additional information [...] and if, in an exceptional situation, applying an accounting foreclosure is inappropriate for providing a true and fair view to the patrimony, financial situation and result, one must make a derogation from this foreclosure". Therefore, a true and fair view could be achieved only by noncompliance with effective rules, and this derogation may lead to exaggerations and distortions of the reports from financial situations.

One of the elements that may lead to applying some creative techniques may be even the pressure of certain categories of users. An example could be the investors who desire a larger profit in order to raise dividends to more superior values, fact that would induce a pressure upon administrators in this sense.

Because the fixed relationship between cost and expected yield is very volatile for immaterial investments it is very difficult to identify and to measure most of these assets. The problem is even greater as the progressive increase of immaterial investments requires taking them into account in order to define the enterprise. Therefore, this is a favorable field for creative accounting to manifest, having a potential effect of distorting the accounting information in time and space.

Another element that could induce creative accounting, in specialists' opinion, would be the absence or insufficiency of national accounting norms regarding the constitution of social and consolidated accounts. In some authors' opinion (Bernheim, 1993: 58-60, 93), creative accounting practices lean more and more towards a so-called "real management of accounting result" in order to maximize it. According to other authors, besides this objective, creative accounting also aims to increase equity and to decrease the gearing rate (Feleagă, 1996:151).

II. Research methodology

Under the aspect of mainstream research, our paper is oriented to the positivist theory, pursuing to explain through a detailed and thorough approach the different sides of the matter concerning creative accounting techniques in the light of Romanian accounting regulations. We intend to use

some elements from the interpretative and critic theories, as a result of approaching different concepts, regulations and practices in this field, in a interpretative and critic manner, following a deduction-based approach. By studying the Romanian accounting regulations one can grasp the applicable creative accounting techniques and their influence on the true and fair value. The limit of this research is the fact that it represents only a fundamental research and it is not complemented with an applicative research which would identify the practical instrument to apply the creative accounting techniques.

III. Creative Accounting Techniques

Creative accounting techniques regarding non-current assets

Creative accounting techniques regarding non-current assets generally refer to the treatment of development costs and of goodwill, to revaluation, amortization policy and impairments, to capitalization of expenses subsequent to commissioning and to interests. For example, creative accounting techniques regarding the development costs are linked to the decision to capitalize or not the expenses, and also to the capitalized expenses' value and to their amortization policy.

The difference between development cost and research costs creates premises for creative accounting manifestation. Thus, an entity that uses a policy of capitalizing development costs can increase or decrease the result of a financial year by simply transferring them within the research category, situation in which the profit and loss account is affected, or within the development category, situation in which the balance sheet is affected. Moreover, the entity can invoke at any time uncertainties regarding the project finalization in order to transfer the development costs from the balance sheet to the profit and loss account (Feleagă & Malciu, 2002: 399).

Creative accounting can also emerge when there are common expenses for several projects, and their delimitation on every project has a subjective character. Also, the dimension of goodwill is easy to manipulate. Thus, the undervaluation of purchased elements determines the increase of goodwill and provides an image of fake profitability in the future.

Creative accounting regarding tangible assets envisages the asset revaluation, the capitalization or not of certain expenses subsequent to commissioning, the amortization policy, and other special transactions.

Amortization policy influences the result evolution by means of three variables: Depreciable cost; Amortization's duration; Method (regime) of amortization (linear, accelerated, and digressive).

In certain countries the depreciable cost is the difference between the input value (historical cost) and the residual value estimated at the end of the period of use. We can observe here a moment in which creative accounting emerges, which is linked to the residual value's estimation and then, at the end of subsequent years, to the revision of this estimation. In Romania, according to the existent accounting regulations, residual value is null, therefore it is not taken into account when calculating the depreciable cost.

Amortization's duration is an accounting estimation available to the economic entity's board, situation which involves subjectivism and, therefore, creative accounting. Within OPFM (Ordinance of the Public Finances Ministry) no. 3.055/2009 it is mentioned that: the amortization of tangible assets is calculated according to a plan of amortization, from the date of their commissioning until the full recovery of their input value, according to their terms of economic use and their conditions of use. The amortization calculated according to its terms of economic use is called financial amortization. Usually, in order for the accounting amortization to be equal with financial amortization, in practice economic entities establish the terms of economic use within the time span in which the normal functioning duration is comprised.

We can also mention that the term of economic use is an accounting estimation, thus, economic entities can modify it subsequent to the commissioning of that certain asset, fact that generates modifications of accounting amortization with all its implications upon the financial year's result.

The situation becomes more complicated if we also take into account the recoverable value of tangible assets at the end of the financial year when the impairment for non-current assets must be registered. Apparently, book value is objective, because at the moment the non-current assets are registered within the entity, it is validated on the market. One must not forget that in order to compare it with the recoverable value, from the book value one must subtract the registered amortization, the latter involving a series of variables.

Creative accounting techniques regarding the non-current assets' revaluation are usually used by the entities that suffer difficulties in order to increase its equity (revaluation reserves) and, thus, to artificially increase their debt capacity. Another place where creative accounting can emerge is the non-current assets production, by means of registering within the non-current assets' value the fixed costs (salaries and amortizations) related to the subtask.

In this sphere of creativity linked to non-current assets we can mention the lease-back operation which consists of selling a non-current asset to a leasing company, which is subsequently taken over in financial leasing. In this manner, the economic entity obtains the necessary economic resources in order to normally develop its activity and, at the same time, it can still use that certain asset, as if the entity still owned it. During the year the transaction is performed, the result increases, but it will decrease during the subsequent years by means of the leasing rates it will pay. The higher the transaction price is, the greater leasing rates and interests paid by the entity will be.

Concerning the financial assets the problem that raises is whether to include them in this category or within the short-term financial investments, thus, modifying the economic indicators and also the determination of adjustments for depreciation. According to the principle of prudence, every loss of assets' value must be acknowledged as an expense by determining adjustments for depreciation.

Another example is the one related to selling equity investments in a moment when the market report is significantly greater than the purchase price; afterwards, the entity proceeds to repurchase them. The same technique is used when updating the securities' input value and, simultaneously when increasing the result, even if the entity has to pay certain brokerage fees and the tax on the profit generated by the transaction.

Creative accounting techniques regarding current assets

Creative accounting regarding current assets occurs in the following directions: stock evaluation, volume of stored production, choosing the accounting method for construction contracts, the artificial cession of placement securities, the calculation and registration of adjustments for stock and receivable depreciation, etc.

The decision to constitute or not stocks of finished products enables an entity to improve its result.

The decision to continue the production, even without immediate usefulness, allows hiding the subtask costs and obtaining a favorable result. Certainly, there is the risk that the market will not accept these products without a firm order, and therefore, they will transform in loss in the next period.

The subtask's cost accounting can be another manner of creative accounting manifestation. In management accounting there are two manners of including fixed costs within products' costs: the full-costing method and the method of rational imputation. According to the full-costing method, the production cost consists of a share from the annual fixed costs in the following proportion: $\text{annual fixed costs} \times \text{quantity in stock} / \text{annual produced quantity}$. According to the method of rational imputation, the production cost consists of a share from the annual fixed costs in the following proportion: $\text{annual fixed costs} \times \text{quantity in stock} / \text{annual normal quantity}$. In the first situation there is not such a subtask cost, all fixed costs being included within the production

cost even if the production capacities have not been used at their full capacity, while in the second situation the costs related to not using the production capacity is directly discounted upon the result without being included within the production cost.

Creative accounting can also manifest in what concerns the methods used (the direct method or inventory method, respectively the indirect method or accounting method) in order to evaluate unfinished production at the end of the financial year.

For the construction contracts which develop during a longer period of time one can apply two accounting methods: the method of progress percentage, when the revenues and expenses from the contract are acknowledged as the percentage of works in progress is registered within every financial year, which has as effect benefit distribution in every financial year; and the method at completed works, when the result is acknowledged only after the construction works are completed.

When using the method at completed works, the result will be acknowledged only at the completion of construction works, until then the value of registered expenses being acknowledged as work in progress.

In what concerns stocks, if their record is kept according to effective cost (purchase cost or production cost, as appropriate), the evaluation of stock outputs being made through FIFO, LIFO or CMP method, which, in case of inflation, ensure the achievement of different results. An entity's result does not only rely on real economic performances, but also on the option for a certain method of stock evaluation.

Another case of creative accounting emerges in the case of circular transactions, when two or more economic entities perform transactions amongst them in order to improve their results; for example, when two entities sell the same type of stocks at the same price to each another. From the cash-flow point of view the impact is null, because everything one pays, one charges; from the VAT point of view the impact is also null because the purchase price is equal with the sale price. The sole difference is that the purchase cost of stocks would eventually increase (therefore, an increase of assets' value is registered) and, simultaneously, the result would also increase (the equity volume increases). In this situation, there is a price that the two entities have to pay in order to embellish their results, which is the tax on profit that registered an increase.

If the economic entities consider that there is a risk of not charging certain receivables, they can insure them. In this case there is no longer need to constitute an adjustment for receivables' depreciation. There are companies which, urged by the desire to achieve a good embellishment of the result, insure the receivables only after the depreciation is determined. Thus, if the company determines the depreciation in the first year and within this year it is registered a high profit level, it will be interested in creating an adjustment for depreciation. When the result is unsatisfying, it will insure the receivable, registering expenses with the insurance premium and revenues from adjustments (Malciu, 1999: 18-28). Creative accounting regarding short-term financial investments manifests by including them within the non-current assets category, by means of cessions of placement securities, followed by their repurchase when the sale price is significantly higher than the initial purchase cost, by registering or not adjustments for depreciation.

Creative accounting techniques regarding liability elements

Creative accounting regarding liability elements concerns share premiums which can be used in three directions: capitalization, including them within reserves and covering the expenses generated by new shares' issuance and sale. The expenses generated by issuing and selling new shares are initially registered as assets, within set-up costs and from this point creative accounting may emerge: either set-up costs are amortized and, therefore, the result is directly influenced, or set-up costs are covered by share premiums.

Choosing the second situation is justified by the fact that it does not affect any shareholder, but it favors the state by not including an expense within the result and, therefore, one pays a greater tax on profit. However, applying this situation, the result remains higher which misleads the external users who give priority to result variation and less to share premium variation. Another liability element taken into account are the provisions which have the role to cover risks, expenses or losses that are uncertain concerning their dimension or the moment of their emerging. They occupy an intermediary position between equity and debts. Because they require estimations, provisions create conditions for results' smoothing.

Another creative accounting technique is related to debts towards employees. This technique especially emerges within small entities where the associates are not limited to capital contribution, but they also make a work factor contribution. The remuneration for the work force is the salary, but in order to avoid pay taxes considered too high, the associates register themselves as self-employed persons which, according to their field of interest, pay an annual fixed tax, irrespective of obtained revenues. Therefore, in this case, there is a profit transfer within the entity which pays the tax on profit, by means of bills issued by entity's associates for their work, at the level of an individual who pays the flat tax. The associates win twice: firstly, they make savings from the tax on profit, and secondly, they do not have to pay the tax on dividends. This way, creative accounting is used for optimizing financial pressure, taking into account that the associates are not very interested in the information published within financial situations as the entity is a closed company (not quoted to stock market) of small dimensions.

A creative accounting technique that has a direct impact upon the result of the current financial year emerges within certain entities which establish by means of formal or informal agreements that the buyer may return the goods that have not been sold. Basically, this practice does not pursue to influence results but, in certain situations, it can be considered a method of result smoothing if in the year the sale was performed, economic performances are inappropriate. In this manner, in the year the sale was performed profit will be acknowledged, and the next year a decrease of profit will be registered in return.

One of the reasons for which annual financial situations are being approved after a certain period from the moment the financial year is closed is to identify events and transactions subsequent to that moment, but which actually belong to that certain closed financial year, in order to influence its results. If, at the end of the financial year goods sales are performed, followed by their return in the next financial year, which is previous to the approval of annual financial situations for the closed financial year, there are methods to remove the effects upon the result, as it follows: the revenues registered from sale will be annulled at the end of the financial year, and stocks will be considered as being produced by third parties and, therefore, stock variation related to sold products will also be annulled. The sole negative impact on the seller remains the VAT within the financial year in which the sale is performed, but it will be recovered in the next financial year.

THE GOING CONCERN – THEORY AND PRACTICE IN THE FINANCIAL AUDIT

Tara Ioan Gheorghe

University of Oradea, Economic Sciences Department

Introduction

The whole financial and economic world is really interested in more reliable information so as to be possible to avoid bad events or, perhaps, the crisis.

It is known and equally acknowledged that financial audit might have been more useful in preventing the actual financial crises. It is strongly necessary for further debates on the subject and for the most effective levers to enforce the best practical examples in the field.

Therefore, we consider that a component part of financial audit activity that might be a source for more debates and, as a result, for some better results in performing financial audit, would be both the concept and the practice of “going concern”.

The results of our research show that we could reconsider the moment of the going concern assessment. It is not necessary to be performed at the same time with the audit of the annual financial statements. It also might be required by the investors, mainly by the stockholders, at any time they wish. This fact would induce changes in the actual standards statements which refer to auditor’s and management’s responsibilities regarding “going concern”. Not the latest as importance appears the fact that in this situation a larger team, and more competitive, being compounded from a wide range of experts along with the financial auditor, could perform the audit mission of going concern.

The paper is structured as the following: an overview of the main approaches of the subject of “Going concern” in both scientific literature and in the regulators work, the analysis of some data published by The Securities and Exchange Commission (SEC) along with the results and proposals of some other authors in the field, conclusions and my own proposals.

The main scientific background and regular framework

The most recent studies on “going concern” are focused on the following aspects:

The going concern concept and its component part. Thus, *Nirosh Kuruppu, Fawzi Laswad and Peter Oyelere(2003)* accepted that the going concern is a concept that assumes that the reporting entity will continue in operation for the foreseeable future, and that it will be able to realize assets and discharge financial obligations in the normal course of operations.

The methodology of going concern assessment and its impact and connection with the auditor’s opinion: *Mahdi Salehi and Co. (2009)* declares that one of the ranking methods in relation with going concern concept is applying financial ratios through a combined form. Liquidation prediction model for assessing going concern can be used as a valuable audit tool due to the high costs associated with misclassifying failing companies argues *Nirosh Kuruppu and Co.*

The behavior of financial auditors facing certain kind of regulations and the practical answer of the management representatives to the modified going concern opinion. *Sylvia Constantinides (2002)* analyzed the influence of a going concern opinion on three categories of actors respectively auditors, bankers and insolvencies practitioners and concluded that there is a different way of behavior. *A.Rosman (2011)* found that auditors are adaptive in ill-structured tasks and rigid in structured tasks as predicted by theory. The likelihood of default for firms that received going concern opinion is 2.792 times that of firms that received a clean opinion shows *Alnoor Bhimani, Mohamed Azzim Gulamhussen and Samuel Lopez (2009) from London School of Economics, United Kingdom.*

Marshall A. Geiger, K. Raghunandan, and Dasaratha V. Rama (2005) documented that the increase in going-concern modification rates for bankrupt companies after December 2001 is due to changes in auditor reporting decisions and not solely due to differences in client characteristics between the times periods studied.

The regulations on financial audit started before nineties with the description of going concern principle in 1975 - *IAS 1 Disclosure of Accounting Policies*- continued with US SAS 59 issued in 1988 by American Institute of Certified Public Accountants (AICPA). In 2002 after the famous bankruptcy of Enron, *the Sarbanes Oxley Act* brought tougher regulations that refer to going concern as well. Beginning with 2009, the going concern activity is performed on the basis on the International Standard on Auditing *ISA 570 Going concern* according to which the auditor's responsibility is to obtain sufficient appropriate audit evidence about the appropriateness of management's use of the going concern assumption in the preparation of the financial statements and to conclude whether there is a material uncertainty about the entity's ability to continue as a going concern.

After the financial crisis beginning IFAC issued recommendations both to its members and to the representatives of the G20 members aiming at convincing the decision factors from those countries to take the proper measures in the financial and accounting field, including financial audit, so as some of the crisis' causes to be effectively prevented. Thus, the recommendations for G-20 meeting of April 2009 and of June 2010 refer to the necessity of *Strengthening Transparency and Accountability in the Context of the Audit of Financial Information*. On the same purpose IFAC issued in 2009 the document headed *Audit Considerations in Respect of Going Concern in the Current Economic Environment* that deals with the effect of the credit crisis and economic downturn on an entity's ability to continue as a going concern and whether these effects ought to be described in the financial statements. One of the document key message consists in stressing the fact that going concern assumption is a fundamental principle in the preparation of financial statements and that the assessment of an entity's ability to continue as a going concern is the responsibility of the entity's management.

Method and data

In order to document my opinion of separating the audit mission of a going concern from other auditors' engagements, particularly from the audit mission on the annual financial statements, I used two levers: a study of a sample of data provided by Securities and Exchange Commission (SEC) and an analyses of the most recent scientific papers of other authors dealing with this subject and whose findings entitle me to go forward with the proposal.

On a sample of eighty entities published by SEC on April 18th and April 22th, 2011, at each date forty filing entities, I studied their documents for going to bankruptcy, the moment of filing, the auditor's opinion on the annual financial statements as well as the connection between the financial auditors' opinion and the decision for bankruptcy of these entities management. The SEC information offers a list of the most recently bankruptcies received and processed at SEC. Therefore, those eighty entities sampled at different dates appear relevant to the goal of showing the connection between financial audit opinion and the decision on filing for bankruptcy. After selecting the sample we searched on each entity's own site the latest financial audit report. In this way we found out the moment of the financial audit opinion (before or after filing), the type of decision and finally its connection and influence on the bankruptcy's proceedings.

From the analyzed data encompassed in the (*Table 1*) result the followings:

Table 1. Audit opinions for the sampled entities

Nr	Audit opinion	Date of April 18th 2011	Date of April 22nd 2011	Total	Percentage from total	Number of entities getting the audit opinion	
						Before filing	After filing
1	Going-concern modified	9	11	20	25%	20	–
2	Not modified	28	25	53	66%	23 (43%)	30 (57%)
3	No audit report	3	4	7	9%	–	–
4	Total	40	40	80	100 %	43 (58%)	30 (42%)

Realized by the author

- Only a quarter from all companies got a going concern modified opinion before filing. At the same time these entities represent less than a half (46%) of all entities getting an opinion before filing.
- The majority of all companies got an unmodified opinion and from all of these 57% is represented by those getting it after starting the bankruptcy proceedings. That means that the connection between the decision for bankruptcy and an unmodified opinion hardly exists.
- There are some entities (9%) that maybe did not at all get an audit opinion or their report was not published. Nevertheless, because of their small percentage, they do not affect or change the previous results.
- On the whole, we could assert that a slim majority of the companies got an opinion before filing for bankruptcy and from all of them, a big majority, is represented by those getting an unmodified opinion.
- Studying the content of some auditors' opinions we found that they are strongly criticized by the stockholders' representatives when somebody should account for the bankruptcy situation.

Analyzing the conclusions of the most recently published papers on the subject we found that they consistently support the idea that: financial auditors' behavior concerning the new, stronger regulations or a litigation environment is extremely subjective, there are many disadvantages for the companies getting an modified opinion even if they are in the position to escape bankrupt situation and that there is hardly a real connection between the bankruptcy decision and the unmodified opinion of the financial auditors.

Thus, *M. A. Geiger and K. Raghunandan (2002)* demonstrated that changes in the litigation environment are associated with the issuance of fewer going-concern-modified opinions to stressed companies in recent years. This finding is consistent with the SEC's claim that auditors' behavior in recent years has been influenced by reduced litigation pressures.

On the same idea Marshall A. Geiger, K. Raghunandan, and Dasaratha V. Rama (2005) found that auditors are more likely to issue going-concern modified audit opinions in the period after December 2001 when Sarbanes-Oxley Act was issued.

Andrew J. Rosman, (2011) documented that auditors are adaptive in ill-structured tasks and rigid in structured tasks as predicted by theory. We can easily notice a real subjectivism in the financial auditors' activity with the respect of a new and stronger regulation or for a litigation atmosphere.

An analysis realized by Alnoor Bhimani, Mohamed Azzim Gulamhussen, Samuel Lopes (2009) shows that the risk for entities to reach bankruptcy is much higher when receiving an modified going concern opinion. At the same time it is acknowledged that the performance of the auditors in predicting the bankruptcy is much inferior to that of the risk models: Alnoor Bhimani, Mohamed Azzim Gulamhussen, Samuel Lopes (2003), P. Cybinski (2005)

A certain independence of decision for bankruptcy from going concern modified opinion is also documented by Alnoor Bhimani and Co. (2009) and by Marshall A. Geiger, K. Raghunandan, and Dasaratha V. Rama (2005)

We think the results of our investigations along with the above evidence of the effectiveness of going concern opinion entitle us to look for a better way to use the concept of "going concern".

Conclusions

Relying on the evidence above shown we conclude that a separate or off-audit mission could be performed at the shareholders demand. It might appear too courageous to go for such a proposal but I think in this way a going concern opinion would be much more professional (it appears possible for experts to be involved in the audit process, using the statistical and mathematical models) and more close to the reality. On this purpose the content of the concept of going concern should be changed correspondently. The ISA standard of Going Concern should be adapted concerning the period of "twelve months" and the obligation for auditors to produce a going concern opinion at every engagement as well. From these changes would mainly take advantages the auditors, management representatives and shareholders.

More relevant data will enable us to more deeply argument this proposal. The future researches will be headed toward the improvement of the concept of going concern and, correspondently, the necessary adaptation of the financial audit standards.

ENVIRONMENTAL REPORTING AT INTERNATIONAL LEVEL STUDY OF THE LITERATURE

Ienciu Ionel-Alin

Babeş-Bolyai University, Faculty of Economics and Business Administration

One of the most important areas of development during the last 15 years, as far as accounting is concerned, has been the environmental reporting and accounting, generating interests beyond the restrictions imposed by purely academic discussions or the professional accountants community. The objective of the paper is represented by the analysis of scientific knowledge and existing practices in the area of environmental reporting. Mathews (1997, 2001) and Parker (2005) are one of the most representative studies that examine the evolution and status of researches in the area of accounting and environmental reporting. Because of the fact that reports offered by the traditional financial accounting system are insufficient for reflecting a clear and complete image of the company's environmental impact, I monitored the frameworks or mechanisms of environmental information. Also, the paper analysis the articles treating international environmental reporting, articles published in ISI quoted or BDI indexed journals. The collection and analysis of reporting frames, the interpretation and analysis thereof represent the main instruments used in order to bring to the forefront the main existing reporting frames for environmental information, found at international level. The quantitative, applicative research is used to reflect the current status of researches in the field of environmental reporting, using the non-participative observation to reflect the current status of researches in the field of environmental reporting, by using the non-participative observation, the collection and analysis of articles as main research instruments. The study concludes that environmental reporting continues to represent the main attraction of researchers in the field of environmental accounting. The main reason for researches on environmental reporting is represented by the description, investigation and improvement of practices on accounting and reporting environmental impacts. Although the complexity of researches and existing international and European reporting frameworks have contributed to creating the required premiss for introducing the environmental accountability international standards and regulations, they delay their appearance. The study add value to the existing literature in the field of environmental reporting by presenting and analysing environmental reporting frameworks and important papers that analysis environmental reporting practices.

Keywords: environmental reporting, reporting framework, analysis of literature, applicative research, environmental accounting

JEL Classification: M49 , Q56

I. Introduction

Accountancy researchers and practitioners have been tempted to get involved into environmental related issues at the moment when communities, governments, and even companies have acknowledged the importance of these issues. Environmental protection thus becomes an opportunity for researchers and the accounting profession to prove that they are ahead in contemporary problems and that they can master and maneuver these new opportunities and modern problems (Medley, 1997). The major desideratum of this scientific work is the creation of added value to the existing scientific knowledge (Mustaşa, 2008: 17). The most important objective aimed during the study is represented by the analysis of scientific knowledge and existing practices in the area of environmental reporting. In the attempt to accomplish the set

objective, the conducted research is focused on two levels: *the study of reporting frames for existing environmental information, on European and international level* and *the analysis of articles handling international environmental reporting, articles published in ISI or BDI indexed journals*. By means of this study we have intended to answer the following research questions: Are there sufficient prepared reporting frames at international level? Which are the most important studies approaching the area of environmental reporting at international level? Which are the predominant researches in the area of environmental reporting, what is the purpose of research, as well as the methodology being used?

II. Analysis of Literature

The most important studies bringing upfront the evolution and status of researches in the area of accounting and environmental reporting have been elaborated by Mathews (Mathews, 1997, 2001) and Parker (Parker, 2005).

In 1997, Mathews (Mathews, 1997) created a review of main research directions for the period between 1970 and 1995 in the area of environmental accounting, by analyzing the following aspects: empirical studies, regulatory and philosophical statements, the alternative research current in environmental accounting, the education programs and manuals / accounting profession, the regulatory context. The author has asked himself the following question: *Why accounting academic environment has yet to accept social and environmental accounting?* (Mathews, 1997). Mathews argues the „lack of interest” for this field by the fact that environmental related issue, the scarcity of resources were not „fashionable” at that time, and the methodology used in the attempt to answer certain empirical questions was underdeveloped. Nevertheless, the study outlines the growing trend of researchers in environmental accounting and especially environmental reporting. In 2001, Mathews (Mathews, 2001) approached again the evolution of researches in social and environmental accounting for the period between 1995 and 2000 by analyzing the following aspects: empirical studies, regulatory and philosophical statements, the alternative research current in environmental accounting, the education programs and manuals / accounting profession, the regulatory context. The author outlines the progress of researches in this field by comparison to the previous period 1970-1995 especially in the subfields of environmental audit, environmental management accounting, and social responsibility and considers researches between 1995 and 2000 as more complex and being performed by more experienced researchers. The author suggests that analysis of environmental reporting remains the preferred subfield of environmental accounting.

A presentation of researches in the field of environmental accounting, as appearing in the main accounting journals has also been performed by Lee Parker in 2005 (Parker, 2005), study in which he approached the issue of social and environmental accounting by means of works published in four interdisciplinary accounting journals: *Accounting, Auditing & Accountability Journal (AAAJ)*, *Accounting Forum (AF)*, *Critical Perspectives on Accounting (CPA)* and *Accounting, Organizations and Society (AOS)*, as well as works published in two international journals dedicated to social and environmental accounting: *Social and Environmental Accounting Journal (SEAJ)* and *Journal of the Asia Pacific Centre For Environmental Accountability (JAPCEA)*. Researches in the field of environmental accounting dominate the social accounting researches, and the predominant is represented by national practices or regulations on environmental accounting.

III. Research Methodology

From the point of view of research trends, the present work is included in the main research trend, with a positive and constructive intent. The collection and analysis of reporting frames, the interpretation and analysis thereof represent the main instruments used in order to bring to the

forefront the main existing reporting frames for environmental information, found at international level. The quantitative, applicative research is used to reflect the current status of researches in the field of environmental reporting, using the non-participative observation to reflect the current status of researches in the field of environmental reporting, by using the non-participative observation, the collection and analysis of articles as main research instruments. This research methodology was applied by Muller (Muller, 2010) and Bonaci (Bonaci, 2009) in their studies regarding the current state of research in the field of consolidated financial statements and financial instruments.

IV. Research Results

Gray (Gray, 2006: 3) has severely criticized the relation between financial accounting and sustainability: „Few ideas can be considered as more destructive, for the notion of sustainable planet, as an economical system designed to maximize those aspects being measured by financial reporting”. Gray and Bebbington (Gray and Bebbington, 1992: 6) were describing the traditional accounting system: „...it is very wrong for a system of evaluation, a system that makes things visible and guides the corporate and national decisions, to be able to declare success right in the middle of destructions”. Because of the fact that reports offered by the traditional financial accounting system are insufficient for reflecting a clear and complete image of the company's environmental impact, we have rigorously monitored the frameworks or mechanisms capable to supply a desirable balance of environmental information, in accordance to the company's economic performance, frameworks intended to complete the reports offered by the traditional financial accounting system. The main sources of reports existing at international and European level are Global Reporting Initiative Guidelines, Triple Bottom Line Reporting, Reporting Guidelines for UK Business, The United Nations Global Compact, International Standard Organisation (ISO) and Social Responsibility:

a) On European and international level, Global Reporting Initiatives Sustainability Reporting Guidelines (GRI Guidelines) issued by the World Commission on Environment and Development, enjoys a dominant position, being generally accepted as the best set of practices, as far as sustainable (environmental and social) reporting is concerned. In time, there were three versions of the guidelines: the first version issued in 2000, the second in 2002, and the last in 2006. The GRI reporting framework is intended to serve also as generally accepted framework for the economic, environmental and social performances reporting. It is designed to be used by any company, regardless of size, sector of activity or location and is based on practices encountered within various companies – from small companies to companies with extended activities and geographically dispersed (GRI, 2006: 4).

b) Triple Bottom Line Reporting is based on a triple bottom line approach for sustainability, on the creation of a balance between and economic, environmental and social dimension of sustainability. Such an approach is based on the conception of researcher Elkington, that of setting at the same level the three dimensions of responsibility (Elkington, 1997; Elkington, 2001). The supporters of this idea argue that, if implemented properly, the method supplies information allowing users to assess the sustainability of a company.

c) Reporting Guidelines for UK Business is a guide of voluntary character issued by the Department of Environmental Food and Rural Affairs (DEFRA) in 2006, a sequel of the General Guidelines on Environmental Reporting published in 2001 by the DEFRA and is intended to serve United Kingdom companies in reporting information on environmental impact. The Guide proposes a set of 22 indicators on environmental performance for the UK companies, as well as other information on the company's environmental impact. In 2009, the Department of Environmental Food and Rural Affairs (DEFRA) in a partnership with the Department for

Energy and Climate Change (DECC), published a guide on how companies should measure and report carbon emissions.

d) The United Nations Global Compact (UNGC) is an United Nations initiative to encourage companies to integrate and report social and environmental aspects. The initiative is based on 10 principles, out of which, principles 7, 8 and 9 concern environmental aspects and how companies should report these aspects.

e) International Standard Organisation (ISO) issued in 1996, the ISO 14001 Environmental Management Systems, revised in 2004, as well as the ISO 26000:2010 Guidance on social responsibility, standard which completes very well the GRI Guidelines 2006.

As far as reporting frameworks proposed in other countries outside Europe are concerned, the most representative ones come from Canada, Japan, Australia. These are:

a) CSA STUFF NOTICE 51-333 Environmental Reporting Guidance, issued by the Canadian Security Administrators, presenting information on the environmental impact a company should report, as well as the government structures that should ensure environmental reporting.

b) The Japan Ministry of Environment issued in 2004 and 2007 respectively, the Environmental Reporting Guidelines, introducing a framework for the environmental reporting, on various categories of information, as well as indicators per each category.

c) Australia introduced in 1998 the compulsoriness of reporting environmental information and indicators, based on the Section 299 act, (1)(f), from Australia's Corporations Law. Also, in 2000, the Australian Environmental Ministry published the Framework for Public Environmental Reporting, considered to be highly complex. The Australian Environmental Protection Agency published in 1997 the guideline "Corporate Environmental Reporting. Why and How?"

d) In the United States of America, The International Institute for Sustainable Development; IISD, Deloitte Touche Tohmatsu International and SustainAbility Ltd published in 1993 the first guideline on environmental reporting.

As a result of documentation on frameworks and reporting mechanisms for sustainable or environmental reporting information we can conclude that the most complex framework of sustainable reporting, existing on European and international level, is the GRI Guidelines 2006, offering beside a general reporting frameworks specific reporting frameworks for environmental information on various industries. Even though this framework is highly complex and internationally acknowledged, its enforcement remains voluntary, which determines companies to report environmental information according to GRI Guidelines exclusively in the case when advantages implied by enforcement would supersede costs and disadvantages thereof.

After performing a rigorous documentation on existing European and international reporting frameworks, we have moved to the analysis of articles treating international environmental reporting, articles published in ISI quoted or BDI indexed journals. We have performed the documentation by utilizing the existing computer databases. The articles have been selected based on the following methodology:

1. first of all, we have selected the existing international accounting ISI journals (16 ISI journals: Abacus - A Journal of Accounting Finance and Business Studies; Accounting and Business Research; Accounting and Finance; Accounting Horizons; Accounting Organizations and Society; Accounting Review; Australian Accounting Review; Contemporary Accounting Research; European Accounting Review; Journal of Accounting&Economics; Journal of Accounting and Public Policy; Journal of Accounting Research; Journal of Business Finance & Accounting; Management Accounting Research; Review of Accounting Studies; Revista Espanola de Financiacion y Contabilidad - Spanish Journal of Finance and Accounting), as well as the most representative international BDI journals (5 of the most internationally representative BDI journals: Accounting, Auditing & Accountability Journal; Accounting Forum; Critical

Perspectives on Accounting; British Accounting Review; Journal of Corporate Accounting and Finance).

2. within each journal, we have identified and selected for the period starting in 2000 and until present times, the articles treating environmental reporting. We have selected articles published in the period mentioned, because during this time there has been an extension of this research field in many developed countries, as well as developing countries. We have identified a number of 69 articles treating environmental reporting, published between 2000 and present days.

3. we have analysed the identified articles from the point of view of applied methodology as well as obtained results. The database of analysed articles can be viewed in Appendix 1.

From the analysis of selected articles, we were able to notice the predominance of quantitative, empirical, case studies, interviews or questionnaires type of researches, and content analysis of environmental information reported within the annual statements or other information sources (site, mass media, administrator's report etc.). The main general conclusions drawn from the performed analysis:

- the majority of studies describe reporting practices encountered within companies from different countries, attempting to find determining factors of environmental reporting;
- the obtained results are mixed and contrary. Although the majority of studies present the theory of legitimacy as the determining factor of voluntary environmental reporting in a large number of cases, there are studies which consider environmental reporting more like a company management related issue;
- researches outline the low level of environmental information reported by companies, insufficient for the financial-accounting information users; most information have a general, descriptive character and in many cases, the financial or quantitative information are missing altogether;
- certain studies conclude about the existence of a direct link between environmental information supplied by the companies and the environmental performance within the company, as there are also studies stating that environmental information supplied by the companies do not reflect the environmental performance;
- most studies treating reporting frameworks for environmental information consider the GRI Guidelines as the most complex existing international reporting frameworks for sustainable information;
- there are studies that consider financial performance, company's size, public exposure, debt-to-equity ration or corporate governance system as the determining factors of environmental reporting performed by companies;
- the increase interest and involvement of companies and accounting profession in the environmental reporting, the insertion of compulsory reporting frameworks for environmental information, the improvement of corporate governance systems represent the main arguments that would lead to an increase of reporting and environmental performance within companies.

V. Conclusions

There is a multitude of environmental reporting frameworks at international level, but the applicability thereof does not have a voluntary character. Companies are tempted to use them especially for boosting their image to the users and investors in particular. We believe that the compulsoriness of these frameworks would increase the relevance of environmental information supplied by the companies and would determine them to grant a continuously increasing significance to the environmental impact, mostly to avoid damaging their image for the investors. In Romania, there is no such proposed reporting framework and the Bucharest Stock Exchange listed companies supply environmental impact information without considering any reporting

framework. Environmental reporting continues to represent the main attraction of researchers in the field of environmental accounting, although we can also emphasize the high interest for other research subfields, such as environmental management accounting and environmental audit. The main research current, positive and constructive, dominates the environmental researches, despite the reactions from critics which have not delayed to appear. The main reason for researches on environmental reporting is represented by the description, investigation and improvement of practices on accounting and reporting environmental impacts. Although the complexity of researches and existing international and European reporting frameworks have contributed to creating the required premiss for introducing the environmental accountability international standards and regulations, they delay their appearance.

EVALUATION OF ENVIRONMENTAL REPORTING FOR COMPANIES LISTED ON THE LONDON STOCK EXCHANGE

Ienciu Ionel-Alin

Babeş-Bolyai University, Faculty of Economics and Business Administration

Environmental aspects have become significant for an increasing number of companies and can have, under certain circumstances, a significant impact on financial statements. A large number of studies can be outlined in time analyzing the variation of environmental reporting (Deegan et al, 2002; O'Donovan, 2002; Holland and Foo, 2003; Nyquist, 2003; Cormier et al, 2005; Yusoff et al, 2006; Jorgensen and Sodorstrom, 2006; Taylor and Shan, 2007; Sumiani et al, 2007). The main objective targeted by this study is the evaluation of environmental reporting for the European companies listed on the London Stock Exchange. In order to achieve the proposed objective, we have completed an longitudinal and transversal analysis of environmental reporting within companies listed on FTSE 100, monitoring first of all the way in which these companies report non-financial and financial aspects related to environmental impact as well as how these reports are being audited. For each annual statement or sustainable report, we have analyzed the level of environmental reporting. The evaluation of how information on environmental impact are being reported is based on four categories of information: information on indicators (technical, financial) that would reflect the environmental impact (water, air, soil), information regarding the financial indicators (investments, assets and other environmental costs, debts and provisions), non-financial information (related to the company's commitment, objectives, programs, management, future perspectives etc), information on environmental audit. Analysing the results we have obtained, the following can be outlined a certain increasing trend on the level and relevance of environmental information supplied for the companies listed on FTSE 100. Only 22 of the analysed companies are reporting the environmental performance indicators recommended by accredited bodies such as the GRI Guidelines (the most complex guidance in this respect). 20 of the 48 analysed companies have audited such information, thus increasing the relevance of this type of information. The paper contribute to the understanding of environmental reporting at international level, creating an image of the quality of environmental informations provided by the most representative companies at international level.

Keywords: environmental reporting, companies, London Stock Exchange, applicative research, environmental aspects

JEL Classification: M49 , Q56

1.Introduction

Gray (Gray et. all., 1996) considers that financial reports within a company, social and environmental reporting and financial accounting included, should be framed in pattern of responsibility (accountability model) according to valid regulations. The first steps suggested by Rob Gray in developing such a system of environmental and social reporting would be the identification of the target group and purpose of such a report, followed by specification of how the company will be able to supply information as a whole. The purpose of the annual report, in Gray's opinion, is to release responsibility towards the society. Due to the fact that information needs cannot be satisfied in full, Gray believes that an environmental balance (eco-balance) and a social balance would be sufficient for those interested to be able to have an image regarding the social and environmental performance. Gray sets the financial, social and environmental dimensions on equal standing, all considered as equally important, both for the company and for

the users. As reporting environmental information remains internationally voluntary, it leads to major differences in the quality and quantity of environmental information reported by companies from various sectors and countries. The economic crisis brought into question the manner in which the systems of reporting ensure a faithful image of the provided information (Groșanu and Răchișan, 2010). Verifying the objectivity of certain information can be achieved by means of audit process. The same as the environmental information presented in the financial statements, the information included in the environmental reports and sustainable reports are also the subject of the audit process. In a study directed by KPMG, on the publication of environmental information, it has been proven that most companies audit their environmental reports independently from their financial statements and that the number of companies auditing their environmental reports is increasing (Bențianu and Georgescu, 2008).

The main objective targeted by this study is the evaluation of environmental reporting for the European companies listed on the London Stock Exchange. In order to achieve the proposed objective, we have completed an longitudinal and transversal analysis of environmental reporting within companies listed on FTSE 100, monitoring first of all the way in which these companies report non-financial and financial aspects related to environmental impact as well as how these reports are being audited.

2. Analysis of Literature

A large number of studies can be outlined in time analyzing the variation of environmental reporting, through time and space, either on company, activity sector or country level:

a) Studies analyzing the variation of environmental reporting within companies from various countries (Fekrat et al, 1996; Stittle et al, 1997; Williams, 1999; Buhr and Freedman, 2001; Holland and Foo, 2003; Nyquist, 2003; Yusoff et al, 2006; Jorgensen and Sodorstrom, 2006).

b) Studies analyzing the variation of environmental reporting in a certain country for various companies from the same sector or different sectors of activity (Gamble et al, 1995; Deegan and Rankin, 1996; Walden and Schwartz, 1997; Cormier and Magnan, 1997; Brown and Deegan, 1998; Larrinaga et al, 2002; Deegan et al, 2002; O'Donovan, 2002; Cormier et al, 2005; Taylor and Shan, 2007; Sumiani et al, 2007).

Within the companies listed on the London Stock Exchange, we have only selected the companies listed on FTSE 100, companies with the highest public exposure, reporting the largest number of voluntary information. From the total of 101 companies listed on the FTSE 100, we have restricted the study to companies operating in industries with a certain environmental impact, as a series of studies have proven that the industry (sector of activity wherein the company operates) influences the environmental reporting (Milne and Patten, 2002). Holland and Foo (2003) have compared in their analysis (UK/SUA) the way in which the legislative framework can influence the performance and the level of environmental reporting within four industries (chemical, mining, oil and gas, constructions and energy), considered to be relevant with regard to environmental impact. Cormier et al (2005) has captured the factors that determine the level of environmental reporting within German companies listed on the stock market, with a sample of 304 companies from the following industries: consumption goods and services, manufacture of industrial products and energy, water, energy, chemical products and medicines, food and drinks industry, high technology industry, heavy industry. All of these studies reflect the increasing level of environmental reporting in developed countries such as Germany, Great Britain, USA, Australia.

3. Research Methodology

We believe to be irrelevant from the point of view of reported environmental information that we analyze the quality and quantity of environmental reporting within the companies operating in

sectors of activity with small risk for pollution. Thus we have eliminated from the sample the companies operating in activity sectors with low pollution risk, such as: banking, investment funds, financial companies, insurance, services, intermediaries, mass-media, telecommunication. As a result, from the total of 101 companies, by eliminating the companies operating in the above mentioned sectors of activity, we have been left with 48 companies in the sample, companies that can be viewed together with their respective sectors, in the Appendix 1. For each analysed company, we have chosen four annual statements (for the period between 2006 and 2009), as well as other reports including possible reporting from the company with regard to environmental impact (sustainable report, environmental report, social accountability report etc.). These reports are available on the website of each company. For the total of 48 companies, we have analysed 192 annual statements as well as 87 other reports (prepared and available only for some companies).

For each annual statement or sustainable report, we have analyzed the level of environmental reporting. The evaluation of how information on environmental impact are being reported is based on four categories of information and the following encoding system (in-house encoding system attempting to consider the relevance of reported information):

I. Information on indicators (technical, financial) that would reflect the environmental impact (water, air, soil). For this category of information we have utilized an encoding system from 0 to 2, as follows:

-0, the company does not report such indicators;

-1, the company reports such indicators, but the reported indicators are not accredited / stipulated by the various reporting standards (GRI Guidelines);

-2, the company reports such indicators, and the reported indicators are accredited / stipulated by the various reporting standards (example: the company applies the GRI Guidelines); also, if the company applies the GRI Guidelines, we have also marked the level of application thereof (for details referring to the levels of application visit <http://www.globalreporting.org/ReportingFramework/ApplicationLevels/>).

II. Information regarding the financial indicators (investments, assets and other environmental costs, debts and provisions). For this indicator, we have used an encoding from 0 to 2, as follows:

-0, the company does not report environmental costs or debts;

-1, the company reports such indicators, but the indicators reported are not separated, not detailed on activities / sources / types of expenses;

-2, the company reports such indicators, and the reported indicators are separated, detailed on activities / sources / types of expenses.

III. Non-financial information (related to the company's commitment, objectives, programs, management, future perspectives etc) that would reflect the company's environmental performance. We have used the following encoding system:

-0, the company does not report such information;

-1, the company reports information of general character;

-2, the company reports information of specific character (indicators, correlated with the company's policy).

IV. Information on environmental audit:

-0, the company does not certify information on environmental impact (does not perform environmental audit);

-1, the company certifies information on environmental impact.

This method of encoding the quality of environmental information is used in the study performed by Comier et al (Comier et al, 2005) and offers the following advantages (Comier et al, 2005: 15):

- It allows the integration of different types of information into a single figure, comparable between companies, in terms of relevance;
- It allows the performance of a qualitative scoring for the environmental information provided by each company;
- Irrespective of the subjectivism of the process, it eliminates non-relevant information, considering only the relevant pieces of information.

4. Research Results

The level of environmental reporting for each category of analyzed information (a. Information on indicators (technical, financial) reflecting the environmental impact (water, air, soil); b. Information on financial indicators (investments, assets and other environmental costs, debts and provisions); c. Non-financial information (on the company's commitment, objectives, programs, management, future perspectives etc) reflecting the company's environmental performance; d. Information on the environmental audit) are presented in the Appendix 1. Analysing the results we have obtained, the following can be outlined:

- From the point of view of progress, we can notice a certain increasing trend on the level and relevance of environmental information supplied for the companies listed on FTSE 100;
- With regards to the information on indicators (technical, financial) reflecting the environmental impact (water, air, soil) we can notice that only 22 of the analysed companies are reporting the environmental performance indicators recommended by accredited bodies such as the GRI Guidelines (the most complex guidance in this respect). From the 22 companies reporting such indicators, only 13 of them have been accredited by this body (the GRI Guidelines) as companies applying (by a level C, C+, B, B+, A, A+) these indicators (the "+" means the indicators are being audited by an external auditor);
- With regards to information on financial indicators such as investments, assets and other environmental costs, debts and provisions, we can notice that the large majority of analysed companies offer adequate details within their annual statements for this type of information;
- As well as in other analysed studies, the non-financial information (related to the company's commitment, objectives, programs, management, future perspectives etc) reflecting environmental performance of the company are being predominantly exposed within the annual statements or sustainable reports;
- With regards to the auditing of environmental information included in the annual statement or the sustainable report, only 20 of the 48 analysed companies have audited such information, thus increasing the relevance of this type of information;
- 70% of the analyzed companies have an environmental committee or a committee in charge with social accountability within their corporate governance structures, a fact which should impact positively on the reported environmental information;

5. Conclusions

Although we have been able to notice an ascending trend on the level and relevance of environmental information supplied within the companies listed on FTSE 100, the majority of information provided have a non-financial character.

Indicators such as emissions level are being reported by the majority of companies, but the relevance of such indicators is questionable, because only 22 of the companies report such indicators on the basis of a framework or reporting guidance and only 27% of them certify such indicators by means of external bodies.
