The Romanian case is quite similar, excepting the interest rate, much higher because of he historical high level and the joining to EU which enhanced the trends. The real estate prices went up, about 700% in 5 years, the stock exchange index increased 500% in 4 years (from 2004 to 2008). After the peak in 2008 the real estate properties lost about 50% in 2 years and the stocks lost about 80% in about 1 year.(3) The GDP felt 7,1% in 2009 and 1,3% in 2010. The pattern of crisis and of its roots are quite similar with the other countries. An euphoria of credit spending, fostered by cheaper money that came from abroad after joining EU in 2007, increased all assets prices, to unsustainable levels, leading to an steep decrease after the peak.(2) The NBR and government measures were rather pro cyclical by easing the credit conditions – credit only with ID – and by running a budget deficit -4,8% in a year - 2008 - with an economic growth of 7,1% . Could such things been avoided? The answer is yes in an ideal, neoclassical world, populated by rational maximizers people. Is such a world, proposed by mainstream economics, the disequilibrium's would be rapidly absorbed and neutralized. The people would analyzed the unhealthy increase of the assets prices and voluntarily restrained from making more credits. The policy makers would took counter cyclical measures – budget surplus in steady growing years and deficits in negative growing years – which would smooth the trends. The real life individual prevented these rational but difficult actions, and the results are seen in these days in the life we live.

We can conclude as Akerlof and Shiller do about "important economic events […] that their causes are largely mental in nature." (Akerlof and Shiller 2009: 2)

V. Conclusions

The economic crises that started in 2007 started new debates about human behavior. How could it appear in a period of the spreading of free market that assures, on medium and long term, all the equilibriums in an economy? This paper analyzes the causes of the crises from the point of view of economic behavior. Both those who support the presuppositions of rationality and maximization of behaviour and those who are against them have solid arguments. Yet, the debate went outside the academic rooms. The effect of a wrong economic theory, which impacts on the public policies accompanied by a corresponding ideology like free market efficiency, which impacts on all economic actors can be devastating. It is not about academic recognition, but about human lives. This is why even neoclassical theory is mainstream, it is inevitable an in depth inquiry in psychology and a dynamic approach to economic processes.

The reality offer permanently example of situations in which one ore more of the rationality and maximization axioms are broken. In this respect Herbert Simon defined bounded rationality as a substitute for perfect rationality from standard economics and Daniel Kahneman proved through various experiments that there are many biases in human behavior. The conclusion is that, in order to avoid the huge disequilibrium's that led to the actual crisis we need new theories more close to the real life and an agent description that capture the limited characteristics of the human being despite the abstract "homo oeconomicus". People, specialists and non specialists, have to be aware of the difficulties to make a perfect rational decision and to learn to avoid the irrational phases of economic cycle.

VI. Notes

1. The actual evolution of GDP was -0,8% (2008/2007) compared with an average forecasted of 2%, while the actual unemployment rate was 6,9% compared with an average forecasted of 5,2%(2008/2007) .

2. In fact we can see that the faster the bubble increase, the steeper the fall.

3. The value raised from 2000 points in 2004 to over 10.000 points in 2008 and returned to 2000 points in 2009.

ADOPTING THE SINGLE CURRENCY AND THE CHANGEOVER PROCESS

Stanculescu Mimi-Florina
Academy of Economic Studies Faculty of Accounting Bucharest, Romania

Changeover will be a complex phenomenon which depends not only macroeconomic indicators, but also the social reaction, the way the environment social, consumers, unions, the population in general will be able and willing to adapt to the rigors of the euro. Adapting systems to the changeover is a complicated process that should not be underestimated, all businesses need to prepare a project with all the changes resulting from the changeover: what steps should follow the objectives and those responsible.

Legislative adjustments represented an important part of the public sector changeover preparations.

Conversion to a common currency, the euro, will not only involve economic issues, like the reduction in exchange rate risks and the increase in price transparency , but also a number of business and technical issues. Will be strategic decisions that will fundamentally affect the way an enterprise conducts its affairs,who can change the functionality that is expected from information systems.

The impact of euro conversion on retail systems reflects changes on price displays, labels, pack pricing, bar codes,psychologically sensitive price points,weighing scales, the unit pricing directive,the loss of margin on low-unit-price items,consumer information, personnel training,adapting cash registers, scanning systems,cash office management, security, the use of credit cards, and so on. Sales and purchasing price lists will have to be reviewed.

The paper structure consists of the following parts:

Convergence Methods

The Changeover and the Public Sector

The cash changeover

The five main reasons why the euro is still a strong currency

The methodology for conducting research involves analysis of the accounting measures adopted by other Member States of the Economic Monetary Union in the pre-stage and after accession, generated, especially by the changes.

The research results will have a particular importance for the economic consultancy. Even if the results will mainly target the romanian accounting system, they could be used by a broad category of the population (students economists, economists accountants, tax consultants, officers of the legislative system, etc.).

Conclusions: The research aims to identify issues that the Romanian accounting system is going to meet them as result of finalising the process of monetary integration. The paper will focus on changes in every aspect: formally, logistics, functional etc.

Keywords: the convergence, the changeover process,euro-strong currency

JEL classification: G32, M41

The euro is the single currency shared by (currently) 17 of the European Union's Member States, which together make up the euro area. The introduction of the euro in 1999 was a major step in European integration. It has also been one of its major successes: around 330 million EU citizens now use it as their currency and enjoy its benefits, which will spread even more widely as other EU countries adopt the euro.

Apart from making travel easier, a single currency makes very good **economic** and **political** sense. The framework under which the euro is managed makes it a stable currency with low inflation and low interest rates, and encourages sound public finances. A single currency is also a logical complement to the single market which makes it more efficient. Using a single currency

increases price transparency, eliminates currency exchange costs, oils the wheels of the European economy, facilitates international trade and gives the EU a more powerful voice in the world. The size and strength of the euro area also better protect it from external economic shocks, such as unexpected oil price rises or turbulence in the currency markets. Last but not least, the euro gives the EU's citizens a tangible symbol of their European identity, of which they can be increasingly proud as the euro area expands and multiplies these benefits for its existing and future members.

Dellors plan established covering three stages to achieve transition to monetary union:

First Stage: 1 July 1990 - January 1, 1994: • full liberalization of capital movements: was made from 1July 1990.

 • realignment of pairs to be less common and have been a closercoordination of monetary policies.

 • What happened in that period?

  The second phase: 1 January 1994 - January 1, 1999: It is a stage of transition from the European Monetary System to Monetary Unionthat has provided the following:

 • Monetary policy, while still being national, were to be closelycoordinated.

 • Creating a central monetary institutions to become, later, the bankCentral Europe. This institution was established as the InstituteEuropean currency, based in Frankfurt. Central banks continued tooperating in the national banks.

  The third phase: 1 January 1999 (latest): Delors Report provides orientation and irrevocably fixed exchange rateseventually replace single currency.

Those countries that wish to enter the EMU must meet the convergence established in the Maastricht Agreement, as follows:

1) the average inflation rate, measured against the CPI inprevious examination, should not exceed more than 1.5 pointsaverage percentage rate of inflation in the first three countries that have registeredlowest rates of inflation;

2) long-term interest rates calculated in the previous examination notexceed by more than 2 percentage points the average interest ratesrecorded by the three European countries with the lowest interest rates;

3) public deficit ratio, defined as the ratio between state and overheadsgross domestic product (GDP) must not exceed 3%.

4) gross national debt (external), defined as the ratio between the nominal value ofexternal debt to gross domestic product later this year and should notexceed 60%;

5) is required at least two years active participation and compliance withinmargins of the exchange mechanism of the European Monetary System.

The process of building Europe is one of progressive integration. The single market for goods, services, capital and labour, launched in 1986, was a major step in this direction. Economic and Monetary Union and the euro take economic integration even further, and to join the euro area Member States must fulfil certain economic and legal conditions.

Adopting the single currency is a crucial step in a Member State's economy. Its exchange rate is irrevocably fixed and monetary policy is transferred to the hands of the European Central Bank, which conducts it independently for the entire euro area. The economic entry conditions are designed to ensure that a Member State's economy is sufficiently prepared for adoption of the single currency and can integrate smoothly into the monetary regime of the euro area without risk of disruption for the Member State or the euro area as a whole. In short, the economic entry criteria are intended to ensure economic convergence – they are known as the 'convergence criteria' (or 'Maastricht criteria') and were agreed by the EU Member States in 1991 as part of the preparations for introduction of the euro.

In addition to meeting the economic convergence criteria, a euro-area candidate country must make changes to national laws and rules, notably governing its national central bank and other monetary issues, in order to make them compatible with the Treaty. In particular, national central

banks must be independent, such that the monetary policy decided by the European Central Bank is also independent.

The Member States which were the first to adopt the euro in 1999 had to meet all these conditions. The same entry criteria apply to all countries which have since adopted the euro and all those that will in the future.

Adapting systems to the changeover is a complicated process that should not be underestimated, all businesses need to prepare a project with all the changes resulting from the changeover: what steps should follow the objectives and those responsible.

This implies: involvement of members from various areas of activity and the existence of knowledge the following areas:

> Specify the business and software are used (users and management);
> designing and developing information systems (systems analyst)
> technical aspects of information systems (programmers);
> management and accounting (accountants and auditors).

Conversion to a common currency, the euro, will not only involve economic issues, like the reduction in exchange rate risks and the increase in price transparency , but also a number of business and technical issues. Will be strategic decisions that will fundamentally affect the way an enterprise conducts its affairs,who can change the functionality that is expected from information systems.

The impact of euro conversion on retail systems reflects changes on price displays, labels, pack pricing, bar codes,psychologically sensitive price points,weighing scales, the unit pricing directive,the loss of margin on low-unit-price items,consumer information, personnel training,adapting cash registers, scanning systems,cash office management, security, the use of credit cards, and so on. Sales and purchasing price lists will have to be reviewed.

The changeover to the euro has three specific features:

1. New products or services may introduce
new functionality. These new requirements
must be managed just as in all
other new projects, particularly at this
difficult time for obtaining IT resources.

2. The transitional period involves
handling two denominations of
currency with a fixed conversion rate.
There is no need to spend any more
than is absolutely necessary for a transitional
period. Coordinate with your
trading partners to reduce this effort.

3. The conversion effort is plagued by
exaggerated claims of difficulty. Don't
(be fazed by these pronouncements.- Managing Risk in Euro Currency Conversion-Cutter it journal- by Patrick O'Beirne)

The Changeover and the Public Sector
Legislative adjustments represented an important part of the public sector changeover preparations. Every country will have to implement a lawon the conversion of national currency into euro. Although this seems to be a rather trivial task, it should not be underestimated. The question of how to round certain

amounts remains. So far, all participating Member States have defined some signal amounts (round numbers) in the legacy currency; these signal amounts are e.g. related to tax thresholds, social security payments, charges and fines or fees.

In the euro area countries, national legislation ensured correct conversion according to specified rounding rules, taking into account practicability. This step is of particular importance also for all types of official forms, stamps, public transport tickets, parking tickets or any other public services sold via vending

machines.

In turn, these forms, stamps, ticket machines and the like will have to be adapted or newly produced. Last but not least, also any references to interest payments linked to central bank interest rates must be considered (Lachs and Ritzberger-Gru‹nwald, 1998).

All these legislative adjustments have to go through specific national legal processes which probably also involve decisions made by parliament or other democratic institutions. Keeping in mind that legislative and political processes can sometimes be lengthy, the preparations of the necessary legislative adjustments are definitely among the first steps in the changeover process.

Another main preparatory task — and perhaps the most demanding for the public sector — is to adapt the whole system of public accounting and the respective IT systems to the euro. With respect to social security data, the question will also be whether all historical data will have to be changed into euro or whether data should be converted into euro only when necessary.

In Austria, as in the other participating Member States, there was a preference for the second option, which certainly represents a reasonable approach in terms of costs and time (Federal Ministry of Finance, 2000).

The public sector may take the function of a frontrunner. If the public sector switches to the euro early, this will be a positive signal and a good example to the general public. However, the public sector did not do so in most of the current euro area members. While the EU institutions switched to the euro on January

1, 1999, the national administrations in general proved to be the slowest ships in the convoy. Some administrations justified this on grounds that an early changeover might be confusing to the public.

(The Euro Changeover in the New Member States — A Preview Focus 1/05 _ ceec.oenb.at 59)

The cash changeover

The cash changeover requires thorough information and major logistical efforts, including the production of euro banknotes and coins, frontloading the new cash, promoting security and increasing storage capacities, supplying the citizens with euro cash and, last but not least, withdrawing the former national currencies.

Although most countries announced a dual circulation period of two months, the responsible authorities had the ambitious aim to complete the cash changeover within a much shorter period of time.

The cash changeover poses considerable logistical and organizational challenges and constitutes an enormous task not only for the NCBs but for all parties involved, such as commercial banks, retailers and others. In addition, after the old national currency has ceased to be legal tender, the withdrawal of old national banknotes and coins remains a challenging task.

Against this background, three periods can be distinguished within the cash changeover process:

1. the pre-changeover period
2. the actual changeover or dual period and
3. the post-changeover period

The five main reasons why the euro is still a strong currency

Here are the five main reasons in vision of <u>Jeremy Warner</u>- assistant editor of The Daily Telegraph-at October 24th, 2011 why the euro is still a strong currency .

"1. Internally, the eurozone is a terrible mess, with extreme imbalances of debt, trade and competitiveness, but in aggregate, it looks like a remarkably strong economy. The current account is broadly in balance, public debt and the ongoing deficit as a proportion of GDP remains well below that of the US, levels of household and private indebtedness are relatively low, and there's even a little growth, albeit fast disappearing.

2. China is attempting to diversify its foreign exchange reserves away from undue reliance on the dollar. The euro is the biggest and most obvious alternative.

3. Interest rates are higher than in the US and the UK, and there has been no quantitative easing of any significance to debauch the currency.

4. The dollar and sterling are justifiably weak. All problems are relative, and both the US and the UK still have big ones in terms of dealing with the aftermath of the financial crisis.

5. If the eurozone breaks up, forcing weaker members such as Greece to leave, you are left with a potentially much stronger core. The more "Germanic" the centre of gravity in the eurozone, the stronger the currency will be."

Conclusions:
This paper aims to determine the changes produced by joining the single currency.To achieve full economic integration, Member States should join the euro zone and harmonize their fiscal policies, including taxation,and other economic policies.The procces of implementing the single currency will deal with various problems, like: functional problems, logistics problems, formal aspects.

REALITIES AND PERSPECTIVES OF BUSINESS TOURISM ON A GLOBAL SCALE

Tileagă Cosmin
Lucian Blaga University, Sibiu Faculty of Economic Sciences

Cosmescu Ioan
Lucian Blaga University, Sibiu Faculty of Economic Sciences

At en extensive level, business tourism is often defined as being the action of travelling for business purposes, more precisely to solve commercial problems or to attend different conferences and meetings organized by economic institutions in order to diversify and improve the quality of the economic goods and services. Although, the vast majority of these actions may involve running a paid activity, they are part of tourism, the organization and their implementation requires the use of technical facilities for accommodation, food services, leisure and consumption of specific services supplied by the organizers. Until now and much more to come, business travel is and will be the privilege of developed countries with established and authentic market economies. However, business travel is the most important niche which can enable Romania's access to the international touristic circuit.

Theoretical aspects concerning business tourism in the history of tourism evolution

Business tourism is part of the activity of tourism, being in the same time the most dynamic type of tourism, with a share of about 20% of the international travel and nearly 25% of the total tourism revenues, representing one of the most „dynamic" and „expensive" activities (Minciu: 2004).

History of business tourism is trapped in time. Emergence of subsistence agriculture in Africa and Europe, with thousand of years BC, automatically led to the development of commercial trade which was increasingly carried on longer distances. However, urban development stimulated an increased need for household products. That being so, one can say that business travels were first initiated by small traders and artisans who could travel thousands of miles to sell their products. The commercial phenomena developed in the era of the great empires: Egypt, Persia, Greece and Rome, which stimulated trade and thus increased business travel. The decay of the empires brought each time periods of economic and political instability, temporarily reducing the volume of business travel (Swarbrooke and Hower: 2002).

In the Middle Ages and until the early modern era, the main travelers were merchants and pilgrims. Not incidentally, from an historic point of view, business men represented the major element of mobility and continuity factor in relations between people. This statement is confirmed by the fact that until the XIVth century, there had already been adopted advanced technics and legal instruments such as bills, insurance policies and fee contracts that obliged traders to a greater care of their businesses (Constantini: 1996), mechanism which are very much improved nowadays. Along with merchants, throughout history, there were three other professional categories who practiced business tourism even if in an incipient way: the priests of all religions who traveled in order to include religion in the occupied territories, for meetings or for pilgrimages, soldiers and private mercenaries travelling to either take part in battles or to move to the occupied territories or simply to move the garrison, workers who temporarily

migrated seeking work for a few months per year when in their willages, workplaces were not to be found.

However, in the second half of the XVIIIth century and throughout the XIXth century, business travel and tourism in Europe have developed due to three main reasons: the industrial revolution which started in England and then extened in almost all european countries, the development of the modern age empires, the improvement of the road network prefaced by the appearance of the railway systems. Cities were able to combine greater benefits by hosting such events and by becoming destinations for business, consumption growth and developing facilities offered to the tourists for the fundamental role of stimulating business. Especially, towards the end of the XIXth century, ,,economic tigers" of southeast Asia, Middle East and oil rich countries, undoubtely became major factors in developing this form of tourism (Swarbrooke and Hower: 2002).

In addition, in the past very few were those who traveled for pleasure, most of them due to the commercial activity, religious and military motivation, activities that are found today among the reasons for business travel, although to a much larger and advanced scale. Eventually, everything that was stated to be a history of tourism, is in fact a history of business tourism.

Conceptually, business tourism involves travelling to another town, a distance more than 50 kilometres from the town of origin, business travel being strictly determined by events or educational purpose. In fact, business travel may be divided into individual travel, group travel, travel at events (MICE Area-Meetings, Incentive, Conventions, Exhibitions), team-building and trening trips (Svetlana: 2008). Basically, business travel can be divided into different categories:

-Meeting, organized in the form of several alternatives (meetings, colloquim, conference, congress, convention, reception, seminar, symposium, summits, workshops) to discuss common issues (commercial or non-commercial, bringing together many people, lasting a few hours or a week, employing a few services of the tourism industry and is based on the assumptions of organization and justification, the membership to the business tourism field, R., Davidson., 1994).

-Exhibitions and trade fairs, presentation of products or servicies wirh a target audience to promote sales or visitor information, business organizational form of tourism that stimulates exhibitors and visitors travels, while ongoing different touristic servicies such as catering and guests accommodation.

-Internal trening courses, where all participants belong to a single organization, or open events where the institution that coordinates trening courses offers trainings which are available to all who want to benefit from them.

-Product lauches, special events, which means that many organizations currently use them as a way to promote producs and services to be marketed with different audience including the media, retailers and consumers, involving a relative short time (sometimes just a few minutes) but with a relative large budget.

-Incentive travel, defined in 1998 by the ,,Society of Incentive Travel Executies -SITE", as a management tool that, by providing exceptional travels, motivates and/or recognizes participants the high level of performance achieved in performing the tasks within the organization.

-Individual business travel, entrepreneurs who proposed in their strategy the development of their companies, and the expansion in a national or international area (multinational, transnational) that involves all basic and complementary services in the touristic area, including leisure tourism.

-Officials travelling in companies interest, nationally or internationally, during which the local or national communication interests are promoted on very different areas (economic, social).

However, the contents of the complex business travel, allows for multiple definitions and classifications, the literature in the tourism field and developing practical reality, have developed more and more in the last decades.

Similarities and differences between leisure tourism and business tourism

Basic touristic services and many of the additional or complementary services are characteristic both to business and leisure tourism. Transportation, accommodation, food, information and promotion services or activities of travel agencies and even landmarks are present in both markets, even if tourism services may be different. Business tourism includes an important element of leisure tourism.

However, there are important differences between the two types of tourism. If incentive travalers can say that almost all the rest are similar to leisure tourism, except how they pay for services, but even for delegations at a conference, visitors to trade fairs or even individual business travelers, visiting attractive places may be the relaxing solution after a hard day of work.

Chart.1 Similarities and differences between leisure tourism and business tourism

Factors of influence	Differences		Similarities
	Leisure Tourism	Business Tourism	
Who pays?	Tourist	Tourist employer or associates.	Managers may pay their own trips.
Who decides the destination?	Tourist	Trip/meeting/incentive/conference /exhibition organizer. All year round from Monday until Friday.	The organizers may take into account people wishes.
Period of time for these trips	During holidays and weekends.	All year round from Monday until Friday.	July and August are avoided when choosing importans events.
Control period- the period of time between booking and departure	Holidays are often booked with months in advance; for short-time holidays booking may be done with a couple of days in advance.	Some trips may be announced short time in advance.	Important conferences are booked years in advance.
Who travels?	Anyone with enough money and time.	Persons whose work requires travelling or associate members.	Some business men are often accompanied by partners.
What type of destinations are used?	All types: seaside, cities, mountains and rural area.	In cities focused more on industry.	Destination for incentive tourism are close to those of leisure tourism.

(Swarbrooke and Hower: 2002)

Unlike classic tourism, those who travel in business interest, often spend more money on accommodation and transportation, mainly because quality touristic services and specialized services (conference rooms, translators) are needed.

There are four great similarities between the demand for leisure tourism and business tourism:

-Business tourists become leisure tourists with the end of the working day;

-Conference program includes leisure activities for delegates;

-Travel incentive means offering a holiday as a reward for one's work;

-Business people are accompanied by their partners and/or children who are travelling for pleasure and not for business.

Trends in global business tourism.

Business tourism has been know as one of the most dynamic sectors of the economy, the development trend is supported by the growth of international relations in all fields and especially due to the globalisation of the economic life. According to statistics, in 2010 there were 9160 meetings in 223 countries and 1557 cities. Compared to 2009 (which saw the maximum number of meetings), the number of meetings was reduced by 11% in Africa, 11% in Europe, 6% in North America, 16% in South America, 2% in Australia and Pacific, and just in Asia growing by 14,9%. Share of mainland meetings in 2010 is as follows:

Chart 2. Meetings share by mainland in 2010

Mainland/ Meetings share	2006	2007	2008	2009	2010
Total	100	100	100	100	100
Europe	56,8	58,3	56,7	57,66	56,19
North America	13,9	14,9	16,5	15,96	17,17
Asia	14,9	12,9	13,7	12,8	13,08
South America	6,4	6	4,71	5,19	5,12
Africa	4,8	4,8	4,6	4,25	4,03
Australia and Pacific	3,2	3,1	3,8	4,13	4,41

Europe continues to mantain a relative constant position (56,19%), for the period, while North America recorded a significant increase (17,17%) in the succession of years taken into analysis. Top countries in terms of international meetings in 2010 is as follows:

Chart.3 Top 10 countries by international meeting organisation in 2010

Country	Number of reunions	Percentage of total meetings %
USA	1080	11,70
FRANCE	552	6,03
GERMANY	404	5,36
UK	377	4,12
SPAIN	301	3,04

ITALY	336	3,67
SWITZERLAND	302	3,30
BERLGIUM	282	3,08
AUSTRIA	279	3,05
CHINA, HONG KONG AND MACAU	231	2,52

It can be remarked that developed countries, by their economic and technical size, have the largest percentages from the total countries. Top 10 cities in terms of international meetings in 2010 is as follows:

Chart 4. Top 10 cities in terms of international meetings in 2010

City	Number of reuniouns	Percentage of total reunions %
PARIS	221	2,41
VIENNA	219	2,39
BRUXELLES	190	2,07
GENEVA	188	2,05
SINGAPORE	156	1,70
COPENHAGEN	137	1,50
BARCELONA	133	1,45
LONDON	131	1,43
BERLIN	110	1,20
SEOUL	109	1,19

We also remark the fact that cities have supremacy in urban tourism, monopolize the largest share of international meetings. The reunions considered in the classification meet the stringent selection criteria imposed by the UIA (Unioun of International Associations):
-are organized or sponsored by international organizations that are included in the „Yearbook of International Organizations " and the „International Congress Calendar";
-are national meetings with international participation, organized by national branches of international associations.

Chart. 5 Total business tourism revenues during 2005-2010 and forecast for 2015

Years Revenues(mld)	2005	2006	2007	2008	2009	2010	2015 (F)
TOTAL Business tourism:	502,64	480,05	461,32	521,81	592,08	652,9	962,71
Corporations	434,57	414,53	398,03	450,08	509,91	561,95	834,37
Governments	68,08	65,51	63,29	71,74	82,16	90,94	128,34

Total tourism business (growth compared to previous year %)	10,32	-2,18	-6,15	2,16	5,22	4,64	3,13(annual)

Correlating the data, we find that the private sector focuses mostly business tourism revenue (about 75%) in contrast to the actions initiated by public institutions. As regard to Romania, the general positive developments in the lasy few years, have had direct effects on business relations. As a result, business tourism may now have an increasing trend, although this type of tourism has a quite low development. Before 1990, in Romania business travel was underdeveloped and the only events were organized in Romexpo Exhibition Complex.

Currently, business tourism is probably is the most stable sector in the Romanian tourism, with a steady development in the past two or three years. Following the references offered by accredited institutions to the media, there is a permanent increase in this area, with over 20% per year from 2005 until present. The main reason for about two-thirds of the total 2 million foreign tourists who arrived in Romania in 2010, was the participation at conferences, team-buildings or trening sessions. Recording a major proportion in the urban sector, business tourism has its landmark in Bucharest, where the percentage of those arrived for business work last year was around 80% of the total capital stays in hotels, and major cities such as Timişoara, Cluj-Napoca, Sibiu, Iaşi and Constanţa, evolving infrastructure domain MICE (Meetings, Incentives, Conventions and Exhibitions), due to the existence of international airports and development of new accommodation at a high level of rating.

Moreover, the number of arrivals at the border crossings in 2010, was over 25% higher than the same period in 2009. Currently, the capacity of 4-5 star hotels in the capital, is situated as that of some cities such as Budapest or Prague, and the number of conference rooms can not fully satisfy the demand for events in many cases requring reservation with two to three months before. The 110 hotels in Bucharest comprise a total of approximately 8.000 beds which meets the requirments for making a proper business travel.

Business tourism performed for the governamental, commercial and educational purpose, attracts clients not fully interested in prices but rather interested in speed, quality and efficiency. In general, to the purchased business package, an agreement package could be joined, taking into account the possibility that a satisfied customer might make a request for a return circuit with thier beloved ones in the same places.

In Romania, after a careful study of the saving process and the analysis of the determinant factors, it could be highlighted a number of ways of population savings. Because the permanent correlation of income and expenditure by business entities is not part of the economic and social reality, issue of placement of saved income rises, in certain periods of time, and also making use of investments in previous periods, in which case the need to use the savings appears. It is important to make distinction between the different possible allocations of savings, because depending on their destination, the economic effects are radically different.

Key Words: savings, income, investments

JEL Classification: E2, E21, E22

The paper "The savings in Romania" was designed based on the belief that in our country, after 1989, the saving contribute greatly to economic growth and to reach the goals of European Union membership. In this context it has been studied and analyzed the saving in conditions of freedom and in terms of access to financial and monetary market.

The purpose and tasks of the work are formed by the theoretical and methodological study of the forms and motives underlying the romanian population process of saving and the impact of the influence factors on this process. Achieving of its purpose is conditioning the following research tasks: (i) analysis of scientific papers that are directly or indirectly the subject of research data, (ii) studying the nature and the content of economic category of "saving", (iii) research into the causes, the reasons and the assessment methods of inequality savings of the population;

The Research subject is the process of population saving, especially the impact of several factors influencing the evolution of this process. Theoretical-scientific and methodological support of the presented work is based on the works of renowned scientists: A. Smith, D. Ricardo, JS Mill, D. Marshall, J. M. Keynes and other economists from abroad and domestic. The informational support of the work was the data of the National Institute of Statistics, National Bank of Romania, the Deposit Guarantee Fund in the Banking System, sociological data and statistics in Central and Eastern European countries.

The Research methodology was based on the use of methods such as dialectical method with its components - analysis, synthesis, induction, deduction, research from simple to complex, from the historical to logical, from qualitative changes to quantitative changes and the internal methods of economic subjects - observation, comparison, selection, grouping, etc.

After a study made by HVB Bank with GfK group, and in conformity with the studies conducted by Metro Media Transylvania can be said that public confidence in savings instruments is increasing.

According to all these analyzes the preferred way to save money is buying apartments or houses (58%), respectively investing in real estate. These rules are, at present, the most profitable forms of savings, but also the safest.

Chart 1 –Forms of savings (%)
Source: data processed from National Bank statistics

For many people, buying a land or buying a building or a home is an important saving. In addition to the dream of having a house with own garden, an important role is played by the desire to have a safe investition and that of ensuring a stable situation for old age.

Bidimensionality scale assessment of the main ways of saving - safety and profitability - indicates an inclination to appreciate the savings in real estate, the banking investment in precious metals as the safest and profitable. Bank placements are better appreciated in terms of safety than in terms of earnings.

Preferences for bank deposits are found in greater for categories: over 50 years, people with high occupational status, with higher studies, medium and large cities, with a monthly personal income between 900 and 1,500 lei from Bucharest.

Generally, the bank deposits and savings books CEC type are very low risk instruments, but with minimal gains. Socio-demographic differentiators being analyzed shows that young people prefer saving tools evolved, characterized by risk and high profitability. CEC preferences deposits will be found in greater on people over 50 years and retired with elementary education, relatively low-income urban areas.

The main tools promoted by savings institutions are:
- librettos with interest on demand savings account;
- librettos of term interest savings deposits;
- teenager deposit;
- youth deposit;
- deposit with fixed interest rate, etc..

Keeping savings at home is preferred by 18% of the population, being largely preferred by young people with relatively low education level, with a maximum personal income of 300 lei monthly. But it also found that this preference decreases with increasing education levels. Thus, young people do not think to save, and the elderly are based on the youth for support in old age.

A very important form of investment is the purchase of securities. The securities are investment securities with legal regime by which people can ensure the funds to cover the expenses. Percentage of interest rate, the current issue and the redemption period shall be such that acquisition of such securities to be an attractive investment option for investors. There are two types of securities: stocks and bonds. Statistics shows that 23% of Romanian invests in bonds, Treasury bills, government securities, 13% in shares and 20% in simple life insurance. So the trend now is for people to save in real estate. Lack of diversity of these tools, but also of confidence in them, leads more towards consumption than for saving.

Keeping savings in Euro or dollars is preferred, usually, by the people with high occupational status, with higher education in cities of over 20,000 employees, with personal and household monthly income of over 900 lei. Thus, the share of those who have opted for the euro (29%), being by 5 percentage points higher than those who have opted to save the U.S. currency (24%). However, saving money as deposits are classified as economic behavior fitting in general causality which works in the wider economy. Although many financial-related behaviors have non-economic causality (psychological, contagion generated etc..), generally, they are subsumed to the dynamics of some macroeconomic variables that are either generating or conditional for saving behavior, both in volume as and the structure of the "portfolio" of saving.

It should be noted that the consumption/saving border is far from being clear, obvious; so, buying jewelry or paintings can be seen as a form of savings, although it is consumer goods. If diamond kept in a box is then placed to achieve capital gains, it is undoubtedly speculative purposes. But more often, buying carpets and paintings from East is part of consumption that integrates a heritage whose function of precautionary saving is often located in the background in relation to the main use.

So, we can conclude that saving is immediate unconsumption of an income part and raising money for a certain period, a process that has as possible destinations the hoarding, placement and investment.

In terms of profitability that measures the difference between profits when investing in real assets and the interest rate that would be obtained by placing the used capital to finance these investments.

It's a key indicator to understand the inclination to investment and the decision of capital holders when they have to choose between industrial adventure and financial investment.

As noted, between 2009-2011, the investment portfolio has as main instrument of saving, the current accounts and debit cards used in the last year by 40-43 percent of accessed household members. Then comes the deposits in lei and shares used in 18 percent and 14 percent of visited households (in the study conducted by Metro Media Transylvania). The following are placed in descending order the books in domestic savings (8 percent), euro current accounts (7 percent), life insurance (6 percent), deposit certificates (5 percent), euro term deposits (3 percent), private pensions (3 percent), units in investment funds (2 percent).

Chart 2 - Savings instruments (%)
Source: data processed from National Bank statistics

Most households with savings instruments have only one instrument of some sort in this category, notices are valid for credit instruments.

In 2011, total savings instruments of some kind held in the household usually overcomes 1,000 lei.

Also, at this moment, in Romania the population invests small amounts in private pensions. The number of those who seek special funds and pension savings products is relatively low (about 21%). But in the future we hope to increase demand for advisory services in asset management. Due to this growth and market potential, pension plans will become increasingly important. Since 2008 in Romania and the countries of Central and Eastern Europe, almost half of the working population began to invest or consider investing in individual pension in addition to state pension. By this pension program, young people have a huge advantage: due to the longer period of saving, they will have to make smaller investments to receive sufficient additional payments from sources such as private pensions. The young people will start saving earlier, so they will benefit from greater savings during idle.

In conclusion we can say that in this paper this problem has been treated both theoretically and in practical terms, being made a sociological study on how to keep the savings. There are many reasons for saving, which reasons the literature has structured so: the reason of speculation, of precaution, business or income. Of course, one of the basic ideas of people about what saving is, is to put aside, regularly every month, for example, a certain amount of money for the next period.

Savings portfolio is generated by building upon the structure of possible savings. As the promise of fructification is accompanied by an associated risk factor, we can say that, in fact, savings portfolio is generated by profit-risk ratio associated with each possible way of financial investment. Based on the above, saving can take the following forms: pure savings, which preserve the saved material (such as bank deposit, non-bank money saving), savings and investment, which not preserves the saved material but preserves an equivalent form of it (such as real estate investments).

The paper concludes with an analysis of placing savings, analysis that is aimed to highlight the growing confidence of the population in saving instruments. According to these analyzes it could

be highlighted the fact that in Romania the people's most preferred way to save is to invest in real estate, which currently represent the most profitable forms of savings, but also the safest.

Regarding the savings instruments, they have been studied throughout the end of the work, using statistical and mathematical analysis. Thus, it could be concluded that currently the investment portfolio has as principal saving instruments the current accounts, followed by deposits in lei and shares acquired on the capital market. Starting in 2008 in Romania, began to take shape the people's confidence in private pension saving because they have a huge advantage: young people will begin to save early and both will benefit from greater savings during idle.

SUSTAINABLE DEVELOPMENT CHALLENGES AND FDI IMPACT IN HOST COUNTRIES

Zaman Gheorghe
Institute of National Economy – NIER, Romanian Academy

Vasile Valentina
Institute of National Economy – NIER, Romanian Academy

Cristea Anca
Institute of National Economy – NIER, Romanian Academy

This survey analyses aspects of the relationship between FDI and sustainable development within the Romanian economy, focusing in particular on volume, dynamics and structure of FDI companies in Romania, impact on imports and exports as well as ratio between repatriated profit and profit reinvested in the host country. A series of proposals have been made for increasing the contribution of FDI in the sustainable development of Romania by attracting FDI in particular to the tradable sector and for increasing the favourable propagation effects to Romanian companies.

Key words*: export, import, FDI, trade balance deficit, reinvested profit, repatriated profit.*
Jel Classification*: F15, F21, F23, F43.*

We shall try to evaluate on a macro-economical scale the manner in which the foreign direct investments in Romania have succeeded to meet the requirements for sustainable development starting from the assumption that the foreign capital intake must represent, together with other internal and external agents, a factor which contributes to sustainability of economic growth.

Volume, Structure and Dynamics of FDI.
According to official statistics issued by the Romanian National Bank and the National Institute of Statistics[30], the final stock of FDI in Romania as of 31 December 2010, equalled 52.585 billion euro, registering an increase of 5.2% in comparison with the former year. This amount included equity investments (including reinvested profit of 35.5 billion euro (67.5% of final stock of FDI) and 17.0 billion euro (32.4% of final stock of FDI) total net credit received by transnational company subsidiaries, which represented an increase in weight of 26.5% in 2009 to 32.4% in 2010.

**Equity investments are consolidated with net losses.

---

[30] See Direct Foreign Investments in Romania

Unlike equity investments of companies with FDI which do not require reimbursement thereof to the parent company, the net credit is a debt which must be reimbursed by the subsidiaries, the parent company having total decision control on reimbursement terms. Having in view the particularities of the two components of FDI, we consider appropriate to have a distinct analysis thereof, with due consideration of the fact that the first component is direct contribution to the stock capital of the FDI company while the second is a loan with all associated rights and obligations.

As far as equity investments to stock capital of FDI companies are concerned, in case of privatisations of public assets with foreign investors, a special attention should be paid to the difference between subscribed and paid capital as intangible capital or in-kind contribution which has to be correctly evaluated based on appropriate and customary market methods.

As pointed out in Table 1, equity investments to stock capital of FDI companies (including reinvested profits) in Romania have increased in the period 2003-2010 by about 5 times while volume of credits has increased about 6.3 times, which highlights the interest of parent companies in granting credits to their subsidiaries both in order to obtain the higher interest rates practiced in Romania as compared to rates in the country of origin of the parent company, as much as to increase the profit rate of the Romanian subsidiary as compared to profit rate in other countries hosting subsidiaries of the parent company.

The volume of FDI in Romania has known a fast growth during the entire period of transition considering that FDI's were practically non-existent at the beginning of the 90's due to the autarchy and the monopoly of the state over the foreign trade and external economic relationships.

Several distinct sub-periods of FDI evolution in Romanian can be highlighted in the years from 1991 to 2011 in connection with the economical reforms in progress in the Romanian economy as well as with a series of external factors having a strong impact on the local economy such as association, pre-accession, accession and post-accession to the European Union and the international financial crisis.

During the **sub-period of pre-association to EU** (1991-2005), FDI have had a modest evolution with small variations from one year to another, the annual volume of FDI being situated between 817.9 mil. euro in 1991 and 183 mil. euro in 1995, which placed Romania as one of the Central and Eastern Europe countries with the lowest rates of FDI per capita.

Diagram no. 1

Evoluţia investiţiei exprimată în echivalent valută (milioane $ SUA) în perioada 1991-2011
In the period of Romania's **EU association,** the annual volume of FDI fluctuated between 729.9 million euro in 1999 and 278 million euro in 1997, with slightly higher rates than the former period, marked however by the heavy economic decline of Romania in the period 1995 – 1999.

In the **pre-accession period** 2000-2006, the annual rate of subscribed stock capital fluctuated between 833.8 million euro in 2002 and 2435 million euro in 2005, the annual volume of FDI exceeding in the last three years 2.38 billion euro, this period being particularly marked by start up of important privatisations in the manufacturing industries and in the banking system.

The post-accession period of the years 2007-2011 has known annual growths of FDI of over 3.5 million euro, which basically consisted in a higher control of Romanian FDI companies, an entire range of economic sectors being fully privatised to foreign capital which had a controlling share thereof oscillating between 70 to 85% in certain cases. It is in the same period, namely in 2009, that the economic crisis broke in Romania and led to a drastic reduction of annual FDI.

At the beginning of 2012, following decisions made by applicable authorities, the partial or majority privatisation of 35 public companies in the field of energy production, distribution of natural gases, national post, railway transport, etc has been foreseen although part of these companies made substantial profit.

Proposals were also made for privatisation of a series of public assets in the mining industry, proposals yet incomplete however.

The main reticence against these privatisations is related to the poor argumentation of the short, average and long term economic-financial efficiency thereof, the crisis situation which is hardly a period o high sale prices, the fact that too many state assets are sold in a single step which makes the privatisation offer exceed the demand, and thus reduce the price of transactions to the detriment of the seller, unfavourable long term impact on the environment, etc.

Table no.2   Weight of number of companies with foreign equity investments and value of subscribed stock capital in Romania reflected in sub-periods between 1991 to 2011

-%-

	Total period 1991-2011	out of which per sub-periods:			
		1991-1994 pre-association	1995-1999 association to EU	2000-2006 pre-accession	2007-2011 post-accession
Number of companies	100.00	21.70	15.86	36.0	25.45
Subscribed stock capital calculated based on euro	100.00	6.97	6.82	33.47	52.74

Source: Calculations made based on data concerning Companies with foreign equity investments. Statistic synopsis of data offered by the Central Trade Register on 31 March 2012 (provisional data).

Although the number of companies with FDI in Romania may have a secondary relevance, it can be however noted that greatest number of such companies was registered in the pre-accession sub-period, when the negotiations for assumption of the Acquis Communautaire have represented a factor of attractiveness and security for foreign investors, the Romanian legislation being adjusted to the Community legislation.

Over 50% of the total stock of FDI in Romania was set up in the post-accession sub-period, from 2007 to 2011, when the largest state assets were privatised and the most important Greenfield investors came to Romania which had become a Member State of the European Union.

During the crisis of the period 2008-2011, data offered by the Trade Register reveal the following information on monthly and annual evolution of FDI in Romania:

- drastic drop of **subscribed stock capital into new companies** from 6.665 billion $ in 2008 to 4.817 billion $ in 2009 and to 40.854 million $ in 2010 and 41.132 million $ in 2011, revealing a severe reduction of foreign greenfield investments in Romania in the period 2010-2011;

- a significant reduction of number of new FDI companies has taken place in the period 2009-2011 as compared to 2008, fact which can be explained by the long-term effects of the crisis over the new FDI in Romania;

- a slight increase of the subscribed stock capital as well as of number of companies with FDI stock capital can be noted in 2011 as compared to 2010.

As far as country of origin is concerned, FDI in Romania (balance as of 31 December 2011) is grouped in following categories for the entire period 1990-2011:

- the group of EU-27 Member States, neighbouring Romania or in the close vicinity of the country (the Netherlands, Austria, Germany, France, Greece, Cyprus, Italy) which hold the greatest share – 69.0% of total FDI, having traditional economic relationships with Romania and being at the same time the main trade partners on whom Romanian exports and imports heavily rely on;

- the group of remaining EU Member States, with reduced share of FDI below 3.07% each, totalling together about 15.15% of the total volume of FDI;

- other countries outside EU - Panama 3.12%, Switzerland 2.95%, USA 2.33%, Turkey 1.29%, China 0.92%, Japan 0.44%, Lebanon 0.32%, etc.

EU-27   countries hold together about 84.15% of FDI stock in the period 1991-2011, a fact which is explained by Romania's membership of the European Union as well as the powerful influence of Romania's proximity to EU developed Member States in particular.

One of the issues of strategic significance for our country[31] in both theory and practice is the issue of optimum weight of FDI from EU Member States in total FDI in Romania taking in consideration the current existing opportunities in Romania for FDI coming from countries outside EU 27, under an increasingly higher globalisation and the need to eliminate a certain imbalance and asymmetry in economic and international relationships.

Experience of other EU Member States shows that weight of FDI coming from EU-27 countries in each Member State is situated at a "limit level" and definitely not at a level of 100%. The more developed a country is, the lowest this limit level is.

The analysis of the territorial distribution of FDI per counties in Romania, in accordance with share of each county in total volume of FDI, highlights the following issues:

- **23 counties with low share** (up to 1%) of FDI in total FDI, ranging from 0.06% (Gorj County) up to 1.02% (Suceava County) ; aggregate share of these counties in total FDI at national level represents 9.32%; these counties include the most poorly developed areas of Romania;

- 15 counties with shares between 1.02% (Suceava County) and 3.79% (Timis County) and referring to counties with higher economic-social development rates;

- Bucharest Municipality (51.6%) and Ilfov County (6.95%) with the highest share of FDI.

Distribution of FDI per counties reveals **a high discrepancy in value** between Bucharest Municipality and Ilfov County on one hand and remaining counties on the other. This discrepancy is explained by the fact that FDI have primarily searched locations in area with a high profit rate potential. Placement of counties in terms of economic-territorial development has not represented a major point of interest for foreign investors in Romania. The Sectoral

---

[31] The strategic dimension has in view capitalisation of the similarities not only between the Romanian economy and the EU-27 countries but also with the international economy as a whole, based on the advantages of mutual competition, elimination of a concentration beyond the boundaries safeguarding equal opportunities and a relative independence for cooperation in an extended economic area, outside EU-27.

Operational Programmes 2007-2013 and the Sectoral Operational Programme in particular have set as their primary objectives and goals the reduction of regional disparities, yet the insufficient absorption of structural funds proves a poor contribution to this effect;

The idea that the FDI have reduced the regional disparities of the economic-social development has not been statistically supported, at least not until now, and it is rather apparent that they have increased them, confirming S.Kuznets' theory on the development following a curve in shape of "J" in the first stages of economic growth.

As a result, given the relatively small volume of FDI in a number of 38 counties, it can be stated that the most important factor for the development of Romania is the local investment, FDI playing a more or less complementary role.

The economic crisis has further aggravated the regional disparities of FDI, part of foreign investors leaving many poor or averagely developed counties or putting a halt to their investment therein.

Distribution of FDI in Romania on main economic activities

Structure of FDI per economic sectors and industries has a special significance for future sustainable development of Romania and improvement of its performance of efficiency and competitiveness, innovation and technological progress.

For the purpose of this analysis and in order to reach the objectives of this research study, the national economic industries shall be classified in accordance with the following criteria:

a) **technological levels**, with industries having **high** (high tech), **medium** (low tech) and **non-tradable** technological levels of goods and services;

b) sectors with **tradable** and **non tradable** products and services;

c) **primary, secondary** and **tertiary** sectors.

The scientific-intensive (high-tech level) industries have represented in the period 2007-2010 a share of about 4.5 % of the total volume of FDI, the highest share, over 43% being held by the non-tradable sectors, **financial brokerage services, insurance, trade, services supplied to companies, consultancy**, etc, which are in most part primarily speculative and provide relatively high profit rates with low stock capital input and no direct contribution to export.

The share of 31-32% of FDI of the manufacturing industry has remained relatively constant and concerned branches such as metallurgy, petroleum processing, chemicals, rubber and plastics, other industries belonging to **low and medium technological level** categories, with relatively low involvement and contribution to added value;

The lowest share of total FDI belonged to agriculture which presents no special attractiveness to foreign investors for the time being although aggravation of effects of the elementary crisis shall increase the interest for this sector where about 1 million hectares of arable land has been purchased by foreign investors.

Evolution of FDI during the economic and financial crisis of the period 2007-2010 started in 2008, powerfully reveals the negative impact of the crisis on FDI in 2009, with particular stress in the following sectors: metallurgy, food, beverages and tobacco, wood products, furniture included, computing, radio, TV, communication tools, textiles, clothing, leather goods, financial brokerage and agriculture. The highest decline was registered in 2010 with disparities from one year to another from start up of crisis in the construction and real estate sectors.

We would therefore like to stress as a final conclusion that most part of the DFI in Romania are concentrated in low technological level sectors and industries (low-tech)[32], i.e. food processing industry, light industry, wood and wood products, cellulose, paper, publisher houses, printing, furniture, recovery and recycling of waste, as well as medium technological level (medium low-

---

[32] The low technological level includes the following NACE divisions and groups: 15, 16, 17, 18, 19, 20, 21, 22, 36 and 37.

tech33): crude oil processing, coal coking, nuclear fuel treatment, rubber and plastic products, non-metal mineral products, metallurgy, steel structures and products (except machinery and equipments), construction and repair of ships. In most part of these industries Romania registers indeed higher indices of revealed comparative advantages (Zaman Gh., Vasile V., 2004-2008; Giurgiu A., 2008), which stresses an **inter-industry specialisation** of exports of Romanian products as against the **intra-industry specialisation** where the most relevant indices are the Grubel-Lloyd indices.

Exports of the two groups of industries, the low technological level and medium low technological level, prevail in Romanian exports in a percentage over 65% (Ciupagea et al., 2007; Iancu A., 2004), while products of **high technologies** (high-tech level) have a share of only about 4% of the total exports.

The group of **medium high technologies** (medium high-tech) industries refers to chemical products (excluding drugs), machinery and equipments, electrical machinery and devices, road vehicles, other transport means, construction and repair of aircraft. This group has a small share of Romanian exports, less than 30%, almost equal to the FDI structure.

As far as promotion of FDI is concerned government policies should concentrate in the future on the promotion of FDI as an instrument for increase of foreign trade profits, **by supporting sustainable development exports in the high-tech and medium high-tech sectors** (Mazilu A., 1999), so as to increase weight of exports with high added value. Current FDI structure in terms of economic activities is not as yet compatible with the aspiration for increased export competitiveness and sustainable development.

Foreign Direct Investments in Mergers and Company Acquisition and Development and Greenfield

Companies with FDI include the following categories: *greenfield, mergers and company acquisition and development,* each having specific characteristics and different impact on sustainable growth and competitiveness.

 Greenfield investments are usually concentrated in developed countries in the high technological industries and enjoy the preferential protecting treatment granted to *infant industries*. These investments have registered **a very low level, of only 46 million euro** in Romania, the equivalent of merely **1.1%** of the equity investments in the companies with foreign direct investments. Investments in the category mergers and acquisitions (M&A), with 93 million euro (2.3% of total equity investments) are in a similar position.

The highest share of the equity investment flow in 2010 came to *company developments*, with a total amount of 3 928 million euro, 96.6% of equity investments respectively, these figures highlighting among other things a relative slow down of the process of diversification of exports during crisis periods, as well as a tendency to invest mainly in cost savings and improvement of manufacturing technologies.

Foreign direct investments in *Greenfield companies* were primarily targeted on the processing industry (13.9% of FDI balance). Other industries were these investments hold a significant share include: trade (10.2%), financial brokerage and insurance (6.8%), constructions and real estate (5.5%). A prevailing higher percentage of investments in the service sector (22.5%) in comparison with the processing industry is again apparent. Judging from the experience of other countries as well as Romania's, growth in absolute and relative terms of the service sector in parallel with reduction in absolute and relative terms of the processing industry **does not validate a sustainable evolution of economy**, being well known the fact that a significant part of services depends on the vulnerable and volatile sector of speculations and "pseudo-tertiary" process

---

[33] The medium low technological level includes the following NACE divisions and groups: 23, 25, 26, 27, 28, 35; the high technological level includes NAVE groups: 24, 30, 32, 33 and 35; the medium high technological level includes NAVE groups: 24, 244, 29, 31, 34, 35 (except ship construction and repairs), 353.

having the highest crisis and pro-cyclic instability potential. Unfortunately, in the over two decades of transition to market economy we witnessed in Romania a strong reduction of absolute volume of production of greatest part of processing industries and in particular of high technological industries (pharmaceutics, fine synthesis chemistry, electronics, etc).

Most of foreign direct investments in *greenfield enterprises* are concentrated as all FDI in the area BUCHAREST-ILFOV (30% of FDI balance), followed by the CENTRAL Region with 5.3% and WESTERN and SOUTH MUNTENIA Regions with 3.9%, and 3.2% respectively. The concentration of regional allocation of *greenfield* FDI in several development regions of Romania may contribute, on a short and average perspective, **to increased inter- and intra-regional disparities** within the country which may generate significant internal and external migration of labour force. The most important investments in *Greenfield companies* come from Germany (8.5% of FDI balance), followed by the Netherlands (8.4%), Austria (5.6%) and Italy (4.2%).

Privatisations of Romanian state companies with strategic foreign investors have highlighted a series of deficiencies in terms of FDI volatility, change of business area or bankruptcy of certain enterprises, which contributed to the **dissolution and de-industrialization** of the domestic economy and reduced performance and efficiency thereof. Foreign investors have not met the post-privatisation investment commitments, unacceptably took advantage of their dominant position, only based on the capital subscribed to companies without also ensuring the paid-up capital, have changed the profile of the production, have purchased industrial enterprises not for their economic and technological recovery and maintaining their activity profile as originally committed, but for demolition and export of scrap originating from write off of machineries and equipments or for capitalisation of lands purchased at very low prices on a rising real estate market.

Worldwide, unlike Romania, the largest amount of FDI[34] in 2009 and 2010 was allocated to manufacturing industries, with a rising share from 37% to 48%, followed by services were, with a decreasing weight from 33% to 30%, the primary sector registering a decline of weight from 30% to 22%.

The financial sector, considered by most experts as the "epicentre" of the international economic crisis, has registered a decrease in absolute volume and share of FDI in developed countries, a trend expected to continue in the future. In Romania, however, the largest share of FDI is owned by the service sector, especially financial services and consulting, which generated "soap bubbles" infected by the external worldwide explosion.

Impact of Exports and Imports of Foreign Direct Investment Companies on the Trade Balance of Romania

The desiderate of an active trade balance, with associated advantages is unquestionable especially considering that countries with a powerful, competitive economies have such a trade balance. Romanian decision makers have unfortunately, both unsuccessfully and without judgement, embraced the theory according to which devaluation of the national currency would ipso facto encourage exports, neglecting that success of currency depreciation with subsequent stimulation of exports should meet the following requirements:

- devaluation must occur in **homeopathic doses** (very small) and on **short term**;
- **existence of** a needed and sufficient **foreign demand** for the export production of the subject country;
- possibility to increase the production capacities in the country to match the foreign demand for export;
- the import content of the exported production should not be relatively high, being known the fact that depreciation of the national currency has a negative impact on imports.

---

[34] See UNCTAD, *World Investment Report 2011*, p. 34 (http://www.unctad-docs.org/files).

Countries which have attempted to use the depreciation method (West Germany, USA) have quickly abandoned this policy, realizing that this policy would lead to total bankruptcy on the long term. China which increased its exports much faster than its imports without resorting to a drastic depreciation of the national currency stands as a relevant example to this effect.

The sectoral structure of FDI has a special significance for the foreign trade of the host-country in the sense that a too high FDI share in sectors such as brokerage and financial services as well as non-tradable goods may lead to strong trade imbalance. FDI prevailed in Romania in the "non-tradable" sector, which has spurred strong domestic demand, which led to an unprecedented increase in imports, so that trade balance and current account deficit became chronic, which has consequently increased the vulnerability of Romania during the worldwide economic crisis and financial crisis.

Experts (Kinoshita Yuko 2011, p. 4) specify that a relative high volume of investments in the financial sector, non-tradable goods and services **may stimulate the internal demand and imports, including the trade balance deficit**, having a detrimental influence on the current account difference and external debt "and FDI in the tradable product sector boost imports on short-term only". On the other hand, foreign investors in the "tradable" sector pay a higher importance to qualification and productivity of labour force as against mere lower cost of labour force, the latter having a secondary role as influence instrument.

FDI attractiveness for tradable goods and services sectors in the host country requires a good infrastructure, a large internal market, a high level of skilled labour and a stronger integration into internal and external business networks, proximity to developed countries, which means lower transportation costs and a number of other advantages, including a stimulating business environment, good corporate governance, less bureaucracy and corruption and a friendly business environment and permissive taxes.

Changing of direction of movement of FDI from the "non-tradable" to the "tradable" sector contributes on average and long term to a better insertion of the host country's economy into international value chains, to settlement of infrastructure shortcomings, as well as to improved human capital expertise. Such guidance can be also implemented by **control and monitoring of FDI.**

Experience of other countries with emerging economies has shown that control of stock capital investments such as inflows of FDI **does not alleviate foreign investors** (Ostry I.D. et al., 2010)[35] from the tradable sector. Conversely, lack of selectivity and relevant information on the specifics and the creditworthiness of strategic investors can lead to erroneous decisions, damaging to the host country's economy.

The predominant targeting of FDI to the financial sector, the sector of insurance companies, consulting firms, etc. resulted, in times of crisis, in a major and long term economic decline, accompanied by the danger not only of higher credit lines but also withdrawal of foreign bank branches which could no longer be persuaded to continue their activity in Romania, where they had formerly made consistent profits for extensive periods of time.

We basically agree with the quasi unanimous opinion according to which FDI improves the export performance of the host country by increasing internal capital, facilitates the transfer of new technology and products, offers best practices, expertise and managerial capabilities to local labour force, promotes employment growth particularly in case of *greenfield* companies etc. Positive worldwide experiences on the favourable impact of FDI on exports may be quoted for several countries, the most interesting case however remaining that of China, which promoted an export oriented growth, so that $ 1 FDI stock accounted for 70 cents' worth íncrease of exports

---

[35] I.D. Ostry, A. Ghosh, K. Nahermeyen, M. Chamon, M.S. Qureshi and D.B.S. Reinhardt, 2010, *Capital inflows: The Role of Controls,* IMF Staff Position Note SPN/10/04 Washington, International Monetary Funds, February 19.

(Zhang, 2005).[36] These favourable contributions of FDI for the economy of the host country are noted:

–   Current sustainable development of Romania largely depends on FDI companies, taking in consideration the fact that these companies control some 70% of the foreign trade and about 85% of the banking system. This impact can be approached:

–   in **absolute terms,** as difference between exports and imports, to determine the favourable/unfavourable contribution of subject companies to the total amount of the trade balance of the country:

–   **in relative terms,** as share of exports and imports performed by FDI companies in the total volume of the country's exports and imports, at various levels of aggregation;

In 2007 FDI in Romania have had a share of 70.8% out of the total amount of aggregate volume of country's exports and a share of 59.2% of total imports of the country which strongly highlights the powerful control FDI companies exercise on the Romanian foreign trade, but also the role they play in the development of the national economy. In 2008, FDI export and import losses increased as compared to 2007, after which they decreased in 2009 due to the negative impact of the crisis.

Given the size of the percentage contribution of exports and imports of FDI companies in the country's total exports and imports in 2007-2010, there are voices considering same a favourable situation in that that these firms have the highest share as compared to exporting companies with domestic capital. We believe however that in terms of trade balance, the **contribution** of FDI companies was **unfavourable** (negative), because their imports exceeded exports in value. In other words, FDI contribute to the current account trade imbalance and to payment balance of the country (N. Falk, 2009 E. Borensztein et al., 2005 Navaretti G. Barba, 2004).

Analysis of data in terms of volume and structure of exports and imports of FDI companies in Romania highlights the following issues for the period 2007-2009:

- the trade balance of the period analysed was negative which means that imports of the FDI companies exceed their exports and according to the forecast of the National Prognosis Commission this trade deficit will be perpetuated until 2016;
- the economic agents with foreign equity investments activating in the retail business represent the main trade deficit generating sector (-7,77 billion euro in 2007; -8,372 billion euro in 2008; -4,387 billion euro in 2009), followed by the sector of another activity with trade deficit of -1,5 billion euro in 2007 and -601 million euro in 2009.
- the industry has contributed with a **positive stock** to the Romanian trade balance in the years 2007 and 2009 and with a **negative stock** in 2008, which brings the conclusion that it is however the industry, in particular the manufacturing industry, which has the highest potential to overcome the crisis and reduce the negative stock of Romania's trade balance, based on exports exceeding the imports.

	Exports (FOB)		Imports (CIF)		
	FDI Companies	% of FDI companies of total economy *	FDI Companies	% of FDI companies of total economy *	Stock of Trade balance (+/-)
Other activities	3	0.0	15	0.0	-12

* Does not include exports and imports associated with activities of NACE groups 84 – Public administration, 97/98 – Activities of population households and 99 – Extraterritorial activities.

Note: Exports and imports have been aggregated based on the main activity of the companies, in accordance with NACE Rev.2. Export and import of FDI companies are those related to exhaustively analysed (having more than 20 employees). Data concerning export and import within the economy as a whole considered for determination of relative figures are those reported by the economic agents who exceeded the reporting thresholds for 2010 established for the interstate statement purposes.

Source: Processing of data offered by the Romanian National Bank.

- **the manufacturing industry** is the main branch with **trade surplus** (3 085 million euro), this being mainly accountable to its *transport* sub-sectors (1 893 million euro surplus), *metallurgy* (1 153 million euro surplus) and *machinery and equipments* (474 million euro surplus);

- **agriculture, forestry and fishing**, although having relatively low inflows of FDI (2% of total FDI stock as of December 31, 2010), represent the second branch of the economy where FDI enterprises have registered an aggregate trade surplus (of 243 million euro), figure well below the real potential of Romanian agriculture and forestry

- branches having registered a deficit in the trade balance include: mining, food, beverages, tobacco, cement, glass, ceramics, crude oil processing, chemicals, rubber and plastics; other manufacturing industries; professional, scientific, technical and administration activities and support services; trade; construction, hotels, financial brokerage, transport, other activities; industries with negative stock of trade balance include some companies which enjoy some favourable production conditions in Romania and which were net exporters before 1989 (food, cement, glass, petrochemicals, plastics, etc.).

- in all other branches, FDI enterprises registered **trade deficits**, raising serious problems on promotion of exports and substitution of competitive imports in the future.

The main issue raised by the exports of the enterprises with foreign capital established in Romania is not the level of competitiveness[37], but the extent in which this level has a **direct and indirect positive propagation effect on the national economy** on short, medium and long term perspective (spillovers or positive externalities). From this point of view, if **profit is fully repatriated to the parent company** abroad, then the impact on the investments in Romania is very low or nonexistent, leaving as favourable effect thereof only the wage income of employees working in such foreign companies, income which may well be below the wage rates practiced by Romanian companies and a number of other benefits related to improvement of expertise and skills, use of resources such as raw materials, fuel and electric power, a greater confidence in observance of environment standards.

Consolidation of the relationship between sustainable development and FDI should not neglect some aspects related to **impoverishment or poverty exports** (Bhagwati J., 1958, Blomstrom M., Kokko A., 1998), which, due to the low value added and high share of export of natural capital, may generate significant medium and long term environmental and economic damages.

---

[37] We have seen that FDI are not concentrated in high technological industries, having high added value and competitiveness.

Another major strategic challenge for the sustainable development of the national economy, involving FDI as growth factor concerns the increasingly chronic character and the increasing trend of Romania's trade deficit, as shown by recent versions of official medium term (2012 - 2015) and long term (up to 2020) forecasts.

Table 4. Deficit of Stock of Romanian Trade Balance,

as foreseen for the Periods 2012-2015-2020

	Years				
	2012	2013	2014	2015	2020[*]
Deficit of stock of trade balance, billions euro	-10,58	-10,96	-13,51	-15,35	-17,1

[*] 2009 estimation of the National Prognosis Commission for long term forecasts

Forecasts of the National Prognosis Commission forecasts on the trend of increasing trade deficit of Romania until 2020, highlight that trend projections coincide with the projections of the Country Report of IMF[38] of 2011, in which, for 2012, which provide for 2012 a deficit (export FOB-import FOB) of -8.4 billion euro and -8.4 billion. euro in 2013, -9.1 billion euro in 2014 and -9.3 billion euro in 2015.

It is our opinion that development and implementation of programmes and strategies intended to reduce this tendency toward increase of negative stock of trade balance for some groups of products and services is imperatively required at least on following grounds:

− FDI should increase its contribution to Romania's foreign currency earnings from exports which show current or future comparative and competitive advantages, and not from exports made at "any price", which, some of them at least, may have unfavourable effects on the economy;

− FDI import policies should be discouraged by local products and services to replace some of the competitive imports, including by increase of absorption of EU structural funds for 2007-2013, which is currently very low (in late September 2011, absorption was 3.7% per overall sectoral operational programmes - POS, of which 7.3% - POR, 2.49% - SOP Transport, 1.89% - SOP Environment; 2.96% - HRD, 4.60% - POSCCE, 4.13% - PODCA, 6.85% OPTA.

− general restriction of unnecessary imports, having a negative impact on the environment and sustainable development, in compliance with EU regulations;

− stimulation by specific policies of exports of goods and services from creative-cultural industries which hold a significant share of the GDP in some countries, employment and foreign trade.

It is also worth mentioning on the other hand that change of vision on exports as growth factor "under any circumstances" also results from the fact that according to the National Prognosis Commission, **the percentage contribution of net exports (exports-imports) to growth of real used GDP was negative** in 2009, by -28.6% (value-priced 2008), of -30.3% (value-priced 2009) and, in 2010, by -31.5% (value-priced 2009) and -27.7% (value-priced 2010). Even higher negative contributions of net exports are estimated for the years 2012-2015.

FDI Exports: Reinvested and Repatriated Profit

One of the major FDI companies-related strategic challenges for the host country refers to the profitability and revenues made by the foreign capital in terms of internal and external economic and social impact, and the benefits made by participants to this profit (stakeholders).

---

[38] Vezi: *International Monetary Fund,* 2011, January 2011, IMF, Country Report No. 11/20
(http://www.imf.org/external/pubs/ft).

Although status of subsidiaries of multinational corporations or other foreign investors is similar to the corporate standing of domestic investors (enterprises), there are still a number of peculiarities in the level of profitability compared to domestic producers, on the one hand, as well as the manner to obtain profit and use profit or revenues in the host-country, by **re-investment** or **repatriation** into the country of origin on the other hand, which differentiate them from local companies.

The latest UNCTAD data confirm that the repatriated profits of FDI companies are usually **higher** than reinvested profits in the host country's economy, which shows a greater advantage for foreign investors than for the national economies where the subsidiaries of multinational corporations are located (MNC), (A. Burnstein, 2005; Durham KB, 2004 E. Borensztein, 1998).

Table 5. Share of worldwide aggregate value of reinvested and repatriated revenues of foreign capital companies in the period 2005-2010

	Years					
	2005	**2006**	**2007**	**2008**	**2009**	**2010**
Reinvested revenues (% of total revenues)	24.7	30.8	40.3	23.4	24.4	40.0
Repatriated revenues (% of total revenues	75.2	69.1	59.7	76.5	75.5	60.0

Source: Own estimative calculations based on the data offered by *World Investment Report 2011*.

Details offered in Table 5 as well as other analyses of revenues of MNC subsidiaries highlight following important issues:

a)   global earnings reinvested in the "host" countries are usually smaller by 1 to 3 times than those returned in the country of origin, which shows that MNCs are profitable, in general, and that they legitimately follow their own interests, their volatility in the host country being determined not as much by bankruptcy or insolvency, as by the emergence of new opportunities for profit in other host countries, where they can obtain better competitive advantages;

b)   the decision on the amount of reinvested profit is made by the parent company for its subsidiaries, subject to their expansion objectives, the level of operational costs in case of start up companies or upgrades;

c)   **reinvested revenues** (Lundan S., 2006) does not mean only additional costs to increase production capacity of MNC subsidiaries in the host country, but also the establishment of contingency reserve funds to be used under unforeseen circumstances or for favourable foreign exchanges, so that contribution thereof to gross fixed capital formation does not equal the entire reinvested profit;

d)   in the crisis years 2008 and 2009 the share of repatriated earnings was relatively higher than weight of reinvested revenues due to the general decrease of the overall value of the total earnings of multinational corporations;

e)   even if foreign investors accept loss situation in the first years of operation of MNC subsidiaries, low profitability or total reinvestment of earnings, recovery of losses, of investments and search of profit throughout the entire operational lifetime of the investment remain a sine qua –non requirement.

We have attempted based on official data provided by the Romanian National Bank and the National Institute of Statistics to determine extent of profit reinvested and repatriated by FDI companies operating in Romania.

Given the importance of FDI for the Romanian economy, we understand the major concern of certain representatives of Romanian governmental institutions on issues related to losses registered by banks or other subsidiaries of parent companies. It is less understandable however their lack of equal concern for the cumulated profit repatriated by foreign investors and for the critical condition of Romanian economic agents, SMEs in particular.

If the profit repatriated as dividends granted to foreign shareholders for the host country represents an issue aggravating problems related to financing of new investment programmes, the profit reinvested in the host country is a financing source of investors even if such investments represent assets belonging to the foreign capital company.

The prevailing idea according to which FDI stand at all times as a beneficial instrument for the sustainable development of Romania should be in our opinion adequately and finely adjusted to each particular case and issues, based on real analyses facts and solid arguments.

Romanian DFI companies have repatriated in the years 2003 – 2010 a total amount in distributed dividends equal to 11.730 billion euro, augmented by an additional amount of 2.382 billion euro in net interest income, i.e. **a total repatriated profit of 14.112 billion euro** for a stock capital of about 52 billion euro in 2010. The equivalent of such an index of „Return On Investment" (ROI) of 27% highlights a high profitability of FDI in Romania for the period under analysis.

Table 6. Revenues of FDI in Romania, reinvested and repatriated profit

in the period 2003 – 2010

- million euro -

Years	Revenues made by FDI	Revenues	Repatriated profit (distributed dividends
2003	1047	29	446
2004	2083	66	568
2005	2352	87	1101
2006	3313	61	584
2007	4350	266	2757
2008	6412*	634	2696
2009	4496*	475	1608
2010	4222*	764	1970

* Total loss registered by FDI in the subject years was not considered.
Source: Romanian National Bank and National Institute of Statistics data based on the exhaustive research of
6473 enterprises with foreign direct investments, including enterprises with at least 20 employees
(6242 entities), all foreign capital credit institutions (40 entities), all foreign capital insurance companies (34 entities), as well as atypical companies, all enterprises with foreign direct investments having a turnover of the stock capital over 30 million RON (157 entities). Representation at regional level of development and NACE division is provided by the foreign direct investment enterprises analysed exhaustively holding a 87.3% share of total FDI stock. The number of enterprises with foreign direct investments which has not been covered in this exhaustive statistical survey (about 36,900) is represented by the sample consisting of 1050 entities. The total number of entities investigated (exhaustively plus sample) was 7523. The degree of error of the results of the statistical survey on foreign direct investments in Romania (flows and stocks) is $\pm 3\%$, is guaranteed with a probability of 97%.

Dividends distributed by FDI companies in the crisis years 2008-2010 in Romania were lower than in 2007, and net interest income experienced a general growth trend, with larger and smaller fluctuations from one year to another .

World Bank data (http://businessday.ro/12/2010) show that during 2005-2009, TNC subsidiaries in Romania repatriated profits of about $ 19 billion (14 billion Euro) , their value reaching $ 1.54 billion in 2009, lower by 65% compared to 2008, data which is close to our estimates (Table 12). As far as reinvested earnings are concerned, we had more reliable data only for the period2003-20n07 when the aggregate amount thereof was 7.188 billion euro. In 2008-2010, due to losses registered and changes in methodology of calculation it was no longer possible to rigorously determine the size of reinvested profit. We estimate however that **profits repatriated** by FDI companies in Romania were about twice as large as profits reinvested in Romania, which is close to the average situation worldwide. The extent to which such a ratio is favourable or not for Romania would gain consistency and credibility if it were the subject of a complex survey, based on real cases of foreign investors.

Ratio between reinvested and repatriated profits of foreign companies in Romania differs from one sector to another and from one company to another, making it difficult to establish standard benchmarks for profitability and distribution of invested and repatriated profit. It is important though to apply the **principle of cost-benefit analysis** and integral economic efficiency for each involved party (Manoilescu M., 1986), in order to allow establishment of ratio between results/costs in the broad and not only financial sense, which would imply that a number of **negative and / or positive discounted externalities** are added to direct financial costs and benefits. In other words it is necessary to determine RIRF[39] (Financial Internal Rate of Return) and RIRE[40] (Economic Internal Rate of Return), using updating techniques and choosing a suitable discount rate (AE Boardman et al, 2004; guide analysis cost-benefit, 2004, M. Florio, S. Vignette, 2003).

The cost-benefit analysis allows to determine the size of the benefit accruing to a unit cost to each party and to avoid unacceptable efficiency gaps (A. Lehman, A. Mody, 2003) between partners beyond reasonable confidence limits. It is unquestionable that such an approach does not ignore the role and benefits of FDI for the host country, but is rather an invitation to avoid unilateralism, generalizations that can blur particular different or totally opposite situations, advocating for greater objectivity, scientific integrity and professionalism.

Final Remarks

This survey concerning correlation between FDI and the requirements for a sustainable development of Romania has highlighted that in addition to their favourable effects, FDI may also have some adverse effects on the trade balance, current account and balance of payments of the host country.

Given that FDI companies have the largest share of the Romanian economy, we consider it is absolutely necessary to promote policies intended not only to attract them at any cost in the country but also to verify their creditworthiness, to monitor to what extent they represent stimulant for an increased efficiency and welfare of Romania, for the improvement of Romania's position in international rankings of competitiveness. The fact that many foreign investors realized in Romania profit rates much higher than in their country of origin must be analyzed and compared with the intake, the beneficial propagation effect these investments have on the national economy, according to the requirement of the win-win criterion, in terms of equivalence and mutual, reasonable fairness.

This research represents only a first step in the comprehensive analysis of the role of FDI for the Romanian economy. A series of issues concerning transfer pricing and barter relations between subsidiary and parent company, relevant aspects, tax facilities and incentives, volatility, observance of commitments in the post-privatisation contracts, the comparison between vertical

[39] RIRF – Financial Internal Rate of Return
[40] RIRE – Economic Internal Rate of Return

and horizontal FDI benefits , parallel loans from companies, etc. remain to be further investigated.

THE ORGANIZATIONAL STRUCTURE OF THE BODY SHOPS CONNECTED TO GENERAL MOTOR'S COLLISION PARTS

Zima Liliana Adela
Technical University of Cluj Napoca North University Center of Baia Mare Faculty of Sciences

The selling of collision parts represents 28% of General Motor's business. The main customers of collision parts on the market are the international dealership and the independent Body Shops. The successes of these shops have a direct relation with the sale collision parts through the dealership Parts Department. For optimize the collision parts sales it's important that the operations of the dealership Parts Department meet the needs of both internal and external Body Shops. It is important to know the organizational structure of the body shops and the main factors which influence the activities such as: shop volume, expense budget, available skills, facility size, and production methods. The Collision Parts Marketing Group of General Motor's made an independent market research related to survey dealership and independent Body Shops. This research provided insight to General Motor's as to how and why decisions are made to purchase collision replacement parts.
Key words: body shops, satisfaction, collision parts
M: Business Administration and Business Economics; Marketing; Accounting
M11:Production Management

1. INTRODUCTION

Organizational structure of the Body Shops must be based on the presume that all the revenues are resulted from labor. It is fain to say that when the labor is produced, part sales, point and material sales and sublet sales will follow.

Two groups of employees are involved in production of labor.

- The technicians who perform the labor operations on vehicles and makes up the production staff.
- The managers, administrative and maintenance personal make up the support staff.

The objective for a staffing ratio is one support person for each three production employees. The organizational structure of support and production staff and collaboration may be different from shop to shop. The factors which influence the staff's structure are:

- shop volume;
- expense budget;
- available skills;
- facility size;
- methods of production.

This study lists job positions commonly found in production and support staffs. Production and compensations methods on different types of shops are included.

2. THE INVESTIGATION OF ORGANIZATIONAL STUCTURE

2.1. Production Staff

Production staff is made from professional technicians in different disciplines. These range from basic skills like prepare the vehicles through technical skills like paint spaying on frame straightening. Many shops are stopped with technicians passing a range of disciplines.

Paint technicians – usually has experience in all the phases of the refinishing process. His or her skills range from vehicles preparation, to paint mixing, to color matching, to paint spraying and blending.

Detailer – has experience in cleaning the vehicle or recondition process. These include inside and outside cleaning, buffing, polishing and paint touch up.

Paint Prepare Technician – have experience in prepare painting like cleaning, sanding, taping, mashing. This is sometimes an entry level or apprentice position.

Metal Technician – has experience in damage car. These include disassembly, component replacement, and sheet metal alignment, cutting and welding.

Frame Technician – has experience in frame and chassis damage repair. They can use specialized frame straightening equipment and measuring equipment.

All technicians are named qualified persons and can perform several different tasks.

2.2. Support Staff

Support staff performs management tasks, administrative tasks and other miscellaneous tasks in support of the production staff.

Manager is responsible for Marketing, Sales, Production, and costs control and customer satisfaction. Duties that are exclusively performed by managers include: marketing strategy development, inspect quality of workmanship, review actual sales, gross and profits to forecast, set goals.

Estimator is responsible for preparing and writing the estimates of repairs and securing the customer's approval to perform repairs. Knowing the process of repair is obligatory and communications and selling skills.

Dispatcher coordinates the flow of work in shop and serves as a liaison between estimators and technicians. His primary responsibility is to assign jobs to technicians in coordination with receipt of parts and support services. He can possess strong organizational skills.

Shop Foreman serves as a liaison between technicians and support staff through coordination the work flow and providing technical support to technicians and estimators. He assigns jobs to technicians, recommends repair processes to technicians, assists them, identify training needs, substitute for Dispatcher.

Secretary (clerical) Receptionist supports both and communicates information to clients, estimators and insurance companies.

3. ORGANIZATIONAL STRUCTURE

Sample body shop manager description

Position Profile. Responsible for the profitable operation of the body shop.

Objective of Position. Will carry responsibility by operating the shop at maximum production while controlling cost, setting and obtaining profit objectives, and insuring customer satisfaction through quality workmanship. Minimum performance standards include maintaining and estimate shop closing ratio of 70% or higher, and maintaining a minimum net profile level of 8%.

Overview of duties & responsibilities. Allocate work to the body and paint staff. Prepare estimates on all work. Work with insurance adjusters. Schedule work on daily basis. Flag all work. Maintain payroll and productivity records. Handle expenses. Hire and train necessary manpower. Complete perform tracking.

Reports to. Service director/dealer/general manager

Schedule for Task Completion:

Daily
- Maintain body shop appearance to company standards.
- Review work in progress.
- Inspect quality of workmanship.

Weekly
- Review individual productivity to forecast.
- Review actual sales, gross and profits to forecast.

- Check parts on backorder.
- Review work completed and compare to work scheduled.

Monthly
- Forecast sales, gross, controllable expenses and profits.
- Review work in progress.
- Perform routine shop equipment maintenance.

Sample estimator job description

Position Profile. The Estimator functions as the communications liaison between the customer, insurance companies, technicians and management.

Objective of Position. Satisfying the insurance company, the employees, and the customers. Minimum performance standards include an estimate closing ratio of 70%, average estimate sold equaling $1,500, supplement 80% of all estimates sold, and 90% customer satisfaction.

Overview of duties & responsibilities. Responsible for insuring each of the person's needs are communicated clearly to each other. Duties include writing estimates, repair orders, supplements, making appointments and answering phones.

Reports to. Body Shop manager/owner

Schedule for Task Completion:

Daily
- Write estimates
- Write repair orders
- Follow-up on job promises

Weekly
- Update next week's appointment log
- Follow-up on open supplements

Monthly
- Prepare open repair order list for management.

Sample lead technician (Team system) job description

Position Profile. Diagnoses and repairs vehicles

Objective of Position. Serves as a liaison to the estimator for 3 – 5 technicians. Assists estimator and assistant manager in maintaining proficiency levels and CSI. Minimum performance standards include achieving profit level for group of 90 – 110% while maintaining CSI level of 93% or better.

Overview of duties & responsibilities. Supervise activities of the team, distribute work, and coordinate activities with Assistant Collision Center Manager. Insure quality control standards are met.

Reports to. Assistant Collision Center Manager/Collision Center Manager

Schedule for Task Completion:

Daily
- Report daily activities to assistant Collision Center Manager
- Assign individual job to team members and assure satisfactory completion
- Assist and train team members as required
- Punch in and out the time clock, morning, noon and night.

Organizational charts

The structure of the organization is usually based on the number of technicians employed. Technician staffing requirements for the Body Shop are dictated by many factors, including: facility size; technicians capability; expense structure; market size; sales and profit goals

3.1. *Conventional structure – 2 options*

```
┌─────────────────────┐
│ Manager/Shop Foreman │
└─────────────────────┘
```

```
┌──────────────┐      ┌──────────────┐
│  Estimator   │      │  Technician  │
└──────────────┘      └──────────────┘
                      ┌──────────────┐
                      │  Technician  │
                      └──────────────┘

```
- Best applied to a 8 to 10 Technician shop
- Manager and Assistant Manager each perform the Estimator and Dispatch tasks for their teams
- Clerical support both teams
- Technician pay plans are based on overall team production

Production Methods
Methods of production are directly related to the various categories of labor performed in the process of collision repair. General labor categories most frequently performed are metal, paint, frame, and mechanical. These categories can be further divided into more specific disciplines such as tear-down, re-assembly, paint preparation, frame straightening, trim work, and glass installation. The two most commonly found production methods are the Combination Method and the Specialized Department Method.

Combination Method
This method requires that each Technician perform all categories of labor on an assigned vehicle, beginning with disassembly and ending with final paint spraying.

Advantages
Quality is usually very good; Performance is easily tracked; Responsibility is specific; Vehicle movement within the shop is minimal

Disadvantages
Rate of profit is usually low; Technicians must be qualified in all disciplines; Equipment requirements are higher

Specialized department method
This method requires that each Technician perform only certain categories of labor. The first level of category separation occurs between paint labor and metal labor. A shop using this

method employs specialized Paint Technicians and specialized Metal Technicians working in assigned areas.

A second level of specialization occurs when the labor categories are even more specifically divided. The following Technician Organizational Charts illustrate two levels of specialized shop.

4. Conclusions

Organizational structure is relevant even for compensation methods within the Body Shop industry include a variety of pay plans for both production and support personnel. Pay plans should be designed to motivate maximum production while maintaining high quality. They must be structured to meet financial benchmarks and achieve customer satisfaction. Evaluation of the Body Shop's financial performance is necessary in order to develop an effective business strategy. The operating report of financial statement , along with the repair order and estimate data, may be used to analyze performance. Specific performance indicators may be compared to industry benchmarks. These comparisons identify areas of opportunity and assist management with goal setting. Consistent goal setting in conjunction with routine performance tracking and feedback are effective techniques to improve overall financial performance.

The information about a company's performance is necessary in order to evaluate the potential modifications of the economic resources that the entity will be able to control in the future, to anticipate the ability to generate treasury fluxes with the available resources, and to establish the efficiency with which it can employ and make use of new resources. In current practice, the information regarding financial performance are mainly given by "the profit and loss account", respectively "the budgetary execution account", but things are not so simple as to reduce them to the synthetic data in a certain periodic report form since it would be a pity to ignore the real - time information given by the account itself.
In our paper we have tried to resume the most important non-financial indicators, through which the performance of a company is measured.

1. Introduction

Measuring the companies' performance seemed to be until relatively recently the exclusive appanage of the financial analysis and its own criteria, namely: traditional financial-accounting criteria, criteria derived from the theory of creating value for shareholders (Economic Value Added, Market Value Added), cash-flow –based criteria, stock criteria, etc. (Mironiuc, m. Et al, 2007: 1-22).

Financial market pressures have undoubtedly led to the communication privilege in terms of financial value.

But, the many phenomena that have marked the global economy in the past few decades (the internationalization and the delocalisation of business, the crisis and the turmoil in financial markets, the change of the consumer profile through the emergence of consumer segment sensitive to ecological theme, dematerialisation of the economy) have triggered a new outlook on the economic development at planetary level and have exposed the companies to the critical eye of a company more and more attentive to the ethical values.

The communication exigencies occurring amid such changes require that the measurement of the company's performance be carried out in a comprehensive manner, through financial and non-financial criteria (extra-financial).

2. Measuring the company's performance using non-financial criteria

Lately, the companies use multiple non-financial criteria for assessing the company's performance and are closely related to corporate governance practices (V. Robu, C. Vasilescu, 2004: 181, FASB Report, 2001). The FASB report in 2001 on the Financial Reporting in the

context of the new economy shows, in Chapter 3, the new non-financial performance measurement indicators. Among the examples cited are the balanced scorecard (Kaplan, 1992), the innovative reports on the intellectual capital of the Swedish company Skandia, the Karl-Erik Sveiby matrix etc.

The balanced scorecard "translates the organization's mission in a complete set of performance measures that creates the framework for a strategic system of measurement and management" (Kaplan, 1996). This type of dashboard takes into account four balanced perspectives (in the sense that it is not given disproportionate importance to any of them, much less to the financial one): the financial perspective, the customer-focused approach, the internal perspective and the innovation and lifelong learning perspective.

These indicators can be grouped according to the purpose for which they are used:

- evaluation indicators of the quality management: the degree of implementation of the company's strategy, the quality of the company's strategy, the managerial experience, the quality of the leadership vision, organiyational style of the management;

- evaluation indicators of corporate culture: the ability to attract and retain talented people, the quality of workforce, the quality of the granting incentives system, the staff training programmes' quality, the social and environmental policies, the use of teamwork;

- evaluation indicators of the effectiveness of the policies for the executive board remuneration: the harmonization of the management enhancement policy and the interests of shareholders, pay policy based on appropriate criteria of performance, the ratio between the executive board remuneration and the workforce remuneration;

- evaluation indicators of the quality of Shareholders Communication System: management credibility, management accessibility, effectiveness of the Shareholder Relations Department, the quality of the published materials;

- evaluation indicators from the clients' perspective: the number of contracts, the number of customers, customer satisfaction index, the accessibility by phone (%), savings/contract, the number of individual policies, points of sale;

- evaluation indicators from the perspective of human resource capital: number of employees in full time employment, the number of women managers, the human capital index, employee rotation, employee/ training costs, average age, average number of employees, the number of days of training, the percentage of employees with secondary and higher education, the percentage of employees with more than three years' experience;

- evaluation indicators from the perspective of the processes: number of contracts/employee, the occupancy rate measured as area (%), the percentage of employees in IT (%), computerization expenditure/ total administrative expenses (%), the result of exploitation per square meter, costs per square metre;

- the evaluation indicators from the perspective of development and innovation: percentage of new customers in 12 months (%), number of contracts per the employee (%), funds accessed through Telelink (%), percentage of the insurance premiums in the new launched products (%), development expenditure/total administrative expenses (%), number of registered ideas documented with Idea IdeaGroup, change and development.

The main criticism of these types of reports are the lack of relevance of some indicators, the opacity of the instruments used (which are not always explained by the authors) and the lack of continuity from one year to another, which may suggest hiding certain bad events.

3. The analysis of and reporting the non-financial information

The sustainable development needs a measurement, evaluation and decision system which intercepts the relationship between the economy, society and the setting, which reveals the "invisible intangible resources" dynamics so that the results recorded in the financial circumstances and the company's value may not be distorted.

Amid changes in the global economy, the analysis methodology evolves. Thus, the financial analysis should integrate in a complementary and progressive manner the nonfinancial component analysis. This is based on a Stakeholders Approach. It quantifies the non-financial (extra-financial) performances derived from the company's social responsibility and from promoting the immaterial capital which concentrates a great deal of of the company's growth and development opportunities. Together these two types of analysis will respond to the financial community regarding: the economic impact of the environmental and social aspects; the risk factors, the social and environmental opportunities; the causes of deviation between the market value and the company's economic value.

The literature discusses several approaches to non-financial analysis, depending on the investors' expectations, namely: the non-financial analysis in an "exclusionary approach" which is based on the use of the exclusion criteria of investments in controversial sectors of activity (tobacco, weapons, alcohol, gambling, nuclear, etc.) or non-responsible sectors (exploit minors, perform tests on animals, use pesticides etc.); the non-financial analysis in a "performance approach" is made starting with defining the positive selection criteria of the investments ("best in class") and has as its objective the identification of the sources of financial superperformance over the medium- to long-term, by developing in companies the best practices regarding: human resources management, ensuring the working conditions, remuneration policy; environmental risks management; product quality compliance; innovative capacity; politics of patronage etc.; the non-financial analysis in a "risk-opportunity approach" is to provide those who manage investment funds with a full view of the risks and non-financial opportunities which the companies who hold titles present. The non-financial performance analysis is very linked to the emergence of the socially responsible investments market ("ethical investment"), a niche market, which has a growing number of international institutional investors, of which a large part are Europeans, convinced that, investing in companies and in the countries that comply with the environmental and social standards, will have an active role in the process of sustainable development and the return on their investments and the volatility of securities will bear positive influences.

In reality, the elaboration of measurement systems of non-financial performance and the guarantee of the information quality of this nature is difficult to accomplish.

The difficulty arises from the fact that the reporting of the sustainable development (stakeholder's report) remains a voluntary approach, the non-financial indicators are very little normalized, the international regulations are missing in socially responsible investments, there is no homogeneous practice/methodology in the domain of non-financial analysis. In addition, the costs involved in the organisation of a recording system of the economic, social and environmental information may represent an obstacle for the companies that would like to communicate the sustainable development performances. At the same time, the communication of the sustainable development performances may prove harmful to the companies when elements of their strategy are disclosed, which are the source of some competitive advantages in relation to competitors. Because of these issues, yet there is no consensus at international level in relation to the contents of the report and the standard indicators for the overall assessment of the progress of the sustainable development. Experts believe that the consensus is difficult to achieve because of the variety of natural conditions, of the different levels of economic, social and cultural development of the countries of the world. The choice of performance indicators for the sustainable development, which must meet the requirements of the external communication and the internal control management, continue to be subjective, consistent with the goals of the companies, with the stakeholders' expectations involved in the design and reception of information relating to the sustainable development performance (Janicot, l., 2007: 49).

The most advanced initiative towards the elaboration of a credible system for reporting on the sustainable development is the Global Reporting Initiative (GRI). The initiative was launched in 1997 by the U.S. non-governmental organization "Coalition for Environmentally Responsible

Economies" and the United Nations Environment Programme (Reynaud, 2006, p. 139) and benefited from the support of multi-stakeholders coalition for whom the transparency for the sustainable development of the organisations is of interest.

Its objective is to improve the quality of reporting on sustainable development, to elevate it to a level of rigour, comparability and reliability equivalent to that they have met in their financial reports. Most of the principles specific to the international standards of financial reporting are taken by GRI and adapted to analyze the companies' sustainable development performances. The success enjoyed by GRI, including among the small and medium-sized enterprises, is explained by the fact that it proposes an international, structured and flexible framework of indicators of sustainable development, as opposed to the initiatives promoted by other bodies which relate to a particular sector of activity or to particular social issues.

The performance indicators elaborated by GRI are subdivided into:

- the economic performance indicators reflect the economic dimension of the sustainable development, the company's impact on the economic condition of its own stakeholders and on the economic systems at local, national and global level.

These indicators describe the capital flows between the various stakeholders (the economic value generated and distributed directly, the employees remuneration, the ratio between the average wage and the minimum local wage, the undistributed profit, the donors and the State remuneration, the company's opportunities caused by climate change, the funding received from the public administration, expenditure on local suppliers, ways of making the staff more responsible etc.) and the main implications of the organization on the society (donations and other community investments, investments in infrastructure and public utilities, the analysis and the description of the indirect economic impacts considered externalities generated, the share of the managers with responsibilities in the local community etc.).

- environmental performance indicators refer to the size of the sustainable development ambient and to the organization impact on the natural systems (ecosystem, air and water), via inputs (raw materials, energy, water etc.), outputs (products, services, emissions, waste) and investments in the environment. The information necessary for the assessment of the environmental performances have to be relative to the significant environmental aspects, environmental policy, environmental nonconformities, responsibility of the environmental issues management, training the personnel in the field of the environment, monitoring the environmental issues with significant impact, corrective and preventive actions in the environment, certifying and controlling the ambient management system of the organization, success, deficiencies, environmental risk, environmental strategy, etc.

- social performance indicators reflect the organization's impact on the social systems in which they work and are subdivided into:

  - performance indicators of the practices and working conditions: the occupational aspect, the health and safety at work aspect, training and education aspect; the performance indicators of human rights: non-discriminative aspect, free association aspect, work of minors aspect, the rights of the indigenous population;

  - performance indicators of society: the community aspect, the corruption aspect, the political contributions aspect, the conformity aspect;

  - performance indicators of the product responsibility: consumer's health and safety aspect, products labelling aspect, marketing-communication aspect, the conformity aspect (Mironiuc, m., 2008: 220).

Despite the limited information possibilities for the financial communication, the financial-accounting performance indicators are the most present in the analyzed subjects' practice and the most often communicated in relation to non-financial criteria: the social initiatives (creation of jobs and occupational safety, the involvement in community life, sponsorships, etc.), the

company's image, management team prestige which are the least disclosed and used to reflect the performance, mainly in the small and medium-sized enterprises.

4. Conclusions

In order to ensure competitiveness in the long term, today's companies cannot ignore a number of external factors, such as: the changes in regulations, the media pressures, the stakeholders' suggestions, rating agencies' pressures etc. Companies have to integrate into their development strategy responsibilities that cover areas of: ethics in business, reducing the environmental impact, relationships with partners, human resources management, growth and innovation. These issues, which is likely to generate financial risks tend to represent new benchmarks in assessing the company's sustainable performance that are part of a logic that cannot be exclusively financial-accounting.

The multiplication of the extra-financial rating agencies is the expression of the fact that organizations are today exposed to the critical eye of society in terms of their civic behaviour and that they must take account of the views of a public increasingly attentive to the ethical values, which reacts against the excesses, of social and environmental externalities.

The partnership concept of "governance" of the sustainable company makes the ways of analyzing and quantifying the performance incapable of existing as a result of the new realities. Thus, the financial analysis integrates in a complementary and progressive manner the non-financial component analysis.

This is based on a stakeholder approach, it quantifies the non-financial performances (extra-financial) derived from the company's social responsibility and from promoting the immaterial capital that concentrates a great deal of opportunities for company's growth and development. Together these two types of analysis will respond to the financial community: the economic impact of the environmental and social aspects; risk factors, social and environmental opportunities; the causes of deviation between the market value and the company's economic value. The difficulty of making the non-financial analysis derives primarily from the fact that the reporting system of the sustainable development remains a voluntary approach, there is no homogeneous practice/methodology in the non-financial analysis domain and from the lack of practice uniformity in this field. Due to these difficulties, as well as lack of normalization of the non-financial indicators, the practical side of this research will be focused primarily on the financial information and financial indicators respectively.

THE CONSTRUCTION OF IMPORTANCE-PERFORMANCE GRID IN TOURIST SERVICES RESEARCH WITHOUT THE DIRECT DETERMINATION OF THE ATTRIBUTES IMPORTANCE

Ban Olimpia
University of Oradea, Faculty of Economics

The importance-performance grid is a marketing instrument used to make decisions regarding the growth of the consumers' satisfaction, by optimizing the attributes of products. This grid is a useful instrument, as it is shown in the paper, to the extent to which the importance and performance of the attributes are correctly recorded. Another idea underlined in the paper is that regarding the difficulty to directly determine the importance of attributes or in the same stage with the determination of the service performance, according to these attributes.

The objectives of this paper are to analyze the importance-performance grid (suggested by Martilla and amended by Abalo),through an empirical study in the field of tourist services used and to test the conditions to carry out this grid taking into account the hypothetical case of indirectly determining the importance of the quality attributes.

The literature in the field regarding the importance-performance analysis is analysed and the subsequent amendments to the previous grid suggested by Martilla and James in 1977.

The present paper is a continuation of several studies on the same subject, in which the following research methods were used: direct survey by questionnaire, the Spearman correlation coefficient, and the entropy calculus. A comparative analysis of the importance-performance grid if directly recording the importance of attributes (through survey by questionnaire) and of the indirect determination of the importance of the attributes (through the Spearman coefficient and entropy calculus) is being suggested. The results indicate possible uses of methods, yet it raises a series of collateral problems regarding their application.

The contribution of this paper is given by the suggestion of two methods to indirectly determine the importance of attributes, which take into account the data measurement scale used and the collinearity among attributes and which lead to pertinent results when we use the IPA grid amended by Abalo as a decision instrument.

1. Introduction

Two major instruments have been developed in time in order to analyze the concept of consumer satisfaction and they are: Importance-Performance Analysis (IPA) and SERVQUAL.

The roots of current measurement methods of consumer satisfaction are to be found in the first efforts to investigate the consumer's decision making process (Churchman and Ackoff 1954:172-187). Other efforts were concentrated in constructing models to determine the consumer's attitude (Fishbein 1963: 233-9; Rosenberg, 1956:367-72), followed by complex models of consumer's satisfaction (Oliver 1996; Tse and Wilton, 1988). Among these, is situated the use of the conjoint analysis (Green and Rao 1971:355-63; Luce and Tuckey, 1964).

Approaches regarding the perception of the quality of services and the identification of the evaluation attributes is to be found in many studies and empirical researches (1994; Parasuraman et. al. 1988: 12-37; 1993: 1-12). Kano (1984:38-48) developed a model which distinguishes different types of quality attributes. Kano's model divides the quality attributes of products and

services into five distinct categories (attractive, one-dimensional, must-be, indifference and reverse) each influencing differently the consumer's satisfaction. Other studies regarding the consumer's satisfaction suggests that the quality attributes can be perceived by using three categories: basic factors, performance factors, stimulation factors. Levitt suggests two categories of attributes: core attributes and facilitator attributes (Levitt 1983). We can see the correspondences among the three models. The basic factors are indispensable, their below average level creating dissatisfaction, yet their presence at an average level does not create satisfaction.

Starting with the previous researches regarding consumer satisfaction, Martilla and James opened up a new research direction by creating the Importance-Performance Analysis grid - IPA:

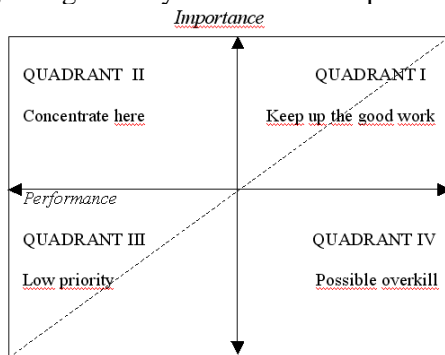
1. In 1977, J.A. Martilla and J.C. James launched the Importance-Performance Analysis grid (IPA)(Figure 1); According to the method suggested for the chosen product, service, or destination the attributes considered important by the target audience are established through the focus-group method. Regarding the sources used to determine the attributes considered important, the literature mentions the proposals of the managers in the field. The attributes identified are placed on a Likert scale and the respondents are asked to establish and evaluate the performance for a given product, service, or destination. According to the initial variant, any attribute placed in the grid with a higher score than the performance is a candidate for improvement efforts. The higher the discrepancy between importance and performance, the more improvement efforts are required because a high discrepancy means high satisfaction. IPA was applied in different fields, such as: health services (Cunningham and Gaeth 1989: 584-586), education and banking services (Ennew, Reed, and Binks 1993: 59-70), industry, quality of services and tourism (Bush and Ortinau 1986: 281-85; Lin et al.2005: 84-87). In the field of tourism, IPA was applied in order to determine the selection factors of a hotel in order to establish the critical attributes of the tourism guide performance to identify the competitivity factors of destinations or to draw up different strategies (Deng 2007: 1274-1284). After the applications, several problems have been identified and the improvement variants have targeted changes regarding the way in which the importance and performance are measured.


Figure 1 Importance-Performance grid by Martilla & James
(Martilla & James, 1977, p. 78)
Figure 2 Importance-Performance grid obtained through direct research

2. IPA alternatives were created suggesting improvements, examples, (Abalo et. al 2006:115-121; Bacon 2003:55-71; Oh 2001: 617-627). The most interesting are those emphasising the difference between importance and performance by drawing a diagonal given by the equality points between importance and performance. In the IPA grid, suggested by Abalo, the left superior part is enlarged and it includes quadrant II, ½ of quadrant I and ½ of quadrant III and the attributes in this area are candidates for improvement. The part under the diagonal in the graph

maintains the interpretation of Martilla and James' IPA. The difference is that everything with a higher score for importance than for performance, situated on the left superior part is regarded as a candidate for improvement.

Constructing the importance-performance grid has as a critical point the accurate determination of the importance and performance of the attributes of the researched product/service.

2. The literature on the determination of the importance of attributes for the construction of IPA

The measurement of the importance of the attributes in the IPA importance-performance grid can be done:

- directly, through Likert or metric scale; The disadvantages are: it hinders data gathering, it increases the duration of answer recording, the scores have a very low inter-item variation, the answers being uniformly high, therefore useless (Bacon, 2003: 55-71), many times the answers are not honest. A possible cause of problems could be that fact that in the method suggested by Martilla and James, before the application of the questionnaire, the most important attributes are already selected through the focus-group. Thus, using Likert scale there is a natural tendency to confer high values to each attribute. The most serious problem is that the absolute measurement is used not the relative, competitive one. Yet, there is still the best method due to the problems raised by indirect methods. (Abalo, Varela and Manzano 2007_115-121)

- indirectly, by measuring the importance of the attributes through a composite average of median scores and of Pearson correlation coefficient (O'Leary and Adams 1982) or by using the Spearman coefficient (Crompton and Duray 1985: 69-80).

- indirectly, through regression coefficients and the multivariate regression (Dolinsky and Caputo, 1991:61-79); By using these methods, the global satisfaction is correlated with the performance given to each attribute in order to find out the importance given to each attribute. This method's major disadvantages are: the collinearity among attributes (Bacon 2003:55-71) which leads to very poor results, inconsideration of a non-linear relation between the global performance and that of each attribute. There are studies showing that the negative effect of a product's low performance in the total evaluation of satisfaction is higher than the positive effect of an above the average performance (Abalo, Varela and Manzano 2007: 115-121). Yet, the Spearman coefficient has the advantage, that is can be used for non-parametric data.

- by conjoint analysis; This very useful method becomes unfeasible when it implies more than several attributes, a situation often encountered.

There were other measurement methods, yet they contradict one another and give different results for the same case. (Crompton and Duray 1985:69-80; Oh, 2001: 617-27)

3. Methodology

The research took place in three stages:

- In the first stage, we carried out a survey through questionnaire which recorded the importance given by the respondents to quality attributes and which evaluated the performance of tourist services from the perspective of quality attributes.
- In the second stage, we tested the extent to which the indirect determination of the importance of quality attributes leads to acceptable results (by comparing them with the results obtained directly).
- In the third stage, which makes the object of current paper, we constructed the three grides afferent to the information obtained in these three ways and we compared the three grides according to the marketing decisions.

Work hypothesis: using Abalo's IPA grid, the results obtained by direct investigation of the attributes are comparable to those obtained indirectly, in order to make marketing decisions. The market research ad implicitly the construction of the IPA Grid can be simplified by eliminating

the questions related to the importance of attributes and the determination of the importance of attributes through mathematical methods.

During March-April, 2010 a survey was conducted among the population of Oradea, Romania (Ban and Popa 2010: 378-384). The sample was composed of a total of 1,060 people, sampling method chosen was the stratification method (margin of error of 3%). The segmentation criterion used was age. The respondents were persons who received accommodation services in Romania at least once since 2007 till 2010.

The research goal was to investigate the level of Oradea inhabitants' satisfaction, with the quality of tourism services and the performance of service staff. The research instrument was a questionnaire with 21 questions, plus some questions related to socio-demographic aspects.

There were 19 attributes chosen for tourism staff, in correspondence with SERVQUAL, for which it was done the analysis of the importance given by respondents and the analysis of the perceived performance of the staff from Romania. A scale with five steps was used in this research, from "unimportant" to "very important".

The results obtained indicated a hierarchy of the attributes from the point of view of the importance and a hierarchy of the attributes from the point of view of the perceived performance with regard to the tourism staff in Romania. (Table 1, column 1 and column 4)

Excluding the direct responses referring to the attributes' importance, we have tried by two mathematical methods to indirectly determine this, by checking the correlation between the perceived performance and the global satisfaction.

Mathematical methods used in correspondence with the type of scale used in the survey applied, that is multivariate ordinal scales and these are: the calculus of entropy and the calculus of the Spearman coefficient (through SPSS). (Tabel 1 Ban, 2012: 348-354.)

Table 1

Attributes according to their importance in the survey		Attributes according to the importance inferred through the Spearman coefficient $(x10^{-2})$	Attributes according to their importance determined through entropy calculus $(x10^{-2})$	Attributes according to their performance in the survey
Q8.16 Kindness	4.62	0.134	5.3768	3.2

Q8.1 Anticipate desires	3.82	0.111	5.4893	2.96
Medium	4.3989	0.1166	5.263	2.9868

Based on the information obtained directly, we constructed the importance-performance grid (Figure 2).
Figure 3 Importance-Performance grid   Figure 4 Importance-Performance grid
obtained by determining the importance   obtained by determining the importance
of attributes through the Spearman coefficient   of attributes through the entropy calculus

If we take into consideration the IPA grid amended by Abalo, in the exterior of the diagonal there are two attributes left (Q6 and Q14) at *keep up the good work*, the rest requiring improvements, meaning the concentration of efforts.
Based on the indirect determination of the importance of attributes, through the Spearman coefficient, in the exterior of the diagonal there are two attributes left at *keep up the good work* (Q5 and Q6) and two attributes at *low priority* (Q7 and Q2) and one attribute at *possible overkill* (Q14).(Figure 3)
Based on the indirect determination of the importance of attributes through the entropy calculus, under Abalo's diagonal, there are four attributes suggested for *keep up the good work* (Q9, Q5, Q8 and Q14) and one attribute proposed for elimination (Q6). (Figure 4)

4. Results, limits and conclusions
Results:
- the IP grid constructed from the attributes evaluated directly as importance and performance, shows a concentration of 17 attributes (out of 19 attributes) in quadrant II and only two attributes in quadrant I (Q6 and Q14) which actually means the continuation of the efforts and their concentration on all the attributes analysed;
- the analysis of the IP grid constructed from the direct evaluation of the performance of services from the perspective of attributes and of the importance of attributes indirectly determined through the Spearman coefficient, shows a concentration of 14 attributes in quadrant II, of two attributes in quadrant I (Q6 and Q5) and two attributes in quadrant III (Q7 and Q2) and one attribute in quadrant IV (Q14);
- the analysis of the IP grid constructed from the direct evaluation of the performance of services from the perspective of attributes and of the importance of attributes indirectly determined

through the entropy calculus shows a concentration of 14 attributes in quadrant II, four in quadrant I (Q9, Q5, Q8 and Q14) and one attribute in quadrant IV (Q6);
- the comparative analysis of the three grides presented above, each grid analysed in accordance to the grid constructed from direct research, shows a similar positioning for 15 out of the 19 attributes analysed, which maintains the utility of the Spearman coefficient and of the entropy calculus in order to indirectly determine the importance of attributes;

Limits:
-for Q14 (skills), the verdict is elimination when the Spearman coefficient is used while for other two situations, it is a completely reverse verdict, that of effort continuation;
-for Q6 (Physical Appearance), the verdict is elimination when the entropy calculus is used while for the other two situations, it is a completely reverse verdict, that of effort continuation;
-it is possible that these results are valid only in the case of the proposed empirical study and they might not test for other concrete situations;
-we didn't take in consideration different category of quality attributes, like Kano's category or Levitt's category that sustain the asymmetrical relation between attributes and global satistaction.

Conclusions:
The hypothesis has been confirmed with the above mentioned reserves.
The discussions regarding the improvement of the usefulness of the importance-performance grid are being carried out in relation to the asymmetrical connection between attributes and global satisfaction (Slevitch and Oh 2010: 559-569), which supports the classification of attributes into categories according to their impact on global satisfaction.
We have to make another survey on the same population with attributes category distribution and indirect importance determination of attributes.

TOURISM INDUSTRY IN ROMANIA AND THE NEEDS OF PEOPLE WITH DISABILITIES

Babaita Carmen Mihaela
University of the West Timisoara
Faculty of Economics and Business Administration

Internationally, elaborated research about the tourism of people with disabilities are rather limited, and they focus more on the lack of physical access to certain services in hotels. But very few studies have been published on the issue of tourism and people with disabilities. In this context, this paper draws attention to the issue of the tourism of people with disabilities in Romania. The aging population is a growing phenomenon worldwide and it leads to the shaping of a new market segment with a visible and complex dynamic, namely that of persons with disabilities. The purpose of this study is to identify other potential external barriers related to the development of tourism of people with disabilities in Romania, such as hotel infrastructure. At the same time it has been tested the degree to which managers of these hotels are aware of the phenomenon itself and their opinions on the development of this area.
Keywords: tourism, people with disabilities, consumer profile
Cod JEL: M20, M21

- **People with disabilities a new market segment for tourism and hospitality industry**
  The percentage of people with disabilities (impairment) in the world, according to UN documents and statistics is on average 10%. In the USA it is estimated that the number of these people represent 20% of the population, and in the European countries there are 37 million people with disabilities - which means that a family out of four has a disabled person. The percentage of these people in the UK is of 15%, in Spain, Germany and Poland of 9-10%. According to the official data, Romania has a percentage below 10% of the population, which requires a serious analysis of this aspect (Babaita, 2008).

  There are enough reasons for that segment of people with disabilities to require special attention from both the service providers of any kind, and the researchers in management, marketing, tourism, law, computer science, etc. The most important thing is the fact that this phenomenon is more and more present, and should be given special attention.

  To identify this market, we have to use the classification of the **World Health Organization** (WHO), which defines disability as *"any restriction or lack of ability to perform an activity in a way that is considered normal for a human being"* .

  The first classification was made by the International Classification of Impairments, Disabilities and Handicaps (ICIDH), established by Philippe Woods, an English rheumatologist. This classification was revised in 2002, when it became the International Classification of ICIDH -2. Disability can mean impaired, hearing, mobility, intelligence or mental health. Physical disability may mean inability to work or move freely and may extend to the inability to perform normal movements in a timely manner at a reasonable level (Ozturk, Y, Yayli, A, and Yesiltas, M., 2008).
  According to the **European Commission** (1996), a physical disability often involves reduced mobility, disabled people often using wheelchairs, canes, crutches or other means of mobility. In a study conducted by Daniel Rodgers and Wiggins (2005), it has been stated that it is necessary to include patients with diabetes in the category of persons with physical disabilities, as this condition can affect patients' mobility.

In Romania, analyzing the official terminology frequently used, Law. 519/2002 suggests the following **definition** in Article 1: *Persons with disabilities are people whose social environment, inappropriate for their physical, sensorial and mental deficiencies, prevent them totally or limit their access to equal opportunities to social life, according to their age, gender, material factors, social and cultural ones, requiring special protection measures to support their social and professional integration.*

The official definition emphasizes **the social barriers raised for people with disabilities.** The emphasis is still on the presence of failures and less on the need to change the environment according to the needs of these persons or the right to an independent living, which must provide free access to exercise the citizen rights and eliminate the current situation in which many people with disabilities are considered *"passive recipients of services and benefits"* (statement made by the signatories of the *Country Report on Disability in Romania*, 2011)

The European Year of People with Disabilities - 2003 - boosted in Romania too the movement towards unity and cohesion of organizations of disabled people to increase the level of consultation with organizations of such persons. In the spring of that year, with the initiative and financial support of the ***European Disability Forum (EDF)***, seven national organizations have joined their forces setting up The INITIATIVE GROUP FOR SETTING UP THE NATIONAL COUNCIL OF DISABILITY IN ROMANIA (GIC-NDRC) and drew up a document called ***The Manifest of disabilities***. This is a document through which people with disabilities, organizations and representatives of their interests, communicate their problems and expectations to public authorities, other organizations, society in general. In this document, the signatories are trying to define disability in several ways, such as: disability (impairment) is a legal issue, about human and citizen rights, it is a matter of ethics, part of human experience, affecting one or more essential functions of the human being, such as to diminish freedom of expression or action of it. In case of people with disabilities, the exercise of human rights should lead to full elimination or reduction of the incidence of disability, according to its nature and extent of work undertaken on this topic etc. Humans are moral beings, free and responsible, thus having the power to overcome their disability.

According to Article 2, para. (1), Chapter I, of ***Law 448/2006 on protection and promotion of disabled persons***, disabled persons are those persons whose social environment, inappropriate to their physical, sensorial and mental deficiencies and / or associated to, entirely prevent or limit their access to equal opportunities in society, requiring protective measures in support of integration and social inclusion.

It is certain that, so far, within tourism literature it has not been set up a social model of people with disabilities. The natural question is whether tourism can meet the needs of such persons. However, it is important to note that a number of researchers have realized that this phenomenon is a global one, but focused very much on the definition of disability and less on finding real solutions to support this segment of consumers.

For tourism and hospitality industry (if we refer to it in a broader sense) a correct definition of disability is very important because it helps shaping a profile of the consumer with disabilities, which the tourism industry, and others must take into account when they have to adjust their offer to the demand of the tourists with disabilities. Among all the industries, tourism is perhaps the one that should respond more quickly to the needs of consumers of this segment. By the nature of tourism products designed, it may even improve health conditions or disabilities that limit their access to daily activities and achieve social inclusion.

Taking as a starting point the analysis of this research findings on the issue of disabled people in the tourism and hospitality industry internationally, in our opinion **the profile of customer with disabilities** can be outlined as follows:

- *he/she is a person who has specific consumer needs according to the the type of disease (permanent or temporary), the type of disability which gives a certain limit or prevent performing*

certain activities) or the type of disability that limited him to perform an activity in a manner or range considered normal for a human being;
- he/ she is a person who has a lower income limit but if the offer is adapted to their needs he/she can become a loyal consumer of these products and services;
- very loyal to places (hotels, motels, restaurants) and destinations that prove to be sensitive to their needs so that they can have access to tourism and healthcare services.

- **The objectives of this research**

Trying to meet these challenges, we have focused on the following research objectives: to learn if the infrastructure of the hotels is adapted to this market segment, to conduct a research in the hotels in Timisoara and Arad., to analyze the opinions of these hotel managers on travel opportunities for people with disabilities (impairment); to analyze managers opinions about hiring persons with disabilities (impairment) in the tourism industry.

- **The research method used**

To reach our target, we have used as a research tool the telephone survey based on questionnaires. The sample under investigation was determined randomly and was made up of managers of 60 hotels in Timisoara and Arad (Romania). We have to underline the fact that we encountered a number of impediments in the process of data gathering. Firstly, questionnaires were distributed to hotels in Timisoara which helped us to evaluate in details the facilities (ramps size, room size, the facilities, etc.) But, these were not filled in, people answering that "*we don not know what to write*" , "*we are not allowed to provide information*", "*we do not know how the rooms for these people are supposed to look like*", etc.

4 Interpretation of results

The sample was structured according to the classification of the hotels: 2 ** 7 hotels, 42 hotels 3 *** , and 11 hotels 4 ****(Table 1).

Table 1.

Hotels according to their classification

Hotels in Timişoara			Hotels in Arad		
Category	Frequency	%	Category	Frecuency	Percentage (%)
2 **	5	11,90	2 **	2	11,11
3 ***	28	66,67	3 ***	14	77,78
4 ****	9	21,43	4 ****	2	11,11
Total	42	100	Total	18	100

The managers were asked if they provided services to customers with disabilities and what kind of disability those people had. Analyzing the centralized data, one can see that the majority (88%) answered negatively and furthermore that they had no database of those persons. Among those who answered YES, have indicated for 2010, a total of about 53 people with disabilities who were provided services in the hotels , out of which 58, 40% were physically disabled, 18, 86% with hearing loss, 11, 32% with deaf-blindness. Because there were not found any databases, we can say that the managers of the hotel were not aware of that market segment and that they must adapt their services according to the needs of these persons.

To determine the reasons of reduced travel opportunities for people with disabilities, there were interviewed managers of these hotels on: the quality of infrastructure, environmental conditions,

the training of the staff office, the interest shown by the organizations involved (governmental and non-governmental) and hotel architecture, at least for travelers with physical disabilities.

Analyzing the data on managers' opinions, presented in Table 2, we draw the following conclusions: the sample under research shows that 75% of the managers of these hotels are not aware of the existence of this market and 78.33% believe that staff is not well prepared for this market segment. On the other hand, they feel that reception facilities are ready in terms of tourism infrastructure (61, 66%) and hotels architecture is prepared (88, 33%) for the access of people with physical disabilities. What is remarkable is the fact that 55% of these managers consider that governmental and nongovernmental organizations are not concerned enough with these persons, and on the other hand 65% of them consider that local governments are involved in some way in solving problems of this market segment.

To find out if these hotels are equipped for people with physical disabilities, managers were interviewed on the existence / lack of facilities at the receptions entrances, lifts, stairs, parking, reception, rooms, bathrooms, toilets, restaurants, bars, pools and saunas. By analyzing the answers, one can notice that the proportion of 93.33% hotels have marked special parking places for disabled persons, 88.33% have entrance ramps, 71.67% said that place in their restaurants is large enough for wheelchairs, and 63 managers, 33% said that elevators are large enough to allow transport to higher levels. There are areas where the facilities is very low as: stairs (100%), rooms and bathrooms (76.66%), reception (71.66%) and toilets (53.33%).

Table 2.

Opinions of the managers of hotels in Timisoara and Arad on identifying barriers to people with physical disabilities in tourism

Opinions	Answer	Frecquency	Percentage %
1.The tourism infrastructure is suitable for people with physical disabilities	YES	37	61,66
	NO	23	38,67
2.Environmental elements are suitable for people with physical disabilities	YES	18	30,00
	NO	42	70,00
3.The management of tourist enterprises are fully aware of this market	YES	15	25,00
	NO	45	75,00
4.Hotels architecture is suitable for the access of persons with physical disabilities	YES	53	88,33
	NO	7	11,67
5.The staff is is well prepared to serve such customers	YES	13	21,66
	NO	47	78,33
6.Governmental and non-governmental associations in this area work effectively	YES	5	8,33
	NO	55	91,66
7.Local administrations are involved in solving the problems of these people	YES	39	65,00
	NO	21	35,00

The opinions of the hotel managers on improving the conditions for people with disabilities in the tourism industry were tested and evaluated using Likert Scale, also called the aggregate scale, which is classified by type ordinal scales, leading to information of nonparametric nature. Thus, a set of 10 sentences was designed (Table 3), positive a

nd negative statements.

Managers' opinions on improving the conditions of disabled people in tourism

Opinions		1	2	3	4	5	$\overline{X}$
1.Tourist facilities should not do anything in this respect	F	22	14	11	4	9	**2,40**
	%	**36,66**	**23,33**	18,33	6,67	15,01	100
2.Tourist facilities should adapt	F	7	7	11	25	10	**3,40**
	%	11,66	11,66	18,33	**41,67**	**16,68**	**100**
3. Access infrastructure should be improved	F	1	3	12	13	31	**4,16**
	%	1,66	5,00	20,00	21,67	**51,67**	100
4. Authorities should become more involved	F	0	0	9	15	36	**4,45**
	%	0	0	15,00	**25,00**	**60,00**	**100**
5. Hotels must have a qualified staff	F	1	9	17	**24**	9	**3,52**
	%	1,66	15,00	28,33	**40,00**	**15,01**	**100**
6. Non-profit organizations should become more involved	F	0	3	5	10	42	**4,52**
	%	0	5,00	8,33	**16,67**	**70,00**	**100**
7. Local administration should be more involved	F	2	2	8	21	27	**4,15**
	%	3,33	3,33	13,33	**35,00**	**45,01**	**100**
8. These issues should be advertised more	F	0	1	2	19	**38**	**4,57**
	%	0	1,66	3,33	**31,67**	**63,34**	**100**
9.The segment of people with disabilities should be ignored	F	32	15	11	2	0	**1,72**
	%	53,33	25,00	**18,34**	**3,33**	0,00	**100**
10.There is no legislation in this respect	F	0	2	3	17	38	**4,52**
	%	0,00	3,33	5,00	28,33	63,34	100

Respondents were given to possibility to choose one of the five scaling (1-5), depending on their agreement or disagreement with the statement in the sentence. After calculating the average assessments, one can conclude that most managers have a positive opinion regarding this market, and I think we should have done something to improve the conditions offered to those customers with special needs.

- **Conclusions on the extent to which the tourism industry is ready to meet the needs of people with disabilities**

By the undertaken research, we have tried to support business environment in the tourism industry in Romania to find the best solutions to meet the consumption needs of this new and dynamic market segment, by improving accommodation, transport, food, recreation and adapting the services provided. It seeks to help policy makers, managers of travel companies, local governments, nonprofit organizations, foundations, associations of disabled people (handicapped), etc. take on real solutions to meet the needs of this market segment, even if the tourism industry in Timisoara and Arad is not adequately prepared for this market, having a of a lot **weaknesses.**

Firstly, governmental and non-governmental organizations do not seem to work effectively to help people with disabilities. Secondly, the facilities in terms of transport, is a very important problem in carrying out tourism for the disabled people. Inappropriate environmental conditions, quality of staff training within the industry and architecture of hotels is another very important issue, areas such as entrances, car parks, halls and receptions are equipped to some extent for this group, while other areas of stairs, rooms and bathrooms, reception and toilets, most of the managers believe that this market has potential.

WOMEN IN BUSINESS. THE NEED FOR POLICIES TO FOSTERING WOMEN ENTREPRENEURSHIP IN ROMANIA

Bădulescu Alina
University of Oradea Faculty of Economic Sciences

Borza Adriana
University of Oradea Faculty of Economic Sciences

In developing economies, the issue of overcoming the gaps in public policies regarding gender is closely linked to the ability of governments to identify policies that have worked successfully in regions with similar economic circumstances. Equally, there is a need for innovative data solutions that have the capacity to determine a real change of socio-economic relations. For now, as far as the Romanian context is concerned, female entrepreneurs do not enjoy as much government support as it is really needed. What literature refers to as the "glass ceiling" seems to be doubled in Romania by collective suspicion towards the discrepancy between the ambition and the skills of women who find themselves in the position of decision makers at top management level. This crisis of confidence faced by women makes their management tasks even more difficult. Not incidentally, literature mentions opinions according to which a woman must work twice as hard as a man to reach a certain position. The crisis brought about by the lack of models is confirmed by numerous studies and researches, all highlighting the urgent need for mentoring. Given such gender related constraints, it is only natural to expect that decision makers at government level would show a special interest for policies designed to encourage female entrepreneurship, and, in general, to support increase of employment of women in economic activities.

Key words: gender policies, women entrepreneurship, women in business

JEL Code: M13

1. The context: facts and figures

In the academic environment in Romania, the issue of female entrepreneurship has seen in recent years a lot of different approaches. The technical and statistical perspective dominates the research and the collective preference for the noticed issues can be explained by methodological reasons. It was desirable that, based on factual material and a rigorous field documentation, to produce models of policies or provide a basis for practical solutions. However, it turned out that, besides rigorous methodologies, statistics do not ensure a priori efficiency, and thus it become usual considerations with general appearance and which had not the expected utility with respect to real need for policies and measures to correct the regulations in the domain.

We cannot say that the simple overview of statistical items is not welcome. But we have good reasons to believe that, by itself, they do not represent a real contribution in the concrete process of elaborating public policy to encourage and support female entrepreneurship. As stated, 'in the Romanian context, supporting female entrepreneurship appears, in a distorted way, as a minor, frivolous and irrelevant issue to the priorities and imperatives of crisis" (Dodescu et al., 2011, p 24)

It can be assumed that these biases have partially contributed to a certain lack of government concern, so that "the potential of female entrepreneurship as an engine for exiting the economic crisis and poverty reduction for families and communities (...), is no doubt, not only undervalued,

but even neglected in the public strategies and policies at national and regional level in Romania, with the exception of the support provided by the European Union" (Dodescu et al., 2011: 24).

It was stated that "In recent years the overall situation of female representation in politics or management structures of organizations did not recorded any significant changes. Relations were maintained, at least in the distribution of powers in the political, legislative and executive."(On, 2009). But the arguments only partly justify the thesis under discussion: "Consider only the composition of the Parliament and the Government of Romania: the proportion of women deputies in our country remains the last three legislatures at 11% of the total members of the lower house of Parliament, and in the Senate, when after the 2000 elections were chosen 11 women (8% of senators) and after 2004 13 women (9%), at the last elections in 2008 the proportion of women declined to 6%, i.e. only 8 women senators. In the composition of the Romanian Government, the current legislation recorded only 3 female ministries in a total of 22 portfolios (14%)."(On 2009). It is unlikely that the analogy business environment -political environment to function as bi-univocal relation and even if things would be so, a brief analysis of the public visibility of business woman registered in recent years is sufficient to raise serious questions on the matter. It is clear that, in the situation of women entrepreneurs, there are enough things that already have changed.

It is to mention that, in the same time, women – who represent 51% of the total population and 44.8% in the labour force, have a economic activity rate of 56% (against 70.1% for men), with considerably lower proportion in some sectors, but surprisingly high in other (such is the 71.7% of female judges in total number of judges):

Table 1. Some figures on the female participation in selected professions, Romania, 2007

Women Researchers, Percent of corresponding total for both sexes	44.7
Female legislators, senior officials and managers, percent of total	28.2
Female professionals, percent of total for both sexes	51.2
Female clerks, percent of total for both sexes	25.0
Female craft and related workers, percent of total for both sexes	25.0
Female plant and machine operators and assemblers, percent of total for both sexes	29.2
Female government ministers, percent of total	..
Female members of parliament, percent of total	11.2
Female ambassadors, percent of total	16.0
Female judges, percent of total	71.7

Source: UNECE database

A real problem remains the difficulty for the business woman to identify credible models of success. What in the literature is the so-called "glass ceiling" (Singh &Winnicombe 2004, quoted in: Avram and Cooper 2008, p. 127) would be doubled in Romania by the collective suspicion on the difference between the ambitions and skills of women who had reached in the position of taking decisions by top management. This crisis of confidence facing women makes their management task even more difficult. Not incidentally, there are opinions in literature that, in order to reach a certain position, a woman must work twice more than a man. Crisis models are confirmed by numerous studies and researches, all highlighting the urgent need of mentoring: The percentage of women who recognize the lack of mentors as a major weakness. "In the case of women, due to their under-representation in management and business environment, the problem gets worse accents. It is considered that women who are successful in business or management and not assume the role of mentors for other women who want to turn to build a similar career, merely close the vicious circle which results in lower and lower female representation. "(On, 2009)

Just in considering this need, in the academic environment in Romania there were developed several substantial projects. Taking into consideration the impact demonstrated on the women entrepreneurship of the models, of learning from the others' experience, success, or mistakes, by using the Action Learning method, mainly, characterised by Learning with and from the others, The AntrES Entrepreneurial School set up – and it succeeded, we believe – to help the women managers to better understand their business, to develop it and to become real entrepreneurs, to infuse to the women wishing to start up their own business the necessary courage to pool and mobilize resources in order to become entrepreneurs, and to transform the young trainers in the field of entrepreneurship into promoters of entrepreneurship from conviction, not from necessity (Dodescu and Bădulescu, 2010, pp. 470-476, Dodescu et al., 2011, pp. 23-46). In recent years, the private sector get the idea (confirmed by the results) that native women have qualities that recommend them for a performant management. Increased empathic abilities, willingness to efficiently mitigate conflicts offer to women entrepreneurs, in certain circumstances, a real advantage over autocratic management style with emphasis specifically men. "I appreciate that companies operating on a profit base need, at this point, just the typical female values: availability of mind, intuition, compassion and sympathy to the values of others. These are values that, considered together, began to turn slowly all organizational structures. Changes in the scale of values, in "corporate culture", the technology work, the structure of available jobs and labour, the classic pattern of lifestyles, social attitudes and the distribution of roles in the family, globalization, new requirements of the legislative framework, reorganization of companies, the emphasis on teamwork and the involvement of every employee - all these changes are factors that stimulate the emergence of new opportunities for women to withstand and compete successfully in an economic environment increasingly harder" (Pastor 2011)

Keep clearly enough traditional prejudices about gender differences. At the public opinion it takes time and factual evidence on women's capacity to perform tasks that are associated in the collective mental reflex typically male skills. A concerted civic action does help overcoming this inertia in mentalities. "Based on these issues, often raised by various bodies set up to promote woman and have outlined a series of possible measures necessary adjustment balance participation, including by changing attitudes about power and rights in society. He noted the need for real networks, functional, business women to exchange information, mentoring, partnerships, promotion, and models. (...) Finally, promoting women in decision-making bodies that can contribute to better represent and support women, may be crucial for better gender balance in society. "(On 2011). Given the specific nature of managerial work in the public and private nature of conditionality, the access of women in administrative top management positions is limited not only by prejudices, but also the total commitment involvement required by the administrative work. There are rare the cases of women with career objectives put ahead of all family aspirations. Research has shown that female managers increased the significance attributed to family and moral support expected from relatives and family.

2. Woman entrepreneur – an active factor of business development in Romania

In Romania, no study has challenged the existence of issues related to gender disparities in entrepreneurship - the so-called gender gap in entrepreneurship. European statistics show that in Romania the difference in wages between women and men (functions equal) in recent years is lower than in some countries with strong democratic tradition. Also, for now, in Europe, relevant gender differences remain and the number of entrepreneurs than men rather than that of women.

The same picture is also true for the Central and Eastern Europe countries, where female entrepreneurs are less numerous than men. Some facts are as follows:

 men start their own businesses twice as often as women;

 only 9% of employed women were entrepreneurs in the Czech Republic as compared to 18.8% of men (in 2000);

in Hungary, 9.6% of the women, against 18.7% of the men are entrepreneurs;

in Romania, due to the larger share of self-employed in agriculture, the share of self-employed women is 17.4%, compared to 32.6% for men;

in Slovakia, 4.1% of the women, against 10.9% of the men are entrepreneurs;

in Slovenia, 6.5% of the women, against 15.3% of the men are entrepreneurs (UNECE 2004).

Next charts reveal another aspect of the entrepreneurial gap between women and men, e.g. the proportion of firms with female participation in ownership:
Chart 1. Employers and own-account workers, percentage of all employed
Source: UNECE gender database

Consequently, it is not accidental that in most cases women entrepreneurs believe that the main quality that a successful business involves remains perseverance (Dodescu et al., 2011, p.36). Statistical results confirm a specific type of resistance that women entrepreneurs face when they compete in the business market.

Taken into consideration the gender constraints already mentioned, it is expectable that government shows a special interest in the policies fostering women entrepreneurship and supporting the economic involvement of women. Among the programmes related to that objective we can mention as follows:

    1. Funding from the national budget:

    - Multi-annual National Program during 2005-2012 to develop an entrepreneurial culture among women managers of small and medium sized enterprises sector.

    - In 2010, 600,000 lei were allocated for this program, for which 826 women applied online and 232 women followed the business training course. Absorption rate is 100%.

    2. European funding

    - National Rural Development Program (PNDR). Although PNDR does not include a scheme for female entrepreneurship, it is supported under Priority Axis 3, the measures 312 "Support for the creation and development of microfirms," and 313" Encouragement

of tourism activities", with priority (extra points) to projects undertaken by women / young people.

- A.I.P.P.I.M.M.- National Network of Female Entrepreneurship Ambassadors, funded by EC, aiming to achieve the first network of 10 ambassadors of female entrepreneurship in Romania in order to determine and motivate women to start their own business (project launched in March 2011). Budget: 100,086.15 euros, from which grants of 48,840 euros (Paul-Vass, 2011).

National measures were designed to further existing EU regulations. One of the declared objectives of EU social policy is equality between women and men. This objective is supported practically by a series of documents such as the directive on the undifferentiated treatment and undifferentiated payment for equal positions. To ensure equal opportunities for women and men, the opportunity to make a career, at European level it was decided to adopt measures to ensure that more women can be employed and have access to industries and professions previously dominated by men. In this context, an important role has got the Directive on providing evidence within discrimination. This regulation introduces a new principle: the defendant must prove that he did not violate the principle of undifferentiated treatment.

In Romania, these principles are implemented through EU funded programs. In this framework, an initiative with immediate effect is the National Network of Female Entrepreneurship Ambassadors funded by the European Commission. "It aims to achieve the first network of 10 female entrepreneurs ambassadors of Romania and determine and motivate women to start their own business (project launched in March 2011). Awarded this new project budget is EUR 100,086.15, of which euro 48,840 grant. "At European level, it was created in 2000 the European Network to promote female entrepreneurship, which currently has 30 countries as members. Through annual reports, the organization highlights the major programs initiated in the individual countries on the promotion of female entrepreneurship (...) In Austria, the percentage of women who have founded a start-up in 2008 compared to 1997 increased by 13%. In 2008, out of 24,788 people setting up new enterprises, 33.9% were women, compared with only 27.1% in 2007. Out of all enterprises in Austria, about 32% were held by women, and their average age was 45 years" (Stefanescu 2011)

The situation of female entrepreneurship in Romania can be realistically assessed only by taking into account the impact of global crisis on local businesses. It is significant that since 2008 such entrepreneurial activities were seen as an alternative and not as an opportunity. "Early-stage entrepreneurial activity rate for women fell from 3.1% to 2.1%, and the early stage entrepreneurial activity motivated by the opportunity fell 2.7% to 2.12% in 2008 compared to 2007, while motivated by necessity entrepreneurship rate increased to 0.56% (2007) to 1.37% (2008). "(cf. GEM). These figures are confirmed by reports from the GEM 2009 and 2010. AntrES (see more on www.antres.ro) researches undertaken in 2010 led to conclusions that reinforce the hypothesis that in most cases women are willing to start a new business in the desire of self-realization (which also involve financial success) and secondly the need to earn more. These findings confirm similar results reported in various studies and national reports. According to GEM Romania in 2008, "In Romania the number of early-stage entrepreneurs motivated by opportunity and mainly aiming increasing revenue is greater than the number of entrepreneurs motivated by independence. Men in early-stage entrepreneurs are predominantly motivated by opportunity and women by necessity" (GEM, 2008, p.22).

In the case of AntrES database, we have found that, among female entrepreneurs from urban level, 52% indicated the desire for self-realisation, 33% the need for making more money, 10% the desire for a superior social and professional status.

According to the major stage of economic development (Porter, ME & Schwab, K., 2008), Romania is placed in the group of countries with 'efficiency-based economies". The entrepreneurship among women is mainly motivated by the severe impact of the crisis symptoms.

Lack of safe alternatives for earning money and more and more complicated situation of labour market result in a growing number of women interested in starting their own business. Also, over time, successful entrepreneur woman model serves as a model of success and personal achievement. In this context, efforts to support female entrepreneurship highlight an immense potential that Romania can benefit.

PUBLIC SERVICES AND THE EURO-REGIONAL COOPERATION

Bădulescu Alina
University of Oradea Faculty of Economic Sciences

Bucur Cătălin-Adrian
University of Oradea Faculty of Economic Sciences

Besides the goods and private services, covering the specific needs of individual or groups based on specific mechanisms of demand and supply, human needs can be addressed also through public services. They are designed to meet the general interests of members of a community or society at large and established by public authorities, subject to certain fundamental principles of organization and operation, such as: the principle of efficiency, the principle of equity, the principle of continuity, the principle of movability and the principle of decentralization. In the same time, public services involve in many areas of economic and social life is not just a national issue, but also have characteristics and provision ways at international, regional and euro-regional level. This paper underlines the main areas of euro-regional co-operation interest in the public services sectors, such as: the sectors of environment, agriculture and territorial planning, the sectors of transportation, security and telecommunication, the sector of the economy and labour force, the sector of cross-border populations: social protection and public health, the sectors of education, research and culture.

1. Short conceptual insight

Human needs can be accomplished through private services, which cover the specific needs of individual or groups based on specific mechanisms of demand and supply, and public services designed to meet the general interests of members of a community or society at large. Establishment of a public service is made by public authorities, while a private service is established by a private decision, and as long as there is demand. It is worth mentioning that although the initial provision of public services was achieved by public authorities, gradually, from the postwar period, there is a continuing trend, although mixed, to transfer a large number of public services to private operators, expression of the impossible cover of all services required by public authorities, central or local.

Complex and fundamental notion of the administrative law, the concept of public service has seen significant changes over time; the doctrine took shape until now three definitions coexisting and included in community law.

> 1. The classic definition, accepted the early twentieth century, believes that the public interest is the activity performed only by a public figure
>
> 2. The definition emerged between the two world wars appeared as a necessity imposed by the new economic and social realities that characterized the mid-twentieth century, and requiring various public services, and operational flexibility. According to it, "The public interest is the general interest work, performed by a private person with public power prerogatives of government control" (Grigoruţă-Bedrule, 2007: 13-15)
>
> 3. The current definition has emerged in the late 80s by the evolution of democracy, recognition of civil rights and government accountability to the communities they represent. They have cleared up the problem of delegation of public powers, recognizing that some public services performed by private persons should not necessarily enjoy the

prerogatives of public power, whereas a number of social public services, such as health, culture, education, etc.. is done by private persons, but without public power prerogatives.

Today, finding a public service requires taking into consideration of three elements:

a) material element: public service is primarily an activity of general interest. Public service is not viewed as a public body, but especially as an activity that achieves the general interest, which may possibly be provided by a private person; any activity of interest is a public service;

b) voluntarist element, i.e. intent of public. The public service exists if public authorities (national or local authorities) have indicated their intention to take (directly or indirectly) an activity of interest. There is, therefore, public services "by nature", public service is a subjective term and evolving and is identified by:

-Activity - is subsumed to a mission of general interest;

-The organization must have real public powers;

-Organization (private or not) must be subject of the control by public authority.

c)   formal element. The   rules normally   applicable   to public service   activities originate from the legal system that is subject to interest activity concerned. If the service is provided by a private person, the reference to the administrative law has only a value if criterion for identifying public service.

The term public service is used both in organizational sense, the social organism, and in the functional sense, of activity of this body. Public service can be defined as a set of activities organized and authorized by the government to meet social needs in the public interest (Costea 1999). Other authors define public service as "any entity of state or local government, established by the competent authorities to ensure the requirements of the society members needs, under administrative law or civil law enforcement process" (Alexandru 2001).

The authors working in the field of administrative law consider public service "an administrative body created by state, county or village, with competence and decisive power, purchased with funds from the general assets of the administration, publicly available to meet regularly and continuous need of a general nature which private initiative could give satisfaction only intermittent and incomplete "(Alexandru and Matei, 2000).

Instead, the authors from the sphere of public economics relate the concept of public public service with the concept of public good. Public goods are defined by Paul Samuelson as "the consumption by each individual of such goods does not lead to any reduction in the consumption of the good by another individual "(Samuelson 1954: 387-389).

Public goods are those goods and services that cannot be provided through the market because of its failure, so they are provided by the state government. In the case of public goods, their provision in the private system is inefficient and therefore less desirable. Public goods are goods consumed in common: peace and security, national defence, justice, pollution control, fire protection, street lighting, weather forecast, television.

It should be noted that Samuelson's definition focuses only on the quantitative dimension, ignoring the qualitative one: the greater is the consumer public good, its quality decreases. Group size as a decision variable is taking under discussion by the club theory (Buchanan 1965, Wiseman 1957).

Pure public goods are characterized by two features: the impossibility of excluding third parties, and non-competitive use. If for purely private property the set of property rights defines the owner, the owner, the only one who can enjoy the good utility and who can, in addition, to exclude all others from consuming the good, in the case of pure public goods this possibility of exclusion disappears. For example, in the case of national defence, it is extremely difficult to exclude anyone who lives in that country from the protection provided, but in addition, there

exists in the case of public goods a feature of impossibility of denial, rejection of that good: an inhabitant of the country enjoys the services of national defence whether he or she likes or not.

A second feature is the non-competition in consumption: a good is non-rival in consumption if the marginal cost of adding a consumer is zero. Examples of such goods are a coach or a bus not full, an underused computer.

Feature exclusion of third parties from consumption generates also the impossibility of providing public goods through market. There is no temptation for a manufacturer, presumably to maximize profit, to provide these goods, if it cannot exclude anyone from their consumption and, therefore, cannot claim any price. Providing this can be achieved only by the government, which has the power to compel members of society to contribute to the cost of their production through the tax system (Badulescu 2005: 469-470).

Public services are currently associated with the term "public enterprise", considered part of the public sector providing public services or public utility. "Public company is defined as state-owned (wholly or partly) organization, controlled by the Government and operating as an economic enterprise" (Plumb, Androniceanu şi Ábaluta 2007: 24). Services offered are: electricity supply, water supply, sewerage, rail transportation, air transportation, maritime transportation, urban public transportation, telecommunications, gas supply etc.

Public services shares common characteristics with the general services (immateriality, impossibility to get stocked, intangibility, indivisibility, inseparability etc., but they also have specific features:

    -The fundamental purpose of meeting a social need;
    -There is a permanent legal relationship with the public administration which settled it and manages it;
    -Satisfy the interests of a group or society in general;
    -Exposure to a legal system, governed by principles of public law which differentiate it from those of a private enterprise;
    -It is settled and stopped by an administrative decision;
    -It is performed by public institutions;
    -Public service gratuity or existence of a minimum price that must ensure recovery of costs and ensure a minimum profit.

Establishment of public services, regardless of their nature and management, is subject to certain fundamental principles of organization and operation, such as: the principle of efficiency, the principle of equity, the principle of continuity, the principle of movability and the principle of decentralization.

2. Public services - domain of euro-regional co-operation

Public services in many areas of economic and social life is not just a national issue, but also describes characteristics and providing ways at international, regional and euro-regional level, this last point making the object of our investigation.

2.1. The sectors of environment, agriculture and territorial planning

Environmental, agriculture and land-use planning sector is a difficult exam of the numerous cross-border obstacles that can cause, is often conditioned by what we call "national territory". In some approaches to cross-border cooperation in Europe, it is sometimes preferred to speak of a "right of interference" necessary in the environment (Anon. 2006).

Even if geography and political science have long developed the idea of national border, cross-border co-operation, touching the environmental domain, discovers the spatial continuity of cross-border areas, and therefore needs to manage the common border areas to face and properly address to the problems of pollution, degradation and optimum utilization soil.

Therefore, there can be undertaken the following actions:

-studies on pollution and treatment of residuals of different types and making the networking of facilities to treat these wastes

-protection programs and management programs for the natural environment and life support system, harmonization of working methods of the stations of observation of the environment;

-raising awareness of environmental issues, joint interventions in some cases, information on risks or possible risk, for example chemical, along the borders;

-organizing a plan of mutual assistance in case of disaster with use of airborne;

-establishment of common information databases concerning the fauna and flora of the region or settlement of programs for knowledge and studying the groundwater mapping, interregional and transnational composition of major infrastructure;

-annual event for youth environmental awareness;

-establishment of cross-border parks, joint initiatives on water quality of rivers, lakes.

Regarding nuclear energy, institutionalized cross-border cooperation can be in front of a taboo subject, energy issues, especially nuclear, belonging solely to the responsibility of national sovereignties. This can be overcome through more effective cooperation across borders and institutions to better articulation of national projects dam or control in border areas (Council of Europe 2006).

Also in the case of there are some cross-border co-operation initiatives, in an area that seemed so far reserved exclusively for national competence, such as joint actions, especially conciliation commission on cross-border exploitation of land, joint programmes against excessive multiplication of animal or insect control, the origin of agricultural products, culinary tourism, etc.

Linked to agriculture and environment sectors, multi-border activity of mountain populations (agriculture, handicrafts, white tourism, green tourism) is about to become one of the socio-economic issues of border areas in these areas.

In spatial planning, the first challenge is agreeing on a definition of this term. It is about, in a narrow concept of simply using soil, and in a global perspective, all terms of spatialized human activity, both in economic and social or cultural level.

The main actions that can be developed in the field of spatial planning are:

-implementation of concerted policy on border management of soil and harmonize employment plans on both sides of the border;

-global studies on the socioeconomic structure and urban framework of the border area and, in parallel studies in sectoral projects such as construction joint bi-national industrial areas;

-creating a dynamic atlas, encompassing inter alia, joint projects of major cross-border infrastructure, in transport, telecommunications, health, training.

It is known that, in many cross-border institutions, spatial planning approach tends to embrace other sectoral approach. Some initiatives could appear in one or other of these three activities mentioned above, for example, for studies on regional climate, for developing glossary for technical terms used by specialists of environmental protection and by specialists in planning in general (Del Bianco 2010).

2.2. The sectors of transportation, security and telecommunication

By their very vocation, these sectors are undoubtedly among the main types taking into consideration in cross-border cooperation (Anon. 2006). There is a large number of actions developed in this area: studies on the common needs of transport in general and cross-border transport in particular, the systematic exchange of information agreements, joint interventions and studies on how to optimize the operation of railway lines or of public transport, studies on interregional air traffic (transport and communications) and the construction of transport

infrastructure, studied or employed by each side of the border and looking the other hand, to achieve "economies echelon", opening or closing the border posts, etc. . In the sphere of security (Council of Europe 2006) we speak about: the adoption of recommendations and measures to ensure the safety and free flow of cross-border road and rail; study issues relating to security (business risk, civil security, natural hazards), the development of procedures to alert border, where border can support emergency services (fire brigade, civil protection), and in telecommunications about: negotiations and the establishment of preferential telephone tariffs and specific indication for the whole border region, distributing courier border without through major national centers, common PBX specific regional information, development of computer-border bodies and their articulation of national systems, etc.

2.3. The sector of the economy and labour force
In this important sector of cross border co-operation we can distinguish the following areas:
-economic aggregates (Keynesian theory) in a cross-border vision: production and income, consumption, investment, savings, import, export;
-economic flows: free movement of goods, services, capital, people;
-economic actors, public and private, especially networks of small and medium-sized enterprises, sources of job creation and equivalence "training - jobs."
Among the many cross-border actions related to the economy and labour force sectors we can mention (Anon. 2006): coordination and regular exchange of information on socio-economic statistics, setting common statistics and diagnostics, joint economic publications, joint meetings, training and employment policy, cross-border labour assistance and relations between business and technology research centers, technology transfers, joint exploitation of resources, creation of joint tourism products, harmonization of infrastructure (investment and training): arrangement of stadiums (water fittings), coordinated policy in show business etc.

2.4. The sector of cross-border populations: social protection and public health
This section concerns social protection of the border population in general, frontier workers and health infrastructure.
Among the actions we mention: editing guides on social services for populations on both sides of the border, border disease tracking, mutual administrative assistance in fighting against drugs, improving the social security of frontier workers, simplifying and speeding up border crossings for border formalities, editing practical guidelines for the use of frontier workers, mutual assistance plans in case of disaster; maps of hospitals and medical institutions, exchange of staff and / or paramedic personnel.

2.5 The sectors of education, research and culture
Finally, the education-research-culture is characterized by a considerable advance cooperation activities with all the variety that defines these sectors (Council of Europe 2006), such as: sharing responsibles for education, organization of exhibitions presenting training opportunities and bridge between them, each side of the border, inter-university cooperation, aid for cross-border projects and research training, organizing programs to improve language learning and neighboring border population, mutual recognition of diplomas either global or sectoral, recognizing years or semesters of study (the "credit transfers"), including cultural guides active bodies, libraries, directories cultural "export" of cultural exhibitions, organizing cultural exchanges, joint concerts, co-production of various performances, interregional tours of musical ensembles bi-or tri-national cultural bands, cultural awards, music-graphical and ethnographical studies, exhibitions and publications on the issue of minorities in border regional space, development of bilingual cultural routes, bilingualism and bilingual support associations, publishing books, guides and atlases border, making "cultural passports" that allow access to

many cultural institutions belonging to regions separated by cross-border exchanges in the arts, theatres, music, cross-border associative relationship on the occasion of popular and folkloric holidays, cross-border schools or institutions for the training in mass-media professions, media networking and making radio broadcasting modules interregional and joint promotion of regional sport events etc.

Cultural distances imposed in the past by certain political nationalist may gradually fade, to be intertwined and cause a border profile that distinguishes these populations from those in the "inside" and provide a positive real border culture. The latter one would be sediment border areas about regional micro-integration (Anon. 2006).

ARE SMES MORE CONFORTABLE WITH SMALL DOMESTIC LENDERS? (I – THE LITERATURE)

Badulescu Daniel
University of Oradea Faculty of Economic Sciences

Petria Nicolae
"Lucian Blaga" University of Sibiu Faculty of Economic Sciences

Small and medium enterprises (SMEs) are recognized having an important role in economic development, but this recognition doesn't resolve the essential problems of the SME sector. We found that one of these are the problems of insufficient or inadequate funding, the lack of availability of financial institutions or private equity investors to meet the SMEs financing requirements. The need for financing of SMEs is predominantly covered by bank loans, but it is difficult to say if this demand finds an appropriate offer, in amount and structure. Thus, it is important to understand if the role of lending techniques and organizational structures of the banks, types and origin of the owners (state, private, domestic or foreign) or the size and the market power (large, small, local, or niche banks) individualizes the banks offer and if the banks know the best way to mitigate the demand and supply constraint. Even though the traditional view explains the strategic predisposition of large banks to finance their clients(by default large clients, corporations) through transactional lending and, and local/domestic banks use the relationship lending- suitable to small customers (SMEs), however, the more recent opinions show that the large international banks use a combination of methods and techniques to gain favorable position on SMEs segments.

Keywords: SMEs lending, large banks, foreign banks
JEL Code: G21

Introduction

There is an evidence that small and medium enterprises (SMEs) have an important role in economic development of any country, demonstrated by the large number of practical and theoretical approaches, however, this unanimous recognition doesn't resolve the essential problems of the SME sector, among them are the problems of insufficient or inadequate funding, the lack of availability of financial institutions or private equity investors to meet the SMEs financing requirements.

The objective of this work consists in the understanding how SMEs are affected and how they perceive the bank involvement in financing SMEs needs, in terms of the nature and characteristics of organizational structure of these lenders. Based on an generous literature, we quickly review the issues of supply and demand constraints in SMEs financing, the favorite place of bank loan financing the SME needs, and then we have focused on the nature and particularity of lenders that may affect the quantity and adequacy of funds lent to SMEs: the role of lending techniques and organizational structures of the banks, types and origin of the owners (state, private, domestic or foreign) or the size and the market power (large, small, local, or niche banks). The main findings we have corroborated and tested with our recent research results, where we have investigated the SMEs perception about the link between specificity and nature of lenders and their involvement in SMEs lending. We considered necessary to update the main finding from literature and our research with the recent events and decisions took by the large international European banks, regarding their presence and involvements in the Central and Eastern European market, including Romania.

The overall study is organized as follows: I. Introduction, II. The importance of the bank finance and the main difficulties of SMEs lending, III. Bank features and SMEs lending, IV. Our research. Methodology, data and content and assumptions, V. Discussion and results, VI. Conclusion. The present paper focuses on chapters I-III.

1.The importance of the bank finance and the main difficulties of SMEs lending
Based on Flash Euro barometer Access to finance No 271/2009 (European Central Bank and European Commission 2009), one of the most pressing concern of SME managers from EU is access to financing, adding more than 16% from answers (after *finding customers,* but far away of *the competition* or *availability of skilled staff*). Regarding the profile of companies we notice that the "access to finance" was more often selected as the most pressing problem by managers of companies with a turnover of less than €10 million (16%-17% vs. 8%-10% for companies with a turnover above €10 million), established between two and nine years ago (20%-21%), in the construction sector, or that have introduced innovation in at least one area – products or services, marketing, production and management (18% vs. 14% in non-innovative companies). According to the same survey, the most popular source of debt financing was a bank: 30% of companies had used bank overdraft facilities or a credit line and 26% had used a bank loan. Other alternative to financing were: public source (10% of respondents), a friend or family member (as named "other loans" with 7%) and a very few managers (1%) said they had used a subordinated loan, participation loan or similar financing structures.
Other financing forms as leasing, factoring were preferred by 23% from managers and 16% said they had used trade credit as a source of short-term financing. Regarding debt securities issuing, in the past six months, the majority of managers considered this type of financing not to be relevant for their needs. Equity issuance or external equity investments were mentioned by 2% of managers as one of the sources of external financing they had used in the past six months (European Central Bank and European Commission 2009).
Where are the place of bank loan in the future, what expectations have the SMEs managers from banks, and what are the anticipated obstacles accessing bank finance? Around 59% from SMEs managers considered that their SMEs would be able to obtain the desired result after talking to banks about financing, and around 27% are skeptics. It was noted that confidence to talk about future financing with banks was the highest in Slovenia (93%), Belgium, Slovakia or the Czech Republic (between 85% and 90%). Romania - together with Lithuania, Croatia and Estonia - shows a moderate confidence (between 56% and 69%). Overall on UE, the confidence to talk about future financing with banks was highest among managers of companies with at least 10 employees, that had combined internal and external financing in the past six months (65%), or that reported growth in turnover in the past three years (64%-65%), or had seen their financial situation improve in the past six months (72%), (European Central Bank and European Commission 2009).
Bank loans were also the most preferred type of financing for future needs: 64% of managers who expected their company to grow in the coming years answered that they would prefer to apply for a bank loan to realize this growth. Regarding the countries rank, we notice that the loans option is dominant in Malta (86%), Finland (79%) and Luxemburg (78%) and register the lowest position in Latvia (36%) and Estonia (29%). Romania has rather a skeptic position (49%), under European average of 64%.
The Euro barometer offers interesting information regarding perceived obstacles for future development of their business related to bank loan. For example 27% from SMEs managers who would prefer a loan from a bank considers that there would be no obstacles while a similar proportion (26%), however, thought that insufficient collateral (or guarantee) would be the main limiting factor to stop them receiving the required financing, and 24% mentioned interest rates and a price that would be seen as being "too high". Countries situation is more interesting, on the

first places is Germany, where SMEs managers saw the importance of loan barriers no more than 47% of options, and on the last place is Romania, where all kind of obstacles cumulate 92% of answers! For Romanian SMEs managers the most frequent obstacles are: high interest rates and a price (46%) and insufficient collateral (European Central Bank and European Commission 2009). However, dominant opinion in each country was that the willingness of banks to provide financing would remain the same. Furthermore, in all countries surveyed, not more than a fifth of managers expected that access to bank loans would improve in the next six months. With all this imperative need for financing and the clear identification of banks as favorite lenders, the banks are reluctant to lend to SMEs. The scholars (OECD 2000, Cressy and Olofsson 1997) often divide the reasons of unsatisfactory financing in two large categories: the demand and the supply constraints of SMEs financing, including the following:

-the information asymmetry that arises from small businesses' lack of financial information, the bank's limited knowledge about the borrower company (Badulescu and Badulescu 2010), lack of relevant financial and commercial track records. The second issue is the moral hazard: once the loan granted, the control of its use according to the original application (the risk and opportunity analysis) could face serious difficulties, the loan could be used for other purpose.

-high failure rates, low capitalization and vulnerability to market risks. The limited power in market, considerable share of intangible assets, insufficient circulating assets or tangible fixed assets tends to create a higher risk profile of SMEs for potential investors (OECD 2004, Lin and Sun 2006, Toivanen and Cresy 2000, OECD 2000).

-Insufficient collaterals to meet the lenders' request in order to overcome the risks associated to moral hazard is probably the most claimed cause of the difficulties in accessing a credit by a SME.

-the banks are unable to determine whether the borrower possesses the technical, managerial and marketing skills to generate adequate cash flows and service the loan

-in developing countries, the risk profile is supplementary marked by the unstable legislative and competitive environment, with negative consequences on the transactions security.

The problems of inadequate funding of SMEs may come also from the supply (*supply side constraints*), and in particular to the way in which financial institutions work (Beck et. al. 2010):

-overlapping between the state institutions and banks (private or not) regarding the SME financing, distorting the market mechanisms and influencing competition;

-excessive collateral requirements could result from conservative methods in the assets valuation and risk weighting (Badulescu 2010, RAM Consultancy Services 2005);

-Insufficient ability of loan officers to understand and analyze the SME sector, seen as less attractive because "the banks would occur substantial amount of cost to process the loan, while the absolute dollar returns are much smaller compared to large corporate loan. Applying the same techniques of large corporate evaluation to SME obviously results in many SME not being able to meet bank lending criteria" (RAM Consultancy Services 2005);

-complicated procedures, expensive and sometimes unnecessary (detailed business plans, documentation and risk scenarios, commitments in legal forms) together with long credit approval period but shorter repayment period for the loans. Finally, the overall costs (financial and time) to obtain a credit can be substantial, and deter SME from banking financing;

-structural problems – unclear definition of SME, insufficient financing alternatives to bank loans, lack of comprehensive and easy to use SME databases, fragmented banking systems (RAM Consultancy Services 2005).

2.Bank features and SMEs lending

While SMEs consider bank financing very important for their development, is important to understand what are the most important bank features, which optimize the bank-SME relation. In other word, what are the better type of bank for SME lending, analyzing ownership, dimension, structure, the origin of owner, technique and internal organization use in lending process, etc.

The analysis of SME financing, various theoretical studies or empirical evidence provides a considerable quantity of information regarding relation between structures of the financial institution, technologies, management. Moreover, recent researches (Berger and Udell 2004, Beck et. al. 2010) try to show some distinction between lending technologies versus relationship lending to understand the very different transactions technologies, focusing on the comparative advantages of different types of financial institutions in using transactions (Berger and Udell 1996, 2004).

According to Berger and Udell, "transactions lending technologies are primarily based on "hard" quantitative data that may be observed and verified at about the time of the credit origination" (Berger and Udell 2004). This kind of information comes, *ex limited*, from the financial indicators calculated on the basis of financial statements; information provided by credit bureaus, the national database of payments incidents – as cheques, promissory notes, the Central Credit Registers, collateral registration, valuation reports etc. The main feature of this type of information: are relatively easy to observe and checked and can serve as a basis for future decisions. Standardized and disseminated through internal channels of communication inside the financial institution, are used for conceptualizing and standardization of the credit policies, in line with corporate strategies, being a reliable element in the management of the networks of the large international banks.

On the other hand, the relationship lending "is based significantly on "soft" qualitative information gathered through contact over time with the SME and often with its owner and members of the local community […] may include the character and reliability of the SME's owner based on direct contact over time by the institution's loan officer" (Berger and Udell 2004). To these are added the information stored in the records of the credit institution (frequency of transactions, payment behavior, the number of additional operations carried out by the shareholder or manager in own name - deposits, credit cards) or from variables, intuitive interactions with employees, clients or the suppliers, or with other entities. Unlike transactional lending, authors insist on the fact that, more often, credit officer is the holder of such information, proprietary in nature, and these information can be hardly standardized and sent through official channels within financial institution, difficult to be verified by other experts, located in head offices, separate by the customer interaction

On the first sight, foreign-owned institutions may have comparative advantages in SME technologies lending and domestically-owned institutions may have comparative advantages in relationship lending (de Haas and Naaborg 2005, Berger and Udell 2004). This assumption can be explained by following reasons:

-Foreign-owned institutions are part of large organizations, have advantages in transactions lending to some SMEs due to a better access at information technologies for collecting and assessing hard information, cheap funds or greater expertise, even training for loan officer and risk managers in their headquarters

-Foreign bank has often difficulties in processing and transmitting soft information inside their network, with various managerial layers. But the advantage of a great expertise and experience with multiple and different economic, cultural, language, and regulatory conditions, could easy transforms into a weakness point. Often SMEs acting on local markets are little impressed by the cosmopolite image of the large banks.

-Domestic banks are more suitable to finance SMEs because they are better engage in "relationship lending", a type of financing based on "soft" information collected by the

loan officer having continuous, personalized, direct contacts with SMEs, with their owners and managers, and the local community

A recent paper (Beck et all. 2010), shows significant differences across ownership types in lending technologies and organizational structures: foreign banks are more likely to use hard information relative to private domestic banks, and the share of secured SME loans is lower among domestic banks than foreign banks, these foreign banks n banks use different lending techniques and organizational structures to reach out to SMEs. (Beck et al. 2010)

Regarding the ownership (state vs. private) we noticed that state-owned banks may have comparative advantages in transactions lending comparing with privately-owned institutions, but these cannot always transform in an advantage.

Referring on scale economies, and the differences between large banks compared with small, niche banks we can say that the large bank could take advantage from hard information processing, but are disadvantaged in processing soft information because there are difficulties to quantify and transmit this kind of data through long communication channels. This may give comparative advantages in relationship lending to small institutions with lower administration costs, a less distinctive separation between ownership and management and fewer levels of management (Stein 2002, Berger and Udell 2002).

The empirical literature on this topic usually based the conclusions from the characteristics of the SME borrowers and contract terms on credits contract between SMEs and banks of different sizes (Berger, Rosen, and Udell 2003):

-Large bank institutions are found to lend to larger, older, more financially secure SMEs, they based their SME credit decisions more on strong financial ratios than on relationships

-Large banks often promote lower interest rates and obtain lower yields on SME loan contracts comparing with small institution, which have to compensate the higher costs with flexibility, non-bureaucratic procedures in credit assessment (Berger, Rosen, and Udell 2003, Berger 2004)

-Small banks have more longer, privileged and personal relationships with their SME customers, comparing with larger banks, based on long distance, impersonal and short terms relation with customers, appreciated as weaker (Petersen and Rajan 1997, Stein 2002) and often unsatisfactory for a better loan decision.

In spite of all these different approaches, the results show that different lending techniques and organizational structures lead at similar results in terms of SME lending, the researchers find no evidence that foreign banks tend to lend less to SMEs than other banks, i.e. that different bank types, applying different lending technologies and organizational structures can play an important role in financing SMEs, in developing economies.

Conclusions

The present paper has sought to put into question, theoretically and then, practically, how different types of financial institution could influence the availability for SME lending. We started from the E.C and E.C.B researches and surveys amongst SMEs, which showed that the issue of financing is of prime importance for SME and banking lending is, and will be, the preferred way by SMEs in order to fulfill their objectives. It was mentioned the main opinion of the literature relating to the manner in which various kinds of banks build the lending relationship with SMEs, being underlined two approaches: transactional lending and relational lending. We have identified the main guidelines and characteristics of the lenders in relation with borrowers. Foreign banks and large (private) banks are focused mainly on transactional lending ("hard" data, scorings, national databases, internal channels, decision and risk centers, certain types of collaterals etc.) and this approach seems more appropriate for the large firms. On the other hand, there are small, niche banks, local, domestic, that offsetting the effectiveness of the large banks

techniques by a greater proximity to the client, processing "soft" data, recover the close relationship with the customer, asking fewer or various collaterals, but their small power cannot support the whole need for funding of the SMEs sector. We found recent opinions who stated that large banks use both transactional and relational lending, and SMEs are not an exclusive area of domestic/niche banks.

The theoretical conclusions, far from being unanimous, show, however, a few directions: although the large banks build their expanding policies (territorial, market share, profitability, technological) on behalf of large clients, are also interested by the SMEs sector. Foreign banks have not proved, at least until the onset of the crisis, as acting pro-cyclic for their subsidiaries countries; on the contrary, these banks have increased their involvement in economies, including the SMEs sectors. Finally, as we stated in other paper, we consider that a well-balanced structure of banking sector, a real knowledge of SME needs, a relationship banking based on mutual trust can exploit all opportunities, creating a large base for meeting SME financing requirements.

ARE SMES MORE CONFORTABLE WITH SMALL DOMESTIC LENDERS? (II –EVIDENCE FOR ROMANIAN SMES)

Badulescu Daniel
University of Oradea Faculty of Economic Sciences

Based on a consistent literature presented in the previous part of our paper, and analysing our research results, carried out on a significant number of SMEs from Romania in 2011, the purpose of this paper is to examine how SMEs are affected and how they perceive the bank involvement in financing SMEs needs, in terms of the nature and characteristics of organizational structure of these lenders. We have found that, despite of the recent development of the crisis and the decision of the most of important European banks to reduce theirs involvement in Central and Eastern Europe, the mostly of the Romanian SMEs considered they are not ignored or under-privileged by large, international banks operating in Romania.

Introduction

In the first part of our work we theoretically analyzed the way that different types of financial institution could influence the availability for SME lending. Based on various studies showing that the issue of financing is vital for SME and the bank loan will be the preferred way for SMEs in order to fulfill their objectives, we have identified the main guidelines and characteristics of the lenders in relation with borrowers. On the first step we presented that the transactional lending use mainly by foreign or large banks seems more appropriate for the large firms than for SMEs, but the small, niche banks, local, domestic, are focused on a greater proximity to the client, processing "soft" data, recover the close relationship with the customer. However, their small power cannot support the whole need for funding and expansion of the SMEs sector. Complementary, we admit some recent opinions who stated that large banks use both transactional and relational lending, and SMEs are not an exclusive area of local/domestic niche banks. Large or foreign banks have not proved, at least until the onset of the crisis, and even later, as acting pro-cyclic for their subsidiaries countries; on the contrary, in terms of opportunities and good yields, these banks have increased their involvement in the financing of the economies concerned, including the SMEs sectors.

Using the results of theoretical research presented in the first part of our work, this paper is organized as follows: I Introduction, II. Our research. Methodology, dataset and assumptions, III. Discussion and results, IV. Conclusion

1.Our research. Methodology, dataset and assumptions

Our research is part of a larger project regarding of some aspects of the relationship between SME and banks, the role of the main determinants of the banking relationship, utilization of credit products, which type of bank (domestic, foreign, large, small, local, etc.) serves the best interests of the SMEs, etc. Data was collected mainly from Bihor county and Oradea main city, during the period March-May 2011, observing the following rules and objectives:

-potential portfolio was checked in advance using the site of the Ministry of Public Finance (Ministry of Public Finance 2011), in order to:

a. Removing, *ex ante*, the firms without financial statement, closed, suspended, etc.

b. checking if potential respondents belong to SMEs category (turnover less than 50 million EUROS and up to 250 employees)

c. Removing the firms working in financial intermediation (mutual funds and other financial entities, financial leasing, other lending activities, insurance and reinsurance of pension funds, insurance agents and brokers, credit, pawn houses), and, as far as possible, the group of firms, which, after consolidation, may exceed SMEs threshold (e.g. employees, turnover, etc.).

- the Ministry of Public Finance website also served to obtain various data such as age of the company, the turnover and the profit (for 2010), the average number of employees, etc.

- the questionnaires were addressed to the executive manager; regardless if he/she was accompanied by the financial manager of the company.

As a result of the survey, the primary database covered 611 questionnaires. Removing ineligible or wrong questionnaire, have resulted a sample of 595 firms (statistical error of 2.62%, confidence level of 95%).

Although the data are collected the majority of the Bihor County (95%) and, in small extend, from the neighboring counties of Arad and Satu Mare (Western and North-Western Regions of Romania), there are no special features on different economic laws and regulations for this area, or special behaviors of banks and government agencies relating to SMEs, comparing with other regions of Romania, in order to influence the results of our research.

Moreover, based on data issued by the National Bank of Romania and the main commercial banks, we found a regular position of the region to the national average for a series of banks indicators, such as the number of bank units, the number of inhabitants/bank unit etc., loans (in national currency RON and foreign currency) granted to companies, the volume of deposits, current accounts and so on. Thus, in terms of number of branches, the data of the National Bank of Romania and commercial banks for 2010 show an approx. number of 5,700 bank units, i.e. a banking density of 25.5 units per 100,000 inhabitants (National Bank of Romania 2011 a, b). For Bihor county, at the end of 2010, there are 143 bank units (2,49% of total bank units in Romania), a banking density of 22,52 units per 100,000 inhabitants (based on websites of the main commercial banks in Romania), that is a position close to the national average.

For the main bank indicators (loans, deposits) we can notice a position close to the country average (excluding the capital- Bucharest), only exception being the loans granted in foreign currency, where the figures for Bihor County is over 2.5 times higher than the national average (excluding Bucharest).

Objectives of the research, transposed in the content of the questionnaire were inspired, in part, by the Hernandez-Canovas and Martınez-Solano paper referred to some basic elements that define the banking relationship and its effects in perception among SME (use of banking relationship, determinants, concentration, confidence, reciprocity), collateral issue (Hernandez-Canovas and Martınez-Solano 2010), but our questionnaire contained additional research elements related to the lenders specific and the ownership natures – local banks vs. foreign banks, small/niche banks vs. large banks etc., obviously viewed through relationship banking and availability for SMEs financing.

In this paper we analyses a set of three questions focused to the perception SMEs regarding the most suitable type of bank (in terms of ownership, dimension, structure) for SME financing, and if the SMEs from peripheral area (e.g. rural vs. urban, small town vs. main cities) feel being deprived or discriminated by lenders (banks).

Herein questions were:
1. On a scale from 1 (strongly disagree) to 5 (strongly agree), evaluate the following statement: "Have domestic banks a greater availability to SMEs finance?"
2. On a scale from 1 (strongly disagree) to 5 (strongly agree), evaluate the following statement: "Have small/niche banks a greater availability to SMEs finance?"
3. On a scale from 1 (strongly disagree) to 5 (strongly agree), evaluate the following statement: "Are SMEs from peripheral backgrounds deprived of bank's funding?"

2.Discussion and results

To the question concerning if the domestic banks (comparing with foreign banks) are more involved in SMEs financing, we have the following responses (Chart 1): approximately 22% of the total (i.e. 132 respondents) are strongly against and 29% (i.e. 174 respondents) disagree with this idea. Neutral respondents have 30% (180 responses) and those we sustained this idea are: 11% (i.e. 67 respondents) agree and 7% (42 respondents) strongly agree. The weighted average shows a score of 2.52, that, in the announced scale 1 (strongly disagree) to 5 (strongly agree), indicates a solid opinion not to place/establish domestic banks as the main lenders for SME sector, as being more attached by local market or better understanding the local or national realities.

Our findings confirm the above mentioned theoretical position, but remarkable are the period and the events happened between the literature conclusion and our finding, thus:
- the literature conclusions were made (was drawn) in a more optimistic background, mostly in 1996-2007 interval, dominated by dereglementation, liberalization and privatization of financial market in the entire world, including Central and Eastern Europe, before the crisis, when international banks had an impressive expansion in CEE, reporting yearly exceptional results, in terms of turnover, profit, market share or customers number;
- our survey was carried out in March-May (2011), in the middle of the crisis, when the main international banks represented in Romania already announced significant decrease of their involvement in Romanian economy.

No of responses	strongly disagree	disagree	neutral	agree	strongly agree
No of responses	132	174	180	67	42
Chart1. Have domestic banks a greater availability to SMEs finance?
Source: own calculations, based on the dataset

The next question, if small/niche banks have a greater availability to SMEs finance has generated the following responses (Chart 2): approximately 16% of the totals (i.e. 97 respondents) are strongly against and 27% (i.e. 174 respondents) disagree with this idea. Neutral respondents have 31% (186 respondents) and 25% (i.e. cumulated 151 respondents) are those we sustained this idea. The weighted average shows a score of 2.76 that, in the announced scale 1 (strongly disagree) to 5 (strongly agree), indicates rather a neutral poisons (neither disagree, nor agree).
Chart 2. Have small/niche banks a greater availability to SMEs finance?
Source: own calculations, based on the dataset

Thereby, the small/niche banks doesn't remark thorough special feature, as relationship lending (see literature review presented part I of this work) suitable for a SMEs strong relationship. In this respect, it seems to be valid the opinion that both small banks - using relationship lending, or large, international bank - using transactional lending, modern structures, or sophisticated techniques (see de Hass, Lelyveld) have an approximately the same chances to reach the SME confidence and business.

Finally, the third question, if SMEs from peripheral backgrounds are deprived of banks funding, we have the following responses (Chart 3): approximately an equal percentage 24% (i.e. 141 respondents) and 23% (i.e. 136 respondents) strongly or mostly disagree with this assertion, while the neutral responses register the higher score of 29% (171 respondents). Those who agree with this question has 14% (86 respondents) and 10% (strongly agree). The weighted average shows a score of 2.13 that, in the announced scale 1 (strongly disagree) to 5 (strongly agree), indicates mostly a kind of disagree position regarding this questions. As the bank's networks are an acceptable territorial presence, active searches for opportunities in all economic environments, the answer may explain why the SMEs from peripheral backgrounds (small towns, rural areas, niche sectors, etc.) do not perceive, obviously, a careless of lenders for their own condition.
Chart 3. Are SMEs located in peripheral backgrounds deprived of bank's fundings?
Source: own calculations, based on the dataset

With all this positive confidence of SMEs in foreign banks, the reality are not so simple, and the crisis remembers to emerging economies that, however, the capital has a nationality, and the interests of origin countries are making towards the interest of the economies they have implanted.

In the first half of 2009, the possibility of a run from Eastern Europe of most Western European banks determined Central banks and Government officials to unite in the Vienna Initiative, requesting multinational banks operating in Eastern Europe to commit to maintain exposure and for injecting new capital into local branches. At the end of 2011 and first months of 2012, tensions have recurred much stronger. Central Bank of Austria urged subsidiaries of commercial banks in Central and Eastern Europe countries to limit the exposure of the respective markets to 110% of the resources collected from these markets, which is equivalent to halt or even to decrease the lending activities in those countries.

In these conditions, a new Vienna initiative took place in January 2012, in order to enhance the coordination of national policies that could impact the economies of emerging Europe (World Bank 2012). Even the European Central Bank saw a remarkable consensus (Reuters 2012), many analysts doubt that such a solution will have the same results as in 2009, due to that many of these multinational banks have huge problems on internal market (Capital, 2011).

Conclusions

The present paper has sought to put into question, theoretically and practically, how different types of financial institution could influence the availability for SME lending. The issue of financing is of prime importance for SME and banking lending (in the variety of its forms) is, and will be, the preferred way by SMEs in order to fulfill their objectives. Based on various studies, we identified the main guidelines and characteristics of the lenders in relation with borrowers. Foreign banks and large (private) banks are focused mainly on transactional lending (analyzing "hard" data, scorings, national databases, information are sent through internal channels within institution, the center of decision and risk assessment are separate from the customer, a definite requirement for a certain types of collaterals etc.) and this approach seems more appropriate for the large firms than for SMEs.

On the other hand, there are small, niche banks, local, domestic, that offsetting the effectiveness of the large banks techniques by a of greater proximity to the client, processing "soft" data, recover the close relationship with the customer adding to the financial analysis, asker fewer or various collaterals, etc., but their small power cannot support the whole need for funding and expansion of the SMEs sector.

Alongside these views we found recent opinions who stated that large banks use both transactional and relational lending, and SMEs are not an exclusive area of local/domestic niche banks, but an interesting area, where large and foreign banks began to rapidly expand. .

The theoretical conclusions, far from being unanimous, show, however, a few directions: although the large banks build their expanding policies (territorial, market share, profitability, technological) on behalf of large clients, do not find uninteresting or inappropriate the SMEs sector. Foreign banks have not proved, at least until the onset of the crisis, and even later, as acting pro-cyclic for their subsidiaries countries; on the contrary, in terms of opportunities and good yields, these banks have increased their involvement in the financing of the economies concerned, including the SMEs sectors.

The second part of the work draws on our research, a survey carried out in 2011, on a considerable number of SME in the Western and Nord Western regions of Romania's, aimed to understanding how the SMEs perceive the involvement of banks in lending relation, issues of trust, loyalty etc. For this paper, we tried to notice the extent to which SME consider that certain types of banks (e.g. domestic banks vs. foreign banks, large banks vs. small, niche banks) could better serve SMEs interests. We were, also, interested if SMEs from peripheral areas (urban vs. rural, small towns vs. main cities, niche sectors, etc.) perceive a certain discrimination when try to access bank loans. The results confirmed the theoretical the assessments stated in the first part this paper: there is a considerable need for financing, but also a need for distinctive, authentic, relations between the SMEs and banks. Regarding the nature of the banks involved, most

responses show the small or local banks are not, by default, the most suitable for financing SMEs. The large banks or foreign banks could also do that, to an extent comparable with local banks, sometimes more efficient. It also appears that banks do not ignore or neglect SMEs from less attractive area (rural, small towns, new or less known sectors). The explanation could stand to the banks effort to identify new business opportunities, increased competition, or the need to make profitable an extensive network. We consider, however, that the theoretical views supporting a strong and constant involvement of foreign banks in the emerging economies should be reviewed, at least in the light of the recent decisions of the parent banks of the main European countries regarding a reduction of their support for the subsidiaries existing in emerging economies from Central and Eastern Europe (including Romania). Of course, that requires a period of time, while the results of those decisions have to settle by the superficial phenomena, in order to obtain valuable theoretical and practical analysis.

Finally, as we stated in other paper, we consider that a well-balanced structure of banking sector, a real knowledge of SME needs, a relationship banking based on mutual trust can exploit all opportunities on the economies, creating a large base for meeting SME financing requirements.

THE IMPACTS OF TOURISM ON SOCIETY

Bâc Dorin Paul
University of Oradea
Faculty of Economics

Tourism is one of the most important components of the global economy. It generates billions of dollars in revenues and millions of jobs worldwide. It is considered by many communities, especially in emerging countries the only tool for development, and the only chance for increasing the quality of life. Thus the tourism industry has stretched from seaside to mountain resorts and from small villages to big metropolises. But at the same time, tourism started to show its uglier side. Both the actions of investors and of tourists are having negative impacts on the socio-cultural values and environmental assets of host communities all over the world. In the present paper we are trying to observe the impacts of tourism on society from three perspectives: economic, social and cultural, and environmental. From the economic perspective, tourism generates wealth and jobs, but the wealth leaks from the community and the jobs are mainly low-income. From the socio-cultural perspective, tourism brings together people from different backgrounds, cultures and traditions and promotes peace. But at the same time, due to globalization, many communities have lost their cultural identity and gave way to a Disney-fication of their village or town. Last but not least, tourism helped create national parks and protected areas, where unique examples of flora and fauna can be found. But tourists have been proven to be a problem, because of the pollution they generate. Tourist entrepreneurs can also be blamed for a total disrespect to local traditions and the environment. The main problem from these negative impacts is that the local community is the only side that picks up the check for all the damages on the culture, tradition and, most importantly on the environment.

Introduction

Since the second half of the twentieth century, tourism has been gaining momentum and in 2011 total revenues from tourism activities have reaches 1000 billion dollars (UNWTO, 2012). So we can firmly say that tourism: 1. compared to other industries, it has a superior capacity to distribute wealth and promote regional development, 2. it has a high multiplier effect, 3. it generates a varying consumption of goods and services.

But a series of scholars and researchers have found a growing number of examples of negative impacts of tourism in the host regions. In the present paper we are trying to present a series of positive and negative impacts of tourism from three points of view: economic, socio-cultural and environmental.

Tourism activities take place in a natural and manmade environment, which is extremely complex. The manmade environment consists of economic, social and cultural processes and factors, and the natural environment is made up of the natural landscape, climate, flora and fauna present in a certain space. Mason (2003: 27-28) argues that there can be made a clear delimitation between the two environments, which is necessary when we talk about tourism's impacts.

1. The economic impact of tourism

In the '60s and '70s the first studies regarding the impact tourism could have on regions or destinations have been focused on economics. This singular point of focus was based on two facts: 1. the economic impact was easier to quantify and 2. there was a general optimism

regarding the benefits that tourism generates. But tourism in its nature is drawn by unique and fragile destinations, and it became clear that in some cases the economic benefits can be shadowed by the negative consequences on the community and the environment, which were never estimated in the past (Dwyer et al. 2004: 307 – 308; Archer et al. 2005: 79-80)

The benefits and costs generated by the tourism activity should be viewed from three sides: tourists, local community and authorities. On one side we have the tourists, who pay to enjoy a certain form of tourism. On another side, we have the local community who enjoy the benefits (mainly financial) from the tourism activity. At the same time, they are the ones who have to face the hidden costs tourists leave behind. Last but not least, we have the government and the local authorities. For them, tourism generates revenues through taxes, the creation of jobs and contribution to the balance of payments (Goeldner and Ritchie, 2012:24, Lickorish and Jenkins, 1997:65-66; Saarinen, 2007:42).

If we go further into details, we can talk about a fourth side: investors. From their perspective, the benefits are solely financial, based on the incomes of the businesses they have set up in the host-region. Regarding the costs, investors are immune to any other cost, than the financial one.

The tourism industry seems to be the most efficient branch of the economy in generating jobs and income in less developed, peripheral countries / regions, where development opportunities are limited. In these regions, the economic impact of tourism is felt most strongly. People from these regions are generally farmers or fishermen and the involvement in tourism activity can substantially increase their household income. Also an increase in the local tourism industry can provide an incentive for related activities (agricultural products or souvenirs that could be used for the accommodation and catering). According to some authors (Archer et. al., 2005:81-82), the introduction of tourism industry in these regions may have a greater effect on the welfare of the resident population, compared to a more developed region in the same country. For such a development of tourism in an emerging country or region the following are need: basic infrastructure (access roads, drinking water etc.), lodging (hotels, pensions, etc.) and other facilities and services necessary for tourism (catering, transport, etc.).

Archer et. al. (2005:83) believes that some of these utilities are indivisible in the sense that they are provided the tourism industry, and at the same time they are used by local people. Thus, in many emerging countries, motorways and airports built for tourism, now offer easier access to more distant markets for many local products. Unfortunately, the local population enjoys little benefits from this development. This is essentially a problem of distribution, both physical and economic.

The market does not ensure that development will keep up with demand. It is imperative that realistic and accurate planning is made and the enforcement of rules and laws to reduce conflicts and, where appropriate, preserve and protect the unique features of the nature tourists and residents can enjoy. This is a lesson that was learned quite recently by emerging countries. At a superficial level, the economic benefits of tourism seem obvious."In recent years an increasing number of authors have expressed reservations about the nature and extent of the benefits of tourism and expressed skepticism about the potential of tourism as a catalyst for growth and development as a means of maximizing the welfare of local people" (Archer et al., 2005:82-83).

In a study conducted in Turkey (Tosun et. al. 2003:155-159), it was noted that although tourism – as an economic development strategy - increased the rate of economic growth and created inequalities between regions and social classes. The inequalities were caused by economic incentives for coastal tourism development at the expense of rural areas. In essence, this is a problem of allocating resources and whether the developing of the tourism industry represents the optimal use of available resources - natural, human, etc.

Rural areas are generally lacking economic diversity and adequate infrastructure, and are based on a limited number of economic activities, and have a less educated population. All this contributes to the limitation of the rural population to secure jobs, promote investment, etc.. Also,

in these regions there is some lack of planning, management and monitoring of economic activities – including tourism. In terms of jobs the ones supplied by tourism they are to some extent seasonal, with low wages and limited opportunities for promotion. If we compare it with other industries, tourism requires employees with a low level of specialization, which determines the relatively low salary (Mathieson and Wall, 1982, Lickorish and Jenkins, 1997:73, Muller and Jansson, 2007:4).

In conclusion, from an economic perspective, the objective of the local community should be to obtain higher results than the costs they have to pay.

2. The socio-cultural impact of tourism

Tourism has often been associated with the contact between cultures, behaviors, values and traditions. Tourism is considered a framework where hosts and tourists can learn better about from each other, through direct interaction. Also, tourism requires host communities to be more responsive and educated to provide quality services to tourists. In addition, interactions between locals and tourists generates the emergence of new ideas, values and motivations for social and economic progress (Brown 1998: 237-238; Bersales 2005:239; Nyaupane et al. 2006: 1373). Tourism can revitalize a community's cultural life, as art and traditions are an attraction for foreign visitors (Mason 2003:43).

The attitude of local people on tourism crosses four stages, as they were defined by Doxley (quoted by Fennel 2007:47-48):

• euphoria – tourists are welcomed by the community, without control or planning;
• apathy – tourists are considered a given by the community, and the tourists – locals relationship becomes formal and commercial;
• discomfort – reaching saturation with the tourism industry, the community starts to change its attitude towards tourism. Decision makers further develop infrastructure instead of limiting growth;
• antagonism – locals show their irritation with tourism and tourists. Planning should be the remedy, but increased promotional activity is contracted to change the deteriorating image and reputation of the village.

We cannot talk about the socio-cultural impact of tourism without talking about globalization and its effects on local cultures. One result of globalization is consumerism. It is defined as an increase in demand for consumption in an increasing variety of products and services. Consumerism affects tourists, who are a part of the consumer-oriented society, characterized by: modern urban lifestyle, expectations for high-level services and an attitude characterized by the expression: "everything is for sale"(Reisinger 2009:11-13).

There are authors (Reisinger) who argue that consumerism destroys culture and generates environmental and social problems: traffic congestion and queues at natural and man-made attractions. An example of this is Venice, which is overwhelmed by tourists, generating an increasing number of environmental and social issues. "Venice is full of tourists. The invasion of tourists in San Marco Basilica caused damages to the frescoes due to the condensation created by the breath of the visitors. Also, the stone floor was constantly eroded by the river of travelers. Unfortunately, this type of problem is often accepted by tourists as an important part of the personal experience. "(Richards, quoted by Reisinger, 2009:20)

Globalization is accused of destroying the socio-cultural identity of the local communities and indigenous values, traditions and lifestyle (Macleod 2004:15; Reisinger 2009:21). Cities visited by tourists in developing countries are not authentic, but rather disinfected and McDonaldized (Paramo La Haine 2008). Diversity gives way to efficiency and local culture to global culture. A small village, which is facing many economic problems can succeed a change of 180 degrees, by capitalizing on several features: beautiful scenery, tranquility and lack of congestion.

Unfortunately, for many communities the change equals with the loss of local traditions and values by replacing them with a false rural culture (Hester, 1990:5).

In rural areas, land and coastal areas are purchased by developers / investors, who transform farming and fishing communities in tourist resorts, replacing farms and forests with apartments or shopping centers. Modern hotels, highways and recreation centers have no local charm. All the resources that have attracted tourists in the beginning - the beauty of the landscape, peace and tranquility – are continuously eroded by tourism development and the rapidly increasing pace of life. For this reason, the meaning of local culture might dilute and dissolve (Macleod, 2004:16). Today, tourists experience fishing on "authentic boats", while fishermen work in supermarkets. This situation causes a fracture between the locals and the socio-cultural environment. Also contributing to the fracture are the growing number of tourists and the new technology and modern life.

Also, the need for "authentic" has tarnished to some extent the traditions of certain civilizations. The Keechak dance, interpreted by the Hindu community in Bali on some special occasions, was shortened, and performed out of the religious context, daily for the foreign tourist groups. In theory, tourists may feel cheated by such non - authentic events, but that would require a good knowledge of the cultural traditions of the area visited by foreign tourists (Mason, 2003:46).

In the cities and urban concentrations, the response to consumerism is the emergence of a growing number of stores or shopping centers in central areas. The transformation of spaces into tourist attractions was called by Paramo - La Haine *Disney-fication*. "Through this process, a general feeling of security was created with an excessive control combined with increased attention. Security cameras are installed, alarm systems are engaged and security services are hired, to ensure that tourists are not bothered by the negative realities such as poverty, begging, social issues or ecosystem degradation. The less beautiful face of the world has no place in this controlled environment (Paramo, Le Haine, 2008).

Liu (2003:468) states that tourism is not the main culprit for the loss of cultural identity and traditions: "The globalization and homogenization of culture, often referred to as Coca-colaisation, Hollywoodisation or McDonaldisation may not be caused only by tourism. The media, by means of modern communication and information technology often play a more important role in shaping the values, opinions, lifestyle and fashion of the world."

3. The environmental impact of tourism

If the positive impact of tourism can be observed most easily on the economy, then surely, that the negative impact on the environment is the most evident. Compared with the economic impact of tourism, the environment has become a theme for studies and research recently, joining in the ecologist stream at the end of the '80s and early '90s (Holden, 2003:94).

For an accurate overview of the relationship between tourism and the environment we must take into account a large number of actors involved in tourism activity(Holden, 2009:17): authorities (local and central), private sector (local and external contractors), non-governmental organizations, with the focus on tourism activity, local community, tourists/visitors.

"The common denominator of these actors is the man. Consequently, when we talk about the relationship between tourism and the natural environment it is necessary to consider that this relationship is the expression of human interaction with nature ... [so] to determine the effect of tourism on the natural environment we should take into account the following: the price we attach nature, cultural stereotypes about nature and the ethical relationship of man with nature." (Holden, 2009:17)

Sharpley (2006:22) believes that the environment is a fundamental element of the tourists' experience. Tourists are looking for attractive natural resources, different and special, allowing specific tourism activities. At the same time, the development of tourism consumes resources,

creates waste and requires a certain degree of infrastructure development, which in some cases can lead to the degradation and destruction of the environment.

The relationship between tourism and the environment crossed four stages over time (Sharpley 2006:122):

- coexistence in the beginning of tourism activities, the impact was minimal;
- conflict: mass tourism was seen as a destroyer of nature;
- idealism: symbiosis possible by developing "green" tourism;
- realism: different approaches to development that put in balance the needs of the tourists, the locals and the environment.

Sharpley (2006:121) argues that there is a high degree of difficulty to pinpoint the negative impacts that tourism can have on the environment because:

- it's not always clear if the environmental degradation is caused by tourist activity or other human activities;
- the impact of tourism on the environment is rarely visible immediately; tourism development may cause an indirect impact that is felt in some cases in other regions;
- often we lack references to measure the consequences of tourism on the environment.

On one hand, Swarbrooke (1999) and Holden (2009:22) believe that the natural environment has benefited from tourism, through the conservation actions and protection of nature (natural and national parks, protected areas etc.). Also, tourism causes a deeper appreciation of the nature of the tourists and the local population. Tourism is considered a "friendly" alternative to other industries that could benefit the locals.

On the other hand, tourism has direct negative effects on the natural environment and it puts a high pressure on the carrying capacity of host regions and indirect, from development of tourist facilities (Ioannides, 1995:583).

It becomes obvious that the environment consisting of the countryside will suffer from the construction of hotels, parks, shopping malls or amusement parks. Most common consequences of tourism on the environment are:

- changing the structure of flora and fauna (ski slopes);
- pollution of water, air and soil, etc.;
- soil erosion (landslides or disappearance of beaches);
- depletion of natural resources;
- traffic congestion and public transport;
- visual impact (anarchic/chaotic urbanization of seaside and mountain resorts).

Unfortunately, the local population is one that has to "pay" the costs of the resulting environment degradation from tourist exploitation and the degradation is most of time observed or felt only after a period of time (Beeton 2006:19; Holden 2009:19).

Conclusions

We can conclude that tourism has various consequences, which are influenced by a large number of factors, especially the ability and willingness of the community to accept changes (Beeton, 2006:21). For some communities, tourism is one of the few options for economic survival. For others tourism is a combination of positive and negative factors (the most common situation). Finally, there are communities where tourism has generated a large number of negative externalities, for which the population was not ready. To avoid these unpleasant situations planning and strict control by the community and authorities are needed (Statzu and Strazzera, 2011:58; Roberts and Hall 2001:55). Goeldner and Ritchie (2012:25) believe that the challenge for the tourism industry is obtaining benefits that will outweigh the costs, and taking measures to

mitigate negative effects. "Tourism development should be part of an economic development and must be done in a manner that is sustainable."

MODELS OF TOURIST DEVELOPMENT
IN THE CONTEXT OF REGIONAL DEVELOPMENT

Borma Afrodita
University of Oradea Faculty of Economics

Third year PhD candidate at the University of Oradea, under the guidance of Professor Mrs. Alina Bădulescu in the doctoral research project entitled: "Doctoral studies and Ph.D. candidates for competitive research on a knowledge based society", a co-financed project by the European Social Fund through the Sectoral Operational Program for Human Resources Development 2007 - 2013, Priority Axis 1. "Education and training in support for growth and development of a knowledge based society" I chose to present this subject in order to demonstrate the connection that exists between tourism and regional development. Having as research topic "Tourism and development in the Euro regional context" I felt it would be appropriate to devote a subchapter in presenting the impact of tourism in regional development.
Thus I have analysed a number of specialised papers found at national and international level in order to achieve a synthesis on the approached topic. Authors such as Williams and Shaw (1991), Sharma (2004), Keskin and Cansiz (2010) were concerned with presenting the positive aspects of tourism in regional development. Condes (2004) presents on one hand the secrets regarding success in matter of tourist development, and on the other side he presents the possible risks that follow the development of tourism in a country / region (Condes 2004).
Following the gathered information we found that indeed tourism plays an important role in regional development.
The used research methodology consisted in using specialised literature in order to identify some models that illustrate the potential success of tourism in regional development.
The space-temporal development model of tourism proposed by Opperman (1993), although it was developed at national level represents a useful tool in illustrating the potential success of tourism in regional development. Miossec's model (Sharma 2004:300) describes the structural evolution of touristic regions in time and space. Butler (1980) develops a more complex model than the one of Miossec regarding the hypothetical development of a tourist area. There are a number of studies on the role of regional clusters in increasing regional competitiveness of an industry (Porter, 2000; Rocha, 2004) paying a special attention to clusters in tourism.

Keywords: tourist development, regional development, models of tourist development, clusters in tourism
 JEL codes: O16

1.Introduction

The theory of tourism as a means of achieving economic development embraces two distinct subjects (Sharma 2004:262):

- − on one hand, tourism is seen as a vehicle for regional development in a developed country, that contributes in eliminating regional disparities, especially between metropolitan centres and peripheral areas.
- − on the other hand, the developing role of tourism is analysed in the context of a divided world between developed and less developed countries, the assumption is that the gap between the two can be reduced by tourism development projects in less developed countries.

Keskin, Cansiz (2010:24) also present some positive aspects regarding the development of the tourist activity that leads to maintaining peace in the world, educating the nations, environmental

protection, protection of historical and traditional structures. In addition, tourism contributes to (Keskin, Cansiz 2010: 24):

- the growth employment, while accelerating socio-economic development;
- the increase of living standards, thus stopping the migration;
- the improvement of national and international law;
- the development of national conscience etc.

WTO (2009:6) includes all these aspects in one sentence: *tourism means jobs, infrastructure, trade and development.* The purpose of WTO is primarily related to the contribution of tourism to development in the less developed countries of the world. In this context, tourism is seen not only as a catalyst for development, but also as a political and economic change. That is, international tourism is seen as a means to achieve "development, social and economic progress" and the reward with wealth and power are, as some claim, required for such development. (Sharpley and Telfer 2002:13; and Sharma 2004:149)

2. Tourism - a factor of regional development.

Using a rich specialised literature, Sharma (2004:297) states that tourism has been used as a strategy for promoting regional development (Oppermann, 1992) both in urban areas (Beauregard, 1998) and in rural areas (Sharpley, 1997).

Higgins and Savoie (1988) - presented the *main reasons for which it is important to pay a particular attention to regional structure of the national economy* (Sharma 2004:286):

- Regional disparities create social and political issues that have to be addressed in any political society, especially in countries where "the gap between regions" is due to states or provinces;
- Accelerating growth of a country as a whole requires eliminating the problems of less developed regions;
- All countries face increasingly complex urban problems. The interaction between various cities and regions is a fundamental aspect of these urban problems, but also of the social and economic problems at regional or national level.

Williams and Shaw (1991) show the potential that tourism has in bringing development in neglected regions of European countries. Peppelenblosh and Tempelman (1973) suggest that infrastructure requirements for tourism could act as tools for regional development (Sharma 2004:297).

Through tourism can be capitalized a series of natural and human resources such as topography, landscape, climate, thermal waters, vegetation, cultural landmarks, elements that cannot be exploited in other domains. Taking as reference points these elements (which attract most tourists) there can be created real resorts, in different parts of a region that will lead to economic and cultural development of that area, and, therefore, in creating better life conditions.

The important point here is that the attention is most often focused on the role as developer of tourism in less developed or peripheral countries.

From Condes's (2004) point of view regarding success in tourism development, in the case of poor or emerging countries, he focuses on at least three main ideas:

- *the training of professionals and of the local populations for tourist flows* (by maintaining cultural and gastronomic traditions, sustained learning of foreign languages as well as that of foreign cultures in order to create natural tourist – host relationships etc.)
- *facilitating their access to capitals and financing* (in recent years national groups have emerged, even in poor countries: Abou Nawas hotel groups Tunisia, Camino Real Mexico or Dusit Thani Thailand);

– *knowing tourists' expectations in order to adapt supply to demand* (a risk of poor or emerging countries is also to their "panic" due to tourist manna, by developing projects that fail tourists' expectations or that are too bold, oversized).

In Condes's opinion, reorienting the economy of the countries with and obvious touristic potential carries at least three risks:

– *Excessive dependence on tourism* – in this way countries that offer only one type of tourism or limited forms are more exposed to risks. We could also add the case of poor tropical countries, where an increased reliance on weather conditions and natural disasters had been reported and that are real obstacles to destinations like South East Asia or the Caribbean. For example, in 1999, Antigua-Barbuda (where the incomes from tourism represent 70% of GDP) was ravaged by four hurricanes that seriously unbalanced the tourist sector and the economic one.

– *short-term management and limited local gains.* The impact of tourist development on the natural and cultural environment may be, in time, disastrous, as well as an uncontrolled influx of tourists. The destruction or degradation of the fragile natural patrimony (e.g. Galapagos Islands) has serious consequences, evidenced by a rapid and irreversible decline of this destination, especially when this natural heritage is precisely the attraction of the area.

– The *"Folklorization" of cultures and prostitution.* Economically speaking, the main risk for poor and emerging countries is that the income that tourism generates is only very modest (especially in the case of fixed price travels), tourist performance being controlled by foreign operators tourism (namely tourism complexes are rather as "implants" and the staff belongs in most cases, to the issuing country). " Over 65% of the revenues from tourism in the Mediterranean countries, unfortunately go into the accounts of a number of about ten companies from the tourists emitting countries that have air transport companies, tour operators and hotel structures "(Cazelais, 2004).

Another equally major risk is that of sex tourism, against which developed countries take legal actions, but at the same time also organise awareness and prevention programs of this true scourge.

Tourism has traditionally favoured the poorer regions, but recent changes on tourism markets have favoured markets and investments of rich countries and regions (Williams and Shaw, 1998:13), i.e. the rapid expansion of new forms of tourism, such as urban tourism, cultural tourism, historical tourism, and theme parks, which favour those destinations that are relatively affordable in large metropolitan areas. This phenomenon was observed in Great Britain, especially in London and southern countries and in Austria, where a major change in tourism demand turned to rich regions (Sharma 2004:266 after Zimmerman, 1998:30).

3. Models illustrating tourism's potential success in regional development - theoretical approach

The relationship between tourism and regional development was realised by highlighting some models outlined in tourism literature.

The space-temporal development of tourism proposed by *Opperman* (1993), although it was developed at national level, represents a useful tool in illustrating tourism's potential success in regional development. This model supports the economy of developing countries and it is composed of two separate sectors (formal and informal tourism sectors) that although co-exist side by side, they have very few links.

– *Formal tourism sector* is characterized by things such as international hotel standard, investment costs with high capital, high leakages as profit transfers, imported food and construction materials and a very limited integration into the local economy.

The governments of developing countries often take into account only this way for developing tourism.

– *The informal sector* consists of the stall vendors brotherhood, minibus and accommodation operations of private individuals. This sector implies an intensive labour with a very limited capital. Although small, they can generate large profits per unit and the money increase the multiplier effect for the local economy. The importance of this model is that a destination needs to decide what form of tourism it will address. While formal and informal sectors can interact, the formal sector can be closely associated with mass tourism. If the strategy behind regional development is to generate economic benefits, then governments must calculate which type of tourism will bring more benefits to local communities.

Miossec's model (Sharma 2004:300) describes the structural evolution in time and space of tourist regions. He identifies five distinct phases regarding the changes that occur in the provision of facilities (the resorts and of transport system) and in the behaviour and attitude of tourists, of local decision-factors and the host population.

Table no. 1. Miossec's model of tourism development

Phases	Resorts	Transportation	Tourists' behaviour	The attitude of the local decision factors and of the host population
0	The area is unknown to tourists	The area is isolated, transportation network is missing	Lack of interest and of knowledge	Oscillates between mirage and refusal
1.	In the area appear a first resort (trailblazing resort)	Opening the connections to other areas	Vague local perception	Observation
2.	Multiplying resorts	The development of the transportation network between resorts	Progress in the perception of the places and itinerary	The preoccupation for improving the infrastructure that serves the resorts
3.	Organising of vacation spaces in each resort; the beginning of the hierarchization and specialisation	Trips – different tourist circuits	Competition regarding space and segregation	Demonstrating the dualist effect of segregation
4.	Hierarchic specialisation's saturation	Diverse system of connections	The disintegration of the space of perception; populating the area; saturation and crisis	Total tourism; planned development; measures for ecologic protection

Source: adapted from Miossec (1976).

Miossec's model presents several useful aspects. First it includes a dynamic element, namely the development of the region in time and space. The notion of space / time evolution is very important both in the analysis of past processes as well as in future planning of the development. Secondly this development is seen as a whole; changes in the behaviour of tourists and local people are closely related to the increased number of resorts and to the expansion of the transport network. The key factor is the relationship between effect and development. Other aspects of the development process are less explicit, although it could have been included in the model. For example: who builds resorts? how? why?. These are questions to be asked and addressed. Also, there must be identified the factors that determine the choosing the resorts' location. In other words, the context in which this development takes place is neglected in this model.

Other models highlight a few untouched points by Miossec, regarding the expansion of the local/non-local participation in the development process and the changes intervened in the structure and volume of the tourist traffic over time.

Butler (1980) develops a more complex model than the one of Miossec on the hypothetical evolution of tourist areas. But in the evolutionary sequence imagined by Butler, based on the concept of product life cycle, are presented six major stages: exploration, involvement, development, consolidation, stagnation and decline or rejuvenation (Condes 2004:282). In the first stage, there aren't specific facilities for tourists; the facilities from the involvement stage are provided by the inhabitants of the area; in the development stage, locals' involvement decreases rapidly, the control being taken by external organizations, particularly the accommodation of tourists. The consolidation phase is represented by the important chains of companies in the tourism industry. Local involvement will increase again only in the decline stage, when there will exist the possibility of providing facilities at lower prices in order to revive the industry (Murphy 1985:86; Butler 2011:6).

There are a number of studies regarding the role of regional clusters in increasing regional competitiveness of an industry (Porter, 2000; Rocha, 2004) paying a special attention to clusters in the tourism domain. What is a cluster? Porter (2000) defines the cluster as "a group of interconnected companies, suppliers, service providers and associated institutions in a particular field, linked by analogy and complementarity". (Estêvão and Ferreira, 2009:4).

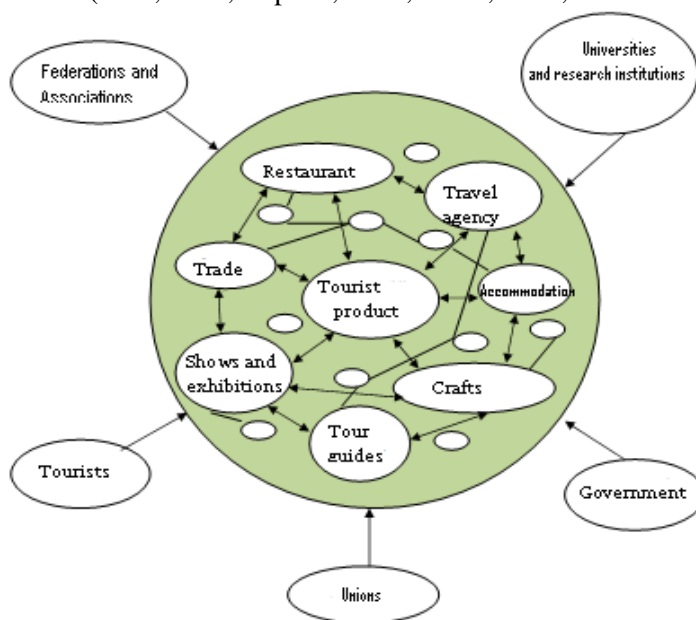
Estêvão and Ferreira (2009:4-6) devote a special attention to clusters from the tourism domain realising a expansion of this concept with the help of specialists concerned with the meaning and role of clusters in tourism (Beni, 2003, Capone, 2004; Costa, 2005; Novel are et all. 2006).


Figure no. 1. The representation of a tourism cluster
Source: adapted from the model developed by Da Cunha Sieglinde Kindl and Joao Carlos Da Cunha (2005:52).

4. Conclusions

Tourism has positive effects on revenues and employment, but let's not ignore that, besides these beneficial effects, there are negative consequences for the receiving communities: the degradation of the natural environment, of life's quality and that of the cultural and social heritage due to overexploitation and excessive concentration of tourist flows to certain destinations. Mono-development, predominantly based on a single industry such as tourism, is very risky from an economic perspective. Thus, countries that depend exclusively on tourism are

considered fragile environments and any external event that negatively influences tourism (those mentioned above), can have devastating effects on them.

The multitude of models encountered in the specialised literature in fact represents specialists' concern in highlighting the connection between tourism and regional development. The most common model in current literature, which presents the potential success of tourism in regional development, is the cluster. The phenomenon of cluster can be found not only in developed countries (U.S.A., Germany, England, France etc.), but also in developing countries that have a developed potential of the regional tourism, based on one or more tourist resources: balneal, cultural, agritourism cluster etc.. (Iordache et all, 2010:11).

A tourist cluster's objective is to mobilize companies that generally work alone in creating, capitalising and promoting successfully a tourist product in a region (Scarpino 2010:12).

TOURISM - AS A DEVELOPMENT STRATEGY

Borma Afrodita
University of Oradea Faculty of Economics

Third year PhD candidate at the University of Oradea, under the guidance of Professor Mrs. Alina Bădulescu in the doctoral research project entitled: "Doctoral studies and Ph.D. candidates for competitive research on a knowledge based society", a co-financed project by the European Social Fund through the Sectoral Operational Program for Human Resources Development 2007 - 2013, Priority Axis 1. "Education and training in support for growth and development of a knowledge based society" I chose to present this subject in order to demonstrate the connection that exists between tourism and development. Having as research topic "Tourism and development in the Euro regional context" I dedicated a subchapter of this thesis in presenting tourism as a development strategy.

Thus we have analysed a series of specialised papers encountered at national and international level in order to achieve a synthesis about the addressed topic. Authors like Sharpley and Telfer (2002) found that the specialised literature in the tourism domain contains few articles on the relationship between tourism and development despite the fact that tourism remains an important area of the economic policy regarding development in most regions of the world.

Writings on tourism, that debate development, are often written in terms of the impact of tourism on the environment in which it unfolds.

Following statistical data collected on Faits saillants OMT du tourisme, 2011 Edition I found that indeed tourism is an important element in the development strategies.

The research methodology that was used consisted in documentation from the specialised literature and the site http://mkt.unwto.org/sites/all/files/docpdf/unwtohighlights11frhr.pdf in order to gather representative data on the evolution of international tourism for the 1950-2010 period, also highlighting the potential success of tourism in the economic development.

For this study to be more representative I presented the evolution of international tourist arrivals in the main tourist regions of the world. The graphical representation shows that Europe is the main destination for tourists from around the world.

Projections made by UNWTO (2011), confirm the fact that international tourism is continuously expanding, in 2020, the number of international tourists arrivals is approaching 1.6 billion.

1. Introduction

The articles on tourism can be traced to the 1930s and even before that, but the most part of the tourism literature appeared after 1960 (Sharpley and Telfer 2002:50 after Pearce, 1993). The development and tourism theory evolved almost in the same manner since the Second World War, however, there have been few efforts to connect the two fields of study (Sharpley and Telfer 2002:35 after Telfer 1996a). Tourism research initially functioned as an instrument for development having the most of researches done by planners and economists who worked for organizations such as UN, World Bank, and OECD (Graburn & Jafari, 1991). During the 1960s, tourism has been considered development and there also existed the belief that tourism creates increases in the currency exchanges and level of employment and the tourists' spending generate a multiplier effect that stimulates the local economy (Sharma 2004:201 after Davis 1968, Graburn & Jafari, 1991).

Regarding the specialised literature in the tourism domain, it was written much about the relationship between tourism and development, despite the increasing social and economic

significance and the use of tourism as a development strategy in developing countries. Writings on tourism, which refer to development, they are most times written from the perspective of the impact of tourism (Sharpley and Telfer 2002:51 after Pearce, 1989b) on the environment in which it unfolds. This is surprising, given the fact that tourism remains an important area of economic policy for development in many regions and in many nations (Sharpley and Telfer 2002:35 after Maleki 1997).

2. Tourism - an effective means to ensure development

Due to its rapid and continuous growth and the related contribution of economic potential it is not surprising the fact that the tourism is generally considered both in practice and in academic circles, as an effective means to ensure development. In other words, both in industrialized countries as well as in the less developed world, tourism has become an important and integral element in the development strategies (Jenkins 1991:61).

Countries from all around the world turn to tourism as a strategy for development, thus, in a fierce competition for the revenues obtained from the international tourism, (the foreign tourist arrivals are estimated at a peak of 1.6 billion; source UNWTO 2011:11). The locations that can develop even on the market of a tourist product, (a natural attraction, historic or cultural, an urban or rural destination), can take advantages of this market by attracting revenues from visitors (Sharpley and Telfer 2002:35 after Maleki, 1997). Tourism is used to generate foreign currency exchanges, the increase of the volume of employment, attracting capital for the development and promotion of economic independence (Sharma 2004: 180 after Britton, 1982). However, tourism literature has given low attention to the notion of development and to the link between tourism and development.

The specialists in the tourism domain recognize the importance of tourism as a development strategy, but only a small number of studies make any reference to the theoretical construction based on the development theory (Sharma 2004: 202 after Pearce 1989b, Britton 1991, Oppermann, 1993, Harrison 1994, Dieke 1993 and 2000, etc..).

As a result, the alleged contribution of tourism to development was accepted quietly, while a number of fundamental questions remain unanswered. For example: What is "development"? Which are the development's goals and objectives? How is development made? Does tourism represent an effective or realistic means of achieving development? Who benefits from development? Which forces/influences will contribute to tourism's development or militates against it? (Sharpley and Telfer 2002:12; and Sharma 2004:149)

Therefore, it is important to understand what the term "development" refers to and how its meaning can vary in different contexts. However, first of all, it is necessary to reconsider the reasons for which tourism, as opposed to economic industries or sectors, is seen as being an attractive vehicle for development (Sharpley and Telfer 2002:13; and Sharma 2004:150).

3. Tourism - an industry in a continuing evolution

The most compelling reason to consider tourism as a development strategy has to do with the alleged positive contribution that it has in the local or national economy. Internationally, tourism represents an important source of income derived from currency exchanges; indeed, it has been suggested that the main reason why governments support the development of tourism is its contribution to the balance of payments (Opperman & Chon 1997:109). In developing countries tourism has become one of the main sources of income from the currency exchanges while even in developed countries revenues obtained from international tourism can have a significant contribution in general to the balance of payments and especially to the travel accounts. Tourism is considered to be also an important source of creating jobs. In Cyprus, for example, about 25% of the labour force is directly or indirectly employed in tourism. It is also one of the reasons for

which tourism is often considered to be a new activity or a replacement activity for the areas in which traditional industries have been in decline (Sharpley and Telfer 2002:14; and Sharma 2004:151-152).

For many developing countries, with a limited industrial sector, with few natural resources and dependent on international aid (for example Gambia - one of the poorest and smallest countries in Africa), tourism represents the only realistic mean to win the much desired foreign income, creating jobs and attracting more foreign investments (Sharpley and Telfer 2002:15; and Sharma 2004:152).

Table no 1. International tourist arrivals and international tourism revenue (1950-2010)

Year	Arrivals (million)	Receipts (bilion US $)	Year	Arrivals (million)	Receipts (bilion US $)
1950	25	2	1990	435	262
1960	69	7	1995	528	403
1965	113	12	2000	675	475
1970	166	18	2005	798	679
1975	222	41	2008	917	939
1980	286	105	2009	882	851
1985	327	118	2010	940	919

Source: from 1950 to 1985 and adapted by Sharpley and Telfer (2002: 16) and Sharma (2004: 154), and from 1990-2010 completed by the author after *Faits saillants OMT du tourism,* 2011: 4 Edition, available on: http://mkt.unwto.org/sites/all/files/docpdf/unwtohighlights11frhr.pdf

Since 1950 (Table no 1), when there were recorded around 25 million of international tourists arrivals, international tourism has shown a constant and remarkable growth (issue confirmed the UNWTO data of June 2011). Thus, in the second half of the 20th century, it is shaped the importance of tourism in the economic and social activity under the name of tourism industry.

Interesting is the fact that the growth rate in arrivals is constantly decreasing (Table no 2). For example, during the years 1980 - 1990, the average increase rate in international tourist arrivals was of 4.8%, the lowest value recorded since 1950 to the present day (Sharma 2004:154).

Table no 2. Tourism arrivals and receipts growth rates, 1950-2010

Decade	Arrivals (average annual increase %)	Receipts (average annual increase %)
1950-1960	10,6	12,6
1960-1970	9,1	19,4
1970-1980	5,6	10,1
1980-1990	4,8	12,6
1990-2000	4,5	6,1
2000-2010	3,4	6,8

Source: from 1950 until 1990 adapted by Sharpley and Telfer (02: 16) Sharma (2004: 155), and from 1990-2010 conducted by the author based on the formula: $\sqrt[years]{\frac{ending\ value}{beginning\ value}} - 1$. The source regarding the method of calculation of the average rate can be found on this site: http://www.investopedia.com/terms/c/cagr.asp%20#%20axzz1YOwbrZj2

However, predictions made by UNWTO suggest that international tourism will continue to grow in the new century, in 2020, the number of international tourists arrivals approaching 1.6 billion (WTO 2011:11). So, at first sight, tourism as an economic sector showed a healthy growth and, therefore, is considered an attractive and safe option for development.

However, the general overall data mask important factors (Sharpley and Telfer 2002:16-17; and Sharma 2004:154-155):

-First, although international tourism can claim to be a growth sector, certain periods showed decreases or even negative growth. OPEC crisis of the mid-1970s, the global recession of the early 1980s and the 1991 Gulf conflict, have led for some countries, a decline in arrivals. Thus, tourism is very susceptible to external influences that, certainly in the short term, can have a significant impact to a tourist destination, regarding tourism's contribution to economic development.

-Second, Shaw and Williams (1994:23) show that global tourism growth does not imply the fact that "mass tourism materialized at global level, and that populations in most countries are caught in a whirlwind of international passenger traffic."Despite the increase in international tourism in some regions, especially in Eastern Asia and the Pacific, the flow of international tourism remains highly polarized and regionalized. That is, international tourism is still dominated in most of developed countries and, in a lesser extent, in developing countries and less developed. Indeed, despite the emergence of new destinations and more popular, such as China, Thailand, etc., the economic benefits of tourism still remain highly polarized (Vellas and Becherel, 1995:21). The largest international movements of tourists take place between well-defined regions, especially in Europe.

Graphic No. 1. The evolution of international tourists' arrivals (expressed in millions of persons) on regions during 1990-2010
Source: made by author on the basis of the statistical data obtained from the work *Faits saillants OMT du tourisme*, 2011:10 Edition, available on:
http://mkt.unwto.org/sites/all/files/docpdf/unwtohighlights11frhr.pdf

The above figure clearly highlights the fact that the number of arrivals on "the old continent", has increased continuously from 250.7 million in 1990 to 507,5 million in 2008 and in 2009 - 2010 compared to 2008 (the year with the largest number of arrivals) were recorded slight decreases of

1.10% (2009) respective 0.97% (2010). Compared with other continents, we see that despite recorded declines in 2009-2010 Europe remains the main destinations of tourists from around the world.

4. Conclusions

The attraction of many countries and regions lies in the natural resources – the sea, the beaches, the climate, the mountains, and so on. This aspect suggests the fact that tourism's development is based on natural resources that are free or "of the country", as far as these don't have to be constructed or created, and "the economic value can be derived from limited resources that may or may not have alternative uses."(Jenkins 1981:86) Similarly, historical sites and attractions, (whether natural or artificial), which have been passed on from generation to generation, can be considered free, although the costs are obviously included in their care, maintenance and management of tourist attractions and resources (Sharpley and Telfer 2002:19; and Sharma 2004:155)

Due to the fact that tourists need a variety of goods and services in the destinations in which they are, including accommodation, drinks and food, entertainment, local transport services, souvenirs and so on; tourism mainly offers more opportunities than other industries, in establishing connections with the entire local economy. Such opportunities include direct links, such as the expansion of the farm industry of the area in order to provide food for local hotels and restaurants (Telfer 1996b) and indirect links, for example, the construction industry.

A variety of other reasons, secondary, can be suggested for tourism's popularity as a development option. These include the idea that tourism development can lead to improvements in infrastructure and in providing facilities that are useful to both local communities as well as to tourists; the fact that tourism often provides justification for the protection of the environment and that tourism can encourage the revitalization of traditional crafts and cultural practices. These secondary reasons along with the primary ones, explain why all the countries of the world have developed, in greater or lesser extent, the tourism industry (Sharma 2004:159).

COOPERATION BETWEEN INSTITUTIONS OF PUBLIC ORDER AND SAFETY FROM BIHOR (ROMANIA) AND HAJDU-BIHAR (HUNGARY): A CASE STUDY

Bucur Cătălin-Adrian
University of Oradea Faculty of Economic Sciences

The forms and degree of cooperation between public order and safety on both sides of the border took on different forms from country to country, from one region to another. Some countries have a very extensive inter-institutional cooperation and substantial, while in other countries relations are characterized by a deep division, competition and lack of communication. To understand existing forms of cooperation, and how best practices can be transferred to some Member States it is necessary to understand the existing diversity across the European Union. This paper focuses on presenting several cooperation projects with direct reference to public order and safety activities implemented in Bihor - Hajdu-Bihar euroregion, within the CBC Programme Hungary-Romania 2004 and especially the project "Mirror network for operative and operational data trasfer", a joint project of cooperation in the public order and safety in Bihor - Hajdu-Bihar Euroregion.
This paper is part of the doctoral thesis on Integrate perspective on companies sector, coordinated by professor Ph.D. Alina Bădulescu from University of Oradea, Faculty of Economics.

1.Introduction

This paper is part of the doctoral thesis on Integrate perspective on companies sector, coordinated by professor Ph.D. Alina Bădulescu from University of Oradea, Faculty of Economics.

Despite the extensive development of management standards common problems of the EU border regions, forms and degree of cooperation between public order and safety on both sides of the border took on different forms from country to country, from one region to another. Some countries have a very extensive inter-institutional cooperation and substantial, while in other countries relations are characterized by a deep division, competition and lack of communication.

To understand existing forms of cooperation, which are the best practices and the extent to which they can be transferred to some Member States is necessary to understand the existing diversity across the European Union. Three characteristics that best describe and explain the diversity and intensity of the phenomenon of cooperation forms (CSD 2011):

> 1. Organizational diversity: in addition to specific duties border police or customs authorities in some Member States, the police or gendarmerie units may have skills in the border area and in others may be involved tax police;
> 2. Degree of competence: in some EU Member States, public order and safety authorities, customs and border police have no jurisdiction to investigate, in others not even patrol outside powers / crossing point border;
> 3. The legislative basis should also be considered in order to cooperation: while in some EU countries there is comprehensive legislation, in others there are only local decisions

or agreements of cooperation, or even just informal cooperation but requires their transformation agreements with legal support.

CBC main areas that can be done in this area (CSD 2011) are:

-Strategic planning

-Communication and exchange of information

-Workflow coordination

-Risk analysis

-Criminal investigations

-Joint operations

-Mobile units

-Emergency and calamity situations

-Joint use of equipment and insfrastructure

-Training and human resources management.

2. Accomplished actions within the Cross-border Cooperation Program Hungary-Romania 2004-2006, in the field of order and public safety (selection) (VÁTI)

In the Bihor - Hajdu-Bihar euroregion, within the CBC Programme Hungary-Romania 2004 may be mentioned several cooperation projects with direct reference to public order and safety activities.

Thus, we refer to the "Training for a Healthy Lifestyle and for spending one's free time properly, drug prevention in Cooperation with the police", ID: HUROSCG0501/018/I/2.3/HU. Beneficiary of the project was Taltos Foundation Program, Békéscsaba County Békés place in Hungary and implementation grant amount being 3,347,228 HUF. The project aimed to create a suitable environment for young people, characterized by a philosophy of joyful, constructive, instead of dependency and self-destructive behaviors. Strategy project sought to replace the problem of drug addiction through various activities, formalized, leisure. During activities focused on the knowledge skills to young people, awareness of the harmful effects of drugs so that they are able to make the right decisions, to learn to say "no" to the pressures of others, to understand that such a decision would to cause problems to discuss and develop skills to use logical arguments, in order to convey a positive effect on friends and groups they belong.

A second project that was "Development of transport infrastructure at EU borders in a Hungarian-Romanian project in the Mirror", ID: HUROSCG0501/019/M/1.1/HU. Beneficiary of the project was public road company, Budapest, where the implementation Békés County, Hungary, and financing amounted to HUF 114,934,800. The rationale of the project based on the fact that acceleration and multiplication of public road and rail traffic is accompanied by a deterioration of the quality of the roads. Their maintenance and repair roads and building new transport routes, have become requirements not only for transport within Hungary, but in the international transit of goods and people, the project aimed at developing transport facilities in the border area. Project funding was directed to link road sections leading to border crossing points from Elek (Hungary) - Guard (Romania), Dombegyház (Hungary)-Variasu-Small (Romania), and Lokösháza (Hungary) - Court (Romania).

Finally, a third project to be mentioned is that entitled "For effective cooperation with police Bihor county (Romania)", ID: HURO0602/117/M/2.3/HU. Beneficiary of the project was police (police captain) of Hajdú-Bihar County, Debrecen, Hungary, instead of implementing the Hajdú-Bihar, Hungary, and the amount of funding amounted to 13,937,668 HUF.

Project financing was used to equip a training hall for producing a publication in several languages, crime prevention and strengthening public safety, to conduct a training project manager, crime prevention workshops and public safety, with the participation of police officers in the counties of Szabolcs-Szatmár-Bereg, Jász-Nagykun-Szolnok, Hungary and that Bihor

County, Romania. Programs were conducted at extremely high standards is very useful effects already seen in labor relations further.

3.Case Study: "Mirror network for operative and operational data trasfer" -a joint project of cooperation in the public order and safety in Bihor - Hajdu-Bihar Euroregion
Bihor County Police Inspectorate won, first in the country, European funding for a mirror project in the border with Hajdu-Bihar County (Hungary) on creating a network to transfer operative and operational data.As indicated to the Chief Commissioner Liviu Popa, Bihar Chief Inspector of Police Inspectorate (at the time) and project manager, in the press conference of 14.09.2007: "... the idea of this project was born from the desire to stand in future structural changes will occur with Romania's integration into the Schengen Area. the abolition of border police, the fact is that police will return a very important role in monitoring trafficking in persons and goods on the border with Hungary "(ziare.com).

The project called " Mirror network for operative and operational data trasfer was located in the North Region - West, Bihor county, Oradea, Romania, and the applicant was Bihor County Police Inspectorate.

Coordinates of the project are:

Priority 2 - Promoting cross-border cooperation initiatives

Measure 2.3 - Encourage cooperation between institutions and communities (projects "people to people", financed by the Small Projects) Phare CBC 2005 /

Contract: EN 2005/017-536.01.01.02.17 (mdrl.ro)

The project proposed improved collaboration between police captain IPJ Hajdu Bihar and Bihar, under the cooperation protocol between the two organizations by developing a system to enable the development of data exchange in real time so that you can coordination of the crisis involving the two institutions (prefecturabihor.ro).

3.1.Premises and framework
The project was founded on the existence of a cooperation protocol between the master and IPJ Hajdu Bihar Bihar dating from 2001. Partnership, which is also currently takes place mainly in combating organized crime, cross border crime and exchange of experience in forensics. This cooperation is carried out through meetings taking place at the border or through the exchange of experience took place in Oradea and Debrecen. This type of collaboration is costly and time, hitting the weights and the border.

The project was established as a natural continuation of direct contacts between the partners involved - IPJ Hajdu Bihar and Bihar police captain and a bilateral partnership agreement concluded, as I said, in 2001.Visits, exchanges of techniques and experience, operational exchanges, solving concrete cases of common crime is continuing actions that took place over 15 years and could improve. The cross-border cooperation in this field can find common solutions to harmonize legislation and to prevent victimization of citizens in communities partners in Bihor - Hajdu Bihar.

3.2.Objectives of the project
The overall objective was to develop a European-style institutions in the Bihor County Police, based on internal policy and transfer of knowledge and expertise in European integration, the Hungarian partners.

In the cooperation that has developed with the police captain of Hajdu-Bihar County, Bihor County Police sought to improve information and communication infrastructure, and to increase training for its staff, using successful experiences in the field of partner, already familiar with European integration issues. The overall objective was based on clear need time resulting from failure to respond to increasing pressures of crime generated by the free flow of movement.

Specific project objectives were:

1. Accelerate information exchange inter-institutional between police inspectorates in the Bihor - Hajdu Bihar Euroregion. Under this objective, we have developed two activities:

-introduction of audio-visual system via internet, purchase computer equipment and communicational equipment that facilitate the development of a network consisting of 6 local users for the county of Bihor able to collect data of operative interest, with possibly for processing in the center of the network (Oradea, Bihor County Police Inspectorate, IPJ). This network is connected with the network existing in Hajdu Bihar Police Captainhood;

-joint publication of materials for the prevention of committing crimes. With the European experience of the partner, Bihor County Police edited documents to prevent victimization adressed mainly to citizens, especially printing of a neccesary support materials to form an harmonized way of operating in the two institutions.

2. Specializations and training of the staff with activities in the field of preventing and combating crime and in the field of information exchange related to cross-border cooperation. Under this objective, we have developed two activities:

-managerial training, in order to transfer managerial experience between partners, with the final objective of improving skills of the institutional staff in terms of on-site investigation, criminal investigation, transfer of information, operations in network

-seminars on crime prevention focused on mutual knowledge - harmonized methods of operation, training and information system in operation with audio – visual equipment, partnership among institutions with responsibilities in preventing victimization and skills development on accessing European funds.

The target group consisted of six municipal and city police offices from the proposed network in Bihor county, institutions with adjacent responsibilities in preventing and combating crime and the final beneficiaries were communities in Bihor and Hajdu-Bihar and staff of institutions involved in the training and specialization, given that the publications were made available for a number of about 20,000 people, and in the training and specialization activities were involved a total of about 50 workers.

The accession process requires the institutional development related to EU requirements. Among these requirements is the increase of the climate of public safety and prevention of victimization. Hencethere is a the need to improve the operational infrastructure and institutions involved in this field skills, and optimize cross-border cooperation.

Experience organization was determined by two approaches: involvement in similar projects accessed by the General Inspectorate of Romanian Police and the Institute for Crime Prevention and Research, but managed locally by the working group IPJ Bihor (MATRA project "Preventing and combating violence in family","Preventing and combating street violence","Institutional capacity building in combating cybercrime"," Patterns of inter-institutional cooperation in countering smuggling in the area of organized crime"," Prevention of juvenile delinquency in schools") and hiring of professionals with proven expertise in project management. The latter come from local institutions with activities in public participation and community development (project OMAT - "Planning traffic in Oradea metropolitan area") and the Hungarian partner, the Police captainhood of Hajdu Bihar County (4 projects TAIEX (Technical Assistance Information Exchange Unit) of European Commission - "Methods of checking the traffic of cars and trucks used in the EU", "The police role in crime analysis", "Current and future role of police and judicial cooperation development in the EU", "Police Cooperation in the organized crime").

3.3.Description of the cooperation actions achieved

Activities undertaken have had as main objective *speeding up the inter-institutional information exchange within the two police inspectorate of the constituent counties of Bihor Euroregion - Hajdu-Bihar.*

Based on the urgent need of effective communication, a first objective of accelerating activity subsumed under inter-institutional information exchange police inspectorates Bihor - Hajdu Bihar was the *introduction of audio-visual system* via the Internet, by purchasing information and communication equipment to enable the development of a local network of six users from Bihor county, able to collect the operative, with the possibility of processing the hub (Oradea, Bihor County Police) and the existing network connection to the Police Captainhood of Hajdu Bihar.

This work has started, like any project, with specific administrative actions: establish the organizational and team work tasks, related to the management plan, listing contact persons and addresses, making newsletters on the project goals and objectives target groups, implementation of project presentation brochures, letters, invitations to target groups, organization and holding a conference to launch the project, with partners in Hungary. On this occasion, the launch took place and a first working meeting of those involved in the project on both sides of the border: the implementation team, representatives of Hungarian, representatives of profile institutions and volunteers.

Then there were a series of meetings of the Working Group on the local information network operators to identify data exchange and establishing networking arrangements, the Working Group meetings with local operators to implement data exchange system.

Note that these activities were organized and implemented by IPJ Bihor, with its own contribution of specialists in IT and media relations and acquisitions, and with the participation of Hungarian.

Later to the acquisition of equipment necessary to implement audio visual system for data exchange (drafting of specifications and tender equipment, identify potential suppliers of advertisements in newspapers, by sending requests to offer specialized companies for goods purchased) was carried out the activation and enabling the communication network and users. This involved: computer work stations connection to the Internet, common training workstation users, establish, jointly with the partner system passwords and computer network security and data exchange protocols work. This time, work was organized and implemented by IPJ Bihar mirror with Hungarian partner, a police captain Hajdu-Bihar County.

The information required for operationalization to realize a common data network. This was achieved by exchanging data from existing databases, the types of crime, Hungarian and Romanian partners, setting out how it actually - the steps for registration, filing or data exchange network, implementation of regular (at least once a week) to the data summaries of the target groups, by type of crime, and communication between the Romanian and Hungarian partners to base decisions on crime prevention, field trips, 10 days per month, to capture the realities of the surrounding areas target groups and recording crime situation.

In case of serious offenses, and making trips have agreed on the spot, capture and storage, electronic, images, and other such evidence incriminating details that will help solve the case and thus to improve security the community. Filling the database with suggestions received from the target groups was carried out by each partner, and Captain Hajdu Bihar Bihor County Police, partners and each providing the necessary data.

Data processing was done by updating the databases created daily, weekly preparation for studying the synthesis of values, data processing decisions based crime prevention in the Euroregion, the returns of each partner to the other end. The work was done by each institution by users.

A second activity subsumed under the same primary objective was the joint publication of books on crime prevention commission. With the European experience of the partner, Bihor County Police took and edited documents that prevention of victimization addressed primarily citizens by printing an appropriate substrate to form a harmonized way of operating in the two institutions.

Made jointly by both partners, this action resulted in the publication, in Romanian and Hungarian theme of preventive educational materials, namely printing of about 5,000 leaflets, 200 posters, 200 brochures and realization of audio 3 spots in Romanian and Hungarian.

These preventive and educational materials were distributed in border crossing points, public institutions, the means of transport, schools, travel agencies, train stations, airports, coordinated action by IPJ Bihor (for its area) and included data summaries provided by the Hungarian partner, which acted similar to the area.

The second objective - *Specialization and training staff with responsibilities in preventing and combating crime in the area related to information exchange and cross-border cooperation* has been achieved through staff training activities.

Thus, management training course was conducted by specialization whose aim was to transfer managerial experience between partners, with the ultimate aim to improve staff skills in terms of research institutions on the ground, concrete actions criminal investigation, information transfer, network operation. This work was prepared in terms of logistics to drive the best results, resulted in final the training of 20 participants for 3 days with intake of 4 lecturers.

An important activity in effective cooperation in the field officers of the Euroregion Bihor - Hajdu-Bihar have set up a seminar on prevention of crimes committed.

This work has been carefully prepared, establishing prevention issues presented by the operational situation, making the media training course maps, logistics etc. The actual work involved produce a series of six seminars, two in Romania, four in Hungary, focusing on mutual knowledge - harmonized methods of operation, training in computer operation system audio - visual, partnership between institutions with responsibilities in preventing victimization and develop skills for accessing funds. Participants were 30 in number, trained by four lecturers in the 6 seminars of two days each. Also, a number of five people participated in the Romanian partner in a series of four seminars organized by the Hungarian partner.

3.4. The impact made on beneficiaries AND T II common

The proposed project aimed to increase the level of safety in communities of the Euroregion, direct meetings of those attracted to the project presentations at the launch of the project, evaluation and finalization, and especially promotion activities in each project, helping to identify communities project and, therefore, to develop new complementarities.

The project was an initiative for the first time in Romania, with the effect of "model" is estimated at that time that could be implemented successfully by other police inspectorates, located in border areas.

The project has attracted other institutions, both in Bihor county, and in Hajdu Bihar: institutions of local government (County Council, Local Councils and Mayors of towns involved), the relevant institutions and the General Inspectorate of Border Police Directorate Customs, Department of Finance, school, University of Oradea, which, as their ultimate beneficiaries, receiving and issuing information or data, participated in conferences launch and completion of the project, promoted and disseminated project results.

The role and contribution of partners, Bihor Police Inspectorate and Hajdu Bihar Police Capitainhood were similar, each being effectively involved in the project by introducing system audio - visual collection and exchange of information, the monitoring of crime in their sector to substantiate joint publication of books on crime prevention commission and the election of current topics, drawn from practice, to organize seminars on crime prevention commission.

The activities proposed, the project aimed to improve inter-institutional collaboration as follows:

-gave an overview of on developing the system to prevent and combat the cross-border crime, identifying concrete ways to undertake in this field;

-promoted the diversification of working methods in regional framework;

-contributed to the improvement of the cross-border co-operation;

-led to improving the information exchange between the components of the target groups;

-generated the development of the infrastructure and services in preventing and combating crime, with emphasis on preventing victimization of national citizens;

-facilitated the harmonization of the relationship between community and institutions responsible to prevent victimization.

In concrete terms, it is estimated that, after the project implementation, in a horizon of 3-5 years, the number of people informed about the commission of illegal acts of any kind in the region increased by about 50%. The project also has generated the possibility of extending the network to institutions with similar concerns.

The project aimed to abandon the perception of competition between border regions and to promote common strategies between institutions involved in promoting, developing and strengthening existing relationships.

The results of the project aimed at increasing prevention and safety in the border area, resulting stability able to determine an important influence on economic growth.

The project proposed and succeeded creating the possibility of a quick resolution for difficult police cases up to that time, setting types in solving such casuistry, creating models of effective cross-border and inter-institutional partnerships for other institutions in the public sector.

The development and cooperation will influence policy decisions at euroregional level and can generate an attitude of support from the part of local authorities for the harmonious development of the safety and public order system.

HUMAN CAPITAL'S IMPACT ON THE PERFORMANCE OF ROMANIAN KNOWLEDGE BASED COMPANIES

Burja Camelia
University „1 Decembrie 1918"of Alba Iulia

To meet the desiderata expressed by the implementation of knowledge-based economy, companies must reconsider development strategies and must facilitate the shift from a management largely based on resource consumption to knowledge-based management. In this view, the importance of the human factor increases, becoming a precious resource that creates value and competitiveness. This paper shows the interaction between company performance and human capital, exemplifying this aspect through a case study based on a regression model in Romanian software companies. The obtained results show the strong connection between company performance, expressed by net income, and the quality of the human capital, synthesized by labour productivity.

1. Introduction

Knowledge based economy requires companies to rethink the role of production factors in creating value and increasing performance. Human resources represent the active and determining factor in the activity of companies. Human capital has a decisive role on the results obtained by companies through the substitution of ideas for physical matter in the process of creating value (Sheehan, 2010). A study conducted by Ernst&Young for 98 listed European companies concluded that human capital contributes an average of 30% to the market capitalisation of a company (Binvel et al., 2010).

Since 1996, Handy has identified that a key element for boosting organisational changes in companies is the good management of employees' knowledge and skills. Thus, human capital opens up new opportunities for economic growth by exploiting the potential of knowledge, creation and innovation of the company. It creates the most important segment of intangible assets and, to the extent that it is used efficiently, it contributes decisively to company performance. Currently, the management strategies applied by companies take into account expanding the techniques of knowledge based management and adopting an integrated vision where the intellectual capital management is promoted in direct connection with organisational learning management and organisational knowledge management. As the implementation of these strategies takes place, the conditions for improving performance through productivity and higher quality arise, which happens through a continuous process of innovation (Minnone and Turner, 2009).

Being in an ongoing process of reorganization of the productive, organizational and legal structures, especially after joining the European Union (2007), Romania has experienced a strong dynamism in the economic sectors, including the software industry. According to Eurostat, between 2006 and 2010, the information technology expenditure recorded an increase of 30.4%.

This study aims to highlight the interaction between performance and human capital within Romanian software companies.

In analyzing the correlations between the performance recorded at microeconomic level and human capital, an important issue is choosing the indicators so that their specific content will better serve the pursued goal. Of the many indicators used to study performance, we chose Net income, which synthetically expresses the efficiency of companies.

Another reason to choose the indicator is that companies don't recognize the intellectual capital used in their practice as an element of asset. Although it is generally accepted that creating value is closely linked to the presence and quality of the intellectual capital, the current financial reports don't provide information regarding the value of these important intangible assets. Therefore, the performance calculated as return on assets (Profit/total assets) is distorted, it excludes intellectual capital and it forms only on the basis of physical and financial assets (Westphalen, 1999).

To show the contribution of human capital to the process of creating value and financial results, the analysis used the labour productivity indicator. This indicator is expressed as a ratio between turnover and number of employees and it reflects the quality of human capital, which has a crucial role in the activity of companies because of its know-how and skills.

To achieve the main objective of this paper, we used an econometric analysis method, namely the multifactor analysis. The analyzed data regards 138 software companies in 2008 and 2009.

The obtained results show that in the Romanian software industry, human capital is a factor that leverages the firm, providing a competitiveness advantage. Directing decision-making factors to better monitor and manage these assets is an important way to increase performance and competitiveness in knowledge-based companies.

Measuring the performance obtained by a company on the basis of its intellectual capital is a difficult problem. First, it is necessary to define the company's knowledge assets, the intellectual capital and its components for a better management and, of course, it is necessary to use appropriate methods for assessing the impact on financial results.

Most frequently, the concept of human capital refers to a combination of skills, experience and competencies that gives staff a productive potential (Foong and Yorston, 2003).

Traditionally, the contribution of human capital to the economic performance of a company may be assessed by studying aspects regarding employment of personnel and the influences exercised by employees on performance indicators (Burja, 2003). It is believed that currently there is no comprehensive system for the financial expression of human capital, which can also be an instrument used by companies to monitor and control the conversion of knowledge assets, and therefore of human capital, into value, which makes it necessary to introduce a new performance measurement and accounting system (Daum, 2003).

In practice, there have been a series of researches conducted to quantify the connection between human capital and the performance measured through shareholder value. An example is the study conducted for companies from Europe and Asia by Watson Wyatt (2001). With the score provided by Human Capital Index, the study highlighted the existence of a cause and effect relationship between human capital management and the future share price of a company.

Another way to measure the value created by knowledge assets is the one based on the production function concept, according to which economic performance is a function of various production factors synthesized in physical assets, financial assets and intangible assets (Gu and Lev, 2001).

For Romania, a study conducted by a group of American researchers through panel data techniques on 297 small enterprises showed that human capital has a low impact on growth (Brown et al., 2004).

2. Data and methodology

The exploratory research presented in this paper aims to determine the relationship between human capital and economic performance in Romanian knowledge-based companies, contributing to widening the perspective on ways to increase the competitiveness of companies.

The information about software companies was gathered from the database "Total Firme Romania", which is the biggest electronic catalogue of companies in Romania. It includes identification data and financial data going back to the year 2006.

The data sample taken into account for this research includes companies involved in manufacturing software on commission, CAEN 6201 (CAEN means Romanian National Classification for Economic Activities - NACE). The reason for choosing software companies consists in the fact they are active in the area of knowledge management.

When we consulted the database (November 29, 2011) there were 161 companies enlisted under CAEN 6201. We conducted a selection according to the criterion "more than 10 employees" and the existence of complete information about financial indicators. We chose a number of 138 companies with information available for the period 2008-2009, companies that manufactured software on commission. At the end of this selection, we had a balanced panel data of 276 firm-year observations.

Our study used the multifactor regression analysis, which allowed taking into account the factors relevant for analyzing company performance.

In this study, company performance was measured by Net income, having information provided by the financial statements of the studied companies. The indicator Earnings before interest and taxes was used in the analysis of performance and of the value created by human capital in several German companies (Scholz and Muller, 2010).

To quantify the influence of the determining factors, we used the approach suggested by F. Gu and B. Lev (2001), according to which, at microeconomic level, economic performance is a function of physical capital, financial capital and human capital used in production. The lack of explicit information in the database, particularly for the various forms of financial capital, has led to the use of the indicator Total capital, which largely includes the stable funding sources used to finance the business.

According to data presented by Foong and Yorston (2003), companies from Great Britain use various indicators to measure human capital: Employee Turnover, Absentee Statistics, indicators regarding: Competencies/Training (Performance reviews, appraisal completion, Training per employee, Staff with professional qualifications, Competency ratings, Mistakes, Exam passes, Quality of leadership based, Average educational level), Employee productivity (Profit per Employee, Revenue per Employee, Wealth Created per Employee, Cost per Employee, Productivity measures), Workforce profile, Employee attitude/Engagement, Employee Compensation, Recruitment, Health and Safety etc.

Of these indicators, our paper used Employee productivity calculated as the ratio between sales revenue and number of employees. Due to its content, this indicator connects human capital management to company performance, which corresponds with opinions formulated in various studies that analyzed labour resources and performance (Gratton, 2000), (Foong and Yorston, 2003). Sales revenue per employee ratio expresses the contribution of the personnel to revenues and profit from the sale of production and provides information about the efficiency and financial health of the company (Vause, 2009). This indicator is particularly useful for studying the impact of human capital in the same company during a period of time or for the analyses conducted by operators in the same industry.

The dependent variable used to assess performance is Net income (NI). The explanatory variables are Total capitals (TC) and Sales revenue per employee ratio (SRER), which valuates the contribution of human capital to value creation. The descriptive statistics of the variables used in the analysis are presented in table 1.

Table 1. Descriptive statistics of variables

Variables	Mean	Maximum	Minimum	St. Deviation
Net income, lei	395820.7	12711734.0	-1042753.0	1408500.0
Total capitals, lei	1067135.0	43242701.0	-2010270.0	4072814.0
Sale revenue per employee ratio, lei/pers	129235.2	1186248.0	3000.0	150325.8

Source: realized by the author based on data available on www.totalfirme.com

The average net income achieved between 2008 and 2009 by the analyzed software companies was 395,8 thousand lei, recording a maximum of 12711,7 thousand lei and a minimum of -1042,7 lei. The average capital used by software companies was 1067,1 thousand lei, and the largest capital was 43242,7 thousand lei; however, there are companies that use sources other than their own to finance their business. The average productivity of an employee was 129,2 thousand lei, with a maximum of 1182,2 thousand lei/person and a minimum of 3000 lei/person.

3. Human capital's impact on performance- Empirical analysis

To investigate the behaviour of the performance indicator, one can use two models. The first model expresses the interdependency between net income and total invested capitals. The second model reflects the interaction between net income and the variables Total capitals (TC) and Sales revenue per employee ratio (SRER):

$$NI = \beta_0 + \beta_1 \cdot TC_{it} + \varepsilon_{it} \qquad (1)$$

$$NI = \beta_0 + \beta_1 \cdot TC_{it} + \beta_2 \cdot SRER_{it} + \varepsilon_{it} \qquad (2)$$

where: ε is the residual variable;

β_0- intercept;

β_1, β_2 - regression coefficients that indicate independent variables' effect on the dependent variable;

i - firms (cross-section dimension)

t - years (time-series dimension)

Estimating the impact of human capital on performance in the selected software companies was achieved with the help of the cross-section SUR PCSE methodology, which is appropriate for the analysis of data with many cross-sectional units and relatively short time-series (Beck and Katz, 1995). Assessing the accuracy of the models and their trust level for future predictions was based on the results of statistical tests regarding the violation of basic hypothesis of linear regression, namely: non-normality of variables, non-stationarity of time series data, multicollinearity of variables, autocorrelation and heteroscedasticity. The predictions for the two models and the results of the regression analysis are presented in table 2.

Table 2. Regression analysis - Performance determinants for software companies – 138 Romanian software companies, 2008-2009

Dependent variable - Net income				
Model	Explanatory variables	Regression coefficient	t-Statistic	VIF
M1 R² ajust 0.812 F-prob 0.0000	Intercept	63031.3	-	-
	Total capitals	0.312	7.30 (0.0000)	1.00
M2 R² ajust 0.817 F-prob 0.0000	Intercept	-17762.5	-	-
	Total capitals	0.307	6.92 (0.0000)	1.04
	Sales revenue per employee ratio	0.667	2.31 (0.0214)	1.04

Source: realized by the author

Note: in parentheses are p-values robust for heteroskedasticity and contemporaneous correlation resulted by cross-section SUR (PCSE) using Panel Correlated Standard Error methodology standard errors & covariance correction

Model 1. The regression results obtained by model 1 indicate that the financial results of the selected software companies were positively influenced by the size of the capitals used in their activity. The increase of the capitals by one value unit led to a profit increase of 0.312 lei.

The calculated value of statistic t for Total capitals exceeds the table value, $|t_{TC}| > t_{0.05;274} = 1.96$, which indicates that the prediction is statistically significant, having a 95% probability to guarantee the results. In these conditions, it can be said that the corresponding explanatory variable influences the dependent phenomenon. At the same time, the low value of Variation Inflation Factor suggests that the prediction can be slightly modified by the presence of multicollinearity.

Using the OLS technique with panel-correlated standard errors (PCSE) treated the potential problems related to group-wise heteroskedasticity and contemporaneous correlation.

The coefficient of multiple determinants (R^2 adjusted) shows that the performance of software companies is largely determined by the managed assets, so that the variation of profitability may be explained in proportion of 81.2% by the indicator Total capitals.

Model 2. The second model is run by using the dependent variable Net income and the explanatory variables are Total capitals and Sales revenues per employee ratio.

The coefficient of multiple determinations is 81.7%, being higher that the one of model 1, which shows that the second model is better at explaining the factors that determine the profitability variation of companies.

By monitoring the obtained coefficients, one can notice that there is a positive relationship between the two influence factors and the profitability of the studied companies. The coefficient for Total capitals is 0.307 (p value is 0.0000), and for sales revenue per employee ratio is 0.667 (p value is 0.0000). The low values of VIF indicate the absence of multicollinearity between estimators, which are significant for the studied phenomenon.

The obtained results suggest that increasing or decreasing capitals and human capital influences significantly the performance of software companies. The size of the estimators for the two explanatory variable shows that the change in company performance was mainly due to the influence of human capital, whose impact was two times higher than the impact resulted from the use of other capital forms.

4. Conclusions

The analysis performed on a representative sample of 138 Romanian software companies for the years 2008-2009 highlighted the existence of a positive connection between performance and the elements of the capitals managed by these companies.

The regression coefficients obtained for Total capitals (model 1 and model 2) suggest that the profitability variation was due in proportion of approximately 31% to the influence exercised by the management of the assets. However, the influence of the human capital identified by using the second model was decisive, the impact of quality and of the efficiency of the human factor causing a change in performance of 66.7%.

The coefficient of multiple determinations (model 2) shows that approximately 81.7% of the manifestation law of profitability may be explained by the identified factors.

The results back-up the conclusions of studies regarding knowledge-based economy, where it is considered that in addition to technology and connectivity, human capital plays an increasingly dominant role, which reflects in the financial results of a firm (Low, 2000), (Seetharaman, Sooria, & Saravanan, 2002), (Gratton, 2000),).

This study shows in the Romanian software industry, the close dependence between performance and the human factor is obvious, the human capital being the main element in creating value. Making better use of the creative and innovation potential and of the potential of the labour force, especially of the high-skilled staff, is an important way to increase company performance and

competitiveness, aspects that give them a qualitative economic development and helps them to survive in a competitive environment.

The findings of the study show that at least in Romanian software companies, managers can create more value for their shareholders by increasing the knowledge of labour force. At the same time, the findings can be useful for decision makers from other enterprises and institutions that play a role in the education and training of the labour force, in identifying real strategies to create, use and improve human assets, thus stimulating performance growth and the development of elements specific for Knowledge economy.

GLOBALIZATION AND MASS-MEDIA IN THE CONTEXT OF ECONOMIC CRISIS

Burtic Daniel
University of Oradea, Romania Faculty of Economic Sciences

Globalization is a reality that we cannot deny or run away from. The economic, political or social issues, even if they have a starting point, spread very quickly, covering large areas in a very short time. Modern communication systems enable crisis transfer. They also bring us information about the actions that have been taken in order to overcome those critical circumstances. Does recession have positive aspects, too? If it has, what are these positive aspects and how can they be used to produce highest benefits? We will try to describe the concepts we maintain by means of some notorious works written by authors with a vast experience, some of them being Noble Prize winners. The idea that we propose is to bring hope out of this situation generated by crisis and globalization. The economic crisis has created a huge opportunity to the mass-media system: it brings the required information to citizens from different nations. Taking this into account, mass-media has played and still plays an important part in making the people involved find solutions and communicate whenever the decision makers are trying to hide facts. With the help of innovation and transformation, let's look for solutions to develop our abilities, relationships, products, markets and results. We should never forget that the greatest and most impressive changes are often born in times of crisis.

I. Introduction

Is it professionalism or pure coincidence? This question arises every time we look for success factors when dealing with crisis situations. Is it enough being happy with the reality of globalization and copying other people's solutions, hoping they will also be good for us, or should we do more? This is our main concern when approaching the globalization phenomenon, a concern which is deepened by mass-media in the context of economic crisis. This is the reason why, in the first part of this study, our aim is to approach globalization and present economic crisis on a positive note, emphasizing the opportunity we have to find appropriate solutions to the complex circumstances we are facing. In this process, the first winners are those who overcome crisis successfully and manage globalization skillfully. In the second part, we will try to demonstrate the link between globalization and mass-media, having in mind the dissemination of the flow of information. We would also like to reveal the dark side of mass-media; the costs regarding time and resources which especially the young generation pays for this modern vice called multimedia. The perspective from which we approach this subject is related to immediate every day reality. Our aim is to provide a descriptive and explanatory study. From this point of view, our analysis will sometimes become passionate, but will be strongly rooted in the reality that is shaped by each and every action of man.

II. Globalization and economic crisis

When discussing about globalization and future, we cannot ignore economy and mass-media, because both are essential and decisive factors in modern man's life. Globalization can be analyzed in 2012 from the perspective of economic crisis and of the adopted solutions as well as from the perspective of its consequences on the entire world. The economic crisis we are now undergoing is one of the deepest crises ever existed. „When crises acquire worldwide

dimensions, as it is often the case with the worst ones, their end depends on the possibility that the international reaction should be characterized by cooperation or conflict. In this case there are so many things at stake. If they are not given much attention, crises will bring about huge losses, wiping out industries from the face of the earth, destroying wealth, leading to massive dismissals of employees and overloading the administrative department with heavy taxes. But it's even worse than that. Crises overthrew governments and bankrupted nations; they forced countries to apply the *lex talionis* and get involved in commercial wars. Sometimes crises paved the way to armed conflicts, in the same way The Great Depression prepared the ground for the Second World War. We are not allowed to ignore crises." (Roubini and Mihm 2010:36). In this respect, both on a macroeconomical and microeconomical level, the present stage is characterized by all kinds of challenges, unknown things as well as opportunities which should not be overlooked.

A. Crisis or growth?
It seems that in every person's life moments of crisis mingle with moments of growth. Is giving birth to a child a moment of crisis? What about weaning? Are puberty, adolescence, looking for a job, marriage, having the first child, all moments of crisis which indicate each person's growing up and development? We can ask ourselves if all these elements in somebody's life are crises or growth stages. It is true that when we undergo them, we feel pain rather than pleasure and disappointment instead of hope, but when all these become simple memories, we understand that they actually were growth stages. We forget all the pain and remember only the beautiful part. „In economic analysis, we start from man and his needs. The evolution of human society is actually the history of a constant growth process, multiplication and diversification of needs and this evolution process interwove with the entire development and progress of society." (Bădulescu and Vancea 2011:7)
Similar to man's life, but on a much larger scale, the life of nations and of all mankind carries on. There are many records which prove that difficult economic stages have given birth to spectacular ideas, which turned hardships into opportunities. In 1937, Howard Stephenson wrote a book, *They Sold Themselves*, about people who could easily find a job during the devastating economic crisis in the 1930's. He says that those who were successful in finding a job were „people who didn't have a brother-in-law to hire them to sweep the floors of a warehouse; these people were full of creativity and managed to fill good positions or even started their own business which brought them satisfaction and prosperity." (quoted by Roubini, Mihm, 2010:41). In this respect, we have the example of George Washington Carver, who was born into slavery, lived till the age of 10-12 on the cotton plantation of his first master and afterwards worked as a servant in different households. He finished high school after he had been 20 years old, then he took the degree of Bachelor of Science and a master's degree at the Iowa State Agricultural College. The Alabama state built him a national monument because after the cotton crops had been devastated by the cotton beetle, Carver promoted and organized the cultivation of fields with peanuts, sweet potatoes and beet root, helping people in Alabama become rich.
The moments of crisis are difficult especially when you experience them personally. But your whole perspective will change when you see them as growth stages. Here is how, in 2009, a year after he had been awarded the Nobel Prize for economy, Paul Krugman spoke about the Great Depression from the 1930's: „When they think about this topic, most of the economists consider the Great Depression from the 1930's a free tragedy, which they think wasn't necessary." (Krugman 2009:7). Mister Krugman continues saying that three or four measures would have been enough and, if they had been adopted in 1929, they would have led the following year to a „kindergarten recession". Even to this famous economist, the crisis that started in 2008 carries within itself a much deeper anxiety than the one from 1930. Why is it so?

B. Trust or mistrust?

If we remember history well, when states emerged in Europe, people put their hope in the state. The state was the agent or the instrument which would solve all the problems. It was empowered to do justice by the laws it issued and applied. The state was also in charge with education, health and citizens' safety. Whether we refer to the communist or the capitalist state, each of them tried to show its almightiness. First, the communist state revealed its real face and the most obvious aspects were the economic incompetence and the leaders' lack of ethics. At the end of the 80's, the European countries, some which underwent violent revolutions while others experienced „velvet" revolutions, passed from communism to capitalism. In capitalist vision, the role of the state is still very important. In every election campaign, politicians promise to solve all people's problems. Of course, they promise more than they can do or even intend to do. Thanks to mass-media, the public opinion has become more and more aware of the discrepancies between words and facts. It seems that nowadays people trust less and less those who represent the state, no matter who these are or whatever state we refer to. Every day mass-media brings into light many corruption cases or, at best, cases of administrative incompetence. The „almighty" capitalist or communist state went bankrupt.

Together with the establishment of capitalism, we have witnessed another worshipping, namely to the market. It was said that the market would bring solutions to every problem. „Let the market function and everything will be all right!", was the idea we've heard from many political and economic decision makers. But lately we have witnessed the market bankruptcy. The instability is so big that we need more and more money to cover at least the critical part of deficits. Disappointed by the state, by the market and by the system, people have started going out in the streets. Last year we saw what happened in London, in New York, in the African states and in Greece, when extremely unhappy people protested and almost all these demonstrations degenerated into acts of violence. Unfortunately, in the first part of this year people from Romania have gone out in the street, too. It seems that their protest does not regard only one aspect, but is caused by dissatisfaction on multiple levels.

Beyond what it can be seen, a collective conscience seems to take shape and this phenomenon is prompted by the modern means of communication. Nowadays, information spreads at a very high speed. We read or listen to the news, but the whole process is much more complex, we take over unconsciously and involuntarily the mentality of those who convey us the information. Here is how the famous psychologist C.G. Jung explains this phenomenon: „Each Roman was surrounded by slaves. The slave and his psychology invaded ancient Italy and every Roman became in his own self a slave, without even noticing it. Because Romans lived on a constant basis in a slave context, they were unconsciously infected with their psychology. No one could avoid such an influence." (C.G. Jung 1928:135). C.G. Jung's diagnosis is also valid for our society. Dissatisfaction as well as a negative vote is rather a rule than an exception.

If we come back to the economic field, in our opinion in this period of time the nations' leaders, especially those involved in the economic sphere, have adopted an anti-panic management strategy. Therefore, they speak of debt guarantee funds in order to „settle down markets". They also speak of a „negative economic growth", instead of an „economic decrease", so different communications strategies are set up rather than some practical recovery measures. In this context, we wonder how big will be our losses in reestablishing a proper balance? And our second question is how big will be the invoice or the share each of us will have to pay for? Will this generation try to pay the bill or will it condemn the next generation to cover its cost?

III. Globalization and mass-media

We live in a world which absorbs more and more information. The economic crisis has increased both the amount of information that is supplied and the demand for information. More than that, the flow of messages carries the deep mark of the worldwide area. The interest of the citizens

who live in more developed countries is not limited to the events taking place in their own country, but to all the factors involved in the worldwide stage which have an impact on the entire world's economy. In the same way, the community members of less developed countries have learned from the very first days of the economic crisis that what happens in their countries is the direct result of the worldwide economic situation or, more precisely, of the events taking place in the more developed countries. Thus, we can see the interest of all parties in finding out more and more. Mass-media has proved to be extremely skillful and examined this issue in every possible way. Each news bulletin has received a double amount of space from the time allocated to the economic field. Analysts, economists, politicians, jurists and other specialists have been invited to debates, which turned either violent or peaceful, each debate trying to meet the increased demand for information. In this way, mass-media represents an important tool in the globalization process. „In the last few decades, the world became more and more «globalized». Goods and services trade reached an international dimension and this is also the case with migration of work and spreading of information. Globalization went hand in hand with technological progress, each supporting the other." (Roubini and Mihm 2010:498) As Roubini suggests, on the overall the main feature of globalization is the continuous flow of information, propagated all over the world by media industry at a very high speed. The development of the communication system had a huge impact on all countries.

A. Mass-media – globalization accelerator

One of the accelerators of globalization is television. This filtering tool and means of broadcasting information on a global level enables social exchanges and also promotes and outlines behavioral patterns and lifestyles. The impact of movies on viewers is not limited to the time spent in front of the TV set, but extends to the values which are presented, taken over and eventually adopted. Mediafax quotes from a research made by Eurodata TV Worlwide, which shows that the inhabitants of the earth spent in 2009 an average of three hours and 12 minutes daily in front of their TV set,

Timpul petrecut la TV

Minute pe zi

Regiuni

Series1

Source: Mediafax

which indicates an increase of 3 minutes compared to 2008.

„Therefore, this research shows that as a result of recession people haven't changed their behavior towards their use of mass-media. As far as a region analysis is concerned, the North America consumers spend the longest time in front of their TV sets, with an average of four hours and 40 minutes daily, followed by those from Middle East, who, on the average, watch TV four hours and 34 minutes daily and by those from Europe, who watch TV programs three hours and 42 minutes. In Latin America, a normal consumer watches TV around three hours and 30 minutes daily, while those from Asia-Pacific region spend around two hours and 41 minutes in front of their TV sets. Africa is the only region where the average time spent by consumers in front of their TV sets hasn't increased, but remained constant to three hours and 52 minutes." (Mediafax)

B. The dark side of modern systems of communication

It seems that television remains one of the most enjoyed sources of information for the postmodern man. Nowadays man's life without a TV set is unconceivable, even if many things have been said or written about the dark side of the television impact. In almost every home, the

TV set, whether it is bigger or smaller, expensive or cheap, represents a props element of the living room and sometimes of the bedroom.

As a globalization tool, the internet skips some of the underdeveloped regions, overlooking the population from the poorest areas of the earth which, out of economic reasons, doesn't have access to internet. Even if internet represents an efficient means of communication and information, its participants being able to exchange messages quickly in spite of the huge distances between them, it can have negative connotations. Especially for children, internet is time and resource consuming. In our globalized world, internet tends to become a life pattern changing tool.

A research on the behavior of 8 to 18 years old mass-media consumers, initiated by Kaiser Family Foundation and published in 2010, shows that the time children spend in interaction with mass-media is gradually growing. (Kaiser Family Foundation)

According to this research, children spend 7 hours and half daily interacting with mass-media. In 10 years, we notice an increase in mass-media use to 79 minutes daily. This research also shows that a portion of time children are connected to several media channels and, if we sum up all the hours, we come to an average use of mass-media services of 10 hours and 45 minutes per day. So, in 10 years we have an increase in mass-media use of 3 hours and 15 minutes daily.

Media Use Over Time

Among all 8- to 18-year-olds, average amount of time spent with each medium in a typical day:			
	2009	**2004**	**1999**
TV content	4:29[a]	3:51[b]	3:47[b]
Music/audio	2:31[a]	1:44[b]	1:48[b]
Computer	1:29[a]	1:02[b]	:27[c]
Video games	1:13[a]	:49[b]	:26[c]
Print	:38[a]	:43[ab]	:43[b]
Movies	:25[a]	:25[ab]	:18[b]
TOTAL MEDIA EXPOSURE	10:45[a]	8:33[b]	7:29[c]
Multitasking proportion	29%[a]	26%[a]	16%[b]
TOTAL MEDIA USE	7:38[a]	6:21[b]	6:19[b]

Changes in Media Use, 2004–2009

Among all 8- to 18-year-olds, change in average amount of time spent with each medium in a typical day:

[†] Not statistically significant. See Appendix B for a summary of key changes in question wording and structure over time.

Source: Kaiser Family Foundation

If we study the behavior associated to mass-media use during 2004-2009, we notice an increase in the average amount of time spent daily as follows: music-audio 47 minutes, TV 38 minutes, computer 27 minutes and video games 24 minutes. In 2009, there was a decrease of printed materials. It seems this was only the beginning, because after 2009 we witnessed an accelerated decrease in printed media product use.

But the biggest difference in TV watching is that nowadays 8 to 18 year-olds, on the average, watch daily around one hour (56 minutes) of TV content and movies on other platforms, too, including internet (24 minutes), cell phones (15 minutes) and iPods (16 minutes).

Talking and Texting on a Cell Phone

Among 8- to 18-year-olds, time spent in a typical day using a cell phone for:												
	Among all	AGE			GENDER		RACE/ETHNICITY			PARENTS' EDUCATION		
		8-10	11-14	15-18	Boy	Girl	White	Black	Hispanic	HS or Less	Some College	College +
Talking	:33	:10[a]	:36[b]	:43[b]	:28[a]	:38[b]	:25[a]	:46[b]	:37[b]	:35[ab]	:41[a]	:28[b]
Texting[†]	1:35	~	1:13[a]	1:51[b]	1:14[a]	1:58[b]	1:22[a]	2:03[b]	1:42[ab]	1:40[ab]	1:56[a]	1:21[b]

Note: Statistical significance should be read across rows, by section.
[†]Among 7th–12th graders only.

Source: Kaiser Family Foundation

Concerning the use of cell phones, the research indicates an obvious tendency in using this terminal more for texting than for talking. Only one third of the time the cell phone is used classically, two thirds being used for written communication.

Time Spent with Cell Phone Media, by Demographic

Among 8- to 18-year-olds, time spent in a typical day using a cell phone for:									
	Among all	AGE			GENDER		RACE/ETHNICITY		
		8–10	11–14	15–18	Boy	Girl	White	Black	Hispanic
Listening to music	:17	:08[a]	:18[b]	:23[b]	:16	:18	:08[a]	:35[b]	:21[c]
Playing games	:17	:06[a]	:18[b]	:22[b]	:17	:16	:09[a]	:29[b]	:24[b]
Watching TV	:15	:06[a]	:15[b]	:22[b]	:14	:17	:09[a]	:23[b]	:19[b]
TOTAL CELL PHONE MEDIA	:49	:20[a]	:51[b]	1:06[b]	:47	:51	:26[a]	1:28[b]	1:04[c]
Percent who did any of the above	43%	28%[a]	48%[b]	48%[b]	42%	44%	33%[a]	59%[b]	53%[c]

Note: Statistical significance should be read across rows, by section.

Source: Kaiser Family Foundation

Our contemporary society joins the virtual media on a constant basis, which is increasingly accessed from mobile terminals. The cell phone is often used for listening to music, playing games and watching TV. Almost half of its use time, the cell phone is used as an internet access terminal. Coming back to the economic aspect, internet is the medium in which on-line orders and financial transactions are made, being the new human interaction platform. Optimism or skepticism regarding internet doesn't change the reality of on-line expansion in all fields. The use of the internet is vital both for local and worldwide economy.

IV. Conclusions

„Nothing lasts forever, and crises will always come back. But they should not darken our horizon; they should not overshadow permanently our economic existence. If we set up protective dams around our financial system, we will be able to overcome the crises of the coming years. Although high waves will roar against us, we will be protected. But if we don't manage to get ready for inevitable hurricanes – if we deceive ourselves, thinking our obsolete defenses will never be broken – , the danger of future floods will surely lie ahead of us." (Roubini and Mihm 2010:460)

In the first part of this study, we tried to show that globalization and present economic crisis also have a positive aspect, emphasizing the opportunity we have to find appropriate solutions to the complex circumstances we are facing. In this process, the first winners are those who overcome crisis successfully and manage globalization skillfully.

In the second part, we tried to demonstrate the link between globalization and mass-media, having in mind the dissemination of the flow of information. The negative aspects are related to the costs regarding time and resources which especially the young generation pays for this modern vice called multimedia. The perspective from which we approached this subject is related to immediate every day reality.

We've got crisis, globalization and mass-media, but what are we doing about them? „Globalization is a reality, the reality of our times, having positive outcomes, as science propagation, but also vicious effects, as the lamination of national cultures. Nowadays the idea of

refusing or accepting globalization cannot even be raised." (Guetta 2000:328) With the help of innovation and transformation, let's look for solutions to develop our abilities, relationships, products, markets and results. We should never forget that the greatest and most impressive changes are often born in times of crisis.

We have got crisis, but can we make an opportunity out of it!?

SECTORAL RISK AND RETURN FOR COMPANIES IN ROMANIA

Lala – Popa Ion

Risk is an important factor in explaining capital structure choices of companies.Risk is the probability that cash flows or return will vary from expectations. Standard corporate finance theory supposes that a company chooses a capital structure that maximizes company value. A fundamental idea in finance is the relationship between risk and return. The greater the amount of risk that an investor is willing to take on, the greater the potential return. The reason for this is that investors need to be compensated for taking on additional risk. Why put capital at significant risk for a return that is no higher than the return on government bonds? Or expect higher than averages returns from low-risk activities? It is impossible to separate measuring the performance of a company from the risks that the management takes to achieve it.In most aspects of company operations, risk assessment plays a different but equally important, role. It is an integral part of informed decision taking in achieving performance. Risk assessment is involved from the highest level in strategic choices about what activities to undertake, what assets to buy or what markets to serve all the way to detailed operational decisions about whether to accept payment in foreign currencies and the adequacy of safety measures in the workplace. It plays a part whether or not an organization is aware of managing risk and many managers feel that their instinct and judgment are enough – a behavior risk. The danger is that this leaves company risk unplanned and unmanaged. This paper proposes a framework where we realized a study cases: we test if return on assets and return on equity has influence on the risk, both on long and short term. For this purposes, we conduct an empirical research that covers 59 selected companies traded at the Bucharest Stock Exchange within the time period 1999-2010. For this study our results reveal that dynamic global risk can be associated to a low intensity with total assets performance of the company's. Investments efficiency and the adoption of certain financial positions appear to be key factors in the dynamics of risk.

1. Introduction

To illustrate the connection between the rates that reflect the companies' financial performance, namely the return on assets and the return on equity and a measure of the existing overall risk in the companies, measured by changes in net profit, we considered 59 companies in category I and II listed on the Bucharest Stock Exchange, cases synthesized by the following indicators:
- net profit;
- return on assets – ROA (Net income/Total Assets);
- return on equity – ROE (Net income/Shareholders equity) .

The data are grouped into two sectors conventionally defined to allow noticing the features that the branch / industry sector induce in the "optimal" levels of the rates. The two sectors are grouped as follows:

- Sector 1 - light industry - includes: Chemical Industry, Drugs and Medical Products, Telecommunications, Plastics, Tourism and Hotel Services;

- Sector 2 - heavy industry - includes: Oil Industry - including services related to extraction and processing, Mechanical Engineering, Metallurgical / Steel Industry, Civil and Industrial Constructions, Materials Processing Industry.

2. Methodological framework

The System GMM methodology proposed by Arellano and Bover (1995), Blundell and Bond (1998, 2000) and Windmeijer (2005) is concerned because estimators such as fixed and random effects, IV or the standard GMM could lead to biased results. Also, since a small sample of panel data can produce a "downward inclination of the estimated asymptotic standard errors" in the two-step procedure(Baltagi, 2008: 154), we will use the "Windmeijer correction" for the estimated standard errors.

There are several advantages of GMM - System compared with other static or dynamic methods of estimation of panel data. In the database we have 59 companies (N) divided into two sectors analyzed over a period of 12 years :1999 – 2010 (T). The literature establishes several reasons for using dynamic panel model because it is designed for a situation where "T" is less than "N" in order to control the dynamic panel (Bond, 2002; Baltagi, 2008); the potential endogeneity problem can be easily addressed in the dynamic panel models than in the static and in the LSM(Least-Squares Method) models because all the regression variables that are not correlated with the error term (including the lag and differential variables) can potentially be used as valid instrumental variables; the dynamic panel model is able to identify the implied short- and long-term effects (Baltagi, 2008); the GMM system exploits the stationarity restrictions, while the first differencing GMM estimator can behave poorly when the time series are persistent; if the panel data are unbalanced, then the first-difference GMM methodology may amplify the differences between them (Roodman, 2007) and so on.

Consequently, we will use the system GMM estimator trying to compensate for these specific problems in a small sample of data.

The purpose of this study is to test the following meta-hypothesis:

H: the return on assets and return on equity influences the company risk change for both long and short periods of time.

The implicit formal model of H can be formulated as follows:

$$R_{i,t} = \propto_i + \omega_t + \rho * R_{i,t-1} + \beta * Re_{i,t} + \theta * Rf_{i,t} + \varphi * Z_{i,t} + \varepsilon_{i,t}$$

Where $R_{i,t}$ is the risk level of a sector calculated in our study by the net profit, $Re_{i,t}$ is the return on assets, $Rf_{i,t}$ is the return on equity, $\propto_i$ represents the specific time invariant

unobserved effects, ω_tI captures a common deterministic trend, Z is a set of tools for R and Re and $\varepsilon_{i,t}$ is a random disturbance considered to be normal and identically distributed (IID) with $E(\varepsilon_{i,t})$=0; $Var(\varepsilon_{i,t}) = \sigma^2 > 0$.

3. Risk - Return Correlation estimated by applying the GMM System

To illustrate the connection between the rates that reflect the companies' financial performance, namely the return on assets and the return on equity, and a measure of the existing overall risk in the companies, measured by changes in profit, we considered the 59 companies in category I and II listed on the Bucharest Stock Exchange, divided in two sectors conventionally defined. Data processing was carried out in DPD (Dynamic Panel Data), a program that facilitates the estimation of the dynamic panel data models.

The estimation strategy carries the running of a separate regression for highlighting the existing connections between each of the estimation ways of the overall risk and rates of return for each sector. An additional step in the advanced analysis is the development of regressions in panel data in order to estimate the intensity of the connections that can be outlined between the various forms of estimation of the dynamic in the outcome indicator changes (as a measure of the overall risk as shown in the company) and economic and financial rates of return.

The data are grouped as follows:
- at the level of the entire set of observations by grouping all the companies within each sector in a single set;
- at the level of each sector, considered separately.

The implementation of the estimation strategy involves:
- obtaining of the regression parameters;
- the estimation of the intensity of the links between endogenous and exogenous variables in terms of Student t-test (an empirical value of this test greater than 2 reflects a significant connection; the higher this value is so can be presumed the fact that the bond strength is more pronounced);
- the estimation of the instrumental variables accuracy in terms of SARGAN test (an empirical value of this test as close to 1 percentage point reflects a correct estimation of the residual variables).

a1. The connection between the net profit and ROA and ROE -sector 1
Dependent variable: net profit
Method: Dynamic Panel Generalized Method of Moments (GMM – System)
Transformation: first-order difference (orthogonal deviations)
Total comments included (balanced panel): 384

Variable	Coefficient	Standard Error	t-statistic	Probability
Return on assets	0.83	0.09	8.65	0.299
Return on equity	0.009	0.009	1.04	0,428
Sargan Test	31.59 [1.000]			

According to these results, return on assets has an explanatory power in forecasting the net margin rate at the level of sector 1. Based on the value of the Sargan test, one can assess the model relevance chosen through the correctness of the chosen instrumental variables.

In order to avoid some multicollinearity problems that can be induced by the structural connections between financial indicators considered, we will conduct separate regressions for each explanatory variable.

a2. The connection between the net profit and ROA - sector 1
Dependent variable: net profit
Method: Dynamic Panel Generalized Method of Moments (GMM - System)
Transformation: first-order difference (orthogonal deviations)
Total comments included (balanced panel): 384

Variable	Coefficient	Standard Error	t-statistic	Probability
Return on assets	0.71	0.07	9.11	0.000
Sargan Test	31.08 [0.912]			

According to the results obtained within this regression with a single independent variable, namely return on assets, we can state that, based on this change we can forecast the net profit as a measure of the overall risk at the level of sector 1. The value of the t-statistic indicates a strong intensity of the link between the two variables, the net profit and return on assets, and the value of the Sargan test involves a high relevance of the model chosen in terms of accuracy of the chosen instrumental variable.

a3. The connection between the net profit and ROE - sector 1
Dependent variable: net profit
Method: Dynamic Panel Generalized Method of Moments (GMM - System)
Transformation: first-order difference (orthogonal deviations)
Total comments included (balanced panel): 384

Variable	Coefficient	Standard Error	t-statistic	Probability
Return on equity	0.05	0.02	2.37	0.018
Sargan Test	31.63 [0.900]			

The regression obtained with return on equity as the single independent variable indicates a direct proportional link between the net profit and return on equity, the first one having a weaker power of prediction for this sector than the return on assets.

a4. The connection between the net profit and ROA and ROE -sector 2
Dependent Variable: Net Profit
Method: Dynamic Panel Generalized Method of Moments (GMM - System)
Transformation: first-order difference (orthogonal deviations)
Total comments included (balanced panel): 372

Variable	Coefficient	Standard Error	t-statistic	Probability
Return on assets	0.96	0.15	6.26	0.000
Return on equity	0.0008	0.001	0.56	0.57
Sargan Test	26.69 [1.000]			

Similar to sector 1, considering the net profit as an independent variable and a measure of the risk and return on assets and return on equity as dependent variables, only the economic one has the ability to forecast changes in the estimated risk based on the net profit.

In order to avoid some multicollinearity problems that can be induced by the structural connections between the financial indicators considered, we will conduct separate regressions for each explanatory variable.

a5. The connection between the net profit and ROA - sector 2
Dependent Variable: Net Profit
Method: Dynamic Panel Generalized Method of Moments (GMM - System)
Transformation: first-order difference (orthogonal deviations)
Total comments included (balanced panel): 372

Variable	Coefficient	Standard Error	t-statistic	Probability
Return on assets	0.85	0.1	7.76	0.000
Sargan Test	29.56 [1.000]			

This regression being obtained confirms the previous estimates, namely that there is a strong direct proportional link between return on assets as an instrumental variable and net profit. The Sargan test indicates a high level of model relevance from the considered instrumental variable perspective.

a6. The connection between the net profit and the ROE - sector 2

Dependent Variable: Net Profit
Method: Dynamic Panel Generalized Method of Moments (GMM - System)
Transformation: first-order difference (orthogonal deviations)
Total comments included (balanced panel): 372

Variable	Coefficient	Standard Error	t-statistic	Probability
Return on equity	0.008	0.003	2.27	0.024
Sargan Test	30.99[1.000]			

Considering the return on equity as a unique instrumental variable within the regression formed which has the net profit as a dependent variable, one may though identify even here a direct proportional link between the two variables, which confirms the possibility of errors emergence because of the multicollinearity induced by the structural connections between the financial indicators considered.

4. Conclusions

Analyzing the econometric model built, having the net profit as the risk measure and return on assets and return on equity as independent variables, it is advisable, using this measure to estimate the risk, to take into account return on assets both for Light Industry and Heavy Industry. Within this model, the return on equity is not the most appropriate risk calculator, imposing either the use of the model having the return on assets as a single independent variable or reconsidering the model by introducing other financial or non-financial performance indicators as independent variables.

It can also be noted that between the two sectors, even in the conventional manner in which they were defined, there are important differences in the intensity and in the relative importance of the links established between the risk dynamics and the economic and financial rates of return.

These differences can be explained by both environmental uneven factors characteristics to companies activities and the distinct perception that the companies have regarding sector specific risks.

The objective of this study is to demonstrate a series of empirical issues that support the thesis according to which, even on a short term, in order to identify the changes in risk at sector level shows the relevant companies performance, measured within the study based on the economic and financial rates of return.

Of course there are clear limitations of the analysis, namely: limited number of financial ratios considered, analyzed data heterogeneous structure and possible errors induced by the non-linear interactions between the variables considered.

Despite these limitations of the proposed analysis, the existence of some mechanisms can be reveal based on this analysis, through which the instrumental variables described by the economic and financial rates of return may affect the manifestation of the risk at sector level.

In tourism, hotels play an important role and contribute to the economic growth in cities and other places endowed with attractions which are universally recognized.
Two elements are essential in the tourism industry system: product quality and human resources.
In terms of quality of the hotel services, that is the one that allows to the tourist enterprise to own a competitive advantage, gain competitive differentiation and reputation among customers by achieving a high degree of customer satisfaction.
Hotel customer satisfaction would be impossible if the hotel management does not perform periodic evaluations on customer satisfaction and quality, which are the focus of this paper. Therefore, this paper focuses on customer satisfaction measured by the SERVQUAL model.

1.Introduction

Tourism is a growing market, especially in Romania, where it started to take increasingly bold wings. This makes room for everyone, but to seek the best from all of them. The difference is not made nor by the hotel offered to the tourist, or program. The tourists are becoming more and more educated. The tourists know what to ask for and appreciate what is offered. Therefore, the difference lies in attitude, awareness, ability to listen and to know how to solve the most relevant wishes of the guests that step into the hotel. Only if you know how to provide an additional shade to the paid services, you will ensure that the tourists will confer again their (or others) holidays again to you, being known the fact that a satisfied tourist brings another 10! Two elements are essential in the tourism industry system: the product quality and human resource.

In the economic life, the most successful organization is the one that is able to satisfy the needs of its customers and strives to maintain its customers satisfied.

Customer satisfaction is achieved when the client believes that the specifications meet his expectations of a service.

Consequently, measuring the customer satisfaction, including a service company's internal research, can lead to higher quality of its services.

In the '80s, the researchers Parasuraman, Berry and Zeithaml, following an extensive research on service quality, have concluded that, compared to the quality of goods offered to the customers, the evaluation of the service quality is a much harder task. According to the three researchers, the five main dimensions that customers use in evaluating the service quality are explained as follows:

- Material assets (tangible): appearance of equipment, personnel and communication materials.
- Reliability: the ability to perform the promised service safely and accurately.
- Responsiveness: willingness to help the customers and provide prompt services.

- Safety: the knowledge and courtesy of the employees and their ability to instil a sense of trust and safety.
- Empathy: the care, individualized attention that the service organization provides to its customers.

To assess these five aspects of service quality, Parasuraman and all. have designed the "Servqual" model which includes a questionnaire with 22 questions. Half of the questionnaire is related to expectations of the customer concerning the services and the other half is related to the customer perception of the consumed services. Hence, it appears that the service quality is given by the relationship: perceptions - expectations = quality.

The Servqual model has many applications (it can be used both in marketing studies, and in comparison among similar services offered by competitors, as Parasuraman and all. said in 1988). The most important use of it, however, is keeping track of the changes happened in the service quality provided by an organization, fact that is done through a regular survey of the customers.

In tourism, the hotels are very important due to their crucial role played in improving the tourism sector and developing a certain region (Hessamaldin M.S.2008).

2. Problem Formulation

Although it is known the important role the hotel plays in satisfying the tourists requests, it is however, very difficult for the hotel to meet the infinite variety of hotel guests' expectations.

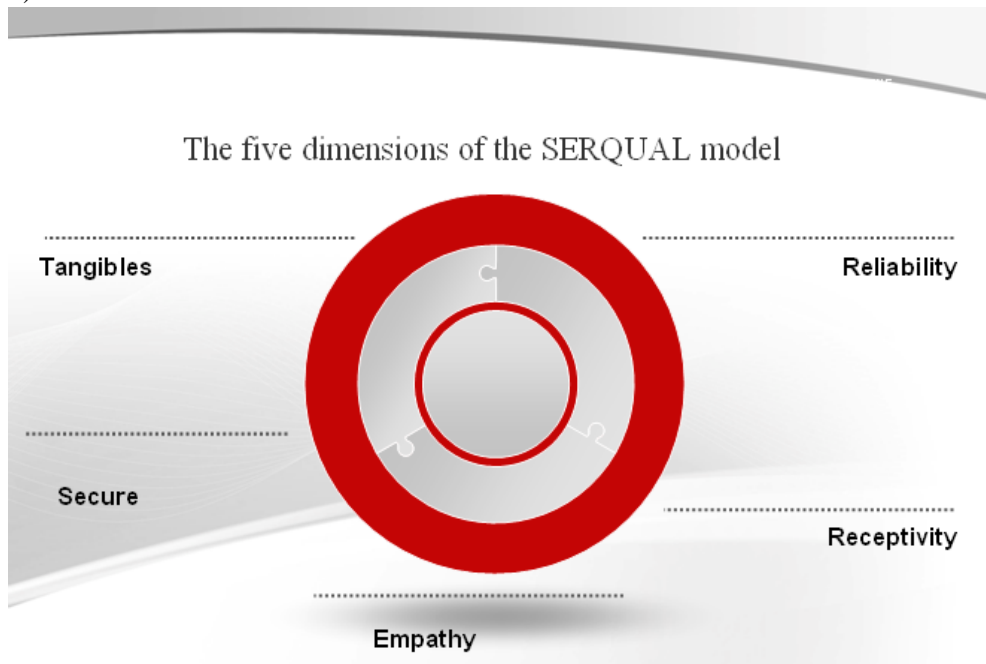
In order to obtain an advantage compared to the competing hotels, the hotel managers must provide their customers with quality services and meet their expectations properly by performing periodic evaluations on customer satisfaction and quality improvement using the Servqual model (figure 1).


Figure 1. The dimensions of the Servqual model (source: made by the author)

The elements of the Servqual model are: material goods (tangible), reliability, responsiveness, security and courtesy, which are considered to be the five criteria in considering the quality of the services provided for guests, aiming to:

- Indicate the difference between the customer perceptions and expectations in the tangible dimension;

- Indicate the difference between the customer perceptions and expectations in the reliability dimension (ability to perform the promised service safely and accurately);

- Indicate the difference between the customer perceptions and expectations in the receptivity dimension (desire to help the customers and provide prompt services);

- Indicate the difference between the customer perceptions and expectations in the secure dimension (knowledge and courtesy of employees and their ability to instil a sense of trust and safety);

- Indicate the difference between the customer perceptions and expectations in the empathy dimension (care, individualized attention that the hotel offers to its customers).

3 Problem Solution

For each of the 5 dimensions of quality (tangibles, reliability, receptivity, secure, empathy) there are determined the customers expectations before using the services, and, after the service consumption, there are determine the customers perceptions.

In the questionnaire, customers respond on:

1. tangibles, referring to:
   - Attractiveness of the exterior structure
   - New and modern hotel facilities
   - Staff discipline and cleanliness
   - Attractiveness of the hotel interior decorating

2. reliability, referring to:
   - Room service
   - Adjust the room to customer expectations
   - Adequacy of the available room facilities
   - Speed in answering to customer orders

3. receptivity, comprising:
   - Hello and welcome
   - Response to the guests requirements
   - The rate of customer information by the hotel staff
   - The operational speed of the staff serving the clients

4. secure, referring to:
   - The skills and experience of the staff
   - Politeness of the staff
   - The rate between services and their price
   - Providing a calm place
   - The efforts of the staff in providing and maintaining a secure environment

5. empathy, referring to:
   - Access to the hotel
   - The attention of the staff in establishing effective relations with the tourists
   - The flexibility of staff
   - The predictions and perceptions of the top management regarding the customer needs

Each dimension (tangibles, reliability, receptivity, secure, empathy), which was evaluated by the tourists, receives points from one to five, the highest score representing the maximum degree in customer satisfaction.

The difference between customer expectations and perceptions regarding the material assets, reliability, receptivity, secure and empathy, ultimately reflect these items' quality which was felt by the guests.

For example, a hotel that presents the data from the table 1, is a hotel that was not able to provide quality services in order to satisfy its customers, the poor quality being reflected in all the five dimensions.

The gap between customer expectations and perceptions on service quality judged on the five dimensions of the Servqual model

Quality dimensions	Expectations (E)	Perceptions (P)
Tangibles	3,96	2,90
Reliability	3,90	2,63
Receptivity	4,78	3,20
Safety	5,19	3,93
Empathy	3,87	2,88
TOTAL	**4,34**	**3,11**

In the present case-study, the value between the total perceptions and total expectations is negative. In conclusion, the overall quality is not reaching the customers expectations (figure 2).

By using the Servqual model, the hotel management has now the necessary information regarding the weak points of the services the hotel provides and can take the necessary actions to improve hotel's service quality.

The Servqual model has been used successfully over time in the tourism sector, with results showing that in different parts of the world, quality is perceived differently by the tourists, and so, the model can be completed with more elements to meet the costumers expectations (Juwaheer and Ross (Juwaheer T.D., Ross, D.L. 2003: 15(2) have identified nine dimensions of the quality, "responsiveness", "reliability" and "assurance" being considered as main determinants of the service quality).

Quality dimensions	Expectations (E)	Perceptions (P)	P - E
Tangibles	3,96	2,90	- 1,06
Reliability	3,90	2,63	- 1,27
Receptivity	4,78	3,20	- 1,58
Safety	5,19	3,93	- 1,26
Empathy	3,87	2,88	- 0,99
Service Quality	**4,34**	**3,11**	**- 1,23**

The gap between customer expectations and perceptions of service quality on the five dimensions of the SERVQUAL model

- 1,23
Service Quality

Figure 2. The Service quality in the studied hotel using the Servqual model (source: made by the author)

Over time, the Servqual model had and still has supporters, but also opponents. Thus, some authors reproach that the scale of the model is not sufficiently comprehensive, as other reproaches refer to how relevant the model is for the quality in situations involving multiple stakeholders due to the fact that the model ignores several stakeholders (Sararoudi M.B. 2008).
By grouping the difficulties regarding the use of the Servqual model, we can speak of the following five main categories:

- the gaps issue and their use;
- reliability of the gaps
- little predictive and convergent validity;
- ambiguity in shaping the expectations;
- the unstable dimension of the model.

Although the Servqual model has been criticized on theoretical and operational criteria, Ausbonteng et al. concludes that "until there will appear a better model, but as simple, the Servqual model will prevail itself as a measure of the service quality" (Sararoudi M.B. 2008).

4 Conclusion
The Servqual model provides, due to its five key factors (tangibles, reliability, receptivity, secure, empathy), a detailed description of the customer needs, perceptions and expectations, the information provided by Servqual being used in order to adapt the services to the customers' priorities. However, there is possible to arise problems linked to the uniform application of this measurement tool across multiple service sectors because the five dimensions are not universal.
For many organizations in the hospitality industry, the Servqual model implementation involves many difficulties. It involves such a profound transformation of the organization that there is inevitable the emergence of a strong resistance. For this reason it is necessary to take into account the huge effort that is required to resolve the difficulties in this process.

The conclusion is: *quality is a goal, an objective which must mobilize all the units of the service organization. Quality shows the direction towards which the action must be oriented*.

COGNITION AND INTELLIGENT ENTREPRENEURSHIP.

Meo Colombo Carlotta
University of Pavia Faculty of Economics Department of Business Research "Riccardo Argenziano"

The aim of the paper is to study how it's possible to enhance the cognitive enterprise model by the theory of autopoietic systems. I propose a model that considers the organization as a closed system in which all cognitive activity is necessary to develop coherent operations needed to adapt the firm to environmental perturbations. The central issue of the work consists in the presentation and description of the "chain thinking-action" as a cognitive basis that builds models from which derive the actions that characterize the transformation of a business enterprise in order to maintain the viability over time. A "winning" entrepreneurial thinking is able to give a direction (objectives-strategy) always aimed at improving the organization's vital parameters. The role of entrepreneurship and management, therefore, is to create the conditions to encourage a continuous development of cognitive models in organizations, in order to maintain the conditions of survival and to lead the company in a situation of evolution and improvement.
Keywords: cognitive system, cognitive models, autopoiesis, organizational behavior, intelligent firm.
JEL Code: L21, L26, M10.

1. Introduction

"Every man from the birth builds models" (Laborit 1979: 60).

"The knowledge that guides human behavior is made up of symbolic mental representations and cognitive activity consists in the handling of these symbols" (Edelman 1991: 33).

This study is based on the belief that organizations, and firms, can be understood as cognitive systems which develop a learning process in order to survive in a changing environment, as it has been authoritatively demonstrated by Stafford Beer (1989).

In observing enterprises I have chosen a model of cognitive system that comes from the representationalist view of cognition, typical of the cybernetics and cognitive theory (Wiener 1961; Ashby 1956; Conway and Siegelman 2005; Maturana and Varela 1980).

According to this conception, cognitive systems must create inside them a representation of the external world, by building coherent and sensible models, selecting through their sense organs, environmental cues, and transforming them into information necessary to update these representations on which they form the basis of decisions making which are translated into behaviors in order to preserve their existence.

The representationalist hypothesis is denied by Herberto Maturana and Francisco Varela who state: "in every interaction, is the structure of the nervous system that determines which perturbations are possible and what changes they may cause in its dynamics of states. it would be wrong, therefore, define the nervous system as something that has inputs and outputs in the traditional sense" (Matuana and Varela 1987: 149).

In this paper I demonstrate how it's possible to enhance the cognitive enterprise model by the theory of autopoietic systems. The model I propose considers the organization as an operationally closed system, structurally coupled to the environment, in which all cognitive activity is necessary to develop coherent operations needed to adapt the firm to environmental perturbations.

According to this approach, knowledge consists of a modeling system that the organization builds and fits through a continuous structural adaptation between the firm and the environment, in a perspective of maintenance of its homeostasis (Maturana and Varela 1987).

In this work I share the enactive approach, according to which cognition derives from the construction of the world by a cognitive subject through the mind-body interactions. Indeed, we read in Varela, Thompson and Rosch that "the fundamental intuition of the enactive approach is that you can see our activities as reflections of a structure (nervous system), without losing sight of the immediacy of our experience" (Varela, Thompson and Rosch 1992: 33).

The central issue of the work consists in the presentation and description of the model called "thinking-action chain" as a cognitive basis that builds models from which derive the actions that characterize the transformation of a business enterprise (Mella 1991) in order to maintain the viability over time (Beer 1989). The theoretical basis built in this study allowed us to reach a definition of the necessary conditions that a firm must comply in order to be considered an intelligent system.

2. Firms as cognitive systems

To represent enterprises as cognitive systems should be necessary, first of all, define and highlight the characteristics of cognitive systems, in order to build up a model adaptable to firms. A cognitive system can be described, in a concise form - by an external observer (Maturana and Varela 1980), as an autonomous system, an "individual", able to process information, to structure them in knowledge and preferences in order to develop interactive behaviors with the environment and in the environment with the purpose of survival, maintaining its identity, even in the evolution, sometimes, of its own structure (Mella 1997).

According to autopoietic theory, a cognitive system appears to act in a "world" (environment) only to the eyes of an observer outside the system. This has no chance of "come out of himself": all that it can "know" are the changes in its cognitive basis - built by its physical structure - which it can control partly through the activity that took place through effectors (1), as theorized by von Foerster (2003) the father of second order cybernetics.

According to the model of Maturana and Varela (1987), organizations are "closed" autopoietic systems able to maintain their unity continuously producing relationships that make up their own organization. These systems operate in circular mode, in the sense that self-components of the system produce the same parts, while maintaining a stable interconnections between vital processes, in a cycle of continuous production and re-production. They are able to generate throughout their own organization, even under conditions of continuous perturbations from the environment (Maturana and Varela 1980). The system is autopoietic since it produces itself.

The organization, as cognitive system, through its management, consumes value for the re-production of value, in order to survive into the environment, maintaining its identity and revealing a teleonomic project, or objective of survival (Mella 1991). The firm maintains its identity and remains viable, if it can maintain vital parameters to levels that prevent its disintegration, showing a behavior typical of homeostatic autopoietic systems (Beer 1989).

The firm, appearing as a system able to self-produce its own organization through business operation (Vicari 1991; von Krogh and Vicari 1993; von Krogh and Roos 1995) and as a system in which the internal states - organizational, economic and procedural - should assume conformations compatible with the structure itself, and with the variability of the environment that perturbs the homeostatic balance, becomes a viable system as defined by Stafford Beer in his well-known model (Beer 1989).

In this context, the environment, with its variability, is only an "activator" of the cognitive activity, which appears restricted to the field of internal cognitive processes (Vicari and Troilo 2003). The cognitive process has an organization which appears, therefore, closed and circular and this aspect is typical of all living organisms and all cognitive systems.

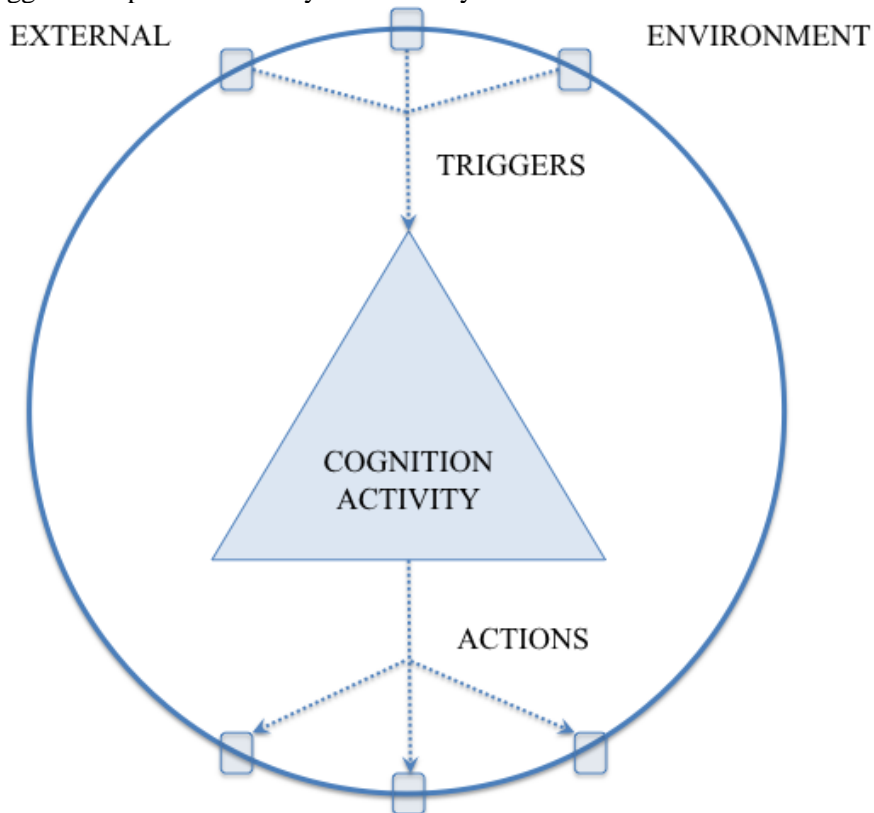
To an external observer, any cognitive system can be represented, in first approximation (Figure 1), as a transformation system (Mella 1991), i.e. as a black box that transforms stimulation into actions (interaction with the environment) in order to maintain its structure and maintain its identity in a changing environment. From the system itself point of view, it appears as a closed system, in which knowledge is constructed internally to react to environmental variety. The environment contains no information that the system can detect. The environment is only a source of triggers and perturbations by which the system builds its own information.


Fig. no 1 – Cognitive system (author elaboration)

A cognitive system, then:
- must have sensory organs, or receptors, to perceive environmental triggers from which training data are transmitted to the mind organization;
- must be provided with effectors (organs) to manipulate the environment through the use of external energy by developing actions and activities; must feed energy through the development of metabolic processes;
- must have a mind, characterized by its own organization, in which are developed cognitive processes - thinking - by basic cognitive resources.

The behavior of organizations, seen as autopoietic social systems, should be investigated in terms of interaction among individual members and in terms of how they take decisions and implement collective behavior to maintain the autopoiesis of the firm. It is therefore necessary to realize the rules sharing among the members of the organization (Gioia and Sims 1986).

Firm behavior can be defined as a set of processes by which the organization interacts with the environment, through its effectors; such behavior depends on the internal cognition processes, developed by the management through the detection processes that process the signals received by the sensory organs, and lead to the construction of models of the environment through specific instruments: accounting, budgets, plans and programs, and, in general, the performance management systems, market research, and the amplification of weak signals.

Maintaining autopoiesis, therefore, appears to be essential for the correct formation and management of knowledge; its formation represents an entrepreneurial process of improvement of the firm competitive capacity (Nonaka 1988, 1991, Leonard-Barton 1995; Nonaka and Takeuchi 1995; Vicari 1991).

3. Conscious behavior

Cognition, however it is defined, is a detection activity, i.e. perception of triggers and development of useful models to react to environmental changes in order to maintain viability (Beer 1989; Vicari 1991; Mella 2009, 2011). In shaping a model of cognitive system, we necessarily have to distinguish two levels: the *mental* - not visible by an external observer - in which the cognitive activity takes place, and *behavioral* - that can, instead, be observed - in which are developed the system actions into the environment.

Mental activity is characterized by the presence of cognitive resources and the implementation of cognitive processes. Cognitive resources are represented by a system of information, by a system of weights, that is, preferences, and by a computational system, in order to process information, taking into account of the weights (2). Cognitive processes can be regarded as thinking, since they lead to the formation of representations, to the expression of judgment, decision-making and monitoring of their implementation.

The thought/thinking joins action, implemented by the effectors, understood as a reaction to triggers and, in advanced forms, as an execution of decisions developed by the thought, so that the cognitive system can profitably modify its "position", however defined, perceived into the environment.

Linked processes of thinking/thought and action form the system behavior that can be defined, dynamically, as a sequence of 'thinking' and 'action' acts, as a chain thinking-action, fruit of cognition. This chain allows an autopoietic system to maintain life coupling with success to the environment, produce metabolic processes that allow the regeneration of the structure and eventually the re-production.

In these terms, a cognitive system that develops a behavior, can be represented as a transformation system of triggers into actions (interaction with the environment). This transformation is mediated through a knowledge basis continuously adapted (Maturana and Varela 1987).

Taking account of the triggers, the knowledge base and the evaluation of the weights, using the computational system, the cognitive system forms representations (models) of the environment and establishes - through decisions (thinking) (Fioretti and Visser 2004) - the efficient behavior to keep (action) - in order to survive or to improve the conditions of existence; decisions are reflected into action and new thinking.

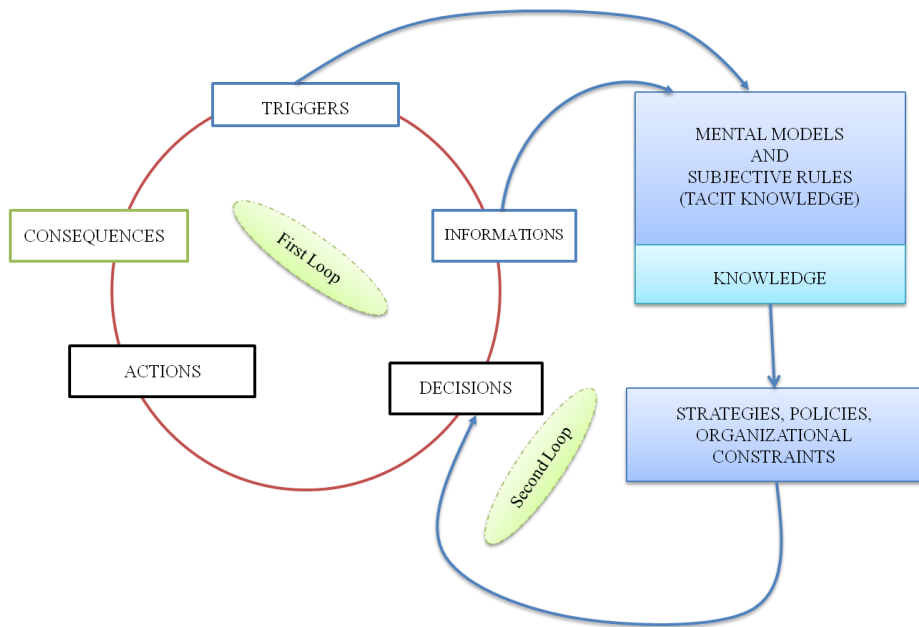
The scheme becomes the following:


Fig. no 2 – Cognitive system: our adaptation from Argyris (1993).

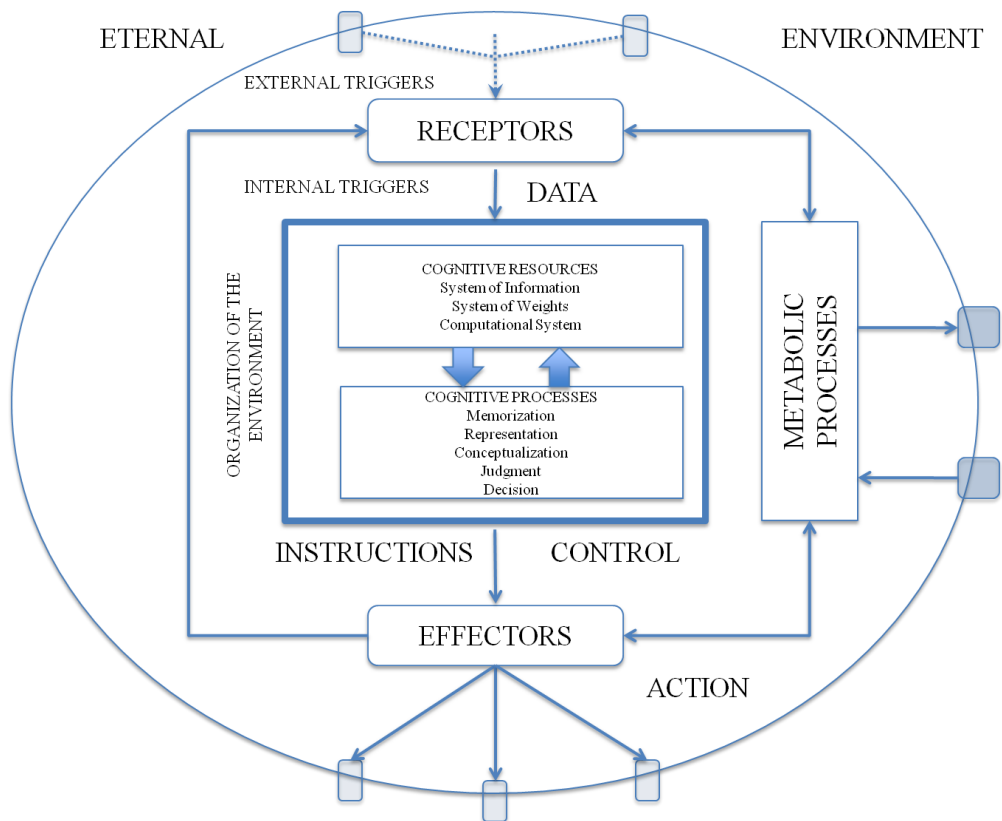
A cognitive system can be defined as conscious when the reactions to the triggers are the result of decisions. The organizational structure of every conscious cognitive system should, then, necessarily include:
- Sensory organs of interface with whom the system is coupled to the environment in order to implement environmental information i.e. signals;
- Internal sensors organs in order to perceive vital parameters that is triggers of disequilibrium of the autopoietic network;
- Organs to select and store the triggers and transform them into meaningful information;
- Computational organs to put in a system the information and build representations of the environment which form the cognitive base;
- Organs of comparison and evaluation of information and representations (assignment of "weights" and formation of the "scale of preference");
- Effector organs in order to intervene in the environment (searching for adaptation) and in order to implement actions which make processes.
Every conscious cognitive system tries to improve its cognitive resources:
- Enhancing sensory organs in order to increase the range of perceived triggers;
- Developing the attention organs in order to improve representations of the environment;
- Improving the perception of the internal viable parameters;
- Refining the weights system, i.e. criteria evaluation of risk and trust (decision criteria);
- Reinforcing the computational system,
- Making more powerful and efficient the effectors.
The above considerations can be summarized in the general model of conscious cognitive system as a transformer of data and information into sensible representations (3), from which descend behaviors, as shown in Figure 3, which is a specification of the model of Figure 1.


Fig. no 3 – Cognitive conscious system (author elaboration)

The model in Figure 3 perfectly describes the business organizations - such as cognitive systems in which is developed a thinking - made up of cognitive processes - and an action - consisting of the productive transformations of energetic input (factors of production) in energetic output (production of goods and services).

To an external observer organizations can be interpreted as instrumental systems that develop operational processes to achieve institutional objectives - individual, social and institutive (Masini 1964, 1979; Superti Furga 1975) - being an useful tool for the environment, according to structural coupling.

If social goals are perceived as positive, the environment will introduce favorable interactions to the organization's life, both as a single system or as a kind of systems (defined by the structure and processes). For an inner observer designed to analyze the structural processes, organizations-firms are fully cognitive systems that form representations of the external and internal environment, decide, plan, implement and control appropriate behaviors in order to counter the perceived negative perturbations and to find conditions favorable for a durable life.

Precisely in this sense, organizations-firm should be considered as autopoietic systems, cognitive and conscious, since they develop metabolic processes that reproduce continuously the organs and the network of organizational processes, in order to maintain and evolve their structure over time, for a duration that exceeds that of the structured permanence of individuals components.

The fundamental resources of the company, considered as a cognitive system, are cognitive resources, i.e. capacity of:

- Training and developing the knowledge base necessary for survival;
- Enhance the models used by the management to represents external reality,
- Collect environmental information, and order them in correct representations (external monitoring), in order to increase the cognitive base;

- Early detection of internal parameters (internal monitoring),
- Develop of appropriate weights of evaluation and size them to changing circumstances,
- Implement efficient managerial calculations,
- Enhance the computational system.

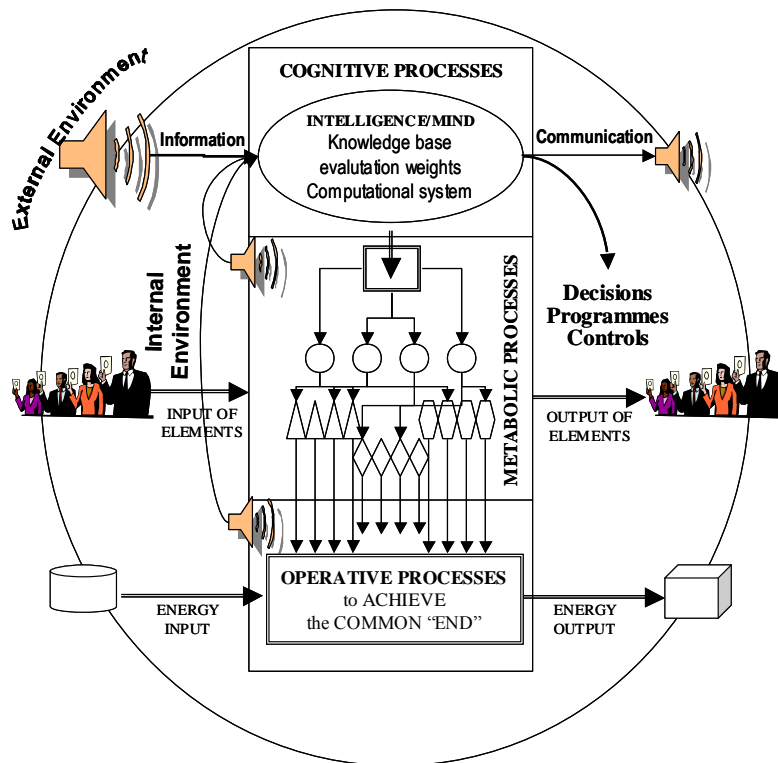
The enterprise is a system, then, able to operate on the basis of his knowledge and capable to continuously feed the knowledge of which is provided, through the cognitive behavior.


Fig. no 4 – Firm as a cognitive system (author elaboration)

Cognitive resources, ie information, weights, computational systems, themselves, are formed and modified, or by observation, ie, monitoring the environment, driven by the same cognitive processes, or by behaviors capable of finding internal and external information.

4. The "chain thinking-action"

Enterprise knowledge is the result of a collective process of choices formation, that appears as a result of continuous interaction, of exchange of signals, of individual processing, of individuals expectations, of shared norms, of carried out procedures, of organizational mechanisms created within the organization.

The firm, as cognitive system, is not the sum of knowledge of the individuals who make it up, but "something more and different", being composed of several "processing nodes or networks", formed by individuals, organs, structures and procedures (Vicari and Troilo 2003).

Both thinking and action are widespread activities in the network of organizational processes. It should be observed that between thinking and action there is, necessarily, a feedback relationship: the cognitive system is a dynamic system (Sterman 2000; Reading 2004), not simply a causal system, because the actions and behavior does not depend directly by triggers but by cognitive status inside the system, i.e. by the cognitive structure which incorporates an experience, a knowledge and a culture.

As a cognitive autopoietic system, the firm bases its existence on the ability to self-create and maintain its network of knowledge. This constant process of creation of cognition through a continuous interaction between thinking, which determines action, and action, which produces triggers that modify the knowledge base, can be identified in the "chain of thinking-action", which is the process that - thanks the computational devices and evaluation - develop rational calculation from which flows the decisions that are implemented in organizational actions.

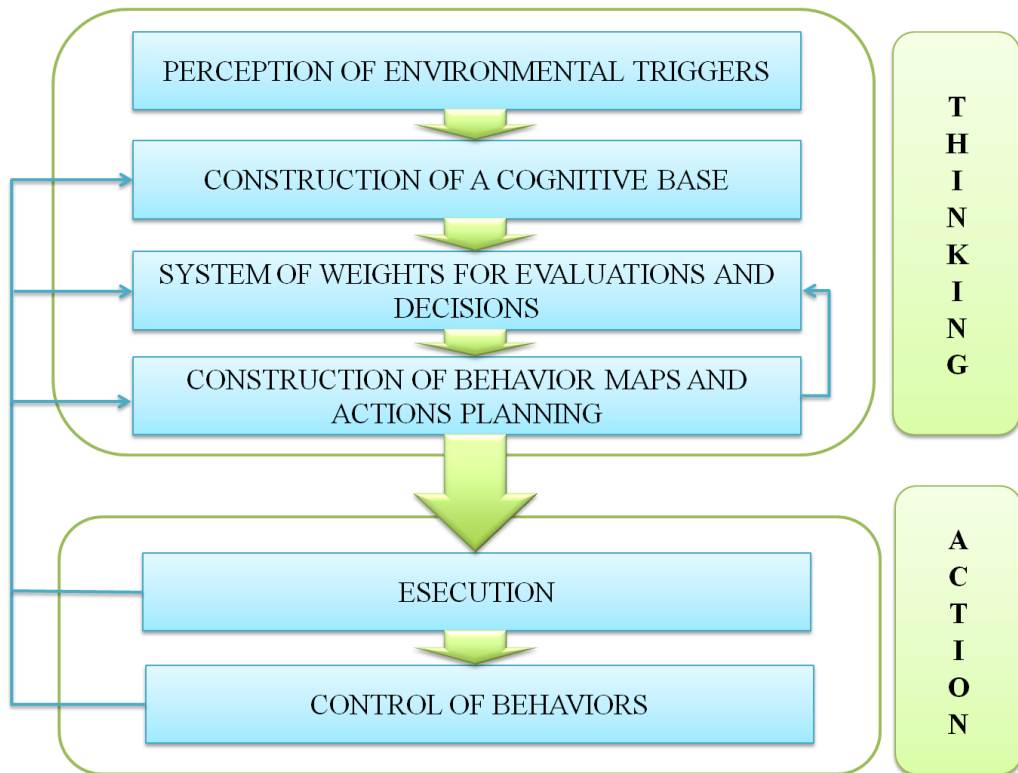
The "chain thinking-action" can be represented with a cyclical model made up of six phases, shown in Figure 5.


Fig. no 5 – The "chain thinking-action" (author elaboration)

The experience accumulates by detecting information about the successes and failures (errors) resulting from the execution of actions, through the activity of objectives control (Mella 1991, 2011). Any firm behavior depends on the experience, therefore, accumulated in representations and models, and, depending on the relationship between experience and behavior, we can distinguish four types of behavior:

1. *Automatic Behavior*: the behavior is reactive, and originates from automatic feedback that activate control systems which act outside of the thought, in order to react quickly to triggers or to remove the causes of interference. This behavior does not depend on the experience stored by the system, but comes from contingent facts that require an immediate reaction.

2. *Adaptive behavior*: the organization is aware of the triggers and perturbations and, using the experience gained through cognitive processes, reacts according to action models considered effective. The success of such behavior reinforces and consolidates these models, for the use in future decisions.

3. *Exploratory behavior*: it is a typical behavior in which management, seeks new challenges and new knowledge in order to predict and prevent errors and avoid them or to find new positive triggers to strengthen its survival.

4. *Innovative or creative behavior*: try to overcome the experience stored, creating new incentives that can bring benefits to overcome stored models and form new representations, through processes of creation and invention, which incorporate elements of the knowledge base.

5. The successful entrepreneurial thinking: intelligent firms

We define intelligent a cognitive system if it can translate its experience into models, expanding its cognitive basis by carrying formal descriptions of experience, transmittable through a linguistic behavior, so that linguistic behavior makes possible enabling new structural couplings.
A necessary and sufficient condition for an intelligent cognitive system is that it is able, with its own cognitive processes, to build representations of the world, i.e. descriptions, concepts, uniformity and laws, and to develop a formal communicative behavior through which it extends the range of structural couplings that favor its existence.
The cognitive activity of firms (Figure 3), considered intelligent cognitive systems, can be specified in entrepreneurial and managerial "thinking" (Mella 2009; Beer 1989). These forms of "thinking" are distinguished by the manner in which it is developed the "chain" presented above.
1- *Entrepreneurial thinking* (or innovation): the output is represented by the policies, strategies and plans that put the company's management in performing productive, economic and financial behavior; so the entrepreneurial thinking directs the system i.e.:
a) evaluates the competitive position of the firm in the environment in terms of strategic vector: [products (quality service) / market (customers, price) / channel] / [processes (productivity, cost) / technology / organization],
b) develops innovative thinking and then creative in order to change the competitive position of the firm,
c) establishes the desired position in terms of strategic vector,
d) sets the goals as points of arrival to the desired position,
e) determines the set of actions necessary to achieve the objectives, i.e. the company's strategy to change the competitive position,
f) acts feedforward; the thinking is strategic: to move from the present to the future strategic situation; to modify the efficiency matrix:
g) enacts a typical exploratory behavior (trying several solutions) and innovative (new solutions).
2 - *Managerial thinking* (or conservation): the output is a system of controls on production, economic and financial behaviors, in order to ensure that these will be realized according to the strategic decisions and management policies; the organizational transformation controls, i.e. configures the most efficient paths to get to the points of arrival:
a) considers strategies such as objectives,
b) sets out plans for implementing the organization behavior,
c) controls the execution trying to minimize the deviations between the implemented and scheduled execution,
d) develops, therefore, a conservative thinking, then adaptive;
e) acts feedback; the thinking is programming how to develop the efficiency matrix: put goals and determine courses of action for self-maintenance of the structure,
f) enacts a typical automatic behavior (procedures) and adaptive (planning and control for exceptions).
As an intelligent cognitive system, using an innovative entrepreneurial thinking, the firm is able to construct actively the reality in which it operates (Weick 1979, Daft and Weick 1984; Smirchich and Stubbart 1985; Vicari and Troilo 1998), and to check its path in it, through managerial thinking.
Particularly importance is seen in the ability of developing entrepreneurial thinking since it is the basis of innovation and organizational change strategies (Amabile 1988, 1997), but, above all,

because it stimulates the differentiation of product and process which represents a crucial determinant of competitive advantage (Andrews and Smith 1996; Im and Workman 2004).

The cognitive and intelligent firm does not fit, therefore, the scope in which it operates, but it creates a different context from the others in relation to its own patterns of knowledge and activates its specific environment, in a typical autopoietic view of structural coupling (Maturana and Varela 1987).

The environment does not provide, thus, any "objective" input to the firm. By coupling to it (putting itself in relation to it) and "activating it" the company, through the looping of the "chain thinking - action", generates a pattern of cognitive representation of its position, i.e., a map, which takes the form of a "network of causal sequences" (Hebb 1949; Hayek 1952; Weick 1979), which provides guidelines on the future production, economic and financial path (Mella 2011; Senge 1990).

The environment "activated" is, therefore, that section of space to which the company attributed a sense, that portion of the environment in which it is immersed, and which identifies as close to its own action and needs (Vicari and Troilo 1998).

6. Conclusions

To build a model of autopoietic cognitive and intelligent, I wanted to emphasize cognitive activities developed by industrial organizations. I tried to show how the process described by the cognitive model called "thinking-action chain" - that fuels the entrepreneurial and managerial thinking - both features companies that want to maintain high levels of viability (Beer 1989), performance (Sobek, Liker and Ward 1998) and to develop their ability to evolve from environmental perturbations.

The perturbations, which the organization is constantly subjected during its economic life, are the conditions that allow it to build, improve and expand its cognitive processes and models and entrepreneurial (innovation and implementation) and managerial (monitoring and adaptation) behavior, organizing itself, finding new ideas, new solutions, new products, new market approaches, new ways to "invent the future" (Fink et al. 1971; Hedberg et al. 1976; Ford 1985; Ford and Baucus 1987; Mone et al. 1998), in order not to lose its independence and unity, in a perspective of homeostasis maintenance (Maturana and Varela 1980, 1987).

A "winning" entrepreneurial thinking is able to give a direction (objectives-strategy) always aimed at improving the organization's vital parameters.

The entrepreneurial thinking develops knowledge models that derive less from direct experience, since it programs innovative and exploratory behaviors and the parallel managerial thinking, oriented to control programming, translates in efficient behavior.

The role of entrepreneurial and managerial thinking is to create the conditions to encourage a continuous development of cognitive models in organizations, in order to maintain the conditions of survival, leading the company in a situation of creative tension (Senge 1990) to generate new ability to evolve.

7. Notes

(1) The representation of the external environment arises inside the system and it is not able to know, in any way, if such representation corresponds to the environment or if, on the contrary, the environment is a typical mental construction.

 (2) For weight we mean the intensity according to which thinking influence action. Weights, or preferences, are the basis for the formation of judgments, make the system capable of evaluating cognitive triggers, to classify them as positive or negative depending on their survival. Therefore, each observation can be transformed into a judgment, if combined with a preference. Weights affect actions since they select (with a rank value) information considered necessary for survival by the cognitive system. The system of weights is dynamic and usually structured in levels; the highest level of the system of weights (from which comes the system of weights of the lower

levels) is defined value system or ethical system; a system of knowledge and representations associated with a system of weights is defined cultural system.

The computational system is the cognitive resource necessary to "keep together" triggers, and turn them into information and representations, taking into account the weights. Triggers processed by the computational system can also become symbols for the system so that processing becomes an elaboration of symbols and not of triggers.

 (3) A representation is meaningful to the system, if it represents a point of reference for behavior, i.e. if it is coherent with other representations so that the system can take it as a basis for its actions.

ORGANIZATIONAL CHANGE: BUSINESS PROCESS REENGINEERING OR OUTSOURCING?

Michela Pellicelli
University of Pavia Faculty of Economics Department of Business Research "Riccardo Argenziano"

Carlotta Meo Colombo
University of Pavia Faculty of Economics Department of Business Research "Riccardo Argenziano"

Andrea Cioffi
Catholic University of Milan Faculty of Economics Department of Business Research

This article aims to analyze the decisions that lead management to decide whether to make business process outsourcing or business process reengineering.
Investigating business phenomena, economic literature assumes some preliminary statements - or postulate - that guide the method of analysis, synthesis and generalization. In particular, we recall some preliminary statements method that helps us to understand the processes of organizational change.
We focus on the relevance, difference and usefulness of outsourcing and business process reengineering to support organizational change in the managerial function of an enterprise.
We show that BPR and BPO principles have a relevant content that could and should be the basis for imprenditorial change and innovation.

Keywords: business process reengineering, outsourcing, organizational change, change management, innovation.

JEL Code: L24, L25, L26

1. Le premesse per l'outsourcing

In generale, quanto processi e funzioni sono facilmente replicabili e standardizzabili, tanto maggiori saranno i vantaggi dell'esternalizzazione. Proprio in funzione della standardizzazione dei processi, l'outsourcing può riguardare attività di produzione di beni oppure servizi e possiamo individuare quattro tipologie: a) outsourcing industriale nel settore produttivo manifatturiero, b) outsourcing industriale nel settore dei servizi, d) outsourcing di servizi nel settore produttivo manifatturiero, e) outsourcing di servizi nel settore dei servizi.

Di fatto, l'esternalizzazione riguarda, con maggior frequenza:

a) la produzione di parti, componenti, prodotti finiti;
b) la produzione di servizi industriali, quali la manutenzione, il controllo di qualità, le lavorazioni accessorie;
c) la ricerca e lo sviluppo di nuovi prodotti e servizi; la progettazione e il design;
d) i servizi amministrativi, quali la contabilità, il controllo di gestione, l'auditing, la gestione del personale;
e) il settore dei sistemi informativi che rappresenta uno dei punti focali dei processi di outsourcing;
f) i servizi di consulenza gestionale;
g) i servizi logistici ed i trasporti;

h) la mensa e le pulizie;

i) la rete distributiva, la promozione, la pubblicità, e altri servizi di marketing;

j) la gestione del circolante e della tesoreria; i servizi incasso e pagamento;

k) la ricerca di fonti di finanziamento.

Nell'indagare i processi ed i fenomeni aziendali, l'Economia Aziendale assume alcune premesse – o postulati – che guidano il metodo di analisi, di sintesi e di generalizzazione.

In particolare, ricordiamo tre premesse di metodo che aiutano nella comprensione dei processi di outsourcing.

La *prima premessa* (Mella, 2008) è che le imprese – a qualunque settore appartengano e di qualunque dimensione siano – devono essere osservate quali organizzazioni che sviluppano funzioni differenziate tutte preordinate allo sviluppo di un portafoglio di business per la produzione di beni e di servizi intermedi o terminali.

La *seconda premessa* è che il management delle organizzazioni pone sempre in atto processi decisori fondati sul criterio di massima efficienza.

Tale criterio, com'è stato dimostrato, nelle imprese capitalistiche – che finanziano i loro business con capitale di Equity e di Debt – si traduce nei correlati criteri della *massima economicità* (massimizzare il risultato operativo) e della *massima redditività* (massimizzare il Return On Equity).

Questi due criteri sono tra loro inscindibilmente integrati e formano il criterio ultimo di *razionalità aziendale* secondo il quale ogni azione manageriale deve essere decisa scegliendo l'alternativa che renda massimo sia il rapporto tra ricavi e costi (massima economicità) sia il rapporto tra profitto e capitale proprio investito (massima redditività sul capitale investito).

Il criterio ultimo di *razionalità aziendale* si applica sia a livello di business, sia a livello di funzioni aziendali e di processi di produzione.

A *livello di business*, esso mantiene validità tanto per il *portafoglio* di business considerato come unità, quanto per i *singoli* business che lo compongono; il criterio di *razionalità aziendale* può tradursi, allora, nelle seguenti regole che specificano come selezionare i business da inserire o da far uscire dal portafoglio (Pellicelli M., 2007):

a) nel valutare i business occorre tenere conto sia della loro economicità sia dell'entità del capitale investito per la loro attivazione, sia delle fonti di finanziamento disponibili;

b) tra due business scegliere quello con maggiore ROE medio negli anni di vita (maggiori risultati operativi e/o minori volumi di capitali investiti e/o minor WACC, inteso come costo medio ponderato dei capitali reperiti ai tassi di rendimento attesi dai finanziatori);

c) a parità di ROE medio scegliere quello con pay-back period più breve;

d) un business con ROE medio negativo, per gli anni di vita residua, deve essere eliminato dal portafoglio.

A *livello di funzione organizzativa*, il criterio si applica per selezionare le funzioni da mantenere o da far uscire dalla struttura organizzativa.

Se assumiamo che una funzione possa essere considerata come un'entità astratta per la produzione di servizi necessari al funzionamento ed al mantenimento dell'integrità dell'organizzazione, il criterio di razionalità aziendale può essere tradotto nella seguente regola: per massimizzare economicità e redditività aziendale, occorre svolgere internamente le sole funzioni che forniscono servizi a costo inferiore rispetto ad analoghi servizi acquistabili da altre imprese esterne, a parità di affidabilità (qualità e tempestività) e di rischio di continuità di fornitura, cioè le funzioni "vincenti" nel confronto con il mercato.

Simmetricamente, occorre esternalizzare le funzioni il cui mantenimento rappresenta un'alternativa non efficiente, cioè che sono "perdenti" rispetto ai fornitori esterni.

Il criterio di razionalità aziendale si applica, infine ai processi aziendali necessari per la produzione.

Supponendo che il prodotto finito sia la risultante di un sistema di attività, ordinate in processi, svolti dall'organizzazione, la *razionalità aziendale* si esplicita con la regola seguente: per massimizzare economicità e redditività aziendale, ogni attività non necessaria per la produzione non deve essere attuata; ogni processo il cui costo unitario medio risulti superiore al costo per acquisire analoghi risultati da fornitori esterni, deve cessare.

La *terza premessa* è che le imprese operino in un sistema economico capitalistico, nel quale vi sia disponibilità di capitali da investire in business, sia garantita la libertà di investimento che favorita la nascita spontanea di nuove imprese e la concorrenza tra quelle operanti.

Queste tre premesse rappresentano il framework operativo e concettuale per l'esistenza dell'outsourcing, per l'analisi delle sue motivazioni e forme.

Appare, infatti, intuitivo che ove esse non siano riscontrate valide – imprese individuali, mancanza di libera iniziativa, mancata ricerca della redditività (aziende di erogazione, non profit, ecc.), impossibilità di genesi spontanea di imprese, scarsità di capitali, insicurezza economica ecc. – il fenomeno dell'outsourcing appare assente o limitato a forme embrionali.

2. L'outsourcing come decisione volta all'efficienza delle trasformazioni aziendali

Il modello di impresa proposto da Mella (1992, 2005, 2008) – ancor più che la semplice logica del "make or buy" – consente di chiarire la logica che guida il management delle imprese alle decisioni ed alle strategie di outsourcing.

Si ricorda che per Mella l'impresa *capitalistica* è, per sua natura, un'organizzazione permanente *business e profit oriented* che può esistere se, ed in quanto, sviluppa cinque tipi di trasformazioni, orientate alla massima efficienza e dirette al conseguimento della massima economicità e redditività per rendere massimo il valore dell'impresa, comunque definito.

In sintesi, le imprese sviluppano:

1) una trasformazione *tecnica produttiva*, attuando uno o più processi per trasformare flussi di fattori produttivi (materials, machinery, manpower, management, know-how, tecnology, ecc.) in flussi di *prodotti* finiti a fronte di una domanda. Appare evidente, allora, che il management, con decisioni di "make or buy", può ritenere conveniente affidare in outsourcing in tutto o in parte i processi di trasformazione produttiva. Un sistema di decisioni dell'impresa (acquisti, logistica in entrata, trasformazione industriale e logistica in uscita) è così trasferito stabilmente ad un'altra impresa secondo vincoli regolati da un contratto. La produttività dei processi e la qualità dei processi esternalizzati, i due elementi determinanti della trasformazione produttiva, sono gestiti dall'*outsourcee*, ma sottoposti al controllo dell'*outsourcer*. L'*outsourcee* ha interesse a controllare e a migliorare la produttività e la qualità al fine di contrastare i propri competitors nei confronti dell'*outsourcer* ed al fine di migliorare la customer satisfaction dei clienti dell'*outsourcer* stesso. Nel presentare il significato attribuito all'espressione *smartsourcing* da loro coniata, Koulopoulos e Roloff (2006, p.111) scrivono "*In una economia globale efficiente ogni organizzazione dovrebbe fare soltanto ciò che più esalta le sue core competencies. In tal modo smartsourcing conduce non soltanto ai costi più bassi, ma anche alla qualità più alta e all'innovazione.*";

2) una trasformazione *economica* o di *mercato,* che si configura come trasformazione di valori, in quanto tiene conto dei prezzi che rappresentano i valori degli input e degli output della trasformazione produttiva. Secondo il principio della massima economicità, l'impresa

deve modulare la catena verticale (par. 1.1) non solo in considerazione di scelte tecniche di produttivtà e di qualità, ma anche, e soprattutto, di scelte economiche di "make or buy" per rendere massimo il divario tra i costi di produzione (da minimizzare) ed i prezzi di vendita (da massimizzare), come indicatori di valore per il mercato. Appare chiaro che il ricorso all'outsourcing mira, innanzitutto, a ridurre i costi di produzione o ad acquisire competenze specializzate di cui l'impresa non dispone per accrescere, dal lato dei ricavi, il valore dell'intera value chain. Possono essere affidati in outsourcing sia la produzione di un componente, sia un processo di gestione (recupero crediti ad esempio), sia un processo di marketing come il "customer care" – e, in generale, i rapporti con i clienti – o i servizi post-vendita. Questi processi, se efficaci, consentono di pagare prezzi inferiori, per ridurre il costo di produzione interno, o di sostenere minori costi di gestione, oppure di praticare prezzi di vendita più alti se nei rapporti con i clienti aumenta l'apprezzamento verso il prodotto ed i connessi servizi, quindi il suo valore percepito.

3) una trasformazione *finanziaria*, per acquisire il capitale di *equity* (capitale proprio) e di *debt* (capitali finanziari) necessari per effettuare gli investimenti necessari a formare, mantenere e rinnovare la struttura produttiva necessaria per la trasformazione produttivo-economica, secondo un'efficace leva finanziaria che minimizzi, nel tempo, il WACC (weighted average cost of capital) (Pellicelli M., 2007, Cap.1). La ricerca e la gestione del capitale investito in attività fisse (immobilizzazioni) e circolanti (crediti e debiti di fornitura e magazzino) sono funzioni finanziarie svolte dall'organizzazione. Non è infrequente la possibilità di esternalizzare alcune di queste funzioni ad imprese o a consulenti specializzati; l'outsourcing può riguardare il cash management, la gestione del circolante, la gestione degli assets e le decisioni di scelta degli investimenti strategici;

4) una trasformazione *manageriale*, nella quale le informazioni operative circa il funzionamento della struttura si traducono in un sistema di pianificazione, programmazione e budgeting che ricerca la massima efficienza nel conseguire gli obiettivi di *valore dell'impresa* e in un connesso sistema di controlli operativi relativi all'efficienza produttiva, economica e finanziaria per verificare che la produzione di valore segua i percorsi stabiliti (Mella, 1997). La decisione di ricorrere all'outsourcing può dare un notevole contributo alla trasformazione manageriale in quanto l'affidare ad altri attività di direzione e di controllo aventi carattere ripetitivo consente al management di realizzare economie di tempo e di concentrare l'attenzione sulle decisioni di maggiore importanza. Possono essere esternalizzare molte funzioni che richiedono competenze tecniche fungibili, con esclusione, pertanto delle funzioni connesse alle "core competencies" che devono essere mantenute per non compromettere la sopravvivenza dell'impresa.

5) una trasformazione *imprenditoriale* nella quale le informazioni esterne, di mercato, macroeconomiche, tecniche, politiche, ecc., sono trasformate in *decisioni strategiche* volte a modulare il portafoglio di business da gestire, alla tecnologia, ai mercati, ai prezzi e alla struttura finanziaria, per rendere massima l'efficienza economica generale, cioè per produrre nel tempo i massimi risultati economici con il minor volume e costo del capitale finanziario, rendendo, di conseguenza, massimo il valore dell'impresa.

La trasformazione *imprenditoriale*, in quanto modifica la *posizione strategica* dell'impresa, risulta subordinata ad un sistema di *corporate governance* che sceglie i soggetti responsabili delle decisioni strategiche e ne controlla l'attività.

La stessa definizione di outsourcing esclude che queste attività possano essere esternalizzare; l'imprenditorialità è connaturata all'impresa e la sua esternalizzazione trasformerebbe l'impresa in una semplice unità produttiva, strumentale per altre imprese. Non deve trarre in inganno il fatto che spesso i vertici delle organizzazioni ricorrono alla consulenza esterna per la revisione

delle strategie e per la formulazione di nuove strategie. La consulenza appare come una premessa alle decisioni. La responsabilità della scelta definitiva è sempre dell'imprenditore o dei consigli di amministrazione che valutano le informazioni su opportunità e minacce dell'ambiente esterno, su forze e debolezze interne e, avendo sullo sfondo obiettivi di valore da raggiungere, modulano le azioni strategiche in relazione al grado di rischio percepito e ritenuto sopportabile dagli shareholders e dagli stakeholders.

3. Come decidere il ricorso all'outsourcing: una serie di modelli

Quinn e Hilmer (1994) hanno ricordato che, per assumere razionali decisioni di ricorso all'outsourcing in un'ottica "strategica", le imprese devono prima di tutto individuare quali siano le fonti dei vantaggi competitivi, al fine di:

1) concentrare le risorse sulle "core competencies" che creano valore per il cliente in modo distinto e non imitabile;

2) affidare in outsourcing i processi e le attività per le quali l'impresa non abbia né particolari esigenze strategiche né particolari competenze, spesso includendo molte che in passato erano per tradizione considerate parte integrante di qualsiasi strategia.

Con lo scopo di mettere in evidenza i criteri che possono essere adottati per le decisioni di esternalizzazione, sono stati proposti vari modelli per avviare a soluzione la scelta dei processi e delle funzioni da affidare in outsourcing piuttosto che mantenere *in house*.

Riteniamo utile presentare i caratteri distintivi di quattro modelli ritenuti significativi per l'individuazione dei processi da esternalizzare in un'ottica "strategica".

Occorre premettere che tali modelli devono essere considerati più strumenti di diagnosi che criteri di decisione e che raramente possono fare scattare un'idea "creativa", un'idea che spezza le regole, che innova drasticamente.

Il primo modello ricorre ai concetti di strategie generiche e value chain.

Il modello noto come "La regola 80/20" distingue le funzioni candidate all'outsourcing a seconda della capacità dell'impresa di mantenere il controllo su di esse.

Lo "Strategic sourcing model" evidenzia due criteri di scelta: l'importanza strategica della funzione e dell'attività che l'impresa intende cedere in outsourcing e l'impatto che sulla finanza potrebbe avere l'outsourcing.

Il quarto modello, infine, propone di affrontare la scelta tra "core" e "non core" individuando una scala di priorità e distinguendo cinque tipi di competenze ordinate per grado di rischio della loro esternalizzazione.

3.1 Il modello delle strategie competitive

Relativamente al primo modello, Kedia *et al*. (2005) ricorrono al concetto di strategie generiche sviluppato da Porter (1985) per valutare vantaggi e rischi dell'affidare produzioni in outsourcing, sostenendo che l'outsourcing – ma le argomentazioni valgono ancor di più per l'offshoring – può dare all'impresa la possibilità di combinare e ottenere vantaggi in tutte le tre dimensioni delle strategie generiche: cost leadership, differenziazione e focus.

Vantaggi competitivi derivano dalla cost leadership "*quando l'impresa riesce ad essere il produttore con i costi più bassi del settore*" (Porter 1985, p.149). Tuttavia anche se l'impresa riesce, in un determinato momento, a raggiungere questa posizione, resta sempre sotto la minaccia dei suoi competitors che possono "fare meglio". Ricorrere all'outsourcing può, allora, mantenere l'impresa in posizione durevole di cost leadership.

Il suo vantaggio cesserà quando un'altra impresa riuscirà a produrre a costi più bassi o a realizzare una rete di outsourcing che spinga i costi a livello ancora inferiore.

Per riguadagnare la cost leadership, l'impresa deve cercare nuovi *outsourcees* e cercare nuovi distributori che siano in grado di competere a costi più bassi di quelli dei rivali e pertanto, in questo processo ripetitivo, la ricerca dell'*outsourcee* con il costo più basso è continua, senza fine.

Con la strategia generica di differenziazione, l'impresa costruisce vantaggi competitivi quando "*cerca di essere unica in campi che il compratore valuta positivamente*" (Porter 1985, 129).

In questa ipotesi, l'outsourcing consente al management di concentrare le risorse e l'attenzione sulle "core competencies" dell'impresa, destinando le economie di costo ottenute dall'outsourcing per aumentare il valore aggiunto delle produzioni investendo, ad esempio, in R&D, con la possibilità di ottenere vantaggi da nuovi prodotti o servizi o da nuovi processi produttivi.

L'impresa può invece "focalizzarsi" per eccellere in un segmento o in un gruppo di segmenti. *"E' una strategia profondamente diversa dalle precedenti perché è basata sulla scelta di un'arena competitiva molto ristretta all'interno di in un settore"* (Porter 1985, p.129).

Questa strategia ammette due varianti: focus sui costi e focus sulla differenziazione. L'impresa supera i competitors o perché serve meglio i clienti offrendo loro prodotti o servizi a prezzi più bassi, oppure perché offre loro prodotti o servizi nuovi e differenti da quelli dei rivali.

Affidando in outsourcing le attività più semplici e i processi ripetitivi il management può concentrarsi maggiormente sulle relazioni con i clienti.

Come abbiamo visto nei capitoli precedenti, Dell e Ibm nel settore dei computer, Microsoft nei software, Nike nelle calzature sportive hanno costruito le loro posizioni dominanti affidando a fornitori a basso costo e "Third world" parte delle produzioni concentrando le risorse su due core competencies, marketing e R&D, mantenute saldamente all'interno.

Kedia *et al* (2005*)* affrontano il problema di come selezionare funzioni, processi e, in generale, le attività che potrebbero essere affidate in outsourcing, rilevando che, per tale selezione, il management deve svolgere un'analisi approfondita che porti a:

1) specificare con chiarezza la value chain dell'impresa;
2) distinguere le "core competencies" dalle "non core";
3) definire la value chain delle "core competencies";
4) distinguere le attività essenziali da quelle non essenziali;
5) separare le attività "core" o "quasi core" da quelle "non core".

Occorre che il management affronti, innanzitutto, il problema di definire i caratteri delle "core competencies".

Per tale definizione, Quinn e Hilmer (1994) individuano una serie di requisiti: 1) danno origine a capacità distintive o a conoscenze distintive, non solo prodotti o funzioni; 2) non sono aree ristrette in cui l'impresa eccelle, ma piattaforme ampie e flessibili, in grado di adattarsi al cambiamento e di evolvere; 3) sono in numero limitato; 4) sono fonti uniche di vantaggio nella value chain; 5) costituiscono aree nelle quali l'impresa può mantenere una posizione dominante; 6) rappresentano elementi che il potenziale cliente considera importanti anche nel lungo termine; 7) risultano innestate profondamente nella cultura dell'organizzazione.

Per Prahalad e Hamel (1990) le "competenze distintive" sono *"conoscenze collettive dell'organizzazione, relative soprattutto al coordinamento delle diverse conoscenze produttive con i flussi di tecnologia"*.

Gli Autori rilevano che, per essere definita "core", una competenza deve avere alcuni requisiti: 1) dare accesso ad una varietà di mercati e segmenti; 2) contribuire a creare benefici per il cliente; 3) essere difficile da imitare; 4) agire trasversalmente su tutte le funzioni dell'impresa, su tutti prodotti e su tutti i mercati; 5) essere radicata nell'organizzazione e quindi persistere anche quando alcuni particolari persone o gruppi di persone lasciano l'impresa.

Per svolgere l'analisi da essi proposta, Kedia *et al* (2005*)* suggeriscono di ricorrere allo strumento della value chain e alla "matrice competenze/ vantaggi competitivi".

La value chain che, come afferma Porter *"disaggrega un'impresa nelle sue attività strategiche rilevanti allo scopo di interpretare il comportamento dei costi e le fonti attuali e*

potenziali di differenziazione" (Porter 1985, 150), comprende cinque attività primarie e quattro attività di supporto.

Le attività primarie sono: logistica in entrata, gestione operativa, logistica in uscita, marketing e vendite, servizi.

Le attività di supporto sono: gestione degli approvvigionamenti, gestione della tecnologia, gestione delle risorse umane e infrastrutture dell'impresa.

La value chain – proprio in quanto rappresenta i legami tra le varie attività ed esprime le potenziali sinergie tra prodotti e servizi – consente di esprimere il valore di un dato prodotto o servizio in termini di valore delle attività necessarie per produrlo, proprio distinguendo tra attività primarie e attività di supporto.

L'analisi della value chain è, pertanto, fondamentale per individuare la natura dei vantaggi competitivi e per individuare le azioni strategiche per proteggerli e rafforzarli.

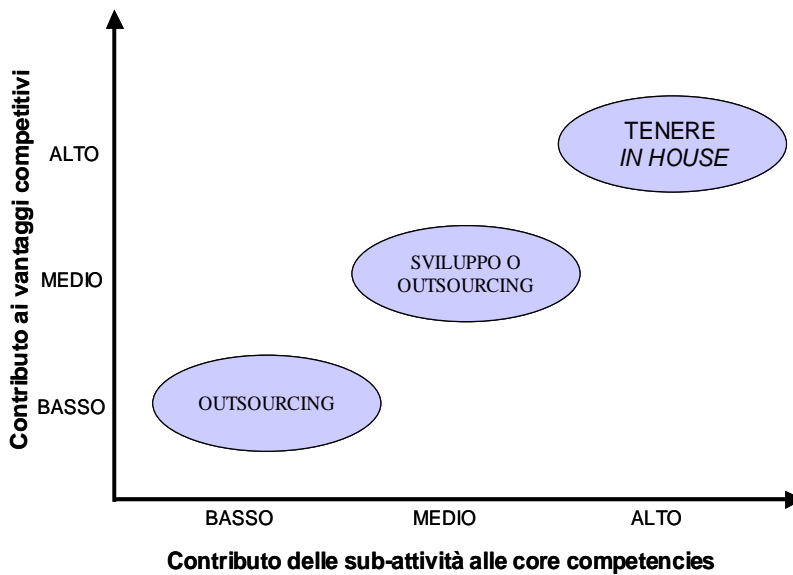
Kedia *et al.* suggeriscono di analizzare ciascuna attività primaria e di supporto in sub-attività e tentare di individuare: 1) quale contributo ciascuna sub-attività porti ai vantaggi competitivi dell'impresa; 2) quale contributo ciascuna sub-attività porti alle "core competencies". 3) quali sub-attività debbano essere date in outsourcing al fine di mantenere e/o raggiungere vantaggi competitivi.

Per attuare questa analisi, le sub-attività individuate nella value chain possono essere collocate in una "matrice competenze/vantaggi competitivi" – che può assumere la forma indicata in Figura 3.2 – per esaminare come ciascuna contribuisca alle core competencies e ai vantaggi competitivi dell'impresa.

L'esame combinato della value chain e della matrice dovrebbe fornire gli elementi per decidere quali sub-attività o quali attività cedere in outsourcing.

Le attività che si collocano nella posizione basso-basso sono candidate potenziali all'outsourcing in quanto il loro contributo sia alle "core competencies" sia ai vantaggi competitivi appare modesto. Queste attività consumano risorse non necessarie senza dare vantaggi competitivi all'impresa. Le considerazioni sono opposte per le sub-attività che, collocandosi nella parte alto-alto della matrice, sono le fonti principali dei vantaggi competitivi; esse devono essere, pertanto, mantenute all'interno, protette e potenziate.

La posizione centrale è rappresentata da sub-attività che non contribuiscono in modo significativo né alle "core competencies" né ai vantaggi competitivi dell'impresa; per esse vi è la scelta tra lo sviluppo, attraverso investimenti, in modo da diventare risorse strategiche nel lungo termine, e collocarsi nella posizione alto-alto della matrice, oppure l'essere considerate come candidate all'outsourcing.

Fig. 1 – Matrice competenze-vantaggi competitivi


Fonte: Kedia B., Lahiri S., Lovvorn A., Seeking competitive advantage on distant shores, *EBF*, (21), spring 2005.

Il ricorso alla tecnica di analisi della value chain e della costruzione della matrice è necessario per impostare il problema di stabilire per quali attività ricorrere all'outsourcing ma non sufficiente per arrivare ad una soluzione; il management deve, infatti, individuare, con altre accurate analisi, quali siano le fonti delle "core competencies", le fonti dei vantaggi competitivi, e i legami tra queste fonti.

In ogni caso, queste analisi presentano alcuni evidenti limiti.

Anzitutto, occorre ricordare che i cambiamenti dell'ambiente economico e competitivo impongono revisioni frequenti delle decisioni riguardanti l'outsourcing. L'outsourcing non è una decisione "una volta per tutte" (one-off).

Affiora quindi un punto debole sia della value chain, sia della "matrice competenze/vantaggi competitivi". Tali strumenti individuano posizioni attuali, mentre ogni strategia competitiva deve essere la risultante di una proiezione futura e deve considerare anche la verosimile risposta dei competitors.

Zook (2007) stima che i due terzi delle imprese nei prossimi dieci anni debbano ridefinire il loro core business sotto la spinta di forze che vanno dalla globalizzazione all'impatto di Internet.

Secondo tale Autore, le imprese per competere devono essere pronte a passare ad un nuovo modello di business utilizzando ciò che egli definisce "i punti di forza dormienti". Le tre principali "forze dormienti" sono: a) "forze" adiacenti al core business (segmenti di clienti non esplorati, mercati geografici, o servizi); b) esistenza di organizzazioni di sostegno (ad esempio la divisione servizi di IBM che per lungo tempo aveva fatto da sostegno alla produzione manifatturiera); c) attività "non core" ma ad alto impatto economico di breve periodo.

L'outsourcing, come tutte le attività di un'impresa, non può essere ricondotto ad una mappa. Le decisioni prese e le attività avviate da entrambe le parti continuamente estendono o riducono il loro campo di azione.

3.2 La regola 80/20

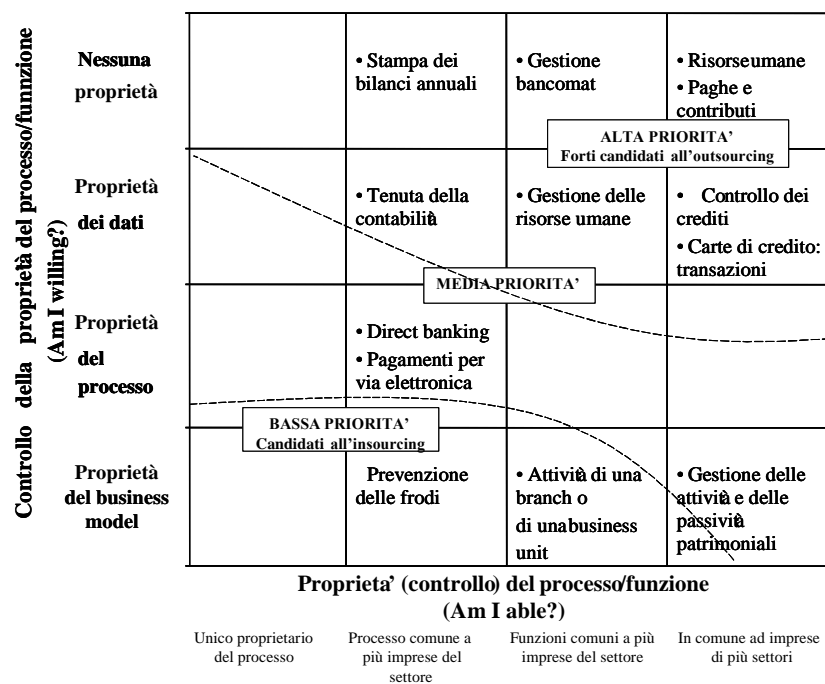
Un secondo strumento diagnostico che può aiutare a prendere la decisione circa quali attività affidare in outsourcing e in quale paese o area geografica è proposto da Puryear (2000).

Questo strumento si distingue da quello esaminato al paragrafo precedente in quanto non cerca tanto di individuare quali attività si *vogliano* esternalizzare ma quali l'impresa *sia in grado* di dare in outsourcing senza minare la base della sua capacità di competere.

L'Autore applica il noto principio dell'80/20, introdotto da Pareto, osservando che, in genere, tra imprese di un dato settore, l'80% delle attività sono simili e che quindi occorre porre l'attenzione sul rimanente 20% se si vuole dare unicità all'offerta. L'impresa dovrebbe cercare di ottenere l'80% delle attività simili dal miglior fornitore alle condizioni migliori – incentivando l'outsourcing – e concentrare le risorse sul 20% delle attività che "fanno la differenza".

Per individuare le attività distintive rientranti nel 20%, il management deve dare risposta a due domande.

La prima domanda è se l'impresa sia in grado di gestire assieme ad altri una determinata attività. La possibile risposta è rappresentata nel grafico di Fig. 3.4, sull'asse orizzontale denominato asse "Am I able?"; in esso si posizionano, da un lato, i processi unici di esclusiva proprietà dell'impresa e, dall'altro, i processi comuni alle altre imprese del settore, fino ad arrivare all'estremo dei processi comuni alle imprese di più settori.

Fig.2 – Aree di priorità nell'outsourcing


Fonte: Puryear R., (2000), *CIO Insight*, april.

La seconda domanda è se, esternalizzando attività in outsourcing, l'impresa rischi di cedere definitivamente conoscenze di importanza critica. L'asse verticale, l'asse "Am I willing", esprime il grado di proprietà (capacità di controllo) del processo. Su tale asse si posizionano le alternative di nessuna forma di proprietà su un processo o su una funzione (ad esempio la gestione delle paghe e contributi o l'applicazione degli IAS ad una particolare voce di bilancio)

alla proprietà del business model. La seconda domanda così diventa: se divido con altri la proprietà, cedo ad altri conoscenze distintive? E quindi cedo informazioni di importanza critica che non potrò più mettere in comune con altri?

Le risposte possibili alle due domande, rappresentate nel grafico, indicano le priorità nell'outsourcing. Nell'angolo in alto a destra si collocano le funzioni e i processi che l'impresa è propensa a cedere in outsourcing, in quanto comuni a molte imprese e sono condivisibili senza il rischio di cedere competenze esclusive. Le funzioni per le quali l'oustourcing è più utile tendono a collocarsi in questo angolo.

I processi che si collocano nell'angolo in basso a sinistra sono invece quelli che l'impresa non è propensa a dividere con altri, in quanto sono di sua proprietà, oppure sono particolarmente distintivi, unici. Di conseguenza non sono candidati per l'outsourcing, bensì per la produzione *in house*.

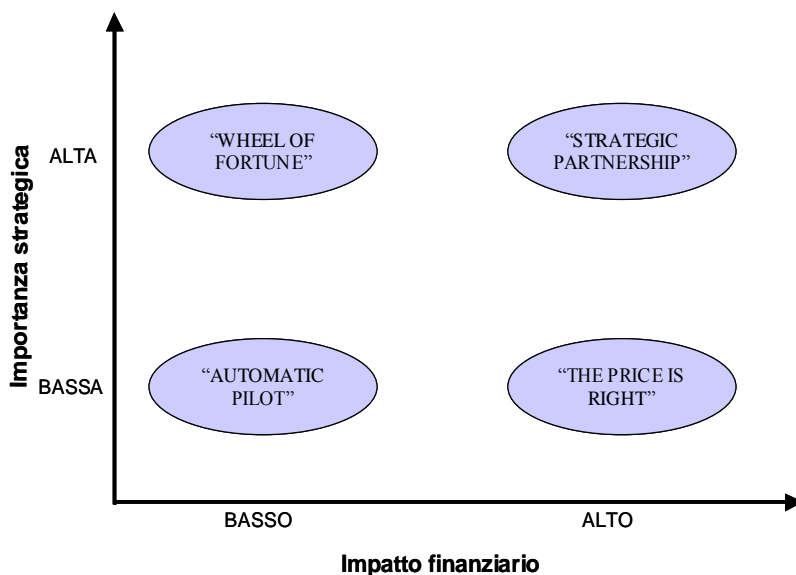
3.3 Lo Strategic sourcing model

Owens *et al*. (1998), ponendosi dal lato della funzione degli acquisti, propongono un modello per integrare le scelte di outsourcing nelle strategie corporate che offre una valido supporto per orientare la scelta in una prospettiva strategica.

Rispetto ai modelli precedenti, il modello proposto da Owens ha il pregio di introdurre anche la variabile tempo e l'impegno richiesto al management nei vari tipi di decisione di esternalizzazione.

Rappresentato con la matrice di Fig. 3.5, il modello individua, lungo la dimensione verticale, il grado di priorità che, per la sua importanza strategica, una data attività ha nella gestione e nell'organizzazione dell'impresa; rappresenta lungo la dimensione orizzontale l'impatto finanziario di tale attività, cioè l'impegno intermini di investimenti richiesti.

Combinando in una matrice le due dimensioni si ottengono quattro aree. A seconda dell'area in cui si colloca l'attività si hanno prime indicazioni circa il se e il come procedere con l'outsourcing. In particolare il modello può dare suggerimenti circa l'approccio che il management dovrebbe adottare nell'outsourcing dei vari tipi di attività.

Fig. 3 – La matrice dello "Strategic sourcing model"


Fonte: Owens G.,Vidal O., Toole R., Favre D.,"Strategic sourcing. Aligning procurement needs with your business goal", in Gattorna J. (1998), *Strategic Supply Chain Alignment. Best practise in supply chain management*, Gower, Brookfield.

L'importanza strategica di un'attività, rappresentata sull'asse verticale, è determinata dal peso che ha sul "core business" e sulla futura capacità di competere dell'impresa.

Le attività di modesta importanza strategica possono essere necessarie, ma non danno vantaggi competitivi rispetto ai rivali. Un esempio è rappresentato dai sistemi informativi standard basati su software che qualunque impresa può acquistare. Le attività di importanza strategica sono invece in grado di agire sulla capacità di competere. Un esempio è la capacità di alcuni stilisti di moda italiani di dettare tendenze.

Oltre a graduare l'importanza strategica di un'attività, occorre anche stabilire quale impatto essa abbia sull'impegno finanziario. Tale impatto agisce sul tempo da dedicare alla decisione se ricorrere o non ricorrere all'outsourcing e sull'impegno finanziario che l'outsourcing può richiedere al management. Se il tempo e l'impegno sono valutati bassi, allora anche l'impatto risulta basso.

Esaminiamo le caratteristiche delle quattro aree mantenendo il loro titolo originario.

"Authomatic pilot". L'attività di modesta importanza strategica e modesto impatto sulla finanza si collocano nell'area in basso a sinistra. La soluzione migliore è ricorrere al normale sourcing di fornitura e stabilire in presenza di quali condizioni ripetere l'ordine al fornitore, senza ulteriori interventi del management.

"The price is right". Vi sono poi le attività di modesta importanza strategica, ma con forte impatto sulla finanza. La soluzione è ricorrere all'outsourcing e indire gare tra fornitori per ottenere il prezzo più basso. Essendo modesta l'importanza strategica, il prezzo è il criterio base per la scelta.

"Wheel of fortune" L'area in alto a sinistra raccoglie le attività con forte importanza strategica, ma con modesto peso finanziario. La scelta del *supplier* tra i possibili candidati è molto importante e Owens *et al* (1998) suggeriscono di adottare un contratto tipo che stabilisca gli obblighi di fornire uno specifico numero di prodotti e servizi entro un determinato periodo di tempo. Dopo la prima negoziazione gli ordini sono ripetuti seguendo una procedura predeterminata, di routine. Il pagamento attraverso carta di credito ha un'importanza strategica per Amazon. Il cliente deve essere rassicurato in quanto teme atti di pirateria. Amazon ha ceduto la gestione dei pagamenti a istituti bancari specializzati in cambio di commissioni basse relativamente agli importi della transazione.

"Strategic parternship". Nell'area in alto a destra sono classificate le attività che presentano un'elevata importanza strategica ed un forte impatto finanziario. Le decisioni ad esse relative richiedono la maggiore attenzione e il maggiore impegno. La soluzione migliore, nel caso in cui l'impresa voglia esternalizzare, può essere un'alleanza strategica con il vendor/outsourcee. Uno stilista di moda che intenda affidare all'esterno parte del processo creativo (ad esempio la prima realizzazione dei prototipi) dovrebbe farlo soltanto attraverso un'alleanza con l'outsourcee. La cessione totale potrebbe far perdere il controllo sull'evoluzione delle tecnologie di realizzazione (ad esempio Cad/Cam).

Owens *et al*. osservano che il trattare l'outsourcing in una prospettiva strategica comporta anche una revisione della struttura organizzativa, per quanto riguarda, in particolare, le relazioni interne tra funzioni. Comporta anche una revisione delle relazioni esterne: quelle tradizionali dell'ufficio acquisti se si opera in "Automatic pilot" e quelle riguardanti le alleanze strategiche se si propende per "Strategic partnership".

Se la scelta è per l'esternalizzazione mediante uno "strategic sourcing" non vi è dubbio che che lo "Strategic partnership" debba essere potenziato e le funzioni connesse debbano rimanere accentrate.

Occorre osservare che senza uno stretto coordinamento tra più funzioni è impossibile costruire relazioni efficaci con i fornitori esterni.

Lo "Strategic sourcing" deve interagire, in particolare, con R&D, progettazione, produzione e gestione operativa, vendite e marketing, contabilità e finanza.

3.4 I modelli di Cordon, Vollmann ed Heikkilä

Tenere all'interno le "core competencies" e affidare in outsourcing le "non-core competencies" è un criterio di decisione che pochi mettono in discussione.

Cordon, Vollmann, Heikkila (1998) vanno controcorrente e considerano questa distinzione come un'eccessiva semplificazione della realtà che può condurre gravi errori e che le attività "non-core" non necessariamente devono essere esternalizzate.

Chiariscono di non mettere in discussione il concetto di "core competencies" reso popolare da Prahalad e Hamel considerandolo, infatti, un concetto utile per definire una strategia e per concentrare l'impegno del management sulle azioni che rafforzano le "core expertise" come è accaduto in Honda la cui "core competency" è produrre motori a combustione interna in quanto sono il "core" di un'ampia varietà di prodotti: autoveicoli, motociclette, tagliaerba, fuoribordo, generatori di energia elettrica.

Come decidere allora cosa affidare in outsourcing e cosa non affidare? Inoltre, dato che l'outsourcing può assumere varie configurazioni, qual è quella più adatta alle attività di una data impresa?

Cordon *et al* hanno proposto due modelli per arrivare a questa decisione. Il primo modello ha lo scopo di capire a fondo la situazione attuale classificando le competenze in più categorie. Il secondo mira a preparare la scelta tra insourcing e outsourcing.

Il primo modello pone le premesse per costruire una priorità tra i vari tipi di competenze, classificando le competenze in cinque categorie:

1. *Distinctive competencies*: sono le competenze "più importanti" di un'organizzazione; ad esempio la miniaturizzazione per Sony, la produzione di motori per Honda.

2. E*ssential competencies*: sono le attività di cui una organizzazione ha necessità per operare. Ad esempio il fornitore di componenti di un costruttore di auto deve avere competenza nella gestione di processi di qualità elevata e deve essere certificato come ISO 9000 al fine di essere abilitato a fornire un particolare cliente.

3. *Spillover competencies*: sono quelle che consentono ad un'impresa di mantenere l'economicità attraverso un'attività legata alle competenze distintive. I tre autori fanno l'esempio di Michael Schumacher. I guadagni derivanti dal merchandising di abbigliamento con il suo nome è una competenza derivata dalla sua abilità di pilota di Formula 1.

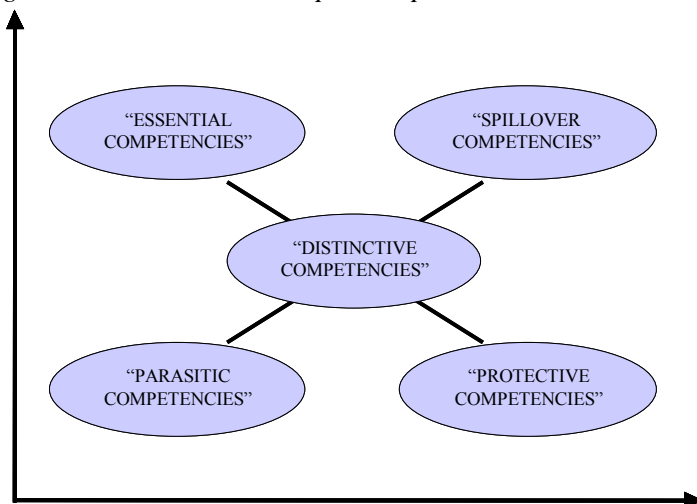
4. *Protective competencies*: riguardano le attività il cui venir meno o la cui cattiva gestione porrebbe a rischio il successo dell'intera organizzazione.

5. *Parasitic competencies*: sono le attività che "sprecano" risorse se realizzate all'interno di un'organizzazione. Sono spesso l'eredità di decisioni prese in passato. Un'attività diventa parassita se sul mercato sono presenti imprese che possono realizzarle a costi di molto inferiori.

Gli Autori giungono alle seguenti conclusioni. Agli estremi della scala di classificazione, le "distinctive competencies" devono essere mantenute *in house* e potenziate, mentre le "parasitic competencies" devono essere esternalizzate.

Le "essential competencies" e le "protective competencies" possono essere esternalizzate se l'impresa si assicura, attraverso opportuni meccanismi, la continuità delle forniture e la minimizzazione dei rischi di peggioramento della qualità.

Le "spillover competencies", proprio in quanto fondamentali nella catena del valore, possono essere affidate in outsourcing solo se l'impresa può far proprio il valore creato con l'esternalizzazione.

Fig. 4 – Il modello delle competenze per le decisioni di outsourcing


I tre Autori avvertono che il modello, rappresentato nella Figura 3.7, deve essere inteso in senso dinamico, in quanto le competenze di un'impresa possono passare da una categoria all'altra a seconda dell'evoluzione dell'organizzazione e del mercato. Una "essential competency" può diventare "parasitic" nel caso in cui si sviluppi un mercato che offra stabilmente prodotti/servizi migliori a prezzi più bassi come, ad esempio, accade quando l'impresa entra nel mercato di un paese emergente, nel quale non si trovano affidabili fornitori di componenti o di servizi accessori. L'impresa che entra in un tale mercato deve pertanto far fronte alle proprie esigenze produttive con proprie attività che rientrano nella categoria delle competenze essenziali. Se in tempi successivi nel mercato locale si sviluppa un'offerta adeguata, le competenze possono essere affidate in outsourcing, cessano quindi di essere considerate essenziali.

Il secondo modello proposto da Cordon, Vollmann ed Heikkila (1998), che assume la forma di una matrice, analoga a quella di Fig. 5, ordina le attività o i processi di un'organizzazione secondo due dimensioni correlate: il *rischio* relativo al trasferimento all'esterno dell'attività (asse verticale) – come la perdita di know-how e la perdita della capacità di competere – e *l'efficacia* dell'attività realizzata *in house* contrapposta a quella realizzata in outsourcing (asse orizzontale).

Ciascuna area della matrice individua specifiche azioni che il management dovrebbe intraprendere.

Se l'efficacia *in house* è alta e i rischi derivanti dalla cessione di attività in outsourcing sono alti (lato destro in alto) l'attività va tenuta all'interno, almeno fino a quando l'impresa sia in grado di mantenere elevata l'efficacia.

Se l'efficacia *in house* è bassa e i rischi di esternalizzazione sono bassi (lato sinistro in basso) appare logico ricorrere all'outsourcing.

La situazione più difficile si ha quando l'efficacia *in house* è bassa e il rischio è alto. In questo caso, il management dovrebbe riconfigurare l'attività (come indicano le frecce) o per renderla più efficace (spostandola verso destra) o per ridurre i rischi (spostandola verso il basso). Se la riconfigurazione consente di riposizionare l'attività nel quadrante in basso a sinistra, essa può essere affidata in outsourcing.

Queste azioni possono, però, trovare, in fase di decisione, molte resistenze da parte del management a vari livelli dell'organizzazione.

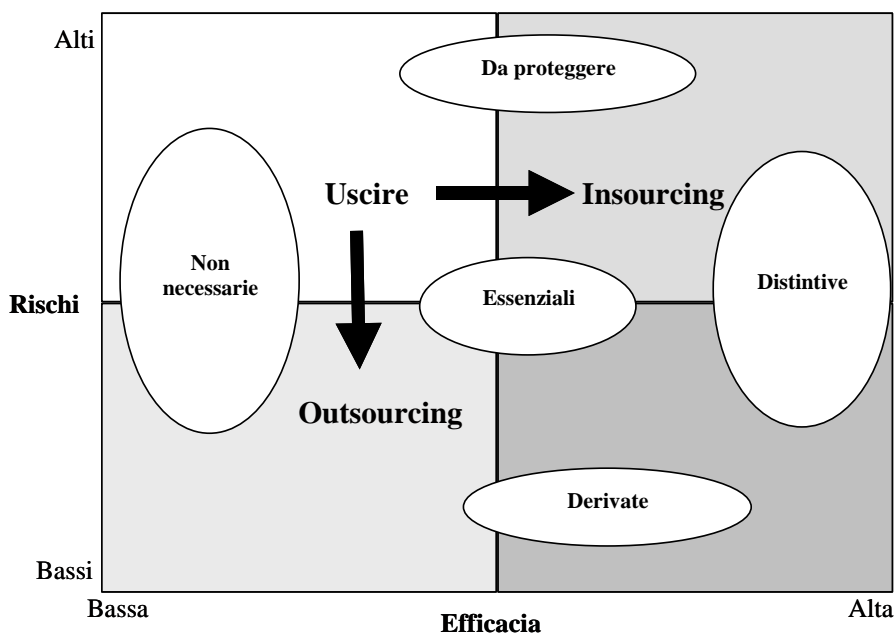
Le resistenze manageriali emergono anche quando, dopo aver affidato in outsourcing un'attività, si deve decidere per internalizzarla con un *backsourcing*.

Per completezza, si ricorda che Kumar *et al* (2007) presentano un modello che ha gli stessi obiettivi di quello appena illustrato, appare più articolato ma riguarda unicamente il settore dei servizi industriali.

Tale modello, che impiega un software specializzato, vuole essere uno strumento operativo per decidere cosa e quando affidare in outsourcing al fine di ottimizzare la redditività o la produttività e minimizzare i rischi.

Individua le scelte ottimali secondo lo schema decisionale "go-no-go" a seconda della fase del ciclo di vita del prodotto in cui si pone il problema dell'esternalizzazione.

Assume che l'impresa sia nella fase di maturità, abbia elevata capacità di competere e intenda esplorare le opportunità di outsourcing su scala globale; il modello, rappresentato in Figura 3.8, appare interessante in quanto basa le scelte di outsourcing non solo su valutazioni interne dell'impresa ma anche sull'analisi delle *best practices* impiegate nei settori di riferimento per le decisioni.

Fig. 5 – Matrice efficacia e rischi nell'outsourcing


Fonte: Cordon C., Vollmann P., Hekkilä J., "Thinking. clearly about outsourcing", *Mastering in Global System*, Financial Times, 19.02.1998.

A conferma dei modelli precedenti, risulta interessante, da ultimo, citare ancora l'indagine Kearney, in quanto sono specificati i motivi di preoccupazione relativi alle aziende del campione esaminato.

SURVEY ON THE USE AND THE INTEREST OF INDIVIDUALS IN ONLINE STORES

In Romania, most products sold in online stores are technology and communication ones. Best sold products through the Internet, globally speaking (games, toys, flowers, watches, tickets), are only 30% of the online products offered in Romania. Culture (books and information) only represents 10% of all products, as well as clothing and grooming products.
In recent years electronic commerce has had an explosive increase, starting to gain more and more ground on the traditional trade. In what follows, we will analyze the factors that favoured the development of electronic commerce, both in terms of consumers as well as vendors.
Keywords: electronic commerce, online store, customers, loyalty, Internet.
JEL Classification codes: M10, M15, M31.

In analyzing the evolution of electronic commerce in Romania we must start with the evolution of the number of Internet users. Despite the fact that in Romania the share of Internet users in the total population increased from 3.6% in 2002 to 35.5% in 2010 (according to statistics provided by Internetworldstats.com), our country ranks last in the European Union, which had a share of 67.60% in 2010. Countries with the highest percentage of Internet users are The Netherlands with 86.6% being users and Sweden with a share of 92.5% in 2010.

Romania is well below the European average considering the frequency of Internet users' online presence: in Romania only 21% of Internet users access it daily compared to 53% which is the European Union average.

Electronic commerce in Romania is still in its infancy. Romanians show fear because they are exposed to fraud (stolen credit cards, personal data's privacy, lack of compliance of the bought product with its presented description etc.). Although there are not many companies that have adopted this form of commerce, is a certainty the fact that their number and that of the online customers is increasing.

The slower growth of this new type of commerce in Romania has many causes. The most important cause is related to Internet access, either because of physical inability to connect, or because of lack of computer literacy, especially among the elder population segment. Also, another reason is that Romanians are still tributary to the mentality that an achieved property must be touched and seen in reality, measured and turned all around, while when shopping on the Internet the buyer can only read the product's description which may be more or less in line with reality.

The factors representing advantages of electronic commerce for consumers are primarily, consequences of the economic and social global development. Economic globalization has been one of the factors that have led to changes in the life of the population, with a direct effect on the way they makes their purchases.

Among the advantages offered by the electronic commerce we include the following:

a) *time* - nowadays, because of the many activities the population is involved in, the time required for shopping has become an important element in choosing the purchasing method. From this

perspective, electronic commerce has the advantage that a buyer can visit several virtual shops in a much shorter time than he would need for visiting the actual stores.

b) *distance elimination* – is a great advantage offered by electronic commerce. By eliminating the distance between buyer and seller, anyone can easily buy products that are offered for sale in other cities or countries, without one of the parties having to move around.

c) *access to information* - both online stores and the Internet give the buyer a lot of information about product's features. Most sites offer, besides the section where they display product characteristics, a section where those who already own one can provide feedback.

d) *the price* - the use of electronic commerce offers the opportunity to get a much better price for a product, whereby the seller's trade mark-up not having to cover rental expenses and also having lower staff costs. Also, many sites offer the possibility to compare prices from various online stores for the same product. A good example is the electronic supply procedure (eProcurement) which by organizing auctions offers the opportunity to obtain lower prices for public procurement of goods and services.

e) *freedom of choice* - because of the large number of stores, the customer can choose according to a much important number of options he desires, such as price, delivery date, colour, etc.

f) *product* comparison - electronic commerce makes choosing a product from a group of products with similar characteristics much easier. Online stores sites offer the possibility of selecting more products for comparison. The selected products appear then in a table where one can see their compared characteristics, facilitating a purchasing decision for the customer.

g*) permanent availability* – the uninterrupted running of the online shops throughout the year, 24 out of 24 hours a day, allows customers to shop at any time. It is one of the biggest advantages of electronic commerce, especially for people who have a very busy schedule, purchases being available at any time of day or night.

i) *post-sales technical support* - buyers can receive online technical support from the provider, on the company's website in a separate area dedicated to questions and answers, solutions being provided by the company's technical staff, or through a facilitator who provides real-time answers. If none of the two support techniques is offered, it will be done by e-mail.

This study explores how does the general population understand and use online stores to buy certain products.

The research's subject, which is the public's perception on electronic commerce is relatively difficult to address in a quantitative research. In the present study's case, a special attention was given to how the questions were formulated, in order to avoid the respondent's tendency to generalize.

This study captures some of the topics addressed by other researchers, but new questions being also introduced.

The methodology:
The purpose of the study was to carry out a survey on the public's perception on online store.
The study's general objectives:
- The perception of individuals on Internet use and their interest in online stores;
- The perception of individuals regarding the categories of products in online stores.
- The perception of individuals on how shopping is being done in an online store and the relationship with the store.

Target population: Romanian citizens (men and women), urban and rural residents in Romania, over 18 years of age.
Sample size: 60 people
Type of sample: random sample, in stages,stratified
Sampling: probabilistic selection of the sampling points

Representativeness: the 60 people sample is representative of the population over 18 years old in selected areas (a 2.8% error at a confidence level of 95%).

Method of research: survey - face-to-face interview-based questionnaire administered by the interviewer.

Data collection: For each individual, data was collected using the questionnaire below, with one or more accepted variants, by a field operator (the authors of the paper). The interviews were conducted face to face.

Fieldwork, data processing: they were carried out by the authors of this paper between September and October 2011.

Study results:

A. The perception of individuals on Internet use and their interest in online shops
When asked "Have you ever bought from an online store?", 27 people (47%) of those surveyed said they have shopped in online stores several times and 28 confirmed that they only bought products from an online store once. 8% of respondents (5 individuals) have never shopped online.
Graphic no.1
Realized by author

When asked "How often do you access the Internet to visit online shops?", more than three quarters of the respondents (76%) stated that they use the Internet daily to visit online stores, compared with 16% who frequently access the sites of electronic stores and only 8% of respondents who rarely or never use the Internet for this purpose.

B. The perception of individuals on categories of products in online shops
When asked "What kind of products you are interested in when you visit an online store?", 25% (15) of respondents are interested in IT products, 18% (11) want to buy gifts and 17% (10) appliances . 15% (9) of individuals are seeking clothing in online stores, while in electronics 10% (6) are interested. People who buy CD/DVD and other products are in proportion of 5% (3), and 3% (2) show an interest in books. Only 2% (1) of them goes online to buy medical products.
Graphic no. 2
Realized by author

The fact that you cannot try on or/and test products may induce a feeling of insecurity when one wants to purchase products from online stores, so: 45% of respondents have no fear in buying products from online stores, while more than half (35%) choose stores where they can return unsatisfactory products. Only 20% of respondents avoid such stores.
Graphic no. 3
Realized by author

Three quarters of the individuals consider that the price of the products in online stores is lower than in real shops, while 28% think the price is higher. Only 8% see no difference.
Graphic no. 4

844

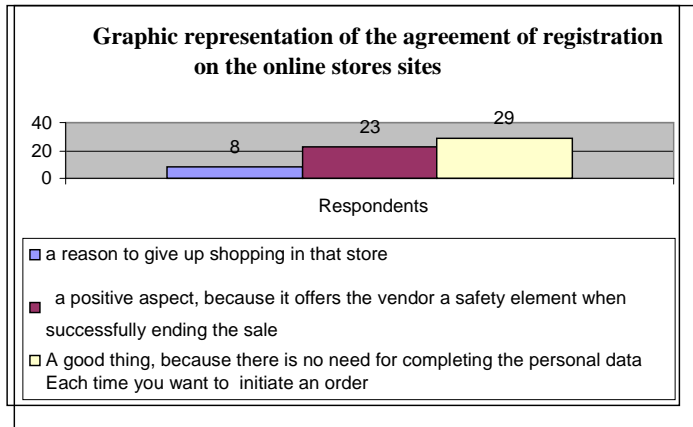
Conclusions:

Most of the people who answered the questionnaire, are interested to purchase IT products (25%), in online stores, and prefer to buy clothing / shoes in stores where they can return products if they do not fit (45%). In large proportion (24 people) choose to purchase daily/street vestments and 64% believe that online stores prices are lower than in real stores.

C. The perception of individuals on how shopping is being done in an online store and the relationship with the store.

When asked "What do you think about the fact that some online stores ask for customer registration before an order?", almost half of individuals considered it to be a benefit for them to register on the site, while 23 consider that this gives a safety element to the sales process. 8 people would choose not to buy from an online store, where they would require registration.

Graphic representation of the agreement of registration on the online stores sites

- a reason to give up shopping in that store
- a positive aspect, because it offers the vendor a safety element when successfully ending the sale
- A good thing, because there is no need for completing the personal data Each time you want to initiate an order


Graphic no. 5
Realized by author

When asked "What are the reasons that would determine you to choose to buy from an online store?", 26 people of 60 respondents would choose to buy from a store, where the transportation of the products would be paid, 21 would be influenced by the opinion of other clients, and 9 would not shop in stores where the procedure is too complicated. 4 individuals consider that the lack of technical support would make them hesitate when buying online.

Graphic representation, by number of respondent individuals, of the reasons why they would choose to give up buying in an online store

- The transportation must be paid — 26
- Other clients consider the products not to be quality ones — 21
- There is no technical support — 4
- The ordering method is too complicated (registration, confirmation, etc) — 9

No. individuals
Graphic no. 6
Realized by author

Of all respondents, 51 (55%) prefer the courier as a transportation method, whereas 7 (42%) are convinced that by Post they can receive goods safely. Only 2 people (3%) choose the personal delivery of the ordered goods.
Graphic no. 7
Realized by author

Regarding payment methods, more than half of those who participated in the study (33) prefer cash payments, while 25 chose to pay with a credit card. Only 2 people find it more convenient to do a bank transfer.
Graphic no. 8
Realized by author

When asked "Do you consider it useful for online stores where you have registered, to send you e-mail alerts when they offer discounts on certain products or they have new products?", 63% of respondents said yes, while 22% are not interested in such price alerts. 22% say they are not registered with such stores.

Usefulness of e-mail price alerts

22%

15%

63%

□ yes ■ no □ I am not registered with such stores
Graphic no. 9
Realized by author

Regarding the relationship with the loyalty tools used by some stores, at the question "Would you be more willing to buy from a store that rewards customer loyalty?" the answer was clearly yes for 50% of respondents. Furthermore, this is one of the aspects that proves the great interest of customers for the customizing of the products and services they buy, and this regardless of how the transaction takes place.

Graphic representation of buying availability

in stores that reward loyalty

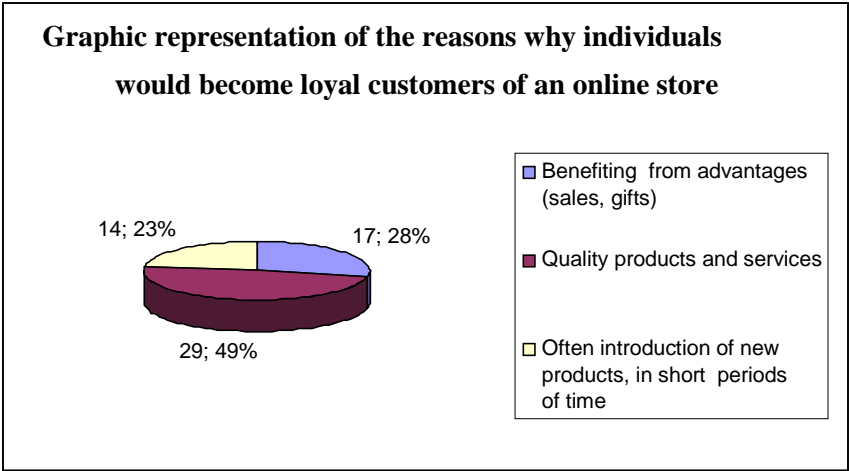
don't know — 1

no — 8

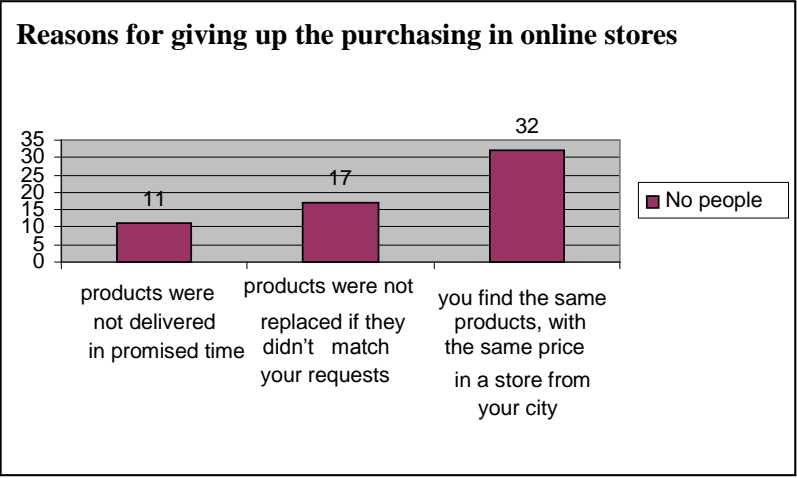
yes — 51

0   10   20   30   40   50   60
□ No. respondents

Graphic no. 10
Realized by author

Almost half of respondents (29.49%) would become loyal customers of stores that offer shopping benefits and advantages, while 17.28% appreciate in a store, the quality of products and services. 14.23% are more interested in the frequent occurrence of a novelty.


Graphic no. 11
Realized by author

Regarding the reasons which would determine them to choose not to purchase products in online stores, respondents' answers reveal an aspect any trader already knows, namely, the fact that the ultimate differentiation element in the perception of buyers- especially in times of crisis - is and will remain the price of the products.


Graphic no. 12
Realized by author

Conclusions:

Regarding registration on online store sites, only 8 respondents would choose to buy when they are requested to create an account, while almost half believe it to be useful. 26 of the respondents do not agree to pay for the transportation of the products and 51 of them would like to receive them by courier. As for payment methods they prefer reimbursement. Almost half of the individuals consider it useful to receive notifications about discounts by e-mail and appreciate stores that offer discounts and benefits, but would decline to buy online products that can also be found in traditional stores using the classical sales method.

With regard to information pertaining to the structuring of other elements of the survey respondents, key findings are presented in the table below as follows:

Socio-demographic data

	Sex	Age	Occupation	Studies	Background	Monthly income on family member
Answers	**Female** (33 people)	**21 – 35 years old** (17 people)	**Employees** (19 people)	**Superior** (31 people)	**Urban** (45 people)	**Less than 950 lei** (25 people)
Percent (%)	55,00	28,34	31,67	51,67	75,00	41,67

Survey conclusions:

Without pretending to having finished up the questions related to online stores and hardly considering the number of respondents as being enough, we conclude that people from all walks of life and different environment, know about the existence of virtual stores, and, if they don't shop in them yet, they are interested in certain categories of their products or in products they think they might find online.

COST MEASUREMENT AND COST MANAGEMENT IN TARGET COSTING

Moisello Anna Maria
University of Pavia Department of Economics and Business

Firms are coping with a competitive scenario characterized by quick changes produced by internationalization, concentration, restructuring, technological innovation processes and financial market crisis. On the one hand market enlargement have increased the number and the segmentation of customers and have raised the number of competitors, on the other hand technological innovation has reduced product life cycle. So firms have to adjust their management models to this scenario, pursuing customer satisfaction and respecting cost constraints. In a context where price is a variable fixed by the market, firms have to switch from the cost measurement logic to the cost management one, adopting target costing methodology. The target costing process is a price driven, customer oriented profit planning and cost management system. It works, in a cross functional way, from the design stage throughout all the product life cycle and it involves the entire value chain. The process implementation needs a costing methodology consistent with the cost management logic.

The aim of the paper is to focus on Activity Based Costing (ABC) application to target costing process. So:

-it analyzes target costing logic and phases, basing on a literary review, in order to highlight the costing needs related to this process;

-it shows, through a numerical example, how to structure a flexible ABC model – characterized by the separation between variable, fixed in the short and fixed costs - that effectively supports target costing process in the cost measurement phase (drifting cost determination) and in the target cost alignment;

-it points out the effectiveness of the Activity Based Costing as a model of cost measurement applicable to the supplier choice and as a support for supply cost management which have an important role in target costing process. The activity based information allows a firm to optimize the supplier choice by following the method of minimizing the total cost of ownership (TCO). Moreover the activity based analyses reveals the opportunities for rationalizing the supply related activities and containing costs and it enables the effective involvement of the supplier in the process of target costing when he provides activity based information on the costs sustained to produce the product/service: the purchaser can evaluate the impact, in terms of cost, of the activities requested of the supplier and, as a result, he has the chance to rationalize these activities by reducing their number or intensity and enables the effective involvement of the supplier in the process of target costing.

-The paper gives a contribution in the advancement of costing methodologies applicable to the target costing, proposing the use of a flexible model that supports the decision process according to different time horizons so that effectively supports target costing. The model is suitable for production characterized by high complexity in terms of number and intensity of activities.

Keywords: Activity Based Costing, Target Costing, Total Cost of Ownership, Supplier Selection, Supply Management

1. Introduction

The traditional approach of mark-up or cost plus pricing may be adopted in a market where demand exceeds supply and the number of competitors is limited. When the supply of the good outstrips customer demand, prices set on a cost basis can render the product uncompetitive. In such scenarios, pricing policies should be the related to external factors. To obtain margins that

adequately exceed costs, firms must revise their logic and begin to manage costs as a function of an exogenous variable, i.e. the price that the market allows to be applied, then shift from the logic of *cost measurement* to *cost management*. The opportunity to use *target costing* depends not only on the characteristics of the market where the company operates but also on the characteristics of the production process and the product. The methodology is used mainly in manufacturing companies and is particularly suited, as Sakurai stated (Sakurai, 1989: 39-50), to companies that manufacture a wide variety of products in small-medium volumes, those implementing production characterized by a continuity in the production process with high product differentiation, and to high technology firms. Whether the methodology is adopted or not depends on the complexity of the product portfolio: target costing becomes more appealing when products are differentiated, characterized by high quality and with short and contracting life cycles.

2. The logic of Target Costing and cost information

Target costing is the management tool that realizes this operational logic and is based on the assumption that price must take into account the prevailing market price conditions and that production cost must also be coherent with the objectives of profitability, maintaining a convenient product differentiation.

The definitions developed in the literature on the subject differ according to the particular feature the author wants to highlight. *Target costing* can be defined as a suitable tool for the reduction in new product costs (Afonso, 2008: 559-568)- already active in product planning and design (Monden and Hamada, 1991: 16-34) - or goods already existing that need to change. The logic of target costing directs the design and product development by focusing on customer and market opportunities, because the ultimate goal is not the minimization of cost, but product profitability maximization. Target costing is a cost management tool that works across the entire product life through the cooperation of the functions of production, research and development, and marketing and administration and control (Sakurai, 1989: 39-50) which fosters connection and coordination (Kato, Boer and Chow, 1995: 39-51). It was also defined as a methodology that allows the creation of new products claiming "reasonable cost", obtained by design and development aimed at meeting the objective costs of different business areas (Tanaka et al, 1994, p. 45). Target costing is a complex of behaviours and attitudes regarding the management of the factors that determine the cost of products and it is characterized by different approach (Everaert, 2008: 236-263). The various target costing features identified in literature are synthesized efficiently by the definition proposed by the CAM-I Target Cost Core Group (Ansari, Bell and the CAM-I Target Cost Core Group, 1997: 11): "The Target costing process is a system of profit planning and cost management that is price led, customer focused, designed centered, and cross functional. Target costing initiates cost management at the earliest stages of product development and applies it throughout the product life cycle by actively involving the entire value chain". This approach stems from the fact that in conditions of strong competitive pressure, with a changing market, companies may be unable to impose a market price based on internal production characteristics: on the contrary it would be important to identify the selling price that customers are willing to pay, which would render the product competitive on the market. The difference between this value and the margin of profitability, defined by strategic planning, is the maximum sustainable cost to achieve consumer consent, attain a satisfactory market share and realize profit objectives. The cost of production then assumes the role of the dependent variable.

Determining the cost objective requires the identification and subsequent reduction of the product costs starting at the product planning stage. Therefore, target costing is not a tool to control costs but a planning tool based on the product specification required by the market. The traditional management of costs is configured as a closed system, oriented to efficiency rather than effectiveness, focusing on a system of internal efficiency measures that do not take into account

the relationships between different business functions or relations with the external environment. It is based on feedback control through the analysis of variances between actual costs and standard or budget costs. Target costing is a management methodology aimed at driving the development process by effectively managing cross-functional relationships. It takes into account the external environment in order to obtain products that meet customer expectations. The cost of these products is consistent with business goals throughout the life cycle of the product and based on a feed-forward control (Cooper, 1994: 20-25).

The target costing process can be summarized in three main stages which are linked to the development cycle of the product (Sakurai, 1989: 39-50; Marelli, 2003: 73-124):

1-setting the *allowable cost* that relates to the planning stage *(corporate planning)* and initial design of the product;

2-setting and achieving the *target cost* that is linked to the detailed design of the product and to the production

3-plan (industrialization and *manufacturing preparation); target cost achievement* in the product implementation phase using standard cost, the *kaizen costing* technique or *value analysis*.

The first two stages make up the design phase of *target costing,* while the third constitutes the operational phase. The first stage of the target costing process is aimed at determining the allowable cost and is linked to strategic planning - identifying specific markets, consumers and products that the company intends to develop - and to the initial design of the product. This cost is determined by calculating the difference between the price, set according to the logic outlined above, and expected profit and it constitutes the largest value of resources that can be used by the company to obtain the product.

The problem of choosing a costing model (Kee, 2010: 204-211) relates to the second stage of the target costing process, which consists in setting and achieving the target cost and relates to the industrialization and *manufacturing preparation phase.* This stage consists of two steps:

1- calculating the difference between the allowable cost and the currently achievable one;

2- cost reduction, driven by this difference analysis.

The current cost is the one sustainable with the current level of capacity utilization, methods of production and distribution and is called *"drifting cost"* because it aligns the acceptable cost through successive modifications of the design.

The definitions of acceptable cost and initial cost should be based on the total cost of the entire product lifecycle and includes components consistent with the cost objective. In particular:

- the full product cost should be used because profit planning and price are determined by considering the product as a whole. This means that the allowable cost shall include the costs of research and development, manufacturing, sales, distribution, servicing, and service and property. Owing to an emphasis on product design, many companies focus the target costing process on the manufacturing and purchasing cost of components while disregarding the cost of support activities;

- the costs incurred throughout the life cycle of the product should be analysed in order to consider both the producer and consumer perspective. Target cost should be determined considering the costs of warranty, repair and servicing that constitute the consumer *cost of ownership for* and costs incurred by the producer from research and development up to the abandonment of the product. The target cost can then refer to costs incurred by the producer (cost of planning, design, development, production, and disposal) or it can also refer to the costs incurred by the customer (operating, maintenance and disposal costs of the product) .

Cost reduction is led by analysing how product design affects all costs associated with the product from its birth to its elimination, using different tools such as value engineering, functional analysis and tables of costs (Ansari, Bell and The CAM-I Target Cost Core Group 1997: Ch. 10). The planning cost process is dynamic and iterative. At each stage of the product

development cycle, cost is continually reduced until the allowable cost and the achievable cost are aligned.

Each company develops models to estimate the costs suitable for their needs. In particular, the variables used in the estimation must be related with the technical attributes of the product or process. As attributes are the focus of design, cost estimation models must make clear to the engineers how changes to these attributes can affect the cost of the product.

3. The ABC in the *target costing* process

Activity-Based Costing (ABC) was introduced (Johnson and Kaplan, 1987: 183-208) in response to the need for a costing tool based on the factors that give rise to indirect costs as well as one able to express more objectively the causal relationship between products and costs. The method is based on the assumption that production costs are incurred for the implementation of activities which are performed in order to produce and sell products. Therefore, ABC correlates costs to activities, then to products, through a two-stage imputation methodology. The strength of ABC is due to its recognition that the consumption of resources in the production process is related not only to the volume of production, but largely to activities related to transactions that occur within the organization (Cooper and Kaplan, 1988: 20-27). The innovative contribution of ABC is twofold: on the one hand, through considering a wide variety of cost drivers, it provides the analytical causal-functional determination of the product cost of multi-product or multi-service companies. These have differentiated outputs depending on their varied complexity; on the other, it is a tool to guide management decisions because, by ordering activities by hierarchical logic, ABC highlights relevant costs and makes it possible to determine the actual cost of a decision. The Target Costing process would be effectively supported, by structuring the model in order to keep - within the activities costs - the separation of costs according to their dynamic in relation to changes in output (Woods, 1992: 53-57; Christensen and Sharpe, 1993: 38-42; Kee, 2001: 1-7, Moisello, 2008: 107-119), in order to enlighten the effect of different solution on product cost structure and on capacity utilization both in the short and the long term. Woods (1992: 53-57) proposes a partition of costs between variable and fixed, while Christensen and Sharpe (1993: 38-42) suggest a more detailed classification of the activity costs: variable costs in the short run, fixed costs and fixed costs in the short term, which I assume in the model. The distinction between short-term variable costs, fixed costs and fixed costs in the short-term depends on the time horizon in which management can change the costs. The variable costs in the short-term change in direct proportion to changes in cost drivers and are therefore related to the volume of the driver. Decisions involving activities related to the units or batches have a short-term impact. Decisions that affect the fixed costs in the short term, which is normally one year, involve cost drivers in the batch or product-support level. The fixed costs in the short term, for example, vary with the number of batches, but not in relation to the number of units in the batch. Decisions that affect the fixed costs imply a long-term time horizon. These costs are normally linked to activities in support of the product, to support the industrial structure or the business. Since both fixed costs and fixed costs in the short term have the problem of unused capacity that must be properly highlighted, the costing rates must be calculated on the basis of the offered capacity but charged in relation to the used one. From an operational standpoint the ABC model is flexible processing information on capacity because, through the comparison of variable cost capacity and the capacity of the factors that result in short and long-term fixed costs, it shows:

the size of the unused capacity in accordance with the following relations:

[1]   *short-term fixed cost capacity – variable cost capacity =*
= short-term fixed cost available capacity – utilized variable cost capacity =
= non utilized capacity that can be managed in the short-term

[2]   *fixed cost capacity – variable cost capacity =*
= fixed cost available capacity – utilized fixed cost capacity =
= non-utilized capacity that can be managed in the long term

the presence of constraints in the short term if :

[3]   *short term fixed cost available capacity = variable cost capacity=*
= short-term fixed cost utilized capacity
the presence of constraints in the long term if :
[4]   *fixed cost available capacity = variable cost capacity =*
        = fixed cost utilized capacity

[1] measures the unused capacity manageable in the short as the difference between the capacity of fixed costs in the short and the capacity of the variable costs, since the first indicates the maximum available capacity taking into account that capacity constraints can not be eliminated in the short term and the second expresses the short run used capacity as the acquisition and, therefore, the availability of variable factors is modulated by the planned use of their capacity.

[2] detects idle capacity that can be managed in the long run as the difference between the capacity of fixed costs and variable costs capacity as the first expresses the long term available capacity that is not constrained by capacity limits of short term fixed costs.

When the capacity of the short-term variable cost is equal to the capacity of short term fixed costs [3] shows the presence of capacity constraints in the short period because on the base of [1] production capacity is fully used. Similarly, [4] shows a capacity constraint in the long run when the capacity of the variable costs completely absorbs the available capacity of fixed costs.

The flexible model shows the extent of available resources and possible areas of intervention, to optimise the management of production capacity through capacity reductions or reallocation of resources to activities whose capacity is at saturation level. This pattern is also designed as compromise in the wider discussion around ABC absorption versus direct costing that stresses the importance of highlighting the costs of idle capacity (Aranoff, 2011: 6-10; Baxendale and Foster, 2010: 5-14; Sopariwala, 2009: 41-46).

The example below shows a possible structure of flexible ABC model. Table 1 summarizes the data related to three hypothetic productions: X, Y and Z. Table 2 records the unit costs of activities in the three distinct classes of cost determined on the basis of practical capacity and it highlights the non-utilized capacity costs manageable in the short and in the long term. Table 2 shows the unit costs of activities that are subsequently used in Table 3 to allocate activity costs to products on the base of the used capacity. Table 3 presents the calculation of the average unit cost of the three productions. The cost of production is the sum of operating costs directly attributable to the production and variable costs, fixed and fixed in the short term incurred to carry out the activities required by the productions.

Table 1. Values of drivers and direct costs

	X	Y	Z
Volume of production	1.000	15.000	8.400
Unit direct costs	180	100	90
Hours of dir. labour per unit	8	1	2
Number of components per unit	105	20	40
Volume of components	100.000	300.000	325.000

Machine hours	7	1	3
Number of Batches	50	50	100
Batch size	20	300	84
Controlled units per batch	2	2	2
Number of shipment orders	550	750	800
Order average size	2	20	11

Table 2 - Unit cost of activities and non-utilized capacity cost manageable in the short and in the long

	Total cost	Driver	Variable	Fixed in the short	Fixed
Logistics	690.000	No of components	210.000	400.000	80.000
Capacity			740.000	750.000	800.000
Unit cost of activity			0,28	0,53	0,10
Non-utilized capacity in the short				10.000	
Cost of Non-utilized capacity in the short				5.300	
Non-utilized capacity in the long					50.000
Cost of Non-utilized capacity in the long					5.000
Setup	740.000	Batch size	200.000	190.000	350.000
Capacity			200	200	200
Unit cost of activity			1.000	950	1.750
Non-utilized capacity in the short				0	
Cost of Non-utilized capacity in the short				0	
Non-utilized capacity in the long					0
Cost of Non-utilized capacity in the long					0
Automatic machining	2.200.000	Machine hours	0	950.000	1.250.000
Capacity			46.700	70.000	70.000
Unit cost of activity			0	13,57	17,86
Non-utilized capacity in the short				23.300	
Cost of Non-utilized capacity in the short				316181	
Non-utilized capacity in the long					0
Cost of Non-utilized capacity in the long					0
Finishing	1.550.000	Hours of dir. labour	590.000	600.000	360.000
Capacity			39.800	60.000	60.000
Unit cost of activity			14,82	10,00	6,00
Non-utilized capacity in the short				20.200	
Cost of Non-utilized capacity in				202.000	

the short

	Total	Cost driver			
Non-utilized capacity in the long					0
Cost of Non-utilized capacity in the long					0

Packing Shipping	2,80	0,28	0,51
Unit Cost	947,03	194,75	330,04

With regard to the use of ABC in the design phase, it should be noted that the model performs to its maximum potential when the products are characterized by different levels of complexity since the cause-effect relationship between product-activities-resources leads to undistorted determinations of cost. When, as commonly happens in the manufacturing industry, the cost of materials and labour play a dominant role, industrial cost is the most appropriate cost configuration to use because it is characterized by the certainty of the calculation. The ABC model is, therefore, unsuitable as it determines a full product cost that covers all stages of the value chain. Environments with product differentiation are characterized by high product development costs and considerable Flexible Manufacturing Systems (FMS) costs for assembly services of complex logistics transactions with suppliers and customers and for information systems; in such circumstances the ABC model, as it highlights the role of support activities in the absorption of resources, allows a more accurate determination of the achievable cost and can be usefully integrated with target costing.

The vision of the product as a set of activities, and product cost as the sum of the costs of activities to attain it, allows an evaluation of the effects of possible interventions on existing products and an evaluation of the cost of new interventions. The information obtained with the application of the model permits an appraisal of the impact that the various design variants have on the costs of activities and, consequently, on product cost. ABC can determine the effect of planning and design proposals on the product cost (Cokins, 2002: 13-22). Costs related to the design and product development phase can be determined with greater accuracy than the traditional methods and therefore they can be more effectively controlled (Ben-Arieh and Qian, 2003: 169-183). In the case of new products, the model, together with a functional analysis, shows the impact of different combinations of technical and aesthetic characteristics on the cost of production as it measures related activity consumption and, therefore, the different solutions' absorption of costs. Moreover, with the separation of variable costs in the short term, fixed cost in the short and fixed, it highlights the effects in terms of capacity utilization and capacity constraints of the various activities.

Further, as noted above, a definition of the target cost should take into account the cost of the product lifecycle, which can be effectively determined by the ABC model (Moisello, 2008: 188-193) because it allows for the measurement of operating, warranty, repair and service costs incurred by the customer and the costs incurred by the producer from research and development to the abandonment of the product, taking into account the complexity of the product in terms of type and intensity of activities required.

In the case of existing products, if the achievement of the target cost means, for example, the evaluation of the opportunity to produce a component that is purchased on the market, the flexible model gives an immediate test of the incremental costs related to the hypothesis of internal production. The model identifies the costs that vary (variables) and those that may have a relevance in the decision in the case where the existing capacity should be changed (fixed costs in the short). Moreover, from the point of view of fixed costs, the model renders apparent the available capacity for internal production because it is based on the distinction between used capacity and available capacity.

The focus on process, which characterizes the activity based costing model, provides useful information for effective process redesign or re-engineering. Activity-based costing highlights weak processes, characterized by a complicated set of activities that do not create value and by long response times. It provides adequate information on which to base redesigning interventions aimed at streamlining and speeding up processes. It highlights the *drivers* - which, being the cause of the costs - constitute the key variables to control for the achievement of efficiency targets respecting quality and time standards. ABC is also useful for predicting the decrease in activity frequency resulting from the redefinition of processes or products. If the reduction in the frequency of activities frees capacity of resources which are not constrained, it can translate into a contraction in medium to long-term costs. If the released capacity is related to constrained resources, depending on whether the firm has the possibility to expand or not, it can be used to reduce costs or to support a suitable production. Stand-alone ABC provides guidance on costs, without taking into account consumer preferences. The integration of ABC and Target Costing usefully supports the decisions related to changes in the product use of standardized components, the choice of distribution channel, the sizing of the production lot and the possibility of outsourcing, as well as the management of the delicate trade-off between the product cost structure cost and the attributes and characteristics required by the market. Target Costing produces information on market demands and cost goals, while ABC shows the changes in cost structure resulting from the various design alternatives of the product. The connection between activity-based costing and target costing also encourages designers to contribute to cost control but designing products involving the use of common and standardized components (Taylor, 2000: 3-19).

The ABC methodology provides a useful contribution in the application of the target costing model in determining the drifting cost and provides guidance on possible areas of cost containment in the operational phase of target cost alignment. On the one hand the creation of the activities map helps identify those activities that produce value-added and whose rationalization allows a more efficient cost management; on the other hand it is useful for the selection of the vendor and highlights the actions required to achieve a reduction of the purchase price and cost control in the internal management of purchase orders. Supply management plays a crucial role in the target costing process, and ABC can provide support at this stage of the process when externally purchased components are used.

4. The ABC in supply choices and in supply management

The target costing process requires careful management of the supply process and the decisions concerning purchases require two basic types of information. On the one hand, they require a store of information that allows the company to evaluate the price of goods and services not internally produced, and thus to determine the factors that can be used to obtain cost reductions from suppliers. On the other hand, they require information that effectively supports the planning of purchases and the definition of orders so as to contain the cost of those activities that must be carried out internally in order to manage supplies.

In this context activity based costing can provide important information regarding the reduction of the purchase price as well as costs concerning the management of purchase orders, since it highlights the direct relation between complexity and cost and allows the company to identify those activities without value added that can be reduced or eliminated.

The purchaser can get a reduction in price-cost through a reduction in the number, intensity and unit cost of activities (Lere and Saraph, 1995: 25-31). When the supplier, faced with a long-term or exclusive supply arrangement, is willing to provide information on the costs sustained for the product/service, in order to justify the unit prices quoted, ABC allows the purchaser to have information that is decidedly superior to that available from traditional cost accounting techniques. The purchaser can obtain a flow chart of the supplier's activities during the entire

process; that is, from when the order is received to when it is shipped out, which highlights in particular those activities without value added that can eventually be reduced and the waste that must be eliminated. As regards the activities specifically undertaken for the supply product, the purchaser can have a clear idea of the indirect cost allocation per unit, batch and product, and thus of the cost determinants used in the allocation. For the supplier cost drivers represent the variables that explain the complexity of the product and of the client; for the client they represent the lever to use to obtain a reduction in the purchase price by lowering the supply cost. The supply cost varies as a function of the technical characteristics of the product and of the order. The technical characteristics of the product translate into a request for a certain number of production support activities involving varying levels of intensity; for example, planning and quality control activities. On the other hand, the level of complexity of the order determines the level of intensity of support activities such as shipping, shipment planning, the preparation of documents necessary for shipping, and obtaining the required certifications for international supplies.

The activity point of view and the awareness of the cost drivers make it easier to identify waste, which is advantageous for both the purchaser and the supplier as well as providing important information for assessing the opportunity for reorganizing the complexity of supply by reducing the use and/or cost of activities that have no effect on the quality and functionality of the product.

The activity based method provides valuable information also with regard to the control of costs incurred internally in the management of purchase orders, since it represents an effective model for the analysis of the purchase department.

The complexity of the internal and external variables facing companies make it appropriate to extend cost analysis to the entire chain of value, paying proper attention to links with organizations both up and down the production line .

So Roodhooft and Konings (Roodhooft and Konings, 1996: 97-102), base the choice of supplier on the total cost of ownership (TCO) – which is the set of costs associated with the purchase, use or maintenance of a product or service – which is determined by means of activity based costing, whose merits were underscored and whose adoption favored in Ellram's studies (Ellram, 1995: 22-30).

This approach bases the choice on identifying the supplier with the lowest value of the following indicator:

$$[5] \qquad S_i^B = \left(p_i - p^{\min} \right) \times q + \sum_j c_j^B \times D_{ij}^B$$

where:

$S_i^B = \text{score for supplier } i$

$p^{\min} = \text{unit sales price for most economical supplier}$

$q = \text{number of units purchased}$

$c_i^B = \text{estimated unit cost of activity } j, \text{ whose use is measure by cost driver } j$

$D_{ij}^B = \text{estimated units of cost driver } j, \text{ which is consumed by supplier } i$

The indicator is thus constructed taking into account both the price differential applied by the supplier with respect to the lowest market price and the costs of the activities of the same supplier. The evaluation thus considers the costs relating to the various levels of quality of the purchased factor, as well as shipping and service costs.

The model is proposed for both the selection as well as the subsequent evaluation of the supplier, which can lead to a review of the choice. In the second case, the values estimated in [5] are replaced with the actual values obtained from the following equation:

$$[6] \quad S_i^A = \left(p_i - p^{\min}\right) \times q + \sum_j c_j^A \times D_{ij}^A$$

[5] is subtracted from [6] to obtain:

$$[7] \ S_i^A - S_i^B = \sum_j c_j^A \times D_{ij}^A - \sum_j c_j^B \times D_{ij}^B = \overbrace{\sum_j \left(c_j^A - c_j^B\right) \times D_{ij}^B}^{\text{purchaser–effect}} + \overbrace{\sum_j \left(D_{ij}^A - D_{ij}^B\right) \times c_j^B}^{\text{supplier–effect}} + $$
$$\underbrace{\sum_j \left(c_j^A - c_j^B\right)\left(D_{ij}^A - D_{ij}^B\right)}_{\text{combined–effect}}$$

So the model can explain the variance between the ex-ante and ex-post scores by determining the purchaser effect, the supplier effect and the combined effect. The purchaser effect depends on the company's ability to reduce the unit cost of driver j; thus the variations in the score that depend on this driver should not affect the assessment of the supplier. The supplier effect depends on the variance between the estimated and actual consumption of the driver; it is caused by variations in the volume of the activities of the supplier and has an impact on the seller's performance measure. The combined effect refers to variations in those costs not attributable solely to the purchaser or the supplier. The logic of the model is useful in different context. The criterion of choice based on the minimum total cost of ownership determined by ABC is employed in the model by Degraeve and Roodhooft (Degraeve and Roodhooft, 1998: 781-789; Degraeve and Roodhooft, 2000: 69-98), who treat the problem of selecting a supplier in situations where the supply is more complex.

Roodhooft and Konings' model for choosing an outside supplier can also be utilized, with appropriate adjustments, in the choice between one or more outside suppliers and an internal one. In the case of the make or buy choice, we propose to replace [5] with the following equation:

$$[8] \ S_n^B = \left(p_n - c^{abc}\right) \times q + \sum_j c_j^B \times D_{nj}^B$$

Where:

$S_n^B = $ value of the indicator for the nth supplier

$p_n = $ unit sales price applied to supplier n

$c^{abc} = $ cost of self - production

The cost of self-production corresponds to the average unit cost of production, determined using the flexible ABC model that maintains the separation between variable and fixed costs in the activity costs. The flexible model enables us to develop an average unit cost of production that is appropriate to the specific situation; that is, the model is made up only of incremental costs with respect to the "make" decision, however this is interpreted: as autonomous production in the country of origin, in a foreign country, in a partnership in the country of origin, or in a partnership in a foreign country.

The different values that [8] can have take on the following significance:

$S_i^B > 0$ indicates the advantage of self-production with respect to purchasing from outside;

$S_i^B = 0$ shows that the two alternatives are different from the economic point of view;

$S_i^B < 0$ signals the convenience of the *buy* choice as opposed to the *make* choice

If for $\forall n$ with $n = 1,..., N$, $S_i^B > 0$, the model indicates the advantage of self-production with respect to outside purchasing.

If for some n $S_i^B < 0$, the model leads to choosing the *buy* option and selecting the supplier with the lowest value of the indicator.

The methodology proposed by Roodhooft and Konings, which is based on the systematic determination of a quantitative measure, overcomes the problem of subjectivity that characterizes models, which base their choice on specific criteria and evaluations that can considerably differ depending on who does the assessment.

The determination of TCO provides important information for decisions when the purchase price of the factor represents only a small part of the purchase cost and of the use of productive factors. TCO clearly brings out the difference between low-price and low-cost suppliers. A low-price supplier can have high costs; for example, because it is unreliable regarding delivery times, in carrying out orders, and from the point of view of quality, thereby forcing the company to keep higher stocks than they would like to protect against uncertainty. The supplier is chosen on the basis of a gradual and systematic management and reduction of the ownership cost of productive factors.

The analysis of the model brings out the potential contribution of TCO to the control of costs since it underscores, on the one hand, the variables influenced by the supplier's performance, and on the other those variables that depend on internal efficiency and which affect the company's economic efficiency; thus TCO allows the company to positively assess the choice to accept purchase prices which are higher due to higher quality and overall supply management costs which are more moderate in the long run. TCO enables companies to analyze the economic effects of relations with suppliers in terms of the amount and trends in the internal and external costs of selection, evaluation and management, the internal costs for the utilization of purchased goods, and the internal and external costs associated with the distribution or the damage/defect of the good or service, while also allowing the purchase function to be carried out on the basis of value.

The TCO method shows how supply costs do not depend solely on the volume of production but on the conditions and circumstances linked to supplier performance: each supplier has a different degree of complexity in the supply process which translates into a difference in the type and intensity of activities. This brings out the third advantage in the model we have presented: the reconstruction of total cost ownership through activity based costing. In the studies on the application of TCO to supply decisions, some writers have interpreted the model as a special application of ABC – used to quantify purchase costs and the use of the products/services acquired – that extends its concepts and tools to an interorganizational context (Wouters, Anderson and Wynstra, 2005: 167-191).

The costs that are included in TCO models (Ellram, 1995: 22-30), though different depending on the company that uses the model, are divided into four categories: quality, delivery, customer service and price/cost. In traditional costing systems most of these costs – for example, the cost associated with machine downtime or quality control – are hidden in the accumulation of manufacturing costs. Internationalized firms meet with two further costs categories: international delivery solution costs and financial costs related to the international payment and to the exchange rate risk management (Moisello, Gorbunova and Gottardo, 2008: 70-72). In traditional costing systems a relevant amount of these costs too are hidden in the accumulation of administrative costs. The ABC method traces costs correctly to the cost object that generated

them, but the amount of detail usually found in ABC models is not sufficient to adequately support supply decisions; the cost object must be traced to the supplier and the individual purchase item. The ABC model allows us to use the costing system to directly derive the analyses necessary for TCO, thereby increasing the accuracy and efficiency of the TCO model.

Table 4 – Cost categories for TCO in internationalized firm (Moisello, Gorbunova and Gottardo, 2008: 72).

Costs connected to quality	Inspection cost
	Cost of returned goods
	Cost of equipment downtime
	Cost of remanufacturing
Delivery	Cost of orders not carried out on time
	Transport cost
	Lead time related costs
	Cost of reminders
	Cost of reopening orders due to partial supply
Customer service	Cost of delays due to slowness in solving problems
	Cost of adapting a system to that of the suppliers
	Cost related to time employed for problems with orders
International delivery solution cost	Eventual cost for agents
	Insurance
	Clearing for export and import (licenses, authorization and formalities)
Financial costs	International payment transfer cost
	Exchange rate risk management:
	Commission costs
	Personnel, information systems and supports, other costs of administration
Price/cost	Price
	Quantity discounts
	Price reductions linked to product/process improvements

5. Conclusions

Activity based costing, due to its ability to model the relationship between complexity, use of activities and the indirect costs dynamic, can adequately support the target costing process, both for the design of the product and for the redesign and re-engineering process, when indirect costs have a significant impact on the cost structure of the product that is the object of the process. ABC performs to its maximum potential if structured flexibly, with the separation of variable costs, fixed and fixed in the short because it makes evident the effects of changes in the product or in the processes in terms of capacity utilization and capacity constraints of the various activities. It also highlights the time horizon to which excess capacity is related. The ABC methodology effectively supports target costing both in determining the drifting cost and in the operational phase of target cost alignment because the creation of activities maps and the identification of value-added and non value-added activities highlights those on which cost containment should be focused. Supply management has a very strong impact in the target costing process, and ABC can also provide support at this stage of the process.

The ABC model is useful in managing the supply process both as a model of cost measurement applicable to the choice of supplier and as a support for supply cost management. The ABC

model provides the correct determination of both the internal cost of producing the factor as well as the costs of the activities necessary to use productive factors purchased externally. This information allows a firm to optimize the choice of supply alternative by following the method of minimizing the total cost of ownership (TCO). ABC clearly evidences the direct link between the complexity of the activities and the incurrence of costs, revealing the opportunities for rationalizing the activities and containing costs. An awareness of the internal activities costs related to managing the supply process guides the planning process for the purchase and management of orders and this leads to the containment of the costs of such activities. Moreover, when the supply relationship is such as to induce the supplier to provide information on the costs sustained to produce the product/service, ABC allows the purchaser the chance to evaluate the impact, in terms of cost, of the activities requested of the supplier and, as a result, to rationalize these activities by reducing their number or intensity and enable the effective involvement of the supplier in the process of target costing.

A REVIEW OF TOURISM AND HOSPITALITY INNOVATION RESEARCH

Nagy Andrea
West University of Timişoara Faculty of Economics and Business Administration

Innovation plays a vital role in a company's development and in helping it keep up with new technologies and customers' highest expectations. A large number of publications on tourism innovation reflect the interest of many authors in this topic. In the past few years several authors have approached tourism innovation, developed models of innovation in tourism, analyzed innovation types or the factors that influence innovation in this field. The purpose of this paper is to review the existing literature on tourism innovation and to identify the main research tendencies in this area of interest. Therefore, we searched for keywords like "tourism innovation", "hospitality innovation" or "service innovation" in several databases such as Science Direct, Emerald, Sage Publications and The Center for Hospitality Research of Cornell University. Because this study focuses on tourism and hospitality innovation, there were analyzed 17 research papers regarding these aspects. Relevant findings such as factors that influence innovation in tourism and hospitality (hotels' size, category and chain structure, introduction of ICTs, employee involvement and commitment, customer or guest requests etc.), types of innovation implemented in this area and correlations between innovations' success and hotel performance were highlighted.

Keywords: innovation, service innovation, tourism, hotel, hospitality industry

JEL Classification: M10, O31, L83

Introduction

Innovation is an intensely studied phenomenon in the tourism field, a relatively new area of interest – fact proven by researches that first appeared in the late 80's and intensified in the 2000's when researchers and entrepreneurs started to notice the importance of innovation in tourism. Several aspects regarding innovation were discussed in the undertaken research (Hjalager, 1997; Hjalager, 2002; Enz and Siguaw, 2003; Orfila-Sintes *et al.*, 2005, Ottenbacher and Gnoth, 2005, Ottenbacher, 2007): factors that influence innovation, innovation types, innovations effects on firms' performance, innovation cases, measurement of innovations' success.

In order to highlight the importance of these aspects, further sections of the present paper analyze aspects regarding:
- definitions of innovation and service innovation based on the Schumpeterian approach of the concept (innovation is analyzed from a manufacturing perspective);
- some relevant findings regarding tourism and hospitality innovation;
- analysis of these findings in order to frame three important dimensions of innovation.

Aspects regarding innovation and service innovation

In the field of economics, innovation was first approached in 1912 by the Austrian economist and professor Joseph Alois Schumpeter. He sees innovation more from a manufacturing/production perspective and defines it as "the setting up of a new production function" (Schumpeter, 1939: 84), because this covers the case of a new product, a new form of organization or the opening of new markets (Schumpeter, 1939: 84).

Studies regarding innovation were also conducted by Peter Drucker, according to whom innovation is the act that gives products the capacity of creating wealth (Drucker, 1993: 27).

Drucker approaches the innovation concept from an entrepreneurial perspective derived from Schumpeter's manufacturing perspective, however none of them is approaching innovation in the service industry, let alone in tourism.

Service innovation was first studied by Richard Barras in 1986. In his approach, he started with the service characteristics and also proposed a theoretical model of process innovation in services based on the idea of reverse product cycle (Barras, 1986: 161-162). Other approaches regarding service innovation were made by Gallouj and Weinstein (1997), Sundbo (1997), Evangelista and Savona (2003), Hipp and Grupp (2005), de Vries (2006), Verma *et al.* (2008), Gallouj and Savona (2009), Lu and Tseng (2010).

Relevant findings for service innovation were pointed out by Gallouj and Weinstein (1997). In their opinion, service innovation is difficult to accomplish because of two major aspects: first, because the innovation theory was developed only on its technological analysis in manufacturing, and second, because unlike products, services have certain specific characteristics and the outcome of their production process is not something tangible – which makes service innovation more difficult to measure and monitor (Gallouj and Weinstein, 1997: 537).

Also, relevant findings regarding innovation in the service industry were highlighted by Verma *et al.* (2008). In the research they conducted after a Roundtable between academics and practitioners, there were framed the principles of service innovation (Verma *et al.*, 2008: 7): *customer focused* – needed in order to exceed customers' expectations; *process focused* – by using new technologies or new methods of organizing the innovation process, a service provider can improve and adapt its products; *continuous improvement* – needed to keep up with the newest trends in service industry, as well as to analyze and monitor guests' experience.

We find the aspects mentioned above very important and relevant for further studies in this field, more likely for tourism, especially because they offer a solid feedback regarding the importance of involving both customers or guests and employees in the innovation process.

In order to identify the main research directions and trends in tourism innovation, there will be analyzed several research papers on this topic.

Innovation in tourism and hospitality – main findings

Even if it is important for tourism field development, tourism innovation is a relative recently studied concept, several researches being conducted only after 2000, when along with technological development, the results (new technologies) were implemented in tourism field as well. Many authors (Poon, 1988; Hjalager, 2002; Orfila-Sintes *et al.*, 2005; Victorino *et al.*, 2005; Sundbo *et al.*, 2007; Orfila-Sintes and Mattsson, 2009; Hjalager, 2010; Aldebert *et al.*, 2011; Lopez-Fernandez *et al.*, 2011; Meneses and Teixeira, 2011) reach the conclusion that most of the innovations in tourism are technological. This assertion is sustained by the results of a study regarding service companies developed by Evangelista and Savona in 2003, according to whom "more than one third of the service firms in Europe (40,3%) have introduced a technological innovation" (Evangelista and Savona, 2003: 456).

In order to identify relevant findings regarding innovation in tourism field, there were analyzed several databases such as Science Direct, Emerald, Sage Publications and The Center for Hospitality Research of Cornell University. A search was done after keywords like "tourism innovation", "hospitality innovation" or "service innovation". There were analyzed 17 research papers regarding tourism or hospitality innovation. The results are highlighted in the table bellow (Table 1). The earliest paper identified was written in 1988 by Auliana Poon and focused on developing all-inclusive vacation concept in the Caribbean tourism. Also it analyzed the main types of innovation: technological, organizational, in management practices, in finding new markets or in introducing new goods/services to the markets.

Table 1. Relevant findings for tourism and hospitality innovation

Year	Author/Authors	Analyzed variable(s)	Relevant findings
1997	Anne-Mette HJALAGER	Innovation types	Main types of innovation that can be or were implemented or developed in tourism field: product, classical process, management, institutional innovations.
2002	Anne-Mette HJALAGER	Innovation types Innovation model for tourism	Development of a model of innovation in tourism based on Abernathy and Clark's model including regular, niche, architectural and revolutionary innovations.
2003	Cathy ENZ, Judy SIGUAW	Innovation cases	Examples of innovation from lodging industry, based on the analysis of hotels like Marriott, Ritz, Motel 6.
2005	Francina ORFILA-SINTES *et al.*	Hotel category, governance and chain structure, Hotel size, Human capital skills, Targeted market segment, Seasonality, Performance	Hotels that are part of a chain innovate more easily than the ones that are operating individually because they can benefit from managements' know-how; Human capital skills and the ability of their update is materialized in trainings and reflected in HR investments, both important for innovation success; The most innovative hotels have a higher classification (3 or 4-5 stars).
2005	Michael OTTENBACHER, Juergen GNOTH	Factors determining innovation success in hospitality industry	Innovations' success in the hospitality industry is determined by: market selection, strategic human resource management (SHRM), training of employees, market responsiveness, empowerment, behavior-based evaluation, marketing synergy, employee commitment and tangible quality.
2007	Jon SUNDBO *et al.*	Hotel size, Organization, Tourism firms' innovativeness	The most innovative hotels use professional management tools; Innovative hotels have a positive attitude regarding ICT instruments utilization; Innovative behavior of tourism firms is related to their size: the bigger the firms, the more innovative; Amongst tourism firms, hotels, restaurants and transport companies are the most innovative ones.
2007	Michael OTTENBACHER	Performance dimensions, New service performance dimensions	Innovations' success can be measured using three performance dimensions: market performance (market responsiveness, effective marketing communication, raising awareness, tangible quality), financial performance (market attractiveness, SHRM, employee involvement in NSD, NSD prelaunch activities) and employee and customer relationship enhancement (employee commitment, behavior-based evaluation, training, empowerment).
2009	Ester MARTINEZ-ROS, Francina ORFILA-SINTES	Independent variables: management, strategic decision of differentiation, market-	Hotels' dimension positively influences both degrees of innovativeness; The use of tour-operators is a determinant factor of incremental innovations especially

		orientation strategy. Dependent variables: degree of innovativeness: radical or incremental. Control variables: part of a chain, use of tour-operators, hotels size, age and location	because they have a limited negotiation power; Once a hotel develops an incremental innovation, it increases its chances of developing a radical one.
2009	Francina ORFILA-SINTES, Jan MATTSSON	Service provider's competences (size, use of physical capacity, additional services), Customer competences (travel motive, booking way, accommodation type) and Market drivers.	Hotels' dimension positively influences the innovation decision; Customers' requests have a positive effect on hotels' innovative behavior, increasing their chances to innovate; Managers' lack of experience (under 1 year) has a negative influence on innovation; Employees with higher education are positive determinants of innovations.
2009	Lori SIPE, Mark TESTA	Innovation and performance	Framework for innovation research in hospitality and tourism marketplace including innovation drivers, outputs and business performance.
2011	Bénédicte ALDEBERT et al.	ICT and tourism innovation Tourism @ event	Importance of ICT actors for tourism innovation development Software, Internet and databases are the main technologies used in tourism innovation development
2011	LÓPEZ-FERNANDEZ et al.	Firm size, belonging to a business group, changes and rigidities, high costs of innovation, lack of qualified personnel, financial support provided by public institutions, lack of information and of interest for innovation by customers.	Large size firms positively influence the innovation decision; Belonging to a business group or hotel chain has a positive influence on innovation decision; Organizational changes have a positive influence on innovation decision in hospitality industry operating firms; The lack of qualified personnel can slow-down the hospitality innovation process, but does not stop it.
****	The Center for Hospitality Research of Cornell University	Innovation cases	There are presented 55 cases of innovative service companies from all around the world and the innovations they implemented. Most of the companies are hotels, restaurants or transport companies.

(Source: author)

Result analysis

It can be noticed that there are several similar aspects regarding tourism innovation. Firstly, it was empirically proven that firms' size influences their capacity to innovate (Sundbo *et al.*, 2007; Martinez-Ros and Orfila-Sintes, 2009; Orfila-Sintes and Mattsson, 2009; López-Fernandez *et al.*, 2011). Secondly, the importance of involving employees and guests in the innovation process was highlighted (Orfila-Sintes *et al.*, 2005; Ottenbacher and Gnoth, 2005; Orfila-Sintes and Mattsson, 2009; López-Fernandez *et al.*, 2011), and thirdly, the importance of using information technologies in order to be innovative was pointed out (Sundbo *et al.*, 2007; Aldebert *et al.*,

2011). Also, there were pointed out the main types of innovative firms from the hospitality industry: hotels, restaurants and transport companies.

Upon analyzing the above research papers on tourism or hospitality innovation, one can notice that there are several trends followed by most of the researchers. These trends will be further referred to as *dimensions of innovation* and they can be structured as follows:

- *human dimension* – when there are analyzed aspects regarding the involvement of employees or guest in the innovation process (Orfila-Sintes *et al.*, 2005; Ottenbacher and Gnoth, 2005; Ottenbacher, 2007; Orfila-Sintes and Mattsson, 2009; López-Fernandez *et al.*, 2011);

- *financial dimension* – when there are involved aspects regarding the costs of innovation, investments, profit maximization, sales (Orfila-Sintes *et al.*, 2005; Ottenbacher, 2007);

- *organizational dimension* – refers at aspects regarding firms' size and capacity, chain structure, management (Orfila-Sintes *et al.*, 2005; Sundbo *et al.*, 2007; Martinez-Ros and Orfila-Sintes, 2009; Orfila-Sintes and Mattsson, 2009; López-Fernandez *et al.*, 2011).

Conclusions, limitations and future research

As proven above, tourism innovation research was approached by several European and American authors, both from theoretical and empirical perspectives. The analysis of these studies is relevant for Romanian tourism as well, because there is a lack of research in this field. The analysis revealed some important factors that influence innovation in tourism and hospitality: hotels' size, category and chain structure, employee involvement and commitment, managements' orientation towards innovation, empowerment etc. Also, the analysis of relevant findings allowed us to identify three important dimensions of tourism innovation: human, financial and organizational. It is important to highlight that these dimensions were developed from the analyzed papers and are not the result of an empirical research, which we plan to undertake in order to validate them.

CULTURAL TOURISM MOTIVATION – THE CASE OF ROMANIAN YOUTHS

Negruşa Adina
Universitatea Babeş-Bolyai Facultatea de Business

Yolal Medet
Anadolu University School of Tourism and Hotel Management

Cultural attractions have become particularly important and play an important role in tourism at all levels. They are also increasingly being placed at the centre of urban and rural development and constitute an important aspect of social and cultural lives of the residents. Cultural tourism is defined as 'visits by persons from outside the host community motivated wholly or in part by interest in the historical, artistic, scientific or lifestyle/heritage offerings of a community, region, group or institution. The main purpose of this research is to identify and understand the general dimensions of motivation for attending cultural tourism. Cultural tourism is motivated by tourists' interest in historical, artistic, scientific or heritage offering by a community, region, group or institution. It can be considered an independent segment of the tourism industry as well as a complement to mainstream tourism, in connection with other forms of attraction. In this sense, local communities and national organizations all over the world have developed particular cultural and heritage tourism products that attract increase the number of tourist visits each year. The study examine the motivations of Romanian young people in attending cultural tourism for underling the perspectives of cultural tourism development in Romania. We developed a quantitative study and designed a structured questionnaire to obtain information regarding youths' motivations and perceptions toward attending cultural tourism, including their demographic characteristics. Based on significant literature review we included 7 composite motives: learning reasons, cultural motives, experience something new, pleasure-seeking and entertainment, physical reasons, relaxation-based motives and indirect motives. The findings of this research provide a comprehensive view of cultural tourism behavior in Romania. The evidence suggests that for the young and highly educated generation the most important reasons which attract them to cultural tourism activities are the novelty and learning experience. These distinct characteristics of young people's motivation and their behavior toward cultural tourism have a number of both practical implications for the cultural tourism organizers and theoretical contribution to the growing research of cultural tourism.

Introduction

A growing number of visitors are becoming special-interest travelers who rank the arts, heritage and/or other cultural activities as one of the top five reasons for traveling (NASAA, 2010). In the last decade cultural tourism became a big business, representing from 8 to 20 percent of the tourist market share. The number of international tourists increased in the last years as well as cultural tourism. However, a distinction should be made between those people visiting specifically for cultural purposes and those who are incidentally taking in culture on their visits. For this reason a clear counting of cultural tourists for a country could not be done properly in practice. In fact it is considered that only a small proportion of international visitors could be motivated by a single cultural attraction. According to a study conducted by the European Commission, 20 percent of tourists who visited Europe cited cultural motivations, while 60

percent of European tourists are interested in cultural discovery during their trips (European Forum of World Heritage Cities, 2003).

What motivates people to participate or experience cultural tourism? Although there is extensive research on travel motivations, preferences and behaviors, going back to the early years of tourism research, until very recently travel research on students has been a neglected area. This study aims to explore the motives of students attending cultural events, heritage exhibits, rural places, or historical sites; collectively termed cultural tourism. For the purpose of the study, the paper starts with a review of the literature on motivation, and a short section of cultural tourism development in Romania.

Literature review

Motivation is the initiator of the decision process in individuals. It is '*the internal, psychological influences affecting individuals' choices*' (Middleton, 1994, p. 51). Motivation is composed of psychological/biological needs and wants that arouse, direct, and integrate a person's behavior and activity (Dann, 1981; Iso-Ahola, 1980). Therefore, understanding consumers' motives is a key prerequisite to designing and tailoring offerings to particular markets (Park, Reisinger & Kang, 2008). Effective marketing and managements is impossible unless the consumers' motivation were identified, understood, and prioritized. Knowing the motivation of visitors allows tourism agents to intercede more successfully at various points in the visitors' decision-making process, resulting in the attraction of more visitors, getting them to stay longer, increasing their enjoyment, changing anti-social behavior, and much more (Dewar, Meyer & Li, 2001).

There are three well-known theories of tourism motivation that can explain tourists' behavior. These are Maslow's (1954) needs hierarchy, Dann's (1977) and Crompton's (1979) pull-and – push factors, and Iso-Ahola's (1982) *escape* and *seeking* dichotomy.

According to Maslow, human needs are arranged in a hierarchy, from the most important to the least pressing. Maslow's hierarchy of needs in order of importance is physiological needs, safety needs, social needs, esteem needs, and self actualization needs (Kotler, Bowen & Makens, 2006). The theory implies that when a need is satisfied, it will not be a motivator any longer, and the person will then try to satisfy the next most important need.

Dann (1981) and Crompton (1979) explain tourism behavior with pull-and-push factors. Pull factors are external factors that are aroused by the product or destination and induce people to visit a destination, stay in a hotel, or attend an event. On the other hand push factors are internal forces that are psychological in nature and create the desire to travel. Pull factors are connected to external, situational, or cognitive aspects of motivation (Yoon & Uysal, 2005) and stimulate push factors. Crompton (1979) identifies seven push motives and two pull factors. The push motives were escape from a perceived mundane environment, exploration and evaluation of self, relaxation, prestige, regression, enhancement of kinship relationships, and facilitation of social interaction. The two remaining motives, novelty and education, formed the pull factors. Iso-Ahola (1982) model proposes that the two major motivation forces that influence behaviour are *escapism* (from the daily routine) and *seeking* (desire to obtain psychological rewards via experiencing new things, places, tastes etc.).

The main cultural points of interest in Romania are represented by monasteries and churches, which attract most of the foreign tourists who want to learn some of Romania's traditions and history. Domestic cultural attractions seem to raise a limited interest among Romanians (Dulau, & Coros, 2009). From one year to another, the cultural tourism consumption is gradually diminishing among young people. In 2009, the smallest consumption of culture was registered compared to previous 5 years. This decrease of cultural tourism consumption affected entertainment and cultural tourism specifically (National Barometer, 2009).

In 2009, a 20 percent decrease was registered for the museums and exhibitions visitors comparing to 2008 (National Barometer, 2009). The most important factor which determined this tendency was the decrease of visitors with high school level of education, which in 2009 visited museums more frequently. More than 60 percent of the respondents to this barometer did not visit a museum, nor attend to an opera or theater performance, nor participate a folkloric fair or to a music or entertainment event. In conclusion the Romanians are less interested in cultural activities and so in cultural tourism. Cultural event like Sibiu European Capital of Culture 2007 has been demonstrated to have a strong impact on cultural tourism. This proves that the program was efficient both from national and international perspectives. Tourists mostly preferred artistic products like: musical performances, art festivals, visiting museums, film shows and theater plays. The popularity of the program resulted in a growth in the number of tourists and visitors who enjoyed cultural activities. The program attracted more than 800,000 tourists which represent a 300 percent increase compared with the previous year, 2006 (Statistical Yearbook for Sibiu County, 2006).

Methodology
This paper aims to examine the motivations of students in attending cultural tourism. For the purpose of the study, we developed a quantitative study on the students from the Faculty of Business, 'Babes-Bolyai' University from Cluj-Napoca, Romania.
A structured questionnaire was designed to obtain information regarding students' motivations and perceptions toward attending cultural tourism, including their demographic characteristics. The data collection instrument was developed in Romanian and had two sections. The first section had a motivation scale. The current study adopted the motivation scales from previous travel motivation studies (Uysal, Gahan & Martin, 1993; Prentice, Butler & Airey, 2006; Cetinel & Yolal, 2008). Based on significant literature review we established that these motives fall into 7 dimensions: learning reasons, cultural motives, experience something new, pleasure-seeking and entertainment, physical reasons, relaxation-based motives and indirect motives. Thirty-three items were measured on a 5-point scale ranging from *1= not important at all*, to *5= very important*. The last section of the questionnaire included such demographic variables as age, gender, class, monthly budget and participants' monthly budget spent on cultural tourism activities.
Data were collected by way of a self-administered questionnaire with the study sample comprising students from bachelor degree programs. Of the 200 students who responded, 19 questionnaires were incomplete and thus eliminated from further data analysis. As a result, 181 usable questionnaires were retained in the analysis, representing 90 percent response rate.

Results and discussions
The descriptive analysis of the demographic characteristics of participants is presented in Table 1. The gender distribution of the students was quite uneven, with 32.0 percent male and 68.0 percent female. They are mostly between the ages of 20-21. Forty-four percent of the students are in their first year of education, 22.1 percent in the second and 33.7 percent in their third year.

Table 1. Demographic Profile of the Participants

Demographic characteristic	Frequency N	Percentage %
Gender	**181**	**100**
Female	123	68.0
Male	58	32.0
University degree	**181**	**100**
1st year	80	44.2
2nd year	40	22.1
3rd year	61	33.7

24.5 percent of the students are also employed. This factor influences their budget available (Pearson Chi-square value is 41.9). Thus, 45.5 percent of students which indicated a monthly budget about 200-350 Euros are employed, and similarly 63 percent of respondents indicated a budget of 350 or more Euros are employed, too.

The exploratory factor analysis of 33 items of motivation resulted in five factors; learning, cultural, relaxation, entertainment and novelty, and explained almost 51.65 percent of the variance in motivation.

The main reason why students attend cultural tourism is the 'need to experience something new'. Due to the highest scores obtained for 'experience new and different things' and 'the variety of things to see and do', a younger generation could be attracted to different forms of cultural tourism regarding the offer's novelty and promotional activities (Table 2).

Cultural tourism in general is connected with some types of learning experience like getting information about places, people and events, expanding knowledge or doing something worthy for themselves. Thus 5 items for learning motives were defined in the questionnaire: to broaden general knowledge, to prepare homework, to contribute education, because it is important, and to learn about culture. These items also obtained high scores from the total 33 items, placing 'learning' motive in the second position of the five factors.

Also we took into consideration the need to attract students to cultural events, such as festivals, exhibitions, performances etc. These kinds of events have a major impact on the development of cultural tourism. Some festivals are organized now in historical places or use cultural themes for attracting more visitors and creating a cultural image for the city and for the community. For this reason we analyzed student's attitudes toward cultural reasons on 7 items. The entire factor comes in the third position with an average of 3.71 mean values and the highest score was obtained for the 'need to experience cultural events and places', followed by the 'desire to have these experiences' and 'learn or share as a part of their culture'.

The results of the study revealed that 'push' factors like learning and experience something new registered higher scores for female as well as male students in comparison with 'pull' factors like cultural motives. These findings are suggesting the idea that promotion campaigns and the promoted image should be more concentrated on the benefits of cultural tourism activities to general education and learning process. The novelty feature should also be highlighted for the younger people to generate a positive attitude on cultural events or places.

Table 2. Descriptive statistics for 5 factors

I	*Learning (5 items)*	*Mean*	*SD*	*KMO*
I.16	*To broaden my general knowledge*	*4.06*	0.857	
I.19	To prepare homework or a project	3.52	0.998	
I.23	*Would contribute to my education*	*4.07*	0.786	
I.26	It is important to visit cultural places	3.79	0.907

Conclusions

This study was an initial attempt to understand the motivation for attending cultural tourism among Romanian youths. The findings of this research provide a comprehensive view of cultural tourism behavior in Romania. The evidence suggests that for the young and highly educated generation the most important reasons which attract them to cultural tourism activities are the novelty and learning experience. Knowing this, the marketing strategies and polices should be more oriented to these characteristics. Since new, different and stimulating experiences are strongly connected with products like festivals and musical events, performance and exhibitions, it may be concluded that these represent the appropriate ways for developing cultural tourism in Romania. Festivals and local events provide the opportunity for the communities to develop and share their culture and help the tourists to interact with the host community.

This study also investigated the differences in motivations of young people according to their demographics characteristics such as: gender, university degree and monthly budget. The results of this study revealed that the gender has a small influence on cultural motivations. The higher budget group is influenced by the reason of 'being a part of my culture'. On the other hand, students with lower monthly budgets are influenced by the need to experience cultural events and places.

The motivational push factors show that learning reasons like 'to broaden general knowledge', 'would contribute to my education', and 'because it is important to visit cultural places' are the most important reasons for attending cultural tourism. In this vein, it is important for the educational institutions to get their students more involved in culture. Assignments and projects would motivate students to participate in cultural events and places. Such reinforcement would

probably get students to be involved in culture in their future life, and contribute to the development of cultural tourism.

Finally, it is suggested that sustained and regular studies are also needed to monitor youths' motivations for attending cultural tourism. Cities and towns that have cultural assets to promote in domestic and international markets should also conduct research to understand consumer behavior in order to increase socio and economic contribution of the cultural tourism. Such information would be of great help in understanding the extent to which local support could be obtained and how the demand for cultural tourism could be measured and monitored. Similar studies conducted in different geographical areas would also help us to comprehend a better picture of young people's motivations of different locations and cultural backgrounds.

THE THEORIES OF INCOMPLETE CONTRACTS IN ANALYZING THE COMPANY

Pacala Anca
University of Oradea Faculty of Economic Sciences

Incomplete contracts theories have developed significantly in recent decades, although insistence for rigorous models left little room for empirical research. By formalizing and extending some results from other theories such as transaction costs, incomplete contracts theory tries to analyze the prudence displayed by the parties before the possible opportunistic behavior that would follow completing a contract, especially in the case of specific investments and how the insufficient contractual protection measures can lead to inefficient levels of investment. Even the name - incomplete contracts theory- suggests that the main concern is to consider the limits of contracts, that the contracts fail to specify not only the investment ex ante, but also many other unforeseen items that may appear ex post, and that would be desirable to be introduced in such an arrangement. Explanations can be either the bounded rationality or excessive cost that would involve writing of such contracts.
This paper is part of the doctoral thesis on Integrate perspective on companies sector, coordinated by professor Ph.D. Alina Bădulescu from University of Oradea, Faculty of Economics.

Introduction
This paper is part of the doctoral thesis on Integrate perspective on companies sector, coordinated by professor Ph.D. Alina Bădulescu from University of Oradea, Faculty of Economics.
According to the promoters of theory, these approaches start from the idea that the company operates through contracts, which are often incomplete. Thus, for various reasons, not all situations, whether expected or not, may be covered by contracts, including ownership of assets or authority within the firm. Thus, within the company, two types of rights may be identified: specific rights and residual rights - the latter referring to the generic rights on making decisions as regards production in circumstances not specified in contracts. According to this approach, the choice between contracting and internal organization is reduced to the efficient allocation of residual rights of control when contracts are incomplete and assets have a high degree of specificity (Draghici 2008).
      The opinions of Coase (1937) and Simon (1951) on the fact that the essence of a company is given by the existence of an employment contract and of the authority that derives from it are also coterminous with the theory of incomplete contracts (Foss, Lando, Thomsen 1999), as they emphasize the need to take into account both the costs of entering a contract and the consequent need to adapt to changing conditions not mentioned in the contract. One could also find elements of the theory of incomplete contracts in the works of Williamson and Grossman and Hart, though they mainly focus on the negotiation power that gives ownership over assets in settling unforeseen circumstances not covered by contracts.

2. The theory of firm authority. The employer - employee relationship
According to Coase and Simon, the characteristic element of the company is the contract of employment, the size and limits of a firm being essentially determined by the number of

employees and the quality of contracts. The difference between an employee and an independent contractor is given the very nature of the contract that ties them to the firm: while the employee is subject to the authority of the business manager, an independent contractor acts independently. Coase emphasizes the advantage of an employment contract as it legitimates the hierarchical relationship and the acceptance of authority and therefore leads to saving transaction costs and chiefly the costs of negotiating situations that go beyond the fixed terms of contract. The disadvantage of such a contract lies in the fact that the hierarchical relationship is often overwhelmed by information and, as the company develops, the manager will probably find it very difficult to organize and manage effectively the actions of all employees subject to his/her authority because she/he will be unable to gather and process the information that is really relevant. The conclusion derived from the situation presented above is that an optimal size of the company should be established, so that it can function effectively.

Simon goes deeper in discussing employee-employer relations and tries to analyze their efficiency by comparing them with a contract set between two independent parts. The typical contract of external labor conscriptions specifies the actions to be achieve in the future, the time course and prices of labor conscriptions, while the employment contract provides for a number of requirements of employers, acceptable for employees, establishes the rights of employers and, concurrently, the obligation of the employee to accept tasks to be completed in the established period of time. Discussing the two types of contracts, Simon shows that, for a company, the advantage of the employment contract lies in its flexibility, as an employee's performance may be adapted to any situation that might appear in the development of work tasks. Obviously the advantages and benefits of an employment contract are greater as it ensures the flexibility to deal with situations of uncertainty in the activity of the company. On the other hand, Simon points out that, in the employment relationship, employment is based, to some extent, on the reputation of the employer that ensures he/she would not abuse his-her authority (the so-called need to trust the employer).

Simon's theory was criticized by Williamson (1975) for it compares the flexibility of a short-term employment contract with the rigidity of a long-term production contract (e.g. subcontracting), although at least in theory, the flexibility of a production contract could be also ensured by a series of short-term contracts.

A modern formulation given by Wernerfelt goes beyond some of the objections that may be raised against the theory of the company as formulated by Simon. Wernerfelt sees governance mechanisms as institutional mechanisms (*games forms*), depending on which players adapt to environmental changes and exchange information on these changes. His conclusion is that different forms of the game will be characterized by different levels of adjustment costs. For example, if there is a hierarchy, the employer and the employee avoid the costs of negotiating a complex employment contract, or of a series of short-term contracts, by means of a general wage agreement, in which authority is simply implicit. Thus, for a stipulated financial reward, the employer has the right to require the employee when and what to do. This kind of game has a reduced negotiation component, in comparison with other forms of games on the market, the employment relationship being thus a form of a game in which the parties decide to act jointly, in order to save the costs of communication and adaptation. Again, the agreement to enter this mechanism that is less expensive is based on information regarding the reputation of the parties (in order to avoid abuse of authority from the company, and, respectively, the employee's willingness to comply). As put forward by the theories of Coase (1937), the size of the firm is limited by the capacity of the authority to manage an excessive amount of information.

3. The theory of transaction costs, between Ronald Coase and Oliver Williamson

The model of transaction costs proposes institutions (companies), not markets, as possible forms of organizing and coordinating economic activities. Thus, when for obtaining a good or a service,

the external transaction costs of the company are higher than the domestic ones, there are reasons for the emergence and development of the firm. Conversely, if the external transaction costs will be lower than internal costs (the transaction) of the firm, then the size of the firm will reduce and it will resort to outsourcing operations.

According to Ronald Coase, firms are ways of organizing production when, due to imperfect information, transaction costs of coordinating production through market exchange are higher than the cost achieved in the company (Coase 1937).

Through his work, *The Nature of the Firm*, published in 1937, Ronald Coase imposes the theory of transaction costs as an attempt to define - in neoclassical terms - the relationship between firms and the market. Coase's affiliation to neoclassicism is revealed by the very explanation of the way companies function in accordance to *constant returns to scale*, and less by *increasing returns to scale (*Archibald 1987*)*. Another reason for this membership is the definition of the company in a manner that is both realistic and compatible with the idea of marginal substitution, thus allowing the application of conventional economic analysis tools.

Coase argued that the company cannot control interactions with the market (e.g., because of taxes or other sale conditions), but instead it can control certain internal processes such as, for example, the internal allocation of resources. Thus, Coase shows that "within the company [...] market transactions are eliminated and the place of the complicated market structure, marked by exchange activities, is taken by the entrepreneur, who is leading the production activity."(Coase 1987). Starting here, the question that arises is why alternative methods to the market, such as for example internal price setting mechanism or mechanisms of economic planning, do not capture economic production activity, so that either all firms use only domestic prices for their entire production or economy would actually be one huge company, in which all economic activity is concentrated.

First, Coase admits that, at least in theory, markets could perform all productive economic activities, and what should be explained is the existence of the company as a defining element of the process of suppressing the mechanism of pricing. For this reason, Coase disagrees with previous explanations regarding the emergence of firms, indicating some counter-arguments:

> 1. Some people prefer to work under the leadership of others and are willing to pay for this "privilege" (but this is very unlikely);
> 2. Some people prefer to lead others, and are prepared to pay for this "privilege" (however, in most cases, people are paid more if they have such coordinating functions);
> 3. Buyers prefer goods produced by firms.

For Coase, the main reason for establishing and for the existence of a firm is that of avoiding some transaction costs associated with the use of the pricing mechanism on the market. These costs include the cost of finding the relevant price (cost that may be reduced but not eliminated, by acquiring this information from specialists), costs of negotiating and drafting executing contracts for each transaction (often these contracts can lead to increased costs, depending on the size of uncertainty). Moreover, in an uncertain world, contracts will be necessarily incomplete and therefore must be frequently re-negotiated. We add to these the (often significant) costs of negotiating a possible profit for activity, particularly in the case of asymmetric information and assets specificity.

However, one should also point out that this approach is problematic, for example, a firm, even if it internalizes a large part of its market activities, will have to manage with an extremely large number of contracts, for every action it undertakes, regardless of its size or significance. In fact, companies manage to solve this problem by signing a much limited (but more complex) number of employment or management contracts, which define the leadership attributes of a manager in relation to the staff, and establish a higher salary for this activity. Obviously, these types of contracts are also written in and for situations of uncertainty, which tend to last for relatively long periods of time (years). This situation contradicts the neoclassical theory, which considers market

action as being almost "instant" and does not allow the development of a long term relationship of the principal-agent type, or planning and trust-based relationships. Coase concludes that "a firm will more often appear in those situations where the preparation of a short term contract is unreasonable and that" it seems unlikely for a firm to appear when uncertainty does not exist"(Coase 1937).

He noticed that government measures referring to the market (sales taxes, rationalization, control of prices) tend to increase the size of firms, because within these firms transaction costs are eliminated. Thus, Coase defines the firm as a "system of relationships that occurs when resource allocation and coordination depends on an entrepreneur."(Coase 1937).

According to this theory, the rationale to perform operations on the market at lower costs than the ones practiced on the market leads to the establishment of the firm size between two limits:

-A minimum size, when the company's costs are very close to exceeding the market costs (in other words, if the costs of the firm exceed market costs, it makes no sense for the company to enter the market, so it does not exist);

-A maximum size determined by the rising costs to the point where further internalization of action is equal to the cost of their obtaining (trading) on the market.

In practice, it is found that reducing payments and incentives to the management team can contribute in a much more rapid and consistent manner to the increase of costs for organizing large firms, particularly in large corporations operating on international markets, with production achievement in different countries etc., or, more obviously, in the case of conglomerates, where there is virtually no economic or functional connection between many activities. Here, the rationalization of internal transactions, the management of rapid changes in market prices is becoming more and more a management problem. The poor reward or stimulation of this managerial activity may rapidly lead to corporate failure or its resize, including through the externalization of some assets based on superficial analyzes of costs.

Coase concludes by saying that firm size depends on the costs of using the price mechanism, and on organizational costs resulting from the work of other entrepreneurs. These two factors together determine the range and volume of a company's production (Coase 1987). "The more transactions the entrepreneur organizes, the higher the chances for these transactions to be different in type or develop in different places. This would be another reason for which, as the firm extends; its efficiency might tend to decrease. Interventions aimed at bringing closer production factors, by diminishing the spatial distribution, would act in the opposite direction, favoring the expansion of the firm. (...) We might say that all the changes that improve the managerial technique have the same effect" (Coase 1937).

According to Williamson, the transaction cost theory was developed in order to facilitate the analysis of "comparative costs of planning, adapting, and monitoring within alternative governance structures"(Williamson 1985). The analysis unit in the theory of transaction costs is the transaction, which occurs when some good or service is transferred across a technologically separate interface. Transaction costs arise both in *ex-ante* situations (drafting, negotiation, protection of agreements between the parties in the transaction), but also for *ex-post* reasons (mismatch of interests, challenges, launching and operating costs, costs of commitment, etc..).

Policy makers need to evaluate the production and transaction costs associated with a transaction within their firms (*insourcing*) in relation to production and transaction costs associated with the same transaction on the market (*outsourcing*). If market transactions are chosen, then the most appropriate contract should be decided upon.

Williamson (1985) argues that there are two human factors and three environmental factors that lead to the development and manifestation of transaction costs (Williamson 1985).

The two human factors are:

1. Limited rationality: It is unlikely that people involved in making a certain decision might have the skills or resources to consider every implication that might result from future transactions.

2. Opportunism: People following in their work their own interest.

The three environmental factors are:

1. Uncertainty: uncertainty enhances the problems that occur because of limited rationality and opportunism.

2. A small number of transactions: If in a market there is only a small number of players, a participant in a transaction may have difficulties in disciplining the other party, invoking removal and searching other partners on the market.

3. Asset specificity: the value of an asset may be subject to a transaction that it facilitates. The party that has invested in the respective asset will incur a loss if the other side, which has not invested, withdraws from the transaction. Opportunity (threat) on the part of those who are acting opportunistically leads to the so-called "hold-up" problem Williamson argues that the three dimensions of a transaction affecting the type of governance structure chosen are: asset specificity, uncertainty, and frequency. As asset specificity and uncertainty increase, the risk of opportunism also increases. Thus, decision makers are more inclined to choose a hierarchical governance structure (i.e. a company). As the frequency increases, the comparative advantages of using market structures will decrease, as a hierarchical structure of governance costs can be amortized in several stages of a transaction, but also through several transactions (Klein 2009).

Table no. 1 Correlation between the determinants of governance structure, the concept of O. Wiliamson

		Uncertainty		
		Low	Medium	High
Assets specificity	Low	Market transactions	Market transactions	Market transactions
	Medium	Contract	Contract or vertical integration	Contract or vertical integration
	High	Contract	Contract or vertical integration	Vertical integration

Source: Klein, P. G., (2009), Transaction Cost Economics, Univ. of Missouri and Copenhagen Business School

According to Peter Klein, Williamson's ambitions on the theory of transaction costs exceed the boundaries of an explanatory model of vertical integration conditions of economic activities, "it aiming to be a widely held, integrative, unifying view on economic organizations, going as far as considering transaction costs theory as an explanation for everything "(Klein 2009).

Any problem that might be represented, either directly or indirectly, as a problem that involves the existence of a contract may be efficiently analyzed in the terms of transaction costs" (Williamson 1985)

4. The company as property rights (the Hart-Grossman-Moore model)

Oliver Hart, John Moore and others developed the theory of "incomplete contracts" or of "property rights"(Grossman, Hart 1986), based on elements of Williamson's work, also in (Hart and Moore 1990), or (Hart 1995). As in Williamson, a central hypothesis of this theory is that, because of transaction costs and / or limited rationality, contracts have to be incomplete, meaning that the allocation of control rights cannot be specified for all future situations. Theory defines ownership as the possession of residual control rights, i.e. the right to use assets in unexpected situations or in contingencies not specified in the contract. Therefore, the allocation of formal property rights will affect the behavior and resource allocation.

The Grossman-Hart-Moore theory defines an enterprise as a set of jointly held assets. The basic distinction between an independent contractor and an employee, or the relationships created within the company and outside it, turns into the relationship between persons who own the physical assets and the people who use those assets in their work. Therefore, according to this theory, the person who gets involved in the development of some business and who depends on a particular asset should hold those assets as therefore the threat of his/her removal (dismissal) by the asset owner is avoided. Hiring an employee means hiring a person who assumes the risk of being excluded from using the asset by a manager's decision, while the employment of an independent contractor (through purchase of some market services) means that that particular person is given a certain amount of power to resist pressures, by the possession of his/her own assets. Thus the optimal size of the company results from the balancing of these two opposing forces (Foss, Lando, Thomsen 1999).

Grossman-Hart-Moore theory was first to provide a formal model that could explain both the advantages and the disadvantages of the company-organization, but also a theory that would convincingly establish the size of a firm.

Grossman-Hart-Moore model emphasizes the central role of non-human assets because they can be bought and sold, being included in what is called "property of assets", but many opinions also indicate the equally important role of human assets, and in particular knowledge related to production and information held by agents (key employees, managers, etc..), showing that understanding the role of "information assets" in an organization facilitates the analysis of these organizations, and that ownership and control of information - and not of physical assets-is crucial (Brynjolfsson 1994). Residual rights of control over those who have access to information related to production can often be more important than the residual rights associated with non-human assets. For example, the departure of key executives, of key decision-makers or researchers (and their knowledge) can affect other members of the company to a higher extent than the loss of equipments or certain locations (Brynjolfsson 1994). In conclusion, understanding the relationship between the role of physical assets (non-human) and human assets can lead to significant changes in the role and structure of stimulation means, especially in modern enterprises and, of course, in the knowledge-based society.

5. Theories of implicit contracts

The essence of these theories starts from the situation in which it is difficult to draw up comprehensive contracts, for example, when certain variables are either impossible to specify at the beginning or impossible to quantify at the end, so people often rely on "unwritten codes of conduct", i.e. the so-called implicit contracts.

These appear to be self-imposed, meaning that each party tries to behave up to the (reasonable) expectations of the other party, for fear of possible repercussions or the loss collaboration or the business (Foss, Lando, Thomsen 1999). The main idea in the theory of implicit contracts is that they function differently, within and, respectively, outside the firm (between different companies). Thus, a person is preferred as employee, rather than an independent contractor, when his/her coordination requires an implicit contract that is easier to implement within the company than on the market.

In a recent paper, Baker, Gibbons and Murphy (1997) point out that implicit contracts appear both in companies (in the case of labor relations) and between firms (in contractual relations). The difference lies in the options available to the parties when the contract is canceled. Unlike an independent contractor, an employee cannot leave the relationship with the assets that belong to him/her or to those he/she depends on. Specifically, in the model described, an independent contractor is defined by the possibility he/she has to sell the finite product in another part, while contracts within the firm are generated by the employer, who owns the finished product and therefore contracting company is determined by the provider (whether employer or not) who

owns the finished product and therefore employees do not have the possibility to leave the organization with the product or service to which they contribute. Power generated by the threat of leaving a relationship determines the implement ability of default contracts. For example, if the market demand for a property is volatile, relational contracts are vulnerable because the supplier is likely to leave the implicit contracts when the market price is higher. If the supplier is a division of the company, this option does not exist and the constant domestic prices preserved internally are a form of self imposed action. Thus it appears quite clearly that the theory of implicit contracts is related to Williamson's contributions, which show that litigation is easier to be performed internally than outside the firm. Mechanisms of solving litigations may be seen as a part of the system of self-imposed contracts within a firm (Foss, Lando, Thomsen 1999).

6. The company and the theory of communication in a hierarchy

Recent work on the "theory of communication in hierarchies" is based on well-known ideas from the theory of organization of Simon and March (Simon and March 1958), namely that an important function of the firm is to adapt and process new information. One should also mention the contributions of Marschak and Radner (Marschak and Radner 1972), on the theory of the team, with a completely different approach to that referring to economic organization, in which conflicts and the problem of incentives have been resolved and where the main accent is placed on coordination and communication. At the same time one should also mention the contributions of Keneth Arrow (Arrow 1985) or Casson (Casson 1997), on coordination within teams.

These works see the company as a communications network, which is designed so as to minimize both the cost of processing new information and the costs of disseminating this information between the participating parties. Communication is costly because it takes time for agencies to absorb new information sent by others, but the waste of time may be reduced by specialization in processing certain types of information (Foss, Lando, Thomsen 1999). For example, in Bolton and Dewatripont's model, each agent manages a specific type of information and different types of information are aggregated via the communication network. When the benefits of specialization outweigh the costs of communication, teams are starting to emerge (in our case, firms) (Bolton and Dewatripont 1994).

However, the theory of the team and communication within the team encounters difficulties in struggling to explain the optimum size or the limits of a company, or the way in which communication is adapted to the existing hierarchy within the company.

RECENT THEORIES OF THE FIRM: A CRITICAL APPROACH

Pacala Anca
University of Oradea Faculty of Economic Sciences

Besides the classical theories of the firms as complete or incomplete contract theories, in the last decades there were developed some new theories bringing new perspectives and approaches. Among these new perspectives we are presenting in this paper the evolutionary theory of the firm, the importance of resources and knowledge, and game theory. According to evolutionary theory the most important element for a firm is the company itself and its specific assets (physical and human). Evolutionist theories, in their diversity, are interested in issues such as the effects of changes in the long run within the firms, in terms of products, processes, decisions, analysis of the determinants of success. Resource and knowledge -based theories try to find a common point between transactions and organizational management analysis, focusing on development issues within companies, the importance of business strategy and achieving competitive advantages. Finally, cooperative game theory sees the firm as a coalition of various parts that compose it, emphasizing the importance of cooperative relations between employees and shareholders, risk sharing and effective collective skills, knowledge and funds using.
This paper is part of the doctoral thesis on Integrate perspective on companies sector, coordinated by professor Ph.D. Alina Bădulescu from University of Oradea, Faculty of Economics.

Introduction
This paper is part of the doctoral thesis on Integrate perspective on companies sector, coordinated by professor Ph.D. Alina Bădulescu from University of Oradea, Faculty of Economics.
In the last decades there were developed some new theories bringing new perspectives and approaches on the firm behaviour, from which we are presenting in this paper the following: the evolutionary theory of the firm, the resources and knowledge-based theory of the firm, and the game theory.

1.The evolutionary theory of the firm
Williamson's contributions and, in particular, his analysis of assets and skills specific of the firm, share common points with the evolutionary theory, which nevertheless distances itself from Williamson's works by choosing a different determining element for the company. Thus, while for Williamson the crucial element in the analysis of the company is the "transaction", for Chandler and other theorists of "firms' evolutionism" the central element is the company and its specific physical and human assets (Chandler, A.D., (1992). Thus, the theory is based on the essential characteristics of the company, i.e. its strategy, structure and organizational capabilities. If the first two are widely known and discussed in literature, organizational capabilities are a relatively new category, as they refer to the managerial availability of a company, arising from *indivisibilities* or uneven rates of development of the various components within the firm and the knowledge, skills and expertise accumulated in the company. Availability, seen as a potential reserve, may practically exist in any area where the firm operates, and according to some authors (Penrose 1959) or (Robertson and Langlois 1995) the generation of new reserve capacities is

continuous: "whenever a new system is functional and procedures become routine, the lack of using management resources appears ".

Organizational routines are therefore the cornerstone of organizational capabilities, and one may speak of routines in each of the different functional areas of the organization: in the activity of purchasing, production, distribution, marketing, research and development - and, more importantly, in the coordination of these functions; "Routine is the genetic code of the company, and it carries the information of adaptation, necessary in the fight against competition and for survival" (Clark and Juma 1987).

Robertson and Langlois clarify the relationship between the skills and the routines of a firm, stressing that routines refer to what the firm actually does, while capacity includes what the company could achieve if resources were reallocated; routines influence the behavior of the firm but do not determine completely what could be achieved if the company used resources competently (4).

It can be said that the evolutionary theory starts from the research of Alchian, seen as a Darwinian interpretation of the socio economic environment in which the company operates (Jacobson and Andreosso-O'Callaghan 1996). According to Alchian, the internal organization and functioning of the company are irrelevant, because "the pressure to survive will be that which, on the long run, will dictate how firms will behave on the market" (Alchian 1950) ... and those who have set objectives other than those considered correct and essential (e.g. tracking and maximizing profit), will not survive. Evolutionist in essence, Alchian's theory focuses mainly on results and less on processes, often ignoring the temporal dimension, technical progress being a type of response to market conditions and obviously, an exogenous factor in the economic development of the company (Clark and Juma 1987). Thus, Alchian's theory ignored behavior patterns, attitudes and motivations of firms, reducing them to "adaptive, imitative behavioral of the trial and error type processes, in pursuit of profit " (Alchian 1950).

The most important representative of the evolutionary theory is, however, AD Chandler, both through his research, and through the school he created, by the challenges and openings to other approaches in the economic research on the firm.

In his well-known article entitled *Organizational capabilities and the economic history of the industrial enterprise*, Chandler interpreted, in an evolutionist vision of the company, historical and empirical data collected. Thus, he looks at the case of chemical industry, both in the United Kingdom and in Germany, showing that although the late nineteenth century Britain had all the necessary comparative advantages of market dominance throughout the world for the products of this industry, (including knowledge scientific materials and access to large markets), however, the early twentieth century German companies Bayer, BASF, Hoechst managed to dominate the market and become world leaders.

Chandler's explanation is based on the accent placed on investments in production, distribution and management undertaken by German companies that managed to exploit economies of scale and scope and create a competitive advantage, to offset the British comparative advantage. Furthermore, the model successfully reproduced in other industries and has multiplied by expanding into foreign markets and related industries. Thus "managers of German firms were less concerned to reduce transaction or information-related costs and focused on using the competitive advantages created by the learned coordination routines in the processes of production, distribution, and on the improvement of existing products and processes (Chandler 1992).

Chandler's research emphasizes the role of "continuous learning that stimulates the assets of a company" (Chandler 1992) and offers an explanation of how some companies managed to maintain their position on the market.

For those interested to develop the subjects, more recent papers, such as those of Porter, return to the main features and go deeper into the analysis and comparison between the comparative and the competitive advantages (Porter 1990) or (Porter 2008).

According to the evolutionary approach, companies are organized as "enterprises", being characterized by three main attributes:

> - they act strategically, i.e. they choose their own segment on which to compete;
> - they look for a strategic advantage not through continuity and long production series aimed at minimizing costs, but through constant innovation of products , processes and of the organization itself
> - thirdly, the organization of production is not based on repeating the same operations, but by maintaining organizational flexibility at all levels, the competitive advantage being preserved through continuous learning.

Why the British entrepreneurs did not manage to make the investments necessary to the development of organizational capabilities, in order to be able to compete with German and american companies? The answer is extremely complex, involving considerations of institutional, socio-cultural and historical nature (...), without those investments that would use the advantages of scale economy, the enterprises and industries in which they operated lost the fight even on external markets they had created before. Moreover, without a basis of organizational learning and of specific capacities in production, distribution, research, development, etc, the forces needed in the competitional fight could not develop (Chandler 1992).

An interesting contribution to the evolutionary theory was brought by Lazonick, who refers to the "innovative" company, namely the company that adopts a development and innovation strategy even at high costs, since the formation of a new cost structure is an "evolutive process" that , if successful, offers a competitive advantage to the company. The process involves "innovation", creating a quality-cost relation that did not exist previously. Unlike other authors, who focused on organizational flexibility and thus emphasized the advantages of small firms, Lazonick suggested that large firms are more likely to succeed.

Several other researchers (Robertson and Langlois 1994), or (Nelson and Winter 1982) examined the role and importance of routines, and their positive and negative aspects, especially the effect of inertia on the activity of the company. "Routines that prove effective and do not come to the fore can be considered a very important asset of the company, but they may also induce inertia", as it is very difficult for firms to replace them once they were established and proved convenient for employees . "It is important to consider not only the positive aspects of routines, but also their negative role in generating inflexibility or inertia, as well as the capabilities they may generate and that can rise to prohibitive levels the cost of adopting a new technology or of entering new domains" (Robertson and Langlois 1994).

Despite the differences that can be identified among the researchers of the evolutionary school, there are many unifying themes such as the interest for the analysis of a change within firms, not only as regards products, but also in terms of production processes and and decision making, the analysis of the determinants of success of a firm or group of companies, etc.

Without denying the role of analysis of actual facts and of scientific conclusions, we believe that evolutionary theory gives too much importance to empirical and inductive approaches, in comparison with other theories of the firm, which makes it difficult to operationalize rigorously.

2. Resources and knowledge in the theory of the firm

This approach tries to find common ground between economic theories centered on the analysis of transactions and those of the organizational management, addressing issues related to the development and limits of companies, the importance of business strategy and the means of obtaining competitive advantages etc..

The theory has many points in common with the evolutionary theory, identifiable in the work of Penrose, entitled *The Theory of the Growth of the Firm,* which approaches issues related to resources, to services offered by resources and to capabilities (Penrose 1959), showing that "unlike resources, capabilities are based on the development, transfer and storage of information by the human capital of the firm " (Muşetescu 2009).

In the concepts put forward by these schools we find a new approach to the link between resources and rents - seen as super-normal rates of profit, and which identified four major types of annuities (Mahoney and Pandian 1992 , quoted by Muşetescu 2009):

  -Ricardian rents coming from a limited resource, a patent, a unique location;

  -Monopoly rents, coming from governmental barriers, abusive arrangements between companies etc.;

  -Entrepreneurial, or schumpeterian rents, which are temporary, generated by risk taking and performance of entrepreneurial anticipations;

  -Quasi-rents (marshalian or Pareto-type), specific to a company, by the characteristics and appropriate use (most valuable) of a company's capital.

3.The co-operative game theory

Relatively recent among approaches to the nature of the firm and inspired from the principal agent theories (and not only), Aoki's research develop the co-operative game theory of the firm, which sees the firm as a coalition of various "parties" within it. Thus, the firm can serve as a link in relations of cooperation between employees and shareholders and allows for optimal redistribution of risk and the effective collective use of skills, knowledge and funds (Aoki 1984).

Co-operative game theory differs significantly from the managerial approach to the company. While the managerial theory interprets the target of the company as the objective of one of its components, the co-operative theory sees a "set of relations of cooperation", a nexus of c-operative relationships, providing a link between the various units that form the company. The behavior of the firm on the market is a result of this relationship, of the cooperative game also called "organizational equilibrium".

It may be observed that Aoki's theory esentially emphasizes the analysis of internal processes within the company and gives less importance to external environmental forces acting on the company. Thus, to these potential external players, the -cooperative game theory has a dual-mode approach. On the one hand, it does not include them in the category of internal "parties" that cooperate in defining one behavior of the firm on the market, but at the same time, it recognizes their important role in influencing the cooperative game solution, here being included financial institutions, capital providers, customers and suppliers, other competitors, and so on. The problem is even more complicated if some employees are also shareholders and / or business customers, situation in which their actions matter to determine the cooperative game solution. Among other forms of criticism raised in relation to this theory, one should not ignore the fact that the theory gives a reduced importance to relationships with customers, and especially it does not take into consideration the role of the entrepreneur in decision making and the activities of the firm.

As being derived from this theory, some researchers speak of non-cooperative game theory (Davies and Lyons 1988), arguing that it is more common and more appropriate in the organizational analysis of the firm, focusing more on how rival firms' strategies and the external environment influences company decisions and market behavior, and less on the nature of domestic coalitions.

According to Rasmusen, differences between a cooperative game and a non-cooperative one is that, in the first case, players can make binding commitments, unlike the non-cooperativ game, in which these commitments can not exist. Thus,the co-operative game theory is axiomatic, invokes the paretian optimum, fairness and equity, and the result is more important than strategy, while

the non-cooperative game theory is claimed from a certain form of economic behavior, where solving the problems arising is based on maximizing the utility function of players, in situations of coercion (Rasmusen 2005). In applied economics, the most common use of the co-operative games theory is found in modeling negotiations. Cooperative games allow players to share the gains from cooperation in payments among themselves, outside the conditions prescribed. The distinction between co-operative and non-cooperative games are not in conflict or in the absence of conflict, having to deal with a variety of situations, summarized as follows (Rasmusen 2005):

> -cooperative games without conflict. Employees of firms choose equally the tasks they will perform and the way of coordination among these;
> -cooperative games with conflict. Bargaining over the price between a monopolist and a monopsonist.
> -noncooperative games with conflict. Prisoner's dilemma (see notes)*.
> -noncooperative games without conflict. Two companies set standards of creating similar products, without communicating in advance these objectives.

Note: Prisoner's dilemma is a classic example of the game theory, which describes the situation of two suspects that would be punished depending on their collaboration with the police or their solidarity with the other suspect. Prisoner's dilemma is an example of non-cooperative game, but one which may be modeled as a game of cooperation, allowing the two players not only to communicate, but also to establish compulsory commitment (see http://www.scientia.ro/homo-humanus/51-psihologie/385-dilema-prezonierului-teoria-jocului.html)

ORGANIZATIONAL CULTURE AND ITS WAY OF EXPRESSION WITHIN THE ORGANIZATION

Pirjol Florentina
University Of West Timişoara Facultaty Of Economics And Business Administration

Maxim Raluca Georgiana
University Of West Timişoara Facultaty Of Economics And Business Administration

The main theme of this paper is the role of organizational culture in a company and its way of expression within the organization, for its management, for its employees and for its competition. Organizational culture is undoubtedly one of the fashionable areas of management, with a relatively recent history. Its purpose is to sensitize readers to the importance of organizational culture for the success of an enterprise, and its objectives were: to define organizational culture and its influence factors, as well as to explain the role of its components in the organization as a whole and for its members. Practically, the interest in organizational culture began in the 7th decade, largely due to the performances of Japanese companies, performance explained by their specific culture. Although the concept is increasingly met in international and local literature, the process that prevents its practical implementation is the lack of scientific (theoretical) research at a company´s level. The old generation of leaders lead based on knowledge acquired years ago, few are those who really consistently do research and are up to speed with the latest news in management, or in the economic field in general. This paper aims to identify key conditions that determine human activity in an organization and their relationship to the successful implementation of an organizational culture by examplifing great successes of international companies. This is relevant, not only because these companies have huge incomes and recorded notable successes, but also because they enter and develop on the local market, trying to implement their thinking. Thus, local businesses can improve their business by adopting and adapting this way of thinking. The rezults of the research results reflect the fact that despite the concept that people are the main value of an organization, companies continue to ignore their employees, instead seeking the magic formula, the immediate solution or the latest management tool, not giving organizational culture the importance it deserves. We want to preclude the notion that it is easier to implement a new policy than to invest time to analyze and improve internal organizational culture. An organizational culture of success tries to improve old ways without losing the tradition, it brings advantages to the organization, to the management and to the employees.

Keywords: organizational culture, symbols, organizational behaviour, beliefs, values.

JEL Code: M14

Organizational culture is the one that directs the employees to act according to the principles and values of the organization and to understand what is good, bad, ugly or beautiful for it. Organziaţional culture refers to those written and unwritten rules, concepts, ways of thinking that spiritually diverse an institution from another and that is reflected in every interaction with its external or internal environment. It is a lifestyle, a set of rules, traditions and beliefs common to all members of an institution.

R. Lynch suggests that organizational culture is a company's own set of beliefs, values and ways of empirical management which reflect in the company's structure and system, in the way the cooporate strategy is developed and implemented.

As each person represents an unique human being, any manager without exception is bound to prove an infinite flexibility in his/her behaviour towards subordinates, on one hand, and in understanding their needs and aspirations on the other.

In order to accomplish this, it is necessary that each manager knows those elements that influence the human behaviour and efficiency. The main factors that characterise the human resources in an organization are creativity, ability to inovate, atitude towards work, needs and desires, character traits and group behaviour. These human traits can be influenced by managers in such way as to ensure maximum efficciency in using human resources.

The efficient use of human resources in organizations requires ensuring and respecting certain conditions, conditions that directly influence the human activity. Thus, the main factors that influence human activity in an organization are:

- factors related to the employee: professional training, practical and theoretical knowledge about their work, work experience, creativity, innovation and other such factors which, as seen, are in a very large extent related to the employee. The manager can intervene here during staff selection and recruitment, identifying those individuals who best fit the organization, on a professioanl level.

- factors related to the organization: motivation policy, working conditions, company reputation, employee facilities, organizational culture and organizational behavior. These factors are heavily related to the organization, namely to its leadership, the manager liberty of action being restricted only by the limits of their creativity and imagination in terms of personnel policy.

- researching organizational behavior is a way of learning about the world through objective and systematic collection of informații. A good research in organizational behavior involves rigorous training in management-applied psychology or sociology. There are two basic techniques of organizational behavior research - *observation and correlation* - , to which a third is added, less used, namely, *experimentation*.

- the observation method requires that the researcher proceeds to examine the natural activities of people in the organizational environment, hearing what they say and observing what they do. Firstly, the researcher attacks the organizational environment with an extensive training on the nature of human behavior and a particular set of questions to be answered by the research. These factors provide a systematic framework for conducting the observation. Secondly, the researcher will try to keep permanent and careful records of the events he observes right as they emerge. He should not influence the behavior of the ones that are being observed in any form. Research results through observation are summarized in a narrative form, sometimes called a case study. This specifies the nature of the organization, the people and the events that were studied, the particular role of the observer and the techniques that were used.

- two researchers, Bensman and Gerver investigated an important organizational problem: what happens when the activities necessary to perform a specific task come in conflict with the official policy of the organization? They were interested in the illegal use of taps by workers in an aircraft factory. A tap is a steel hand tool used to cut a thred in metal. Possession of such a device by aircraft fitters was completely prohibited because workers could use it to adjust inappropriate or difficult to assemble parts, which could ultimately result in lower resistance of the metal structure or maintenance issues. Having a screw tap was a strict violation of the company's policy and a worker could be fired on the spot for it. On the other hand, maintaining a certain quota of work was necessary, and the use of a screw tap could have saved hours of disassembly and alignment. This conflict was resolved through cooperation between supervisors and inspectors to encourage cautious and appropriate use of taps. New employees were gradually introduced into the mysteries by tapping by older workers and supervisors ensured completion of the skills. Taps were used in front of the inspectors or to correct chronical inappropriate works. If he got caught, the one who had illegally used a tap, had to receive the supervisors punishment

even if it was he who suggested the use of the tap. All this resulted in the development of a social ritual to use this tool.

Organizational culture is undoubtedly one of the fashionable areas of management,with a relatively recent history. Practically, the interest in organizational culture began in the 7th decade, this concern being largely due to the performances of Japanese companies, performance explained by their specific culture.

A first approach to organizational culture on management terms belongs to T. Petersand and R. Waterman, who in thier book called "In Search of Excellence" illustrate the relationship between organizational culture and the development of some firms. The term "culture" was used in economy from anthropology, both in economics and anthropology existing several meanings for this term "culture": phenomenologic, structural, critical and anthropological. According to several specialists, four types of cultures can be distinguished in every country:

- national;
- economical;
- on different branches of economical activity;
- organizational;

Organizational culture, as many other managerial concepts has many definitions. Thus, according to N. Oliver and G. Lowe, organizational culture consists of a set of beliefs, shared by most of the staff of an organization, beliefs about how people should behave at work and what the most important goals and tasks to accomplish are.

Another definition of organizational culture belongs to the Americans M.J. Stahl and D.W.Grigsby. In their view, organizational culture designates a set of values, beliefs and major meanings shared by the members of an organization.

Organizational culture can be defined as all the values, beliefs, aspirations, expectations and behaviors shaped over time in each organization, which prevail there, conditioning its functionality and performance.

The content of organizational culture is treated in different ways in the literature.Thus, Williams and Dobson structured organizational culture on three levels:

- of beliefs and convictions, embedded in the consciousness of the staff which often is un aware of these;
- of values and attitudes, which employees choose and display;
- of individual and group behavior within the organization.

Also other researchers make an analogy between organizational culture and an "onion" in the sense that both encompass multiple layers, only one of which is noticeable at first glance. All these approaches of the content of organizational culture have a common thing– identifying multiple levels that are overlapping. The forms of manifestation of organizational culture are largely intangible, less visible, but we believe that the main manifestation form are the following elements: symbols, behavioral rules, rituals and ceremonies, statutes and the role of the staff, organizational stories and myths.

As major components of organizational culture, simbols provide meaning or comon meanings to its members in relation to some organizational elements of group interest, allowing them to communicate and harmonize. The cultural symbols convey meaning that reflects the philosophy and values, ideals,beliefs and expectations shared by employees. For example, a symbol can be even the name of the organization when it reprezents an essential element of its activity. The names of competitive companies become in time symbol of what they represent for economy. Thus, Philips and Mercedes are symbols of top quality in televisions and, respectively cars.

The Logo of the company is often a major symbol for its employees and clients. For example, the „tiger", the logo of the Exxon Company, suggests the power that the respective fuel generates and, at the same time the power that it beholds as one of the most powerful oil companies in the world. As you can see, this symbol is aimed both at customers - through power, symbolic for the

fuel quality - and at employees, and competitors – through the company's market position. The lion can be interpreted the same way, the symbol of Peugeot Comapny. The official language or the slang is also a frequent bearer of symbols in the organization. In competitive firms from developing countries, the practice of formulating commands or sayings that summarize the organization's work concept is increasing. In this respect, the 10 commandments used as informal behavioural guidelines at the American Bankers Insurance Group Company in the U.S., engraved in stone at the entrance of the general headquarters. A special symbolic value are seen in the fittings, furniture, paintings,colors, etc., used in the organization. For example, equipping the meeting room with a round or oval table suggests the idea of participation, of group action. The general manager's use of a of a huge desk and a big chair suggests putting a great emphasis on hierarchy, on autocratic vision in management. In conclusion, we can say that cultural symbols are used to express certain views and to promote certain values and behaviors within the company. They help focus the thinking, the behavior and the actions of the employees towards the crystallization of certain , typical, prevailing organizational behaviors.

However, organizational culture stands not just for values and principles, it means the company´s openness to new, acceptance of changes, development of good communication between employees and between departments, bringing managers down to the level of each individual employee, a climate that support creativity and positive relations between people ... it means creating a place where people love coming to every day. Organizational culture incorporates the following:

- staff ethics;
- attitude towards risk;
- attitude towards competition;
- attitude towards the client;
- attitude towards the employee;
- attitude towards external forces;
- management style;
- identity;
- control.

Managers should be aware that an effective organizational culture brings only benefits to the organization, both on short and on long term. "Management leads culture and culture leads behaviour" (Dygert and Jacobs 2006: 21). Leadership guides the direction organization is headed, they express it through organizational culture, and the staff follow it and reach the desired performances, in the same time feeling satisfied and appreciated for the work they have done.

However, in implementing an organizational culture, managers must be aware of those disturbance factors that may have a negative influence if not controlled. They can create misunderstandings, quarrels, frustration and all this leads to a drastic decrease in performance. Usually employees are frustrated not by their work, but by the working environment, by colleagues, by managers, by the fact that they are not appreciated, etc. The most important elements to be controlled, to be coordinated so as not to create conflictual situations are called "the 4 C's '(Dygert and Jacobs 2006: 32):

- change: an organization is constantly changing, in a process of growth or, conversely, in a decrease, which will generate more and more situations. People struggle with change and fight even between them because of these changes;
- Competition: competition has always been a reason to quarrel between employees, but competition can be positive as long as it stimulates creativity and good cooperation. Internal competition should be transformed into teamwork. The employee must learn to enjoy the success of his colleague, and even help him because the situation may change at any time;

- cooperation: when two people or a group cooperate in a certain situation, success is three times safer than if they all pull in different directions, because it proven that teamwork is more effective than independent work;

- control: control can be the power that unites or divides in an organization. A good measurement of the level of authority required in each situation is key to success. Sometimes, people must be guided in a certain direction and strictly be controlled in what they do, but sometimes it is better for employees to learn to think for themselves, not always be told what to do.

It is very important for employees to understand organizational culture because it affects their daily work through the benefits they receive, through how they interact with colleagues, through how they dress at work and everything else relating to work at the office . Own experience and observation will help employees, in time, to understand the way in which actions are taken in the organization and which are "the house rules". Also, the organizational culture provides them with economical, spiritual security, with the need for recognition and self-esteem that the human psyche craves for. A job means added value, not just execution (for that there are machines). Thinking that the employee works for the boss, should be changed into a different attitude, namely that the employee works for the customer to meet his/her needs and requirements.

Culture actually expresses the way human resources of the company are seen and what behavior the employees must adopt both in the working process and in different situations they face during their activity within the organization. At first glance, one might say that all successful organizations have similar cultures, since they have asserted themselves on a market with fierce competition. But it is not the case. It is almost impossible to identify two identical cultures from two different organizations. This difference in culture is due to several factors, factors which influence the organization,giving it a certain type of culture. Among the factors that influence an organization's culture, the following can be mentioned: the founders of the organization, the national culture within which the company operates, age and size of the organization, managers, the activity profile and the work nature, characteristics of the human factor, etc. All these elemets offer each organization a certain system of values and a certain perception of reality. To grasp the true importance of organizational culture it is enough to observe some successful organizations and the values they promote.

McDonald's is a company known practically all around the world, with restaurants open in our country as well, in almost every major city. Headquartered in Illinois, the company had become the leader in the fast food business and a rolemodel for aspirants in the franchise business. It can be said that the company's success was due to its management and its mission: "fast service of hot snacks, in a clean restaurant, at affordable prices". The company has developed a true"cult of quality". Nothing is left to chance in a McDonald's restaurant, from the interior design, to the equipment and staff behavior. All these are dictated in an operating manual created at headquarters. The manual gives instructions for employees on how to present themselves ,what to tell customers and how to do their work. Hamburgers and fries are made in a way as to respect the most strict uniformity. Preparation of hamburgers is made with great care and each employee is trained to know which layer of meat comes first. Employees in a McDonald's restaurant have a certain dress code and must be very careful with their customers. A McDonald's employee has several tasks in the restaurant: he/she serves, cleans, helps unload the supplies, which means that not everyone is able to integrate in the work environment at McDonald's.

Organizational culture is a concept that is slowly making room in our companies, but they have a lot to make up for over the multinationals that are coming to Romania with a certain mentality,with a vision of success, built in a stable and competitive economic environment. And often, this view makes them proficient,through the people they select and the values they adopt. At this level, organizational culture can make the difference between a successful company and one that struggles to survive.

EXPLORATORY STUDY REGARDING THE QUALITY ASSESSEMENT OF SERVICES OFFERED BY AN AUTO REPAIR SHOP IN CLUJ-NAPOCA

Rusu Corina
"Dimitrie Cantemir" Christian University Bucharest
The Faculty of Economic Studies Cluj-Napoca

The quality of services should be treated as a resultant derived from the satisfaction of the costumers participating in the service consumption, which requires prior knowledge on the predictable behaviour and reactions of the clients to the offered services. In its turn, the service monitoring system's design must be shaped according to these behaviours: service delivery, service delivery management and service quality control are therefore inherently subject to a double purpose: obtaining consumer satisfaction and stimulating them to seek, in the future the services of the same tender.
It is obvious that, in the case services, their intangible character makes quality aspects to be rarely identified in physical or quantifiable indicators, which means that service quality measurements remains largely subjective or up to the client. As a result, each manager must choose some criteria for establishing the principles used in quality assessment and, ultimately, the practice under market competition conditions, is the one that will approve or not, on the long run those criteria, therefore the service's quality and its adequacy for a particular customer segment.
Key word: service quality, global quality, client satisfaction, questionnaire, services.
JEL codes: M10, M20, M30.

In drafting the study conducted in the auto repair shop we covered the following steps:
1. Defining study objectives and setting the existing constraints;
2. Researching the best suited survey basis, most adapted to the situation, taking into account the quality and cost issues as well as the choice of survey method and the sample creation;
3. Observation;
4. Checking and coding the questionnaires. Preparing the data for processing;
5. Data processing and analysis;
6. Final report and the result evaluation.

We summarized below the aspects that we considered relevant for each covered stage.

*1. Defining **study** objectives and setting the existing constraints.*

The survey aimed to identify the quality level of services offered by the auto repair shop in terms of beneficiary's point of view. Since it is not the kind of activity to involve a large number of customers daily, we performed an exploratory study and not a market research or a rigorously underlain scientific survey.

2. Researching the survey basis and creating the sample.

Regarding the survey's basis for the performed study, it was composed of all the garage's customers during the timeframe February-March 2012, which were 67 people.

3. Statistical observation.

Since observation is the act of gathering information concerning statistical units according to rigorously defined criteria, covering this stage involved the following steps:
- ✗ We identified variables that were going to be studied and which later led to the development of the questionnaire;
- ✗ I developed and tested the questionnaire;
- ✗ I chose the data collection technique (taking into account the study objectives and the complexity of the information that we wanted to pick up, I chose the direct administering of the questionnaire through investigation, to potential customers of the car repair shop; this has allowed us to use any type of question because we were able to provide some explanations about certain questions; it even allowed us to get answers for

open questions, that are usually avoided by the respondents, for lack of time or other reasons.

    ✖   I set the place and time of observation, therefore the administering of questionnaires was performed during February-March 2012.

4. Checking and coding the questionnaires

Out of the 67 questionnaires administered to potential customers or car owners who entered the garage during the study, given the direct administering of the questionnaires, there were no inaccuracies.

5. Data processing and analysis.

Not to use outdated data in the analysis, as a questionnaire was completed, we proceed towards organizing the data and registering them into the computer.

6. Final report and the result evaluation

The final report is the relationship between actual research and actions that will follow its results. The research report can be considered a "product" to be capitalized and therefore it must have the following characteristics:

- it should satisfy a need, which is the need for information to be able then to make a decision;

    it addresses precise users who were generically called "target" of the research report;

- it must be properly conditioned - to have an adequate presentation;

- it must be an action of communication – we should be able to talk about promoting the report;

- it must be distributed correctly – the dissemination of the report should be made, taking into consideration the above guidelines and the that he may also end up being read by people other than the "professionals", which implies an increased concern with editing.

Because in our case, the research aimed to inform the manager about customer satisfaction, promotion and distribution were very limited.

Development and testing of the questionnaire:

The questionnaire is the "basic tool used for data collecting, conditioning to a high degree the success of the research."[1] Developing a survey involves studying economics, statistics, sociology, psychology, computer science, because it is a difficult problem with multidisciplinary character.

The questionnaire has a critical role and position in marketing research because it has to translate the objectives of the research into precise, specific questions to obtain the desired information from the investigated subjects.

Although there is no generally valid pattern for drafting questionnaires, the results of theory and practice specialty have pointed out that a "good" survey must meet certain conditions[2]:

- ♠ it should be as short as possible, but also cover all the questions necessary to obtain relevant, significant information;

- ♠ it should be proper for the investigated subjects, namely:
  - ✖ it should be explicitly built for the subjects to understand it;
  - ✖ it should use appropriate language for the intellectual level of the subjects;
  - ✖ it should be easy to fill up, in a concise, interesting, fluent and logical manner.

- ♠ it should be easily manageable, enabling quick response recording and encrypting;

- ♠ it should allow easy listing of the information;

- ♠ it should be translatable, ensuring transmission of the subject's feelings, opinions and thoughts, the findings and recommendations arising from their answers, to satisfy in particular the thirst for information of the managers.

The sketching and drawing up of the questionnaire involves getting through the following steps[2]:

1. Clearly defining the necessary and desirable information

The questions in the questionnaire followed the main aspects of the offered /received services as well as their quality level, according to the questionnaire in the 1st Appendix.

2. Establishing the type of questions (questionnaire's structure)

Given the information we wanted to achieve, we used both open and closed questions (with coded, pre-established answers) as well as questions with scale answers, even if they were more difficult to interpret and there was a need for extra explanations to be offered to the respondents.

3. Formulating questions

We have paid special attention to the formulation of questions, being aware that any changes in the formulation of questions can lead to very different answers. Therefore we tried to use a clear and concise formulation, as short as possible, to avoid ambiguity and to use plain language without "preciosity". We also tried to avoid getting insincere responses influenced by the respondent's predisposition for a certain answer as well as the restriction of the investigated subject's expression possibilities.

4. Establishing the succession of questions

Since the sequencing of questions must trigger and maintain the interest of the investigated subject throughout the entire inquiry, the questions in the administered questionnaires had the following the sequence:

a) Introductory questions, general ones, that were polite, non-threatening, intended to heat the atmosphere; generally they were simple questions, which could be answered directly and easily;

b) Complicated questions, with "worked" answers which refer to the investigated subject's views and options and which were mainly assessed using the scale responses.

5. Questionnaire's design

In creating the questionnaire we intended it to give the impression of an important document, simple and pleasant to look at. We numbered each question, each and every page of the questionnaire and every survey and to facilitate the work of the respondents the size of the assigned letters and spaces were large enough. To avoid any confusion, questions and their afferent answers ended on the same page.

6. Questionnaire's pre-testing

Since all the textbooks present this stage as being absolutely necessary, we conducted the questionnaire's pre-testing, pursuing the following aspects: the understanding degree of the questions, their clarity, the sequence of questions and sufficiency of answers formulated in the questionnaires as well as the time needed to fill in a questionnaire. Following this pre-testing, we eliminated some questions that proved to be unnecessary and we introduced others, according to the information we wanted to obtain; we replaced some words that had proved to be interpretable and / or confusing and we made changes in the sequence of questions to eliminate some discontinuities.

7. Review and final editing

We made the changes required after pre-testing the questionnaires, we checked the design prior to these changes and we drafted their final form.

8. Questionnaire's implementation

As I said before, we used the direct administering of the questionnaires, on the customers of these companies or to visitors.

Conclusions we reached after data processing:
General observations:

We retrieved (based on the answers to questions 7, 8 and 9 of the questionnaire) the following observations:
- 24 out of the 67 interviewed people, came up with private car, which means that most of them (64.18%) came with their work car;
- 41 people, which is 61.19% had previously scheduled the visit to the car repair shop ,while the remaining 26 people had no scheduling;
- most of those interviewed said that they visit / contact a car repair shop every three or four months, as follows:

Table 1.

The time frame for visiting / contracting a car repair shop

	Time frame					Total
	1 month	2 months	3 months	4 months	More than 4 months	
Number of people (%)	-	4,48	35,82	47,76	11,94	100

Observations of the visit:

We retrieved (based on the answers to questions 1 and 2 of the questionnaire) the following observations:
- most respondents had been to the garage before (46 people out of the 67 surveyed) and those who have not been there before, reached it by receiving recommendations from loved ones (19 respondents) while only two people entered the car repair shop by passing by, as follows:

Table 2.

Aspects that determined the visit of the interviewed people

	Determining Aspects				Total
	Advertising	Close people	Previous experience	Others	
Number of people (%)	-	28,36	68,66	2,98	100

There are two aspects to be noticed in this context, given the responses of those who were interviewed:
- a positive aspect – the fact that most of them came back which makes us assume that they were satisfied with the services
- a negative aspect – lack of advertising and therefore the absence of its influence – which in the present economic conditions and on a highly segmented market is imperative for a company working in the field of services.

Features related to the quality assessment of service offered by the car repair shop:
The answers to the third question of this questionnaire, applied to the various respondents who visited the garage, will help us identify the quality of the offered services from the customer's perspective; we tried to identify the quality level of services by determining the marks or the average values of each question that covered a specific attribute (feature); with this purpose, analyzing the responses to the applied questionnaire, we determined the following:

WORK ETHICS IN ROMANIAN COMPANIES (I) - EMPRIRICAL EVIDENCES

Pup Anca[41]
University of Oradea Faculty of Economical Science

In many countries (e.g. Japan, China) it has been proved that a key-driven factor in increasing their economical development consists on employees' attitude toward work. Based on the assumption, the main objective of this article is to compound a descriptive image on drivers and barriers on work ethic in Romania, which illustrate the most frequent ethical issues in firm-employee relation. In this respect, the sense which I attributed to the term "work ethics" refers to specific attributes of relationship between two parts: employee and firm and in the second paper I will use this term based on Weber's definition as a belief in the moral value of the work. The empirical evidences presented here are the results of a research based on an online survey which I applied to managers and/or persons in leading position in Romanian small and medium enterprises. Using this methodological instrument, I collect responses from 828 companies from 41 different Romanian counties land. The resultants indicates that the main source of the unethical practices is based upon a double phenomenon: employees fail to comply with their labor contract duties and management administration restricts employees' rights to work (applying discriminatory practices) and rights to a fair wage.

Keywords: work ethics, business ethics, Romanian companies
JEL: J30, J41, J50,

Introduction

Various studies (Heintz 2005:25) confirms that the economic progress of a country lies in the willingness of people to work harder and more efficiently, and the financial value of a company increases if the human capital is based on a motivated and loyal workforce (Young 2008:185). From an economic approach, the importance of work ethic resides in increasing the employee's productivity and achieving an optimal position in terms of costs and benefits. Well done work is reflected by a corresponding financial reward, leading to the Pareto optimal state, in which no party can improve its present condition without worsening the other. So, the two parties - employer and employee - are in a win-win position. The company is more likely to be concentrated on the economic benefits; meanwhile the workforce looks forward to a balance between social and financial aspects.

But the descriptive aspects confirm us that there are many problems related to workforce. Not all want to be responsible for their work; there is not a fair balance between effort and reward. The first extreme is when the wage is situated below the level that should provide the means of existence – e.g. Nike Company has been criticized many times for very low wages paid to labor in Indonesia, or Wal-Mart Company was involved in many cases of pushing labor costs down. The second extreme is illustrated by the situation in which the salaries of managers in the American financial sector are thousand times higher as the wages of other representative workers in comparison (Stiglitz 2010:446, Chang, 2011:157-173). In order to find out some attribute specific to work ethic, I have applied an on-line questionnaire, based on 25 questions, which illustrate company's relation to its stakeholders.

Methodology of the research project

Research design was based on the following considerations. In order to achieve a representative sample, I use the quota method based on two criterions: employees' number and region. The data

---

for the study were collected from a base of firms called Lista Firme which contains information about over 700 000 companies in Romania. The selected information was: company name, mail address, manger's name and number of employees. This procedure resulted in a total sampling frame of 300 companies from each 41 Romanian counties. Firms were group in four categories, based on the number of employers, according to the national previsions of Law nr.346/2004:

> -*Category I - Microenterprise under 9 employers*, (In this study 52,2% of responses came from micro-firm owner/mangers that have less than 9 employees; that means 444 of participants was from the first category);
> -*Category II - Small Enterprise 10-49 employers* (33,6% firms, that means 286 participants);
> -*Category III - Medium Enterprises 50-249 employers* (11,5%, 98 participants with 80 completed responses);
> -Category IV - *Great companies* with over 250 employers *employers* (2,6%, 22 participants)

Each member of the sample received an on-line questionnaire, particularized with the name of the manager, from which it was expected an answer. In case of unavailability of the manager, it was asked for another member in leading position to fill in. Also the last past of the survey permitted the participant to note his/her name and his/her position. It was used an international leading provider of web-based survey solutions, in order to elaborate and to sent the questionnaire based upon 25 questions. Taking in concern the number of send e-mail and the number of invalid mail address, the response rate was 10,32%, This can be considered high for the customary levels in an on-line survey. This research was finalized in January 2012 and only two specific items from this research will be used in this article.

General ethical issues in firm-employee relation

The perception of work has evolved over time and there are many factors which can stimulate our attitudes towards work. In the ancient world, in almost all civilizations, (excepting the Jewish one) work did not receive a positive value assessment. From Protestant Reform, the perception upon work has been serious changed, being considered a divine call a sacrifice that demonstrated moral worthiness. Over time this divine mandate turned into a social norm and with the information age, work was perceived as good and rewarding in itself.

Within the informational age, the approach to work has become more detailed because of its complexity. Even if the employee-employer conflict remained over time, each party's perception has changed. While human capital can be bought, its potential is only capitalized on the care, value and respect which are offered (Young 2008:185). Various management theories seek to emphasize the role and place of the human being related to his work, in order to motivate worker to perform better. The traditional model is based only on monetary incentives while the scientific management takes into account other non-economic factors, such as: appreciation, responsibility, advancement, training, etc.. (Herzberg, Mausner Snyderman 1959). Work ethic today stresses the importance of skills, discipline, challenge, autonomy, quality of work produced. Worker expects that the application of a positive work ethic to be fairly reflected in rewards.

There are many factors with shapes the contemporary attitude throughout work. Many studies have been dedicated on finding positive correlations between some key-factors and labor. Without getting into particularization, we listed below some of the most relevant ones:

-cultural gaps, (Landes 2000:10) argues that "culture makes almost the difference" as a relevant example is the Jalopies patriotism at work;

-most of the literature in social psychology views considers the parents as a primary source of work attitudes, parental work attitudes have a positive effect (Gradstein 2009:268-288) and it might be a weak correlation between to parents income (Antonji, Dunn 2000:221-58),

-educational influence, more educated individuals may work more (Antonji, Dunn 2000:221-58),

-companies' drivers and barriers: financial and non-financial stimulus, a fair balance between contribution and reward, "the fair wage-effort – workers have a sense of fairness and reduce their efforts if the actual wage falls short of the fair wage", (Akerlof, Yellen 1990:255-83), "status payment and earning compression" (Stark, Hyll 2011:349-75).

Ethical issues in the firm-employee relation are various. We consider that their source is essentially based on the infringement of employees' rights or when the workforce failed to accomplish its obligations. The following table offers an outlook upon the basic rights and duties of employees and points the major ethical issues involved.

Table 1 Rights and duties of the employees and some ethical issues

Employee rights	Issues involved
Right to freedom from discrimination	- Equal opportunities - Affirmative action - Reverse discrimination - Sexual and Racial Harassment
Right to privacy	- Health and drug testing - Work – life balance - Presenteeism - Electronic privacy and data protection
Right to process	- Promotion - Firing - Disciplinary proceedings
Right to participation and association	- Organization of workers in work councils - Participation in the company's decisions
Right to healthy and safe working conditions	- Working conditions - Occupational health and safety
Right to a fair wages	- Pay - Industrial action - New forms of work
Right to freedom of conscience and speech	Whistle-blowing
Right to work	- Fair treatment in the interview - Non-discriminatory rules for recruitment

Employee duties	Issues involved
Duty to comply with labor contact	- Acceptable level of performance - Work quality - Loyalty to the firm
Duty to comply with the law	Bribery
Duty to respect the employer's property	- Working time - Unauthorized use of company resources for private purposes - Fraud, Theft, embezzlement

Listen
Read phonetically

These ethical issues might know some regional distinctiveness. Crane A. (2007:264) sustains that the European corporations are confronted with issues such as the protection of workers' human rights in their factory in China or Cambodia while at home, a variety of different ethical questions are arisen from the use of new technologies, such us the internet or the introduction of a new work environments such as call centers. This example leads us to the conclusion that ethical issues related to employees varies depending on cultural climate, development level governmental legislation and company's attitudes toward workforce.

Some empirical evidences and conclusion upon work ethics in Romania SMEs

In this research, I am focused on identifying the specific ethical issues related to workforce, in Romania. Starting form Crane's classification based on employee rights and duties, I applied a Delphi investigation, to a few specialists, using the option of opened answers, in order to evidence the most common problems. Form their answers, I have chosen the first nine important once. Applying the online survey, 850 managers or persons in leading position across the country have responded by choosing three answers that illustrate the most common ethical issues in relation to employees. The absolute and relative results of their answers are illustrated in the next figure:

Figure nr.1 **The most common ethical issues in Romanian firm-employee relation**
The obtain results are listed below according to the hierarchical relevance and in the parenthesis is mention to which type of employees\s right or duty makes the answer references and if the ethical issue is based on financial or social aspects:

-moral and sexual harassment - 4,9% (employees' right to freedom discrimination, social aspects);

-infringement of privacy – 5,6% (employees' right to privacy, social aspects);

-reverse discrimination – 8,3% (employees' right to freedom discrimination, social aspects);

-adverse working condition - 14,5% (employees' right to healthy and safe working conditions, social aspects);

-giving/taking bribers by the employees – 23,3 % (employees' duty to comply with the law, financial aspects);

-inadequate evaluation of performance – 44,3% (employees' right to process; financial aspects);

-unauthorized use of company resources for private use - 48,3% (employees' duty to respect the employer's property, financial aspects);

-unfair reward – 49% (employees' right to fair wage, financial aspects);

-unfair treatment in recruitment and/or promoting process 49,8% (employees' right to work, social and financial aspects);

-employee's behavior based on immediate benefits – 51,9% (employees' duty to comply with labor contract, financial aspects);

Interpreting the data above, we see that the most three common unethical practices are based on financial sources, four out of five achieving a rate of over 40%. Between the first three, there is not a clear line of demarcation. The first one, the behavior focused on immediate benefits (51.9%), is an ethical issue which is based on the employee duties. It means that the employees' have low level of acceptable performance, work quality and they are not very loyal to the firm. The nest two responses are concentrated on the employee rights: right to work (discriminatory rules – 49,8%) and right to fair wage (inadequate remuneration: unpaid overtime, moonlighting and unfair performance evaluation – 49%). It is important to mention that Romanian managers are aware that the most common ethical issues related to the workforce rise from their prevarication of employee rights. At the other pole is sexual harassment (4.6%), violation of employee's private space (4.9%) and discrimination against certain social categories (8.2%).

Financial constraints have the most important impact, being one of the main causes of unethical behavior, along with the desire to have a higher gain. This assertion is supported by other results from my research. A hierarchical ordering of the main causes of the unethical practices in the conception of 850 managers from Romanian companies is presented in the figure below:

Figure nr. 2 **Main causes of unethical behavior in Romanian companies**
It is important to emphases that on the first position is placed the lack of a managerial culture. There is a clear evidence that the managers from my country, are awarded that the main reason causing various unethical practices, is precisely how are managed and controlled the activities that take place within their company. The implication upon work ethic is an inadequate organization and an incorrect management of labor. On the following two positions are located two items of financial nature: financial constraints (49.6%) and the desire to have a higher gain (48.6%). As I have argued above, most of the unethical practices in my country have a financial background. The perception that business is generally corrupt also has a relatively high impact (39.4%) favoring the emergence of various unethical practices. Discussing with some managers, during my mini-Dephi investigation, I observed a tendency of some to compare to other companies. Analyzing issues related to accurate financial records, the reason often cited was that "everyone is acting in the same way."

Concluding, the most frequent ethical issues regarding the relation between firm and employee are based on a financial background. The managers form the Romanian companies are award that the main ethical problems rise from the way they governance their companies and second placed are employees' specific attributes. This hierarchical ranking of the most important ethical issues in relation firm-employee, can help us to identify with are the main problems but the very important next step is how to resolve them. So it is not enough to know that the Romanian companies fail to evaluate in a proper manner the employee performance.

It is also necessary for the management to be able to create and invest in those organizational structures with conduct to/permit a fair evaluation of the employee and also for the government to provide a framework and treatment conditions in this direction, throughout regulations. In respect with this problem on 1th May 2011, it has been introduced some modification to the Labor Code. It has been introduced an obligatory condition that each company has to make evidence on the way it evaluate the performance of each employee based on the specific attribute of the job description. Unfortunate, in many small companies this was only a formal process because for many it was the first time when they have to face such a condition and the

governmental regulation did not stipulate clear criterion in this direction. In my opinion, this legislative process must be sustained by a moral commitment in order to be obtained the expected results.   ListenRead phonetically

WORK ETHICS IN ROMANIAN COMPANIES (II) -
A DESCRIPTIVE AND A NORMATIVE APPROACH

Pup Anca[42]
University of Oradea Faculty of Economical Science

This article has as start point the following question: "Why do we work?" Indentifying at least three different answers, I consider that the attitude throughout work can be shaped based on these issue. At the first level, the value of work is based on the assumption that by work, the human being provides his living existence. On the second level, it is considered that the work supplies opportunities for self-expression, identity, drawing talent and enriching the personality. And on the last level, it is identified a new perspective upon work – as a reconciliation between private interest and public good. At each level, my aim is to present the status quo, but also the possible distresses when the value of work is bounded to one purpose, for example what happens if throughout our activity we are only absorbed to procure the supply basic needs or only to define our identity. If the attitude towards work specific for the first two levels is focused on "the desire to consumption", I consider that at the third level, the ethics governing employees shifted to "desire to production". That means that workforce is not only interested in economic rewards nor the gratification of self fulfillment or professional accomplishment, - aspects relevant on what one can receive- but it is focused on how it can be help full for the organization or for society, being concern upon on what it can offer, making a reconciliation between private interest and public good.

Keywords: work ethics, attitudes throughout work, economical and social reward
JEL: J30, J41, J50,

Introduction

The first article was focused on presenting some ethical issues and problems which encounter the relation firm-employee. But taking knowledge about empirical evidences without seeking benchmarks for ideal conditions, or the desired ones, minimizes the objectives of this research. Therefore, my aim is to drift from the descriptive site to the normative and prescriptive one, from "how it is" to "how should it be" and "how to get there". The presentation of the effects requires an approach to causes. In this respect, I intent to follow up mainly the anthropological and social side of work. This approach will conduct us to a better understanding and analysis of accurate determinations. Starting from the question: "why do we work?", the following responses can be considered relevant:

> *1. by work, the human being provides his living existence;*
> *2. work supplies opportunities for self-expression, identity, drawing talent and enriching the personality;*
> *3. one desire of human being is to find himself useful and needed in the society; this device can be accomplished by his work done with the aim to serve the other.*

In order to analyze the dynamics of the work ethic in Romanian Companies, I will dispose the three answers mentioned above. On this sense, the terms used to illustrate different stages in the work ethic will be: work ethic on the first level (specific to the first response) work ethic on the second and third level. Throughout this demarcation of work ethic on three levels, I do not intend to relativize this concept. On the contrary, I consider that the intrinsic value of work remains the

---

same on each level. This differentiation is based only on methodological reasons, in order to apprehend more explicitly, how the workforce aligns with the value of work, when it is concentrated on one function of work.

Level I – work as a resort for ensuring existence

Based on historical landmarks, which was tangential debate on the first article, I notice that the work has been seen throughout time, as the main resort for ensuring existence. We can recognize that one of the specific purposes of work is to enable man to obtain his basic needs. In this sense, work is valued not for the virtue of work itself, but for what could be purchased with the wages that were provided. Thus work becomes a means to maintain a certain lifestyle. Numerous investigations (Marsh 2010:2, Lancaster, Stillman, 2003, Marston 2007) consider that in the early twentieth century, "doing good" was equated with working hard; happiness was the result of the hard day's work. But nowadays, as Marsh (2010:2) noted: "doing good shifted away from the work being done and was measured by what could be purchased based on the market value of the job".

Those persons, who limit the purpose of work to what they can obtain later, define their existence throughout what they have and not throughout what they are. If the material world, on which they anchor and which gives them an identity, is destroyed, life itself has no purpose. This way of life leads to what Bauman (1998) calls the "aesthetic consumption". Thereby, we understand that the need to work harder, but not necessarily better, is aimed by the desire to have more. So what ought to be a "balanced life" - the division between work and personal life (Pahl 1995:16) - has become a life controlled by the desires and needs. Heschel (2001:193) argues in a convincing manner that "whoever decides to use the realities of life as means to satisfy his own desires that will soon give up his liberty, will decline to the status of a tool, acquiring more things will be enslaved of them".

The work ethic specific to this level can be resumed to what Fukuyama (1998:28) summarized in the following words: the general trend of the working population to wake up every morning and work long hours with physical or mental sacrifices". The underlying motive behind this trend is financial reward. The promise of a win increases the availability of work. We are entitled to take this approach as being rational, because nobody wants to work all life without avail. Therefore, the function of work ethic at this level is simply reduced to solving the money problem.

In this situation, the activity of many employees is not supported by a conscientious behavior, but a social mimicry, having the ability to adapt to various situations to gain certain advantages. In these conditions, a person works especially when he is seen by others when he is monitored by a superior. When he knows that he is no longer supervised, his attitude is radically changed. In the community, he poses his commitment, but in privacy he gives evidence of superficiality, a lack of discipline shown by dispersion or disorganization time work schedule. He is oriented towards achieving immediate benefits, the degree of involvement and identification with the organization is very low, showing instability at work and limited loyalty. When problems occur, he considers himself a victim of circumstances, having no power to take responsibility.

The restrain of work only to the function of purchasing the basic goods, can conduct to a lack of consideration for the work. This aspect leads to a reduction of involvement, lack of discipline, "money are put before professionalism and reward before the work" (Heintz 2005:18-19).

So far, there is one research about work ethic specific to Romanian conducted by Monica Heintz, based on study cases. The study confirms the presence of numerous cases in which labor practices are not necessarily the reflection of some intrinsic values of work, but the result of some external constraints. Similarly, my research confirmed that ethical issues related to work lie on the focus of employee upon immediate benefits and the desire to obtain a higher gain. I also argued that financial pressures, with the two extremes - the compulsion or desire to have more - have the highest impact to promote the implementation of unethical practices. In conclusion, we

believe that the limiting approach to work only at this level, have a much higher willingness to do "acceptable cheating" (Heintz 2005:72), as the main reason is to seek additional sources of income or the need to survive.

Revising some ethnographic sources to analyze how work is appreciated in our country, we concluded that its activity is often presented as being superficial and less profound, only to meet personal needs, some attributes specific for the work ethic at the first level. Our philosopher Emil Cioran (1996:32) considers that the laziness of the Romanian people is proverbial, and Nicolae Iorga (1998:502-503) analyzing some periods from our history appreciates that the Romanians had no interest to work harder, as it was necessary to survive because in this condition, from their work will benefit other occupying imperials. Nistor Popescu (2003:88) synthesizing the negative features of the physiognomy of the Romanian people recalls: work jumps, split, passivity and tendency to start something hard and very easy to give up.

Level II – work as a source for identity and self-expression
The second level of work ethic, is based on the premise that the work is part of our identity "expresses and enriches the personality" (Somerville 1999:42) and illustrates a fundamental dimension of our humanity. Freud (apud. Somerville 1999:43) states that work is has the function to ensure a life balance: "Recognizing the importance of the work, we contribute more than any other technique of life, to closer links between reality and the individual, through work it is indeed in solitary attached to a part of reality: the human community. " Similarly, the economist Ha Joan Chan (2011:106) believes that "we are the result of our work experience, so the place where we work and how we do it affects our identity."

Work enriches and develops self-esteem, giving dignity. Often we are used to identify ourselves by our profession when we say: I am a teacher, a doctor, an economist, etc. Those who barely manage to fit in work field are gripped by "a sense of failure" and the effects may alter the balance in society.

When a person identifies with the work he has done, his degree of involvement is much higher. I consider that work ethic at this level is based primarily on a good effort, supported by a disciplined and responsible behavior. A sign of good work is even offered by the positive way in which the employees talk about their activities. Various researches (Wüstner 2006:136-140) argue that job satisfaction is afforded by the balance between expected results and rewards received.

However there is a specific danger to those who try to make from their work the only way to succeed in life because they identify personal fulfillment with professional success. They seem to live only to work so all activities are subordinated to the construction and/or enhance a career. These issues are materialized in overtime hours at work, neglect of family duties and reducing order free time spent in recreational or social activities.

The research conduct by Eurofound (European Foundation for the Improvement of Living and Working Conditions) presents the main changes over time, on working conditions. Even if the proportion of the workforce with over time activities (over 48 hours per week) in the EU27 fell from 15% in 2000 to 12% in 2010, these studies show that work intensity has increased with a negative impact on the health condition, and nearly a fifth of European workers have difficulty in obtaining a satisfactory balance between work and private life (Eurofound Report 2011:1-6). Karoshi syndrome – which earmarked the situation when an employee dies because of the overtime work, mainly specific to Japanese-, is more pregnant in our work conditions.

These problems are not restricted to managerial positions, but are specific to those who consider naturally to devote all the time, all efforts for their work, or "to hide anxiety in work" (Heintz 2005:10).

The priority given to personal fulfillment through work, as well as the race for maximum productivity, is an encouragement of competition in work. To obtain a position in the social

hierarchy, others have to be overcome. This involves a competitive spirit, something often considered favorable because it favors progress, avoiding hazards routine, laziness, work done improper, leading to increased effectiveness and productivity. But this "limitlessness of work" (Heintz 2005:7) becomes questionable whether the motive is the desire to dominate the others, to show superiority, and the bias to accumulate experience consists only in the desire to have more power.

Competition without reserve can lead to a situation in which the other colleagues are considered rivals, who must be defeated. Bell (1976:49) summarizes the situation by the following statement: "Behind the chiliasm of modern man is the megalomania of self-infinitisation. In consequence, the modern hubris is the refusal to accept limits, the insistence on continually reaching out". Although this description might be considered hard in words, we have to recognize that many of our motivations for a hard work are based on our comparison with the others.

Similarly, Konrad Lorenz (2001:39) considers "man's race against himself" one of the eight deadly sins of civilized humanity, conducting to "blinding greed for money" and "enervating haste." Analyzing the facts, we see that these two concepts are not foreign to current practices. Greed triumphs over prudence (Stiglitz 2010) and exhausting rush drives people to compete, generating the fear of being overtaken in the race, determining an excessive focus on immediate results, a short-term vision. But this fear, not only robs the human being of one of his essential quality - reflection - but it also leads to use various unethical practices. For example, we can mention the concernment of economic agents to sell a product less relevant in a given situation - when the client hasn't all the relevant information – because in this way he will exceed his target, or will achieve a social or financial reward.

This dialectical approach about competition in the labor force leads us to conclude that its effects may be diametrically opposite, with positive or negative impact. Often, the assessment of a competitive environment is limited to favorable aspects, being ignore the negative one. This perspective: that the encouraging of a very strong competition can facilitate unethical practices is neglected by many managers. Lorenz (2001:39) sustains that "under the pressure of interhuman competition all that is good and useful for humanity as a whole as well as for the individual human being, has been completely set aside."

Based on the presupposition that the large companies offer more opportunities for achieving the highest professional level, and therefore favorite a climate for a strong competition, my research looked for a correlation between strong competition and unethical practices. 850 managers from different companies in Romania were asked to select three causes for unethical practices from a list of eight causes. One of this was the "strong competition". The table below summarizes the obtained results:

Table nr.1 *Perception of a "strong competition" as a cause for unethical practices correlated with company size*

Companies:	1-9 employees	10-49 employees	49-249 employees	Over 250 employees	Results from the sample
Relativ value for "strong competition" as the main cause for unethical behavior	9 %	11,5 %	15,3%	30,8 %	11,0 %

Hierarchical position held by "strong competition" from a eight scale ranking	8	8	7-8	4	8

Source: Data obtained by the author in the research project: Business ethics and competitiveness in Romania, financed in the doctoral program „Cercetători români competitivi prin programe doctorale moderne şi eficiente, Programul operaţional Sectorial Dezvolarea Resurselor Umane 2007 – 2013,"

Analyzing these results, it is obvious that managers who mange companies with a few employees, do not see the strong competition as a key factor of unethical practices. These issues are due to the fact that the desire for professional achievement is not so broad in these companies. It is important to mention that as far as the number of employees increases, the strong competition tends to be one of the main causes of unethical behavior, reaching from the last position, in fourth place. These results reinforce the above statements: that limiting the value of work to desire of self-assertion, can lead to negative consequences.

Level III – work as a reconciliation between private interest and public good
In order to illustrate how I understand the work ethic specific to the third level or how work should be subordinated to the goal of being useful to society, I will take as a starting point J.J.Rousseau's social contract theory undergone by the allegory of deer hunting. If a deer was to be taken, all hunters saw that, in order to succeed, they must abide faithfully by their post: but if a hare happened to come within the reach of any one of them, it is not to be doubted that he pursued it without scruple, and, having seized his prey, cared very little, if by so doing he caused his companions to miss theirs (Rousseau, 1973 86-7). The key feature in Rousseau's example seems to be that the participants are not committed to each other in any way. Those who too readily chase a passing rabbit will find themselves not invited to future stag hunts. Hence those with the self-discipline to accept a short-term loss for the sake of a longer-term gain will be rewarded. If everyone went their separate ways, they would achieve modest benefits. However, with the continued co-operation of others, they can each do better. A surplus is possible, compared to independent action.

Some attributes and conclusion upon the work ethics
Taking in account the specific attributes to work ethics at each level, it is obvious that work ethics at the third level offers a greater consideration to the human being as a workforce. Some key-features of the work ethic at this level might be:

-Employee retains the freedom of conscience and their own reasoning, being accountable for the way in which this freedom to carry out his duties (Young 2009:187);

-The development of a psychological comfort is achieved through work discipline, responsibility, respect for work performed by others. Often the pursuit of debt is hindered by dependence on the results of work produced by another employee. Starting meetings tardily, the lack of punctuality, may lead to personal offending, while punctuality avoids loosing the time and energy resulting from expectations and the achievement of maximum efficiency.

-A proper time administration. More likely when we exercise our activities we are based on the concept of Benjamin Franklin that "time is money" as it is reflected in Max Weber's work (1998:45). The logic of capitalism leads to the conclusion that time is "expensive". In this way, time management is "a reflection of the desire for power: to possess metaphysical uncertainty, to master the own time and others' (Heintz 2005:137). These issues can lead to an intensification of the work, so far that the workforce is no long considered an aim but a mean for some targets, being affecting the principle of

human dignity. A proper time management is not limited to the situation of performing a task in a record time, but it is specific to a correct report on duties.

-The employment seeks to avoid any conduct or unproductive competence conflict between departments or within their relationships with managers. It is not denigrated the image of other colleagues, gossip is refused, maintaining loyalty to the absent ones;

-The workforce is truly concerned about the quality of products and services offered by the company, being not concern on immediate benefits;

- The employees are involved in various voluntary activities or community service. Recent research conduct by European Foundation for the Improvement of Living and Working (2011) shows that Romania has a relatively low level of volunteering along with Belgium, Cyprus, Czech Republic, Ireland, Malta, Poland, Portugal, Slovakia, Slovenia and Spain. Only 10-19% of adults have attended a volunteer activity in 2010, while in countries like Austria, Netherlands, Sweden and the UK the rate goes up to 40%.

-Workforce demonstrates loyalty to the organization in which they operate. In times of economic difficulties, they remain committed to the company being aware of the social impact of its abolition. This kind of relationship is built on mutual commitment for both parties. A proper example in this sense is supplied by Malden Mills Company. In December 1995, the company was destroyed in a fire. After this event, the owner Aaron Feuerstein continued to pay his 3000 employees their full salary for the next six month while the factory was been repaired.

Work ethic at this level is not based on various psychological and social interventions. In this sense, the employee is not designed to work only under certain incentives but based on ethical commitment, endorsed by both sides. No part looks at its own advantages, but a reciprocal account, based on the win-win position; it is what in Levinas words means *concern for the Other*. A company which these specific attributes, succeed to induce loyalty to the employees on the basis of what it offers. Its declared values are sustained by facts and there is no discrepancy between them. Specific to this situation is the harvest principle: *one will reap what he is sowing*.

Finally, to synthesize the approach to the work on three levels, we present a well-known parable of three builders, who were making the same activity. Being asked one by one what they are doing, each gave a different answer, according to the perspective they had about the value of work. The first said that he is "carving in stone", the second one considered that he builds up and the third one said that he is "building a cathedral for the benefit of the people and to the glory of God."

RURAL DEVELOPMENT, TOURISM BUSINESSES IN VADU AND CORBU'S MUNICIPALITIES

Safta Dan
The Academy of Economic Studies, Bucharest
Faculty of Management

The main purpose of this article is to present the transformation needed by a seaside rural area in an internationally competitive tourism. Vadu and Corbu areas are rural municipalities which want to develop and convert into a new city: Orion City. Therefore, Vadu and Corbu's municipalities want to become a cluster region within the tourism industries and hence turn into a resort municipality where tourists can live and run their businesses as well as providing for tourism activities. The reason why it is interesting to create a cluster region is because it comes with benefits for the companies and it helps developing the regional economy, since clusters' lower barriers in a new business formation are the ones which improve the environment for productivity. One investment that needs to be made in the direction of becoming a great resort municipality is the start up of an Advanced Rural Tourism Vocational Education in the region, named Orion Entrepreneur.
It should start with only 20 students in this programme, skilled ones, which should all want to start up own businesses within 10 years, and maybe some of them even plan to establish their companies in Orion City.
Also, the two municipality councils should invest in attractions to capture tourism companies.
However a trend can be estimated from the very beginning. The districts where most of the tourism businesses in Romania take place are rural areas close to populated regions, so called semi-urban areas. Or, there are no cities in Corbu and Vadu's municipality only one bigger town, Constanta. These makes us believe that, if the two rural areas want to become tourism municipalities they must invest, for example creating job opportunities and new residential areas. Therefore, the idea that I would like to promote would be to build a Las Vegas as a city of Romania, a city that would become internationally recognized as a 5-star holiday city, with hotels and rest facilities, shops and famous casinos, access to the delta, the Black Sea coast and to the historical sites for the passionate, but also access to spa treatments.
These investments are needed to attract inhabitants and business people to their municipalities before the tourism companies can flourish. Investments make this type of clusters attractive.

Keywords: cluster, tourism, rural, investments, entrepreneur.
JEL L26; L83

I. Introduction

The rural tourism related industries are clearly growing in Romania and in the European Union. The rural tourism industries come with many job opportunities which have economic benefits (Erlandsson, 2009). Furthermore, there is a demand for cluster regions within tourism industries because clusters develop businesses, build up the rural areas and creates a regional growth (Guinet, 1996; Porter, 2000). There has been a structural change within the rural tourism industries. Historically rural areas were used for agriculture and farming. Nowadays rural areas are starting to be used for leisure time and for sports. There is a connection between people getting more leisure time and the growing rural tourism industries.

Corbu and Vadu's municipalities want to seize the opportunity of these growing industries. The hobby establishments are a large part of these industries, but there is a need for professional tourism businesses to make the rural tourism more solid. Therefore Corbu and Vadu want to create a cluster region and become a rural tourism municipality where tourists can live and run

their businesses as well as providing for sports activities. The first investment in this respect needs to be the Advanced Rural Tourism Vocational Education in their region, named Orion Entrepreneur. One specification needs to be made: the enrollment needs to take place on a national level and to have high entry criteria.

The purpose of this paper is to identify a general outlook about what it can be made to see if the municipality is suitable for transforming from a rural territory into a tourism resort or not. This paper is therefore based on interviews with municipal authorities about their business ideas, and what they think of the future of the municipality and the future of the education. This study aims to answer the following questions:

- Are Vadu and Corbu suitable municipalities for tourism companies and being a cluster region within tourism industries?
- What is missing in Vadu and Corbu area?
- What future investments should the municipality council make?

To be able to answer these questions, interviews have been conducted with several local authorities, local business counselors and entrepreneurs in the area. The reason why local business counselors were encouraged to participate was to eliminate skewness and to receive everybody's opinions. Several interviews took place on the telephone and two have been face to face. The interviews were conducted in Romanian, and parts of the interviews were translated into English, by the author, for quoting purposes. The interviewed persons could choose to be anonymous.

The delimitation on the qualitative part of the report is what arising companies thereof will have on the municipality.

This study begins with an explanation of the theoretical framework including the theory of market demand for cluster regions and the definition of cluster theory and the effects of it. Further on, excerpts of the interviews and quotations were analyzed. The subsequent part presents the qualitative analyze which determines the future outlook for each municipality based on the interviews. The study ends with conclusions.

II. Literature review

This part will examine the theory of clusters and market demand of cluster regions. Porter, Giarratani, Hoover, Nelson, Lundvall, Karlsson, Blien, Enright, and Ohlin are well known researchers who have elaborated much in the field of cluster theory. The empirical study for this article is based upon a cluster analysis derived by Brakman, Garretsen, and van Marrewijk (2001). The analysis investigates the industry agglomeration (y) through geographical and industry concentrations (G and Herfindahl Index (H) respectively).

The theory of market demand is partly derived from the acknowledged microeconomist Varian's book Intermediate Microeconomics, A Modern Approach (2005). Varian (2005) describes market demand as the aggregated demand of all consumers in a market. One part of market demand, which is important for this article, is the market demand for cluster regions.

2.1. Market demand for cluster regions

Why is it interesting to create a cluster region? There appear to be two types of clusters, company clusters and geographical clusters. Company clusters indicate a close relationship with partner companies and organisations, which does not necessarily be within a region. Geographical clusters on the other hand imply that companies interact with each other locally. However, both cluster types are signified by innovations, networks, information flow and labour skill. These effects are valuable for the regions where the companies are located in both cases.

These two cluster types can further be divided into two categories (Porter, 1990). These two are vertical and horizontal clusters. Vertical clusters imply that a whole product chain is present in one region or that the whole product chain has close interactions (no matter where they take

action). Horizontal clusters imply that companies have common costumers, share same technology, uses same channels, etc. A cluster economy is defined as a region where a specific industry has increased to over its normal value (Blien & Maier, 2008). "They [Clusters] are present in large and small economies, in rural and urban areas, and at several geographic levels (for example nations, states, metropolitan regions and cities)." (Porter, 1998b). According to Porter (2000) a cluster economy comes with benefits. Cluster regions, for example, decrease the risks of transport delays and also prevent hidden costs. Cluster regions contribute with increased innovation and knowledge. Even if companies are rivals there will be information spillovers through informal interactions and contacts due to "people talk". This happens mainly between companies in the same region. In Porters' major work, *The competitive Advantage of Nations,* (1990) he states the negative effects of cluster economies. High labour costs due to attractive labour force are one drawback. Further there must be a local demand for quality for companies to develop their products and thus increase their global competitive edge. If this local demand lacks, Porter thinks businesses will lose innovation efforts. Blien (2008) said that knowledge leakage, industry spying and poaching of experts (into the cluster from elsewhere) are some of the negative effects. Martin and Sunley (2003) affirmed that cluster policy has become a trend and is seen as a solution for economic problems, but many decision makers rush into applying cluster policy, the decision makers should be more cautious, they said. Martin and Sunley (2003) further stated that not even researchers have agreed upon the definition of clusters, so there is concept confusion.

According to Brakman, Garretsen, & van Marrewijk (2001:189) "a major drawback of urban agglomeration is to be found in congestion, which can arise in many different ways, such as limited physical space, limited local resources (such as water for cooling processes), environmental pollution (which may require extra investment), and heavy usage of roads, communication channels, and storage facilities".

Clusters can arise either from policy interventions and thus be a transplant cluster, or it can arise from nature, and thus be called an organic cluster (Enright, 1998). A combination of the two is also possible, called hybrid cluster (Enright, 1998). "Transplant strategies can help develop a regional economy rather quickly, but are limited to the investments available for attraction, are subject to imitation and destructive competition, and face the risk that poorly embedded facilities will eventually close." (Enright, 1998).

Local suppliers, customers and society demand for cluster economies. Ohlin (1933) declared that local suppliers and customers will interact where there is specialized labour skills and diversification in order to become economies of scale. Clusters are dependent on labour force and to create a geographical cluster the industrial politicians need to provide attractive opportunities locally with the aim of attracting labour force. With the demand of local economic growth in society, R&D and educational institutions are used to develop the innovation systems (Lundvall, 1992; Nelson, 1993). With increased innovation businesses will utilise their resources in a more efficient way, and hence become more competitive. The most innovative companies are the ones with strongest cooperation globally.

Dissimilar companies or industries located in clusters have also shown economic benefits when interacting. No matter the size of the business, if they are service or goods businesses, or if they are high or low tech, they can still benefit from interacting.

Giarratani and Hoover (1971) stress the importance of clusters to attract customers. For example, high fashion shops are often seen in shopping centres or agglomerated shopping districts. This idea is based on bringing similar products to one place to facilitate customers' decisions.

But, even though the information technology improves steadily, the personal contact between people is still very important when it comes to complicated matters. Therefore geographical closeness is seen as an advantage and lays the foundation for innovation and knowledge.

Clusters increase productivity in terms of outsourcing or vertical integration through improving access to specialized inputs and information, facilitating complementarities among cluster participants, and improving incentives and performance measurement. More important, in many cases, is the role of clusters in improving the rate and success of innovation. Finally, clusters lower barriers to new business formation that improve the environment for productivity. While traditional agglomeration economies are centered on cost minimization, cluster advantages rest on information, transactions costs, complementarities, and incentives as well as "public" goods that result from both public and private investments.

III. Methodology
3.1. *Research design*
Since the research is qualitative, it is clear that it focuses on the studied municipalities, in our case Vadu and Corbu. The study does not proceed from a hypothesis but it is let free to emerge (De Vos et al., 2002). In this type of study, the questions can be modified and the advantage is that the conclusions can be draw directly from the answers. The study is exploratory and it tries to find out which are the necessary tools and techniques in order to guarantee successful rural tourism development.

3.2 *Preliminary Study*
According to De Vos et al. (2002) in a qualitative research, the preliminary study is meant to test and thus conduct to modifications both in the interview plan and in the nature of question in order to improve the investigation.

Also, this preliminary research: asses the non-structured interview, estimates the necessary time during the non-structured interviews, predicts problems which may take place while applying the non-structured interviews and decides on the respondents who will be part of the target group at which the non-structured interviews should be applied to.

The methodology of the preliminary study consisted of several stages. First, the approach of municipalities' involved authorities and entrepreneurs. Second, after making a list with these names and speaking to them, obviously that the researcher introduced to these persons the research goals and inquired them if they would desire to participate in the preliminary study. Ten respondents who were part of the public management team of each municipality accepted to participate in the preliminary study and further on were arranged interviews. Also 10 entrepreneurs accepted the interview. Their names will not be told for confidence reasons. Respondents were offered Appendix A in electronic format. Further on, the study was conducted through a survey where personal interviews were held. The discussion at these interviews was focused on rural tourism development in general and Appendix A.

The conclusions of the preliminary study are presented in the next sections.

3.3. *Sample Framework*
In the hereby research will be used two types of sampling techniques in order to establish the sample framework. Using sample gives you a higher accuracy than a census (Saunders, 2012). Firstly it is judgmental sampling, which implies that sample elements have things in common, in the present case: rural tourism development. The preliminary study was used to identify sample elements with similar features. In our case, the common feature is that both municipality authorities and entrepreneurs claim that they want to make strategic planning for rural tourism development in Vadu and Corbu area.

The major benefit of the sample method used before is the fact that respondents offered to the researcher the contact details needed in order that the most important municipalities public managers, strategy implementation managers and entrepreneurs can be contacted and

interviewed. Five persons from each municipality were chosen and 5 entrepreneurs, a total amount of 15 persons.

IV. Results

In this part, the answers from the interviews are qualitatively analyzed. The analysis is drawn upon how the local authorities and entrepreneurs themselves expect their future to be, as well as how they believe that the municipalities' future will be.

What Strengthens the Tourisme Businesses in Corbu and Vadu area?

A city in full construction, where the extravagant luxury and the opulence surround everyone. I propose therefore to build Orion City, a city that never sleeps a spectacular city full of unexpected energy.

The city would focus on tourism, especially if we consider the area's history, geographical position and traditions.

Therefore, it will be necessary to set up casinos with a range of facilities. Thus, there is a need to restaurants and shops, and local authorities and entrepreneurs proposed even small miniature imitation of the world's major tourist attractions, such as the Eiffel Tower, the Pyramids of Egypt, Hanging Gardens, etc., which will create an interesting atmosphere by locating them geographically together.

In addition to the casino games, other things would be more interesting in the casinos. There will be large palaces that will exceed all imagination. In this regard, it is necessary when selecting projects to be held, to be chosen the most daring, extravagant and, why not, the more difficult to achieve. Each casino will have a special theme. Thus, for example there may be a casino called Luxor, which must have the shape of a pyramid with a Sphinx at its' entrance. Obviously, the casino will be built in the Egyptian style, full of statues.

Another casino could be built in the form of Taj Mahal, this bringing tourist into the Oriental world, close to Buddha and Tagore, etc. Of course, all this luxury should be dazzling; everything should be perfect, so that no one can resist without playing a sum as small.

Orion City is intended to become the shopping capital of Europe, will be a real paradise for shopping lovers from around the world, which can loiter for days in the modern malls with large stores, fashion houses and also in the traditional bazaars, where bargaining should be on the agenda.

Besides this, Orion City would provide other attractions that tourists would not expect: horse racing, hot beaches, archaeological sites, water park sites rarely seen in other cities of the world, golf courses and much sun. Yacht sightseeing cruises and scuba diving, characteristically for a city on the Black Sea coast would be among the highlights. With all this, Orion City would offer unique attractions.

The Romanian state will be the one that will ensure all city utilities and also the building of a football stadium within a public-private partnership, where sport competitions and shows would take place, a stadium with a capacity of about 100,000 spectators, therefore higher than New Camp stadium in Barcelona.

There will also be build Olympic competition pools, tennis courts, volleyball, basketball and the largest amusement park in the world with a capacity exceeding 5 mil. Pers. / year.

In conclusion, the tourist attractions of the new city will be varied, for all tastes, given that the city has natural resources that were not recovered at all so far.

Given all the above, we can provide the Orion City motto as: "Orion City - gateway to absolute luxury".

Both entrepreneurs and the municipality council share the view that when tourism companies will establish in Corbu and Vadu area, they will trigger further establishments of other companies in the area. Increasing the number of hotels, events and activities would spread the news of Corbu

and Vadu area being a developing rural tourism municipality. Tourism development attracts retail stores and service companies.

V. Conclusions

As written in Giarratani and Hoover (1971), they emphasise that cluster regions attract labour force. The reason why it is interesting to create a cluster region is because it comes with benefits for the companies and it helps developing the regional economy (Enright, 1998; Porter, 2000). "Clusters lower barriers to new business formation that improve the environment for productivity." (Porter, 1998a). Also Ohlin (1933) proclaimed that clusters develop rural areas. Vadu and Corbu area are rural municipalities; therefore it is understandable why they would benefit to attract entrepreneurs to their municipality.

Finally it must be said that model-building and development plan of Orion City will be implemented and achieved only if all social actors, at all levels, regional, national or international, will be integrated and only if they will implement the innovative ideas, actions and objectives already stated. It's in the power of governors and of the future Orion City mayor to satisfy the conditions necessary to achieve those objectives. Only through a unified thinking about the objectives that must be followed will be created the necessary prerequisites to ensure the occurrence of a strong impact in achieving a harmonious and sustainable project as the one presented.

The development phase of this project involves examining all complex issues specific to various forms of land ownership.

Also, the Romanian seaside will be unable to compete as long as entrepreneurs in the area will not apply sustainable strategies, aimed at creating quality tourism products which meet the requirements of tourists. This must stop pursuing further high profits by charging extremely high prices not reflected in the actual quality of the services and products marketed.

VII. Appendix A

Dear participant,

By answering the following questionnaire we would like to find out your opinion on tools and strategies which can be used in order to transform the Vadu-Corbu area in a resort city. Therefore, your contribution is considered very important for the successful completion of this study. Your answers will be treated with strict confidentiality.

Thank you in advance for your time and effort.

Kind Regards,
Safta Dan (PhD. In Management)

The Interview Questions
Section 1: Introductory Questions
Gender
□ Male □ Female

Age
□ 18-29 □ 30-39 □ 40-49 □ 50-59 □ +60

Educational background
□ High School □ University □ Postgraduate (MSc) □ Doctoral (PhD)

Marital Status
□ Married □ Single □ Divorced

Department You Work In
□ Management □ Marketing □ IT □ HR □ Production □ Other

Work experience at present job
□ <1 year □ 1-3 years □ 3-5 years □ 5-10 years □ >10

Section 2: Entrepreneur's Questions:
What was your first motivation to start up a business? Which are your best qualities as an entrepreneur?
-        Which qualities would you like to have?

What is your best advice to success in your industry branch?
How has the education influenced you as an entrepreneur?

Section 3: Business/ Local authorities' questions:
What is your opinion about Vadu and Corbu as a municipality?
Does everything you need for your business exist in Vadu and Corbu area?
-        What is missing?
Could you imagine Vadu and Corbu area after investments are made?
What makes Vadu and Corbu area interesting for you?
How can be financed this start up process?
Would it be profitable for people from Vadu and Corbu area?

Section 4: Both Entrepreneur and Business/ Local authorities' questions:
Please shortly describe your business idea.
-        What makes it special? How did you come up with it?
-        For how long have the idea existed in your mind? How has your idea changed during the education period?
-        What has the education contributed with? How can you materialise your idea?

STRATEGIC APPROACHES OF INTERNATIONAL HOTEL CHAINS TO ENTER ON THE ROMANIAN MARKET

Smaranda Cosma
Universitatea Babeş-Bolyai, Cluj-Napoca
Facultatea de Business

Cristina Fleşeriu
Universitatea Babeş-Bolyai, Cluj-Napoca
Facultatea de Business

On the Romanian market 23,9% of all accommodation structures are hotels. Among these 4% are belonging to international hotel chains which is a very small percentage. Almost all international hotel chains realized the potential of the market and that is why they intend to increase the number of hotels opened in Romania. Hotel chains attempt to control and dominate the market as result of an extremely dynamic and complex environment. The decision made by a hotel company to carry out its activity in a foreign country and the way to enter into the market can be motivated by many reasons. The paper analysis the presence of international hotel chains on the Romanian hospitality market and the strategies used to enter on the Romanian market compared with the global strategies. The paper used the comparison method to highlight different entry strategies used by international hotel chains when entering a foreign market. For data collection, the main method used was the observation of annual statistical reports with the support of international hotel chains. The first international hotel chain that came in Romania was InterContinental in 1971, but the majority entered on the Romanian market after 2000. In 2012 other chains announced the intension to penetrate this market. The study identifies strategies for penetrating the Romanian market by international hotel chains. The preferred penetration strategy on the Romanian market is management contract followed by franchise. Not least are highlighted comparative aspects of internationalization decisions taken by the chains in the world and in Romania, analyzing whether in Romania are predominantly used the same strategy as in most other countries or some specific strategies. International hotel companies want to entre on the Romanian market because they consider that in this area is need for hotels which belong to the luxury segment but also hotels that belong to the economy segment.
Keywords: hotel chain, penetration strategies, Romania hotel market
JEL Codes: L83

I. Introduction

According to the statistical data provided by the National Institute of Statistics, in 2010 was a total of 1246 hotels on the Romanian market; that means 23,9% of all accommodation structures from Romania. (Romanian Tourism. Statistical Abstract., 2011:21)

Among these, there are currently 48 hotels belonging to international hotel chains. At this moment, there are 18 international hotel chains on the Romanian market, namely: Golden Tulip, Best Western, Danubius Hotels, Hunguest Hotels, Ramada, Pullman, Novotel, Ibis, Howard Johnson, Radisson Blu, K+K Hotels, Hilton, DoubleTree by Hilton, JW Marriott, Crowne Plaza, Intercontinental, Starlight Suite Hotels and NH Hotels.

II. The presence of international hotel chains on the Romanian hospitality market

In 2010 were 1246 hotels on the Romanian market. From those 48 belong to international hotel chains, representing just 4% form all hotels that are present on the Romanian market. The rest, 96% are Romanian hotels (Fig. nr. 1).
Fig. nr. 1: The presence of international hotel chains on the Romanian hotel market
Source: made by authors

Even, at this moment, the presence of international hotel chains on the Romanian market is very low. Almost all international hotel chains realized the potential of the market and that is why they have the following strategy: increasing the number of hotels that are in this country by opening hotels also in the province. Also, they want to penetrate the Romanian market with other brands that belong to the same international hotel group.

III. The international hotel chain evolution on the Romanian market

To understand the situation, is very important to analyze which was the international hotel chain evolution on the Romanian market. Table nr. 1 shows the penetration years used by the international hotel chains to get on the Romanian market. The first international hotel chain that came in Romania was InterContinental, in 1971, followed by the chains Hilton, Best Western and Crowne Plaza.

Table nr.1: The years used by the international hotel chains to penetrate the Romanian market

Hotel chain	The penetration year on the Romanian market
Intercontinental	1971
Hilton	1996
Best Western	1997
Crowne Plaza	1998
JW Marriott	2000
Danubius Hotels	2001
Ibis	2001
Hunguest Hotels	2002
Howard Johnson	2004
NH Hoteles	2005
Golden Tulip	2005
Ramada	2005
Novotel	2006
K+K Hotels	2006
Radisson Blu	2008
Pullman	2009 (from 1994 Sofitel)
Starlight Suiten Hotels	2009
DoubleTree	2011
Hampton	Starting 2012

The other international hotel chains entered on the Romanian market after 2000. It can be seen, that those chains came on this market, step by step, almost each year had a new entrance. Also, in 2010, no international hotel chain entered on the Romanian market. But 2011 brings another opportunity for other hotel brands or the old international chain development. In 2012 other chains announced the intension to penetrate this market.

Strategies used in Romania based on the number of hotel chains present on the Romanian market

The strategies used by international hotel chains are different. The hotel chain takes into account the specific of each hotel chain, but also the advantages taken into consideration when a chain wants to penetrate a foreign market.

From all 18 hotel chains, which are on the Romanian market the most part of them are using the same penetration strategy for all the hotels. Exceptions are Hilton Hotel (is using franchise and management contract) and NH Hotels (uses management contract and leased contract). Fig. nr. 2 shows the strategies used by international hotel chains, which are present on the Romanian market.
Fig. nr. 2: Strategies used by international hotel chains, which are present on the Romanian market (% number of international hotel chains)
Source: made by authors

The international chain strategies used in Romania, compared with the global strategies

The most part of international hotel chains are using also in Romania the predominant strategies. From 18 international hotel chains, which are present on the Romanian market, twelve are using in Romania the same predominant strategy of the chain and six chains are using a different strategy (Table nr. 2).

Table nr. 2: The use of predominant strategy also in Romania

	Predominant strategy into the world	*Strategy used in Romania*
Golden Tulip	Franchise	Franchise
Best Western	Franchise	Franchise
Ramada	Franchise	Franchise
Howard Johnson	Franchise	Franchise
Radisson Blu	Management contract	Management contract
Pullman	Management contract	Management contract
Novotel	Leased contract	FDI
Ibis	Leased contract	Management contract
Hilton	Franchise	Management contract/Franchise
DoubleTree by Hilton	Franchise	Management contract
JW Marriott	Management contract	Management contract
Crownw Plaza	Franchise	Management contract
Intercontinental	Management contract	Management contract
Danubius Hotels	FDI	FDI
NH Hoteles	Leased contract	Leased contract/ Management contract
K+K Hotels	FDI	FDI
Hunguest Hotels	FDI	Franchise
Starlight Suiten Hotel	Management contract	Leased contract

Source: made by authors

IV. Conclusions

Even at this moment, in Romania, the number of international hotel chains is not significantly; but this situation will be changed in the future. International companies want to entre on the Romanian market because they think that in this area is need for hotels which belong to the luxury segment but also hotels that belong to the economy segment. On the Romanian market, are expected also other hotel companies: Kempinsky, Hyatt, Four Seasons, Sheraton or Leading Hotels of the World, trough private properties but also affiliations, franchise or management contract.

The most important challenges, that the hoteliers must consider, are the high costs to construct the property, the growing costs with workforce and utilities and the unpredictable costs for land acquisition. Also, a big opportunity, that the new international hotel chains have to enter on the market, is the lack of quality services into the secondary cities from this country.

Romania becomes an interesting country for the big international hotel chains, given by the fact that many companies have relocated there production here. This thing is very good and important for the Romanian tourism, because the international hotel chains that are already on this market and those that are not yet in Romania, will want to invest in this country, in the capital but also in the province.

DEVELOPMENT POSSIBILITIES OF THE HUNGARIAN-UKRAINIAN BORDERLAND IN THE MIRROR OF GLOBALISATION

Szabolcs Pasztor

University of Debrecen Faculty of Economics and Business Administration Department of World Economy and International Relations

Abstract

Thanks to the all pervasive globalisation trends previous state borders have become more permeable and subject to change. Regional integrations – like the European Union – spur this process and helps the integration of borderland inside and outside of the common market. This paper focuses on of one the most peripheral external borderland of the Schengen zone: the Hungarian-Ukrainian borderland. After taking into consideration the relevant economic theory it tries to give empirical evidence in connection with development possibilities and more increased economic interactions.

Keywords: globalisation, spatial impact, borderlands, Hungary-Ukraine

JEL Codes: F22, J61, R12

1. Introduction

Among the tremendous globalisation trends, the disappearance of borders, continuous change of borderlands have become a new tendency in the world and in the European Union (EU) as well (Ohmae 1995: 15). The EU is by far the best case because after the 2004 and 2007 enlargement rounds the length of state borders is 26,160 km and the total number of borders is 62. Currently the european integration borders with 16 new countries where almost 400 million people live (Kallioras et al. 2009: 7).

Taking into consideration the previous trends, we could expect that the EU remains such an integration where the removal of artifical borders launches different tendencies (Hanson 1996: 945, 1998: 12). Unfortunately, the Europe without borders concept envisoned by O'Dowd and Wilson is still to be reached in Central and Eastern Europe (CEE) where state borders still divide the previously coherent economic space. In this way borders still play an important role in the economic processes. An average border region is far from the core area and the border narrows the cross-border interactions. No wonder that there the regions show a below-average development level in the national context (Petrakos and Topaloglou, 2008: 150).

Consequently, approaching the macro and micro impact of european integration of borderlands is vitally important.

In this paper first I try to shed light on the question from a theoretical point of view and than I focus on empirical approaches. Later I describe my own research and intend to draw some conclusions. The main focus of my research is on the Hungarian-Ukrainian border where the more intensive economic relations could serve as a huge impetus for economic integration and growth.

2. Theoretical Framework – Implications of Economic Theories

Under the title of theoretical framework I try to approach the different borderland implications of traditional location theory, trade theory and new economic geography (NEG). First I would like to point to the fact that *borders and borderlands are not exactly in the main focus of these theories because countries and different spatial unites are treated as single points with no extension.*

As for the *traditional location theory*, consumers and producers are mobile and they show perfect distribution in space. Firms seeking economies of scale, in this way locate at such places where the total demand can be best served. According to Lösch's theory the market potential of central areas can be described as a circle or as a hexagon. However, a state *border means multiple hindrances*. The total market potential is disturbed so with the appearance of borders the economic area is largely affected (Rechnitzer 1999: 24; Niebuhr and Stiller 2002: 5). This is confirmed in the border literature in many ways (Nijkamp et al. 1990: 242; Paasi 1996: 74). As a consequence *borderlands are not favourable for firms and they try to avoid it.* Lösch (1944/1945: 37) calls these places deserts where consumption is largely restricted by the low availability of goods. *When borders are lifted* borderlands can have a much larger market potential. However just those *economically integrated spatial unites can benefit from these tendencies which have good access to foreign markets.* According to Giersch (1949/1950: 92) these places are the centrally located borderlands in the core of the European Community. This is confirmed by Topaloglou et al. (2005: 70) when *they point to the fact that peripheries are not always able to benefit from the favourable trends.*

For many decades the factor of space was left out of the concept of *trade theory* and even today this aspect is far from fully answered. In addition the *international trade models treat nations as a dimensionless point so they are unable to describe the special effects of integration.* However, one thing is definitely true, integration fostered by the disappearance of trade barriers leads to increased trade relations (Niebuhr and Stiller 2002: 12). Rauch (1991: 1238) creates such a modell which contains space caracter. According to his conclusions the geographic location is important in case of the regional adjustment to the international trade. He claims that *borderlands could have a geographic advantage in attracting export-oriented firms since they are located closer to the largest export markets.* However, the potential market is small or poorish, location becomes less important. As for the limited conclusions of the trade theory the followings can be mentioned. *Proximity to foreign markets can be a huge advantage so those regions which reach foreign markets with lower costs can be natural production zones* (Hanson 1996: 944).

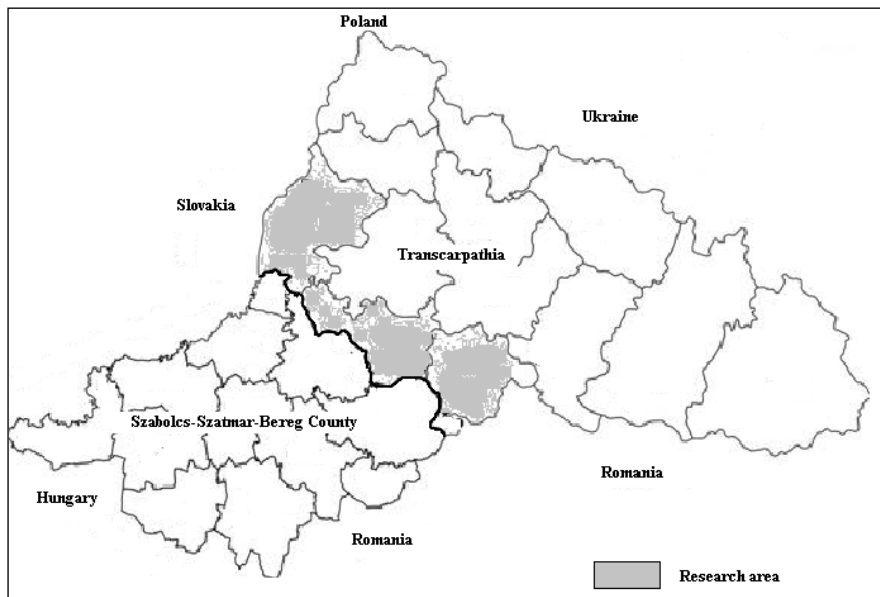
In 1991 Paul Krugman created the *new economic geography theory (NEG)* in which the spatial distribution of economic activity is in the center of the attention. Regional differences are totally answered by endogeneous localisation decisions. According to this theory the *centripetal and centrifugal forces* and their *balance* are determining. Centripetal forces help the concentration of economic activities while centrifugal forces do the opposite: foster the dispersion of economic activities. A large number of studies confirm the fact that integration largely affect the allocation of economic activity (Ludema and Wooton 1999: 220; Elizondo and Krugman 1996: 141; Fujita et al. 1999: 118). When taking into consideration different studies *one conclusion is always clear: centrally located regions enjoy significant geographic advantage in an economic integration.* To confirm this Henderson and Thisse (2004: 137) points to the fact that the largest 38 cities of the EU represented 0.6% of the total territory giving 25 per cent of the population and creating almost 30 per cent of the GDP. In this way it is obvious that previously the core regions were the main beneficaries of integration and this trend is likely to continue. However, new economic centres can also be created *(*Fujita and Mori 1996: 101). Taking everything into account, the NEG modell is also far from outlining the exact future of borderlands. *Concentration of economic activity is very likely in core regions but to a certain extent peripheries can also benefit from the borderless space.*

As a final consequence, I have to point to the fact that the *economic theory is not able to outline a clear-cut picture for the development possibilities of border regions* so an empirical analysis is definitely needed to understand the cross-border dynamics.

3. Empirical Approaches

To describe the spatial effects of integration many methodological approaches are in use. Topaloglou et al. (2005: 82) uses factor and cluster analysis focusing on the most important character of regions. Multi-variable regression modells are also able to give important conclusions (Buettner and Rinke 2007: 538). Regression analysis can also be an important starting point when conducting research (Niebuhr 2004: 152). Gravitation-based approaches are also common and a lot of studies focus on the simulation of the positive effects stemming from the disappearing borders. However, there are many bottlenecks when modelling the integration processes in CEE. Settlement-level data are not always available and up-to-date. This is the case in the Hungarian-Ukrainian borderland as well, and this fact directs the researcher to a questionnaire-based empirical research. This method is also popular in the literature and in some cases this is the only option to measure the possible effects of integration (Baranyi 2001: 15; Baranyi 2008: 22; Zillmer 2005: 8).

4. A Case Study: The Hungarian-Ukrainian Borderland

The Hungarian-Ukrainian borderland is 136,7 km long and currently belongs to the external Schengen border (Map 1.). There are 5 border crossings but the permeability of borders is restricted and the general cross-border interactions are low. In my research I take into consideration a 25 km long area at both sides of the border and now in this paper I focus on those micro regions in Ukraine which directly borders with Hungary. Transcarpathia – as the macro regions is called – is a peripheral but a developing spatial unit in Ukraine. No wonder that expectations are running high in connection with more intensive cross-border relations.


Map 1.: The Research Area of the Study
Source: Made by the author

5. Results

Thanks to a questionnaire-based survey, data have been collected from 6 micro regions from the Ukrainian side. These micro regions directly borders with the Hungarian-Ukrainian border. 50

settlements provided data and the questionnaire contained 23 questions and finally I have 432 number of cases.

I do not want to surpass the limits of the paper so I focus just the most important conclusions. The frequency of border crossings is quite low: more than 60 per cent travels 3 times or even less to Hungary. Behind the reasons financial factors must be mentioned. For example a passport means a huge financial burden for the individual.

In the questionnaire I asked the motivation behind visiting Hungary. Here I managed to confirm the previous research according to which the non-economic motivation (visiting relatives) is dominant. It is indeed favourable that economic motivations are also among the most mentioned factors. As we could see the frequency of border crossings cannot be compared with western border numbers so I was interested in the hindering factors. Almost 70 per cent mentioned financial reasons, more than 50 per cent long queues at border crossings and around 25 per cent bad infrastructural networks. As I have already indicated the development path of the Hungarian side is in the centre of this paper so I was interested in the destination of border crossings. Here I could confirm the former empirical evidence because the respondents mentioned only far-away, larger towns (Debrecen, 76%; Nyíregyháza 74%) not borderland settlements.

Finally, I tried to unearth the most important negative tendencies in the Transcarpathian settlements. The answers were clustered around the following factors: unemployment, *lack of employment possibilities, massive depopulation, increasing number of low skilled population (mainly gypsies).* Almost 35% wants to move to other countries like Hungary, EU countries or the USA but they prefer to move to central, core regions not to the other side of the border.

6. Conclusions

When approaching that question of integration dynamism in borderlands I turned first to the theoretical approach. This framework did not give me a consistent and clear-cut picture of the possible tendencies than I focused on empirical evidence. Taking a large number of studies into consideration I came to the conclusion that methodology differs paper by paper.

In case of the Hungarian-Ukrainian borderland settlement-level reliable statistical data are not available so in paralell with other studies I conducted a questionnaire-based survey. With 432 responses I came to the following conclusions: *existing borders still separate the economic interaction on both sides, crossing the border is expensive and time-consuming. Those who come to Hungary visit only the larger towns not directly the borderland.* In this way it is quite possible that *central and more globalised regions, towns could benefit from the more intense cross-border interactions in the Hungarian-Ukrainian relation.*

AN OVERVIEW ON THE DETERMINANTS OF MERGERS AND ACQUISITIONS WAVES

Vancea Mariana
University of Oradea Faculty f Economics

This paper concentrates on the presentation of the economic dimension of the mergers and acquisitions from a macroeconomic perspective. Thus, the objective of this paper is to reveal the main drivers of merger and acquisition activity. These operations take place in waves, which enters the context of changing the competition game marked by economic changes, technological evolutions, changes generated by the phenomenon of globalization, and by regulating changes. On the other side, a series of studies in the literature argue the existence of a connection between evaluating the securities and the merger and acquisition activity. This research is based on a systematic, logical and comparative analysis of scientific literature regarding the macroeconomic determinants of mergers and acquisitions.

Key words: external growth, merger and acquisition waves, macroeconomic determinants, neoclassical hypothesis, behavioural hypothesis

JEL Codes: M10, M20

1. Introduction

Merger and acquisition activities regard both quoted companies which direct themselves and target the consolidation of the activities at the world level and unquoted companies which have to cope with the growth problems and even survival problems. In the literature there are numerous theories trying to explain why firms adopt the growth strategy through mergers and acquisitions or analyse the consequences of this strategy. Our objective is to present the economic dimension of mergers and acquisitions, from the macroeconomic perspective, in order to understand the determinants of these operations. The merger and acquisition activity takes place in waves which belong to a context of changing the completion game, marked by economic changes, technological evolutions, changes generated by the phenomenon of globalization, and also by changes in what the regulation process is concerned.

2. Research methodology

This theoretical paper is based on a systematic, logical, and comparative analysis of scientific literature regarding the determinants of the merger and acquisition activity. Therefore, we have used as a research method the qualitative approach, in order to identify the macroeconomic determinants of the external growth operations through mergers and acquisitions. The usefulness of the paper is reflected in its contribution to this research, ensuring the premises for future studies related to this topic.

3. The macroeconomic determinants of the merger and acquisition activity

The observation of the annual evolution of the number of merger and acquisition operations emphasizes the phenomenon of evolution in waves, which consists in a sudden and important growth of the number of operations, concentrated in a short period of time. Golbe and White (1993) were the first to notice the cyclic character of the merger and acquisition activity. So far, six waves of mergers and acquisitions have been analysed in the literature: those from the 1890s, '20s, '60s, '80s, '90s, and the last started in 2003 and concluded in 2007, when the economic-financial crisis started. Each of these waves was based on motivations and characteristic specific

to the period of development. Ceddaha (2007:16) considers that, except for the factors specific to each enterprise, the main common points of each wave are those referring to political and regulating factors, macroeconomic factors (the concentrations intensify during the economic growth periods) or to industrial and sector factors.

Gregoriou and Renneboog (2007:1) consider that the economic recovery (after a period of recession) seems to generate takeover waves and these often coincide with periods of credit rapid expansion. The changes regarding regulation are, also, important determinants of the merger and acquisition waves. It is considered (Martynova and Renneboog, 2005 quoted by Gregoriou and Renneboog 2007: 1) that the first waves, those of the 1890s and '20s, were generated by the antitrust laws while those of the '80s seems to have been generated by the markets' large scale deregulation. In the last years, the merger and acquisition activity concentrated on sectors making the object of deregulations, for example financial services, health, utilities, media, telecommunications or defence. There are in the literature significant proofs regarding the fact that the merger and acquisition activity is intensified in the deregulated sectors as compared to the regulated sectors (Jensen, 1988; Mitchell and Mulherin, 1996; Mulherin and Boone, 2000). The deregulation has eliminated the artificial barriers within these sectors and stimulated competition (yet, it had other effects, negative).

The evolution of these operations is characterized by recurrence, in other words, the succession of intense activity periods followed by periods when only few transactions are recorded. These belong to a context of changing the competition game marked by technological, economic, regulation policies changes etc. Thus, innovations, technological, organizational or financial, imply re-engineering simultaneously reaching several sectors (Coutinet and Sagot-Duvauroux, 2003:31-32). Current operations are different from those of few years ago, both in what the size is concerned and their internationalization, a consequence of an economy subscribing to the tendency of globalization.

When technological innovations are transversal, they will determine large organizational re-engineering. In the same time, they will be at the origin of new activities subscribing to the dynamics of a product' lifecycle and which, when they reach maturity, will generate concentration movements. Practically, these technological innovations participate to the "creative destruction" phenomenon described by Schumpeter (2011:40) and within which mergers and acquisitions play a central role. Also, organizational innovations play an important role regarding the waves of mergers and acquisitions. Thus, we can mention the organizational innovation of the '20s, that is the passing from a one-divisional structure (the U firm), to a multidivisional structure (the M firm), illustrated by firms like General Motors or Dupont. Another organizational innovation is the occurrence of the holding firm in the '60s, whose organizational structure corresponds to the conglomerated operations of that period. In the category of financial innovations, we have the appearance of *Leverage Buy-Out* operations or the appearance of *junk bonds*), which stimulated the merger and acquisition operations (Coutinet and Sagot-Duvauroux, 2003:32, 34).

Ceddaha (2007:16) and Depamphilis (2010:16) state that all the waves of mergers and acquisitions have certain common aspects. Thus, the operations tend to get intense in periods of sustained economic growth, of low interest rates and increase of the capital market. The relation between a sustained economic growth and the merger and acquisition operations is quite complex and can be regarded from two points of view. On one side, a high rate of economic growth reflects the dynamism of economy, which can determine intensification of the merger and acquisition activity and, on the other side, the recession periods are favourable to re-engineering which can take the form of mergers and acquisitions. The mergers and acquisitions take place, also, in the context of stock exchange growth. Nelson (1959) or Andrade, Mitchell and Stafford (2001) showed that mergers and acquisitions are concentrated in time, that they tend to group themselves during periods of stock exchange growth and the payment manner is represented,

generally, by certificates. Practically, the anticipation of a future growth in the price of shares can determine enterprise make mergers or acquisitions, hoping to obtain large revenues. The cost of capital can, also, influence the activity of mergers and acquisitions, the low interest rates stimulating the operation through indebting.

In the literature there are two hypotheses meant to answer the question"Why do merger and acquisitions waves appear?" For a wave of mergers and acquisitions to appear, obviously, the frequency of making certain types of mergers and acquisitions must increase in certain periods of time. We will further approach models susceptible to forecast such variations in time of mergers and acquisitions.

3.1. Neoclassical hypothesis

The neoclassical explanation (considered as such because it is based on suppositions such as: the managers maximize the profit; the mergers and acquisitions create wealth; the capital markets are efficient) of the merger and acquisition activity, supported by many studies (starting with Gort's study, 1969, quoted by Harford, 2005; Mitchell and Mulherin, 1996; Mulherin and Boone, 2000; Andrade, Mitchell and Stafford, 2001 or Harford, 2005) is that these operations represent an efficient answer to the reorganization opportunities occurring as a result of certain economic events, the merger and acquisition waves being caused by a combination of economic, technological, and regulating games. Mitchell and Mulherin (1996) clearly emphasize the existence of the waves of mergers and acquisitions in the sectors and associate this phenomenon to different economic, technological ore regulating shocks, reaching these sectors. These researchers suggest the fact that a systematic analysis of the shocks and of the merger and acquisitions activity can help a better understanding of the waves of mergers and acquisitions.

During the conglomerated wave of the '60s, the well managed companies built diversified groups by competing the capital and the *know-how* of the target companies (Gaughan, 2011:44). During the wave of the '80s, the raiders financed through bank loans and *junk bonds* acquired and separated the conglomerated formed in the '60s because the conglomerated organization was not efficient anymore (Jensen, 1986).

Holmstrom and Kaplan (2001) consider that the corporate governance problems represented a determinant factor of the waves of mergers and acquisitions in the '80s and '90s. Andrade, Mitchell and Stafford (2001) and Mulherin and Boone (2000) consider that the wave of mergers and acquisitions in the '90s corresponded to a consolidation within the large sectors, yet it also represented an answer to deregulation. Practically, deregulation, another factor considered determinant for the appearance of waves of mergers and acquisitions, functions in the same way as the appearance of new technologies, because it allows the expansion of the set of input-output combinations. By removing certain constraints, firms are encouraged to penetrate the market. In order to adapt to changes generated by deregulation, a re-engineering of sectors may be necessary and the mergers and acquisitions can facilitate this process. On certain markets, such as that of utilities or flights, the shares of the firms were constrained by deregulation. After the start of the deregulation wave at the end of the '70s, many firms took advantage of this freedom, which has led to the intensification of the merger and acquisition activity.

A wave of mergers and acquisitions may occur as a result of the flexibility of the antitrust policy. Therefore, a more permissive antitrust policy may determine the intensification of the merger and acquisition activity. The antitrust activity of growth of power occurred as a result of innovations in the communication and transport technology and the formation of larger organizations, in many geographical areas.

The neoclassical hypothesis explains the waves of mergers and acquisitions by the fact that numerous sectors have different shocks which make these operations become profitable and, moreover, the favourable macroeconomic conditions reduce the cost of acquisition financing. The economic shock has as potential sources factors such as: industrial over-capacity, the

appearance of new technologies, changes in terms of regulation or changes regarding the access to capital markets which modify the optimal operational scale of firms.

The economic shock takes the form of an economic expansion motivating enterprises to expand in order to cope with the increasing aggregated demand in economy and the mergers and acquisitions represent a much faster form of expansion than internal growth, through own forces. The shocks in terms of regulation may occur by eliminating the barriers which might hinder such operations. Technological shocks may have multiple forms because technological changes can generate important changes within the existing sectors or might create new ones. Coase (1937) was one of the first researchers supporting the fact that technological changes lead to firm mergers. Later, Gort (1969, quoted by Gregoriou and Renneboog, 2007: 6), through a model, argue that economic perturbations like market imbalances, can determine re-engineering within sectors. Jovanovic and Rousseau (2001, 2002b) concluded that technological changes were a determinant of the waves of operations in the 1900s, '20s, '80s and'90s, less of the wave of the '60s and that the waves are shorter when technological changes are bigger. They also consider that the waves of mergers and acquisitions tend to appear in the periods of *boom* of the capital market. The eaves of mergers and acquisitions coincide with the periods in which *price earning ratio* (PER- the report between the share price and the revenue per share) rates on the capital market are high.

Manne (1965) considers that mergers are a means to transfer resources (asset relocation) in the hands of those who can manage them better. He stated that a badly-managed company's share price would be lower and, thus, it would be an attractive target for those capable of managing it better. Moreover, the author states that mergers play the same economic role that the entry on a market plays – that of asset relocation – and that, often, these operations represent an even cheaper means and yet more efficient. Therefore, Jovanovic and Rousseau (2001) underline the idea that mergers and acquisitions, on one side, and the market entry and exit, on the other side, represent substitutable means to relocate assets. The idea that mergers represent asset relocations suggest the fact that this type of waves of operations should occur when there are important technological changes and should disappear when asset relocation is complete.

Yet, Harford (2005) states that these types of shocks cannot, in them, generate a wave of mergers and acquisitions, but there are other generating factors, too. Thus, analyzing the waves of operations on sectors (35 sectors were taken into consideration), in 1981-2000, Harford shows that a necessary condition for these shocks to produce a wave of operations is represented by the existence of enough liquidity capital to permit the asset relocation (transactions). Moreover, easy access to capital may cause the intensification of the activity of mergers and acquisitions even though sector shocks are absent. DePamphilis (2010:13) states that easy and cheap access to financing has been an extremely important impelling factor for the sixth wave of mergers and acquisitions. Also, he considers that the market's differences of evaluation do not represent a cause generating waves of mergers and acquisitions, yet they can represent a determinant for certain transactions.

Another neoclassical theory invoked to explain the waves of mergers and acquisitions is the Q theory of investments, whose promoters were especially Jovanovic and Rousseau (2002a). They say that economic and technological changes increase enterprises' growth opportunities. Such changes can determine the relocation of capital by the more lucrative and more efficient firms. Thus, the high dispersion of Tobin's Q rate records low values (sub-unitary) and in this view we can mention two favouring situations: an inflationist context (a situation in which the acquisition of assets by taking over the control of enterprise on the financial market becomes less expensive than purchasing new assets) and/or strong decreases recorded on stock exchange markets (as the stock exchange crack in 1987 and 1989, which have led the development of the mergers and acquisition activity at the end of the '80s, both in the United States and in Europe). In another paper, Jovanovic and Rousseau (2002b) stated that the *boom*s of the capital markets at the end of

the '90s were caused by important technological changes. The boom of the capital market at the end of the '90s was a result of the innovations in the IT field which has led to the increase of the opportunities for profitable mergers and acquisitions.

Neoclassical methods explain the concentration of takeovers at the sector or country level. Yet, the waves can also result from the firms' answers to the competition's actions. Therefore, if a firm makes more merger and acquisition operations, it can determine other firms to adopt this strategy (Persons and Warther, 1997 quoted by Gregoriou and Renneboog, 2007:6).

The neoclassical theory referring to mergers and acquisitions obviously has a considerable explainable power, yet it is incomplete. For it concentrates on the specific shocks at the sector level, it does not explain the aggregated waves of operations only in the situation in which several sectors experiment the same period of time, money or certificates, thus there are distinct patterns in choosing one or another. Regarding the central idea of neoclassical explanations, that of increasing profitability as a result of mergers and acquisitions, the result is inconclusive. If Ravenscraft and Scherer (1987), concentrating on the period of conglomerated operations, do not succeed in demonstrating profitability increases, Healy, Palepu and Ruback (1992), taking into consideration the period of hostile takeovers, managed to find evidence of profitability increase.

In the end, the neoclassical theory does not manage to explain certain obvious aspects of the capital market and the reaction to different announcements. Loughran and Vijh (1997) state that the market does not react fairly to the announcement of a merger or acquisition, the acquirers making the payment bid in money recording long term positive abnormal returns, while the acquirers offering certificates record long term negative abnormal returns.

3.2. Behavioural hypothesis

A series of papers support the connection existing between bond evaluation and the activity of mergers and acquisitions (Shleifer and Vishny, 2003; Rhodes-Kropf and Viswanathan, 2004 or Gugler, Mueller and Yurtoglu, 2005). The behavioural model requires the elimination of the hypothesis of efficient capital markets and or the hypothesis according to which the managers maximize the shareholders; wealth. This model takes into consideration the psychology of the players on the capital markets and, thus, explains why the waves of mergers and acquisitions appear and why they tend to coincide with the *boom* periods of the capital markets (Gugler, Mueller and Yurtoglu, 2005; Gugler Mueller and Weichselbaumer 2008). Therefore, as Shleifer and Vishny (2003) observed, when the managers of the acquiring company are aware of the fact the company's shares are over-evaluated, they decide to change them for tangible assets, through a merger or an acquisition, which has as effect the protection of the company's shareholders from a loss of value when the market is making a correction of the shares rate. During periods of stock exchange euphoria, the firms with over-evaluated shares use these shares to buy real assets of some under-evaluated or less evaluated companies, the interest of the target companies' managers having an important role in making the transaction regarding the maximization of the shareholders' long term profit. Thus, the merger or acquisition operation is a *win-win* operation, even though there are no value creating synergies (for both parties benefit from the merger or acquisition). Using some over-evaluated shares means that the acquirer can issue less shares, which will be reflected in a lower decrease of returns, in other words of the return per share. Therefore, over-evaluations lead to an intensification of the merger and acquisition activity and, therefore, to the appearance of waves of such operations, the managers taking advantage from the inefficiencies of the markets during periods of stock exchange euphoria. Consequently, the payment manner in the concentration operations should be represented by shares.

Rhodes-Kropf and Viswanathan (2004) suggest a rational managerial behaviour model in conditions of uncertainty regarding the evaluation. They foresee that the waves of mergers and acquisitions in periods of *boom* in the capital market, yet they provide another explanation referring to the fact that the mangers of the target company accept over-evaluated shares. The

researchers consider that the optimism of the market during periods of *boom* makes that the understanding by the managers of target companies of the motivation of over-evaluation be difficult. If they are not certain regarding the fact that the acquirer's actions are over-evaluated due to the market's optimism or to the fact that the synergies expected to take place as result of the merger or the acquisition, can make the mistake to engage in operations that will not generate synergies. In the model built by them, the target companies which do not have perfect information will accept takeover offers from companies over-evaluated in peak times of market evaluation, because in these periods the target companies overestimate the synergies. Therefore, the high flow of transactions produces the wave of mergers and acquisitions. Yet, their model is different from that of Shleifer and Vishny's (2003), meaning that the managers of the target companies rationally accept over-evaluated shares due to the information regarding the synergies and not due to rationales related to short term returns.

Holmstrom and Kaplan (2001), Verter (2002, quoted by Gugler Mueller and Yurtoglu, 2005), Dong et. al. (2003) or Ang and Cheng (2006) are other researchers whose studies mention the hypothesis of share overvaluation, in explaining the waves of mergers and acquisitions. These studies confirm that the long term market fluctuations regarding the evaluation and the number of takeovers are positively correlated. To test the validity of this argument, the researchers used certain methods to track the over-evaluation. These instruments are especially represented by the *book to market* rate value, or its inversion, *market to book*.

Another hypothesis enunciated in the same context explaining the mergers and the acquisitions refers to the managerial freedom and influence. The first researcher to talk about growth as being a manger's objective was Marris (1964, 1998, quoted by Gugler, Mueller and Yurtoglu, 2005). Then, Mueller (1969, quoted by Gugler, Mueller and Yurtoglu, 2005) applied the same theory to explain the wave of mergers and acquisitions at the end of the '60s. He states that the managers take advantage from the firm's growth, either because the returns grow as the organization becomes bigger, either because they obtain a certain "psychological comfort" by managing a bigger organization.

Also, these operations represent a defensive mechanism of managers as Gorton, Kahl and Rosen (2005) consider. Also, they show that the structure of the sector is very important for the dynamics of mergers and acquisitions. Therefore, the sectors in which several firms have relatively similar dimensions with that of the large firm, with opportunities of profitable acquisitions, are open to making defensive operations (generating a wave of operations), if the managers are busy with the private benefits related to control. Inversely, the sectors in which the firms are different from the point of view of dimension or less open to acquisitions (often the operations that are based on such motivations prove unprofitable). The authors maintain that the managers will always prefer to keep the independence of the firm they run and can get to other firm takeovers, as a defensive measure to the danger to become, in their turn, targets for other companies. If the managers consider that the firm is in danger to be taken over, this topic can generate a wave of inefficient activity of takeovers.

Yet, no version of the over-evaluation hypothesis cannot explain the activity of mergers and acquisitions at the level of the firms which are not quoted. The shares of these firms cannot be over-evaluated, or at least not by the capital market which means that these firms cannot change over-evaluated shares with other less evaluated shares. This aspect targets especially continental Europe because a larger part of its economic activity is made by unquoted firms.

4. Conclusions

Over the last decades, the boom that the strategy of growth and development through mergers and acquisitions has experienced, adopted by enterprises, is remarkable. These transactions have become unavoidable in the process to conquest the markets, especially internationally. Without using a merger or acquisition operation, it often becomes impossible for an enterprise to develop

in short time, to reach a right size and to show the financial community that a strategic project can be finalized. The merger and acquisition operations, more and more, the value of the firms and managerial teams represent central elements of their strategic movements. The mergers and the acquisitions do not represent a strategy in itself, as it might seem when initially approaching this subject, yet they are *instruments used to make a strategy.*

At the macroeconomic level, the operations result from economic, technological or regulations shocks and contribute to the intensification of the activity of mergers and acquisitions. Also, empirical studies in the literature have shown that there is a strong correlation between the evolution of stock exchange markets and the merger and acquisition activity, many operations taking place in periods of stock exchange euphoria.

We can state that this modality of growth and development is used by the majority of firms in order to restructure their strategic position, according to the objectives set and the evolution of the business environment. Practically, through merger and acquisition operations, the firms can adapt to the changes occurred in their competition environment. In a competition environment, the enterprise must be proactive and try to create growth and development opportunities.

FEATURES AND CHARACTERISTICS OF MERGERS AND ACQUISITIONS WAVES - OVERVIEW AND THE EUROPEAN EXPERIENCE

Vancea Mariana
University of Oradea Faculty of Economics

This paper analyses the mergers and acquisitions waves that took place in history, emphasizing the generating factors of each wave of operations, as well as the particularities specific to each period. Systematically, these growth and development instruments have become very attractive for the firms in the entire Europe and, in the present, the phenomenon of mergers and acquisitions represents a reality having a major impact on national economies and also on the world economy. This research is based on a systematic, logical and comparative analysis of scientific literature and statistical data regarding mergers and acquisitions.

1. Introduction

The phenomenon of mergers and acquisitions appeared long time ago in the United States, yet at the European level this phenomenon is relatively new, mainly presenting a strategic dimension. The appearance and generalization of waves of mergers and acquisitions in the European countries, following the American model, emphasize the necessity of a vision on this phenomenon over a longer period of time. The mergers and the acquisitions take place most often in waves which affect mainly certain activity sectors. Since the end of the 19th century, the United States have experienced six waves. In Europe, they were less emphasized until the '60s since the increasing interdependence of economies has favoured a convergence of the concentration movements.

2. Research methodology

This paper is based on a systematic, logical, and comparative analysis of scientific literature and of the statistic data referring to the waves of mergers and acquistions. Thus, we used as a research method the qualitative approach in order to analyse the waves of mergers and acquistions whihc took place one after another in history and to emphasize the factors genrating each wave of operatipons, as well as the particularities specific to each period.

3. The waves of mergers and acquisitions – particularities and characteristics

The first waves of mergers and acquisitions took place between 1897 and 1904, 1916 and 1929, 1965 and 1969, 1984 and 1989. At the end of the '80s the merger and acquisition activity recorded a decline, but it was resumed at the beginning of the '90s, giving the start to the fifth wave. We have to mention the fact that only in the '90s, the mergers and acquisitions present, for the first time, similar characteristics in the assembly of developed countries, reflecting the increasing globalization of economies and market deregulation. A relatively short yet intense period of mergers and acquisitions took place between 2003 and 2007, which made several researchers (Gaughan, 2011:35; Ceddaha, 2007:20) consider it as the sixth wave of mergers and acquisitions.

3.1. The first wave of mergers and acquisitions: the wave of horizontal operations

Regarding the first wave of mergers and acquisitions taking place in 1897-1904, Gregoriou and Renneboog (2007:2) maintain the fact that it was generated by the economic recession (that of

1883) and it was impelled by the legislation regulating these operations, by the increase of industrial stocks and also by the enterprises 'desire to obtain efficiency revenues (DePamphilis, 2010:17). The greatest majority of operations targeted industrial enterprises belonging to the same sector, thus being horizontal operations (Bancel and Duval-Hamel, 2008:19; Lees, 2003:47).

Scherer and Ross (1990, quoted by Coutinet and Sagot-Duvauroux, 2003:20) shows that the main characteristic of the first wave of mergers and acquisitions in the United States is represented by the horizontal operations simultaneously involving more than two firms. Practically, the main purpose of this wave consisted in the consolidation of industrial production and in the reduction of competition (Lamoreaux, 1985 quoted by Gregoriou Renneboog, 2007:2). Therefore, Stigler (1950) considers that the main motivation for mergers and acquisitions was to obtain a monopoly position ("*mergers for monopoly*"), the consolidation taking place in main branches such as transports, oil industry or steel industry.

At Europe's level, only Great Britain was touched by this phenomenon of corporate concentrations. Thus, Vieillard (1990, quoted by Briciu and Nivoix, 2009) maintains that this country has experienced, in the same time with the United States, numerous merger and acquisition operations, which has led to the formation of some large national groups in sectors such as textiles, tobacco etc. On the other side, Ceddaha (2007:17) considers that the first wave of mergers and acquisitions affected especially the hard industry, allowing the formation of real empires such as US Steel, General Electric, DuPont, Standard Oil or Rockefeller. This first wave of mergers and acquisitions was stopped by the great recession in 1940, the fraudulent financing and by the first refusal of a merger by Northern Security company by reason of applying the antitrust laws (The Sherman Antitrust Act) (Coutinet and Sagot-Duvauroux, 2003:20).

3.2. The second wave of mergers and acquisitions: the emergence of vertical operations

After the end of the second wave of operations, around 1950, the merger and acquisition activity remained at a relatively low level until the end of 1910. Yet, during the '10s the antitrust legislation started to get roots, both in the United States and in Europe, most probably as a result of the previous monopolization attempts (Gregoriou and Renneboog, 2007:2), which has significantly changed the rules of the game, during the second wave of mergers and acquisitions. The diminution of the opportunities to make horizontal operations within certain sectors and the strengthening of the antitrust legislation in the United States (the Clayton Act of 1914 which forbids mergers and acquisitions reducing significantly the competition in a sector of economy) have allowed the emergence of new types of operations during the second wave of mergers and acquisitions (between 1916 and 1929) that is the vertical operations (Kleinert and Klodt, 2002; Javidan et al., 2004:246, Lees, 2003:47). The enterprises' concentration movements have as objective the consolidation of the position of firms within the oligopolistic markets (Bancel and Duval-Hamel, 2008:19). For this, Stigler (1950) has qualified the operations of the second wave as "*mergers for oligopoly*".

In Europe, only Great Britain had, in the same time, another wave of mergers and acquisitions, even though the other countries, too, experienced at the beginning of the century concentration operations (Morvan, 1972, quoted by Coutinet and Sagot-Duvauroux, 2003:21). According to Ceddaha (2007:17), the phenomenon of mergers and acquisitions reached, for the first time outside the American continent, British economy, too. Thus, the second wave of mergers and acquisitions in Great Britain mainly reached the alimentary sectors, electricity and chemical products. The wave of concentrations in Great Britain coincided, as in the case of the United Sates, with changes occurred industrially and technologically and also the emergence of new sectors (for example, the car sector). The development of mass production techniques has encouraged the growth in the size of enterprises, this being achieved simultaneously both by internal growth and by mergers and acquisitions (Coutinet and Sagot-Duvauroux, 2003:21).

The great depression started in 1929 represented the event marking the end of the second wave of mergers and acquisitions (Coutinet and Sagot-Duvauroux, 2003:21).

3.3. The third wave of mergers and acquisitions: the implication of European continental countries in the merger and acquisition operations

The third wave of mergers and acquisitions took place between 1965 and 1969. This wave was characterized by conglomerate type operations, being known in the literature as the "*wave of conglomerates*" (Bancel and Duval-Hamel, 2008:19). Ceddaha (2007:18) considers that the development of the antitrust laws incited the large groups adopt a diversification strategy. Thus, enterprises developed external growth strategies based on conglomerated mergers, in order to diversify the risks and make synergies (Coutinet and Sagot-Duvauroux, 2003:21; Javidan et al., 2004:246).

The engines of this wave were the growth of the capital markets and the sustained economic *boom* (DePamphilis, 2010:17). The main countries of continental Europe, Geramny and France, experienced only after the Second World War, at the end of the '60s, the first wave of mergers and acquisitions, while the United States and Great Britain were facing the third wave. This wave of operations reached the highest level and was initiated on the background of an economic *boom*. Gregoriou and Renneboog (2007:2) consider that the operations of this wave can be attributed to some multiple causes such as: stricter antitrust regulations, less developed external capital markets and, also, economic, social, and technological changes.

Europe experienced in the same time the first wave of mergers and acquisitions which involved other European countries, too, outside Great Britain. Ceddaha (2007:18) and Coutinet and Sagot-Duvauroux (2003:22) consider that these operations had as motivation, mainly, the desire of industrial groups to reach a dimension called critical, in order to cope with the competitors. Practically, this was the time when large industrial groups were formed such as British Leyland (formed by grouping the national car producers), ICL (a company which became leader in the IT sector after the merger between English Electric and ICT), GEC (General Electric Company, which acquired several firms in the electricity sector) in Great Britain or Saint Gobain-Pont à Mousson, Usinor-Sacilor, Péchiney-Ugine-Kullman in France (Coutinet and Sagot-Duvauroux, 2003:22, Ceddaha, 2007:18). During the period analyzed, in Europe the horizontal mergers and acquisition flourished (Coutinet and Sagot-Duvauroux, 2003:22). The oil shock of 1973, succeeded by a serious stock exchange crisis, ended this wave of mergers and acquisitions.

3.4. The fourth wave of mergers and acquisitions: community scale and amiable character

The fourth wave of mergers and acquisitions, which took place between 1981 and 1989, belonged to an increasing globalization movement which involved a stronger and stronger dependence among the biggest industrialized countries and also a deregulation within different regulating sectors of developed countries (especially the United States and Western Europe countries). DePamphilis (2010:17) considers that the engines of this wave were represented by the growth of the capital markets, the economic *boom*, the conglomerates' weak performances (which mainly targeted USA and were formed during the '60s), the favorable regulating (legislative) environment and favoring accounting practices. Practically, generally, this wave was characterized by operations generated by conglomerate's split (*split* and *spin off*), Leverage-Buy-Out operations, the use of *junk bonds* (indeed, at a much higher level in USA than Europe, which experienced a much more modest activity of corporate takeovers), hostile takeovers (more in USA and less in Europe), the appearance of corporate raiders and financial investors using the lever effect in transactions (Bancel and Duval-Hamel, 2008:19; DePamphilis, 2010:17, Javidan et al., 2004:246).

As a result of research, Briciu and Nivoix (2009) states that more than 95% of the number of operations recorded during this European wave was amiable. The proportion is small if we take

into consideration the value of the operations (75%), which shows that hostility targeted especially operations involving large firms. Regarding the financing of merger and acquisition operations involving quoted European firms, 44% of the operations of this wave were financed wholly with money. These operations represented 42% of the total value of operations announced. The researchers also noticed that the percentage of the operations partially financed with money is of 80% of the total and in more than 40% of the operations made in 1987-1991, the payment was made in bonds exchange.

European countries started preparing themselves for the formation of Single Market by transforming some national champions into international champions or at least European champions. In the perspective of Single Market formation, the antitrust policies adopted at the level of European Union were materialized in the EU Directive regarding the control of concentrations, adopted in 1989 and entered into force on 21 September 1990 (Kleinert and Klodt, 2002).

After analyzing the reports of European Commission, we can notice that the percentage of mergers and acquisitions among enterprises belonging to different member states of European Economic Community and also the acquisitions of European firms by foreign firms, especially American, increased at the end of the '80s, as it can be seen in the following table.

Table 1. The evolution of national community, and international mergers and acquisitions in 1987-1993

Year	National operations (in % of the total number of operations)	Community operations (in % of the total number of operations)	International operations (in % of the total number of operations)	Unknown acquirer (in % of the total number of operations)	Total number of operations
1987	71.6	9.6	18.9	-	2775
1988	65.9	13.5	20.5	-	4242
1989	63.2	19.1	17.7	-	6945
1990	60.7	21.5	17.8	-	7003
1991	54.3	11.9	14.5	19.3%	10657
1992	58.1	11.6	14.2	16.1%	10074
1993	57.4	11.7	18.8	12.1%	8759

Note: for the years 1987, 1988, 1989 and 1990, European Commission does not provide data referring to the percentage of the operations in which the acquirer is unknown, of the total of operations made

It can be noticed that the percentage of national operations in the total of merger and acquisition operations is in majority. Yet, the increase of the number of community operations as compared to international operations is due to the fact that European enterprises, especially the British and French ones, more and more oriented towards Europe, in what cross-border acquisitions are concerned. Regarding cross-border operations, it can be noticed that European firms have become active on the much more developed American market of takeovers. Actually, considering the creation of the Single Market as an integrant part of a larger internationalization process, European enterprises developed, also, acquisitions outside the European space, too, especially in the United States.

This wave of operations was interrupted at the end of the '80s under the conjugated effect of such factors as: the crash of the *junk bonds* market, which ensured the financing in many of the Leverage-Buy-Out operations of this period, as well as different unfavorable conjuncture changes (Coutinet and Sagot-Duvauroux, 2003:23; Ceddaha, 2007:18; Gaughan, 2011:63).

3.5. The fifth wave of mergers and acquisitions: the internationalization and the use of share exchange – this wave's defining particularities

After a short break, the merger and acquisition market had an ascending evolution, during the '90s, reaching a historical peak in 2001. All the opinions expressed in the literature (Ceddaha, 2007:19; Gregoriou and Renneboog, 2007:3; Gouali, 2009:88) indicate the fact that the fifth wave of mergers and acquisitions started in 1993. It is the first truly world wave, both in the United States and in Europe or Asia, the wave presenting in all the areas the same characteristics and resulting from the same causes. Moreover, Europe reached a number of transactions comparable to that obtained in the United States. Thus, during this wave there were approximately 119,000 recorded transactions and in Europe there were approximately 117,000. Gregoriou and Renneboog (2007:4), making a comparison with the previous wave, noticed a significant increase in the number of transactions recorded (during the '80s there had been approximately 34,000 transactions recorded in the United States and 13,000 in Europe). The firms of continental Europe were as eager to participate to the merger and acquisition activity as their homologues in the United States and Great Britain. Also, many of the operations made during this wave were international operations, reflecting a growth of the capital markets' globalization. The mega-transactions, which represented another characteristic of this wave, require considerable financial resources, so that the main financing manner of the operations was represented by bonds, respectively a combination between bonds and the appeal for indebtedness. Except for an especially favorable macroeconomic context, three forces have mainly contributed to the creation of this euphoria: the globalization, the deregulation in all the sectors (energy, banking, telecommunications, and aerial transports) and especially the technological transformations which affected numerous sectors. Moreover, the appearance of the "new economy" transformed this strategic maneuver into a development model (Kleinert and Klodt, 2002; Coutinet and Sagot-Duvauroux, 2003:23-24; Ceddaha, 2007:19; Martin, 2008:177; Gouali, 2009:88-89).

During the fifth wave, European Union recorded a significant growth of the merger and acquisition activity, especially of the cross-border operations. In spite of all these, the large majority of transactions were national transactions. In 1990-1995, according to the European Commission's report (1996:6), more than 70% of all the operations recorded in the EU-15 countries were national transactions, a percentage approximately the same with the percentage of the 1986-1990 period. Countries like Germany, Spain or Italy cumulated most of the national transactions, while smaller countries like Austria or Ireland recorded several cross-border operations. In 1990-1995, according to the same report, the community cross-border operations increased, cumulating 18.7%. The firms in Great Britain, Ireland, Sweden, or Austria got involved in several operations targeting firms outside the community. Companies in countries like Holland, France, or Great Britain took over mainly the role of acquirers, while companies in countries like Italy, Spain, or Germany have often been targets of the merger and acquisition operations.

If in 1985-1987 the value of the mergers and acquisitions involving European enterprises represented 20% of the world total, the percentage increased to 43% in 1991-1993 (European Commission, 1996:115). At the European Union level, the total value of the operations culminated in 1999, even though the number of operations grew until 2000. The data provided by the European Commission (2001) allow the emphasis of the trends manifested during the fifth wave of operations. Thus, during this wave, the number of mergers and acquisitions recoded a constant growth, reaching a peak in 2000, when there were 16750 operations recorded. 2001 marked the end of the wave, the merger and acquisition activity entering a descending path. Obviously, the evolution of the number of mergers and acquisitions is correlated with the evolution of economy. Thus, the low rates of economic growth recorded at the European Union

level in 1992-1993, in 1996 and 2001 were reflected in the decrease of the merger and acquisition activity during these years.

Table 2. The evolution of national, community, and international mergers and acquisitions in 1991-2001

Year	National operations (in % of the total number of operations)	Community operations (in % of the total number of operations)	International operations (in % of the total number of operations)	Unknown acquirer (in % of the total number of operations)	Total number of operations	The variation of the number of operations
1991	54.3	11.9	14.5	19.3	10657	...
1992	58.1	11.6	14.2	16.1	10074	-5.5%
1993	57.4	11.7	18.8	12.1	8759	-13.1%
1994	58.7	12.9	20.5	7.9	9050	3.3%
1995	57.4	12.9	22.8	6.9	9854	8.9%
1996	54.8	12.6	26	6.6	8975	-8.9%
1997	56	14	26	4	9784	9%
1998	53.5	14.1	28.4	4	11300	15.5%
1999	55.7	14.2	26.4	3.7	14335	26.9%
2000	54.7	15.2	25.4	4.7	16750	16.8%
2001	54.1	14.9	24.1	6.9	12557	-25%

Source: Adapted from: European Commission. "Fusions et acquisitions", *Economie Européene, Suplément A*, DGAEF, no12, 2001: 4,5. http://ec.europa.eu/economy_finance/publications/publication2404_fr.pdf.

Several papers of European Commission (1999, 2000) emphasized the development of international mergers and acquisitions, intra and extra-community, this represented one of the main characteristics of the operations of this wave in Europe. Thus, it seems that the tendency of internationalization increased as compared to the previous European wave. Indeed, the percentage of the European firms' international operations overcame, at the end of the '90s, the percentage of 30% of the total value of the recorded operations.

The European firms were active in the activity of cross-border mergers and acquisitions both from the perspective of acquirers and that of sellers. They engaged not only in intra-European operations, so that, the intensification of the merger and acquisition activity cannot be explained strictly through the creation of the Single Market. The percentage of intra-European remained relatively stable during the 1990's, while the operations in these countries increased.

Regarding the distribution of the merger and acquisition activity between the member states, in 1991-2001, according to the data provided by the European Commission (2001:4), we infer that Great Britain was the most active country, followed by Germany, France, Holland, and Italy.

After a fluctuation during the first half of the '90s, the number of community operations increased regularly, starting with 1996, to culminate in 2000 with 2500 operations. The following year marked the decline of the merger and acquisition activity, recording a decrease of 27% in the number of community operations. Practically, the fifth wave of mergers and acquisitions, without precedent regarding the volume of operations, ended in 2001 when the global economy entered the recession.

3.6. The sixth wave of mergers and acquisitions: the strengthening of Europe's position in the global activity of mergers and acquisitions

The sixth wave of mergers and acquisitions started in 2003, three years after the technological bubble went flat. DePamphilis (2010:17) considers that the engines of this wave of mergers and acquisitions were represented by the interest low rates, the increase of the capital markets, the *boom* recorded by the world economy, the globalization, or the high raw material prices. Ceddaha (2007:20) or Marks and Mirvis (2010:33-34) outlined a few characteristics afferent to the sixth wave of mergers and acquisitions. This wave is characterized by very ambitious Leverage-Buy-Aut operations, a consequence of a high appetite for investment funds, in a context marked by interest rates which became very attractive and by stock exchange euphoria. Thus, during this

wave, the world's greatest companies continued their projects of expansion through mergers and acquisitions. Another characteristic refers to the intensification of the operations made by private funds which, in 2007, the peak year of this wave, cumulated 20% of the total value of operations made. Practically, the sixth wave of cross-border transactions, of cross border megamergers, of the increase of the influence of the *private equity* investors (DePamphilis, 2010:17) and of the global expansion of the acquirer originating in the emerging countries (especially China and India) (Bancel and Duval-Hamel, 2008:20).

At the European level, the introduction of Euro (according to the European Commission's report, 2007:14, the percentage of cross-border mergers and acquisitions among the EU12 countries in the total of operations made by the euro zone companies increased from 34% in 1999 to 42% in 2004), the process of globalization, technological innovations, the deregulation and privatization (especially Central and Eastern Europe countries) and, also, by the financial markets *boom* and the existing liquidity gave an impulse to the merger and acquisition activity.

Regarding European Union, this wave of operations manifested in an intensification of the merger and acquisition activity, especially in the EU-15 countries. Yet, in the period analyzed, we could notice an increase in the number and value of the operations recorded in the new member states of European Union. Starting with 2004, Europe has become more and more an opportunity creating area. European enterprises seemed more offensive than during the previous waves, especially under the impulse of English, French, and German enterprises. Parallel with the acquisitions made in the USA, favored by the decrease of dollar as compared to Euro, the dynamics that these had generated actually represented an intra-European market.

Based on data provided by the European Commission (2009), the analysis of the evolution of mergers and acquisitions in which the companies in the old, new member states respectively were targets of the operations, shows that, starting with 2004 both their number and their value increased.

Table 3. Mergers and acquisitions in the new member states, made in 2000-2007, according to the region of the acquirer

	2000	2001	2002	2003	2004	2005	2006	2007
Number of transactions out of which:	**1487**	**1131**	**828**	**821**	**561**	**687**	**746**	**895**
National (in % of the total number)	48.6	52.3	47.5	50.5	41.5	36.7	36.1	39.0
New member states (in % of the total number)	3.2	2.6	5.7	4.8	8.0	5.7	5.6	8.7
Old member states (in % of the total number)	33.8	34.8	32.7	29.6	30.8	40.8	42.0	35.2
USA (in % of the total number)	6.3	4.6	4.5	4.5	6.4	7.6	6.3	7.4
Asia (in % of the total number)	0.2	0.2	1.0	0.4	0.9	1.0	1.3	1.3
The rest of the world (in % of the total number)	7.9	5.5	8.7	10.2	12.3	8.3	8.7	8.4
Value (in billions of Euro)	**19.3**	**19.5**	**16.2**	**7.4**	**15.3**	**28.4**	**20.7**	**36.1**

Source: Adapted from: European Commission . *Five years of an enlarged EU Economic achievements and challenges.* Directorate General for Economic and Financial Affairs, European Economy No1, 2009:167. http://ec.europa.eu/economy_finance/publications/publication14078_en.pdf

Obviously, there are differences between the merger and acquisition activity at the level of old member states as compared to that of the new members. If at the level of old member states, approximately two thirds of the operations were national, in the new member states, the majority of the operations were made by foreign investors. In 2007, the peak year of this wave, 35% of the transactions were made by the acquirers from EU-15, while only 9% of the acquirers originated in the new member states. According to the European Commission's report (2009:167), of the

new member states, most of the target companies were located in Poland, The Czech Republic, Hungary, and Romania.

Table 4. Mergers and acquisitions in the old member states, made in 2000-2007, according to the region of the acquirer

	2000	2001	2002	2003	2004	2005	2006	2007
Number of transactions out of which:	**13208**	**10148**	**7837**	**8083**	**8527**	**8937**	**10283**	**10887**

Source: Adapted after: European Commission. *Five years of an enlarged EU Economic achievements and challenges.* Directorate General for Economic and Financial Affairs, European Economy No1, 2009:167. http://ec.europa.eu/economy_finance/publications/publication14078_en.pdf

This wave of mergers and acquisitions was relatively short, yet intense and ended rapidly when the financial-economic crisis, which started in 2007, enclosed the firms' access to the facile and cheap lending. Thus, if in the United States the merger and acquisition market started decreasing even in 2007, in Europe, 2008 marked the beginning of the decline, as the recession started to encompass the economies of many countries.

4. Conclusions

Since the end of the 19th century, the chronicle of enterprises' lifecycle has been marked by successive waves of mergers and acquisitions, amiable or hostile, national or international. The greatest majority of countries, different sectors have been massively restructured through mergers and acquisitions. Taking into consideration the increased internationalization of economies, we can state that the merger and acquisition operations more and more present similarities forma geographical area to another. We consider that the merger and acquisition operations are far from overcoming the peak times. Certainly, the merger and acquisition activity may know a period of regression when the national economies or the world economy is in recession, when the financial markets are experiencing turbulences and the capital markets are characterized by volatility, yet, once the critical situation is over, the merger and acquisition market can retake its rhythm, reaching new peaks.

Table 3.

Respondents' assessment concerning the quality characteristics of the offered services

-%-

No. crt.	Assessed aspects	marks					Total
		Very good (5)	Good (4)	Indi-ferent (3)	Satisfying (2)	Unsatisfying (1)	
1	How do you appreciate the global quality of the performed service?	**64,18**	35,82	-	-	-	100
2	How do you appreciate the time frame necessary to deliver the solicited service?	**61,19**	38,81	-	-	-	100
3	How do you appreciate the quality/price report for the delivered service?	**58,21**	31,34	10,45	-	-	100
4	How do you appreciate the cleanliness in the car repair shop?	28,36	**50,75**	20,89	-	-	100
5	How do you appreciate the information/ consultancy received from the car repair shop ?	23,87	**58,21**	11,94	4,48	1,5	100
6	How do you appreciate the communication channels offered by our (fax, tel., e-mail, etc)?	35,82	**47,76**	-	16,42	-	100
7	How do you appreciate the diversity of services offered by our garage?	37,39	4,41	-	**55,22**	2,98	100
8	How do you appreciate the professionalism degree of our employees?	16,42	**83,58**	-	-	-	100
9	How do you appreciate the repair warranties?	**59,70**	37,32	-	2,98	-	100
10	How were the complaints about the services offered by our garage dealt with?	**56,72**	38,80	-	4,48	-	100
11	How do you appreciate the company's image advertising campaign (as it is reflected in the media, on the internet, etc)?	1,5	13,43	28,36	-	**56,71**	100

If most of them appreciate as 'good' and 'very good' the overall quality of services, the time necessary for service to be delivered, the quality / price ratio, the cleanliness, the professionalism of the staff, the warranty offered for repairs, the treatment of complaints – there is an obvious need for framing and profoundly understanding the reasons why the following aspects were recorded:

- 55.22%, which is 37 of the respondents are satisfied only by the diversity of the services offered in the car repair shop, while 37.39% (25 respondents) values the diversity of services as being very good. These answers lead us to wonder whether there are services that customers would appreciate but are not provided by the car repair shop

- 56.71% of the respondents (38 people) appreciate the company's promotional activity with its services as being absolutely unsatisfactory – which proves once again, the negative effect of the fact that the garage has no website and it does not assign a budget for various promotional activities. Interesting is the opinion of 28.36% of respondents (19 people) stating that it is all the same for them, if they read, hear or see something about this car repair shop in the media, on the internet etc. They are the ones who have become loyal customers in time and are only influenced by the quality of the services they have already received?! Here's a question that needs an answer!

The marks obtained for each of the evaluated characteristics were:

Table 4.

Respondents ratings concerning the quality characteristics of the offered services

No. crt.	Evaluated aspects	marks					Mark
		Very good (5)	Good (4)	Indi-ferent (3)	Satis-faying (2)	Unsatisfying (1)	
1	How do you appreciate the global quality of the performed service?	43	24	-	-	-	4,64
2	How do you appreciate the time frame necessary to deliver the solicited service?	41	26	-	-	-	4,61
3	How do you appreciate the quality/price report for the delivered service?	39	21	7	-	-	4,47
4	How do you appreciate the cleanliness in the car repair shop?	19	34	14	-	-	4,07
5	How do you appreciate the information/ consultancy received from the car repair shop ?	16	39	8	3	1	3,98
6	How do you appreciate the communication channels offered by our (fax, tel., e-mail, etc)?	24	32	-	11	-	4,02

7	How do you appreciate the diversity of services offered by our garage?	25	3	-	37	2	**3,17**
8	How do you appreciate the professionalism degree of our employees?	11	**56**	-	-	-	**4,16**
9	How do you appreciate the repair warranties?	**40**	25	-	3	-	**4,56**
10	How were the complaints about the services offered by our garage dealt with?	**38**	26	-	3	-	**4,47**
11	How do you appreciate the company's image advertising campaign (as it is reflected in the media, on the internet, etc)?	1	9	19	-	**38**	**2,03**

If we consider the characteristics assessment scale starting with 1 - for the minimum grade, 5 - the maximum grade, knowing that the differences between the maximum score and the evaluation's results that exceed 1.5 points are critical in the provider's activity, we can highlight the following:
Fig.no.1. The marks obtained by respondents evaluation

The graphical representation of the evaluation results shows that the provider company's manager must take very quick measures, in terms of:
- first of all the company's promotion activity and its services - and here perhaps the creation of a website with contact data (the ability to contact the staff via e-mail) would be the first necessary step;
- then, efforts should focus on the range of offered services, which refers to their diversification;
- and last but not least, it should turn its attention to the relationship between customers and staff, to identify the reasons for dissatisfaction concerning the information, the specialty consultancy, provided by the garage's employees.

The 4th **question** seeks to identify elements that are important to the respondents (customers or potential customers) about the quality of services, so that they can be used later to improve the quality of the company's offered service or even to diversify them. Thus between the elements stated by respondents as being able to determine an increased in the quality of the offered services, the following emerged:

- bringing the car repair shop up to date and improving the training of the staff (28.45%);
- other issues (8.37%) such as:
  - diversifying the range of offered services;
  - faster solving of minor technical problems;
  - creating a waiting are;
  - the possibility of paying with credit card;
  - a website should be available to offer information about tariffs and services;
  - extending of the opening hours and work on Saturdays;
  - a stock of items necessary for "minor" interventions should be available

Issues affecting the *service quality assessment*:

The 5th question sought to determine the important elements that have an overwhelming influence in assessing the quality of services offered by a car repair shop, by giving marks from 1 to 10 and ranking some items according to their importance for the respondent. Thus, we determined a mark for each hierarchy's element, producing a score for each item by summing the grades given by respondents and dividing by the number of analyzed questionnaires (which is the number of respondents) we obtained the following results:

Table 5.

The answers to the 5th question

The element	Number of answers for each mark										Final mark
	10	9	8	7	6	5	4	3	2	1	
Service tariffs	41	17	8	-	-	-	-	-	-	-	**9.36**
Repair warranty	48	15	4	-	-	-	-	-	-	-	**9.66**
The diversity of service range	11	15	21	23	7	-	-	-	-	-	**8.57**
Garage's equipments	10	21	35	1	-	-	-	-	-	-	**8.60**
Employees professionalism/technical abilities	12	21	33	1	-	-	-	-	-	-	**8.66**
Promptitude/honouring the deadlines	26	35	6	-	-	-	-	-	-	-	**9.30**
The space fitted for the working area, and the waiting area	10	14	37	6	-	-	-	-	-	-	**8.42**
Received consultancy/information	12	28	26	1	-	-	-	-	-	-	**8.76**
Credibility	29	13	19	6	-	-	-	-	-	-	**8.97**
The garage's working hours/schedule	16	18	23	10							**8.60**

According to the assessments made by respondents we have acquired the following classification of elements having an influence on quality:

Table 6.

Hierarchy of elements that influence a car repair shop quality assessment of services

Rank	The respondents drafted hierarchy
1	Repair warranty
2	Service tariffs
3	Promptitude/honouring the deadlines
4	Credibility
5	Received consultancy/information
6	Employees professionalism/technical abilities
7	Garage's equipments
7	The garage's working hours/schedule
9	The diversity of service range
10	The space fitted for the working area, and the waiting area

The most important element in assessing the quality of services was the warranty granted for the repairs, followed in order by service fees, promptness / timeliness and the credibility of employees and the company in general.

Equally important for the respondents are the garage's equipments and its working hours and almost insignificant is the space fitted for service and waiting are.

The information obtained by the instrumentality of this question is particularly valuable for the company because in the future they will understand better what elements they need to use as background for their offering strategy and for establishing the services with their related tariffs (for example, they will not insist too much on highlighting potential investment in spatial arrangements, as long as the majority does not care about this aspect, but certainly they will be very careful in highlighting the warranties granted for the performed services or in informing the customers about tariffs and generally about the practiced discounts) understanding now, that these elements and the care for their judicious settlement, come to meet the wishes of the customers and to increase their satisfaction.

THE MOTIVATION AND WAYS OF MOTIVATING THE HUMAN RESOURCES – BEST WESTERN HOTEL CENTRAL ARAD

Vlad Silvia
University of the West Timisoara,
Faculty of Economics and Business Administration

On one side, this paper aims to define the motivation and study the methods of approaching and motivating the human resources and on the other side, we take a more closer look in analyzing the motivation and its means by applying a questionnaire to the hotel's human resources. In every enterprise, the core of the motivation reflects the management and economic concepts adopted within its walls. The wide variety of these concepts along with the extreme diversity of the personal and managerial situations available in each firm, reflect in the underlined dissimilarity component of the managerial theories and practices.

I. Introduction

Motivation represents a major key component of management and it is also, a subject that is frequently analyzed in specialized literature. As a result, there is a wide variety of points of view, mostly contradictory. Studying the motivation from a managerial point of view, we can differentiate between two major approaches:

Motivation on a small scale - based on a classic vision of the organization and its management and regards only the employees or the staff.

Motivation on a big scale - it took shape in the last few years, it is based on a modern vision of the organization and its management. It has as an essential characteristic, this being the focus on the stakeholders, meaning those individuals, personnel groups and connections that have a major interest in the development and performance of the company. These two organizational approaches are also reflected in slightly different manner in the definitions of the motivation.

- *On a small scale, the motivation consists of a correlation between the needs, aspiration and personal interest with the achievements, task execution, abilities and responsibilities - all within the organization.*
- *On a big scale, the motivation reflects in the decision making process and actions that oblige the stakeholders to make a direct or indirect contribution towards functionality and superior performance, based on the correlation of their interests in the approach and achievements of the organization and its subsystems.*

Due to the fact that we are looking at the motivation from a managerial point of view, in this paper, we will focus especially on the first meaning of the motivationn. Human motivation represents the sum of factors that determinates the people to fulfill certain activates.

"The Motivation represents the sum of forces, internal and external energies that initialize and manages the human behavior towards a defined purpose: once fulfilled, it will determine the level of satisfying a necessity, since a mutual conditioning exists because between motivation and performance."

(R. Mathis & CO)

The performance of an organization represents the sum of individual performances of its employees. The performance level of an employee is given by: his motivation; his professional capability; his personal perspective upon the role occupied in the organization.

Motivation is the result between the interacting forces that develop in the organizational environment (the organizational culture and the practices adopted by human resources department) and the individual features, qualifications and attitude.

Motivation points out the fact that the human nature is based upon an assembly of ambitions - needs, tendencies and ideals – that lead to sustaining and achieving different essentials and actions as well as adopting a new attitude.

Within an organization, the motivation is defined by the process in which the managers point and concentrate the energies of all the subordinates, thus using the organization's resources at maximal economic efficiency.

Gary Johns **defines motivation, in his book „Organizational behavior", as being the extent to which persistent effort is directed in order to achieve a goal.**

The first aspect of motivation is the employee's behavioral energy regarding his work place, or in other words, the amount of *effort* that he deploys during his work hours. The second aspect of motivation is the *perseverance* that the employees exhibit when they are working.

The effort and the perseverance refer to the amount of work done by an employee. Concerning the work quality, this is given by the behavioral attitude of the personal towards their employment. The full time employees, of Central Hotel Best Western, are offered the following benefits and rewords as motivations:

- *Medical insurance:* for the employee as well as for his family by paying the medical expenses. All the actions include illness prevention and medical prescriptions, information about mental sanity, medical drug overdose and vision problems.
- *Short term disability or medical leave:* It protects the employees when they are not 100% healthy to manage their job responsibilities (illness or accidents recovery);
- *Retirement plan:* It is partially sponsored by the company and it is fully granted only after 5 years of contribution to the retirement fund. At retirement, the employees receive a financial gratuity based on their average winnings and number of years in service.
- *Paid leaves:* the employee is allowed to miss work, but still receive a salary for 31 days/year, that can be taken with the management permission, divided in stages (usually) or all at once (rarely);
- *Reliable salary:* Each employee is ensured that he will receive a salary in a fixed pay day. This is in favor of each and every employee because he can count on a certain income; he can safely plan ahead assuming that he will receive his salary. This way he will have confidence in the management, knowing that they are trustworthy, even in time of financial crisis;
- *Fixed income for each job type:* Seniority bonuses have been removed and the salary is now given considering only the position filled. This is actually an intelligent strategy, taking into account that the elderly staff is already occupying low rank management positions and are already receiving higher salaries. The managers have higher confidence in the older staff than the newer staff which is not familiarized with the working environment or the "house rules". However, this strategy allows the employees to receive a fair salary despite being newly hired and motivating him, in this manner;
- *Career advancement:* Although the management positions are limited and the number of employees is conditioned, the possibility of advancement is achievable - from a low rank job position s to a higher rank executive position (Front of House Manager, Maitre d'hôtel etc.);
- *Maternity or paternity leave***:** In case one of the employees has a baby, by law, he/she has the right to stay at home and nurture the child. Meanwhile he/she receives his/hers monthly salary even though they are not working;

- *Meal tickets:* Besides the salary, each employee receives a number of meal tickets equal with the number of work days for that month;
- *Holiday bonuses:* Christmas or Easter, the employees receive an approximately 100 RON bonuses;
- *Holiday bonuses for children:* Employees having minors are offered gift packages for every child under the age of 18;
- *Participating in the decision making process:* Even tough limited, the employees can be involved in the decisional process through suggestions, recommendations and ideas that are further analyzed by the managers. Only employees that occupy low rank management jobs can benefit from this opportunity;
- *Overtime bonuses:* In case of special events, that have unplanned extensions (like a wedding or baptism), the employees that are asked to stay, even though it was not initially scheduled, receive a reword, at the end of the program;
- *Night shift bonus payment:* In case of special events, that might require service until the following morning, the employees are given a bonus, adding an extra shift for each night that they worked between 00:00 and 06:00AM;
- *Positive working environment:* The majority of the employees have a 5 years seniority thus making them a well organized team, working together and getting along as one, without any major discrepancies. This way is created a friendly and familiar work environment which is very attractive and motivating for potential new employees;

In case small errors are encountered during a work day, the concerned employee is admonished in private or in the worst case scenario, in front of his colleagues. If the eventual errors or mistakes are serious, the concerned employee is officially warned by his direct superior, twice, the third time his superior will report the incident to the General Manager. As a result the employee will be invited in into the General Manager's office, the problem will be explained to him with the utmost importance and the superiors will bring to his knowledge that this will be his last warning. Firing the employee will be considered in case of a fourth mistake or error. In the event of material or financial losses caused by the employees, penalties will be instated until the loss will be covered.

II. Research methods and results

For the second part we have developed and applied a survey of 14 closed ended questions, mainly referring to: work satisfaction, interpersonal relationships at the work place, informing the employees of potential hotel problems, salary satisfaction, management style, subjects that have direct influence in motivating the employees. The survey was completed with the help of 20 hotel employees working in all existing departments: finance & accounting, administration, food & beverage, secretary ship, marketing etc. The survey structure as well as the questions and answers are mentioned bellow:

1. Which is the main reason why you go to work?

For this question, 55% of the responders have chosen job stability and 45% selected job excitement. A good salary, promotion possibilities and job title have not been chosen as a main reason for working in Best Western Central Hotel.

2. Do you consider that there is a relation between the job description and the professional education?

70% of the respondents consider that their educational background is matching their job attributes at Best Western and 10% consider that the two coincide for the most part. However, there are some employees that believe that there is absolutely no relation between their studies and their job attributes (15%) and some consider that there is little relation between the two.

3. How would you characterize your overall job satisfaction in this organization?

Regarding this question, there is no respondent that selected "not at all satisfied" and only 30% stated that "quite unsatisfied". For the most part, 65% confirmed that they do have many job satisfaction moments, meaning that they do enjoy coming to work and 5% consider that their job description offers them many possibilities and satisfaction moments. The study shows that, over roll, the employees are motivated in their daily work environment, due to the fact that the managers have a good strategy for human recourses motivation.

4. How important do you think is your work contribution towards the success of the hotel?

In this area, the respondents' opinions are divided: 40% consider that their contribution is "very important", 40% believe is "somewhat important" and there are some humble employees that chose the option "less important". (fig 2.). The hotel managers should explain to the employees that each of them plays an important role and that a high standard work ethic is imperative for the hotel success. Due to the fact that every job description and every employee are key to good management, it is for the utmost importance that there is no weak link in the hotel administration.

5. How would you characterize your salary level in relation with your work efforts?

If we gather all the answers to this question, the conclusion would be that the salary is not a motivational tool for 15% of the respondents. 20% of the respondents believe that their salary is satisfactory. The rest of the employees, 30% and 35%, consider that the payment is motivating and very motivating in relation with their work efforts.

6. How would you characterize your relationship with your co-workers?

Concerning this question, a big percentage of the respondents have confirmed that their relationship with the co-workers is "very good" (90%) and only 10% stated that the relationship is "good". None of the employees have a bad professional relation and for each of them is very important that the working ties are based on respect and harmony. Due to the fact that they have been working together for a long time, they know each other and they have come to work together as a whole.

7. How would you characterize your relationship with your superiors?

65% believe that, due to the fact that they have a great relationship with the General Manager and also with their superior, these acts as a motivational tool in their work ethics. 35% consider they have a "good" relationship with their superior. None of the respondents selected "satisfactory" and "unsatisfactory".

8. How would you characterize your working conditions?

The respondents were not given "very poor" as an option, however, 75% consider the working conditions to be "fair". 20% believe the conditions are "good" and 5% consider them "very

good". As a result, we would underline the fact that there is place for improvement regarding the working conditions in the hotel. (fig.4)

9. Are you informed with regard to the hotel policy?
For this question, all the respondents have confirmed that they know the hotel policy, they are aware of the requirements and the high standards.

10. Are you offered (have you been offered) the possibility of professional development through training courses?
10% of the respondents selected "Yes", however these employees are part of upper management. The rest of 90% have not been offered anu training courses, even those these would be an excellent motivational tool. The hotel employees wish to take part at training courses and they believe would be a great experience overall.

11. Are you being consulted in the decision making process by your superiors?
The respondents that are department heads are always consulted in the decision making (25%), due to the fact that the ideas are theirs or they are the ones that have to communicate the decisions to the subordinates. Also, they have been with the hotel the longest. The rest of the employees, are only partly consulted in the decision process (75%).

12. Are you informed about the changes that would occur in your hotel and that would affect your work environment?
100% of the employoess are informed regarding the changes and even though they are allowed to express their opinion, they do not have the power to make a change.

13. Are your personal initiatives taken into consideration?
The creativity of the hotel employees is restricted, they only execute the upstairs orders, work in accordance with a regulation form or they follow various unwritten rules. They all know their job description, responsibilities and rights. The only employees that have a creative role are the managers, that come up with the short and long term strategies for their own departments and also, the chef that creates the daily menu, wedding or baptism menus (following the recipes). As a result, 10% have confirmed that their own initiatives are always taken into consideration, 5% are allowed to be creative for the most part and 85% consider that their creative opinions are only slightly taken into consideration.

14. How would you characterize the management style of your superior?
75% of the employees have confirmed that their superiors have an authoritative but participatory style. This highlights the fact that the direct and indirect superiors are trained by the General Manager to adopt a certain attitude towards the employee: giving orders and asking for results, giving appraisals or scolding depending on the case. Due to the fact that the hotel is a family business, the General Manager does indeed consult with other department heads in order to sign on different projects, initiatives and strategies, but not with the subordinates.

15. Respondent profile (age, sex, level of professional studies):
55% of the respondents are between 18-30 years old, 25% are 31-43 years old and 20% are over 44 years old. 60% are women and 40% are men.   20% of the employees are qualified as economists, 30% are workers and 50% have only finished high school and do not hold a degree.

III. Conclusion

As a conclusion, we confirm that the Best Western Central Hotel Arad management team understands the importance of employee motivation through different means. For the most part, the motivation method used is the salary, that proved very affective along with job stability, in times of financial crisis. Nonetheless, the management do not offer any bonus payment or other financial incentives in order to encourage work efficiency or to make the employees more interested in their job description. Although they are not given any bonus salaries, most of the employees consider that their wages are in relation with their work efforts. Regarding the job stability, these is not a problem within the hotel, the employees have learned how to work as a whole, due to their long relationship (over two years) with the hotel business. However, job stability is not a continues motivational tool for the respondents, they would be interested in carrier development, an aspect that is lightly represented in the SWOT Hotel Analyze. Due to the fact that Central Best Western Hotel is a family business that conditions the employee promotion possibilities, the employees have developed a lack of respect towards the people within the management that have trained them.

Within the hotel, the co-worker relations are sociable based on professionalism and respect, an enjoyment work environment is another motivational tool for the employees. However, they are slightly demoralized because their own initiatives are being discouraged and they are not consulted in the decision process. The hotel management considers that they can combat these effects through positive motivation, encouragement and appraisals, in times of professional accomplishments.

To conclude, the hotel management team wrongly believes that their employees are only motivated by their salary, not taking into consideration other financial rewards.

In order to improve the present situation, we would recommend:

- Developing a Human Resources department;
- Motivating employees through training courses at other Best Western Hotels;
- Promotion possibilities for those employees that show a high level of professionalism and loyalty;
- After analyzing the questionnaire responses, we have realized that 20% of the respondents are upper management (marketing manager, administrator, accounting manager) and 80% have an execution role (receptionist, cleaning lady, and waiter).

SUB-SECTION: ECONOMIC STATISTICS

IDENTIFICATION AND MEASUREMENT OF REGIONAL DISPARITIES IN ROMANIA

Antonescu Daniela
Scientific Researcher II, Institute of National Economy

Recent trends in the convergence process between countries are not observed at intra-national, emphasizing differences between regions. Increasing economic disparities between regions belonging to the same country is a result of the concentration processes.
Increasing regional disparities is considered rather determined by high performance regions, rather the slow performance of the backward regions.
The process of concentration is, however, not only the accumulation of wealth and means of production and services in certain areas. Knowing the concentration and influencing factors can make decisions and establish regional policy measures.
This article proposes a synthetic analysis of the development level of regions in Romania with the concentration/diversification model (Gini/Struck coefficients), based on the existing key statistical indicators.
Keywords: regional disparities, concentration/diversification, regional analysis
JEL classification: R1, R12, R15

1. Introduction

Concentration analysis can illustrate the intensity of certain phenomena on economic and social categories, the dominant areas, the territorial distribution of some phenomena, etc. In addition, the concentration analysis allows comparability of data between identical or different phenomena, starting from the same or different number of units, for the same year or different years, etc.

Given the above considerations, this article proposes an assessment of the degree of concentration/diversification in the developing regions of Romania, through a method commonly used by experts in the field: analysis of regional concentration/diversification degree. This method of analysis is also known as the Gini/Struck coefficients method.

2. Methodology

The concentration analysis permits comparability of data between different phenomena, starting from the same or different number of units, for the same year or different years, etc. Different methods of exploratory statistical applied to realizes scientifically sound combinations of indicators.

Given the above considerations, this article proposes an evaluation of the concentration/agglomeration degree in the eight developing regions in Romania, through a method frequently used by experts in the regional field: concentration methods, also named Gini/Struck coefficients method[43].

To achieve the analysis, there were used statistical indicators that exist at regional level, grouped by main areas, so that it can be covered the whole range of economic and social activities of

---

[43] The Gini coefficient is a regular method used for analysis the degree of concentration (inequality) of a variable in a distribution of its components. It compares the distribution of a variable with theoretical perfect equality. The Gini coefficient ranges between 0, which implies no concentration (perfect equality), and 1, which denotes total concentration (perfect inequality).

scientific interest: demography (total population, urban, rural), workforce (employees), economic potential, health, telecommunications, urban infrastructure, investment, regional GDP.

Interpreting the results of this analysis took into account the fact that a higher value of the concentration/diversification coefficients involves an increase in disparities at territorial level, while a lower value may reflect a balanced distribution of some general or specific activities/phenomena. Also, the interpretation of results was envisaged that the region Bucharest-Ilfov is a major urban area, which may significantly affect the obtained results.

The analysis of indicators on the concentration/diversification can indicate us how far we place in comparison with the state of uniform and balanced distribution of economic results registered at the regional level.

Next, to identify the regional disparities in Romania, in 2010 and compared with 2008, we will use the Gini/Struck concentration/diversification coefficients method.

3. The assessment of regional disparities

In 2010, at regional level, the concentration analysis was based on the two coefficients presented above (Gini/Struck), taking into account 10 groups of indicators.

If the value of the coefficients exceeded 0.3, there is a relative concentration that can be mentioned and taken into account, and if the value was close to 0.5, then we can speak of a high concentration. The calculations were made at regional level, taking into account the inherent limitations related to available statistical databases.

3.1. Population at regional level

Regional concentration analysis was based on the following statistical indicators: total population, population in urban and rural areas.

The analysis of existing data shows that, in 2010, nationally, was a predominantly urban population (55.05%), while at regional level, five of the eight regions hold a majority urban population (West, Centre, South-East, North-West and Bucharest). The most urbanization region is Bucharest Ilfov (91,9% - urban population from total) (Figure 1).

Figure 1: Structure of total population in urban/rural and developing regions, 2010 (July)
Source: Author's calculation on the basis of The National Statistical Institute data.

Concerning the concentration of total population in urban and rural areas, the coefficients value is below 0,105, which means that, in the year 2010 (July 1), there was no significant concentration of the total population in the eight development regions. Also, the urban population does not have an important concentration at regional level (Gini coefficient is below 0,1).

Regional allocation of the population is relatively balanced, the exception being given by the allocation of rural population at regional level, where, because the Bucharest-Ilfov region is

highly urbanized, there is a greater concentration of rural population in the other regions (the Gini coefficient is 0.244).

Compared with the year 2008, it is found that there was a decrease in the concentration of total population and a slight increase in the concentration of urban population (the Gini coefficient was 0,0982 in 2008, while in 2010 it came to 0,096) (Table 1). In the same time, we can observed a decrease of concentration in rural population (from 0,2442 to 0,2430).

Table 1: Regional concentration of population (Gini/Struck coeff.), years 2008, 2010

	Total population		Urban		Rural	
	2008	2010	2008	2010	2008	2010
Coeff. Gini	**0,1065**	**0,1060**	**0,0982**	**0,0996**	**0,2442**	**0,2430**
Coeff.Struck	**0,0774**	**0,0770**	**0,0713**	**0,0723**	**0,1812**	**0,1803**

Source: Author's calculation on the basis of The National Statistical Institute data.

3.2. Workforce

The analysis of the concentration of workforce was based on the following indicators: employment in major economic sectors, number of employees and the number of unemployed.

In 2010, the level of Gini/Struck coefficients reveals that there is a low concentration of the employed population in the eight development regions, the value of Gini coefficient being around 0,075 and the value of Struck coefficient being only 0,055. Compared with 2008, there is a decrease in the degree of concentration of employed population (the Gini coefficient was 0,114 and Struck coefficient was 0,083). The decrease of concentration mean o relative equilibrates distribution of employment at regional level.

In the same time, there is a relative concentration of employed population in agriculture and forestry, the Gini coefficient being 0.226 and the Struck coefficient is 0,167, largely due to the importance of Bucharest-Ilfov urban region. It is the same tendency to decrease of concentration employment in agriculture comparatively with 2008.

Different appear in employment of services. The tendency is to growth the employment concentration in services: Gini coefficient was 0,185 in 2010 comparatively 0,139 in 2008 (Figure 2).

Figure 2: Regional concentration of workforce, 2008, 2010
Source: Author's calculation on the basis of The National Statistical Institute data.

At the same time, we cannot say that there is a strong concentration of the number of employees at regional level, their distribution being relatively balanced in the territory, but we can identify the tendency to growth a concentration in services sector.

3.3. Economic potential

To assess the concentration of economic potential at regional level there have been used the following indicators: the number of active firms at regional level, grouped by categories of size and the number of employees.

According to the figures recorded by the Gini/Struck coefficients, there are, at regional level, the following situations (Figure 3):

- Relatively low concentration of the total number of firms - the Gini coefficient is 0,197 and the Struck coefficient is 0,145;
- Relatively low concentration of small firms (0-9 employees) and large companies (over 250 employees); the calculated coefficients record values below 0.20;
- In 2010, the concentration is more or less appropriates for all category of active units;
- Compared with 2008, the values of the two coefficients have recorded significant decreases; in special for medium active units (from 0,490 Gini coefficient to 0,183 Gini coefficient) and active units with 50-249 employees (from 0,346 Gini coefficient to 0,203). The main source of the decrease is the financial crisis..

Figure 3: The regional concentration of economic potential, 2008, 2010
Source: Author's calculation on the basis of The National Statistical Institute data.

3.4. The economic and financial results

The analysis of economic results has been achieved in terms of total turnover. As shown in Figure 4, there is a significant concentration of the total turnover (the Gini coefficient is 0,371 and the Struck coefficient is 0,285). Compared with 2008, it is recorded an increase of the concentration of total turnover, from 0,361 to 0,371 (an increase of about 30%).

Figure 4: Regional concentration of economic and financial results, 2008, 2010
Source: Author's calculation on the basis of The National Statistical Institute data.

3.5. Health infrastructure

The analysis of the concentration in this sector was made using the following specific indicators: the number of hospitals in the region and the number of existing beds.

As shown in Figure 5, there is no significant regional concentration (the values of the two coefficients are below 0,1). Compared with 2008, there is a relatively small decrease of the concentration of health infrastructure at regional level, especially regarding the number of beds (from 0,1801 to 0,1022).

Figure 5: Regional concentration of health facilities, 2008, 2010
Source: Author's calculation on the basis of The National Statistical Institute data.

3.6. Urban infrastructure

Given the importance and complexity of this area, but also the existence of an increased volume of specific data, for the calculation of the degree of concentration/diversification of the sector on development regions there were used several key indicators:
-    The simple length of gas distribution pipelines;
-    The length of public roads.

As shown in Figure 6, the regional infrastructure has a relatively relative high concentration, with Gini coefficients values 0,1908 for the indicators localities with public sewerage, smaller comparatively 2008.

Slightly lower values are recorded at the total simple length of pubic sewerage pipes (0,0971 – Gini coefficient). Compared with 2010, there is a decrease in the concentration of both examined indicators.

Figure 6: Regional concentration of urban infrastructure, 2008, 2010
Source: Author's calculation on the basis of The National Statistical Institute data.

3.7. The investments

The analysis of regional concentration of investments was achieved with the help of the indicator: gross and net investments of active local units.

Thus, as shown in Figure 7, both Gini and Struck coefficients indicates that, at regional level, there is a significant concentration of gross investments, implying that, some regions (especially the Bucharest-Ilfov region) have achieved or have attracted a bigger number of investors. We can talk about an important concentration of investments at regional level, the values of the two coefficients being over 0.3 (the Gini coefficient is 0,408).

Compared with 2008, this concentration is increasing visibly and some regions are more attractive in terms of local investors (the Gini coefficient increased from 0.3 to about 0.4 in the period under review). Similar, the net investments has a high contraction at regional level (Gini coefficient – 0,378).

Figure 7: Regional concentration of investments, 2008, 2010
Source: Author's calculation on the basis of The National Statistical Institute data.

3.8. Education

As a result of the fact that the Bucharest-Ilfov region holds approximately 33,9% of total higher education institutions, the values of Gini/Struck coefficients being higher than those registered by other indicators examined so far.

Thus, in 2010, in this area, most indicators that have been analyzed have recorded significant concentrations at regional level, exception being the indicator number of universities, whose coefficient was below 0.3 (Gini coefficient - 0,335) (Figure 8).

Figure 8: Regional concentration in education and research field, 2008, 2010
3.9. Regional concentration of GDP

The evolution of regional GDP indicator concentration was calculated for the period 1995-2009. Thus, (1995) regional GDP concentration was very low, the Gini coefficient being 0,066. The difference between the highest and lowest value of the regional GDP was between the South and South-West region, including West (22%). In 2000, there is a first clear trend of increasing concentration, the Gini coefficient reaching 0,142.

Calculated for 2009, the Gini coefficient recorded a value of 0,199 (Struck coefficient – 0,147), which means a relatively low concentration of total regional GDP (Figure 9).

This value indicated a tendency to increase concentration of economic performance in term of PIB regional and reducing of convergence process at regional level, in Romania.

Figure 9: Concentration of regional GDP, 1995-2009
Source: Author's calculation on the basis of The National Statistical Institute data.

The regional contribution at GDP is changing in 2000-2009 period. Thus, the regional contribution of capital-region Bucharest-Ilfov is reduced, in parallel whit growing the contribution of North-West, Center, North East, South East, and South West. Another region is reducing their contributions to the regional GDP (Figure 10).

Figure 10: Evolution of regional contribution of GDP (%)
Source: Author's calculation on the basis of The National Statistical Institute data.

Conclusions

Through this article we have sought an analysis of the main types of regional disparities, in 2010 and also in comparison with 2008, based on the Gini/Struck coefficients method and the existing statistical data in the Romanian Statistical Yearbook:

The results obtained after applying the concentration coefficients are the following:

- Most coefficients have values placed in the interval [0-0,3]; this shows a relatively uniform distribution, without too much concentration in those areas;
- After 2010, the analysis of the evolution of Gini/Struck coefficients shows a two relative trend:
- The decrease the concentration of regional disparities in Romania in: population (total, rural), employment (total, agriculture, industry), health infrastructure, urban infrastructure, tertiary infrastructure,
- The increase the concentration of regional disparities in economic performance (Regional GDP, SMEs, turnover).
- The contribution of region Bucharest-Ilfov to national GDP is reducing, in parallel with creasing the contribution of another region. This process may interpret that the possible convergence may be take place, after 2010, in Romania, at regional level.

As a final remark, we underline the necessity to take measures and to sustain the mechanism to promote convergence; taking into account the circumstances created so far, according to, the relatively developed regions are those that access far more Structural Funds than those underdeveloped, which in no case is likely to reduce regional disparities.

MONETARY STABILITY AND UNEMPLYMENT IN AN EMERGING ECONOMY. THE CASE OF ROMANIA

Boldea Bogdan Ion
West University of Timisoara, Romania, Faculty of Economics and Business Administration

BURZ Răzvan-Dorin
West University of Timisoara, Romania, Faculty of Economics and Business Administration

A typical feature of an economic crisis, as is the case of the last economic and financial crisis, is the rise in the unemployment. This phenomenon represents one of the most serious aspects of an economic recession implying additional constraints for the policy makers and increased social and economic distress. In this paper we approach the issue of unemployment dynamics for Romanian economy. Modern economies must cope with the challenge of achieving financial stability, given that the globalizing financial environment is becoming more complex due to globalization, to theintersection of the monetary and financial market, and to the financial industry innovativeness. Although this evolution of the markets encourages more efficient allocation of global capital resources, allowing the ways of financing to adapt more quickly to the needs of the real economy, "the financial sector is not exempt from tensions and destabilizing movements, which generate risks not only for the players of the financial sector, but also for the economy as a whole".
Keywords: monetary stability, unemployment, emerging economy, Phillips curve
JEL Classification: E52, E58, E61, G01

I. Introduction
Ensuring financial stability represents a natural concern of central banks, result of some of its specific functions: lender of last resort, regulation and supervision of the banking sector, regulation and monitoring of the economy payment systems and the function of foreign currency center. In the last years, ensuring financial stability became a major concern of central banks, due to the fast propagation of financial crises, their negative effects on financial markets and the macroeconomic perspectives, but also due to the conomic and social costs that they imply. In comparison to price stability, considered easy to define and quantify, financial stability is a complex concept (due to the complexity and dynamics of the financial system) and up today there is no generally-accepted definition or a synthetic indicator for its quantification.

For example, ECB defines financial stability as the situation in which „*the financial system – comprising of financial intermediaries, markets and market infrastructures – is capable of withstanding shocks, thereby reducing the likelihood of disruptions in the financial intermediation process which are severe enough to significantly impair the allocation of savings to profitable investment opportunities"* [European Central Bank, 2009].

II. Data and methodology
For this analysis we looked at statistical data from Romania between 2000 and 2012 – from National Bank of Romania and World Bank Statistics. We have used a generalized linear model – (Quadratic Hill Climbing)-and for estimation of inflation-unemployment correlation we have use the Huber-White method - Huber-White standard errors are standard errors which have been adjusted for specified assumed-and-estimated correlations of error terms across observations.

We have used the Consumer Price Indicator *vs*. F (inflation expectancies [commercial, consumers, industrial and services], Core1, Core2, adjusted Core 2 + unemployment rate + unemployment gap[$t_{n+1}-t_n$]).

Dependent Variable: IPC
Method: Generalized Linear Model (Quadratic Hill Climbing)

Date: 03/04/12 Time: 22:47

Sample (adjusted): 2007M01 2011M12
Included observations: 60 after adjustments
Family: Normal
Link: Identity
Dispersion computed using Pearson Chi-Square
Coefficient covariance computed using the Huber-White method with

    Observed Hessian
Convergence achieved after 1 iteration

Variable	Coefficient	Std. Error	z-Statistic	Prob.
EXPCOMER(-1)	0.121830	0.009802	12.42975	0.0000
SOMAJ(-1)	0.352673	0.055954	6.302853	0.0000

Mean dependent var	6.041167	S.D. dependent var		1.757305
Sum squared resid	93.63233	Log likelihood		-98.50429
Akaike info criterion	3.350143	Schwarz criterion		3.419955
Hannan-Quinn criter.	3.377450	Deviance		93.63233
Deviance statistic	1.614351	Pearson SSR		93.63233
Pearson statistic	1.614351	Dispersion		1.614351

As main results, we have found the following:
In our opinion, there is a transition in Romania from the adjustable inflationist expectations (in which the future value is just determined by its past values, the time horizon used depending on the memory of the individual), by the rationale inflationist expectations.
Furthermore, in Romania, the inflation expectancies are adaptive, based on the past observed realities. They are not made up of around NBR's inflation target, but are heavily influence by the high level of past consumer prices.

III. Empirical results
The Phillips curs, in our opinion, shows a really weak correlation betwenn the unemplyment and the CPI for Romania – specially caused by structural disbalances – to be seen the 2008 october.

For Romania, there is a alomost unexistind corellation between unemplyment and the rate of oinflation – mainly caused by the government decision of reducting the bugetary employers.

2011:

Variable	Coefficient	Std. Error	z-Statistic	Prob.
EXPCOMER(-1)	0.228203	0.029139	7.831435	0.0000
SOMAJ(-1)	-0.145950	0.145098	-1.005873	0.3145

We cab observed in the above graphic the almost unexisting correlation between the unemployment rate and the inflation rate in Romania (stressing the Romanian Government policy of reducing the budgetary employment).

IV. Conclusion
From the standpoint of monetary policy, the reaction of central banks to the financial imbalances that broke out from August 2007 was different, depending on the particularities of the economic

and financial structure of each state. However, the objective was the same and namely, to restore the health of the financial system, in such a way that economic growth and price stability at middle and long term will not be jeopardized.

At the same time, the present financial disruptions highlight the necessity that central banks give more importance to the price of assets, as they represent the main channels, through which monetary policy measures are transmitted onto the real economy.

These results indicate that the National Bank of Romania should change the instruments of monetary policy in order to give a more „eclatant" character to the inflationist anticipations (especially in the services and prices of final consumption) based on previous developments of overall pricess.

Placing rational expectation in a macroeconomic model mai dramatically affect the governemnt (or central bank) ability to aply efficiently the economic policy. As a result, the monetary base increase affect only the inflation rate, without any interfierence in the overall production or employment.

ANALYSES OF ORADEA MUNICIPALITY'S ECONOMIC SITUATION THROUGH LOCAL REVENUES

Delcea Lavinia Sidonia
Faculty of Economics, University of Oradea

This paper proposes a new approach in presenting the economic situation of a municipality by analyzing its local revenues. The quantity and evolution of local revenues are extremely important in public management because, in their absence, local governments cannot implement any policy, endangering therefore the local economic development. In this paper we conducted an eight years analysis on the evolution of Oradea's municipality revenues. The used research methodology was both analytical and empirical, by constructing and analyzing selected indicators. In the end we conclude that the grants obtain by the municipality from the European Union represent the key to future economic development.

I. Introduction

The institutional decentralization process has given local governments the opportunity to make a significant contribution to the sustainable development of the administrative-territorial units they manage. This contribution is represented by outlining the directions for future development of cities and municipalities based on the strategies and programs undertaken and through the allocation of financial resources to achieve their goals through. It is these increased responsibilities of local governments and their possible impact that led us to choose this research theme.

Each EU member state has its own legislation on local government finance, but the diversity of national rules is consistent with common law adopted at European level. Therefore, legislation is a key factor in the implementation of local financial autonomy and decentralization by establishing general rules for local government finance. Thus, Article 3 of the "European Charter of Local Self-Government", signed in Strasbourg on October 15, 1985, proposes that local authorities have the right to regulate and manage an important part of public issues and Article 9 presents some general principles on the financial resources of local authorities.

According to the current European ideas, it is necessary that the planning and preparation of local budgets to be done according to the requirement of structuring the resources according to the following criteria (Balan, 1999: 8): the needs of economic development, social and cultural needs, and needs regarding local government functioning.

Administrative-territorial units of the Member States of the European Union have pursued the continuing growth of local economies by increasing revenue performance that took place in connection with the five criteria: adequacy of income, financial independence, fairness,

The quantity and evolution of local income are particularly important in public management because, in their absence, local governments cannot implement any public policy (European Commission 2000: 3) thus jeopardizing local economic development. This paper deals with topics of local economic development in terms of revenues, having as its objective the analysis of Oradea's income evolution through specific indicators. The used research methodology is both analytical and empirical, by constructing and analyzing selected indicators.

II. The revenues analysis of Oradea municipality's local budget

According to article 5, paragraph (1) of Law 273/2006 on local public finances, updated, local revenues are own revenues, consisting of: taxes, fees, contributions and other payments, other income and allowances deducted from income tax, the amount deducted from certain state

income taxes, subsidies from the state budget and other budgets, as well as donations and sponsorships.

Substantiation of revenues of local budget are normally based on observation and evaluation of taxable materials and the tax base used for calculating taxes and fees, evaluation of rendered services and revenues from those and other specific elements.

Indicator of own revenues includes both own current income and also deducted ratios from the tax on overall income, emphasizing local economic conditions. Own revenues are those that confer financial autonomy to the administrative-territorial unit. One can therefore conclude that with the increase of their income in total income, the degree of financial autonomy of Oradea has increased gradually from 2005 until 2007. But starting with 2008 a significant decrease in the autonomy can be seen, that continues also in 2012. The cause is the decrease of property tax revenues and particularly revenues from capitalizing assets.
Source: Elaborated by the author according to Oradea City Hall's data
Figure 1. Evolution of Indicator of own revenues

Indicator on property tax shows the evolution of the main categories of taxes managed by local public authority. This income is used for large cities to finance more than one third of total expenditures made by that local authority. Analysis of this indicator can provide information about the local economy: the value associated to tax base reflects, in case of Oradea, the force of local economy. From 2005 until 2007 an increase of share of property tax can be seen, from the total revenue of the municipality. This trend changed in 2008 and 2009 when the share of the total property tax revenues of Oradea fell to 15.25% and 12.13%. The indicator of the property tax recorded high values again in 2010 and 2011, and for 2012 the forecast is to further decline to 9.31%.

Table 2. Evolution of Indicator on property tax

Property tax revenues/Total revenues	2005	2006	2007	2008	2009	2010	2011	2012 Plan
	13.42%	14.49%	17.68%	15.25%	12.13%	16.39%	16.19%	9.31%

Source: Elaborated by the author according to Oradea City Hall's data

Indicator on shares deducted from income tax from the tax on income received by the state budget in each administrative units, every month (within 5 days at the end of month in which the tax was collected), a share of 47% is given to local budgets of communes, towns and municipalities to which taxpayers belong. Shares deducted from income tax allocated to Oradea have been growing from 2005 to 2008, while in 2009 their share in total city revenues started to decline, causing a record value of 21.53%. In 2010 and 2011 this indicator again elevated, but for budget year 2012 is expected to collapse with 14.10 percent points.
Source: Elaborated by the author according to Oradea City Hall's data
Figure 2. Evolution of Indicator on shares deducted from income tax

Indicator on capital revenues expresses the evolution of revenues resulted from sale of the private domain of Oradea. A decrease in the share of capital income in total income of the municipality can be noticed, except in 2006 when this ratio reached a relatively high level compared with other years. In budget year 2012, were projected no capital revenues for Oradea municipality.
Source: Elaborated by the author according to Oradea City Hall's data
Figure 3. Evolution of Indicator on capital income

Indicator of subsidies from the state budget shows the financial dependence of local authority from the state budget and from other governments through some amounts deducted from state income taxes and subsidies received from this and other administrations. The evolution of this indicator is reverse as to progress indicator on revenues. For 2012 is expected an increase of the financial dependence of Oradea to the state budget and the county council's budget, this indicator registering a maximum value in the period analyzed.

Table 2. Evolution of subsidies from the state budget indicator

Subsidies from the state budget / Total revenues	2005	2006	2007	2008	2009	2010	2011	2012 Plan
	45.75%	42.74%	37.14%	11.36%	26.66%	43.62%	42.32%	48.14%

Indicator on the grants attracted - since 2009, Oradea recorded entries of amounts received from the European Union as a result of project proposals submitted to attract structural funds. Their share in total city income was relatively low in budget years 2009 - 2011, but for 2012 it is estimated a significant value of 22.96%. This represents an enormous help to the local budget, with the possibility of significant investments without using own revenues.
Sursa Source: Elaborated by the author according to Oradea City Hall's data
Figure 4. Evolution of Indicator on the grants attracted

The following Figure presents a comparative evolution of the three fundamental indicators of local government revenues: indicator of own revenues, subsidies from the state budget, and
Source: Elaborated by the author according to Oradea City Hall's data
Figure 5. Comparative evolution of own revenues indicator, subsidies from the state budget and European grants

and also the indicator on grants from the European Union. One can notice see a drastic fall in property income, but offset by the significant increase of grants obtained for Oradea's municipality projects, mainly investments.

III. Conclusions
After examining the local revenues indicators we can conclude that their evolution is divergent and does not allow a clear identification of the local economy situation. On one hand we noticed

an alarming decrease in Oradea's autonomy from the state budget through a drastic reduction with 46.73% share of own revenues in total revenues during 2005-2012. This was determined by a decrease of property tax revenues, shares deducted from income tax, and mainly of capital revenues.

Besides this, the indicator on subsidies from the state budget registered in 2012 its highest value from the analyzed period, predicting an increase in financial dependence of Oradea municipality to the state budget and the county council budget.

On the other hand, Oradea municipality has managed to attract large sums of money from the EU and the Romanian Government in the form of grants for mainly infrastructure investment, as a percentage of 22.96% of total local revenues, reducing the pressure on revenue own to cover these investments. Continuing to attract grants to the local level is in our opinion the key to Oradea's economic development, especially in light of local authority action.

THE EXPENDITURES ANALYSIS OF ORADEA MUNICIPALITY'S LOCAL BUDGET

Delcea Lavinia Sidonia
Faculty of Economics, University of Oradea

The quantity, evolution and destination of local expenses are particularly important in public management because they sustain the local economic development policies supported by the local public administration. In this paper we conducted an eight years analysis on the evolution of Oradea's municipality expenses. The used research methodology was both analytical and empirical, by constructing and analyzing selected indicators. We concluded with observing an improvement in Oradea's expenditures policy efficiency during 2005-2012.

I. Introduction

As a result of the decentralization process from central authorities to local administrative units, in all European Union countries, an important amount of economic activity takes place under the responsibility of administrative, financial and legal local administration (Dafflon 2007: 115).

Local public administration has undergone many reforms following the implementation of the principle of local autonomy and decentralization. In terms of local public expenditure, these reforms were adopted according to the needs of each country. Local public expenditure in the new EU member states registered an upward trend due to the decentralization of local government which generated increase of competence and responsabilities (European Commission 1998: 5). The European Union initiates and implements local tax reforms in order to identify the most efficient form of local government, based on the principles of "European Charter of Local Self-Government".

This paper tackles the topic of local public expenditures, aiming to analyze the efficiency of Oradea's expenditure policy through selected indicators. The research methodology used is both an analytical and empirical, by constructing and analyzing the indicators.

II. The expenditure analysis of Oradea municipality's local budget

Parlagi (2000 in Matthew, Anghelescu and Savulescu 2009: 12) defines local development as a process manifested in a certain region or political subdivision which increases life's quality. The purpose of local economic development, as presented in one of World Bank's documents, is building the economic capacity of administrative units to improve their economic future and to life's quality for all residents. Sizing and execution of local government expenditure is extremely important in order to fundament and finance a municipality's development programs as well as determining the efficient use of financial resources.

According to Article 5 of Law 273/2006 on local public finance, funding, sizing and distributing the local expenses on authorizing officers, on destinations, on destinations, respectively activities, programs, projects, goals, tasks, are performed in accordance with the local government's responsabilities, with priorities set by them, for their operation and for local interest. Substantiation and approval of local budget expenditures are made in strict correlation with the real possibilities of local budget revenue collection, which is expected to be made.

Halpern, Weston and Brigfham (1998: 87) believe that the efficiency costs of economic activities can be determined and monitored through cost-benefit or cost-effectiveness analyses. This requires a clear definition of the objectives to be achieved, identify potential resources and technical means that could be taken into account in the design alternatives.

On the other hand, according to the Council's of Europe Report, "Budget and Budgetary Procedures at Local Authority Level Management", in order to analyze the economic efficiency of local public expenditure there must be established indicators of effective use of resources. By using them, one can compare the results obtained in prior periods and even forecasts with the nowadays situation, identifying the specific causes which led to the results found and providing measures to be taken to improve them.

In terms of cost effectiveness analysis of Oradea's expenditure policy, we chose to study the evolution of a series of indicators used in one of Oradea's City Hall documents, namely the "Mayor's Report 2005".

Indicator of the compulsory expenditure is the main indicator of the rigidity of public expenditure and includes personnel costs, subsidies, social spending and public debts. This indicator highlights the share of compulsory expenditure in total expenditure of Oradea Municipality. There is a downward trend during years 2005 - 2012, from 53.58% in 2005 to 23.84% in 2012.
Source: Elaborated by the author according to Oradea City Hall's data
Figure 1. Indicator's of the compulsory expenditure evolution

Indicator of total expenditure with personnel of the city budget reflects the efforts to ensure the necessary funds for paying the salaries financed from local budgets. Throughout the 2005-2009 the salary costs accounted for about half of total local government spending. Their share in total expenditure amount has been constantly declining in recent years, the lowest recorded in the 2012 budget year due to job cuts and public sector wage decreases.

Table 3. Indicator's of total expenses with personnel evolution

Salary expenditure / Total expenditure	2005	2006	2007	2008	2009	2010	2011	2012 Plan
	32.11%	31.60%	31.16%	35.19%	38.45%	33.64%	24.25%	14.65%

Source: Elaborated by the author according to Oradea City Hall's data

Indicator on autonomous personnel expenditure (excluding salaries given for education sector) refers to the amounts allocated by the public authority to pay the administrative personnel and reflects the evolution of their share in total city expenditures. The evolution of this indicator over the period 2005-2012 is a sinuous one, as shown in Table below. According to budget planning, the lowest registration for this indicator will be in 2012, that is 3.16%.

Salary expenditure (no education)/ Total expenditure	2005	2006	2007	2008	2009	2010	2011	2012 Plan
	7.15%	6.65%	8.23%	8.24%	8.38%	7.43%	5.43%	3.16%

Source: Elaborated by the author according to Oradea City Hall's data
Source: Elaborated by the author according to Oradea City Hall's data
Figure 2. Indicator's of personnel expenses evolution

Indicator on public services expenditure highlights the effort of the local budget to finance public services provided by the city of Oradea, including investments made.
Source: Elaborated by the author according to Oradea City Hall's data
Figure 3. Evolution of public services spending indicator

The share of expenditure on public services in local budget expenditures reached highest levels in 2006 and 2010, with a slight decrease in 2011. In 2012, however, the highest value of this indicator in the years analyzed, of 48.66%, is expected.

Indicator of social protection and assistance costs is a measure of local authority's effort to support social policy and programs undertaken, having as target the disadvantaged groups or persons having social problems. Increasing the share of social expenditure in total expenditure during 2007 - 2009 was due to increased direct spending on social assistance, and also to salaries for those persons, goods and services necessary for the provision of these services. In the last two

budget years, this indicator decreased continuously, recording in 2012 the lowest value of 4.70% from the period studied.
Source: Elaborated by the author according to Oradea City Hall's data
Figure 4. Evolution of social protection and assistance costs indicator

Indicator of operating costs represents the evolution of operating expenditure ratio for operation of public services in all local government spending, eliminating the propensity to invest. It is known that these expenses have greater rigidity than the cost of capital for new investments because if officials may decide to postpone the latter in case of shortage of resources, operational expenses cannot be postponed. Note that this indicator has shown a continuous decrease in the last four budget years, with an estimated value of 47.08% in 2012.
Source: Elaborated by the author according to Oradea City Hall's data
Figure 5. Indicator's of operating costs evolution

As expected, taking into account the evolution of the Indicator of operational expenditure, the share of investment expenditure in total expenditure increased continuously during the last four budgetary years, from 17.16% in 2009 to an impressive estimate of 52.92% in 2012, showing a strong preference of local public administration for development.
Source: Elaborated by the author according to Oradea City Hall's data
Figure 6. Evolution of investment costs indicator

III. Conclusions

Given the decrease in the analyzed period of the share of compulsory expenditure in total expenditure by almost 37%, the share of personnel expenses by over 54% and the share of operating expenses by over 44%, and the increased in the same period the share of expenditure on public services in total spending by about 52% and doubling the share of investment expenditure in total expenditure, we conclude that the expenditure policy of Oradea was greatly improved in the period 2005-2012. The analyzed indicators show a greater attention of local government to reducing operational costs and increasing development costs, in its attempt to contribute, to a greater extent, to improving life's quality in the studied administrative-territorial unit.

THE CONTRIBUTION OF BUSINESS CONFIDENCE INDICATORS IN SHORT-TERM FORECASTING OF ECONOMIC DEVELOPMENT

Gagea Mariana
Alexandru Ioan Cuza University of Iasi
Faculty of Economics and Business Administration

Abstract
In this paper we study the usefulness of using confidence indicators derived from business surveys in the assessment of the state of economy and in short-term forecasting. For this purpose, we consider the relationship between the industrial confidence indicator and industrial production index in Romania and other European Union member states. We apply graphic methods to analyze the dynamics of variables considered, cointegration and causality tests, as well as the synchronization analysis of cyclical patterns of the confidence indicator and the industrial production index. The cyclic component of data series is extracted with Hodrick-Prescott filter and the identification of turning points is made with Bry – Boschan procedure. The results indicate that the industrial confidence indicator provides important information on the status and evolution of economic activity, although significant differences were found between the countries analyzed. For Romania, the confidence indicator is not Granger-cause for the reference series and the cycles of the two series do not have a strong synchronization, which restrict the use of the confidence indicator in assessing and forecasting the country's economic activity.

Keywords: confidence indicators, industrial production index, Granger causality test, Hodrick-Prescott filter, Bry-Boschan procedure.

JEL Classification: C22, C53

I.   Introduction

The confidence indicators obtained by means of the business and consumer survey have the role to evaluate and forecast on a short term the status of the economic activity, by economic sectors and as a whole. These indicators are built on the company managers' subjective responses to a series of questions regarding the past and future status of their own activity. One may conclude that, although in many circumstances it provides very useful results, it is still limited by the data quality.

In this paper, we analyze the information provided by the industrial confidence indicator, being the most used indicator in business research. The economic activity is represented by the index of industrial production that, unlike the gross domestic product (GDP) reported quarterly or yearly, has the advantage of being monthly reported.

The hypothesis stating that between the confidence indicator and the reference series there are significant relationships, is verified by means of graphical methods, Johansen cointegration tests (Johansen 1991), Granger causality tests (Granger, 1969), the analysis of the turning points of the business cycles (Bry and Boschan 1991).

The data are analyzed for Romania and other EU (27) member states: Germany, Italy, France. Since in 2005 some modifications have been brought to the computation methodology of confidence indicators aiming to harmonize the data at EU (27) level, the analysis is conducted for the period January 2005-November 2011. The data are taken from the Eurostat website and are processed using the Eviews software program.

II.   A brief review of the literature

In the specialty literature there are numerous works focused on the analysis of the confidence indicators input to the short-term analysis and forecast of the benchmark macroeconomic indicators. Even if many authors state that the confidence indicators have valuable contributions

to the evaluation and forecast of the economic activity, the results obtained are contradictory for different confidence indicators or for different countries.

The authors Santero and Westerlund (1996) studied for a sample composed of 11 world countries, the relationship between various forms of confidence indicators in industry and consumption and macro-economic variables, such as GDP, the industrial production growth and some aggregate demand components. The analysis used cross correlation coefficients, Granger causality tests, turning points of business cycle. The authors' conclusion was that the results obtained for individual countries are difficult to generalize since the indicators convey different information and have a different time-relationship with economic variables in each country.

The relationship between the industrial confidence indicator and the industrial production index was also studied by P. Bengoechea and G.P. Quiros (2004), who proposed a new methodology for dating the business cycle in the euro area economy by means of the industrial confidence indicator considered as a key variable in the identification of the current and future states of the euro area economy.

While several authors such as G. Bruno and M. Malgarini (2002) test the predictive capacity of confidence indicators for the reference series from industry, retail trade, constructions and consumption by using a dynamic factor model, other authors such as A. Paradiso, B.B. Rao and P. Margani (2011) study the relationship between the confidence indicator (CII) and several macroeconomic indicators (GDP, short-term interest rate, industrial production index) in an inverse order, explaining CII in relation to the variables under consideration, by means of the Error Correction Model (ECM).

Other important research in this field was carried out by J. Vanhaelen, L. Dresse (2000), P. Hüfner and M. Schröder (2002), J. Goggin (2008).

III. Research methodology

The preliminary data analysis is conducted by means of graphical methods and Augmented Dickey-Fuller stationarity tests.

The variables cointegration brings an important advantage when undertaking the forecasts through the Error Correction Model (ECM). The verification of the cointegration hypothesis between the confidence indicators and the reference series is performed by means of the Johansen test.

The preciseness of forecasts is obviously improved by the use in the model of Granger-cause variables for the dependent variable. The causality among variables is verified by means of the Granger test (Granger 1969: 424-438). The most difficult problem of the Granger causality test consists in demonstrating the cointegration of the variables and also the estimation of the VAR model when the variables are integrated. The version proposed by Toda – Yamamoto relaxes the stationary hypothesis, through a statistical inference methodology which offers valid estimation parameters even if the VAR model is not cointegrated.

The main function of the confidence indicators resides in forecasting the changes within the economic activity. In this respect, useful information about the relationships between the confidence indicators and the reference series is obtained from the analysis of the turning points of the business cycles. The cyclic component of the data series is extracted by means of the Hodrick-Prescott filter, using Bry-Boschan procedure. In the present paper, we use the definition of the business cycle offered by Burns and Mitchell (1946), according to which, for monthly data, the minimum length of a cycle is comprised between 16 and 22 months, while its maximum duration is between 100 and 106 months. A peak in a monthly series occurs at the time t if:

$$[(y_t - y_{t-7}) > 0, (y_t - y_{t-8}) > 0] \text{ and } [(y_{t+7} - y_t) < 0, (y_{t+8} - y_t) < 0],$$

and a cyclical trough occurs at the time t if:

$$[(y_t - y_{t-7}) < 0, (y_t - y_{t-8}) < 0] \text{ and } [(y_{t+7} - y_t) > 0, (y_{t+8} - y_t) > 0].$$

Taking into account their significance, the confidence indicators are used in forecasts both as a coincident indicator, if they change their tendency at the same time with the reference series, and as a leading indicator, if they change their tendency in advance, systematically anticipating the evolution of the reference series and, therefore, forecasting the appearance of the expansions and of the recessions (Meşter 2007: 129-130).

In order to examine the extent of synchronization between the cycles of confidence indicator and reference series, we use the concordance index developed by Harding and Pagan (2002). The concordance index, written as I_{XY}, is computed using the relation:

$$I_{XY} = \frac{1}{T}\left[\sum_{t=1}^{T}D_t^X D_t^Y + \sum_{t=1}^{T}(1-D_t^X)(1-D_t^Y)\right]$$

where: D_t^X and D_t^Y are dummy variables, having the value 0, if X, respectively Y, are in the recession phase at the t moment and the value 1, if X, respectively Y, are in the expansion stage at the t moment.

IV. Description of the data

The confidence indicators belong to the category of composite indicators obtained by the processing of data from the business and consumer surveys, which are conducted in different sectors of the economy: industry, services, construction and retail trade, as well as consumption. Each confidence indicator is calculated as the arithmetic mean of balances of answers to specific questions selected from the question sets of individual surveys so as to be as correlated as possible to the reference series in the field.

The industrial confidence indicator is the arithmetic average of the balances (in percentage points) of the answers to the questions on production expectations, order books and stocks of finished products (the last with inverted sign). The selection of questions was guided by the aim of achieving an as highly as possible coincident correlation of the confidence indicator with a reference series, such as the industrial production index (European Commission 2007: pp. 16-18). Balances are calculated for the answers to each question as the difference between the positive answers and the negative answers measured in percentages from the total number of answers. The comparability of confidence indicators at EU level is ensured by the joint methodology on the carrying out of business and consumer surveys at the EU (27) member states' level.

In the paper, the economic activity is represented by the industrial production index, expressed as IPI_c, where "c" is the symbol of the country for which the analysis is undertaken: Romania – RO, Germany – DE, Italy – IT, France – FR. The industrial confidence indicator is rendered as CII_c.

V. The results of the research

a) *The preliminary analysis of the data*. The nature and form of the data dynamics are researched by means of a graph and using the ADF stationarity tests.

The graphical analysis of the dynamics of industrial production index in relation to the industry confidence indicator highlights a strong correlation between these variables for France and Italy (Fig. no 3 and 4). In Romania, the two data series are weakly correlated for the entire period under analysis (Fig. no 1), while in Germany a better synchronicity of data can be noticed, after the beginning of the economic crisis which occurred in 2008 (Fig. no. 2).

The results of the ADF tests indicate that all the data series analyzed are non-stationary, integrated of order one, excepting the industry confidence indicator in Germany, which is stationary.

Source: Made by the author
Fig. no 3 *The dynamics for IPI_IT and CII_IT*
Source: Made by the author
Fig. no 4 *The dynamics for IPI_FR and CII_FR*
Source: Made by the author

b) *Cointegration and causality tests*. The Johansen cointegration test is applied between the pair variables CII_c and IPI_c integrated of order one, for the countries: Romania, Italy and France. According to the results obtained, the pairs of variables corresponding to Italy and France are cointegrated (Table no 2). The Granger causality test applied for the cointegrated variables indicates that the confidence indicator is Granger-cause for the industrial production index for the two countries, Italy (Prob.=0.001) and France (Prob.=0.000). when applying the Toda-Yamamoto causality test for the variable pairs corresponding to Romania and Germany, the Schwartz criterion was used in order to identify the optimum lag of the VAR model; it was obtained that CII is Granger-cause for IPI in Germany ($Prob_{DE}$=0.000), but not for Romania ($Prob_{RO}$=0.063).

Table no. 2 Results of Johansen cointegration Test

Variables	Hypothesised No. of CE(s)	Trace statistic	5% Critical value	Prob.
IPI_RO and CII_RO	None	6.252	15.495	0.665
	At most 1	1.885	3.841	0.170
IPI_IT and CII_IT	None	18.560	15.495	0.017
	At most 1	2.889	3.840	0.089
IPI_FR and CII_FR	None	19.244	13.495	0.0130
	At most 1	2.495	3.841	0.1142

Source: Results obtained by processing the data by means of the Eviews program. Made by the author.

c) *Concordance analysis between cyclical patterns of industrial confidence indicators and industrial production index*. The cyclic component of the analyzed data series is extracted by

means of the Hodrick-Prescott filter. The identification of the cyclical turning points for the variables analyzed is performed through the Bry - Boschan procedure (Table no. 3).

Table no. 3 Turning points in the business cycles of CII and IPI, in Romania and other member states of EU (27)

Country	Industrial confidence indicator		Industrial production index

Taking into consideration that the confidence indicators are built so as to obtain immediately information about the evolution of the economic activity, it is desirable that the turning points of the cycle for the confidence in industry should coincide or precede the turning points of the business cycle defined by industrial production index. In our analysis, we do not expect such synchronizations for the moment of the economic and financial crisis break-out in 2008, that the company managers could not have possibly foresee. This hypothesis is confirmed for Romania, Italy and France, where the beginning of the economic crisis is felt by CII a month or two later than IPI. The length of the recession stage caused by the economic crisis was correctly indicated only by CII in France, which anticipated with 3 months the trough level registered by IPI in March 2009.

In Romania, CII forecasts with a month the trough level in 2005 and with 5 months the peak level in 2011. In Germany, CII forecasts with 7 months the trough level from the year 2009 and with 5 months the peak level in 2011. In Italy and France, the turning points of CII are synchronized or anticipated all the turning points of IPI, with at the most 3 months.

The concordance of the cycles of CII and IPI is measured by means of the concordance index proposed by Harding and Pagan (Table no. 4). According to the results obtained, there is a high concordance between the cycles of CII and IPI, for Italy and France and a weaker concordance for Romania and Germany.

Table no. 4 The values of Harding and Pagan's indices between business cycles of CII and IPI, in Romania and other member states of EU(27)

Country	$I_{CII-IPI}$
Romania	0.7590
Germany	0.7108
Italy	0.9518
France	0.9638

Source: Made by the author.

The results of the causality and concordance analysis between the CII and IPI cycles were coherent for Romania, Italy and France. In Germany, even if the causality tests showed that IPI is Granger-cause for IPI, the concordance between the cyclic stages for CII and IPI is quite weak, as it was also indicated by the comparative graphical representation of the two data series.

VI. Conclusion

The graphical analysis has shown the fact that, for all considered countries, the industrial confidence indicator (CII) significantly reflects most of the major changes in the dynamics of the industrial production index (IPI). Thus, being available before the official statistics, CII is useful in identifying the significant changes in the evolution of economic activity, reflected by IPI. On the other side, we can notice that the small changes of IPI in the period between the important turning points are weakly reflected in the changes of CII, which requires precaution when using this indicator for short-term forecasting

According to Granger cointegration and causality tests, the confidence indicator complements the past values of IPI with important information for forecasting, in France and Italy. In Romania, CII is not Granger-cause for IPI, meaning that it does not contain useful information for forecasting economic activity. In order to assess the usefulness of using confidence indicators for forecasting economic activity, we studied the cyclical turning points, verifying if these are coincident or lagged between the data series of CII and IPI. The concordance index of Harding and Pagan displays good cycles' synchronization of CII and IPI for France and Italy.

All the methods used have led to coherent results, showing that CII has an important contribution in forecasting IPI in France and Italy, and a less significant one in Romania and Germany. To conclude, the results of the studies regarding the contribution of the industrial confidence indicator in assessing and forecasting the economic activity have few common points from one country to another and cannot be generalized.

STYLIZED FACTS OF ROMANIAN BUSINESS CYCLE. THE LITERATURE (I)

Meşter Ioana Teodora
University of Oradea, Faculty of Economics

If the more or less regulate moves of the macroeconomic variables are accepted by the economists as a reality, the problem of measuring the aggregate level of the economy in direct correlation with these fluctuations is much more difficult, due to the numerous variables involved.

The way these variables move in time is very different from a period to another as well as from a country to another. While some variables have already reached their maximum level, others are on their descendent slope. This is the reason why the measurement problem of the aggregate level of the macroeconomic activity deserves our attention. Finding the patterns macroeconomic variables move together and influence each other is important both as a theoretical challenge, but for its practical utility as well.

Depending on the result of the measurement process, the authorities are able to conduct their economic policies. More precisely, the monetary or fiscal authority will act differently if the economy is in recession or in expansion. These are the reasons for which a very important phase in the study of the cycle is its descriptive analysis, which is realized by focusing on certain aspects, such as: the length and magnitude, the correlation of the economic variables with the reference series, the study of the cyclical indicators, the analysis of the relative variability of economic series, the diagnose and prevision based on the cyclical indicators.

The first part of this paper presents the relevant literature regarding the evolution of business cycle models as well as the stylized facts of business cycles. In the second part of the paper we'll deal with the most frequent decomposing techniques as well as with the stylized facts for Romania's business cycle. Finally, these stylized facts are used to validate a real business cycle model for the Romanian economy.

Describing Business Cycles

In order to understand why economies are subject to business cycles, it is important to have a good grasp on the empirical regularities (and irregularities) of the key macroeconomic variables that fluctuate as the economy contracts and expands.

One purpose of this paper is to present the quantitative aspects of business cycles, more precisely the depth and duration of both individual and average economic contractions and expansions. The second is to describe the qualitative aspects of business cycles - how different macroeconomic variables move in relation to each other during contractions and expansions. A good understanding of the business cycle data will provide some basic empirical facts that will be used to evaluate the competing theories as well as models that attempt to explain the causes of the cyclical evolution of economies or to provide some forecasts for the future evolution of economies.

Some basic facts

Business cycles are a controversial topic that has been subject to many debates. Economists have not found a consensus on the causes of the cyclical evolution of the economies, the impulses that generate the succession of the phases of a cycle or the propagation methods. Using a variety of econometric techniques, economists have studied a wide range of empirical regularities in macroeconomic fluctuations and business cycles across countries. These stylized facts have often been used as an empirical basis for formulating theoretical models of the business cycle and as a way to discriminate among different types of models.

In the following paragraphs we will make a very short literature review of the evolution of the theories that explain the cyclical evolution of economies as well as their characteristics.

The classical economists were the first to try to give an explanation of the cyclical moves of the macroeconomic variables, but they blamed cycles on exogenous factors, such as war. Jean Charles de Sismondi (1819) was the one that tried for the first time to give a systematic exposition of economic crisis and he believed that the causes of business cycles were overproduction and underconsumption, which were caused in particular by wealth inequalities.

The vision of the classical theory was dramatically contradicted by the realities of the Great Depression. As a response, the Keynesian Macroeconomic models of the 1940's were the first to attain a certain level of explicitness and empirical accuracy. Yet the ability of these models to imitate actual economies has almost nothing to do with their ability to make accurate forecasts, to evaluate how behavior would have differed had certain policies been different in specified ways. The Keynesian paradigm, which reached its highest status toward the end of the 60's, was contradicted by the realities of the market economies so they failed to predict the crises from the 70's. Keynesian models, constructed by simply codifying the decision rules that agents found useful over some previous sample period, without explaining why these rules are used, proved to be of no use in predicting the consequences of policy changes.

Thus we witnessed the resurrection of the controversy between the classical and the Keynesist theories, which lead to a rivalry between two schools, the Real Business Cycles School and the New Keynesian School.

Real business cycles approach originated in the pioneering work of Kydland and Prescott (1982) and Long and Plosser (1983). As Minford and Sofat (2004) argue, this literature was an outgrowth of the equilibrium strategy for business cycle analysis initiated by Lucas (1972, 1973, 1975) and extended by Barro (1976, 1981), but differs from them in two critical aspects. First, RBC models place much more emphasis on mechanisms involving cycle propagation, that is, spreading over time of the effects of a shock and second RBC models emphasize the extent to which shocks that initiate the cycles are real-as opposed to- monetary in origin. Comprehensive reviews of the RBC research by McCallum (1989) and Plosser (1989) have illustrated that despite a number of unresolved issues, the approach successfully explains some of the key empirical regularities that characterize economic fluctuations.

The greatest advantage of the RBC approach is that the structural equations of the model have been derived via an optimization, so that the parameters of the model (preferences and technology) can be regarded as truly "structural" (Minford and Sofat: 2004). We are talking here about an equilibrium model, which is by definition constructed to predict how agents with stable tastes and technology will choose to respond to a new situation and that can be used to analyze how certain macroeconomic variables are likely to respond to economic shocks (Minford and Sofat: 2004). Many extensions have been made to the traditional RBC models, particularly the role of government – Mankiw (1989), Christiano and Eichenbaum (1992), role of money - King and Plosser (1984), Cooley and Hansen (1989).

Stylized facts of business cycles. Cyclical behavior of significant macroeconomic variables

What general properties and relationships can be gathered from studying business cycle data? Documenting the stylized facts or broad regularities on macroeconomic fluctuations could be useful for a number of reasons. The identification of these regularities could be useful for analyzing whether similar empirical regularities are observed across countries with different income levels (Agenor, McDermott, Prasad, 2000). These stylised facts could provide an empirical basis for constructing analytical models of short-run fluctuations that incorporate features particularly important to developing countries. In addition, these findings may have important policy implications, they may also be crucial for designing stabilization and adjustment programs (Agenor, McDermott, Prasad, 2000).

Even though an impressive amount of data about to recessions and expansions had been collected over the years, several basic facts are essential in order to truly understand the properties of a

business cycle (Knoop, 2010). These are presented as follows. *Business cycles are not cyclical.* The term *business cycle* is a misnomer, because it implies that recessions and expansions follow a regular, predictable pattern. The length of one business cycle is not a reliable indicator of the length of the next business cycle. *Business cycles are not symmetrical.* Recessions tend to be characterized by larger changes in output than expansions. Thus, as a general rule, recessions tend to be shorter but with sharper changes in GDP, while expansions tend to be longer but with more gradual changes in GDP. *Business cycles have not changed dramatically over time.* Recessions are somewhat shorter but expansions are significantly longer in the post war period than in the past. This means that recessions have been less frequent than they were in previous eras, though this result has been largely driven by two long expansions in the 1980s and 1990s (Knoop, 2010). *The components of GDP exhibit much different behaviors than GDP itself.* The components of GDP are consumption, investment, government purchases, and net exports. Investment and durable consumption are highly volatile and change more than output over the business cycle, investment has also played a significant part in many of the theories of business cycles. As Knoop argues, government purchases are acyclical and not very volatile. Net exports are slightly countercyclical, meaning that net exports tend to rise during recessions and offset some of the falls in output. However, net exports are not a reliable indicator of peaks and troughs in GDP. *Business cycles are associated with big changes in the labor market.* Unemployment is strongly countercyclical, and changes in employment are much larger during recessions than the changes in other inputs into production. This seems to suggest that any plausible theory of business cycles has to give a prominent role to the cyclical behavior of the labor market (Knoop, 2010).

In order to evaluate and compare competing business cycle models, the evolution of most significant variables has been studied by economists – these variables are unemployment rate, inflation rate, the consumer price index, real wages, interest rates, capacity utilization, productivity, stock prices and the money supply. Out of these, unemployment rate is proved to be countercyclical, wages are acyclical, the rest of the indicators being procyclical and leading indicators.

A quick analysis of GDP and other macroeconomic variables show us that they have a certain common behavior during time, this property being called simultaneous movement or comovement. We are able to classify these movements into 3 different types: *procyclical movements*, if variables move simultaneously, *acyclical movements*, if there is no obvious correlation between the two series and *countercyclical movements*, if the series have a similar behavior but with a certain time lag. A graphical representation of two variables will ease the identification of the variabile type. Here are the three particular situations' graphical representation:
Fig. no. 1. Simultaneous movements of macroeconomic variables
Source: the author

The scatterplot is another graph used for the identification of different correlations between GDP and other significant macroeconomic variables:
Fig. no. 2. Simultaneous movements of macroeconomic variables – identification using the scatterplot

Source: the author

Not all the variables have the same amplitude. We will compare the series' amplitude with the one of GDP chronogramme - Figure no. 3 shows two particular cases.
Fig. no. 3. Business cycle amplitude

Source: the author

The time extent of business cycles is different, but as a general rule it ranges from 2 to 8 years. The length of the business cycle is in positive correlation with its persisance – the longer the cycle, the higher the its persistance, as seen in Figure no. 4.
Fig. no. 4. Business cycle persistance

Source: the author

These graphs are relevant only if they are represented for the macroeconomic aggregates. Unfortunately, hystorical data does not have the same intuitive evolution. When analyzing these

graphs, we search inevitably the turning points (upper or lower ones), comparing them with different variables – their frequency, their correlation in time. When using real data, the turning points are quite difficult to identify, so we need supplementary analysis instruments, in order to reveal the stylised facts of business cycles, and these intruments are statistical ones.

For example, standard deviation measures the volatility of macroeconomic series, as it shows the extent to which series vary from their mean. The higher the standard deviation of a variable, the higher its volatility. Correlation measures the simultaneous movement of two variables. With values that range from -1 to 1, it shows the direction of the relationship between the series. A negative value of the correlation coefficient shows a disincronisation. If the correlation of GDP with another series is close to 1, it proves that the variable is procyclical, while a value close to -1 indicates a countercyclical series. When the correlation coefficient is close to 0, it proves that the series is acyclical. We should also mention here that a correlation that is close to 1 does not indicate that the series are equivalent, as their standard deviation might be significantly different. With the help of these two instruments we will be able to identify the stylised facts of business cycles:

- Comovement: it will be revealed using the correlation of particular macroeconomic series with the GDP as well as with other aggregate variables.
- Amplitude: the standard deviation of a certain variable will not provide useful information unless it is compared to the one of the GDP. In this regard, the comparison between different variables standard deviation will reveal which series is more or less volatile.
- The persisance or the frequency: one of the methods of measuring it is the correlation between a certain variable's values with the its lagged values.
- Simultaneous or lagged deviations are revealed using the correlation coefficient for the simultaneous and lagged series. If the lagged series correlation coefficient is higher than that of the simultaneous series, the variabiles are lagged.

Even though we have presented the main instruments for the analysis of hystorical data, these are not sufficient, as they might not be relevant, for numerous reasons. In order to reveal the true evolution of variables, several decomposition techniques are being used. These techniques, which have as a purpose the separation of the components of macroeconomic variables (trend, cyclical, seasonal and residual component) will be presented in the second part of this paper.

Conclusions

A number of different models developed over the past 250 years have attempted to explain the nature and causes of recessions and depressions. A significant part of these models generate predictions that are more or less consistent with the empirical data. The first part of this paper has presented the relevant literature regarding the evolution of business cycle models as well as the stylized facts of business cycles. In the second part of the paper we'll deal with the most frequent decomposing techniques as well as with the stylized facts for Romania's business cycle. Finally, these stylized facts are used to validate a real business cycle model for the Romanian economy.

STYLIZED FACTS OF ROMANIAN BUSINESS CYCLE. AN EMPIRICAL INVESTIGATION (II)

Meşter Ioana Teodora
University of Oradea, Faculty of Economics

If the more or less regulate moves of the macroeconomic variables are accepted by the economists as a reality, the problem of measuring the aggregate level of the economy in direct correlation with these fluctuations is much more difficult, due to the numerous variables involved. The way these variables move in time is very different from a period to another as well as from a country to another. While some variables have already reached their maximum level, others are on their descendent slope. This is the reason why the measurement problem of the aggregate level of the macroeconomic activity deserves our attention. Finding the patterns macroeconomic variables move together and influence each other is important both as a theoretical challenge, but for its practical utility as well.

These are the reasons for which a very important phase in the study of the cycle is its descriptive analysis, which is realized by focusing on certain aspects, such as: the length and magnitude, the correlation of the economic variables with the reference series, the study of the cyclical indicators, the analysis of the relative variability of economic series, the diagnose and prevision based on the cyclical indicators.

Our paper deals with the stylized facts of Romanian business cycles. In our previous paper we investigated the theoretical aspects regarding the stylized facts of the business cycle. In this second part of our study, we first deal with the most common challenges that economists deal with when handling historical data, we'll present the most common methods to solve these problems. The empirical part of our study begins with an investigation of the stylized facts of Romania's business cycle, then a RBC model is estimated for the same economy. The simulations of the model are compared with the stylized facts of real data.

Keywords: business cycles, stylized facts, comovements, real business cycle
JEL codes: E12

Challenges raised by the use of empirical data

Dealing with real data: in what GDP regards, we can talk about real or nominal data. The nominal GDP is determined using current prices, thus, a rise in nominal GDP might reflect either an increase of price level, or of the consumption. A much more relevant measure of economic activity is real GDP, which is not influenced by prices. Real GDP is determined using constant prices. The same principle can be used when talking about any other macroeconomic variables, except the monetary aggregates, interest rates and, of course, the inflation rate or the consumer prices index.

Dealing with seasonal data: given the fact that we are dealing with the business cycles, it is important for us to identify and separate the different type of frequencies in the hystorical data. Data in december are usually and significantly higher than those in the other months. Statistical techniques are used to eliminate the seasonal component in empirical data. Most of the times, data presented in the official statistics are deseasonalised, but this is not a rule. So before the statistical analysis, seasonality of data should be investigated. The most common used extraction methods of seasonal component are the moving average method, the Census X-11, the X-12 ARIMA as well as TRAMO/SEATS. As Gagea and Ionescu (2008: 356) argue, the last two methods are accepted and recommended, at present, by Statistical Office of the European Union (Eurostat), because they solve the problem of „end points".

Dealing with trends in hystorical data. Another component that has to be eliminated from the hystorical data is its trend. In order to extract the cyclical and trend components several methods had been developped. One that dominates the literature, as Tawadros (2011) argue is the one developped by Hodrick Prescott. Beveridge and Nelson (1981) or Christiano and Fitzgerald (2003), consider the problem of decomposing an observed time series into a sum of its trend component and its cyclical component.

The smoothed trend is the solution to the minimisation problem:

$$\min \sum_{t=1}^{T}\left(X_t - X_t^*\right)^2 + \lambda \sum_{t=2}^{T-1}\left[\left(X_{t+1} - X_t^*\right) - \left(X_t^* - X_{t-1}^*\right)\right]^2$$

where X_t is the initial series, X_t^* is the trend and λ sets the filtering degree of the data. For quarterly data the most common used value for λ is 1600.

An alternative approach is the one proposed by Harvey (1985) – the unobserved components method. The general specification of this decomposition method is:

$$y_t = \mu_t + \varphi_t + \varepsilon_t$$

where y_t is the initial series, μ_t is the trend, φ_t si the cyclical component and ε_t represents the irregular component. The trend is stochastic and linear:

$$\mu_t = \mu_{t-1} + \beta_{t-1} + \eta_t$$
$$\beta_t = \beta_{t-1} + \zeta_t$$

and the cyclical components is

$$\varphi_t = a \cos \theta t + b \sin \theta t$$

Of course, there are numerous developpements and variants of these decomposition methods – for example the non-linear trend-seasonal models or several unobserved components mixed addidive – multiplicative decomposition techniques.

The RBC model – general framework
We will employ the neoclassical RBC model. The representative household maximizes expected lifetime utility given by:

$$U = E_0\left[\sum_{t=0}^{\infty}\beta^t \frac{C_t^{1-\eta} - 1}{1-\eta}\right]$$

where β represents the elasticity of the discount factor with respect to the utility, η - the risk aversion parameter.

The representative agent has to face a budget constraint given by

$$C_t + K_t = Y_t + (1-\delta)K_{t-1}$$

with Y_t – production in t, K - the capital and δ the depreciation rate. The production is assumed to be following the Cobb Douglas specification.

$$Y_t = Z_t K_{t-1}^{1-\alpha} L_t^{\beta}$$

Here L_t represents the labour in t, K_{t-1} - the level of capital in the previous period and Z_t - the level of technological progress. The level of this parameter evolves according to the formula

$$\log Z_t = (1-\rho)\log \overline{Z}_t + \rho \log Z_{t-1} + \varepsilon_t$$

with a ρ coefficient of persistance of technological progress.

There are numerous methods of finding the solution to the model. We will employ Uhlig's (1995) approach, based on the Lagrangian method, in order to derive the First Order Conditions, by computing the first order derivatives of the objective function with respect to the Choice Variables. We derive the steady state solution and then we loglinearise the equations, which will help us obtain the solution to the system.

Data and calibration of the model

Calibration of the model implies the choice of certain parameters in the model. In this regard, we first collected quarterly data for the Romanian economy for 1994 – 2011. We used several of Dobrescu's estimates for the per capita levels of consumption, investments, output and capital stock. Data were first desezonalized using Census X12 and they were expressed in logs. The annual depreciation rate was computed using the level of fixed tangible assets that went out of use during a year, the initial level of fixed tangible assets and the new entries of fixed tangible assets. Our findings confirm Caraiani's (2007: 81) result for the value of depreciation rate of capital of 2,4%.

Empirical analysis

In order to analyze the extent to which our RBC model is consistent with the empirical data we first investigated the stylized facts of Romania's business cycle. For this, we first deseazonalised the quarterly data in logs for selected variables, then we computed the HP decomposition of cyclical and trend components and we studied the standard deviations of variables, the autocorrelation coefficient, as well as the cross correlations (simultaneous and lagged for up to 4 periods ones) between selected variables and GDP. Our results are presented in Table 1.

In order to describe the stylized facts of Romania's business cycle, we first investigated the amplitude of series, taking into account the percentage of standard deviation. Second, as a measure of the degree of persistence of the fluctuations, we have computed the first order autocorrelation coefficient. The lagged cross-correlation coefficient for up to 4 lags were then investigated, in order to identify whether the indicators are leading, coincident or lagged.

	Std. dev.	Autocorr.	Cross correlation with Output								
			t-4	t-3	t-2	t-1	t	t+1	t+2	t+3	t+4
Capital	0,014	0,23	-0,08	-0,04	0,07	0,22	0,32	**0,4**	0,22	0,16	0,06
Consumption	0,015	0,89	0.45	0,54	0,56	0,53	**0,66**	0,43	0,42	0,33	0,26
Interest rate	0,006	0,58	0,09	0,25	0,21	0,57	**0,4**	0,37	0,21	0,22	0,08
Output	0,025	0,64	0,00	0,07	0,14	0,19	1	0,23	**0,33**	0,30	0,29

Table 1. Statistics summary for HP filtered series
Source: author's callculus

In what concerns the amplitude of the movements of selected series, interest rates and capital are the less volatile while consumption is the most volatile variable. The most persistent variable is the consumption, as the first order autocorrelation value is the highest (0,89) and the least persistant is the interest rate. We found that consumption and interest rates are coincident indicators for the evolution of Romania's business cycle, while capital is a lagged one - countercyclical.

These empirical findings are then compared to the simmulations of the RBC model.

	Std. dev.	Autocorr.	Cross correlation with Output								
			t-4	t-3	t-2	t-1	t	t+1	t+2	t+3	t+4
Capital	0,004	0,26	-0,08	-0,03	0,07	0,23	0,3	**0,4**	0,22	0,16	0,06
Consumption	0,011	0,89	0.45	0,54	0,56	0,58	**0,76**	0,53	0,42	0,31	0,26
Interest rate	0,02	0,56	0,08	0,22	0,20	0,45	**0,34**	0,57	0,21	0,25	0,09
Output	0,022	0,63	0,00	0,07	0,14	0,19	1	0,3	**0,43**	0,31	0,28

Table 2. Statistics summary for simulations of the RBC model
Source: author's callculus

The results of the RBC simulation with respect to volatility and cross-correlations are partially valid. Regarding the standard deviations and relative volatility, the model provides very good predictions regarding output and interest rate. Thus, the predicted standard deviation of output is 2.5%, while the real one is 2,2%. The standard deviation of capital stock are not as good, but it is still close to the results for the real data.

Conclusions
This paper had as an objective the presentation of the stylised facts of Romanian business cycle. For this, we first presented the relevant literature review as well as some indicators used to measure these stylised facts and some possible problems that can come up when working with time series. We have presented the most common detrending procedures, Finally we have calibrated and simulated a Real Business Cycle model for Romania, using the neoclassical framework. The simmulations of the models were compared to the real data, with respect to standard deviation, correlations with output.
The results show that the RBC framework can be a starting point in modelling fluctuations in the Romanian economy. While some of the stylized facts of the Romanian economy could not be predicted with the standard RBC, most results are in a close range to those in the real economy.
The RBC offers good predictions regarding the standard deviations of output, capital stock, real return and also regarding the correlations between output and capital or real return. However, it also fails to offer good approximations regarding the consumption volatility or the correlation between consumption and output.

This paper provides an comparative predictive analysis between the models based on the fundamentals with a relationship between exchange rates and fundamentals variable in time by using Bayesian Multivariate Time Series Methods , like Bayesian VAR's being put in evidence the process of Bayesian Inference . The analysis is realized for GBP/USD exchange rate and the prediction realized for h step ahead direct and iterated forecasting and then compared the results between the considered methods .

1. Introduction

A new question to be answered has been put by Meese and Rogoff (1983 a, b) in their initial work when they obtained that the exchange rate models based on economic theory are strikingly outperformed in the process of evaluation and forecasting by the simple driftless Random Walk Model in terms of root mean square forecast errors and mean forecast errors , specially on short term .

Since this classic and what was to become path breaker in the exchange rates research area article , a considerable series of papers have worked to construct exchange rates models that have the ability to outperform the Random walk in the out of sample forecasting performance (Mark (1992); Chinn (1992); Driskill , Mark and Sheffrin 1992 ; MacDonald and Taylor 1993 ; MacDonald and Taylor 1994 ; Chinn and Meese (1995) ; MacDonald 1999 ; Mark 1995 ; Groen 2005 ; Mark and Sul 2001 ; Sweeney 2006 ; Engel , Mark and West (2008) ;Sarno and Valente 2009) , but the problem of the most accurate model for the out of sample estimation between the structural models based on fundamentals and the random walk model still remains not very clear   (Meese and Rogoff 1988 ; Wolff 1989 ; Diebold and Nason 1990 ; Berkovitz and Giorgianni 1996 ; Kilian 1999 ; Kilian and Taylor 2001 ; Faust , Rogers and Wright 2003 ; Cheung , Chinn and Pascual 2003 ; Engel and West 2005 , Engel , Mark and West 2008) .

For example different results were obtained for the short and long term for different authors . Huizinga (1987), Sweeney (2006)   consider the exchange rate movements on long term and finds that on long run the exchange rate dynamic has a mean reversion component made possible by negative correlation of changes (in the dynamic) of the real exchange rate and that mean reversion models beats random walk model on average , (which doesn't happen on short term where the random walk process have been proved to forecast better than the structural models) and for the short term remaining the known random walk process for exchange rate to forecast better than the structural models (Kilian and Taylor (2001)) .

As well, the long run exchange rate movements were proved to be cointegrated with long run movements of other variable considered by researchers like real exchange rates , stock prices ,

industrial production and real wages , relative national prices levels , which is why , the structural models perform better than the random walk model on long term . In the same time (Shiller) , the speculators will , on short time , conduct their actions as function of the fundamentals as well , fact that will affect the exchanges rates on long term as well .

More than that , a number of papers sustained that the results for the models based on fundamentals that perform better in the out of sample forecasting than the random walk model are not very strong or sensitive to the chosen data , historical or in real time and the data vintage for the last case (Kilian (1999) , Groen (1999) , Berkowitz and Giorgianni (2001) , Faust , Rogers and Wright (2003)) .

Besides the exchange rates models based on economic theory perspective , and economic fundamentals , a new direction in economy has been the models based on simple forecasting per se . These models have been approached in a series of articles (Canova 1990 , Carriero and Kapetanios 2008 ,) , models based on the Bayesian analysis , exactly Bayesian Vector Autoregression (BVAR) .

Vector autoregressive (VAR) were introduced by Sims (1972,1980) as an alternative to the large scale statistical macroeconomic models which he argued could benefit in the forecasting procedure from Bayesian methods (prior information) or other mean square error shrinking means in order to improve the estimates of a large number of unconstrained coefficients (by introducing restrictions) , because of the high level of parameter uncertainty and erratic model predictions of VAR's . As a consequence , ulterior research imposes Bayesian restrictions to increase the precision of the parameter estimation and forecasting results , (prior restrictions and extensions in Doan, Litterman, and Sims (1984), Litterman (1986), Sims (1993), Leeper, Sims, and Zha (1996)) (Kadiyala and Karlsson (1997), Robertson and Tallman (1999) , Banbura, Giannone&Reichlin 2007 for reduced form VARs, Sims and Zha (1998) and Waggoner and Zha (2003b) for structural VARs, Kleibergen and van Dijk (1994), Kleibergen and Paap (2002), Strachan (2003), Strachan and Inder (2004), and Villani (2005a) for cointegrated reduced form VARs, and Villani and Warne (2003) for cointegrated structural VARs.) Banbura, Giannone&Reichlin 2007 proved that the Bayesian VAR is an effective and natural tool for forecasting and structural analysis with a set of large information .

If at the beginning the coefficients of the VAR were considered constant , because of the variations in the economy's conditions , shifts in the economy's regimes made it necessary the allowance of time variation in the coefficients which gave birth to the time varying VAR's (TVP-VAR) , the modeling of the error covariance matrix in multivariate time series models which gave birth to the multivariate stochastic volatility models . The time variance of coefficients or the error covariance matrix arose with the problem of over-parameterization so the necessity of introducing restrictions on parameters or shrinking them toward zero , which is called shrinkage into reducing the over-parameterization problem . This can be done by using the Bayesian methods , prior information being a way to obtain the shrinkage necessary to avoid over-parameterization and higher level of estimation and prediction .

Another way of reducing the dimensionality of the model brought by over-parameterization and large series of data used specially in macroeconomic models , is reducing the models into factor models , where all the information is brought down to a few factors . In the case of VAR's , factor methods is expressed in the Factor Augmented VAR's (FAVAR) . As the common VAR, the FAVAR can be used with time varying parameters as well , known as TVP-FAVAR 's . As TVP-VARs , the usage of Bayesian methods is a way to avoid over-parameterization and increase precision in the estimation process . But this type of models will not be studied in this paper .

This paper will present a different perspective of the exchange rate forecasting as a continuity of the Carriero Capetanios 2008 approach , and forecast the exchange rates by using the Bayesian Vector Autoregressive Analysis combined with the economic theory analysis . Because of the

supreme dilemma : Random Walk or Fundamental analysis , the two of them will be brought together in a Bayesian VAR Analysis that will incorporate in the series of data the exchange rate and the fundamentals as well , and it will be considered a priori that exchange rates follow the random walk movement that will be incorporated in the analysis next to the fundamentals base of data . The BVAR will use in this analysis by shrinking the VAR 's coefficients towards a random walk process .

The analysis is made for GBP/USD exchange rate in relationship with a list of fundamentals , the standard monetary fundamentals commonly used in the literature and also variables suggested by the exchange rate theory : the lagged value of GBP/USD exchange rate change , interest rates , trade balances ,net foreign assets . Because of the unpredictable revisions on the data by the agents , there will be used original release data to increase the forecast ability (Christoffersen , Ghysels and Swanson 2001 ; Faust , Rogers and Wright 2001) . The exchange rate forecasting will be made by using a package of Bayesian VAR Models , like : Bayesian VAR with a set of six priors. (The priors considered are Non-informative , Minnesota , Natural conjugate , Independent Normal-Wishart , SSVS in mean-Wishart , SSVS in mean-SSVS in covariance for the common BVAR). As well there are obtained predictions and impulse responses for each model considered . This way there are brought together the economic theory used in exchange rate forecasting , the statistical theory used in macroeconomic theory and the latest observation made about the utility of the real time data in the forecasting process .

The paper is structured as follows . Section 2 describes the VARs ,the shrinkage priors used and methods of finding restrictions with the same purpose , Section 3 describes the data used in this study and the data analysis , Section 4 the results and the results interpretation and Section 5 the conclusions .

2. The Bayesian VARs
The VAR models were used since 1972/1980 when they were introduced by Sims , with applications in macroeconomics . Carriero and Kapetanios's Bayesian VAR for exchange rate forecasting approach put in light a new perspective of the exchange rate's forecasting methodology by using the task of forecasting the exchange rate per se , without the consideration of economic theory or using the fundamentals in this process .

This paper brings the two approaches together and combines the VAR methodology with the economic one in order to perform the exchange rate forecasting .

The Models
Bayesian VARs
Let's consider the specifications for the VAR model . If y_t , $t = \overline{1,T}$, $t \in \mathbb{N}$ is a vector of N series of variables $y_{1,t}\ y_{2,t} \ldots y_{N,t}$ ($y_{\cdot,t}$: the GBP exchange rate change vis a vis the US Dollar at time t , the first Lag of the GBP exchange rate change vis a vis the US Dollar at time t , the deviation from a canonical monetary fundamentals model (Mark 1995) , the interest rate differential on short and long term , the net foreign asset position NFA_t of the US relative to the foreign country UK , the US trade balance tb_t and the UK balance tb_t^* (Sarno and Valente 2009)) , a_0 an $N \times 1$ vector of intercepts and A_j a $N \times N$ matrix of coefficients , ε_t an $N \times 1$ vector of errors/white noise i.i.d. $\sim Normal(0, \Sigma)$ then $VAR(p)$ process will be :

$$y_t = a_0 + \sum_{i=1}^{p} A_i y_{t-i} + \varepsilon_t$$

The reduced form for this VAR will be: $Y = X * A + E$ with: $Y : T \times N$ matrix of N variables at time $= \overline{1,T}$, $X = [x_1\ x_2 \ldots x_T]' \in T \times (1 + Np)$ matrix , $x_t = (1, y'_{t-1}, \ldots y'_{t-p})$

$A = (a_0\ A_1 \ldots A_p)'$ $E : T \times N$ matrix of errors ε_t ,

and for $\alpha = vec(A) \in (1 + Np) N \times 1 : y = (I_N \otimes X) \alpha + \varepsilon \quad \varepsilon \sim Normal(0, \Sigma \otimes I_T)$

Having the probability density function of the data conditional on the parameters of the considered model , which are contained in the form of the likelihood function , will give the latest one in the following form :

$$L = p(y|\alpha, \Sigma) = |\Sigma|^{-T/2} \exp\left\{-\frac{1}{2}[y - (I_N \otimes X)\hat{\alpha}]' \Sigma^{-1}[y - (I_N \otimes X)\hat{\alpha}]\right\}$$

The conditional posterior distributions for α with Σ known will be : $\alpha|\Sigma, y \sim Normal(\hat{\alpha}, \Sigma \otimes (X'X)^{-1})$ and $\Sigma^{-1}|y \sim Wishart(\sigma^{-1}, T - (1 + Np) - N - 1)$ where $\hat{A}$ is obtained by OLS method and is on the form $\hat{A} = (X'X)^{-1}X'Y$ and $\hat{\alpha} = vec(\hat{A})$ and $\sigma = (Y - X\hat{A})'(Y - X\hat{A})$.

Priors

The considered priors in this model will be The Diffuse Prior , The Minnesota Prior or Normal Wishart Restricted , The Natural Conjugate Prior or Normal Wishart , The Independent Normal –Wishart Prior and the Stochastic Search Variable Selection Prior (SSVS in mean - Wishart and SSVS in mean - SSVS in covariance) .

Prior 1 . The Diffuse Prior

The diffuse or Jeffrey's Prior …for α and Σ is : $p(\alpha, \Sigma) \sim |\Sigma|^{-(N+1)/2}$ which , being used in the VAR model considered will get the posterior distribution which is of the form :

$\alpha|\Sigma, y \sim N(\hat{\alpha}, \Sigma)$, $\Sigma|y \sim IWishart(\hat{\sigma}, T - (1 + Np))$

The prior distribution for the case the unknown parameters are α , Σ will be : $f(\alpha, \Sigma) = f(\alpha|\Sigma)f(\Sigma)$ and the joint posterior distribution will be $f(\alpha, \Sigma|y) = f(\alpha|\Sigma, y)f(\Sigma|y)$ where $f(\alpha|\Sigma, y) = N(\hat{\alpha}, \Sigma \otimes (X'X)^{-1})$.

The values for $\hat{\alpha}$, $\hat{\sigma}$ will be obtained as earlier précised , in the OLS estimation procedure .

Prior 2. The Minnesota Prior

The Minnesota Prior is a common prior used in the Bayesian VAR models introduced in the early literature by Doan , Litterman and Sims (1984) and later Litterman (1986) . This is based on the assumption that the variance –covariance matrix is replaced with an estimate $\hat{\Sigma}$, more than that this was initiated as being fixed at $\hat{\Sigma}$ and diagonal (the elements on the diagonal being brought by the OLS estimates of the error variance , for the first equation the variance from the first line in the diagonal matrix and so on) , lately the assumption of diagonal matrix being relaxed by a simple estimate of the error variance σ/T .

The problem remains the estimation of the vector α with Σ known as considered earlier , problem solved by Litterman (1986) with the assumption $\alpha \sim N(\underline{\alpha}, \underline{V})$ or $p(\alpha) = N(\underline{\alpha}, \underline{V})$ where $\underline{\alpha}$ represents the prior mean and $\underline{V}$ the variance-covariance matrix of the α .

For the purpose of avoiding the over-fitting problem and to ensure the shrinkage of the VAR coefficients to zero , the prior mean $\underline{\alpha}$ will in the case of the Minnesota Prior be set to zero , or in the case of level data will be set to ensure the random walk process of the variables involved in the VAR or for the variables (individual) to follow random walk process .

Because the exchange rate evaluation and forecasting literature implies the random walk/fundamentals choice dilemma , will in this care be considered the second case , where the individual variables follow a random walk process and because there are used fundamental data as well , the prior mean for the coefficient on the first own lag be set to 0.9 <1 (high persistence , no unit root)

Regarding the variance –covariance matrix , the Minnesota Prior assumes for it the restriction to be a fixed , diagonal matrix , ignoring any uncertainty in this parameter .

But , despite this , the considerable advantage that deserves to be mentioned is the fact that the posterior distribution for α that it leads to , will make use only of Normal distribution :

$$\alpha \mid y \sim N\left(\overline{\alpha}, \overline{V}\right) \text{ where } \overline{V} = \left[\underline{V}^{-1} + \hat{\Sigma}^{-1} \otimes (X'X)\right]^{-1} \text{ and } \overline{\alpha} = \overline{V}\left[\underline{V}^{-1}\underline{\alpha} + \left(\hat{\Sigma}^{-1} \otimes X\right)'y\right]$$

Prior 3. The Normal Wishart Prior / Natural Conjugate Prior

The Normal –Wishart Prior is a solution for the restriction imposed by the Minnesota Prior for the Variance-covariance error matrix and relaxes the assumption of fixed and diagonal variance-covariance matrix of residuals and it represents the natural conjugate prior for normal data . It assumes that the prior , posterior and the likelihood function belong to the same family of distributions .

This means that for the considered VAR , The Normal Wishart Prior will be : $\alpha \mid \Sigma \sim N\left(\underline{\alpha}, \Sigma \otimes \underline{V}\right)$ with $\Sigma^{-1} \sim W\left(\underline{\sigma}^{-1}, \underline{n}\right)$ where $\underline{\alpha}, \underline{V}, \underline{\sigma}^{-1}, \underline{n}$ are chosen , the unconditional prior distribution is normal with prior mean $\underline{\alpha}$, variance $\left(\underline{n} - N - 1\right)^{-1}\underline{\sigma}^{-1} \otimes \underline{V}$, where $\underline{n}$ represents the degrees of freedom of the IW and $\underline{n} > N+1$.

Given the Prior distribution for the VAR parameters , the posterior distribution for α will be : $\alpha \mid \Sigma, y \sim N\left(\overline{\alpha}, \Sigma \otimes \overline{V}\right)$ with the one for Σ : $\Sigma^{-1} \mid y = W\left(\overline{\sigma}^{-1}, \overline{n}\right)$ where $\overline{V} = \left[\underline{V}^{-1} + X'X\right]^{-1}$, $\overline{A} = \overline{V}\left[\underline{V}^{-1}\underline{A} + X'X\hat{A}\right]$, $\overline{\alpha} = vec\left(\overline{A}\right)$, $\overline{\sigma} = \sigma + \underline{\sigma} + \hat{A}'X'X\hat{A} + \underline{A}'\underline{V}^{-1}\underline{A} - \overline{A}'\left(\underline{V}^{-1} + X'X\right)\overline{A}$ and $\overline{\sigma} = T + \underline{\sigma}$.

Integrating Σ out of the joint posterior , the marginal posterior for the vector of coefficients α will be a multivariate t-Student distribution with mean $\overline{\alpha}$ covariance matrix $\overline{\sigma} \otimes \overline{V}\left(1/\overline{n} - N - 1\right)$ and degrees of freedom $\overline{n}$ and it's posterior inference can be realized (Kadiyala and Karlsson 1997 , Koop and Korobilis 2010) .

Because the Normal Wishart Prior assumes giving values for $\underline{\alpha}$, $\underline{\sigma}$, $\underline{V}$ and $\underline{n}$, in the literature usually $\underline{\alpha}$ depends on the hyper-parameter responsible for the mean for the first lag of the endogenous variable , $\underline{V}$ is a diagonal matrix ,… the degrees of freedom are chosen in respect to the prior variance of the parameters in the regression . This way , by contrast to the non informative prior which doesn't do any shrinkage needed in VAR procedure , for Normal Wishart Prior it becomes possible , with no posterior simulation methods (for the linear functions) to obtain the Bayesian evaluation and forecasting . Impulse-response will be obtained by Monte Carlo Procedures , by using the posterior distribution for α .

As précised in their monologue , Koop and Korobilis (2010) conclude as properties of the Normal Wishart Prior , the fact that every equation must keep the same explanatory variables , which is an disadvantage for the restricted VAR (in the macroeconomic models) and as well the prior covariance of the coefficients between equations must be proportional , which as well could be restrictive for the researcher , by comparison to the Minnesota Prior . But , the advantages are considerable and able to compensate in different situations , because , the Natural Wishart Prior provides the researcher with analytical results and in not necessary posterior simulation in the evaluation and forecasting process .

Prior 4. The independent Normal –Wishart Prior

In contrast with the Normal –Wishart Prior the Independent Normal Wishart Prior provides an evaluation that repairs the disadvantages of the earlier mentioned , by allowing the VAR coefficients and the error covariance to be independent of one another as well as to have different variables in different equations .

In this case , for any $n = \overline{1, N}$ variables , the VAR is :

$y_{nt} = a_{n0} + \sum_{i=1}^{p} A_{ni} y_{n(t-i)} + \varepsilon_{nt} = x'_{nt} a_n + \varepsilon_{nt}$ for any moment in time/obs. $t = \overline{1,T}$, where x_{nt} represents a l_n -vector of explanatory variables for the l_n'th variable a_n represents a l_n -vector of coefficients

For $x'_{nt} = \left(1, y'_{(t-1)}, \dots, y'_{(t-p)} \right)$, results the unrestricted VAR(p) for any $n = \overline{1,N}$ variables

Considering these , the reduced form for the VAR(p) will be :

$$y_t = X_t\, a + \varepsilon_t = \begin{pmatrix} x'_{1t} & 0 & 0 & \cdots & 0 & 0 \\ 0 & x'_{2t} & 0 & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & 0 & 0 & \cdots & 0 & x'_{Nt} \end{pmatrix} \begin{pmatrix} a_1 \\ a_2 \\ \vdots \\ a_N \end{pmatrix} + \begin{pmatrix} \varepsilon_{1t} \\ \varepsilon_{2t} \\ \vdots \\ \varepsilon_{Nt} \end{pmatrix} = \begin{pmatrix} y_{1t} \\ y_{2t} \\ \vdots \\ y_{Nt} \end{pmatrix} \quad (\forall) t = \overline{1,T}$$

$l = \sum_{n=1}^{N} l_n$, $N \times l$ $l \times 1$ $N \times 1$ $N \times 1$
$\varepsilon_t\ i.i.d. \sim N(0,\Sigma)$
 and $y = X\,a + \varepsilon$ where $y_t = (y_1, \dots, y_T)'$, $X = (X_1, \dots X_T)'$, $\varepsilon = (\varepsilon_1, \dots \varepsilon_T)' \sim N(0, I \otimes \Sigma$

The independent Normal Wishart Prior will have the form :
$$p(a, \Sigma^{-1}) = p(a)\, p(\Sigma^{-1}) \text{ where } a \sim N(\underline{a}, \underline{V}) \text{ and } \Sigma^{-1} \sim W(\underline{\sigma}^{-1}, \underline{n})$$
It is important to put in evidence the fact that $\underline{a}$ and $\underline{V}$ can be any chosen value , by contrast to the Normal Wishart Prior which is more restrictive and asks a certain form , more than that in the Independent Normal Wishart Prior can be set as the Minnesota Prior or as the Non Informative/Diffuse Prior by setting $\underline{n} = \underline{\sigma} = \underline{V}^{-1} = 0$.

The conditional posterior distributions are :

$a|y, \Sigma^{-1} \sim N(\overline{a}, \overline{V})$ with $\overline{V} = \left(\underline{V}^{-1} + \sum_{t=1}^{T} X'_t \Sigma^{-1} X_t\right)^{-1}$ and $\overline{a} = \overline{V}\left(\underline{V}^{-1}\underline{a} + \right.$ $t=1TX_t'\ \Sigma-1\ y_t$ $\Sigma-1\ |y, a \sim W\sigma-1, n$ with $n=T+ n$ and $\sigma= \sigma + t=1Ty_t- X_t\ a$ $y_t- X_t\ a'$

In this case , the analytical results are not available, being necessary to perform posterior simulation , the estimation and prediction and comparison between models by marginal likelihoods being realized by using the Gibbs Sampler .

The one step ahead   predictive density   conditional on the parameters of the model and the previous data / lags for the dependent and exogenous variables , other way called Filter will be $y_t \mid X_t, a, \Sigma \sim N(X_t, a, \Sigma)$. The role of the Gibbs Sampling is to produce draws $a^{(k)}$ and Σ^k where $k = \overline{1,K}$,   by knowing the distributions for a , Σ . The purpose will be to create predictive inference , for example $E(y_\tau | X_\tau) = \dfrac{\sum_{k=1}^{K} X_t a^{(k)}}{K}$.

By Gibbs Sampling can be done predictive simulation, very demanding computationally .
For forecast intervals bigger than one , the procedure can be done by direct and iterated forecasting .
Prior 5 and Prior 6: The Stochastic Search Variable Selection Prior (5. SSVS in mean - Wishart and 6. SSVS in mean - SSVS in covariance) . for VAR's is realized as it is described in the monograph of Koop and Korobilis 2010 .

3. Data and Data Analysis
The data consists in real time quarterly data , more exactly the income (gross domestic product) , money supply , the interest rate on short and long term , the trade balances , all for United Kingdom and US , the net foreign assets between US and UK ,   and the spot exchange rates for the US dollar vis a vis the UK sterling .
The data chosen is between 1977 Q1 and 2010 Q4 , it covers most of the floating exchange rate regime and we start in 1977 because of the availability of net exchange rate in US Treasury

Bulletin , the others data being available . From 1977 Q1 till 1999 Q2 there are the historical data , from 1999 Q3 till 2010 Q4 there are the real time data . From all this interval, from 1977 Q1 till 1999 Q2 and with the first real time data in 1999 Q3 till 2010Q4   .

The evaluation is made as follow : the interval from 1977 Q1 till 1999 Q2 and with the first real time data in 1999 Q3 , will be split in 2/3 and 1/3 , for the first part of 2/3 it will be made the evaluation and for the last 1/3 will be made the prediction . the same with the other quarters for the historical data from 1977 Q1 till 1999 Q2 will again be taken and with the next two real time data and the interval split in three parts , and for the first two made the evaluation and the next one the forecasting , and so on , until the last real time data . What it is to be considered is that when the split   intervals are not integer numbers , then it will be taken the integer part every time .

The description of the data

The historical (revised) data will be from 1977 Q1 till 1999 Q2 OECD Statistics, the real time data used in evaluation from 1999 Q3 till 2010 Q4 , which means 46 vintages for UK and US , is taken from OECD Statistics Main Economic Indicators , for the quarterly data in the published issues of January , April , July and October , and for the monthly ones , they were transformed into quarterly for the months January , April , July and October , knowing the rule : the flow data is summed for the three months and the stock data is arithmetic averaged at every three months .

The exchange rates for UK and USA are from OECD , quarterly data , seasonally adjusted , 4 quarters a year , we are interested in the US dollar vis a vis the UK sterling , the sate are detrended and transformed in natural logarithms .

The GDP for USA are taken from OECD, the data are quarterly between August 2002 and October 2006 , till September 2002 and from November 2006 the quarterly data are at annual level , so they will be brought at quarterly levels .   The GDP for UK are taken from OECD , the data are quarterly at annual levels prior to September 2002 and after this data they are quarterly at quarterly levels .   The data is expressed in national currency , seasonally adjusted and transformed in natural logarithms   , for both countries.

The CPI for USA are taken from OECD Statistics Main Economic Indicators , the data are monthly and transformed into quarterly data ,   The CPI for UK   the same . In this way there were calculated the real data for the GDP UK and USA by having the CPI data .

The Money Supply for USA   it refers to the monetary base data , the seasonally adjusted data will be obtained from the Federal Reserve Bank of Philadelphia , M1 Money stock , Quarterly Vintages . The Money Supply for UK , there are used seasonally adjusted M1 plus quasi money till 1989 Q4 vintage and M2 after that moment because the lack of M1 for the full sample , and after that , we'll use M3 data , from OECD Statistics . The data is transformed in natural logarithms   .

The interest rates are from the International Monetary Fund Data Base , for Short Term were being used the Treasury Bill Rates for UK and USA , and for Long Term have been used Government Bond Yields for UK and USA , per cent per year , they have been continuously compounded per quarter from 1977 Q1 till Q4 2010 .

The trade balances : the seasonally adjusted data in the national currency of the USA and UK are from OECD Statistics Main Economic Indicators , calculated by the difference between the Export and Import for every country , in real time data , since 1977 Q2 till 1999 Q2 being the historical data and then , since Q3 1999 till Q4 2010 being the real time data . For Imports as well as for exports , the data is at annual levels since 1977 until 2010 Q4 for USA , and for UK since 1977 till March 2003 were at annual levels and since March 2003 until 2010 were quarterly levels . The data are de-trended .

The Net Foreign Assets data , referring to the international capital movements, were taken from the US Department of the Treasury , Treasury International Capital System (TIC) , US

Transaction in long-term foreign and domestic securities using the past issues of the US Treasury Bulletin , published in March , June , September and December since 1977 till 2010 . The data describes the transactions in US by foreigners and in the foreign countries by residents in US . The data was shared in monthly sales and purchases from and to US residents , they are summed up , transformed into quarterly data by summing the data on every 3 months , obtained the vintages purchases and sales per quarter from 1977 till 2010 , de-trended by Hodrick Prescott Filter in logarithms , and obtained the NFA on quarters by making the difference between the sales and purchases after those transformations . We'll have 46 vintages of NFA quarterly data .

The data is used as follow : the regressors are the next ones : the once lagged nominal exchange rate change ; the deviation described by Mark 1995 on the form $mf_t = (m_t - m_t^*) - (y_t - y_t^*)$ where the first bracket is the difference between the monetary base in the domestic country, here US and the foreign country , here UK ; the interest rate on short term differential (uncovered interest rate parity) between the domestic country and the foreign one $(r_t - r_t^*)$; the interest rate on long term differential (inflation) between the domestic and the foreign country $(R_t - R_t^*)$; the US (domestic country) trade balance TB_t ; the UK (foreign country) trade balance TB_t^* ; the Net Foreign Assets position of the domestic country US relative to the foreign country UK NFA_t .

Every regressor is tested for unit root behavior , by using NG and Perron tests with MZ_α and MZ_t and except the exchange rate and NFA they are stationared by differenciating the series already obtained . The stationarity of the date we have now has the signifficance that the change in the exchange rates is stationary and the conclusion of cointegration of the monetary fundamentals and the rest of regressors with the exchange rate dynamics .

The number of lags considered for the model will be calculated by using the VAR Lag Order Selection Criteria provided by Eviews , for each quarter since 1999Q3 till 2010Q4 . The decisive criteria between Sequential Modified LR test statistic , Final Prediction Error , Akaike Information criterion , Schwartz Information Criterion and Hannan-Quinn Information Criterion is Schwarts Information Criterion which will provide us with the smallest lag necessary in the VAR evaluation .

5. Results

The BVAR Models have been a very important source used in the macroeconomic evaluation and for a very short time in the exchange rate evaluation and prediction . Since Meese and Rogoff's seminal work in 1983, the exchange rate evaluation and forecasting was put into question from the point of view of the choice between the best prediction out of sample results between the random walk model and the models based on fundamentals . The exchange rate prediction by using fundamentals developed since 1983 in a very advanced way but the dilemma between choosing an random walk evaluation and prediction of the exchange rate and a model based on fundamentals is still a constant .

The approach of the exchange rate evaluation and prediction in this article implies a model based on Bayesian VARs that has been used with great success in the macroeconomic forecasting , lately , for exchange tare forecasting (Carriero , Kapetanios and Marcellino 2008).

Certain specifications for the considered model need to be précised : the Bayesian VAR is considered to have an intercept (different from zero) , the lags calculated conforming to Schwartz Criterion and the simulation realized 50 times for every quarter .

The forecasting procedure realized as well direct as iterated , the differences between the two types of forecasting put in light . As well , the evaluation was realized for 2/3 of the time interval considered and for the rest 1/3 the forecasting procedure , with the historic data from 1977Q1 till 1999Q2 and real time data from 1999Q3 till 2012Q4 .

The priors used in the BVAR model are : the Non informative , Minnesota , Natural Conjugate , Independent Normal-Wishart , Stochastic Search Variable Selection in Mean –Wishart ,

Stochastic Search Variable Selection in Mean - Stochastic Search Variable Selection in covariance Prior .

For the first three priors , Non informative , Minnesota and Natural Conjugate , analytical posterior and predictive results are available and for the last three , Independent Normal-Wishart , Stochastic Search Variable Selection in Mean –Wishart and Stochastic Search Variable Selection in Mean - Stochastic Search Variable Selection in covariance Prior , predictive and posterior simulation is necessary . For this, 50000 MCMC draws have been used and in these 20000 are discarded as burn-in draws .

There are computed the Impulse Responses to Shocks for the same 1/3 of the time interval that is used for forecasting . Impulse Responses are non linear functions of the VAR coefficients and the variance covariance matrix and they need in evaluation posterior simulation methods for all six priors considered in this exercise . The Impulse Responses are obtained by considering C_0 lower triangular and the dependent variables , in the standard identifying assumption used (Bernanke and Mihov 1998 , Christiano , Eichanbaum and Evans 1999 , Primiceri 2005) are in the order : the exchange rate dynamic , first lag for the exchange rate dynamic , the monetary fundamental , interest rate on short time , Trade Balance US , Trade Balance UK , Net Foreign Assets . This order will allow for the interpretation of the variables shocks on the exchange rate of interest .

The next results are for the first quarter Q3 1999 , the procedure being repeated and the final results put in evidence .

BVAR Model with Non Informative Prior

The coefficients obtained by OLS Estimation for the first quarter for the BVAR Model with Non Informative Prior , even if not an very high interest are , are for the direct and iterated forecasting :

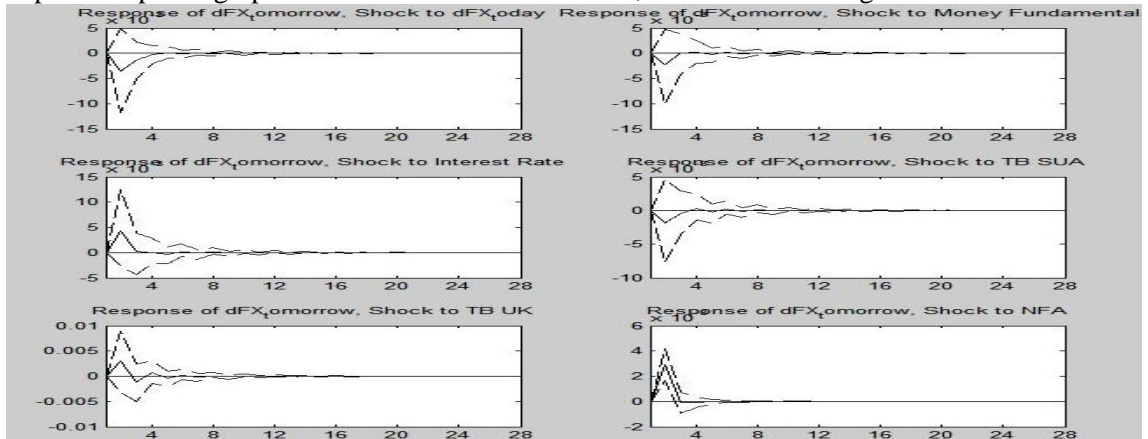
For the following quarters the results will be different from this one , the advantage of using the real time data being the fact that one can use this type of evaluation of each period with the data ones has at the present moment and the best results can obtained with different models each quarter or period considered by the researcher .

For the Impulse Response function, are followed the influence of the shocks for the variables in the VAR on the exchange rate dynamic .

The histograms for the data for the first prior :
Impulse response graphics :   Non Informative Prior , Direct Forecasting :


Iterated :
Minnesota Prior will obtain the same results as the Non Informative Prior in the Impulse response function .

For the SSVS in mean –SSVS in covariance, direct forecasting Impulse Response Function :
As we can see , the results are different for each BVAR Model considered , with the six Priors : Non informative , Minnesota and Natural Conjugate , analytical posterior and predictive results are available and for the last three , Independent Normal-Wishart , Stochastic Search Variable Selection in Mean –Wishart and Stochastic Search Variable Selection in Mean - Stochastic Search Variable Selection in covariance Prior .

For each quarter different results are obtained , so , the models need to be interchanged with the new information that appears on the market , specially because the agents don't have the ability to predict the modification the data will suffer , and they need to use the unrevised data , that is present on the market .

Table 1

The RMSFE for the exchange rate , the RMSFE for the whole VAR and the logarithm of the predictive likelihood are presented in Table 1 . The first column represents the quarter for which the prediction error is made , the second column the RMSFE for the exchange rate , the third one represents the best model for that quarter with the RMSFE obtained in the second column , out of the 12 models : VAR with 1-6 priors on direct and iterated forecast . The RMSFE for the exchange rate has the following graphic :
Graphic 1

And the frequency for each model will be :

FREQUENCY	
prior 1 , direct	3
prior 1, iterated	8
prior 2, direct	2
prior 2, iterated	12
prior 3, direct	8
prior 3, iterated	0
prior 4, direct	3
prior 4 , iterated	0
prior 5, direct	3
prior 5, iterated	0
prior 6, direct	4
prior 6, iterated	3
	46

Table 1*

From the Table 1* , we can conclude the most frequent model to have the smallest RMSFE are VAR with prior 2, iterated forecasting followed by VAR with prior 1 , iterated forecasting and VAR with prior 3, direct forecasting .

Column 4 in the Table 1 , show the RMSFE values for the best model for the entire VAR model , and the following one the best model, what VAR prior and forecasting type bring the smallest RMSFE for each quarter . As we can see , the results for The Best Model are different from the Best Model for the exchange rate forecasting .

In this case , the RMSFE graphic will be :
Graphic 2

Where the horizontal axes refers to the quarters (number), being all up to 46 quarters , and on the vertical axes are shown the RMSFE values . As we can see, there is a certain correlation between the RMSFE for the exchange rates and for the whole VAR , of 0.3791 .

The last two columns represent the logarithm of the predictive likelihood , which refers to the category our VAR model has the highest probability to be included in .

The graphic for the logarithm of the predictive likelihood values will be the following :
Graphic 3

From Graphic 2 and Graphic 3, we can see the negative correlation between the RMSFE for the whole VAR and for log(predictive likelihood) , the value of this correlation being quite high , of -0.73055 .

As this results suggest , for different statistics , different models are to become the best for different quarters . As well , the same model is not the best one for the whole period of time considered , it is not able to perform better than all the others for a long period of time , once again , this model allowing for swifts and swings in the underlying data , the variability of the parameters values and quality (distribution) between quarters .

6. Conclusion

This study concentrated on an empirical analysis which takes into account the heterogeneity in the market participant preferences , who attach different weights to different fundamentals in different moments in time .

This article allows for a menu of fundamentals more complex than Mark's (1995) standard approach , comprising other variables suggested by the macroeconomic theory as interest rate differential , the trade balance and net foreign assets . The data are considered in real time , with the purpose of presenting the real picture of data that the market participants had at their disposal in the moment the forecasting was done , they being unable to predict the revisions that were following in the data .

The chosen models are a series of BVARs , with : Non informative , Minnesota and Natural Conjugate , analytical posterior and predictive results are available and for the last three , Independent Normal-Wishart , Stochastic Search Variable Selection in Mean –Wishart and Stochastic Search Variable Selection in Mean - Stochastic Search Variable Selection in covariance Prior , for each model different results obtained , as a function of the model , data and time .

Our findings are as follows : the best BVAR   model is chosen by the researcher for every quarter considered , so the models will not predict with the same quality for all the quarters , but they offer to the researcher the possibility to change from one quarter to another the best model as well , as the data on the market changes and the shifts on the market and in participants preferences .

 The Exchange rate forecasting remains as hard today as in the seminal work developed by Meese and Rogoff in 1983 , and well approximated by a driftless random walk for prediction purposes . The models based on fundamentals needed a high level of complexity and developed until today and proved to be successful in certain cases , reason for which new approaches are accosted and new directions are developed in time , that will increase the forecasting quality and precision .

THE IMPACT OF INVESTMENTS, EXPORTS, AND OPENNESS ON ECONOMIC GROWTH. A COMPARATIVE STUDY ON THE EAST EUROPEAN COUNTRIES

Simuţ Ramona Marinela
University of Oradea
Faculty of Economics

The study of the economic growth process has old implications. The preoccupation for the study of the economic growth has existed beginning with the representatives of the Classical School and continuing with the Keynesians, Neokeynesians, and Neoclassics. A series of empirical studies have tested the correlation between the dynamics of the different factors and the process of economic growth.
This paper examines the role of investments, export and openness in relation to economic growth for the East European countries using trimestrial data from the Eurostat as well as National Statistical Institute. Also this study has the objective to estimate whith the help of two linear regressions the impact that this 3 variable has on economic growth. The study shows that the most important variable in all the east European countries was the investment from the model that include economic openness as exogen variable.

1. Introduction

The study of the economic growth process has old implications. Starting from the representatives of the classical school – A. Smith, D. Ricardo and Th. Malthus – there have been interests in the study of economic growth. In Malthaus's concept – taking into consideration the limited land available and of the growing population – the balance is achieved when the income is diminished to a level in which the labor force offer rises with a lower rhythm, and the economy is maintained at a stationary status. In their models, the classics omitted the contribution of technological progress to the growth of production per inhabitant. (Socol 2006: 62).

The neoclassic model of Solow represents the fundamental basis in the analysis of the economic growth process. Through this model, the neoclassic show us today the model in which the growth of the savings rate, the population growth, and the technological progress influences the level of production and economic growth in a given time period (Marin and Socol 2006: 122). The neoclassical Solow-Swan model is based on the exogenous aspects of economic growth, based on the attaining of economic convergence between the countries. In his study, Solow starts from the following hypothesis: the capital is submitted to decreasing capacities; the countries with the same demographic growth, technological progress and rate of investments, will have incomes which will converge towards the one from the most developed country; the scale capacities are constant; the technological process is considered to be exogenous; the economy is perfectly competitional as well as the perfect mobility of the production factors (Marinaş 2010: 79-80).

The concept of the inherent unstableness of economy can be found in the Keynesian and Neokeynesian growth models. The element of stability is provided by state intervention. Economic growth is possible, according to these models, through the use of budgetary and monetary policies. The stationary level of economy and its tendency towards complete usage is described in the Neoclassic growth theory. The starting point in the Neoclassic theory is represented by the micro-economic level, meaning that is starts from the preferences of the households, the structure of the market the companies production function. The national income is impacted in the short term by investments, through the aggregated demand. However, long term effects are provided by the growth of the potential national income (Socol 2006: 62). On the long run, the technological modifications represent the main cause of economic growth, together with the capital investments and the new technologies (Angelescu 2006: 89).

The interest for the theory of economic growth reignited with Romer's researches, giving birth to the second generation of models, significantly improving the first ones, as they attempt to explain aspects related to dates which had not been discussed in the neoclassical model, giving a more satisfactory explanation for the differences between the rates of economic growth in different countries, paying a central attention to gathering of know-how as well as they give an increased role to the instruments of the macro-economical policies in the explanation of the growth process (Scarlat and Chiriță: 60 in Meşter and Simuţ 2011: 317).

2. Literature review of economic growth models

This paper presents the relationship between economic growth, investments, export and openness economie in East European countries. A series of empirical studies tested the correlation between the dynamics of the exports and the process of economic growth. Pereira and Xu used the Granger causality in order to identifiy the causal relation between these. According to their model, the exports uphold the economic growth, the estimation of growth being improved by including as an independent variable the lagged exports. In a similar manner, growth causes exports, and the estimation of exports variable is improved by including the delayed growth as an independent variable (Marinaş 2010: 280).

Using Granger causality as well, Sultan and Haque studies the relationship between the growth, investments and exports, trying to identify the long run relation between the variables. Using Johnson's cointegration methodology theirs study found the presence of a long term relationship between investment, exports and the economic growth. The study further shows that only domestic investment significantly contributes to economic growth both in the long run and in the short run. The export, though, has positive relation with economic growth, its contribution has not been found to be significant. (Sultan and Haque 2010: 226).

The fundamental objective from Subasat was to capture the structural characteristics which determine the orientation of exports. He proved that exports are a cause of economic convergence, the countries with a medium level of development and with increasing exports, have a bigger growth rate than those with lower exports (Subasat 2002: 333).

Another analysis of the relationship between growth, investments and exports, was accomplished by Dritsakis. He studied the causality between the three variables for Romania and Bulgaria, with the help of auto-regressive VAR model. The results suggest the existence of a co-integration relationship between the three variables, as well as a positive impact of the exports and of the investments on the real GDP (Dritsakis 2004: 1831). For Central and Eastern European countries - Bulgaria, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, Slovenia, Slovakia - there is an obvious lack of studies that examine the effect of exports on economic growth by using the latest time series techniques. The existing studies on this issue are focused only on one up to three transition countries, Dristsakis (2004) for Romania and Bulgaria, Konya (2004) for Hungary among 25 OECD countries, Awokuse (2007) for Bulgaria, the Czech Republic and Poland (Pop Silaghi 2009: 106).

3. Data and methodology

In order to investigate the relantionship between the GDP (LGDP), direct investments (LFDI), export (LEXP) and economic openness (LEOP), we used quarterly deseasonalized data in log for 2000:1 – 2010:4 collected from the Eurostat and the INSSE Tempo Online series, available online on the Romanian Statistical Institutes website.

4 Model specication and results

The regression between growth, investments and exports, prove a decisive contribution of exports over the GDP. Note that all the variables have been analyzed in the log

$$LogGDP = 0.33LogFDI + 3.07LogEXP - 8.15$$

R^2=0.18 and t-statistic and the assumptions regarding errors was semnificativ.

The elasticity of the GDP is 0.33 reported to investments and of 3.07 in the case of exports. Therefore, we can argue that an increase of 10% of the gross capital formation determined an average growth of 3.3% of the dependent variable for the ten East European countries, and an increase of 10% of exports determined an average increase of 30.7% of the dependent variable.

If in the above mentioned regression the export variable is replaced with the openness, the following result is obtained:

$$LogGDP = 0.20LogFDI + 2.97LogEOP - 9.17$$

R^2=0.47, t-statistic and the assumptions regarding errors was semnificativ.

The elasticity of the GDP in regards to the investments is lower to the previous value with approximately 0.1 percentual points, and that of the EOP is positive, but with a smaller impact over the dependent variable in comparison with the export. Researching the annual elasticity evolutions of the economic growth depending on the other variables for economies of the Eastern European countries, one can notice the increase of the influence of the investments within the model that includes the openness (EOP), from 0.27 in 2000, to 1.09 in 2005, according to the data presented in the following table.

Table 1. The annual elasticity of GDP regards to variable models

	Elasticity of GDP regards to the investment (export-exogen variable)	Elasticity of GDP regards to the investment (economic openness- exogen variable)	Elasticity of GDP regards to the export	Elasticity of GDP regards to the economic openness
2000	0.36	0.37	0.27	0.28
2001	0.23	0.11	0.45	0.37
2002	0.05	0.22	0.66	0.52
2003	0.22	0.20	0.98	0.86
2004	0.97	0.02	1.07	0.97
2005	0.31	0.33	1.09	1.00
2006	0.56	0.61	0.67	0.56
2007	0.28	0.32	0.65	0.64
2008	0.46	0.51	0.55	0.47
2009	0.05	0.35	0.90	0.89
2010	0.17	0.18	0.76	0.82

Source: Authors' calculus

The growth of the openness had a positive impact over the GDP, which generated a growth of the investments rate. This was reflected in the enhanced openness of the GDP in reference to the degree of openness of the economy. One of the integration advantages is represented by growth of the openness towards the rest of the world, with beneficial effects on the flows of foreign received direct investments, bilateral flows of labor force, and work productivity (Ivan and Iacovoiu 2008:91). Therefore, starting from the results obtained regarding the elasticity of the GDP in reference to investments, having as an exogen variable the economic openness, we can appreciate, that the economies of the East European countries will attract higher flows of direct

foreign investments, flows that would accelerate, in turn, through engagement effects, the process of European integration. The GDP elasticity to the export variation registered an ascending trend starting in 2000 up until the middle of the analyzed period, and in 2005 it registered the highest level. An increase of 10% of the export for the East European countries determined a growth rate of 10.9%).

In order to emphasize the reaction capacity of the GDP for each economy in reference to the modifications of the independent variables, we create a regression for each of the two models mentioned above. The free element was not assumed to be identical for the studied countries, because the structural characteristics are different.

Table 2. GDP elasticity for Eastern European countries

	Model LogGDP, Log FDI, LogEXP			Model LogGDP, Log FDI, LogEOP		
	Constant	GDP elasticity/FDI	GDP elasticity/EXP	Constant	GDP elasticity/FDI	GDP elasticity /EOP
Bulgaria	2,85	0,05	0,94	1,62	0,01*	1,06
Czech Republic	-2	0,27	2,44	-1,48	0,30	1,99
Estonia	14,63	0,36	1,53	12,68	0,37	-1,34
Latvia	1,85	0,02*	1,43	-4,77	0,15	2,63
Lithuania	-1,17	0,02*	2,12	-4,52	0,10	2,5
Hungary	4,26	0,02*	0,78	3,79	0,04	0,77
Poland	3,19	0,08	1,19	1,26	0,11	1,44
Romania	11,69	0,23	1,43	10,13	0,34	0,81*
Slovenia	1,38	0,03	1,67	0,5	0,04	1,61
Slovakia	-3,38	0,31	2,58	-5,48	0,34	2,63

Source: Authors' calculus

The results confirm a greater importance over the economic investments within the model which includes the degree of economic openness. The greatest values of the elasticity of the economic growth in reference to the investments are registered by Estonia (0.37), Romania and Slovakia, both having an elasticity of 0.34. Also, Slovakia is characterized through a high degree of competitivity of the openness degree, which leads to an elasticity of 26.3% of the GDP. This is the highest value of all the analyzed countries. For the Czech Republic, Estonia, Hungary, Romania and Slovenia, the variation of export produced a greater impact over the economy in reference to the degree of economic openness.

The degree of openness is one of the optimal criteria that the euro zone fulfills. This is defined as part of the economic activity consecrated to the international commerce, that is the rate between the sum of the imports and exports and the GDP. The majority of the countries in the euro zone are very open and the smaller countries have the greatest openness. This can explain the fact that, traditionally, the smaller countries have been the most enthusiast upholders of the monetary union (Puiu 2010: 9). Therefore, it can be observed that, in the case of Bulgaria, Latvia, Lithuania, Poland and Slovakia, the openness degree of the economy constituted the variable over the economic growth in all the East European countries, except for Esthonia. The GDP elasticities that are statistically significant in reference to the openness are between 0.04, in the case of Hungary and Slovenia, and 0.37 in the case of Esthonia.

5. Conclusions and further implications

This paper examines the role of investments, export and openness in relation to economic growth for the East European countries for the period 2000-2010. Result shows that the growth of the openness had a positive impact over the GDP in all the East European countries, which generated a growth of the investments rate. This was reflected in the enhanced openness of the GDP in reference to the degree of economic openness. One of the integration advantages is represented by growth of the openness towards the rest of the world, with beneficial effects on the flows of foreign received direct investments. Therefore, starting from the results obtained regarding the elasticity of the GDP in reference to investments, having as an exogen variable the economic openness, we can appreciate, that the economies of the East European countries will attract higher flows of direct foreign investments, flows that would accelerate, in turn, through engagement effects, the process of European integration

Starting from the two models that analyze the impact of investments, exports and openness on economic growth in all Eastern Europe countries, the results confirm a greater importance over the economic investments within the model which includes the degree of openness. The greatest values of the elasticity of the economic growth in reference to the investments are registered by Estonia (0.37), Romania and Slovakia, both having an elasticity of 0.34. The majority of the countries in the euro zone are very open and the smaller countries have the greatest openness. This can explain the fact that, traditionally, the smaller countries have been the most enthusiast upholders of the monetary union.

Starting from this paper I would like, in the next study, to estimate the long-run relationship between economic growth, investment and export in Eastern European countries using trimestrial data from the Eurostat. I will used Johansen cointegration test to estimate the nature of relationship and Granger causality test is used to determine the direction of causality in the model.

SOCIAL AND ECONOMIC FACTORS AFECTING POPULATION IN ROMANIA

Toader Valentin
Universitatea Babeș-Bolyai Cluj-Napoca, Facultatea de Business

Gîdiu Valeria
Universitatea Babeș-Bolyai Cluj-Napoca, Facultatea de Business

As a result of the fact that at the end of 2011, in Romania, was conducted the Population and Houses Census, many studies were focused on the demographic evolution from our country. Our paper is focused on the factors that are influencing the evolution of population in Romania, in order to explain the evolution of demographics. The study was conducted on a 20 years timespan, using statistical data that are characterizing the macroeconomic and demographic environment between 1990 and 2010.

To achieve our goals, we will use the statistical methods to analyze the data released (time series and cross section data) by the National Institute of Statistics. We will try to find some correlations between the evolution of population and social (natural increase of population, net migration) and economic factors (employment, average net wage, GDP).

We conclude sustaining that the increase of emigrants and the ageing phenomenon in last 20 years decreased the number of population, while the increase of employment and GDP are two factors that have a positive influence on the population evolution. The average net wage may have two types of effects: an increase of the wage may represent an opportunity for some families to cover easily the cost of having a child, while for others, the opportunity of gaining higher wages may change their working behavior determining them to focus on career and postponing the birth of a child.

Keywords: population, natural increase of the population, migration, employment, net wage, GDP

Introduction

A major component of today is quality of life. All of us need a quality life, because contemporary society focuses directly on life and on social development. There are many years since the world is carrying out research and publishes studies regarding the quality of life, closely linked to social and economic indicators, namely with national and social policies leading to improving existing in people's lives.

In modern times, society had to ensure the greatest happiness, to influence contemporary economic theory and contemporary social policies. The issue of life is best taken in the twentieth century; the other fields of knowledge, so that sociology will take much of the social factors of society and the individual changes. Measuring quality of life is subjective and objective approaches, pursuing a wide range of sizes. Current perception is complex and multidimensional based on progress in all areas, economic components being very important and considered.

We believe that population with physical and economic characteristics, outline the main coordinates of a country and is a component of the indicators of quality of life. As a result, our purpose is to highlight the socio-economic factors that influence the evolution of population in our country.

In order to achieve our purpose, we structured the paper as it follows: in the literature review we present the findings obtained in some representative papers on this topic, in the methodology we describe the instruments and the method used in the analysis, while the results and discussions section enhances our main results we obtained during our analysis. The paper ends with conclusions.

Literature review

Studying the literature, we find out that most of the previous researches were focused on the impact of social factors on the population evolution. There are also, papers where the authors'

studied the impact of economic factors on population evolution. In some of these articles, the authors have studied the relationship between urbanization and industrial structure (Komei Sasaki, Taku Ito, Sotaro Kunihisa, Michihiro Kaiyama, 1997; Sovani, 1964; Gugler, 1982), between urbanization and urban concentration (Henderson, 1980), between urban concentration and economic development (Rosen, Resnick, 1980; Wheaton, Shishido, 1981) and between economic development and income distribution (Kuznets, 1955; Williamson, 1965; Mera, 1975). The underlying hypothesis is that the greater an economy is industrialized or a higher level of urbanization in developing countries cause migration from rural to urban areas, which will increase the national unemployment rate because of limited job opportunities in urban areas. The economic efficiency is increased by agglomeration economy in the early stage of urbanization, while agglomeration diseconomy prevails in the late or mature stage, so as to lower the economic efficiency. Regional income disparity increases in the early stage of development and decreases in the late stage of development.

Vasile V. (2004) shows us that increasing population is influenced by several demographic, economic, social and political factors that covered distinct periods of different intensity or significance. The low birth rate, associated with a total fertility rate fewer than 2 after 1990, caused the diminution in the proportion of the youth. The reduction in the demographic dependence ratio due to the decrease in the segment covered by the young persons caused economic and social problems. There will be less and less working age people to support economically the inactive ones, that is the adults must face a heavier social burden as they provide for their families, the education of the young generation and financial support to the pensioners. The size of the demographic imbalance measured by the ageing index is more serious the more so as it shows a higher dynamics. If in 1992, the number of elderly to 1000 children was only 722, in 2002 this value increased at 1098 persons, an increase by more than 50 percent in 10 years (Vasile V., 2004:9). The population's spatial mobility in order to adapt to the labor market needs and to balance the labor market throughout the country is low. Romania's population prefers commutation and/or temporary circulatory migration to residence/household movement. Inside the country about 6.7 million people migrated at least once in their lifetime, while over the period 1992-2000 about 197 thousand people emigrated and 75 thousand repatriated themselves and the annual flows were decreasing (Vasile V, 2004:9-10).

Romania's labor potential is one of the pillars of the sustainable development of the society in the third millennium. The completion of the economic and social reforms and the functional effectiveness of the economy in the post-transition period depend to a great extent on the nation's productive capability as well.

The National Institute of Statistics confirms in the population projections (reviewed in 2003) the continuation of the population ageing. Until 2025 the number of less than 15 years age people diminishes by about 1.3 million and the number of the elderly increases by 130 thousand. Therefore, the young persons will account for 14.8 percent of all population in 2010 and only 12.9 percent in 2025, while the elderly account for 19.8 percent and 22.5 percent, respectively (INS, Projections, 2004:7). The share of the "60 and over" population increases to a greater extent in 2025 when among the elderly we find even more "very old" people. The population reduction and accentuate ageing trend will bring about the medium-age increase by at least 8 years until 2025 and other 4-6 years until 2050.

The effects will be stronger on the labor market both directly by changing the age structure in favor of the elderly, and indirectly by increasing economic dependence rate of the old people (INS, Projections, 2004:9). The population of 65 years and over will reach about 4 million in 2025 and about 5 million in 2050, and its share in all population will be one-fifth and one quarter, respectively (Vasile V., 2004:17). According to EU population projections 2008 – 2060, the old age dependency ratio is projected to be 65.3 in the case of Romania. In other words, there would

be only two persons of working age for every person aged 65 or more in 2060, compared with four persons to one today (EU, 2008).

Methodology
In order to identify the factors that are influencing the evolution of population in Romania, we decided to use statistical instruments - we studied the correlations between the number of people and different social and economic indicators.

In our study we employed two types of data. Firstly we used time series analysis to detect the impact of socio-economic factors on population evolution and secondly, we developed a cross section data analysis (using county data) with the purpose of identifying the impact of social and economic factors on the number of people in the same macroeconomic environment.

Both time series and cross section data we used in our paper are available at National Institute of Statistics from Romania in Tempo Online section and in Statistical Yearbooks. Time series data cover the time span between 1990 and 2010, while the cross section data describe the county situation in 2009. In the case of cross section analysis we have eliminated the municipality Bucharest because we consider that being the capital of Romania has different characteristics than the other 41 counties.

Results and discussions
Analyzing the evolution of population in Romania, we observe that we are facing a phenomenon of population decrease (Fig.1). The number of people is determined by the natural increase of the population (the difference between live-births and deaths) and the net rate of migration. Also there are a number of economic factors which affects the population growth, like GDP evolution, employment and net wage.
Fig. 1. Population evolution in Romania
Source: realized by the authors using NIS data

We will begin our analysis studying the effects of social factors on population evolution. Usually, the yearly values of people are determined by the NIS adding to the population from previous year the natural increase of population and the net value of migration. We have an exception in the years when we have a census (like 1992, 2002 and 2012 in Romania), when the data series are updated with the values obtained from the census. This is the reason why in these years may appear serious differences between the values computed using the usual formula and the census values. For example, according to NIS, in the 2012 census we had a difference of approximately 1 million persons between the census value and the population from current statistics (NIS 2012:3). In our view, these differences are due to the unrecorded migration.

According to economic rules, an increase in the number of emigrants will reduce the net value of migration, reducing the population number. As a result of statistical analysis of time series, we conclude that the wage and the age of population represent two main determinants of emigration. We have determined a statistically significant relationship (at the 99% confidence level) between the number of emigrants and the evolution of average net wage, the correlation coefficient being equal with -0.921. According to our model, an increase of 1% in the average net wage will generate a reduction of 0.219% in the number of emigrants. Also, R-Squared statistics indicates that the model as fitted explains 84.91% of the variability of emigration.

Since 1992, the natural increase of population had in Romania a negative effect on the population, reducing each year the number of Romanians. Unfortunately, it seems that the

phenomenon will continue to sustain the reduction of population, because of aging population. According to our calculation, every time the average age of population is increasing 1 year, the natural increase of population will decrease 11552.7 persons. The model is statistically significant at the 99% confidence level and explains 41.1987% of the variability in the natural increase of population.

There is also good news. We have studied the relationship between employment and natural increase of population and we concluded that there is a strong relationship between variables, the correlation coefficient being 0.81048, an increase of employment by 1000 persons will ameliorate the value of natural increase of population in Romania by 27.01 persons (the model is statistically significant at the 99% confidence level). Usually, a positive evolution of employment is associated with economic growth, when the chances for the young families to obtain higher revenues increase. As a result of a better economic and social perspective, the number of births increases (Fig. 2). Our conclusion is sustained by the relationship identified between the evolution of fertility rate (live births / 1000 women) and employment. During the time span 1990 – 2010, every time the level of employment increased by 1%, the level of fertility rate increased by 0.93% (the model is statistically significant at the 99% confidence level). Unfortunately, the increase of net wage has a negative effect on the evolution of fertility rate, suggesting that in some situations, women choose to develop a career and to postpone the birth of a child (the average age of mother at the first birth has increased in the last 10 years from 23.7 years in 2000 at 26 years in 2010 (NIS 2012:62)). Our calculations suggest that an increase by 1% in net wage will generate a decrease by 0.03253% in fertility rate.

Fig. 2. Fertility rate and employment (1990 – 2010)
Source: realized by the authors using NIS data

The effects of employment and net wage evolution on the population can be analyzed directly using statistical instruments.

Regarding the relationship between employment and population we prove one more time the hypothesis enounced previously: the increase of employment determines the increase of population (see fig. 3 and 4). We verify this idea using to types of data. Firstly, analyzing time series data we conclude that an increase by 1% of employment will increase by 0.239% the number of population. Moreover, studying the cross section data, we may conclude that at the county level, an increase by 1% of employment will increase the population by 0.884%. As a result, we believe that people tend to migrate to the counties (towns) that generate more jobs, here the population increasing more rapidly.
Fig. 3. Population and employment (1990 –   **Fig. 4. Population and employment - county**
The effects of net wage evolution are different when we analyze time series than cross section data (as we can see in figures 5 and 6).
Fig. 5. Population and net wage (1990 – 2010)
Source: realized by the authors' using NIS data
Fig. 6. Population and net wage - county values
Source: realized by the authors' using NIS data

During the time span 1990 – 2010, the increase of net wage had a negative impact on the fertility rate (as we saw previously). The opportunity of gaining higher wages change the working behavior of many people, some of them neglecting their private life. According to our model, an increase of the net wage by 1% determined a decrease by 0.00941% of population. On the other side, studying the relationship in the case of counties, we obtained that an increase of net wage by 1% will increase the population by 522965 people. This conclusion relates with the idea we mentioned previously, that people tend to migrate to the counties that generate more jobs. In these counties, the labor market tends to be more competitive: we have more jobs and in the same time we have more people who are willing to work, people that are well educated and skilled. As a result they will obtain higher wages and will have better perspectives.

We are obtaining similar results (as in the case of net wage) when we are analyzing the relationship between GDP evolution on population (as we can see in figures 7 and 8).
Fig. 7. Population and GDP (1990 – 2010)
Source: realized by the authors' using NIS data
Fig. 8. Population vs. GDP – county values
Source: realized by the authors' using NIS data

We observe that during time, as GDP increased, the number of population decreased (fig. 7). We believe that one cause is the fact that the intensification of economic activity increased the number of hours worked and the efforts of employees. Also, more opportunities for career development or the fear of losing their job (during the economic downturn since 2008) have

determined many families to think one more time before having a child. According to our model, an increase of GDP by 1% decreased the number of population by 0.0581%. In contrast, when we analyze the cross section data, we can see clearly that the counties that generate a higher GDP tend to have a higher population, because they have more job opportunities and better jobs (as we saw previously). So, an increase of GDP by 1% will increase (attract new people) by 0.555% the population of that county.

Conclusions

Demographic evolution is facing a decreasing phenomenon, because of the natural increase of the population and the net rate of migration. Also there are a number of economic factors which affects the population growth, like GDP evolution, employment and net wage. Using the statistical data, we verified that an increase in the number of emigrants will reduce the population number. In the case of Romania, the number of emigrants is influenced by the evolution of average net wage - an increase in the net average wage will generate a reduction in the number of emigrants. Since 1992, the natural increase of population had in Romania a negative effect on the population, reducing each year the numbers of Romanians – an increase of the average age of population will decrease the natural increase of population. Unfortunately, according to current demographic evolutions it seems that this phenomenon will continue to sustain the reduction of population also in the next years.

The good news in the case of population evolution is the fact that an increase of employment will ameliorate the value of natural increase of population in Romania. A positive evolution of employment is associated with economic growth and with better economic and social perspectives, aspects that will sustain the increase in the number of births. Another proof for this positive relationship is the fact that people tend to migrate to the counties that generate more jobs and that have a highest GDP. Unfortunately, the intensification of economic activity increased the opportunities for a career, or simply for a job, the desire to have a child being left after.

The "new economy" has set new economic and financial development models and consequently new models to predict failure for companies. In this paper we tried a review of risk prediction models based on financial ratios, making classifications by time, space or nature of variables chosen. Although, the studies of prediction failure are extremely large, we note that the developed models are successfully applied in space and time were created, although there are models that have proved their viability over time. Finally, we conclude that for a better accuracy, the bankruptcy risk predictions model based on financial criteria should be supplemented by non-financial criteria (age, market share, the form of ownership, auditor critical comments, etc.)
Keywords: bankruptcy risk, prediction, financial analysis, financial rates, discriminant analysis
Jel Classification: G32, G33

1.Introduction

Unprecedented global economic development culminating in the current economic crisis demonstrates that the results of research studies on the prediction of bankruptcy risk are insufficient. The issue is particularly important for the economies of all countries, regardless of level of development. Need to forecast bankruptcy risk is both the undertaking and the institutions that have dealings with them: banks, which are obviously preoccupied by the quality of the credit portfolios they constitute; different categories of shareholders, who are interested in protecting the capital invested and taking advantage of the benefices provided by the respective enterprise (obtaining dividends); investors, who wish to know the state of the enterprise before investing the capital held; creditors, who are interested in recovering the capital allotted in the form of loan; business partners (clients, suppliers), wish to close agreements with safe enterprises that are able to accomplish their contract obligations

Bankruptcy can be defined as state in which a company is unable to pay its debts to creditors, suppliers, shareholders, state etc. Bankruptcy risk is part of internal business risks and is due to failure to meet timely payments. The term of bankruptcy comes from the Latin verb „fallo-fallere", which means "to miss, to escape" and indicating that debtor couldn't do the payments to its creditors.

The risk of bankruptcy was and is the subject of many research studies aim to identify the time of bankruptcy, competing factors to achieve this state, the financial criteria which expresses best this orientation (the bankruptcy).

2. Predictive models of bankruptcy risk

Bankruptcy risk analysis is performed by several methods, each revealing different aspects of the risk of bankruptcy:
▷Methods based on financial (quantitative) criteria:
    - Economic methods (using the correlation between different indicators calculated on

---

[44] See art. 247, paragraph a), Fiscal Code.

Financial statements);
- Statistical method (discriminant analysis, Logit/Probit Analysis and Hazard Model)
▷Methods based on non-financial (qualitative) criteria:
- Management methods;
- Methods of competitive strategy;
- Methods based on sustainable development approach;
- Other methods (based on critical remarks of auditors, based on macroeconomic growth, the law, fiscal policies etc)
▷ Combined methods (used by banks, rating agencies).

Methods based on non-financial criteria experienced a major development in the last 20 years, one of its promoters being Keasey and Watson (1987). Based on their study, conducted on 73 bankrupt companies and 73 non-bankrupt companies, they concluded that the inclusion of non-financial variables increases the predictive power of the model. However, the vast literature in the field, highlight the fact that methods based on financial criteria, are the foundation on which decisions of all partners in the economic life are made, and thus the main bankruptcy risk companies investigation field.

Among the models based on financial criteria, we intend to present those models based on statistical approach, making a evolutionary presentation, as follows:

2.1. Period 1960- 1980

The earlier work of Beaver (1966) indicated that the financial ratios can predict the likelihood of bankruptcy. His univariate study evidenced that the financial ratios of bankrupt firms generally differ from those of no bankrupt firms and pointed out that the cash flow-to-debt ratio. The work began by Beaver was continued by Altman (1968) who introduced multivariate discriminant technique for predicting firms' failure (MDA). Both (Beaver and Altman) are considered pioneers of bankruptcy risk model based on financial criteria aggregates by multiple discriminant analysis technique.

Since 1968, the primary methods that have been used for model development are multivariate discriminant analysis (MDA). In a general approach, scoring method is based on a block rate (indicators) statistically determinated, weighted by some coefficients in a mathematical model which could determine with some probability the future health of entity. Thus, the analyzed entity is assigned a note Z, called "score" which is a linear combination of several installments, as follows:

$$Z = a_1R_1 + a_2R_2 + a_3R_3 + \ldots a_nR_n \text{ , unde}$$

- $R_1, R_2, R_3 \ldots R_n$ - represents the values of discriminant financial ratios;
- a_1, a_2, a_3 – represents selected importance of financial ratios..

Depending on the score value obtained, the entity shall be presumed healthy or bankrupt. Synthetically, multiple discriminant analysis is a statistical technique used to classify an observation in two or more groups, depending on observable individual characteristics.

Concerns development of prediction failure risk models start with gather of financial ratios linked with the health of companies, following the determination of functions that allows estimating the probability that a company to make losses and therefore to become unable to honor customers and banks debts.

After the study made by Altman, this type of analysis has not ceased to grow, creating other discriminant models for assessing the risk of bankruptcy by various schools such as:

a) Anglo-Saxon school (Beaver, 1966; Altman, 1968,2000; Lis, 1972; Diamond ,1976; Yves Collongues, 1976 ; Bilderbeek, 1977 ; Deakin, 1977; Taffler, 1974,1977,1980,1982; Tisshaw, 1976;Springate,1978; modelul Koh şi Killough, 1980; Ohlson, 1982 ; Zavgren ,1983 ; Fulmer,

1984 ; Grammatikos şi Gloubos ,1984; Peel, 1987, Keasey and Watson, 1986; Eidleman, 1995; Lennox, 1999; Christidis, 2010;

b) **Continental European school** (Beerman, 1976; Weinrich, 1978; Conan&Holder (1979); French Central Balance Sheets Model of French National Bank (1977-1979), French Comercial Credit Model; Poddig, 1995; Danemarks National Bank Model (2004), Mateos and López, 2011;

c) **Japanese school** (Ko, 1982; Takahashi et al. 1984; Tsukuda and Baba,[1994; Lee et al. ,1996; Jo et al. 1997; Sung et al. 1999; Lee 2001; Abdullah (2008), Suntraruk, 2009.

d) **Romanian school**

In Romania, authors concerns to predict bankruptcy risk have resulted in development of several statistical bankruptcy risk models: Cămăşoiu Negoiescu's Model (1994), Ivoniciu's Model (1998), Băileşteanu's Model (1998), Anghel's Model (2002), model "C" Model (Craiova) (2005), and recently the model developed by Armeanu et al (2012)

2.2. Period 1980-1990

Logit analysis and Probit analysis began to appear in the late 1970's, but did not overtake MDA in popularity until the late 1980's. Logit analysis and Probit analysis take into account the probability that the firm will go bankrupt. While the MDA model uses a score calculated from bankruptcy by a linear equation to determine the probability of bankruptcy, the Logit model predicts that probability is "a dichotomous dependent variable that is a function of a vector of explanatory variables" (Aziz and Dar, 2006).

Among authors who have used the Logit and probit models to predict bankruptcy risk include: Hanweck, l977; Martin 1977, Ohlson, 1980; Mensah, 1983; Lo, 1984; Zmijewski, 1984; Casey and Bartczak, 1985; Gentry, Newbold and Whitford, l985; Zavgren, 1985; Peel, 1987; Aziz and Lawson, 1989; Hopwood, McKeown and Mutchler, 1989; Bell, Ribar and Verchio,1990, Lee (2001)

2.3. 1990's

In the late 1980's, **neural networks** began to appear and, in the 1990's, became the primary method used in studies. Neural networks "are designed to emulate the human pattern recognition function" (Anandarajan et aI., 2004) There are several different types of neural network methods; however, the details of these methods are beyond the scope of this paper. Basically, neural networks analyze inputs to find patterns and develop a model capable of a decision-making process. Several sample cases are run during the "training" mode, during which the network "learns" the decision-making process. The "testing" mode is used to validate the neural network model using hold-out sample data.

Another model in predict failure, used over time, consist in **Hazard model** used by Lane, Looney and Wansley (1986), George(1991), Luoma and Laitinen(l991), Henebry(1996), Shumway (2001) find three reasons to prefer hazard models for forecasting bankruptcy:

- The static models fail to control for each firm's period at risk. Static models do not adjust for period at risk, but hazard models adjust for it automatically.
- The hazard model incorporates time-varying covariates, or explanatory variables that change with time.
- The hazard model produces more efficient out-of-sample forecasts by utilizing much more data.

A synthetic time evolution of predictive risk failure models is suggestively shown in the table below:

Table no 1. Type of statistical ttechniques used in prediction of bankruptcy

	Discriminant Analysis	Logit Analysis	Probit Analysis	Neural Networks	Others
1960's	2	0	0	0	1
1970's	22	1	1	0	4
1980's	28	16	3	1	7
1990's	9	16	3	35	11
2000's	2	3	0	4	3
Total	63 (36%)	36 (3 %)	7 (4 %)	40 (23 %)	26 (15 %)

Source : adaping by Bellovary et. al., 2007

From the table above, it appears that multiple discriminant analysis is the most common method of predicting the risk of bankruptcy, being used used in 38% of studies investigated by Bellovary et al in 2007. In the 1980's and 1990's, the trend to use the logit was against multiple discriminant analysis models. 90s reflects an explosion of studies based on neural network to predict bankruptcy risk, a quarter of the studies a quarter of all studies investigated being based on this technique.

Although different models are widely accepted, Aziz and Dar (2006) show that analyze multiple discrimination (MDA) and Logit models are very accurate with error rates of 15% each. In this respect, researchers have compared different models of bankruptcy and concluded that, despite some theoretical and practical limits, the Altman method is superior because of its simplicity, practicality and accuracy (Collins, 1980; Mossman et al, 1998). Opposite, some authors (such as Abdullah et al 2008 but not only) find in this study that the estimation sample of the hazard model has given an overall accuracy rate of 94.9 % which is higher than the MDA and logit model which reported 80.8 % and 82.7 % respectively.

3. Discriminant financial ratios to predict bankruptcy risk

The usage of financial ratios has the advantage that, comparing with absolute levels of indicators, they provide a degree of general applicability. Using financial ratios largely removes limits generated by the size firms.

By using financial ratios, the accuracy of the prediction of bankruptcy of a company exceeds 90% (Chen and Shimerda, 1981). Altman, in his model, uses a variety of ratios to examine the seven factors mentioned above. It should be noted that some researchers (that is to say, Morris, 1998) argue that since the bankruptcy was due to unforeseeable events, therefore it can not be predicted.

More than that, it's impose that financial ratios of a specific business **to be best interpreted as a group** (Walton et al. 2003) rather than making judgments on individual ratios because the interpretation of one ratio may be altered by other ratios of the same business.

In this approach to find predictive models of failure risk, various authors have tried to find correlations and causes of production failures. In briefly, we present below some of them:

- ✓ **Beaver** (1966) found that Net Income to Total Debt had the highest predictive ability (92% accuracy one year prior to failure), followed by Net Income to Sales (91%) and Net Income to Net Worth, Cash Flow to Total Debt, and Cash Flow to Total Assets (each with 90% accuracy).
- ✓ **Altman** (1968,2000) in his studies found that financial ratios measuring the company's liquidity position, profitability and solvency predicts potential failure
- ✓ **Ohslon** (1980) finds a negative correlation between the probability of failure and the size, profitability and liquidity of the company. Also, he found that the probability of failure is positively correlated with the company's gearing.

- ✓ **Dugan et Zavgren** (1989) and Chen et Shimerda (1981) identified seven financial factors that may help predict financial distress: the return on investment, leverage, capital turnover, the short-term liquidity, cash position, the back of the back of debtors and inventory.
- ✓ **Lennox** (1999) finds that profitability, leverage, and cash flow have important effect on probability of bancruptcy.
- ✓ In Korea, **Nam and Jinn** (2000) stated that financial expenses to sales, debt coverage and receivables turnover were important to explain bankruptcy.
- ✓ In Malaiezia, **Low et al.** (2001) found that the cash flow ratios were significant in explaining bankruptcy during the period 1996-1998; while Mohamed, Li and Sanda, (2001) found that the leverage ratio and efficiency ratio (total asset turnover) were found to be significant during the period 1987 to 1997. **Zulkarnain et al.** (2001) found in his study that total liabilities to total assets, sales to current assets, cash to current liabilities and market value to debt were significant in explaining financial bancruptcy in Malaysia during the period 1980 to 1996. Later, **Abdullah** et. al (2008) found leverage ratio, net income growth and return on asset to be an important predictor of distressed companies in all the models used (MDA, Logit and Hazard Model)
- ✓ In Denmark, **Lykke et. al** (2004) by using the logit regression, developed an accounting-based model developed in Danmarks Nationalbank to predict failure rates in the Danish corporate sector. The estimated accounting-based failure-rate model contains a number of key financial ratios that are commonly used in strategic ac-counting analysis such as the company's liquidity position, profitability and solvency. Other variables are age and size of the company, form of ownership and critical auditor comments.
- ✓ In Romania, in the bankruptcy prediction models developed for the Romanian space, we find indicators such as: cash-flow/active, debt / assets, turnover of claims / liabilities / current assets etc.

Among the **most popular financial ratios** used often by researchers were:
- **Profitability ratio** represented by return on assets (Beaver, 1966; Deakin, 1972; Libby, 1975; Ohlson, 1980; Lennox, 1999; Abdullah, 2008; Zulkarnain, 2001; Lykke et. al 2004; Siminica, 2005).
- **Leverage ratio** repreyented by total liabilities to total assets (Beaver, 1966; Deakin, 1972; Ohlson, 1980; Zmijewski, 1984 ; Zavgren et Dugan, 1989; Mohamed 2001; Anghel, 2002; Lykke et. al . 2004; Abdullah; 2008).
- **Cash flow ratio**, represented by cash to total assets or cash to current liabilities (Lennox 1999; Zavgren et Dugan, 1989; Low et al. (2001) and Zulkarnain, (2001; Ivoniciu ,1998; Bailesteanu 1998, Anghel, 2002);
- **Size activity** (Ohlson, 1980; Lennox, 1999; Shumway, 2001; Lykke et. al 2004).

Investigating a vast literature (over 170 studies focus on prediction failure problem) Bellovary (2007) found among those 752 factors which are utilized in the individual studies the first ten financial ratio, as follows: 1) Net income / Total assets; 2) Current ratio ; 3) Working capital/Total assets, 4) Retained earnings / Total assets; 5) Earnings before interest and taxes (EBIT) / Total assets; 6) Sales / Total assets; 7) Quick ratio; 8) Total debt / Total assets ; 9) Current assets / Total assets; 10) Net income / Net worth.

4. Conclusions

Walton (2003) concluded that there are no "magic" ratios which somehow encapsulate all that is important to understand about the position of particular company. In this way, although there were quite a number of possible financial variables available to predict bankruptcy, researchers were neither guided nor constrained by the theory for the selection of ratios (Scott, 1981). Therefore, the important criterion would be to choose ratios based on their simplicity and

relevancy to the local environment (Chen & Shimerda, 1981; Mohamed et al., 2001; Soo et al., 2001).

Although these studies which highlight the importance of financial ratios to predict bankruptcy risk by using the statistical methods, the specialists appreciate that these models are not completed and they should be filled and complete the global risk model of failure with non-financial approaches (with reference to age, market share form of ownership, Sector of activity, management team, auditor critical comments etc).

INVESTMENT FUNDS' PERFORMANCE AND ECONOMIC GROWTH

Apolzan Carmen Maria
West University Timisoara,
Faculty of Economics and Business Administration

In this paper we examine the performance of investment funds during the period 2006-2010, intending to comprise the portfolio performance's dynamics before, during and after the present economic and financial crises climax. We categorize investment funds according to their investment strategy and geographical focus and distinguish a number of 11 classes. In order to analyze their returns' dynamics, we create a fund performance index for each category using principal components method. The instability created in financial system in 2007 had a direct impact on institutional investors' portfolios regardless of investment strategy, effects that have rapidly propagated on real economy. Analyzing index's dynamics correlated with economic growth we conclude that financial and economic environment react in the same direction, but with a certain time delay, to instability factors. We also underline the major impact of boom and bust evolution of financial markets on real economy, cause of the current economic and financial crises.
Keywords: investment funds, portfolio performance, economic growth, crises, investment strategy
JEL Classification: G20, G23, G29

Introduction

One of the important roles of institutional investors is given by the fact that they contribute to the overall efficiency of the financial sector. (Merton, Bodie, 1995) Taking into account this aspect, institutional investors also contribute to the global economic growth. The institutional investors' role of attracting and allocating their resources induces the increase of financial market liquidity, introduction of new financial instruments and products, development of trading strategies and arbitrage and cross-border diversification of portfolios with direct effects on the economic environment. (Harichandra, K, Thangavelu, S, 2004)

One of the issues debated in the specialty literature is the strong correlation between the financial sector and the economic one, the interdependencies between these two leading to propagation of shocks occurring in any of the two environments. To analyze these interdependencies, we employ a comparative method of the institutional investors' performance during 2006-2010 to the gross domestic product growth rate, reference to geographical area and the institutional investors' portfolio-formation strategy.

Data

The study uses data from Thompson Reuters – Lipper database that includes information on annual returns during 2006-2010 for a total of 122.700 investment funds. To reflect the investment strategy and geographical focus, we proceeded to the selection of the following categories of institutional investors:

- Europe-oriented equity investment funds, with the total value of assets held more than 0.1 billion USD, Number of funds 469;
- U.S.-oriented equity investment funds, with the total value of assets held more than 1 billion USD, Number of funds 694;
- ASIA-oriented equity investment funds, with the total value of assets held more than 0.1 billion USD, Number of funds 365;
- Europe-oriented bond investment funds, with the total value of assets held more than 0.1 billion USD, Number of funds 146;
- U.S.-oriented bond investment funds, with the total value of assets held more than 1 billion USD, Number of funds 310;

-   ASIA-oriented bond investment funds, with the total value of assets held more than 0.1 billion USD, Number of funds 48;
-   Europe-oriented mixed investment funds, with the total value of assets held more than 0.1 billion USD, Number of funds 131;
-   U.S.-oriented mixed investment funds, with the total value of assets held more than 1 billion USD, Number of funds 161;
-   ASIA-oriented mixed investment funds, with the total value of assets held more than 0.1 billion USD, Number of funds 34;
-   global monetary funds, with the total value of assets held more than 1 billion USD, Number of funds 480;
-   other types of funds, with the total value of assets held more than 1 billion USD, Number of funds 116.

Of all the entities resulting from the application of filters to each category, there were eliminated funds that do not register data for the entire period observed 2006-2010.

Methodology

In order to reflect the behavior of each group of investment funds, we create a fund performance index for each category using principal components method. Principal components analysis is a variable reduction procedure. The central idea of this analysis is to reduce the size of a set of interrelated variables, retaining as much as possible from the variation existing in the dataset observed. This procedure is used in a variety of fields, from climatology to economics, genetics, psychology and quality control (Jolliffe, 2002).

This type of analysis models the variance structure of a set of observed variables using linear combinations of the variables. These linear combinations, or components, are used in subsequent analysis, and combination coefficients (or weights) are used in interpreting these components.

The principal components of a set of variables are obtained by computing the eigenvalue and decomposing the variance of the observed matrix (Johnson and Wichtern (1992)). The first principal component represents the unit-length combination of the original variables with maximum variance. Subsequent principal components maximize variance among the lengths of linear combinations that are orthogonal to the previous components.

In terms of singular value decomposition, a matrix of data *(nxp)* of rank *r* may be represented as:

$$Y=UDV' \qquad (1)$$

U and *V* are orthonormal matrices of left singular and right singular vectors, and *D* is a diagonal matrix containing singular values.

More generally, we have:

$$Y = AB' \qquad (2)$$

A is a *(nxr)* matrix and *B* is a *(pxr)* matrix, both of rank *r* and

$$A = n_2^{\beta} U D^{1-\alpha} \qquad (3)$$

$$B = n_2^{-\beta} V D^{\alpha} \qquad (4)$$

So $0 \le \alpha \le 1$ is a factor that adjusts the relative weight of the left singular vector (observations) and right singular vector (variables), and the term *n* involving β are scaling factors where β ∈ {0, α}

Basic options for computing the values *A* and the corresponding weights *B* imply the appropriate choice of the parameter α and the scaling parameter β.

In the context of principal components calculation, let Σ be the dispersion matrix of *Y*, and perform the decomposition of eigenvalues:

$$\Sigma = L\Lambda L' \qquad (5)$$

We may set: *U=YLD-1, V=L, D=(nΛ)1/2* so that:

$$A = n_2^\beta YLD^{-\alpha} \qquad (6)$$
$$B = n_2^{-\beta} LD^\alpha \qquad (7)$$

A may be interpreted as the weighted values of principal components and B as the weights of principal components

Results

By analyzing the index dynamics for each category in relation to the economic growth dynamics, we see that institutional investors whose investment focus is Europe, the trend is that of sharp increase in the equity funds' performance until 2007, in 2008 they registered a significant correction and reached a historical minimum. A similar dynamic is given by the fluctuation of the three indexes represented, the index of equity investment funds, bond funds and mixed funds, 2008 representing a significant decrease of the outcomes. The most important losses are registered in stock markets, which are most affected by the turbulences seen since the end of 2007, reaching a historical minimum in 2008. This phenomena can be explained by the panic created on stock markets worldwide, retail and institutional investors seeking to close their open positions on stocks based on the uncertainty of companies' capacity to recover.

Thus, in 2008 international stock markets registered one of the most severe declines in history, international market capitalization suffered a 50% correction, initial public offerings (IPOs) were halved while total trading volume remained at a similar level of 2007. This situation was aggravated by the failure of U.S. Lehman Brothers investment bank in September 2008, an event that caused an extremely negative reaction of stock markets which in a period of about two months had a 40% correction at global level, and remained at minimal levels until the end of year. Stock market volatility remained high in 2009, when in the first two months suffered a decrease by 12%, followed by an increase of 15% starting from April 2009. The end of 2009 represented an increase of nearly 50% of market capitalization, but it is only a partial recovery of losses incurred in the previous year. In the first half of 2010, stock markets experienced a correction of about 7%, remaining well below the highs reached in 2007.

Comparing the index dynamics of investment funds and dynamics of macroeconomic indicator of economic growth, we observe a similar, but delayed behavior of the economic environment, emphasizing the significant influence of financial environment on real economy by transmitting the financial crisis in the real economy. (Figure no. 1)

Another important element to note is the de-correlation of the observed funds' yields from the real economy results, the first ones registering over two-figure positive values during periods of growth and appropriate corrections during trend-reversal periods, with the decrease of 47% of equity markets in 2008 occurring after five consecutive years of growth. This feature reveals exactly the boom and bust period in the evolution of financial instruments' prices.

We also observe similar developments in the case of investment funds with investment horizon in the United States, although the period 2006-2007 is a slight tendency of performance index correction of all types of institutional investors observed, all indexes registering a significant decline in 2008 and a recovery since 2009. The year 2010 marked a new correction for all three indexes observed. We notice the same delayed response from the economic environment, the strong interconnections between the two causing a negative growth in 2009 (Figure 2)
Figure no. 2 Comparative dynamics of performance indexes for U.S.-oriented investment funds and economic growth during 2006-2010

Source: Author's calculations based on data provided by Thomson Reuters - Lipper, IMF database for data on economic growth

We found an interesting evolution for investment funds whose investment area is Asia, mainly due to the dynamics of bond funds registering increased returns in 2008, their correction being highlighted only in 2009, simultaneously with economic growth correction. As far as it concerns bond market performance, we point out that volatility is lower than in equity markets.

The attractiveness of bonds as a form of investment has increased in recent years given the fact that institutional investors seek less risky investments in less volatile markets. Risk aversion and preference for quality determined an increase in demand for bonds, especially in countries seen as more financially stable. On the other hand, corporate bonds offered a potential increased yield during this period, reaching record levels in 2008 followed by a correction in 2009 (The City UK, 2010). The dynamics of equity and mixed funds' indexes is similar to that of other areas, these indexes reaching a minimum in 2008, a recovery in 2009 and a new correction in 2010. (Figure no. 3)
Figure no. 3 Comparative dynamics of performance indexes for U.S.-oriented investment funds and economic growth in 2006-2010

Source: Author's calculations based on data provided by Thomson Reuters - Lipper, IMF database for data on economic growth

In terms of monetary funds and other funds, 2008 represents a minimum for the indexes of the two classes observed. By comparing the evolution of these investors to the global economic growth, we observe a decrease in the real economy since 2008, and a recovery in the second half of that year, this behavior corresponding over time to the general evolution of performance indexes for all selected categories of investors. Regarding the two classes presented in Figure no. 4, we highlight the sharp downward trend of performance indexes in 2010 due to the volatility created by the financial and economic instability experienced in the current period.
Figure no. 4 Comparative dynamics of performance indexes for monetary funds and other funds and economic growth in 2006-2010

Source: Author's calculations based on data provided by Thomson Reuters - Lipper, IMF database for data on economic growth

Conclusions

The most important aspect to note in this comparative analysis is that, as explained before, the instability created in the financial system worldwide has immediate repercussions on all institutional investors' portfolios, regardless of their employment category. These effects have propagated to the real economy as the comparative dynamics presented clearly reflects this

aspect. Therefore, we conclude that the financial environment and the real economy react in the same direction, with a certain time delay, to the moments of volatility created, pointing out the major impact of financial market dynamics, characterized by the boom and bust phenomenon, on real economy, an aspect considered as one of the causes triggering the current economic and financial crisis.

Aknowledgement

Governments around the world register substantial losses due to tax non-compliance behavior. Whether it is tax avoidance or tax evasion, non-compliance has repercussions on the whole society because it mitigates the quality of the provision of public goods. Nevertheless, the level of tax compliance is significantly higher than the classical tax evasion model of Allingham and Sandmo (1972) predicts. A manifold of theoretical and empirical studies invalidate the assumptions of the classical model by trying to give answers to one of the most intriguing questions: Why people pay taxes? Taking into consideration these realities, we summarize some of the findings related to tax behavior within the emerging new field of neuroeconomics. Using state-of-the-art technology (non-invasive brain stimulation, non-invasive measurement of brain activity, pharmacological interventions to raise or lower the activity of neurotransmitters, eye-tracking or skin conductance response), neuroeconomics steps on the scene to give insights on the reasons for which taxpayers display a certain tax behavior. According to the neuroeconomics mainstream literature, emotions guide the decision-making process when outcomes are uncertain with regards to rewards and losses. At neural level, the amygdala triggers bodily states related to reward and loss and the ventromedial prefrontal cortex reenacts past experiences of reward and loss to predict future outcomes. Some taxpayers who decide to engage in tax evasion experience a positive feeling when anticipating the profit from dodging taxes, feeling that is triggered by the amygdala. Other taxpayers don't engage in tax evasion because they want to avoid negative feelings (shame, guilt, regret). Oxytocin facilitates dopamine release which is a positive physiological motivation for cooperation. As a consequence, taxpayers' trust levels increase and, with it, increases the propensity to comply with the tax law. Besides summarizing neuroeconomics findings related to tax behavior, we also draw attention on some policy implications which may derive from neuroeconomics studies and may assist authorities in raising tax compliance levels. Tax evasion is showed to decrease in trustful environments where tax authorities facilitate compliance process and where taxpayers believe their true earnings can be accurately estimated by tax authorities. Tax evasion also decreases when tax authorities publicly denounce tax offenders.

1. Introduction

When talking about paying tax liabilities, two main types of tax behavior can emerge: compliance and non-compliance. According to Franzoni (2000: 54), compliance behavior encompasses simultaneously the following features: 1) true reporting of the tax base; 2) correct computation of the liability; 3) timely filing of the return; 4) timely payment of the amounts due. Any deviations from the aforementioned features results in non-compliance behavior. Going into depth with the analysis, each main type of compliance can be divided into two sub-types. Tax compliance can be *voluntary* or *enforced*, depending on the nature of factors that influence taxpayers' behavior, i.e., trust in authorities or power of authorities (Kirchler 2007; Kirchler, Hoelzl and Wahl 2008). Tax non-compliance can take either the form of *tax avoidance* or of *tax evasion*, depending on the legality degree of taxpayers' activities, i.e., legal activities or illegal activities. In many countries around the world, the phenomena of tax avoidance and tax evasion reach high levels. Yet, these levels are not as high as the classical model of tax evasion predicts (Allingham and Sandmo 1972) because not all taxpayers are rational utility maximizers. As Alm and Torgler (2009: 635) notice: "Still, the puzzle of tax compliance is not why there is so much

cheating. Instead, the real puzzle is why there is so little cheating. Typically, the percent of all individual income tax returns that are audited is often less than 1% and the penalties on even fraudulent evasion are only a fraction of unpaid taxes. Virtually all economic models of taxpayer behavior conclude that there should be much more tax evasion than is actually observed. However, most people pay most of their taxes most of the time". The present study briefly describes the mechanisms behind decisions related to tax behavior from the neuroeconomic perspective, with the aim of highlighting some policy implications that might contribute to generalize compliance behavior among taxpayers. The remainder of the article has the following structure. Section 2 tackles the key features of neuroeconomics studies. Section 3 describes neuroeconomics results regarding tax behavior and their policy implications. Section 4 highlights the main conclusions of the study.

2. Neuroeconomics: the scientific field of the "economic brain"

One of the newest field among social sciences is *neuroeconomics*, a hybrid between neuroscience, experimental economics and psychology which studies the neural basis of economic decisions.   From its appearance in the late 1990s (Glimcher et al. 2009), neuroeconomics caused quite a stir with opinions going from high appraisals and optimistic assessments (Camerer, Loewenstein and Prelec 2004, 2005; Park and Zak 2007; Schultz 2008), cautious conclusions (Bernheim 2008, 2009; Purdy 2006) to harsh critique and deeply rooted skepticism (Gul and Pesendorfer 2008). Nevertheless, neuroeconomics followed its path by: using state-of-the-art technology like *non-invasive brain stimulation* (e.g., transcranial magnetic stimulation– TMS; transcranial direct current stimulation– tDCS), *non-invasive measurement of brain activity* (e.g., functional Magnetic Resonance Imaging– fMRI; Electroencephalography– EEG; Magnetoencephalography – MEG; Positron emission tomography– PET), *pharmacological interventions* to raise or lower the activity of a neurotransmitter (e.g., oxytocin, serotonin), *eye-tracking* (e.g., infrared light cameras), *skin conductance response* (SCR), and applying these techniques to experimental economics game-formats (Smith and Huettel 2010).

According to Fehr and Rangel (2011: 3-4), neuroeconomics investigates three basic questions: a)which are the variables computed by the brain to reach different types of decisions and in what way do they relate to behavioral outcomes; b)how does neurobiology implement and constrain these computations; c)which are the implications of this knowledge for understanding behavior in different contexts (economic, business, legal, political, clinical, etc.). The ultimate goal of neuroeconomics is to provide substantial evidence that will assist economists in developing models based on more realistic assumptions about the decision-making process (Arieli, Ben-Ami and Rubinstein 2009; Zak 2004).

3. Tax behavior from the neuroeconomic perspective: findings and policy implications

Because they examine economic decisions, neuroeconomics studies also focus on tax behavior as an attempt to give more insights into one of the most puzzling economic questions: why people pay taxes (Chorvat 2007). In the case of compliance versus non-compliance, some interesting insights are revealed by the somatic marker hypothesis. This influential neuroeconomics theory states that emotions play an important role in taking decisions whose outcomes are uncertain with regards to rewards and losses (Damasio 1994). According to the theory, bodily states related to different emotions are elicited during decision-making to "mark" some options as advantageous and others as disadvantageous. At the brain level, the amygdala and the ventromedial prefrontal cortex (vmPFC) play distinct but connected roles: the amygdala triggers emotional/bodily states in response to rewards and losses, the vmPFC reenacts past experiences relating to these rewards and losses to predict future rewards (Bechara and Damasio 2005). When taxpayers engage in tax evasion, they are ready to incur the costs of being audited because the profit obtained from not

paying taxes makes them feel good, i.e., the amygdala triggers a positive emotion (Kahn et al. 2002; Zweig 2007; Zweig 2008).

Like any classical public goods game with non-excludable and non-rivaled benefits, taxpaying is no stranger to free-riding, i.e., benefiting from public services without paying, on the efforts of compliant taxpayers. As the optimal allocation of the public good is conditioned by taxpayers' willingness to contribute to the common pool, free-riding propensity could be diminished if governments knew every taxpayer's valuation of the good. Knowing this, governments could compute the optimal level of public goods and tax people proportionally to the benefits they get from these public goods, making sure the benefits exceed the costs (Krajbich et al. 2009: 596). In the attempt to solve the free-rider problem, Krajbich et al. (2009) designed a neurally informed mechanism. By using fMRI, they showed that when it is possible to read subjective states with an accuracy degree ranging from 60%-90% and when tax payments and final outcomes depend on both individuals reported values and neural readings, free-riding decreases dramatically. Indeed, subjects revealed their true values nearly 100% of the time and the public good was provided at a level of 93%. In this case, the only prerequisite is that subjects believe their values can be predicted with sufficient accuracy by technology. Regarding this interesting result, governments could ensure a proper provision of the public goods and a decrease in tax evasion if taxpayers believed their true earnings can be accurately estimated by tax authorities.

One of the groundbreaking discoveries in neuroeconomics is the role oxytocin or "the morale molecule" (Zak 2012) has in facilitating human relationships. Oxytocin is a neuropeptide naturally produced by the hypothalamus. When people trust others, the oxytocin level increases, the midbrain releases a neurotransmitter called dopamine which lowers individuals' anxiety levels and makes people experience a pleasant sensation when cooperating (including with strangers). Due to this sensation, people tend to repeat cooperative behaviors. Studies show that a high level of oxytocin is associated with trustworthiness (Kosfeld et al. 2005; Zak, Kurzban and Matzner 2004, 2005) and it facilitates dopamine release which is a positive physiological motivation for cooperation. Based on these findings, it could be stated that if state authorities would create an environment based on mutual trust and cooperation, taxpayers would be inclined to fully contribute to public funds and tax evasion would be abated.

Regarding the use of eye-tracking in tax related issues, one interesting experiment comes from the corporation *Realeyes* (with headquarters in the US and United Kingdom) specialized in using computer vision to read people's faces and measure their emotions. In order to find out whether UK council websites are designed to ease taxpaying processes, Realeyes asked 54 taxpayers to pay taxes on six different council websites and eye-tracked them. Based on the emotions experienced by the taxpayers that were registered by the eye-tracking devices, the researchers concluded that the UK public sector websites had room for improvement. Three out of the six websites provided a clear and graphically pleasant menu which made taxpaying experience less burdening and facilitated compliance. The clarity of menus also contributed to the lessening of phone calls and e-mails which were addressed to the civil servants and generally implied a lot of time and money. The worst websites had an ambiguous design and very complicated menus. The bright colors used to highlight important information disoriented taxpayers who associated the colored sections with banner ads and disregarded the information. These websites also had a high average of the view to click time (time elapsed between fixating a correct area and clicking on it), which was twice as high compared to the efficient websites and emphasized their unfriendly design. The study had an important eco in the media. As a consequence, after the disclosure of the results one of the 6 councils immediately redesigned the webpage in a user-friendlier manner.

Apart from rationality, emotions also play an important role in decision-making (Coricelli, Dolan and Sirigu 2007). Coricelli et al. (2007) conducted a tax game experiment in which they measured emotions by skin conductance response (SCR) to test the hypothesis that evading taxes

elicits emotions in tax evaders. The experiment had a within-subjects design with two treatments, a first one with monetary sanctions (fines) and a second one with both monetary and non-monetary sanctions (public picture display of tax evaders). The results showed that the relationship between compliance and punishment was mediated by emotions. The amplitude of SCR was higher when underreporting than when complying, especially in the second treatment when evasion decreased significantly. For the subjects reporting between 26% and 75% of their income, the second treatment was more arousing and the strong impact of public picture display was interpreted as shame. According to their study, compliance can be influenced by taxpayers' willingness to avoid negative emotions (shame, regret, guilt). Also, an environment where tax evasion is publicly displayed increases compliance more than an environment with only monetary sanctions. Due to the fact that tax evaders seem to experience negative social emotions, governments could implement policies threatening to denounce cheaters publicly to reduce evasion.

Besides substantial evidence from empirical studies, there are also theoretical approaches. In an article about tax compliance and the neuroeconomics of intertemporal choice, Chorvat (2007) argues that the relationship between the timing of tax payments and the decision of paying taxes impacts on tax compliance more than the standard exponential discounting would predict. This is due to the fact that taxpayers display inconsistent time preferences and apply hyperbolic discounting. Namely, they exhibit higher discount rates between periods of time closer to the current period compared to periods of time in the future. According to Chorvat, tax compliance can be consistently improved by separating the time at which tax returns are filed from the time taxes are paid or refunded.

4. Conclusion

As taxes are ubiquitous in everyone's life, they constitute an endless source for scientific research. Following the stream of literature on tax compliance provided by the social sciences, neuroeconomics offers new insights into the way taxpayers decide whether to comply or not with the tax law. Neuroeconomics studies report that decision-making process is guided by emotions in situations when taxpayers feel uncertain about rewards and losses. These emotions are triggered by the increasing neural activity in the amygdala and the ventromedial prefrontal cortex. The thought of obtaining a profit from not paying taxes makes some taxpayers experience positive emotions and engage in tax evasion. Others fully comply because they don't want to be publicly exposed and experience negative feelings. Some interesting findings state that oxytocin facilitates compliance by increasing taxpayers' trust levels. Although research methodology used in neuroeconomics studies is often criticized by mainstream economists, researchers can benefit from neuroeconomics findings by using neurobiology for developing better models of economic behavior. Neuroeconomics not only can aid future research, but also tax authorities in their attempt to raise compliance levels and decrease tax evasion propensity. Several studies show that the phenomenon of tax evasion is lessened when authorities ensure a trustful environment based on mutual cooperation, in which they denounce tax offenders and are believed to estimate accurately taxpayers' earnings.

THEORETICAL CONSIDERATIONS ON THE ISSUES AND GENERAL VALID RULES FOR LOCAL TAXES AND FEES ACCORDING TO TITLE IX OF THE FISCAL CODE AND POINTS FROM METHODOLOGICAL NORMS OF APPLIANCE THE FISCAL CODE TITLE IX: DEFINITIONS.

Boţa Moisin Anton-Florin
University of Pitesti, Faculty of Economic Sciences

Popescu Luigi
University of Pitesti, Faculty of Economic Sciences

To operate in complex and real problems of determining the amount of local taxes, specialized inspectors from local administration sservices, but also the taxpayers, must have regard to a number of issues and general rules apply across the spectrum, in general, of local taxes. Based legal matter in this issue of principle is found in the Romanian Fiscal Code, Title IX and points from the Methodological Norms of the Fiscal Code, refering of Title IX.

Trying a systematization of issues of local taxes through the Fiscal Code provisions, Title IX and its implementing Norms, we concluded that the issues and generally applicable rules for local taxes are found, scattered, over different articles of Title IX and during various points of the Methodological Norms of application of the Fiscal Code provisions relating to Title IX.

In the analysis we did, we concluded that the issues and general rules applicable for local taxes are grouped into three categories namely: a first group, comprising mainly with issues and rules theory, including here a series of definitions, principles underlying the establishment of local taxes and special to their calculation, as they result from the comparative analysis of art.247 Fiscal Code Section 1-10, 14 and 15 of the Norms of Fiscal Code, the provisions of Title IX. A second category of issues and generally applicable rules applicable for local taxes is considering issues related primarily to the role of - specificly local - in the domain of local taxes, and in the third category of issues and rules generally valid applicable are the local taxes relate to budgetary nature.

Throughouth this article, we detail aspects of the first category, the related issues and general rules applicable for local taxes, mainly theoretical, and for this category, we will insist on clarifying the definitions given in Article 247 Fiscal Code and the contents of paragraphs 1-10, 14 and 15 of the Methodological Norms of the Fiscal Code provisions relating to Title IX.

Keywords: fiscal code, local taxes, local fees, Romania.

JEL Classification: H2, H3.

In art. **247 Fiscal Code** are given several definitions in order to clarify the content of the various expressions used by the legislator to clarify the meaning. Thus:

a) **The rank** of a settlement relates to the rank assigned to a city law[45].

To identify areas and their classification into tiers of cities, is considering cumulatively, the following provisions:

a) The provisions of Law no. 2/1968 on the administrative organization of the territory of Romania, republished with subsequent amendments[46];

b) The provisions of Law no. 351/2001 concerning the approval of National planning arranje - Section IV - Localities network, published in the Official Monitor of Romania, Part I, no. 408 of July 24, 2001, as amended and supplemented[47].

---

[45] See Methodological Norms of Fiscal Code, point 1, paragraph a), regarding Title IX, Fiscal Code.

[46] According to Methodological Norms of Fiscal Code, point 1, paragraph b), regarding Title IX, Fiscal Code.

[47] See Methodological Norms of Fiscal Code, point 2, paragraph a) – f), regarding Title IX, Fiscal Code.

According to Law no. 351/2001, the hierarchy of functional urban and rural locality, is as follows[48]:

a) **rank 0** - Romania's capital, city of European significance;

b) **rank I** - cities of national importance, with potential influence at European level;

c) **rank II** - important cities counties, county or balancing role in the network of settlements;

d) **rank III** - cities;

e) **rank IV** - villages common residence;

f) **rank V** - villages of communes and villages belonging to cities and towns.

In application of Title IX according to the Fiscal Code and Law no. 2/1968, **localities of cities and towns** are assigned the same rank with those of cities and municipalities in whose administrative territory is[49].

b) **Areas of the city[50]** - areas are set by the local council depending on land to the center position of city and other specific elements of administrative - territorial units, utility networks according to documentation planning and urbanism, agricultural registers real estate cadastre specific records - municipal or other records which may affect agricultural land or land value.

According to section 4, paragraph 1) and 2) Methodological Norms of Fiscal Code, on Title IX, **delimitation and determining their number**, in the inter villana, and extra villana limits, are determined by adopted by local councils (according to art. 247, paragraph b), Fiscal Code), according to the criteria listed.

Number of built-up areas in inter villana may be equal or different with the number of areas extra villana limits.

Identify areas (both in inter villana, and extra villana limits), is made by the letters A, B, C, D[51].

If the administrative unit required **zoning changes**, local councils can take decisions in this regard only in May (month 5 of the current fiscal year) for the following fiscal year. Failure of changes in zoning in May corresponds to the respective local councils option of maintaining the existing boundaries of the areas for the next fiscal year[52].

If during the fiscal year changes localities **rank** or the **limits** within intra villana and extra villana, where applicable, the **tax on buildings** - for individuals (PF) and **land tax** for both PF and legal persons (PJ) changes under the new scale of the village or the new boundaries of the built / terrain, where applicable, as of January 1 of the following fiscal year.

In the above situation, **building tax** and **land tax** due is determined, by default, by the specialized department of the local authorities, not to file another tax return after it has previously been made, informing the taxpayers of the rank change town or built-up limits, as appropriate[53].

In case of Bucharest, functions provided in Norms of Fiscal Code, applicable to Title IX, paragraphs 4 and 6, paragraph 1) and paragraph 3) are met by the General Council of Bucharest[54].

To ensure stability in the delimitation of zones, it is recommended that data be multiannual.

If the **number of areas** intra villana is the same number of extra villana areas, it's used the following corespondence (direct corespondence)[55]:

a) The intra villana area A has as corespondent in the extra villana A area;

b) The intra villana area B has as corespondent in the extra villana B area;

c) The intra villana area C has as corespondent in the extra villana C area;

d) The intra villana area D has as corespondent in the extra villana D area.

---

[48] According to Methodological Norms of Fiscal Code, point 3, regarding Title IX, Fiscal Code.

[49] See art.247, lit.b), Fiscal Code.

[50] See Methodological Norms of Fiscal Code, point 5, regarding Title IX, Fiscal Code.

[51] According to Methodological Norms of Fiscal Code, point 6, paragraph 1), regarding Title IX, Fiscal Code.

[52] Idem. point 6, paragraph 3).

[53] Methodological Norms of Fiscal Code, regarding Title IX, point 7.

[54] Methodological Norms of Fiscal Code, regarding Title IX, point 9, paragraph 1).

[55] Idem, point 9, paragraph 2).

At the administrative units - where specific elements allow demarcation of less than 4 areas, local councils can do this, only as follows[56]:

a) if it delimits three zones, this are: Zone A, Zone B and Zone C;

b) if it separates in two zones, this are: Zone A and Zone B;

c) if one area is delimited, this is the area A.

In cases where the number of **areas** intra villana is different from the number extra villana **areas**, the correlation between areas is as follows[57]:

a) in intra villana its delimited only area A area, and the extra villana delimited areas are: A, B, C and D. For this case, any part of the terrain is only correspondent of the built area A;

b) in intra villana its delimited A and B areas, and the extra villana delimited areas are: A, B, C and D. For this case, the extra villana A area is corespondent of area A intra villana, and any of the areas B, C and D from extra villana area only have corresponding in B intra villana;

c) in intra villana its delimited A, B and C areas, and the extra villana delimited areas are: A, B, C and D. For this case, the extra villana A area is corespondent of area A intra villana, the extra villana B area is corespondent of area B intra villana and any other areas C and D extra villana have only correspondent of the intra villana area C;

d) in intra villana its delimited A, B, C and D area, and the extra villana delimited areas are: A, B, C and D. For this case, the extra villana A area is corespondent of area A intra villana, the extra villana B area is corespondent of area B intra villana, and any of the areas C and D intra villana are corresponding only to extra villana area C;

e) in intra villana its delimited A, B, C and D area, and the extra villana delimited areas are: A and B. For this case, the extra villana A area is corespondent of area A intra villana, and any of the areas B, C and D intra villana have corresponding to B extra villana only;

f) in intra villana its delimited A, B, C and D area, and the extra villana only area A. For this case, any of the areas intra villana have correspondent area A extra villana only.

The provisions of point 9, paragraph 3) Methodological Norms of Fiscal Code - Title IX, detailed above in points a) - f) are collated in tabular form as follows[58]:

	INTRA VILLANA		Correspondence of areas in case the area numbers of intra villana is different of extra villana	EXTRA VILLANA	
	Option	Area		Option	Area
Paragraph a)	X	**A**		**A**	X
		B		**B**	X
		C		**C**	X
		D		**D**	X
Paragraph b)	X	**A**		**A**	X
	X	**B**		**B**	X
		C		**C**	X
		D		**D**	X
Paragraph c)	X	**A**		**A**	X
	X	**B**		**B**	X
	X	**C**		**C**	X
		D		**D**	X
Paragraph d)	X	**A**		**A**	X
	X	**B**		**B**	X
	X	**C**		**C**	X

---

[56] Idem, point 9, paragraph 3).

[57] Methodological Norms of Fiscal Code, regarding Title IX, point 9, paragraph 5).

[58] Methodological Norms of Fiscal Code, regarding Title IX, point 9, paragraph 4).

	X	**D**		D	X
Paragraph e)	X	**A**		**A** →	X
	X	**B**		**B**	X
	X	**C**		C	X
	X	**D**		D	X
Paragraph f)	X	**A**		**A** →	X
	X	**B**		B	X
	X	**C**		C	X
	X	**D**		D	X

When calculating the **tax on land located intra villana**, registered at the agricultural register at **other category than land with buildings** (see art. 258, paragraph 1) - 4) Fiscal Code), the **areas** identified by roman numerals have the following equivalences : I area equivalent area A, II area equivalent of area B, area III equivalent to the C, area IV equivalent to the D.

Note that this equivalence is used for areas extra villana outside city limits, established in 2003, for 2004[59].

Under paragraph 10 of the Methodological Norms of Fiscal Code - Title IX, the dictionary meaning of words and actions including use in the work setting, control and collection of local taxes are to be approved by order of the Minister of Public Finance and Minister of Administration and interior.

c) **Street Nomenclature** - is, according to art.247, paragraph c), Fiscal Code, **the list** contains the names of all streets in an administrative - territorial identification numbers on each street side buildings and the owner of the ownership of each building. Street Nomenclature is organized every rural and urban unit is primary evidence used to award home address / residence of the individual, the registered legal entity and each building, land and / or building.

METHODS OF FUNDS ANALYSIS IN THE SALAJ COUNTY

Bechiş Liviu
"Vasile Goldiş" West University Arad

In this paper the authors present methods of analysis of budgetary resources in territorial, the example of Salaj County. We analyzed this county revenues and expenditures during 2007-2010, using a system of indicators related
Key words: resource allocation, income, expenses, results
Gel Classification: G18

1. Introduction.

Economic and financial analysis and resource allocation to the counties can be undertaken using a system of indicators of income and expenditure in territorial administration. That is why in this paper we present such an analysis in Salaj County, though this can be generalized to other counties in Romania.

2. Method and results

The first dimension of analysis is to analyze income. Compared to the original budget forecast, Salaj county public revenues in the period 2007-2010 showed an increasing trend in absolute terms, but the actual implementation of these fluctuations occurred late in the period.

Thus, compared to 2007, the estimated total revenue amounted to 93,111.37 thousand, in 2008 they amounted to 128,110.43 thousand in 2009 to reach a value of 156,885.05 thousand, and in 2010 to reach a value of 192,828.30 thousand. The degree of realization of such income has not increased, however, properly so, in 2008 (the estimated revenue was collected at a rate of 98.10%), in 2009 the degree of achieving them collapsed at a rate of 74.07% and in 2010 rose to 85.91%.

After a favorable period, the total income of Salaj county increased 1.39 times (2008 to 2007), a natural consequence of the context of economic and financial crisis that has characterized the national and international economic environment, although initially provided higher revenues in 2009 compared to 2008, actual revenues fell by 8% (from 125,670.53 to 116,209.65 thousand lei). In 2010 revenues were achieved by 28.5% higher than in 2009 (from 116,209.65 to 165,654.90 thousand lei). The structure of local public resources Salad county, is found following main categories of income (the weights for 2010): rates and amounts deducted from income tax (13.69%), amounts deducted from VAT (27.66%), own revenues (1.29%), financing the paving of the roads program and water supply to villages (23.74%), multi-annual program funding Technical Assistance for public investment projects financed by the Regional Operational Program 2007-2013 (0.46%), transfers from the state budget to local budgets for rights of disabled persons (20.40%) and subsidies from the state budget to fund medical and social care units (0.15%).

Rates and amounts deducted from income tax up 13% share of the income tax and the amounts allocated 27% of the share of 22% of income tax to balance the budget of the county steadily increased in volume during analyzed at 15056.59 thousand in 2007 to 20,303.98 thousand in 2008 to 20,996.70 thousand in 2009 and 22,682.00 thousand in 2010.

As one of stable financial resources of the county budget, the share of these shares in the total local revenues declined slightly from 16.67% in 2007 to 13.69% in 2010, experienced a degree of achievement involution, in 2010 was actually received only a percentage of 95.46% of the estimated value, compared to 2007, when revenues were close to 100% (99.94%). The evolution of this indicator is not spectacular, in 2010 recorded an increase of 50% compared to 2007 and only 8% compared to 2009.

VAT deducted amounts consist of: amounts deducted from VAT to finance decentralized spending in the county, amounts deducted from the VAT for county and amounts deducted from VAT to balance the county's own budget.
Figure 1 Weights in the amounts deducted from VAT

Decentralized spending refers to the county child welfare system and social centers for persons with disabilities, granting rights of dairy and bakery for students in grades one through eight in public education for preschool children in kindergartens State costs of special education and resource centers and support educational, cultural institutions decentralized contributions to the lay staff employed in the establishments of worship, community public service records of persons under the authority of the county.

Amounts deducted from VAT for county roads are divided into administrative units, depending on their length and technical condition, the decision of the District Council, after consulting the mayors.

Volume amounts deducted from a trend of increasing VAT in 2008 (63,109.72 thousand) to 2007 (49,194.02 thousand and degree of performance 100%), because in 2010 to reduce considerably (45,825, 40 000 lei). This translates into an increase of 1.28 in 2008 compared to 2007, a decrease of 21% growth in 2009 than in 2008 and down 8% growth in 2010 compared to 2009.

The significance of these involutions is to reduce the special purpose funding from the state budget. The causes may be an objective (negative national economic context, whether in allocating funding requirement), and subjective (2008 was an election year, the elections both locally and centrally). In the amounts deducted from VAT, hold the largest share amounts for the financing of decentralized expenditures in the county (38.73% in 2007, 41.98% in 2008, 64.13% in 2009 and 60.06% in 2010.

Determinant indicator for determining the degree of financial autonomy of county revenues included in the budget have, unfortunately, a very small share in all local public funds (2.95% in 2007, 4.85% in 2008, 2.13 % in 2009 and 1.29 in 2010).

This income had fluctuated in the period, increasing from 2665.14 thousand in 2007 to 6110.96 thousand in 2008 (a huge increase, therefore, 2.29 times), because in 2010 to reduce by 19% compared to 2007, by 65% compared to 2008 and by 13% compared to 2008, attaining the amount of 2133.50 thousand. Salaj county's own budget revenues (with weights for 2010) is

composed of: tax on vehicles over 12 tons, owned by individuals and legal persons (6.75%), other direct tax receipts (zoning, building permits, specifications, notices of special structure, unique arrangements, special transport permits) (8.33%), revenues from concessions and leases (25.46%) monthly contribution of parents to cover children in institutions (0.09%) monthly contribution to local councils to cover children in day care centers (4.64%), revenues from fines and other sanctions applied under law (0.28%), other income (Official Gazette of the county plan, photocopying services, the road user charge, feasibility studies, other income), (8.60%), donations and sponsorships (1.84%), income from the sale of goods institutions (1.08%); income from sale of property belonging to private sector (42.93%).

Although absolute and relative volume of their income is not high, a positive aspect is that their level of achievement has risen steadily and substantially in the period from 55.13% in 2007 to 94.04% in 2008 to 98.69% in 2009 and 90.83 in 2010.

Funding program of paving roads and village water supply was established as Salaj county budget income reached in 2010 to 39,344 thousand, accounting for 23.80% of total revenues. This program was established by Government Decision no. 577 of 25 September 1997 to improve social and economic situation of residents in targeted areas. Financing is provided from the state budget through the Ministry of Regional Development and Tourism, the amounts approved annually by the destination and local budgets of administrative unit's beneficiary, external loans and other financing sources legally constituted. Technical maturation to promote investment projects for financing from structural funds, the Ministry of Regional Development and Tourism has developed, implemented and funded in the period 2007-2010 Multiannual Technical Assistance for public investment projects financed by the Operational Program 2007-2013. Through this program, approved by Government Decision no. 1424 of November 28, 2007, Salaj County Council received funding to develop economic and technical documentation of six projects for obtaining structural funds in the following areas: social infrastructure, educational infrastructure and tourism infrastructure. Funding framework contracts ending only at the end of 2007, actual revenue realization occurred only in 2008 (527,420 lei), 2009 (1155.78 thousand - 99.38% level of achievement) and 2010 (759.00 lei - degree of achieving 93.70%).

Subsidies from state budget to local budgets needed to support projects running FEN - accession period were estimated at the beginning of 2009 amounted to 40,000 thousand, then they reach the beginning of 2010 amounted to 23,891 thousand, intended for expenses investment in the "Road Rehabilitation Ciucea-Krasna-Vîrşolţ". Because blocking the project in the bureaucratic procurement procedures, the amounts allocated were not used until 2010, when the contract was signed after the execution of investment works adjudication by open tender.

Transfers from state budget to local budgets for rights of disabled persons had a sustained upward trend during 2007-2009, at 23156.12 thousand (2007), to 35,376.67 thousand (2008), to 41378.89 thousand (2009), following a decline in 2010 to 33,789.00 thousand (18.40% compared to 2009). Subsidies from the state budget to fund medical and social care units remained relatively constant during this period (242 thousand in 2007, 241,780 lei in 2008, 249.50 and 245.00 thousand lei in 2009 2010) the decrease registered in 2010 compared to 2009, with only 1.80%.

Analysis of local government revenue shown above leads to a conclusion with serious negative implications on financial dependence Salaj county to central: an overwhelming proportion of its resources (97.87%) comes from the central level (the rates and amounts broken, financing programs, special purpose transfers and subsidies), being represented only 2.13% of their income. In these conditions, local autonomy can be achieved effectively as financial autonomy is far from being achieved.

Another observation may be the degree of achievement of local revenues, which, although time limits are set as minimum tasks were not completed at 100% or above this percentage always. This finding may lead either to the conclusion that a more reasonable substantiation of such

indicators, or the appreciation of the significant influence of external factors on local public finances.

The second dimension in territorial analysis is the analysis of public expenditure. Planned and actual public expenditure in the budget Salaj county recorded similarly trajectory public revenue fluctuated a corresponding financial and economic context nationally and internationally.

Thus, in the first period analyzed, local expenditures have increased the amount of 85,290.72 lei in 2007, the value of 113,004.68 thousand in 2008 to 157,130.14 thousand in 2010, corresponding to a increase of 45% compared to 2009.

If we consider the year 2007, in 2010 we see an increase of 84% of total public spending (which reached $ 157,130.14 thousand), but if we use as the baseline year 2008, we see an increase of 39 %. These developments are explained by external factors, political (2008/2009 was, as I said, an election year) or economic (domestic and international backdrop economic crisis). Analysis of the implementation of public expenditure as indicators whose upper limit is provided in the initial budget imperative, based on the finding that compliance with legal requirements. Progress in the achievement of declining public expenditure in 2007-2009 shows both a positive, reflecting a strategy for saving the global context Salaj county and national economic and financial crisis (the largest reduction in spending is operated public administrative apparatus). In 2010, total expenditure increased by 18.03% compared to 2009 due to investment costs, essential in difficult economic times, such as this. The motivation behind this latter finding is, however, could not be objective. Unrealized investment costs are related infrastructure projects and local development, "Road Rehabilitation Ciucea-Krasna-Vîrşolţ", and its implementation, as mentioned above, was locked in 2007-2009 due to the rigors of the law in the procurement. With the signing of the executive work in January 2010 this project has been the natural result, the estimated investment works to be completed later this year even. This will result in a spectacular development of local public expenditure county road infrastructure investments, a trend that will be reflected in the budgetary account for 2011.

Payments	6.167,92	8.217,98	7.120,22	5.407,00
Figure 2: Expenditure on the executive authorities

Public expenditure in the budget include executive authorities Salaj county maintenance costs and administrative apparatus, consisting of: personnel costs, costs of goods and services, other transfers, welfare, capital expenditures and payments made in previous years and recovered this year. The share of these expenditures in total local government expenditure is not negligible,

being 7.23% in 2007, 7.27% in 2008, 6.58% in 2009 and 3.44% in 2010. Within this category the cost of staff ranks first (79.31% in 2007, 63.41% in 2008, 68.90% in 2009 and 77.88% in 2010). In absolute values, the county administrative unit costs have increased the amount of 6167.92 thousand in 2007 to 8217.98 thousand in 2008, before falling to 7120.22 thousand in 2009 and 5407, 00,000 lei (when, despite being set in a higher amount, respectively 6629.00 thousand, has achieved a saving of 18.50%). Dynamic evolution of these costs shows an increase of 1.33 times in 2008 compared to 2007 and decreased by 13% in 2009 and 24.10% in 2010 compared to 2009.

The category of general public services spending includes the costs to the budget reserve fund county expenses Directorate Salaj County for People (public institution subordinated to the County Council) and other public services. They are not found in a significant amount in all local expenditures (2.60% in 2010), but must be mentioned the dramatic increase of the degree of their achievement from 8.70% in 2007 to 9.43% in 2008 to 85.38% in 2009, because in 2010 the percentage of 73.80% is achieved (expressing an increase of 9.01 times and 1.08 times from 2007 to 2008).

3. Conclusions

In the current economic climate, given the direction of evolution of regional development policy promoted and applied by developed countries on the international scene, local public finance gain increasing importance. Their main component is the local budgets, the main lever of the administrative-territorial assertion of local autonomy.

Analyzing the evolution of local revenues Salaj county, it is clear that they were circumscribed economic and financial trends nationally and internationally. Thus, between 2007 and 2008, revenues increased significantly in 2009 for economic and financial crisis to manifest locally. As a corollary to the evolution of public revenues, local budget expenditures had a fluctuating course, upward and downward between 2007 and 2008 and 2008-2009, which reflect a wise savings strategy undertaken at local level, reflected in reduced administrative unit costs. Given that municipal infrastructure (which involves a serious financial allocation, the largest consuming local resources) is in charge of local budgets of municipalities, towns and villages, it is understandable that the largest share in the county budget Salaj is owned social spending, followed by cultural activities and costs only third the cost of county roads and bridges.

THE ENVIRONMENT OF REGIONAL DEVELOPMENT FINANCIAL ANALYSIS

Bechiş Liviu
"Vasile Goldiş" West University Arad

Moscviciov Andrei
"Babeş-Bolyai" University Cluj-Napoca

The paper presents the difference between the two concepts regionalism and regionalization. It also presents the three types of regionalism analysis depending on the dimension and the nature of the relations: regionalism at national level, transnational regionalism and international regionalism analysis.
Key words: regionalism, development, regionalization
Gel classification: G18

1. Introduction

The State, created as main governing level, goes through a crisis period, being forced to reconsider his part. The State is no longer the only frame for solving the problems that affect the society. The Providence State has appeared after the Second World War, in a moment when the problem of economic reconstruction and relaunching was being discussed, and was synonymous with assuring a general welfare and prosperity. This concept is criticized in the present in the context of the accentuation of the economic crisis, of the raising rate of unemployment, of raising the taxes and duties.

On this accentuation of the globalization process, the States are considered, on one hand, to small in order to cope with the problems that emerge at the global level – economics, security, monetary policy, etc., which leads to creating supra-states (1), and on the other hand are being considered to large in order to be able to efficiently respond to the citizens' problems, problems that can be solved efficiently especially at the regional or local level.

2. Regionalism and regionalization

To understand the movements that took place at the regional level, we must make the difference between *regionalism and regionalization.*

Some authors use the term regionalism with double meaning: seen as a movement from top to bottom thus defining the *regionalization* and the term regionalism also seen as a movement from bottom to top which defines the *regionalism.*

– *Regionalism* seen as a movement *from bottom to the top,* in which the region is seen by the humans that live there as an homogenous territory, represents the awareness of the mutual interests and their aspiration towards the participation at managing theses interests. Thus, we can talk about a "regional conscience" that states that the State is too far away and too big so that it can solve the regional problems. From this meaning, the State is accused to want to impose a unitary model to the regional particularities. Thus, the regionalism corresponds to a profound desire of the local collectivities to be responsible for solving the problems that concern them directly.

– *Regionalization* means an approach *from top to bottom* and regards other purposes and means of application than the ones used by the regionalism. As an answer to the regional movement, the State can recognize a regional identity – the region seen as a territory considered homogenous by the State – and can take the necessary measures so that the regions can participate at managing their own business.

The starring point of regionalization is the regional lack of balances, more exact being aware of them. This awareness is followed by the intervention of the national governmental structures or of some supra-state entities that have as purpose the decentralization or deconcentration at regional level of some activities or competences previously existing at central level. In this case, we are dealing with administrative acts that are the expression of a central political will as regards the local/ intermediary structures.

The regionalization can appear at national level and also at international level. At international level we give as example in Europe: the Scandinavian cooperation, the cooperation between the Benelux States and recently the European Union.

The regionalization and the regionalism are concepts that describe the two movements at regional level between which there is an inevitable interaction. The regionalization mostly wants to reduce the regional economic lack of balance and an harmonious development of the entire national territory, while the regionalism implies a certain power of decision of the region as regards the regional interest affairs and affirming its identity (as regards the culture, the linguistic particularities, the ethnic particularities, the traditions, etc.). The answer to the needs of the regions is made of a State policy that has repercussions over the regional feeling and leads to reactions from the region.

The regionalism, especially in Europe, has become a concept largely accepted as a form of decentralization that reinforces and democratizes the State's power, and also in order to improve the institutionalized forms of international cooperation.

There is an evolution as regards the character of the regionalism at the European level which, from "a movement", has become a "normalized and institutionalized activity", evolving towards the concept of "pacificator regionalism". In the 1990 in the foreground has came a new type of regionalism that that it is shaped partially and under the influence of the globalization phenomenon, being characterized through the apparition of some new regions, sometimes supra-states that are not the result of an organic development and for which are created new institutions.

Some analysts have researched the phenomena as regards the regionalism depending on the dimension and the nature of the relations, and they mention 3 main categories:

– regionalism at national level;

– transnational regionalism – in the case of some spaces that are united culturally and/ or economically – cooperation of Euro region type;

– international regionalism – expressed through structures of OSCE (Organization for Security and Cooperation in Europe) type.

At the same time, we must make the difference between *regionalism* – term used in the political discourse, whose finality can lead to federalization (a territorial complex made on historical and cultural bases, which gains competences in the field of public policies – is the case of the German Lands), and *regionalization* which is an administrative action, that focuses on creating larger space of cooperation and, last but not least, on defining some new administrative-territorial units.

The term of regionalization is, generally, understood as the creation of a new level in the territorial organization of a State; the new institutions can vary as regards the responsibilities and the authorities created, these being always supra-imposed to the local institutions that already exist.

The regionalization is a long term process, through which the State introduces the second level of governing. The regionalization reflects an increasing tendency of identifying some institutions with a certain region, but this idea and those institutions are being extremely heterogeneous from one country to another.

The term regionalization has become larger and presumes a process through which it is created a sub-national but supra-local capacity for actions as regards the development of a specific geographic area. This process can rely on the political-administrative system that already exists

or can lead to the creation of a new territorial organization that could give better support to the social-economic increase and to an equilibrated development.

In the present there is a new relation between the local and the central level. The central and the local administration no longer compete, but have passed to collaboration on the basis of a works and responsibility division (2). The local administration is no longer a simple implementation structure, without own will, but becomes a dynamic entity which, on the bases of the solidarity of a collectivity, promotes local ideas and interests. Thus, it appears the necessity to organize a local administration that unites the important political elements of the center and the ones through which the local communities define themselves.

The continuous economic-social changes lead to the situation when the structures of the local administration take from the central administration more and more tasks, being necessary to create successive administrative reforms (3). In this situation it is necessary to make a compared analysis of the centralization and of the decentralization. The functions of the State can be divided, theoretically, on horizontal and vertical plan.

The horizontal dimension means the division of the responsibilities and the tasks made between the central organs of the State.

The vertical dimension means the existence of different levels of public administration in order to divide the power and the responsibilities.

We must mention the difference between *dividing the power* and *dividing the tasks,* existing cases when the tasks are being delegated at the inferior levels without the corresponding responsibility. In these cases, the central power makes hierarchical structures, having the possibility to control and even to annul the decisions taken at the inferior levels.

The autonomy of the different administrative levels can't be absolute, has as general limits the obligatory character for any structure to respect the existent laws. Existing through the effect of the decisional power of the Parliament, the local/ territorial administrative structures means a new level of power, not structures outside the unitary State.

The division of the tasks can be described through the couple of concepts centralization-decentralization, which underlines the alternation of the centralization periods and of the decentralization periods. The relation between the central level and the local level suffers continuous changes, changes that can be conditions by factors of practical nature.

3. Conclusions

The economic sciences, respectively the economic, investigate the legislation character and the mechanisms that move the components of the economic system, at the world, regional, national, districtual or particular level in order to prevent the economic lack of balance.

The economic-regional analysis wants to underline the mutual efficient economic effort of some States from a certain part of the world, which will assure the economic prosperity of that region, and needs the analysis of a significant number of relevant indicators. The internal gross product is the synthetic indicator that best characterizes the development level of a territory, also being the base for more elaborated social-economic analysis. The present paper wants to make the analysis of the regional internal gross product through the perspective of its level and of its structure, its evolution in the period 2005-2009, the comparison of the North-West region and the national level and also as regards the other development regions, and underlining the intra-regional unparities.

HOW CAN ROMANIAN GOVERNMENT BOOST ECONOMIC GROWTH?

Câmpeanu Emilia
Bucharest Academy of Economic Studies
Faculty of Finance, Insurance, Banking, and Stock Exchange

György Attila
Bucharest Academy of Economic Studies
Faculty of Finance, Insurance, Banking, and Stock Exchange

Restoring economic growth is a challenge for the Romanian government that have to apply fiscal and budgetary measures in order to restore the positive path of the GDP without deteriorating the public finances sustainability. Therefore, it is necessary to identify based on historic data the impact of fiscal and budgetary policy on economic growth. The aim of this study is to analyze the effects of fiscal and budgetary policies on economic growth based on Romania case. The results are useful for identifying the instruments to boost the economy and propagation mechanisms of their effects on growth. Therefore, the economic growth is sustained by governmental measures involving increases for taxes on production and imports and cut for current taxes on income and wealth. Meanwhile, compensation of employees, subsidies and interest have significant statistical effects on growth.
Keywords: fiscal policy, budgetary policy, growth.
JEL Classification: E62, H20, H50, O23.

1. Introduction

It is well known and accepted that the state influences GDP and hence economic growth through fiscal and budgetary policies, In public decision making matter understanding the mechanisms by which fiscal and budgetary policies affect economic growth when they have to apply measures to boost the economy. This requires knowledge of: i) the theoretical foundations that led to the formulation of economic theories focus on growth; ii) impacts identified and demonstrated in these theories; iii) transmission channels of fiscal and budgetary policies. All these must be supplemented by quantitative and qualitative analysis and empirical techniques able to indicate the magnitude and the corresponding times of fiscal and budgetary effects on growth.

Descriptive and econometric analysis is based on the best variables able to describe the fiscal and budgetary policies and economic growth. However it remains the question of indicators that best reflects the fiscal and budgetary policies. In this respect, the literature indicates a range of responses taken into consideration that it can be used to express the behaviour of fiscal and budgetary indicators such as: i) budget revenue, per total and by component (direct taxes, indirect taxes, contributions, other income, discretionary income, non-discretionary income, other income); ii) budget expenditure, overall and component (current expenditure, capital expenditure, expenditure productive, unproductive expenses, other expenses, consumer spending, subsidies, investment); iii) budget balance, that is considered to be a linear relationship between income and expenditure, as its classical forms and derived forms (eg primary balance). These variables can be expressed in real terms, real per capita terms and as cyclically-adjusted that not include temporary fluctuations caused by economic cycles.

This paper focuses on analyzing the effects of fiscal and budgetary policies on economic growth using the case of Romania has been hit hard by the economic crisis triggered in 2008. Although governmental measures taken, the Romanian economy return to growth is slow and apparently lasting due to the poor functioning of the engines of economic growth. Research approach is structured into four sections. The second section presents the literature review, so that in section three are given the results. Conclusions are found in section four.

2. Literature review

In economic theories are shown the possible effects of fiscal and budgetary policies for the whole economy. But do these effects are obtained exactly in reality? What is the influence sign, size, and gap effects of fiscal and budgetary policies? These are questions that the paper aims to provide answers. But the starting point is to investigate state of main findings from the literature review.

Generally speaking, fiscal and budgetary policies can stimulate or restrict economic growth in terms of the effect of government decisions regarding revenue and expenditure. Also, it counts the type of fiscal policy (pro-cyclical, acyclic, and countercyclical) and the fiscal regime applicable in each period.

It is also very important for an emerging economy like Romania as fiscal and budgetary policies to act as engines of economic growth. It is showed that Romania is a country with: i) poor economic performance reflected by low scores on the global competitiveness index of 4.08 in 2011 (position 77 from a total of 142 countries) down by 10 positions from 2010; ii) high risk the fiscal and macro-financial risk (about 0.7 according to the European Commission 2010: 222), iii) very high exposure to risk budgetary fiscal and external (Campeanu and Padurean 2011: 486).

The literature outlines a policy dilemma able to drive economic growth. Currently, one can speak of preponderance in the use of fiscal and budgetary objectives for each state (eg the European Union use of fiscal and budgetary instruments for intervention in the economy for more than 62% having to the number of euro area countries that have only their own fiscal policy). Among these goals are always found and ensure the continuation or resumption of economic growth. Thus, it can say that this is a generally economic objective valid regardless of country, period, form of government, political regimes, level of development, etc.. It also is a major objective imposed and monitored by international institutions.

However, the economic growth is influenced by fiscal and budgetary policies?

What can be said about the influence is that it could be positive (desirable) or negative (to avoid), short or long term, temporary or permanent, ex-ante or ex post, scheduled or ad hoc. Also, fiscal and budgetary policies can influence GDP and/or growth. In terms of influence on GDP, the literature indicates that it may be exercised either directly on the level of aggregate GDP or only on some components of GDP such as consumption and investment.

However, fiscal and budgetary policies give their effects on economic growth indirectly by influencing directly to: i) the average level of education of the workforce through public investment in human capital (budget expenditure for education and training, culture) able to lead to social benefits throughout the economy; ii) productivity of the stock of physical capital whereas it should provide basic social and economic infrastructure allowing private sector activities; iii) the quality of physical capital or labour supply so that the public policies have to minimize the gap between supply and demand for capital and labour.

In the literature it is also shown the transmission effects of fiscal and budgetary policies on economic growth through government measures that affect aggregate demand and supply. Influence on aggregate demand is realized through two channels of transmission of fiscal and budgetary policies, namely: i) confidence in government measures; ii) interest rate. Regarding the first channel, confidence in government measures depends on the perception of change regime capable of ensuring the fiscal budget deficit and public debt in the future without resorting to further the costly fiscal adjustments in terms of affecting the disposable income of population.

Influence of aggregate supply is transmitted via the labour market and labour force supply. This channel of transmission of the effects of fiscal and budgetary policies on economic growth is analyzed in the neoclassical theory that economic growth as exogenous. This theory is based on original neoclassical model proposed by Solow (1956) and Swan (1956) that was developed by contributing to major in the field such as Diamond (1965), McGrattan and Ohanian (2008).

Also, growth may be the result of endogenous forces and not external as in neoclassical theory. Endogenous growth models are presented in numerous works including Arrow (1962), Mines and Villieu (2010).

But since the paper does not aim to develop these theories on exogenous and endogenous growth, the next step of the scientific is the indication of the effects of fiscal and budgetary policies as outlined in economic theory. There are three main theories describing the role in the economy, namely neoclassical, Keynesian and Ricardian (Bernheim 1989). In neoclassical theory is considered fiscal and budgetary policies restrict the economic activities of the private sector through the effects of "crowding out" (Buiter 1977) as expansionary fiscal and budgetary policies (reducing taxes or increasing government spending) lead to price increases, decrease in money supply growth rates. On the other hand, Keynesian theory supports the active role of fiscal and budgetary policies targeted tax relief and / or government spending increases that took effect to improve welfare ("welfare effects") in the short term followed by reduction of output ("crowding-out effect") long while the government measures have led to higher deficits and debt.

The Ricardian theory is demonstrated the neutrality of fiscal and budgetary policies which means that any government measure will not affect the economy because the consumers base their consumption decisions on permanent income and not one available income that is sensitive to any change in the budget and fiscal variables.

In addition, the effects of fiscal and budgetary policies on economic growth depend not only on the relevant time horizon but also other factors such as: i) the size and persistence; ii) the financing of budget deficit; iii) public debt; iv) fiscal and budget rules; v) institutional factors; vi) trust in government measures; vii) expectations of the population and businesses.

At the short and long term effects it must be taken into consideration the compromise between economic stabilization to be achieved short-term and economic growth as a long-term goal (Perotti, 2007). Also, in literature there is a consensus that the tax increase affects economic growth, while reducing spending, particularly those for consumption and social transfers, boosts the economy. So governments have to choose between these measures without having a negative impact on economic growth in compliance with requirements to ensure sustainable public finances, further economic development and efficient ("green economy").

Effects of fiscal and budgetary policies are considered in the literature as resulting from shocks to the economy. These fiscal and budgetary shocks can affect economic growth. Problems consist in defining and identifying the issues related to shocks and also to the type of shocks (endogenous, exogenous).

The impact of fiscal and budgetary policies on growth can be studied using macroeconomic models able to capture the mechanisms of propagation effects. These models were developed by extending the techniques applied to monetary policy. These models are described in the paper Campeanu, 2012.

3. The research results

Analysis of the effects of fiscal and budgetary policies on economic growth is achieved following some steps: 1) statistical profile of growth both in Romania and the international context; 2) profile of fiscal variables, the GDP growth; 3) the relationship between budget and fiscal variables and GDP growth; 4) Econometric the impacts of these effects budget and fiscal variables (total and components) on growth.

Table 1. **The profile of economic growth (1990-2010)**

Country	Average	STDV	Dynamic 1990-2010	Max		Min	
				Value	Year	Value	Year
EMU	1.8	1.8	-1.6	3.8	2000	-4.3	2009

LMC	4.8	1.8	3.2	7.9	2007	1.7	1991
OED	2.1	1.7	0.0	4.1	2000	-4.0	2009
WLD	2.7	1.5	1.3	4.3	2000	-2.3	2009
ROU	1.1	6.5	6.5	9.4	2008	-12.9	1991

Source: own investigation based on World Bank database.
Note: EMU = Euro Area; EUU = European Union; OEC = High income: OECD; LDC = Least developed countries: UN classification; LIC = Low income; LMC = Lower middle income; OED = OECD member states; WLD = World; ROU = Romania.

The profile analysis on the global economic growth indicates that the most important economic growth was recorded in 2000 for most developed countries, respectively in 2006-2008 for developing countries and emerging economies. In Romania, there is an alternation of periods of negative economic growth (1990-1992, 1997-1999, 2009) with the positive (1993-1996, 2000-2008, 2010). In these times of economic decline, Romania had the lowest negative real GDP in 1991 (value being -12.9%).

Dynamics of real GDP during 1990-2010 indicates that the most important change has been rising in Romania (6.5 pp), while developed countries there has been downward. Per whole period remains positive growth rate (average of 0.3 pp).

In a world in permanent connection and constantly evolving, is relevant the Romania's position is the relevant groups of countries to see the national economic growth as percent of international. The results are surprising because it enables to keep pace with international context. For example, to the global economy, Romania's economic growth was 41.4% during 1990-2010, only 22.5% respectively in 2010.

Research on the effects of fiscal and budgetary policies on economic growth envisaged first the quantitative analysis of these variables as a whole. Thus, Figure 1 presents the real incomes of the general government with which the real GDP growth. Budget revenues in absolute real had an upward trend throughout the period except in 2009 when they experienced acute financial crisis effects. On the other hand, real GDP had the same trend as actual revenues which lead us to think of a positive relationship between these variables. This is confirmed by plotting the relationship between two variables with a multiplier of 1.1 to 0.9 for actual expenditures. Thus, it appears that GDP positively affects revenues and economic growth noting that the multiplication factor is much smaller than previously indicated.

The actual general government expenditures are observed also a positive effect on GDP was larger than on growth (Figure 2). Spending trends (absolute and rate) and real GDP growth are similar to that observed with the revenues. When analyzing the dynamics between the variables to produce a negative coefficient (-0.025) lower than the revenues. This is due to spending at a pace faster than the GDP rate has been maintained including in 2009 the actual budget expenditures increased by 4.1% while revenues fell by 5% due to negative real rates GDP growth of 6.6%. This attenuates the budget and fiscal adjustment in 2010 that made the growth rate of real revenues to surpass that of real spending by 6.4 pp (rate was 7.9% of budget revenues and expenditures of the 1.5%) while growth reached -1.6%. We can therefore say that the budget and fiscal adjustments in 2010 and reached their goals (deficit reduction, economic recovery).

But, it matter the engines of economic growth fiscal and budgetary policies. For this approach it must be considered the study of the effects on growth of various types of income and expenditure. This will check the case of Romania if valid conclusions from other studies on boosting the economy through productive spending. This investigation indicates that social

contributions and intermediate consumption are not statistically significant. Therefore, these variables were not included in equation. An instant positive reaction comes from the taxes on production and imports whose growth with 1 percent generates a dynamic growth increase with 0.3 percent. On the other hand, current taxes on income and wealth produce a decrease but the reaction is delayed with 3 quarters.

Figure 1 **General government revenue and economic growth**
Figure 2 **General government expenditure and economic growth**
Source: author's investigation based on Eurostat data.

On expenditure side, the results indicate a positive impact on growth that comes only from the subsidies and interest with a delayed of two and three quarters). Compensation of employees has an important effects on economic growth with a delayed of 1 and two quarters as a direct consequences of the wages payment manner in the budgetary system. These results are obtained using data from Eurostat (2000Q1- 2004Q3). All the data are expressed in real terms using HICP and are seasonally adjusted. The series are stationary by applying first differences.

Surprisingly in a year if income or expenditure budget increase at a rate of GDP over the next period when growth will be adversely affected. This finding should be considered when conducting fiscal and budgetary projections for the next three years.

4. Conclusions

This paper aims to analyze the impact of fiscal and budgetary policies on economic growth. Results of research on Romania's case indicate that revenues act to stimulate the economy stronger than budgetary expenditures. This yields a positive influence on both the GDP and economic growth. On the other hand, the dynamics of income and expenditure negatively affects economic growth.

Romanian government can stimulate economic growth by increasing taxes on taxes on production and imports, subsidies and interest and decreasing current taxes on income and wealth and compensation of employees. Also, the growth rate of general government revenue or expenditure must follow closely the GDP rate because there is a negative relationship between the dynamic of fiscal variables and GDP growth rate.

Abstract.In this paper the authors describe how the analysis of solvency to prevent bankruptcy of Romanian companies. In this respect safety intervals are identified by the authors after analyzing the financial condition of more than 900 Romanian companies.
Key words: solvency, assets, liabilities, financiers
Jel classification: G32

1. Introduction

Lately more and more Romanian companies went bankrupt. One of the reasons is the poor solvency of these companies. Hence, to prevent entry into insolvency present results of a survey of 900 companies from all sectors of activity, we determined which times best Romanian companies solvency.

2. Literature review

The literature solvency is a favorite subject of all specialists in the country and abroad. Thus, many American proffesors, show that long-term debt and solvency analysis evaluate the level of risk borne by a firm, changes over time, and risk relative to comparable investments. A higher proportion of debt relative to equity increases the riskness of the firm.

According with other specialists solvency relates to a long-run perspective of a company's ability to pay its debts and whether it is going concern.

In Hennie van Greuning opinion, solvency represents the risk related to the volatility of income flows often described as business risk (resulting from volatility related to operating income, sales and operating leverage) and financial risk (resulting from the impact of the use of debt on equity returns as measured by debt ratios and cash flow coverage).

Other American author considers that the capital structure of an enterprise consists of debt and equity funds. The sources and composition of the two types of capital determine to a considerable extent the financial stability and long-term solvency of the firm. Equity capital is risk capital, and the return on investment to an investor is subject to many uncertainties. Debt capital must be paid on specific date, ussualy with interest, if the firm ist o survive.

Solvency is an important factor in the analysis of a company's financial statements. Solvency refers to a company's long-run financial viability and its ability to cover long-term obligations. All business activities of a company-financing, investing and operating- affect a company's solvency. One of most important components of solvency analysis in the composition of a company's capital structure.

3. Method and results

Solvency thus expresses the ability of companies to cover all debts (bank, suppliers, budget, etc.) by making all its assets.

An important solvency ratio is the financial leverage ratio. This indicator measures the relation between total assets and the common equity capital that finances assets. It is expressed as:

$$\text{Financial leverage ratio} = \frac{\text{Total assets}}{\text{Common equity capital or Total debts}} \times 100 \quad (1)$$

The indicator is directly influenced by economic sectors, the complexity of technology, manufacturing cycle. Thus, in industries indicator value will be higher and the trading activity will be lower.   Regardless of the situation must be analyzed indicator value higher than one.

Another method of analysis is the degree of financial solvency assets from external sources. In this case the share of total debt should not exceed 50% of total assets to recoverable resources available at any time.

The analysis undertaken have established solvency of weight evolution of total debt in total assets, assuming no uncertain assets, is as follows:

Figure 1:
Source :

The differences are significant to the sector of the company. A solvency of 110% is considered acceptable in the commercial sector, but weak in other sectors of national economy. This difference is due to the nature of the trade, where goods are purchased with the payment term, substantially increasing the company's total debt. From research conducted on the models we identified intervals bank liquidity safety by sector as shown in Annex 1. Comparative analysis by industry liquidity is another dimension of research undertaken. To make a comparison, we randomly selected a total of nine hundred Romanian enterprises, which are representative for the following branches: Trade, Transportation and Manufacturing. For each branch we chose three hundred companies in the banking sense, are considered companies with good liquidity (A), three hundred companies with an acceptable liquidity (B) and three hundred have reduced liquidity (C). Also just to capture the reality of the economy as we presented in two forms of liquidity development. The times are not necessarily the same as the date for the nine hundred companies because we considered it important trend that follows their development over time within the same industries in the table below.

Table 1: Evolution solvency in Romanian companies

Sector	Trade			Transportation			Production		
Ratios	A	B	C	A	B	C	A	B	C

	%	%	%	%	%	%	%	%	%
First period Solvency	340,1	137,7	129,7	164,3	143,3	124,8	323,9	178,8	177,6
Second period Solvency	233,6	194,8	116,5	165,3	149,0	149,5	239,1	190,3	112,2
Third period Solvency	232,2	169,8	125,2	192,7	189,2	173,0	251,0	197,0	138,1

Surce: Own calculus

Based on information presented in Annex 1 on solvency supported by donors ranges, we can say that the situation presented, all businesses in category "A" has a good solvency, well above the accepted limit of 120%. It also notes that the solvency ratio considered "very good" in other sections (transport, ie production) is registered to trade half of solvency. The situation is because trading companies in the sector working with commercial loans that the company's total debt increased exponentially.

Thus, the situation of the category "A" may be due to:
- low level of total debt, which can mean both a higher inventory turnover rate and the existence of a stock of goods enough;
- high level of equity.

The companies in category "C", considered as having a degree of solvency inappropriate situation indicator may be due to:
- high total debt;
- low level of equity.

Total debt levels can be caused both by firm-specific trade credits trading, leases, bank loans and the associated loans. Indicator to improve the situation: adjust incoming and outgoing freight, calling the alternative financing lease made for longer periods, giving up lending sources short-term investments, exclusive use of company resources, recording the associated debt is the most often a "tactic" of members who want to withdraw money from the company for alternative uses.

3. Conclusions

And relying on the information presented in Annex 1 on solvency supported by donors ranges, we can say that the situation presented all companies in all categories have a very good solvency. This is mainly due to ignorance and bad debts recoverable stocks that are not treated as such by society. Theoretically, any stock that exceeds the average capitalization of stocks should be treated as "stock recoverable" and sold subpreț, variation is not part of the practice of Romanian companies.

Also, the indicator is high and that Romanian companies tend to accumulate assets as part of "certain assets" of the company (this may take including service vehicles and other productive assets), leading to a high of total assets. Firms with less than 100% solvency are considered insolvent, and major risk for both investors and financiers.

Abstract.In the paper the authors show a modality of performance analysis based on ratios which are useful tools of analysis that synthesize large amounts of data in a form easier to understand, to interpret and compare. They underline in the same time certain limits to be analyzed for each case. When comparing rates from different periods should be considered the operating conditions of the economic entity and the impact of certain changes to the financial statements such as: changes in economic conditions, the production process, the various product lines or geographic markets served.

1. Introduction

Analysis based on ratios constructed by analysts, from financial statements, should be combined with the investigation of other factors, before they draw relevant conclusions and make recommendations for measures to be adopted by the economic entity's management.

Assessment of the fact that an index is too high, too low or appropriate depends on the interpretation of results by the analyst who is considering on one hand, the type of activity of the economic entity and economic entity's position within the sector and on the other hand, the strategy adopted by the economic entity on a particular market.

The objective of the ratios variation analysis is to determine causes and effects that rates have on the company's ability to repay debt.

2. Method and Results

In the research conducted I've selected from 2178 Romanian IT companies, a sample of 778 companies that were active uninterrupted between 2007 and 2011, companies that I afterwards re-grouped into four sub-areas of activity, namely: Software; Consultancy activities in information technology; Trade activities with IT products; Other activities.

The global crisis was par excellence in its first phase, a crisis of liquidity, which is why it is interesting to see its impact in the IT sector in Romania. The analyzed indicator is current liquidity, whose evolution can be found on the four sub-domains.

Over the period analyzed, on the extremes is the trade specialization - with the least favorable evolution and other activities specialization - with the best evolution and also with the highest values of current liquidity. However, despite these fluctuations, the current liquidity of the companies analyzed fits in the range of financial security around the entire period, except for companies that specialize in trade which beginning with 2009, recorded a significant drop in liquidity.

Another aspect analyzed in this study refers to the most representative statistical values for 10 indicators in the four areas of activity from which a number of issues arise (Table no.1).

Values recorded by the two indicators of the central tendency, mean (average) and median, confirm the lack of importance of the mean value compared with the median value. Basically, the existence of some extreme values leads to significant displacement of the mean value. The negative impact of the global crisis on the consulting company's sub-domain is obvious in the case of performance indicators ROE, ROA and RRG, their median values recording significant decreases in 2010 and 2011 compared with 2007-2009. In the same time liquidity indicators (LC - current liquidity and LI - immediate liquidity) tend not to differ significantly from one year to another, a fact confirmed by the application of some statistical tests for equality of their median value. Degree of Leverage as a measure of exposure of companies, although doesn't vary significantly from one year to another records high levels.

A similar behavior of these indicators can be found if the software companies sub-domain, according to Table no.2.

Table no. 2.Evolution of the values of the representative indicators in software companies - 49 companies

The performance of software companies is high in pre-crisis period, 2007-2009, but had the same downward trend during the crisis. Indebtedness is also high, but does not reach the levels of consulting companies, while liquidity is kept about the same levels.

Commerce sub-domain performance is higher during the crisis than the first two sub-domains analyzed, according to data in Table no.3. At the same time, perhaps due to the specific of the sub-domain, liquidity indicators recorded lower values. Indebtedness is maintained in this case also at high levels of over 60%.

Table no.3. Evolution of the values of the representative indicators in trade companies -11 companies

From the sample of over 700 companies only two were declared to be in the Manufacturing equipment sub-domain and their analysis is unnecessary because both recorded loss in all five years examined.

In the category *other activities* can be found 66 businesses whose performance, according to Table no.4 is located in the average of the IT sector. High levels of liquidity indicators and a lower level of leverage are recorded.

The analysis undertaken revealed the distribution of the median value for ROA and ROE, in the four areas based on "three areas" named: green area (0-30%), brown area (30 -60%) and red area (over 60%). Thus, for Software Median ROE for the green area has a value of 33.53%, for the brown area the recorded value is 65.91% and for the red area the value of the indicator is 0%. Median ROA for the green area has a value of 31.67%, the value recorded for the brown area is 66.31% and for the red are at he indicator value is 1.81%.

For consultancy median ROE for the green area has a value of 56.11%, for the brown area the recorded value is 43.88% and for the red area the value of the indicator is 2.40%. Median ROA for the green area has a value of 47.12%, the value recorded for the brown area is 22.43% and for the red are at the indicator value is 2.66%.

For trade median ROE for the green area has a value of 21.41%, for the brown area the recorded value is 89.35% and for the red area the value of the indicator is 17.55%.Median ROA for the

green area has a value of 21.19%, the value recorded for the brown area is 42.35% and for the red are at the indicator value is 3.02%.

For Other Activities median ROE for the green area has a value of 53.89%, for the brown area the recorded value is 56.90% and for the red area the value of the indicator is 0%. Median ROA for the green area has a value of 48.23%, the value recorded for the brown area is 32.89% and for the red are at the indicator value is 0%.

3. Conclusions

The analysis undertaken revealed the distribution of the median value of ROA and ROE, on the four domains based on "three areas" named: green area (0-30%), brown area (30-60%) and red area (over 60 %).

From the analysis of the main statistical indicators of central and variation tendency of the rate of return on assets and rate of return it can be seen that over 50% of firms that are engaged in consulting activities are in the green area not having continuous problems of financial difficulties. For this reason we believe that it is required in the financial theory and practice of the companies to find more and more often the rating models that can prevent a collapse of economic entities.

The aim of this paper is to analyze the methodology of structuring an index based insurance contract.
The weather has always been the biggest risk factor in agriculture, affecting all aspects of the economic sectors. In the developed countries of the world, there is a significant number of rain-dependent farmers.
To gain insight into potential growth of weather markets in developed countries, we are going to analyze the case of India. In 2003, Basix microfinance company in Hyderabad and ICICI Lombard insurance company in Mumbai have launched a pilot weather insurance, which had as basic index phenomena for Mahahbubnagar district of Andhra Pradesh. Further detail can be found in the full-paper.
In the paper we will enumerate the appropriate steps in the determining the necessity for the use of index based insurances. The appropriate stages are making a comparison between index based insurances and traditional insurances, and optimizing the use of weather indices in insurance contracts.
In order for the contracts to be successful , the recommended steps are : developing a product based in an index, and after the we need to plan and implement the contract. In planning the implementation it is needed that we: identify the risks and areas where they manifest, then identify the best distribution channels; after this we can develop a prototype of the contract. The next step would the testing of the negotiability of the contract, then the contract is opened to be finalized. After this the index based insurance contract can be introduced to the market, but the program needs monitoring in order to insure its successfulness.
In order for the market and contract to grow the necessary step are: having access to the necessary meteorological data, determine the optimal way of integrating the contract in the existing economical context, technical feasibility, property rights and the legal framework.
In the end, the aim is to familiarize the literacy field and potential beneficiaries of such products and to provide some way to address this market for investment purposes, showing a bridge-point between the traditional insurances and the more elaborated weather derivatives.
Keywords: insurance based on indices, Basix, CRMG, weather indice, insurance contracts
JEL: G22

The weather has always been the biggest risk factor in agriculture, affecting all aspects of the economic sectors. In the economy of the developed countries there is a significant proportion of rain-dependent farmers. There is a variety of cultures, production methods and agricultural management techniques that can minimize risk factors, but farmers will always be affected by uncontrollable factors such as rain fall or thermal variations, which may have a significant negative impact on the quality and quantity of seasons harvest.

World Report on Development of 2008 reiterated the importance and the role played by agriculture in the context of the world development . The report highlighted the needs for access to financial resources and for reduction of exposure of farmers to uninsurable risks, in order to create effective development strategies. Risk management products, such as insurances, are considered to be the most important because they facilitate access to financial services. Lending and saving more can stimulate the use of innovative technologies or activities that provide increased receipts. Following the example of agriculture, farmers could benefit from investing in large-scale agricultural activities, if the weather elements are treated

properly. Thus, specific agricultural companies have limited access to financial services and agricultural activities at a rate of profitability in the short term are limited.

In response to these problems and in order to boost international market formation for weather risk, the Risk Management team of the Department for Agriculture and Rural Development World Bank (World Bank Commodity Risk Management Group (CRMG)) began to build up a project to develop insurance contracts based on weather indices. These contracts based on weather indices can't replace traditional policies or other means of risk prevention - such as selection or use of innovative technologies, crop diversification, moisture conservation techniques, yet it provides a complementary mean to protect farmers. Thus, the 2003 CRMG has provided national and commercial entities technical assistance for developing and implementing these tools. CRMG has focused on determining the potential effectiveness of these insurance contracts based on indices forecasts for farms and farmers in developed countries, trying to determine the feasibility, sustainability and scale for implementation.

To gain insight into potential growth markets in developed countries weather, we are going to analyze the case of India. In 2003, Basix microfinance company in Hyderabad and ICICI Lombard insurance company in Mumbai have launched a pilot weather insurance, with had as basic index phenomena for Mahahbubnagar district of Andhra Pradesh. This program has received technical assistance from the CRMG. The program sold 230 contracts for beaver and peanut farms, to be protected against drought. Thus, in 2006 Basix had sold insurance contracts and contracts based on rainfall index and multi-threaten weather contracts (including temperature and humidity them) to over 11,000 customers across India, and continued to develop its network of customers interested in insurances based on weather indices. Basix and ICICI efforts have led to the creation of an innovative insurance product developed in record time, with notable success; their work also catalyzed the insurance market in India.

Since 2004, four insurance companies sold insurance policies to farmers and the weather risk forecasted in India was anchored in the international market risk. Since 2005, a private sector company of India began installing automatic weather stations in over 400 branch network to supplement the Indian Meteorological Department and to support the development of market risk information. In 2007, after distributing subsidies for insurance contracts based on weather indices by the Indian Government, more than 600.000 Indian farmers have purchased such contracts through AICI (Agricultural Insurance Corporation of India). The total amounts registered premiums of over 30 million dollars($).

Given all the basic lessons of CRMGs problems encountered so far, we can see three main issues to be considered in sustainability studies of insurance contracts based on weather indices and risk management in the related market. They are: • the need for appropriate insurance indices, • the need for the definition of key points in their implementation, • the need to clearly depict the pre-requisites.

When is the appropriate time to apply an index-**based** insurance**?**
1. Insurance Insurance-based versus traditional indices
Traditional insurance based on the principle of compensation, where losses are measured either in terms of area affected by the event (at the place) or the perspective taken on crop yields. These products, although appropriate in some contexts, have limited scope for both the insurer and the insured. Farmer behavior and activities may affect the likelihood of the event or damages caused, or might transform the insurance product in a high probability event. To overcome these challenges, a comprehensive monitoring and administrative efforts are required, thus increasing costs. Without stability and efficiency, opportunities for the insurer and for reinsurance portfolios would be affected.

Insurance contracts based on weather indices work differently from traditional insurances. Contracts on indices can be used only if risks have spatial correlation, such as drought. These are

not applicable to idiosyncratic risk, and hail and pests that affect crops of one farmer. Allowances are not paid based on performance deficits registered by firms, but by signs of deficiency strong correlation with factors that can be used to estimate losses. These indices, based mostly on weather, are insurance contracts for predefined time intervals and are used to determine the necessary compensation to be calculated based on contract parameters.

2. Connection with the use of insurance contracts based on indices

Insurance contracts based on indices are a method to reduce agricultural risks, financial risks and logistical relations. Contracts based on weather indices are a risk management tool that provide alternatives to farmers in developed countries and re intended to be used to complement traditional risk management techniques. There are other risks to which farmers are exposed, but those are not correlated with time and can't be structured as indices. The real value of insurance contracts based on indices reach their true potential if they are accompanied by other instruments of risk management or investment opportunities. For this reason, insurance-based indices, like any insurance product, should be integrated into risk management structures organized for farmers.

3. Customers

Various types of indices based approaches have become attractive on the insurance market in developed countries but also in emerging countries. These contracts are flexible and structured to deal with risks at all levels: individual, companies and governments. Even the farmers (because they are objective of the study) accessing time risk management structures can have a significant impact on the timing of when and where the product would be used. Two basic uses for these insurance contracts are to provide farmers insurance products type "retail" (individual insurance) or alternatively make an institutional risk management (portfolio insurance) or other means of pooling risk. But the primary problem is to find a network of trusted and widely spread agents in rural areas.

4. Using weather indices based contracts

Introducing the index based weather insurance can create obligations to customers, besides having their most pressing problems to resolve. Where index insurance support can address the primary risk is important to work with clients who have the power to integrate a new financial product in current operations and are able to manage other risks that may appear.

What are the key elements to implement these contracts?

1 Develop an insurance product based on an index

Identifying a measurable time index, which is strongly correlated with losses for a given crop farmers, is the most critical in developing a risk management program. An index of weather can be built using any combination of meteorological variables in a time interval and any number of meteorological stations able to highlight the risk in agriculture in the given geographical area. Common variables include temperature and precipitation. After collecting weather data, the design of an index will require analysis of how meteorological variables have no influence on yield or long-term analysis of key factors since experts (such as agro-meteorologists and farmers), referring to crop growth model using weather variables as inputs for yield estimates.
An index of "good" must have the sensitivity of crops from the weather during various stages of development, biological and physiological characteristics of crops and soil properties. If a sufficient degree of correlation is established between weather index, quality and crop yield, a farmer can provide production or quality differences, by purchasing a contract that pays damages in case of specified weather events.

A good contract will work well in terms of agro-meteorological conditions, it offers protection for customers at a price they can afford. The aim is to cover the contract or to smoothen fluctuations in income for a farmer.

2 Planning and implementation

Highly critical design contracts are only one component of the program development process needed to start a successful initiative for insurance while. While this approach is still evolving and must be adapted to each country and customer profile, there are seven basic components of the implementation of pilot programs, which must be undertaken to develop a product that not only helps in technical terms, but also asks and has affordability for customers.

1. Identify potential pilot areas and a risk assessment. Where appliable, the order of these two components of the first step can be reversed. If an area is "a priori" defined as a pilot area, there the steps are:

 - identify your target area and clientele for the pilot program, including culture, weather station and potential clients. Ex: regional agricultural map.

 - to conduct a rapid assessment of initial risk, the available data and the risks to customers and cultures.

2. Identifying distribution channels to reach end users .Identification of an institution like a bank, farmers organization, agricultural contracting business, which can be cost effective, but also to provide insurance products to farmers. This institution must be both attractive enough to reach customers and have the organizational capacity to deal with a new financial product. For a portfolio of insurance, this is relatively simple and requires identifying the institution holding portfolio risk.

3. Contract prototypes: prototype design contracts for the weather station and customers. The objective of this step is to design a contract that can act on customer risk, while taking into account the premium that a customer is willing to pay a level of complexity of coverage in which all stakeholders are satisfied.

4. Testing negotiability of contracts and products (contracts): prototype discussion with potential customers and shareholders to determine their interest in insurance, willingness to pay for contracts and how closely related are the initial contracts to their estimated risks. Since the initial contracts are only prototypes, this is a critical step to determine if the product is properly designed and justifies the demand for the product.

5. Finalize design of insurance contracts: Review and finalize contract structure, based on market research and discussions with the customers. Once contracts are finalized, measures need to be established in order to define risk factors for insurers and reinsurers and prepare contract documentation.

 6. Product market: the product market through delivery channels, different pilot areas. At a retail level, in order for individual farmers to buy this kind of product, they need to clearly understand their limitations, meaning a basic risk.

7. Pilot monitoring program: The project will try to detect any unexpected results, determined by lack of all stakeholders / participants fulfilled of their commitments and will result in timely execution of the contract, if the debts are owed to the farmer.

What are the necessary conditions for market growth?
Sustainable growth and the future insurance market depend on their availability and demand. But before those problems of supply and demand can be taken into account, the necessary conditions for market development should be established. While in many countries, some of these conditions have been met in other investments, in market infrastructure contracts reliable indices will be needed. Key issues discussed are: data collection infrastructure, technical feasibility, clients and their integration in the chain of economic activities, property rights, the legal framework.

 Infrastructure for making meteorological observations and data collection
Insurance contracts based on weather indices require the presence of a dense network, safe and properly equipped weather stations that provide long-term, clear, error free and historically consistent records. However, the size of the program of implementation of insurance contracts

based on weather indices is limited by the density of the weather station network. A dense, safe and well-developed meteorological stations means that:

a) insurance products can be indexed by weather monitoring stations that are representative for clients, so that basis risk is low;

b) a large numbers of customers for the insurance product can be attracted.

Therefore, investment in meteorological services is necessary to expand the potential market. More than ever, opportunities and technologies exist and can allow strengthening and modernization of meteorological and historical data, without incurring significant cost. Combining data recorded by satellite and earth stations reports offers a new opportunity to expand the scope of an index-based products.

Customers and their integration in the chain of economic activities

Often, while it is technically feasible to develop a risk management tool based on an index of weather, operational challenges to reach end users can be insurmountable. Defining a "client group" seeking product in a place where he could be sustainable is critical and is one of the most difficult aspects of insurance products in rural areas, in terms of marketing. An insurance contract with a base index is viable if there is a value proposition for the farmer, when linked to credit, market access and other services.

Ownership

Many of the insurance contracts based on weather indices were based on donor resources, expertise in design, contract and program implementation. While this system worked for initiative programs (pilot), sustainability implies and requires the transfer of these capabilities of local actors. Efforts are needed to ensure that local stakeholders have access to indexes and design skills required of the contract. The purpose of this transfer is to facilitate the qualitative and transfer of ownership and control of market development by stakeholders in the market to reflect their own business rules and risk preferences.

Conclusions

Insurance contracts based on indices may raise some problems that limited the use of traditional insurance programs in developing countries and provides an opportunity to expand risk management tools, available to customers in these countries. Customers that manage their own risk can lead to better earnings and possibly access credits which should lead to investment in culture - yields, use of advanced technology and access to more profitable markets. However the evidence-based weather insurance, not a "goldfish" for agricultural development and the experience so far is not sufficient to fully determine how it will affect development. Weather index insurance products have higher costs in advance, given to only a limited aspect of production risks and can be coupled with complementary investments in agricultural technology, marketing, financing and more extensive insurance options that are sustainable and can encourage new farmers to significantly improve the economic welfare of traditional farmers.

However, it is hoped that the availability of innovative risk management products, where implementation is appropriate, will lead to the possibility of elimination of the risks that traditionally had limited investment in agriculture.

As you can see, insurance products based on indices are similar to Weather Derivatives, both based on the underlying weather index. The difference between them is due to the fact that weather derivatives are "stock" traded and contracts based on indices are insurance products designed to "complement" standard traditional contracts.

The aim is to familiarize the literacy field and potential beneficiaries with such products and to provide some way to address this market for investment purposes. New players, in particular of "emerging community" will contribute to the development of such products - insurance contracts based on an index, perfecting and refining a sector. Future applications of these contracts will

expand understanding of risk management and the forms through which weather can promote economic development.

This paper empirically investigates the impact of the Global financial crisis on the efficiency of four Central and Eastern European emerging unit-linked insurance markets, applying the automatic variance ratio (AVR) test of Kim (2009) and variance ratio tests using ranks and signs by Wright (2000) for entire, pre-crisis and crisis periods. This study contributes to the existing literature on efficient market hypothesis with several distinct features: it provides a systematic review of the weak-form market efficiency literature that examines return predictability of the daily ING unit-linked funds prices; also the article aims at monitoring any improvement in the degree of efficiency in time and also examines the relative efficiency of unit-linked insurance markets in pre-crisis and crisis periods. Unit linked insurance are life insurance policies with investment component. In the literature there are few studies investigating the effects of a financial crisis on the potential of predictability and implicitly on the degree of efficiency of financial markets. The occurrence of a market crash or financial crisis is a possible contributing factor of market inefficiency. Most of the studies are focused on the Asian crisis in 1997: Holden et al. (2005) examined the weak-form efficiency of eight emerging Asian stock markets using VR tests before, during and after the Asian crisis; Kim and Shamsuddin (2008) used three different types of multiple VR tests for nine Asian stock markets; the findings reported by Lim et al. (2008) are consistent with those reported by Cheong et al. (2007), in which the highest inefficiency occurs during the crisis period. Todea and Lazar (2010) investigated the effects of the Global crisis on the relative efficiency of ten CEE stock markets, using Generalized Spectral test of Escanciano and Velasco (2006). Wright (2000) proposes the alternative non-parametric variance ratio tests using ranks and signs of return and demonstrates that they may have better power properties than other variance ratio tests. Kim (2009) found that the wild bootstrap AVR significantly improves the size and power properties of the AVR test. Using the bootstrapped automatic VR test developed by Kim (2009) and Wright's test, the statistical findings show that the degree of the markets' inefficiency varies through time and surprisingly the empirical results suggest that the Global crisis led to a decrease of predictability and hence to an improvement of relative efficiency for five of the eight ING funds.
Keywords: Global financial crisis, unit-linked insurance markets, market efficiency, martingale, variance ratio test.
JEL classification: G22, G23, G14, C58, C87.

1. Introduction

Although the efficient market theory and the random walk hypothesis have been major issues in financial literature for the past thirty years, there are only few studies investigating the impact of the global financial crisis on the potential of predictability and implicitly on the degree of efficiency of financial markets, respectively of Central and Eastern European unit-linked insurance markets.

The global financial crisis has negatively influenced the evolution of European unit-linked investment funds. Unit linked insurance are life insurance policies with investment component.

The insurance premiums are invested into one or more investment funds, managed by the insurance company. Each investment fund has its own unit with individual prices. In case of unit-linked insurance policies the investment risks are on the insurance person's side, but the benefits of the investment depend on the investment funds' evolutions.

The efficient market hypothesis (Fama, 1970:383-417) can be viewed as the cornerstone of modern finance. Since the seminal papers of Samuelson (1965) and Fama (1970), the efficient market hypothesis states that efficient market prices follow a random walk or a martingale. When the market is efficient, all available information is fully and instantaneously reflected in price, and no market participant is able to make abnormal profit. When the information set is limited to past price and return, the market is said to be weak-form efficient and the asset return is purely unpredictable from the past information. Most of the efficient market hypothesis studies on financial markets are tested for the weak-form efficiency through the martingale difference hypothesis MDH, where the current price is the best predictor of the future price and the returns are independent or uncorrelated with the past values. According to Lo (2004), there is no consensus among finance academics and practitioners as to whether stock market is efficient. While most of finance researchers believe the market is weak-form efficient (see Doran, et al. 2009), there are some critics who support the idea of maximum predictability (DeBondt and Thaler 1985, Barber and Ordean 2001). Grossman and Stiglitz (1980) even argue that a perfectly efficient market is impossible. In response to these critics, Campbell et al. (1997) proposed the concept of relative efficiency. With relative market efficiency, it is useful to measure the degree of efficiency or return predictability. The common idea of these studies is the fact that the rejection/acceptance of random walk hypothesis (RWH) is equivalent to the hypothesis of inefficiency/ efficiency. Todea and Lazar (2010) stated that a rejection of the hypothesis of efficiency over the whole sample could either mask subperiods of efficiency, or the fact that markets are becoming more efficient over time, so a more accurate approach would be to identify subperiods of efficiency/inefficiency and to rank the relative market efficiency.

The objective of this article is to empirically investigate the effects of the recent Global crisis on the degree of efficiency or return predictability of four Central and Eastern unit-linked insurance markets using the automatic variance ratio (AVR) test of Kim (2009) and rank-based variance ratio tests by Wright (2000). This study contributes to the existing literature on EMH with several distinct features: this paper provides a systematic review of the weak-form market efficiency literature that examines return predictability from past price changes, with an exclusive focus on the unit-linked insurance markets. Moreover, the article aims at monitoring any improvement in the degree of efficiency in time and also examines the relative efficiency of markets in pre-crisis and crisis periods.

The structure of the article is as follows. Section 2 discusses some previous research on the issue. Section 3 and 4 describe the sample data and provides descriptive statistics and outlines the methodology. Empirical results are presented in Section 5. The conclusions are drawn in Section 6.

2. A review of related literature

The globalization of financial markets broadcasted the interest of most of the contemporary empirical tests for the Efficient Market Hypothesis in individual or regional markets from Latin America (Urrutia 1995, Grieb and Reyes 1999, Charles and Darne 2009 etc.), Africa (Smith et al. in 2002, Magnusson and Wydick 2002 etc.), Asia (Huang 1995, Groenewold and Ariff 1998, Kim şi Shamsuddin 2008 etc.), Middle East (Abraham et al. 2002, Al-Khayali et al. 2007 etc), Europe (Worthington and Higgs 2004, Smith 2009, Charles et al. 2009 etc).

The occurrence of a market crash or financial crisis is a possible contributing factor of market inefficiency. This is because investors are generally swamped by panic in that chaotic financial environment, and thus causing a decrease in the degree of efficiency. Thus, Holden et al. (2005)

examined the weak-form efficiency of eight emerging Asian stock markets using VR tests before, during and after the Asian crisis. For most markets, there is no improvement in the degree of efficiency in post-crisis period, except for Taiwan. Using three different types of multiple VR tests for nine Asian stock markets, Kim and Shamsuddin (2008) divided their sample into sub-sample I (1990–1996) and sub-sample II (1998–2005) in order to separate the effect of the 1997 financial crisis. The results of this study show that the stock markets of Hong Kong, Japan and Taiwan remain efficient even after the crisis. The findings reported by Lim *et al.* (2008) are consistent with those reported by Cheong *et al.* (2007), in which the highest inefficiency occurs during the crisis, followed by the pre-crisis and post-crisis periods. Todea (2010) investigated the effects of the Global crisis on the relative efficiency of ten CEE stock markets. The results of the Generalized Spectral test of Escanciano and Velasco (2006) show a decrease of predictability and an improvement of relative efficiency for seven of the ten investigated markets in the crisis period.

3. The data and its properties

The present paper focuses on four Central and Eastern European unit-linked insurance markets and the closing values of ING unit-linked funds at daily frequency for these markets are collected as follows: Czech Republic (Bond Fund, Junior Fund), Hungary (Bond Unit Fund, Balanced Unit Fund), Poland (Bonds Sub-Fund, Balanced Sub-Fund), Romania (Bond Fund, Mixt 25 Fund). All four ING Bond fund portfolios invest 100% in domestic instruments with fixed income. And the rest of ING fund portfolios invest 15-50% in shares issued by companies from the European Union, in particular Romania, Hungary, Poland and the Czech Republic, and instruments with fixed income denominated in national currency**.** All the closing prices of these funds collected from ING database are denominated in their respective local currency units. The data starts from 21 July 1999 and ends at 12 April 2012.

(Table 1) provides the descriptive statistics for the continuously compounded percentage returns, computed as $Y_t = \ln(P_t) - \ln(P_{t-1})$ (1), where P_t and P_{t-1} denote the closing price of the unit-linked fund on two consecutive trading days. To address the impact of the Global financial crisis on market efficiency, one has to first identify the crisis period. The downward trend started in most cases in the middle of 2008.

Table 1. Descriptive statistics of returns for pre-crisis and crisis periods

Market	Czech Republic		Hungary		Poland		Romania

Test is performed by the authors using software Eviews.

The Global crisis had a significant impact on the markets' performance, the highest decreases in prices were recorded for the Czech Republic Junior Fund and Poland Balanced Sub-Fund. During

the crisis period the highest increases of volatility are found in the case of Hungary funds and Poland Balanced Sub-Fund. In general, the daily returns are negatively skewed, which means that large negative returns are more probable than the higher positive returns. The excess kurtosis is positive for all indexes which indicates an increased number of returns around the average, comparative to the normal law.

4. Methodology. Automatic bootstrapped VR test developed by Kim (2009) and Variance Ratio Tests Using Ranks and Signs developed by Wright (2000)

The variance ratio test has been used widely as a mean of testing for the weak-form efficiency of financial markets, and of evaluating predictability of financial return. Since Lo and MacKinlay (1988) proposed its original form, the test has undergone a number of improvements, including the multiple variance ratio test of Chow and Denning (1993), sign and rank tests of Wright (2000), wild bootstrap test of Kim (2006), power-transformed test of Chen and Deo (2006) and bootstrapped automatic VR test of Kim (2009). The test is based on the property that, if an asset return is purely random, the variance of k-period return is k times the variance of the one-period return. The VR test evaluates the hypothesis that a given time series or its first difference (or return), is a collection of independent and identically distributed observations or that it follows a martingale difference hypothesis. Wright (2000) proposes the alternative non-parametric variance ratio tests using ranks and signs of return and demonstrates that they may have better power properties than other variance ratio tests. First, his tests often allow for computing the exact distribution. As it is not necessary to appeal to any asymptotic approximation, size distortions can be neglected. Second, tests based on ranks and signs may be more powerful than other tests if the data are highly non-normal.

When returns are subject to an unknown form of conditional heteroscedasticity, Kim (2009) proposes to employ the wild bootstrap of Mammen (1993) to improve small sample properties, as in Kim (2006) who applied the wild bootstrap to the Lo-MacKinlay and Chow-Denning tests. The wild bootstrap for $AVR(\hat{k})$ can be conducted in three stages as follows: form a bootstrap sample of T observations $Y_t^* = \eta_t Y_t$ (2) (t=1,…,T), where η_t is a random sequence with $E(\eta_t) = 0$ (3) and $E(\eta_t^2) = 1$ (4); calculate $AVR^*(\hat{k}^*)$, the AVR statistic obtained from $\left\{Y_t^*\right\}_{t=1}^T$; and repeat the previous stages B times to form a bootstrap distribution $\left\{AVR^*\left(\hat{k}^*; j\right)\right\}_{j=1}^B$. The two-tailed p-value of the test is obtained as the proportion of the absolute values of $\left\{AVR^*\left(\hat{k}^*; j\right)\right\}_{j=1}^B$ greater than the absolute value of $AVR(\hat{k})$.

5. Empirical results

We investigate the weak-form EMH for ING Czech Republic Bond Fund and Junior Fund, ING Hungary Bond Unit Fund and Balanced Unit Fund, ING Poland Bonds Sub-Fund and Balanced Sub-Fund, and ING Romania Bond Fund and Mixt 25 Fund by testing the MDH from wild bootstrapped AVR test and Wright's test. The (Table 2) displays the AVR test statistics for entire, pre-crisis and crisis periods. Bold letters indicate significant value at a 5% level of significance.

p-value	**0.002**	**0.005**	0.067	**0.001**	**0.002**	0.197

Test AVR is performed by the authors using software R.

Over the entire period, we observe that the martingale hypothesis is clearly rejected on the vast majority of unit-linked insurance markets, except for ING Czech Republic Junior Fund, at 0.05 significant level. In general, the high degree of predictability and implicitly of inefficiency of the four CEE unit-linked insurance markets is observed also in the two subperiods, except for ING Czech Republic Junior Fund, ING Hungary Bond Unit Fund and Balanced Unit Fund in pre-crisis period and the ING Czech Republic Junior Fund, ING Poland Balanced Sub-Fund, ING Hungary Balanced Unit Fund, ING Romania Bond Fund and Mixt 25 Fund in crisis period. Also the Wright's variance ratio test rejects the null hypothesis at a 5% level of significance, for all of the unit funds at most of the aggregation levels. The test statistics R1, R2 and S1 are using the following k aggregation values: 2, 5, 10 and 30. The Wright's test statistics suggest a surprising increase of the degree of efficiency in the crisis period, exceptions being ING Czech Republic Bond Fund and ING Romania Mixt25 Fund for all aggregation levels.

6.Conclusions
The efficient market hypothesis (Fama, 1970) can be viewed as the cornerstone of modern finance. One implication of the efficient market hypothesis is that when purchasing a security, you cannot expect to earn an abnormally high return, a return greater than the equilibrium return. Many studies shed light on whether investment advisers and mutual funds beat the market.
This study investigates the effects of the Global crisis on the relative efficiency of four CEE unit-linked insurance markets, an issue which is surprisingly understudied in the literature. Using the bootstrapped automatic VR test developed by Kim (2009), the statistical findings show that the degree of the markets' inefficiency varies through time. Only in the case of ING Czech Republic Junior Fund, the martingale hypothesis is accepted for the entire period and for the two superiods. Both of the tests suggest that the ING unit values that register an increase of predictability, correspond to ING less risky funds that invest 100% in domestic instruments with fixed income.
Surprisingly the AVR and Wright's empirical results suggest that the Global crisis led to a decrease of predictability and hence to an improvement of relative efficiency for five of the eight ING funds. On the other hand, an opposite result, that of a decrease of efficiency's degree in the

crisis period, was observed by AVR statistics for ING Czech Republic Bond Fund, ING Poland Bonds Sub-Fund and ING Hungary Bond Unit Fund and by Wright's test statistics for ING Czech Republic Bond Fund, ING Hungary Bond Unit Fund and ING Romania Mixt25 Fund.

LOCAL BORROWING AUTONOMY AS PART OF FISCAL DECENTRALIZATION PROCESS

Crâşneac O. Alexandru
West University of Timişoara,
Faculty of Economics and Business Administration

Beside the usual fiscal instruments like taxes and intergovernmental grants, sub-central governments have access to additional revenue through borrowing. When assessing the fiscal decentralization process, a key issue is the local borrowing autonomy, even though the fiscal decentralization literature has devoted surprisingly little attention to this topic. This paper examines the implications of sub-central government borrowing and the reasons behind the borrowing constrains they face. Based on the methodology developed by IADB, we have calculated a Borrowing Autonomy Index for Romania and compared the results to other countries providing a valuable insight on the fiscal decentralization specific features.
Keywords: fiscal decentralization, sub-central government, local borrowing, borrowing autonomy.
JEL codes: H71, H77

Introduction

In the setting of worldwide increase in the degree of fiscal decentralization and urbanization, local authorities are placed in a position to make important investments in areas such as infrastructure, water supply or transport. Thus, at the sub-national government level, the capital public expenditures tend to have a larger fraction of total expenditure, than for the higher levels of government. These public investments involve a high level of fiscal resources, which usually cannot be provided through current own revenues, being financed by capital transfers from central government. Unfortunately, when central governments are forced to implement measures to limit the budget deficit, public spending cuts usually operate among investments (Peterson, 1997). For this reason, local authorities are placed in a position to find alternative ways of financing investment projects, their access to capital markets becoming essential.

Besides the possibility to finance capital expenditure, local government loans can also serve to cover temporary cash flow deficits resulted from different timings in collecting receipts and making payments. Also, local authorities' access to the financial resources supplied by the capital markets, under certain conditions, can promote a responsible behavior and may increase local officials' accountability. Financial institutions may penalize, by increasing interest rates or refuse funding, local authorities with poor performance, and thus provides an independent mechanism for assessing the quality of local public policies (Ahmad, 2000).

For these reasons, institutions like the World Bank, EBRD, Inter-American Development Bank or Asian Development Bank are among the biggest supporters of increased autonomy regarding local public borrowing, as an essential component of financial decentralization.

On the other hand, the theory of fiscal federalism (Oates, 1968) has identified and potential hazards associated with liberalization of access to public loans at local level. Also, Jonathan Rodden (2002) showed that if there are some significant vertical fiscal imbalances, high local borrowing autonomy can lead to fiscal indiscipline by local authorities because they are expecting the intervention of central government to bail them out and to cover their deficits in case of fiscal distress. Therefore, a legal framework that allows local governments' access to public loans must be adopted, but one that prevents excessive local indebtedness. Thus, most countries have imposed certain restrictions on accessing loans by sub national governments.

In addition, due to the high degree of capital mobility within a country, financial securities generated by sub central government borrowing (such as, municipal bonds) will be, most likely, held by nonresident individuals or legal persons in the issuing jurisdiction. Thus, local government debt tends to be a greater degree than government debt, external debt for the local jurisdiction. For repayment of local government debt all community residents will pay higher

taxes in future, but from the interest on loans will benefit, to a greater extent, citizens of other communities. To prevent this transfer of income from the community to other communities and also to limit the size of total public debt (as the local government debt is part of the public debt), most states have instituted various restrictions, limiting, in one form or another, local governments' access to public loans. Ter-Minassian and Craig (1997) provide an extensive debate over the borrowing restrictions faced by sub central governments. They group these constrains into four categories: market discipline, co-operation, rules-based controls and administrative control by the central government.

Subnational governments borrowing autonomy
Local authorities' permission to borrow on the capital market is an important step in the process of fiscal decentralization. Borrowing autonomy can enhance the efficiency effects and quality of governance associated with fiscal decentralization.

To assess the possibilities of public borrowing of local and regional governments, Inter-American Development Bank (1997) has developed a Borrowing Autonomy Index. It is built according to legislative requirements concerning the possibilities of local authorities borrowing and their relations with banks and state owned companies, as shown in Table no.1.

Table 1 The Borrowing Autonomy Index (1)

No	Criteria	Score
1.	*Ability to borrow* If the sub central government cannot borrow	2 points
2.	*Loans authorization* - If all borrowing by sub central government require authorization from higher level of government - No authorization required	1 point 0 points
3.	*Borrowing constrains* - If there are numerical constrains on borrowing (such as maximum local debt service/revenue ratios)	Up to 0,5 points depending on constrains
4.	*The use of debt* - If local debt can not be used to finance current expenditure	0,5 points
The first part of the index is given by: 2 - sum of score for criteria 1. - 4.		
5.	*Subcentral governments relation to banks* - If subcentral governments own banks - If these banks have substantial importance - If subcentral governments have special relation to banks, but don't actually own them	1 point 0,5 points 0,5 points
6.	*Public enterprises* - If subcentral governments own important public enterprises, and these have liberal borrowing practices	0,5 points
To obtain the final index for each country the scores from criteria 5. and 6. are added to the first part of the index. O ne is added so that the final index varies between 1 and 5.		

Source: Inter-American Development Bank, "Fiscal Decision-making in Decentralized Democracies.", Latin America After a Decade of Reforms, Economic and Social Progress in Latin America Report, John Hopkins University Press, Washington D.C., 1997.

The index takes into account institutional features, such as whether every new loan requires authorization by the upper level of government, whether numerical constrains are in place, and whether sub central governments own banks and public enterprises. The major advantage of this approach is the ability to compress information about sub central governments' borrowing autonomy into a single index being suitable for international comparisons.

Based on the domestic legislation provisions we calculated the value of this index for Romania and for comparison with several EU Member States, we used the values calculated by Rodden (2002). The values of the index can range from 1 to 5, where 1 indicates no sub central government is able to borrow and 5 indicates full autonomy in borrowing, which is neither limited nor require any approval from central government. It can be argued that the values computed for the other countries refer to other periods of time and may induce a distorted image. However, the legislation regarding local borrowing powers changes rarely, especially in old Member States, that represent the bulk of the analysis.
Figure 1 The Borrowing Autonomy Index for selected EU Member States
Source: Own calculations, Rodden (2002)

As shown in Figure 1, Most EU member states have restricted access to loans to local authorities, as the index recorded a maximum value of 3. These restrictions are a normal consequence of assuming the nominal convergence criteria stated in the Maastricht Treaty and subsequently enforced by the Stability and Growth Pact.

States where local authorities are required the fewest restrictions in accessing public loans are Sweden, France and Finland. In the federal states, generally, regional governments tend to have a greater freedom than local governments regarding access to loans. Regional governments in Spain are able to borrow even to cover temporary cash deficits by short-term loans, unlike Germany, where they can borrow only to finance medium and long term public investments.

In Romania, local authorities may borrow only to finance investments or refinancing local debt. The legislative framework that enabled local authorities to access loans was developed by Law no 189/1998 regarding local government public finance. Under the current legislation, local authorities are not allowed access to loans or to guarantee any loan, if the total annual debt service from loans and/or guarantees is exceeding the limit of 30% of own revenue from taxes,

fees, contributions and other payments, other revenue and also revenue sharing from income tax. Moreover, any local public loan must be approved by the Commission for local government debt authorization and local debt must be repaid exclusively from own revenue.

Conclusions

When analyzing the fiscal decentralization process, an important component is the local governments' autonomy, which can be described by spending and tax autonomy, as well as by borrowing autonomy. To avoid excessive local public debt, all the EU Member States have imposed some restrictions for local governments in accessing loans. In the context of the current sovereign debt crisis, the control over sub-national borrowing becomes increasingly important. Romania, scoring 1,85 points on the Borrowing Autonomy Index granted local governments limited borrowing power, yet higher than some more developed countries such as Ireland, United Kingdom or Denmark. In the case of the EU Member States considered for our analysis we observe that between sub-national tax autonomy (Crâşneac, Heteş and Miru 2011) and borrowing autonomy is a strong connection observed among some Member States like France and Sweden. However, between the degree of decentralization, expressed by sub-national governments share in total public spending, and borrowing autonomy there is no direct relationship, some states with high degree of decentralization giving local authorities limited borrowing autonomy.

Notes

(1) The index was used by Anderson (2006) as part of a decentralization measure, but only the first part of the index, the values ranging from 0 to 2.

FINANCIAL STABILITY – THE PRE-REQUISIT OF A SUCCESSFUL FINANCIAL ACTIVITY

Chirilă Emil
University of Oradea
Faculty of Economics

Essential component of social life, the economic activity is faced with the problems of permanent balance. General economic balance implies the existence of a correspondence between needs for material goods and goods possibly available; needs for labor force and manpower available; needs for financial resources and opportunities for their procurement; between revenues of the population and their possible coverage with goods and services; between needs for foreign currency resources and those potentially available in given circumstances. We believe that the financial balance of an company must reflect, through financing rates, the method of ensuring, allocating and using financial resources, on the one hand, and the economic-financial results obtained from the activity performed on the other hand, as well as reflect the relation between cash flows generated by operation activities, by investments and financing, on the one hand, and cash flows used for these activities, on the other hand.

The financial balance study, according to "Cross-border research programme - performance indicators of entities in the Bihor- Hajdu Bihar Euro-region" - HURO/0901/204/2.2.3 was based on the basis of financial reporting for the years 2008-2010 for a number of 50 companies grouped in the representative activity sectors contributing to the county's GDP performance as follows: Processing industry, Building, Building materials industry, Light industry, Agricultural products processing, Forestry and wood-processing industry, Commerce, Tourism services, Transport services. The calculation of balance indicators for the examined Bihor county companies are presented in the tables from the second chapter and briefly interpreted.

It is important to note that companies which are representative for the economy of the Bihor county, possess 93,7% of the total subscribed and used capital, given that the number of public limited companies is 330 and represents only 1%, while the number of private limited companies is 21644 and represents 66,7% of the total of companies. In the same period, Hungary was on the first position by the number of companies with foreign capital, representing 1639 companies with registered capital of 21.6 million Euros.

1. Introduction – Methodological Approach and Literature Review

Essential component of social life, the economic activity is faced with the problems of permanent balance. General economic balance implies the existence of a correspondence between needs for material goods and goods possibly available; needs for labor force and manpower available; needs for financial resources and opportunities for their procurement; between revenues of the population and their possible coverage with goods and services; between needs for foreign currency resources and those potentially available in given circumstances. There is a volume and a structure of resources - material, human, financial, monetary and of foreign currency nature – corresponding to the needs and possibilities of the national economy in a given period (Văcărel et all, 2000).

According to the content of economic processes and the way of expressing results of economic activities, economic balance may appear under various forms (Kirițescu, 1982).

a) *Material economic balances*, which expresses the relative correspondence between general offer and general demand in terms of quantity, structure and quality.

b) *Value economic balance*, which expresses, in cash standards, the relative correspondence between various value structures of economic outcomes and efforts put in their achievement, under various forms:

- monetary balance, which consists of the existence or the creation, by regulatory measures, of an optimum report between the mass of money in circulation and the amount of money needed for the normal carrying out of all economic operations which are performed through money;

- financial balance, which reflects the equivalence between the financial resources necessary for the achievement of set objectives and effective possibilities of procurement of these resources;

-foreign currency balance, which represents the correspondence that must exist between foreign currency cash in-flows and cash out-flows of a country.

The definition of economic equilibrium shows that it is difficult to achieve: the existence of mechanisms that allow businesses to adapt activities so as to achieve spontaneous reduction of imbalances (Zăpodeanu, 2002).

A company's financial balance has an important role, whereas the operation of the company implies the existence of correlations between financial applications and the resources for meeting them (Droj, 2010).

Activity continuity determines the improvement and the perfecting of the economic management and it is carried out in the context of an uninterrupted string of interrelations of stability trends with instability factors. Romanian specialized literature focuses thoroughly on the concept and methods of execution, considering financial stability to be:

- equality between income and expense, which expresses the „equality between financial resources and economic means necessary for the deployment of operation and sales long and short-term activities" (Mihai, 1999).

- relation between capital needs and possibilities for their procurement on the one hand, which can be defined, from the point of view of capital use as "capitals advanced in the circuit, on the one hand, and collected capitals, which can be re-advanced or reimbursed, depending on the situation" (Giurgiu, 1995).

- component of the general balance of an company, identified under two forms: "financial balance of the activity and investment balance, i.e. between financial resources and their use" (Bătrâncea, 2000).

- balance reminds of the idea of "harmony between the various elements of a financial field system through the harmonization of resources with needs, reflected in the balance sheet; harmony is presented depending on two principles of balance sheet creation - functional and patrimonial"(Vintilă, 2005).

- equality that must exist "between resources and the need for resources, and between income and expense "(Onofrei, 2004).

- component of economic balance, "financial balance is given by the equality between economic capital and forming resources, between cash-ins and cash-outs, between funds and resources" (Hada, 1999).

- the balance sheet is the instrument of reflection of the financial balance at the end of the year, the material (through assets) reflection of the way in which equity and loans are used.

- the financial and economic balance must be understood as a set of correlations formed in the process of capital rotation. This balance can and must be predetermined by in the financing table and performed every financial year (Radu, 1999).

To conclude, we believe that the financial balance of an company must reflect, through financing rates, the method of ensuring, allocating and using financial resources, on the one hand, and the economic-financial results obtained from the activity performed on the other hand, as well as reflect the relation between cash flows generated by operation activities, by investments and financing, on the one hand, and cash flows used for these activities, on the other hand.

2. Applied Case study – Financial stability for companies located in Bihor – Hajdu Bihar Euro-Region

Financial analysis aims to highlight, on the one hand, the methods of performing the financial balance on the long term and short-term (which is the purpose of the balance analysis) and, on the other hand, the steps of cash generation, of profitability of the company (the purpose of the profit & loss account analysis). The balance sheet summarizes the company's financial position at a given moment, while the results account summarizes performance as a result of economic and financial flows in a given period. The balance sheet, established at the end of the management period, separately presents the elements of assets and debts, and equity of the company.

It is important to note that companies which are representative for the economy of the Bihor county, possess 93,7% of the total subscribed and used capital, given that the number of public limited companies is 330 and represents only 1%, while the number of private limited companies is 21644 and represents 66,7% of the total of companies. In the same period, Hungary was on the first position by the number of companies with foreign capital, representing 1639 companies with registered capital of 21.6 million Euros. The financial balance study, according to "Cross-border research programme - performance indicators of entities in the Bihor- Hajdu Bihar Euro-region" - HURO/0901/204/2.2.3 was based on the basis of financial reporting for the years 2008-2010 for a number of 50 companies grouped in the representative activity sectors contributing to the county's GDP performance as follows: Processing industry, Building, Building materials industry, Light industry, Agricultural products processing, Forestry and wood-processing industry, Commerce, Tourism services, Transport services. The calculation of balance indicators for the examined Bihor county companies are presented in the following tables:

Figure 1 The evolution of liquidity rates, profitability and financing of fixed assets – average per activity sectors

SECTOR	RATA LICHIDITĂȚII REDUSE			RATA RENTABILITĂȚII ECONOMICE			RATA ACTIVELOR IMOBILIZATE

The financing rate of fixed assets, the general average of activity sectors (Figure 1) recorded supra unitary values of 1,16 in 2008 and 1,24 in 2010, except for the transport sector, which recorded sub unitary declining values, from 0,24 in 2008 to 0,77 in 2010.

Supra unitary values reflect the existence of a working capital at the end of the financial year, as an outcome of the coverage of permanent expenses (fixed assets) with permanent sources; respect of financial balance rules and existence of surplus of permanent sources usable for the financing of temporary needs of permanent nature, are thus possible.

The analysis of absolute values of balance indicators (Table II) for most representative companies in each activity sector, generally confirms the conclusions of the analysis of fixed assets financing rates.

The analysis of working capital in absolute values confirms its existence as positive value, except for the Frigoexpres S.A. company in the transport services sector, where there is generally, the possibility for self-financing and respect of financial balance rules.

The working capital need, as main indicator of financial balance, has recorded positive values, except for SC.C FRIGOEXPRES S.A. in the transport services sector and S.C. FELIX S.A. in the tourism sector, which confirms the fact that circulating assets have partially been financed through temporary sources. The negative values recorded by the two companies confirm the full financing of circulating assets through temporary sources, and operation debts. These negative values of the working capital need may be interpreted as an advanced collection of payments of the value of contracted services; there is a beneficial disparity between the liquidity of circulating assets and the payability of debts.

The analysis of net treasury as synthesis indicator of financial balance confirms the fact that permanent sources surplus reflected by the working capital has only partially covered the circulating assets financial needs, which led to a negative net treasury in companies in the processing industry -S.C. PLASTOR S.A., building – S.C SELINA SRL, building materials - S.C ADEPLAST S.A., agricultural products processing - S.C. NUTRIENTUL S.A. In conclusion, the analyzed companies have respected the financing principles according to which negative treasuries were covered by short-term credits, except for S.C. FRIGOEXPRES S.A in the transport services sector, where financial imbalance resulting in a negative treasury was generated because of the non-respect of financing principles, where, for the financing of fixed assets, temporary sources have been used (negative working capital need), creating the possibility of a liquidity crisis

Source: Made by the author

Under the circumstances of the economic crisis, this situation has been engendered by the engagement of investments (the purchase of transportation vehicles in leasing) in the period prior to the crisis, with a debt maturity date taking place in the analyzed period, when crisis led to the decline in the volume of activity and of profitability previously forecast for the repayment of

contracted debts. The analysis of the coverage level through own sources – working capital, and of needs related to operation activities – NFR, in the case of the average per activity sector (Table III), confirms a decline of this indicator, from supraunitary value of 1,01 in 2008 to subunitary value of 0,83 in 2010. The analysis also confirms the conclusions of the balance indicators analysis.

The analysis of FR and NFR rotation durations based on turnover, confirms an abasement of financial balance conditions. Although the average per activity sectors, in 2008, confirm a balance between FR and NFR rotations (42,98; 42,51 days), in 2010 the rotation duration of working capital became lower than the NFR's one (850,96; 60,91 days), which reflects the decrease in the financing capacities, in general, of owned resources, and the increase of external financing resources.

1. Conclusions

Essential component of social life, the economic activity is faced with the problems of permanent balance. General economic balance implies the existence of a correspondence between needs for material goods and goods possibly available; needs for labor force and manpower available; needs for financial resources and opportunities for their procurement; between revenues of the population and their possible coverage with goods and services; between needs for foreign currency resources and those potentially available in given circumstances. We believe that the financial balance of an company must reflect, through financing rates, the method of ensuring, allocating and using financial resources, on the one hand, and the economic-financial results obtained from the activity performed on the other hand, as well as reflect the relation between cash flows generated by operation activities, by investments and financing, on the one hand, and cash flows used for these activities, on the other hand. The financial balance study, according to "Cross-border research programme – performance indicators of entities in the Bihor- Hajdu Bihar Euro-region" – HURO/0901/204/2.2.3 was based on the financial reporting for the years 2008-2010 for a number of 50 companies grouped in the representative activity sectors contributing to the county's GDP performance as follows: Processing industry, Building, Building materials industry, Light industry, Agricultural products processing, Forestry and wood-processing industry, Commerce, Tourism services, Transport services. It is important to note that companies which are representative for the economy of the Bihor county, possess 93,7% of the total subscribed and used capital, given that the number of public limited companies is 330 and represents only 1%, while the number of private limited companies is 21644 and represents 66,7% of the total of companies. In the same period, Hungary was on the first position by the number of companies with foreign capital, representing 1639 companies with registered capital of 21.6 million Euros.

MONEY LAUNDERING TYPOLOGIES SPECIFIC TO ROMANIA

Din Alina -Valentina
University „Lucian Blaga " Sibiu

Money laundering is a process by which some people render or try to render a legal appearance to some profits obtained illegally by criminals who, without being compromised, will afterwards benefit from the respective incomes.
In this context, the issue of money laundering, comprising a wide spectrum of directions, namely: the main landmarks regarding the appearance of "dirty" money and its laundering; the money laundering mechanism which mainly involves its A) the placement the initial movement of money, in order to change its form or place and to place it outside the authorities' coverage area of applying the law. For the incomes in cash which are permanently cashed, there are valid the first techniques used by the mafia groups in 1920 in the USA. Illegal money is mixed with money legally obtained from businesses which involve cash receipts. B) Stratification (or investment) represents the second stage of money laundering in which the money circulates within different companies, corporations and financial institutions, physically, by deposit or electronic transfer. One aims to physically move the money to other entities in order to separate it from its illegal source in an attempt to disguise its origin. In most of the cases, the first concern after committing the basic infraction is to transfer money abroad. The basic rule is that the person whose funds have to be transferred should not assume this risk. At the international level there are networks of professional couriers who take over the transfer action and provide the delivery of money abroad, at the established place and then its integration, respectively the return of clean money to the offender in order to be used as legally obtained money; regulations regarding money laundering, at international level (Convention from Vienna, Recommendations of the International Financial Group - GAFI 40 + 8 Special Recommendations regarding Terrorism Financing, European Union Directives) as well as at the national level; essential characteristics of the activity to prevent and fight against money laundering in Romania, which is mainly the responsibility of the National Department for Money Laundering Prevention and Control - ONPCSB, as well as the financial analysis of the activity to prevent and combat money laundering in Romania within 1999-2011, identifying the specific typologies of money laundering; the connection between money laundering and terrorism financing.
Key words:fiscal evasion, underground economy, corruption, taxes, fraud

1.Introduction

Money laundering is a process that gives or tries to give an appearance of legality of profits obtained illegally by criminals without being compromised further receive such income.

Offenders of different categories, either drugs or firearms traffickers, merchandise smugglers or one of the various types of professionals in frauds, have to launder the money which comes from their infractions, for two reasons. The first one is that the track of the money itself can become evidence against the infraction perpetrator; the second reason is that the money itself can be the target of the investigation and confiscation.

Money laundering schemes have a series of **particularities** determined by:

 -Jurisdiction in which the money laundering takes place. The offenders act according to certain favourable or restrictive conditions of the legislation and customs of the respective place.

-Illegal funds generating infraction. Sometimes, the generating infraction creates a special "style" of the money laundering, by transferring its own characteristics to the laundering process. An eloquent example is that of laundering the funds from fiscal evasion.

-*Transnational character*. A series of characteristics are given by the fact that money laundering takes place inside the national borders or the money crosses several jurisdictions. Offenders adapt their operation method in order to be able to successfully slip through the barriers which accompany the external transfers of different amounts of money.

In 2003, in Romania, such a "star" scheme was the laundering of money from substitution of petrol products.

2.Laundering of funds illegally obtained from substitution of petrol products

The general scheme of obtaining and then laundering the illegal funds from illegal fuel trade is based on the differentiated overcharge of different petrol products.

A characteristic specific to all the cases regarding laundering of money from substitution of petrol products is the intense use of "ghost (fictitious)" companies, both from the point of view of the number of such companies involved in a scheme, as well as from the point of view of their importance in finalizing the fraud, which takes place as follows:

1. a real company purchases from the refinery two products: product A- excised and product B – non-excised. Generally the proportion is favourable to the inferior fuel: 20% product A and 80% product B. Operation is apparently carried out correctly in that it is registered within the accounting, taxes are paid according to the law etc. Then the real company sells the same quantity of petrol products, in the same structure and quality to a fictitious company which does not pay any taxes to the state and in most of the cases it has a fictitious office;

2. within the fictitious "ghost" company takes place the substitution process, in that product B is added different additives and the whole quantity of fuel (A+B) is delivered to the gas station as superior fuel, with taxes. Then it is sold to the final consumer;

3. after receiving the counter-value of the fuel, the amount of money representing taxes regarding product B (sold as product of A quality) is divided in two between the offenders:

> -half of it is withdrawn in cash from the petrol station's accounts and deposited into the personal accounts of the refinery's administrator. This lends his own company (the refinery or another one) and then he can withdraw the laundered amounts, in the form of a reimbursed loan previously granted to this;

> -the other half is also withdrawn in cash and split between the people involved from the side of the real company, the "ghost" company and the gas station.

Scheme of laundering funds illicitly obtained from substituting petrol products

**Payment of products A and B for the
value within the refinery's documents**

		REAL COMPANY

Excised product A → REAL COMPANY

REFINERY

Non-excised   product →

A   B

GHOST (FICTITIOUS) COMPANY

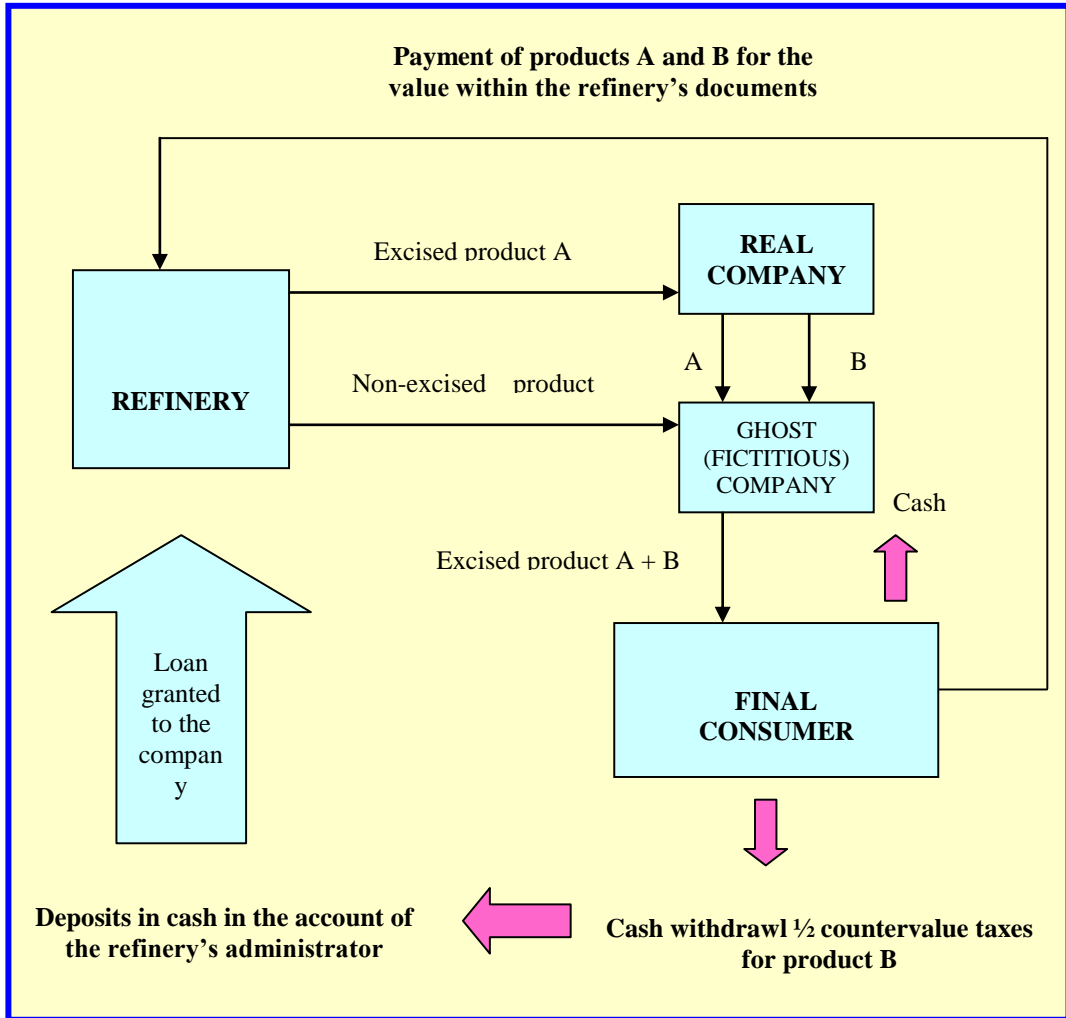
Cash

Excised product A + B

FINAL CONSUMER

Loan granted to the company

**Deposits in cash in the account of
the refinery's administrator**

**Cash withdrawl ½ countervalue taxes
for product B**


It is important to mention the fact that the payment of the fuels' counter-value to the refinery is performed for the values written within the accounting documents concluded between this and the real company, but the payment is performed directly from the gas station, without following the track of the merchandise.

3.Laundering of the money from the illicit trade of petrol products and fraud at the expense of the state budget

Within a period of three months, four trading companies (X, Y, Z and T), having as object of the company "(direct) petrol products trade", commercialized products amounting to 330 billion lei, 85 billion lei representing excises.
In order to comply with the legal stipulations with regard to commercialization of petrol products, respectively to prove that the anticipated payment of the excise taxes to the refinery was performed (special deposit), the four companies carried out a series of fictitious operations, which led to a prejudice of approximately 100 billion lei.

Refinery B received 85 billion lei from refinery A, representing the counter-value of the unprocessed oil. These funds were transferred to the companies X, Y, Z and T in the form of "service providing" and "counter-value of the materials". During the same days, these returned the funds in the form of "excise taxes", and in the end, refinery B returned the 85 billion lei to refinery A, as "financing".

Within a few months, the state budget was prejudiced with important amounts, respectively the 100 billion lei:

- 85 billion lei – excise taxes related to petrol products, received but not transferred to the budget;
- 15 billion lei – VAT related to "service providing" and "counter-value of the materials" fictitious invoices

These funds were mainly laundered by the purchase of movable and immovable goods.

By these operations which aimed to point out different fictitious commercial relationships besides the prejudice of approximately 100 billion lei caused to the budget, there were commercialized excised mineral oils, without previously paying the excise taxes for the special deposit.

4. Laundering of money from illegal VAT reimbursement following different overvalued exports

Based on a Report of suspicious transactions received by the Department from a reporting bank, it was established that an exporter received USD 800,000 from abroad. The same day the amount was exchanged into lei and transferred into the account of Company X as "counter-value of the merchandise" (a total of 18 billion lei).

Based on the export documents it was established that the exporter delivered used machines abroad for a price of USD 1000 per kg (the equivalent of 2.5 mil. lei/kg).

Analysing the commercial flow it was found that the exporter purchased the used machines for the price of 2,500,000 lei, from a "ghost" (fictitious) company X, which does not operate within the declared registered office, and did not fill in the declarations regarding the payment obligations to the state budget and the accounting balance sheets, associate of the company is an Arab citizen B who has never come to Romania.

On behalf of the fictitious company X acted as empowered person the administrator of the exporter – natural person A. In its turn, the fictitious company X purchased the used machines from a producer, for a price of 250,000 lei per kg. Therefore, the first step of the fraud was the overestimation of the price by the fictitious company X from 250,000 lei/kg to 2,500,000 lei/kg.

Based on the further analysis it was pointed out that the payment for the merchandise to the producer for the price of 250,000 lei/kg, 2 billion lei in total, was performed by the exporter, not by means of bank instruments but in cash. The amount received from the exporter by the fictitious company X was transferred based on fictitious invoices to another fictitious company Y, which does not operate within the declared registered office and did not fill in the declarations regarding the payment obligations to the state budget.

In its turn, the fictitious company Y transferred the money abroad in the form of advance payment for different products which were never imported and the advanced payment was never repatriated. It is worth mentioning the fact that the empowered person on behalf of the fictitious company Y is the exporter's administrator, also empowered on behalf of the fictitious company X.

Based on the described operations, the exporter benefited from 3.8 billion lei representing the VAT reimbursement related to the exports performed; the money was transferred to the fictitious company X, as "counter-value merchandise".

Based on different fictitious loan contracts, the fictitious company X transferred the 3.8 billion lei into the personal account of personal of the company's associate, the Arab citizen B (fictitious person), with the justification "loan reimbursement to the associate"; then the

money was withdrawn in cash by the exporter's administrator – natural person A, empowered for the fictitious citizen B's account.

While the fictitious company X did not pay the collected VAT and the income tax related to profit obtained from selling merchandises for an overvalued price, the exporter benefited from the 3.8 billion lei representing the VAT reimbursement related to the exports, amount which, by the operations previously mentioned, was laundered, appearing to be amounts from legal sources (loan reimbursement).

5.Concluzions

A key element in the fight against money laundering and terrorist financing is the need for monitoring and assessing countries on international standards. Mutual evaluations by FATF, IMF and World Bank is a vital mechanism for ensuring that the FATF Recommendations are effectively implemented by all states.At the EU level have been taken several actions and documents were developed significance in money laundering. Of these, two documents have a special place:(C) November 1990 Council of Europe Convention on Laundering, Search, Seizure and Confiscation of the Proceeds from Crime, called Strasbourg Convention, supplemented by Council Decision of 26 December 2001 on money laundering, the identification, tracing, stop, seizure and confiscation assets and earnings of offenses

(D) Council Directive. 308 of June 1991 on prevention of the use of the financial system for money laundering, amended by Council Directive. 97 of December 2001.Financial institution privacy laws should be designed to not hinder the fight against money laundering. Institutions, directors and employees must inform the authorities responsible for combating money laundering on its own initiative or when observing actions that indicate money launderingFrom this point of view, money is more than just smuggling money or the simple act of hiding dirty funds. In this context a distinction is made between technical - which are the individual proceedings - and the scheme - which involves a series of interrelated procedures to an end.Techniques and schemes can be grafted on the mechanisms of the institutions, usually banks or other financial-type (national lotteries, gambling, slot machines, casinos, horse racing etc..).It is also highlighted difficulty in identifying money laundering and distinction, in practice, the existence and disguise hiding / concealing the nature of money. Thus, if the money resulting from a criminal law and hindered by their owner spends his or her moderation and anonymous transfer to a country where the jurisdiction does not apply sanctions against the illegal origin of money, these funds can hardly be described as clean money. In this case, is actually talking to the authorities of hiding money in the country where the basic offense and where such actions are sanctioned by law. If this money but are given a legitimate origin, even in the country where the offense and which by law are established sanctions against their origin (dirty), then talk about money really wash - that nature was disguised.

While carrying out the activity to prevent and combat money laundering, it was found out that in certain periods there are certain "star" schemes, in that they are frequently used within a certain period of time, and then the offenders stop using them and come up with new ones.

THE UNDERGROUND ECONOMY,THE CORRUPTION .
A WAY OF MANIFESTING THE FISCAL EVASION

Din Alina-Valentina
University „Lucian Blaga"Sibiu

Fiscal evasion is mainly found within the underground economy, came to the specialists' attention within the 1960s, moment in which it took a great extent. The main cause which leads to activities within the underground economy is represented by the increase of direct taxes, which has the largest influence, followed by the intensity of the regulations and the complexity of the fiscal system. The imposed taxes determine more and more countries to act within the underground economy, as long as there is not a proper offer of public goods and infrastructure. In his study, Vito Tanzi indicated as the main cause of the underground economy the level of taxes.(Tanzi,1983:11-15) He adds the instability of the legislative framework, legislative restrictions imposed within certain states, corruption and bureaucracy. Corruption and the activities specific to the underground economy are realities all the states confront with. Gathering information about the dimensions of corruption and the connection with the underground economy proves to be a task which is impossible to achieve, because all the people involved within these mechanisms prefer not to be identified. Even if the underground economy and corruption are considered as being twins, the questions which appear are: who needs them and who fights against them? Theoretically speaking, corruption and the underground economy can be complementary or substitutable.The anticorruption efforts have to focus on a real reform of the administrative system, whereas the citizen's perception on corruption is mainly based on his personal experiences in direct connection with the state institutions. Both the public sector as well as the private sector should become more responsible, so that the public institutions to be able to carry out their obligations under integrity conditions and without external pressure or implication. Corruption attracts the economic agents to the underground economy, which leads to a reduction of taxes collected by the state, finally materialized in the increase of the fiscal burden for a less and less number of tax payers.
Key words:fiscal evasion, underground economy, corruption, taxes, fraud .

1.Introduction

The difficulty to define the underground economy, generated by the diversity of the activities it combines, the fact that it varies according to the particularities in space and time, specific to this type of economy, determined a multitude of definitions within the speciality literature. According to the definition adopted by the countries within the European Union, **the activities** which refer to the underground economy's field of activity are classified into:

-undeclared legal productive activities (black economy), including activities which are not recorded at the state's level through the national accounting system (domestic activities, voluntary work, activities for the community's benefit etc.) and those which are not declared within the financialadministration (fraud and fiscal evasion, illicit work etc.);

-undeclared illicit (illegal) productive activities which produce goods and services (drugs production and trade, traffic in firearms etc.).

 Lippert and Walker make another classification of the activities assimilated to the concept of underground economy, based on the monetary criterion and the legality of the respective activities. Within the developed countries, the undeclared legal activities, in order to avoid payment of fiscal obligations, represent the most important part of the underground economy, whilst within the developing countries, due to the fact that auto-consumption is very powerful and the possibilities to statistically record all the activities are reduced, the production which is

not recorded conventionally is very important, often exceeding the official economy. Among the *possible causes* of the underground economy there are:

- fiscal pressure exercised by the direct and indirect taxes;

The empiric results of the influence of tax growth on the underground economy are emphasized in Schneider(Schneier1994:137-152) and Johnson(Johnson,Kaufmann 1998:387-392), Kaufmann and Zoido-Lobatón (Schneide 1986:643-668)]researches, who have found an evident statistic connection with regard to this matter. This strong influence of direct and indirect taxes on the underground economy is proven in the case of Austria and Scandinavian Countries. Similar results were discovered by Schneider in 1986 for the Scandinavian Countries (Denmark, Norway and Sweden).(Jonson,Kaufmann,1998)

- intensity of the regulations;

Intensity of the regulations is another important factor which e reduces the freedom to choose of the individuals involved within the official economy. We may include regulations regarding labour market, commercial barriers and restrictions within labour work for foreigner. Johnson, Kaufmann and Zoido-Lobatón have empirically proven empiric the influence of the regulations within the labour market on the underground economy, their impact being analysed in the case of Germany. Generally, regulations lead to substantial increase of the work force costs within the official economy. But, when most of these costs are transferred to the employees, an orientation towards the underground economy takes place, where they may be avoided. The analysis carried out in order to support Johnson, Kaufmann and Shleifer's model - which stipulated that the countries with a higher intensity of the regulations tend to have a higher weight of the underground economy in the GDP – is found in their empiric studies.(J,K.,S.,1997)The conclusion is that the intensity of the regulations is the key factor which influences negatively the companies and the population, and not the general legislative framework. In this context, the governments have to focus on the improvement of the laws and not on the increase of their number.

-public services.

The increase of the underground economy's dimensions may lead to the reduction of the budgetary incomes, which in its turn leads to the decrease of the goods and public services' quality and quantity. It may also lead to an increase of the tax rate for the economic agents and the population within the official sector, which combined with a deterioration of the public goods' quality (for example the public infrastructure)and administration's quality, determines a strong orientation towards the underground economy. Johnson, Kaufmann and Zoido-Lobatón (Johnson,,Zoido,1998)present a model of these relationships.The study shows that the underground economies of small dimensions appear within the countries with incomes from higher taxes, if these are obtained by smaller tax rates, regulations and reduced restrictions.The countries with a more restrictive legislative framework, which are financed by incomes from taxes, also have small dimension underground economies. Transition countries have higher levels of regulation, taxes from large official activities and a wide legislative framework and, consequently,a higher level of the underground economy.

2.The underground economy and the level of taxation

It is found that the 20-25 percents which represent the increase of taxation in the European states within the last decades were annihilated by the 12 percents of the GDP in the same countries, representing the percentage of the underground economy within the states member of OECD at the end of the last century. The increase of the taxes imposes, even if not proportionally in all the cases, the increase of prices. This affects everybody, especially the final consumers. This way, the underground economy registers supplementary profits because:

-it offers cheaper products of lower quality, because by avoiding the taxes, the clandestine producer can ask prices which fraudulently compete with the prices within the real economy;

-it attracts new activities to its domain because many tax payers overwhelmed with supplementary taxes, choose the underground economy as an exist option;
-it creates the possibility of illegal work, of obtaining different non-taxable incomes.

Numerous specialists have studied the impact of taxation increase on the level of the underground economy, stipulating different increase figures, as a consequence of increasing the taxation by a percent. For example, the results of a study carried out based on the data regarding the underground economy in the USA show that for the increase by a percent of the marginal rate of the income tax the increase of the underground economy is of 1.4 percents. (Cebula,1997)In another study it is shown that the value of the undeclared incomes increases by 0.05% only, for each increasing percent of the value of the incomes from taxes, drawing up the conclusion that, it is questionable whether the increase of incomes achieved by reducing evasion could be high enough in order to cover the loss generated by tax reduction.(Clotefelter ,1983)With regard to the relationship existing between the level of the pressure of taxation and the one of the underground economy, Norman Loayza, a well-known analyst of the underground economy phenomenon, demonstrates in a recent study for countries within Latin America that in the economies where the pressure of taxation is higher than the optimum one, and the application of regulations has a low level, the increase of the relative dimension of the unofficial sector leads to a reduction of the economic growth.(Dinu,2003) His results indicate the following: for an increase of the underground economy by a percent of the GDP a reduction of GDP by 1.22%.

3. Conclusion

The general conclusion is that the developed countries member of OECD and different Eastern European states maintain a stable balance between the relatively low level of taxes and regulations, adequate mobility of the incomes, corruption control and generally they have a low level of the underground economy. At the opposite pole, there are countries within Latin America and former Soviet Union, which have characteristics which place them in an instable balance: high level of taxes, inadequate regulations, a great weight of activities in the unofficial economy. The decision to choose the underground economy is based on cost-benefit analysis in which the illicit work and fiscal evasion are a lot more attractive because of the slight possibility of being caught.(Iceg Ec,2006) One of the main *negative effects of the underground economy* is represented by the way in which the underground economy may affect the fiscal health of a state. There are theories which state that, if the governments were able to control the forms of the underground economy, many of the fiscal issues of the public sector might be reduced.

On the other hand, the underground economy absorbs a part of the labour force dismissed from the official sector and it may compensate the lack of products on the market, thus acting in the direction of balancing the labour market, goods and services market etc. There is an opinion according to which, with the existent taxation and legislation, it is better to carry out a part of the economic activity outside the official market and so get rid of the constraints.(Craiu,2003) There are situations in which the underground economy turns into official economy; they are separated by a fine, artificial, line, formed of regulations and interdictions(Hoanta,2000)Cancelling different restrictions may determine the passage of different illegal activities into the official sector.Poor countries suffer the most due to corruption. The low IPC scores indicate the fact that the public institutions are severely compromised. The government should focus on improving transparency within the financial management, from tax collection to public expenses, as well as on improving the monitoring and control mechanisms. The high scores of the rich countries and territories, mainly from Europe, Eastern Asia and North America, reflect the existence of relatively clean public sectors, based on political stability, solid regulations with regard to conflict of interests and free access to information of public interest, as well as a civil society free to exercise monitoring activities.Despite all these, corruption at high level within the poor countries has an international dimension, which involves the countries situated on the first places

in IPC. In most of the cases the money for bribe comes from the multinational companies within the rich countries of the world. The position of these countries is unacceptable; they consider bribe on the export markets as a legal business strategy. Moreover, the world financial centres have an important role, creating the possibility for the corrupt officials to transfer, hide or invest fortunes illegally obtained. Off-shore financing, for example, played a central role in the misuse of enormous amounts of money from developing countries, such as Nigeria and Philippines; they facilitated violation of the law by the corrupt leaders and poverty of the population. In many cases, pursuit and recovery of the stolen goods are difficult to be carried out due to money laundering by means of different off-shore banks, situated within jurisdictions where the bank secret still represents a general rule. According to the stipulations of the UN Convention against Corruption, the following objectives should be priorities: improvement of the international cooperation and mutual juridical assistance, acceleration of the actions to recover goods and development of the legislative and technical expertise within those countries which request return of the stolen goods. For many states, funds repatriation will mean long and complex processes.

Being a global issue, *the fight against corruption* requires a large range of *measures.*

-Developing countries should use the funds received from donators in order to reinforce the public institutions and thus, to increase the quality of the govern, by using diagnosis studies and development strategies elaborated at the internal level; these countries should include improvement of public integrity and corruption prevention into the poverty reduction programmes.

-Public independency, integrity and liability within the juridical system have to be improved in order to increase its credibility within the poor countries. In order for the justice to operate properly, the juridical procedures should be protected by the influence of the politics. A clean and capable justice is essential in order for the developing countries to be able to process requests of mutual juridical assistance in connection with the recovery of stolen goods

-According to the stipulations of the UN Convention against Corruption, the governments have to introduce measures against money laundering to determine disappearance of those places where the stolen goods are stored. The large bank centres should focus on development of certain rapid procedures to identify, freeze and repatriate the funds and goods obtained from corruption activities. It is essential to have clear stipulations regarding the custody exercised by the third parties on funds involved in disputes.

-Rich countries have to proceed to a stricter regulation of their own financial centres. Some of the important measures these countries can take with regard to corruption facilitators are: a greater attention given to the role of the trusts, better knowledge of the real beneficiaries and intensification of the provisions regarding money laundering.

Corruption Perception Index launched by Transparency International uses a scale from zero to ten, where zero indicates a high level of corruption, and ten indicates a low level of corruption. With regard to Romania, Corruption Perception Index was of *6.7 points* in 2011, increasing by 0.6 points compared to the previous year. The perception of the public regarding the corruption within the business environment, mass-media and civil society is also worrying, the three elements registering high values.Despite all these, Romania continues to be perceived as the country with the highest level of corruption within the European Union.

FINANCIAL PERFORMANCE ANALYSIS BASED ON THE FINANCIAL STATEMENTS FOR THE COMPANIES LOCATED IN THE BIHOR - HAJDU BIHAR EUROREGION

Droj Laurențiu
University of Oradea
Faculty of Economics

This paper will be later used within the Doctoral thesis: "The Mechanism of Financing Investment Projects by Usage of European Structural Funds", which is currently under development at the University Babeș Bolyai Cluj Napoca, Faculty of Economics and Business Management, under the coordination of the prof. univ. dr. Ioan Trenca. This paper comes also as a result of the European Funded project PERINPRO "Cross-Border Research Programme - Performance Indicators of the Economic Entities from Bihor-Hajdu Bihar Euroregion". The goal of the project was to identify of a set of common indicators that characterizes companies in the Bihor-Hajdu Bihar Euroregion and which will be used to analyze the financial health of the economic entities in the Euroregion of Hajdu-Bihar- Bihor.
The first chapter of the paper will introduce the research and also will present the literature review and the methodological framework: by establishing a common set of indicators for the financial analysis of the companies located in the Bihor-Hajdu Bihar Euroregion. Seven of these indicators considered to be highly important will also briefly described and defined. Some of these indicators are used for the first time in a trans-national analysis over companies located in the Romanian-Hungarian cross border area. In the second chapter the research will be focused over establishing a common ground for usage of the financial reporting documents as basis for the analysis. Several characteristics which differentiate the financial reporting documents from Romania and Hungary will be identified and measures for correction of the values of the indicators will be proposed. This comparative study can be considered an innovation, as well, in the cross-border area since in the past no other studies of this types were performed between Romania and Hungary. The third chapter will be focused over the application of seven identified common indicators to companies based in the cross-border area. In the last part of the paper these results will be analyzed and presented.

1. Introduction

The project PERINPRO *"Cross-Border Research Programme - Performance Indicators of the Economic Entities from Bihor-Hajdu Bihar Euroregion"* was developed under the framework of **Hungary-Romania Cross-Border Co-operation Programme 2007-2013** by a joint team of scientists from University of Oradea- Faculty of Economics and University of Debrecen – Faculty of Applied Economics and Rural Development. The goal of the project was to identify of a set of common indicators that characterizes companies in the Bihor-Hajdu Bihar Euroregion and which will be used to analyze the financial health of the economic entities in the Euroregion of Hajdu-Bihar- Bihor.

The methodological approach for the determination of a common set of indicators was based on the requirements of local companies located in inter-connection areas of the Romanian-Hungarian border, to establish a set of criteria, jointly accepted, for the analysis of private companies' performances. Based on this was tried to identify a set of indicators jointly accepted both from the academic point of view, but also which can be used in practical life and which can be transferred for usage in the real economy by the companies within the region.

The set of indicators have been selected based on various criteria which are presented below:
- the relevance of indicators for the subject
- their potential of usage in the economic-financial analysis carried out in the two countries
- their potential of transferability to their real economic use
- the possibility of usage of the financial - accounting databases on both sides of the border.

In this work, the author focused on the presentation, from a theoretical point of view, of the set of indicators used in performance analysis. Also practical application of the proposed indicators was realized and briefly presented in the case study. The proposed indicators were: solvability, liquidity and return indicators and will be described in this chapter and briefly presented from the theoretical point of view. For their determination, national and international specialized economic literature has been studied and the main opinions on the subject have been used to establish the analysis indicators: especially Stancu (2006), Trenca (2006), Pierre(2004), Lezeu (2004), Chirila and Droj(2010) and Brealey et. all(2004). In this study from the 18 selected common indicators were used only 7 indicators. The methodology for calculating these indicators will be presented below. The case study will be generated and presented in the 3rd chapter of this study. The indicators used in the case study are:

- **Global financial autonomy rate (RAFG)** - shows how much of the company's assets are financed from their own resources. By reflecting the weight of the shared capital in total financing sources, it is desirable that the rate is as high as possible.

$$R_{AFG} = \frac{Equity}{Total\ liabilities} x100 \quad (1)$$

- **General liquidity rate (RL)** compares the current assets with short-term debts. This rate reflects the capacity or incapacity of the company to pay its short-term debts only from the current assets possessed in its patrimony.

$$R_{LC} = \frac{Current\ Assets}{Short\ term\ debts} \quad (2)$$

-**Fast or reduced liquidity rate (RLR)** - If the value of the rate is higher than 1, than the rate highlights the fact that stocks are not financed through short-term debts.

$$R_{LR} = \frac{Receivables + Cash\ and\ bank\ accounts}{Short\ term\ debts} \quad (3)$$

- **Immediate liquidity rate (RLI)** reflects the capacity of the company to pay current debts only based on its current cash and bank accounts. The value of this rate provides little relevant information because of the unpredictability of its cash flow management; usually additional information is needed regarding its activity (Trenca, 2006).

$$R_{LI} = \frac{Cash\ and\ bank\ accounts}{Short\ term\ debts} \quad (4)$$

- **Solvability rate(RSV)** - shows the extent to which total debts are covered by total assets, and reflects the security enjoyed by creditors, as well as the creditworthiness of the company.

$$R_S \equiv \frac{Total\ assets}{Total\ debts} \times 100 \quad (5)$$

- The **Return of Assets** reflects the difference between an economic result: net profit, known in specialized literature as EBIT and the assets used for its achievement (Pierre, 2004).

$$ROA = \frac{Net\ Profit}{Total\ Assets} \quad (6)$$

- The **Return on Equity**, also known in French economic literature as "financial return rate", and abbreviated in the specialized literature as ROE. This indicator shows the efficiency of the capital

invested by shareholders. ROE constitutes one of the most important return indicators, being used by company owners and potential investors in the investment decision-making process.

$$ROE = \frac{Net\ Profit}{Equity} \qquad (7)$$

2. Comparative practical study on the profit and loss account used by companies in the Bihor–Hajdú-Bihar Euroregion

The need for comparing the two documents occurred after deciding to realize a joint research over the performance of companies within Bihor–Hajdú-Bihar Euroregion on the basis of the financial statements. For the most effective and equivalent comparison of economic performances of companies present in the study set, the first step was the comparison and the transformation to same standards of the evaluation data contained in the two annual financial reporting documents: from Romania and from Hungary. This approach has been used by other European authors such as: Cole & Branson (2011), Nobes (2006), Roberts et all (2008) and even Nobes (2008), authors which brought to attention the main issues of the comparative analysis of data contained in financial documents in various countries, caused particularly by practices or customs carried out at national level before the adoption, starting from 2005, of the IFRS standards in all EU Member States (Commission of the European Communities, 2007).

In addition, these studies is also highlighted the impact of national subsidies or tax deductions in various Member States as having a key importance on how the economic performance was reported (Christensen et al., 2008). The different practices in the taxation and accounting fields, were also analyzed in a study presented by KPMG & von Keitz (2006) and were later mentioned by Cole & Branson (2011). Thus, by following the same analysis phases, and based on the methodology presented in the specialized literature was observed that both the profit & loss account in Romania and the models currently used in Hungary, have been created and developed based on the IFRS standards, as they were introduced and applied all over the EU, starting from 2005. Otherwise were observed several differences, although they may seem insignificant, but which can lead to the degradation of financial results and later, in distorsion at the level of financial analysis indicators. When analyzing the case of Romania, it can be discovered that the profit & loss account uses only one standard model, while in Hungary, as shown by several studies in the field such as the one carried out by Deloitte Magyarország (2009), there are frequent changes in the way the elements of profit & loss account are introduced and analyzed, and two models exists: Model A and Model B. Several critics highlighted that the frequent changes in the legislation regarding accounting report in Hungary, have been caused by observations made by the World Bank and European Union regarding the differences between the Hungarian legislation and IFRS standards. Also these organizations provided Hungary suggestions and the method for modifying them, according to IFRS.

Therefore, as presented in the Deloitte Magyarország (2009) study, in Hungary two models for profit and loss account are being used:

- *Profit & loss account - Model A - "Total costs"*- where the operating result is determined using costs accounts from the 5th category accounts, according to the Hungarian Chart of Accounts. In this case, the determination of costs is based on their nature and destination: raw materials costs, payment of wages, etc.

- *Profit & loss account - Model B - "Turnover costs, sale costs"*- where the operation results are calculated using category 9th category cost accounts, according to the Hungarian Chart of Accounts. In this case, are used principles corresponding to internal management accounting: costs are classified in 2 important groups – direct costs and indirect costs.

As regarding the operating result, reflected in the profit & loss account, it must be identical, whatever the document model used. The usage of model A or B depends on the organization

form of the company, its size and its type of activity. In general, model B is used by small companies or in those carrying out trading activities. While the model A is used in medium and large companies, in multinationals or in manufacturing companies. Often, such categories of companies require additional financial information regarding costs; production centres costs, activity categories or production phases.

In order to make a better comparison between the data entered in the two financial reporting documents, especially regarding companies located in the Hajdu Bihar County, model A of the profit & loss account was used, which is comparable to the Romanian one. In terms of how the performance of profit & loss accounts is reflected on the Romanian side and on the Hungarian one, there are two major differences: the distinct reflection of operating incomes and the different calculation method of the net income. In the analysis of operational incomes, we observe that this is more detailed in the model used in Romania, but in the case of Hungarian companies, the source of internal or external income are specifically identified. Thus, in Hungary, according to both forms of profit & loss accounts, net incomes from sales are differentiated according to their source, i.e. from internal or external-export sources. Operation subsidies and commercial discounts enforced by the Romanian O.M. F. P 3055 from 2009, which in Romania are considered to be part of the operational income, have no equivalent in the case of the profit & loss account used in Hungary. The organization of operation costs in the two documents is different, but without notable impact on the final result: the operational costs at the level of companies. The main important distinction, which directly influences the analysis of financial performance in the Bihor – Hajdu Bihar Euroregion, consists in the determination of net result in the balance sheets, where, in Hungary - Mérleg szerinti eredmény – MSZE – is obtained after taxation and shareholder payouts.

The net result within the balance is determined through the increase of net profit obtained after the payment of the profit tax, with the sum or dividends granted by using the rolled-over result, and through the decrease of the sum obtained with the value of approved dividends. The sum thus obtained will be shown in the balance. In the case of Romanian companies, the net result is modified only by the profit tax; the amounts corresponding to dividends/shareholders payout would be decided afterwards. Therefore, it is recommended to use performance indicators which take into account the elements mentioned above or to correct them during the numerical analysis phase. The second stage of the analysis constituted in construction of a case study based on limited set of companies and just several relevant indicators.

3. Applied Case study – Application of the performance indicators results analysis
The case study presented in this paper is focused on analysing the sets of companies which have a specific activity in the industrial fields of industry and food processing. These companies were analysed based on the common set of indicators presented in chapter one. The period of analysis is 3 years. The results seem to be surprising especially when comparing the same results of the Romanian with the Hungarian companies. As observed several differences occurred between the financial indicators of the companies from different fields of activities. It was noted that from the point of view of values obtained in the areas studied, the best values in terms of liquidity rate indicators have been obtained in the light industry, the processing industry and service sector, following the trend of consolidation of these sectors in the Euroregion's economy and in particular in the Bihor county.

Thus, the general liquidity rate indicator has recorded the highest value, of 20.25% in the light industry and 17.17% in tourism, and in sectors such as the building materials, the highest values have been situated around 2%. As regards the minimum values, as seen in the above-mentioned analysis as well, the lowest values were obtained in the furniture industry, building materials industry, transport services and agricultural products processing.

In these sectors, the values of this indicator were a lot lower than the advised values, situated between 0%-1%. As regards solvability, we observe that the processing industry recorded the most positive rate values, followed by companies in the services sector and light industry. As regards the sectors where this rate records negative trends, are those of furniture industry, commerce and agricultural products processing, whose high degree of debts generates these concerning results. In terms of profitability, largely dealt with in the studies carried out, we

observe that the rates of profitability (return) are generally low, but extremely low for companies in the services field, following the trend of the national economy, but also internal fiscal strategies of the companies.

4. Conclusions

The current paper dealt in its first chapter with establishing a common set of indicators for the financial analysis of the companies located in the Bihor-Hajdu Bihar Euroregion. Seven of these indicators considered to be highly important were also briefly presented and defined. These were used for the first time in a transnational analysis in the Romanian-Hungarian cross border area. In the second chapter the research was focused over establishing a common ground for usage of the financial reporting documents as basis for the analysis. Several characteristics which differentiate the financial reporting documents from Romania and Hungary were identified and measures for correction of the values of the indicators were proposed. It also can be considered a novelty as well in the cross-border area since in the past no other trans-national studies of this type were performed comparing the differences of financial reporting documents of these two countries. The third chapter dealt with the application of the seven identified indicators over companies based in the cross-border area. These results were analyzed and presented.

Since this is a preliminary study it will be continued further by development of an integrated indicator which will be also included in the Doctoral thesis: "The Mechanism of Financing Investment Projects by Usage of European Structural Funds", which is currently under development at the University Babeş Bolyai Cluj Napoca, Faculty of Economics and Business Management, under the coordination of the prof. univ. dr. Ioan Trenca

USAGE OF ACB-MININD SOFTWARE IN THE CBA ANALYSIS FOR FINANCING INVESTMENT PROJECTS THROUGH EUROPEAN FUNDING IN CORRELATION WITH THE FINANCING FROM THE BANKING SYSTEM

Droj Laurențiu

Droj Gabriela
University of Oradea
Faculty of Construction and Architecture

The extension of the European Union with the first "wave" of new members in 2004 and later with the second "wave" of members in 2007 brought new opportunities for the countries in Eastern Europe, being obvious that "effective utilisation of EU support can foster the success of their economic performance". Financing investment projects proposed by the SMEs can be realized through several financial sources internal and external, from which two of the most common external sources constitute from subsidies-grants and through banking system. One of the most important financing programme present in Romania, available for SMEs is SOP IEC, which awards grants for investments proposed by production companies. This financing program encourages its beneficiaries to combine the European grant with private funds mostly provided through the banking system. The paper analyzed the methodology used in Cost Benefit Analysis and also The ACB-MININD software which is compulsory to be used for the CBA analysis of these investment projects links for the first time elements of analysis used by the European Commission with elements of analysis used by the banking system. In this context the present article tries to analyze how the ACB-MININD software links the main elements of Cost-Benefit analysis such as NPV or IRR with elements of the bankability software which are mainly used by the banking system such as: cash-flow analysis, loan/interest payment and financial sustainability. Also are presented the links between the banking sector and the external financing sector in the field on investment projects. As final conclusions of this paper we will demonstrate the theoretical and practical role of cost-benefit analysis - financial component to select the best applications that will be proposed for funding under the European grant programs and to link them to the banking system in order to ensure a proper co-financing for these investment projects.

Key words: Banking, Loans, Grants, Cost Benefit Analysis, NPV, IRR

1. Introduction

A notion which is under debate in the recent years, from economical, social and political point of views: the non-reimbursable funding/grants is quite ignored by the scientific economics community. The grant concept, which is called also external financial assistance, developed initially from free transfer of specialized goods and services to fund transfers (Moger, 1999 and Kanbur, 2003). In the same time Stiglitz (2003) observes that for a long period of time and even now the World Monetary Fund and the World Bank link their strategic grants to reimbursable funding: loans provided by the banking system. Other studies especially Lerick and Meltzer(2002) in Quarterly International Economics Report, Carnegie Mellon - Gailliot Center for Public Poverty, draw attention that in case of loans contracted through World Bank or other institutional banking lenders some of the loans were transformed into grants since some of the beneficiary countries were not able to pay them back, so their debts were finally erased.

The extension of the European Union with the first "wave" of new members in 2004 and later with the second "wave" of members in 2007 brought new opportunities for the countries in Eastern Europe, being obvious that "effective utilisation of EU support can foster the success of their economic performance" as it is considered in a KPMG(2011) report from 2011. Moreover the integration of Romania into European Union brought new opportunities for the Romanian

private enterprises both concerning the accession of their products and services to the single market and also accession of additional co-financing for funding their business infrastructure investments (Droj, 2010).

Under these circumstances most of the specialists consider that access to European funding and its efficient absorption constitute a key issue in these years both at the level of state level decision makers, at the level of financing institutions and at the level of the decision makers within the companies. Financing investment projects proposed by the SMEs can be realized through several financial sources internal and external, from which two of the most common external sources constitute from subsidies-grants and through banking system. In the recent years a very close relations seemed to be established between the banking sector and the financial aid sector.

In the same time the banking sector evolved and created specialized services which are dedicated to the above mentioned beneficiaries with the goal of supporting development, carrying out or co-financing projects implemented under the European Structural Funds. Lack of experience in this field shown by both at the level of the applicants for Structural Funds, at the level of the management authorities and, finally, at the level of the banking system which is requested to ensure additional funding creates serious obstacles to achieving a higher absorption capacity of EU structural funds in Romania. (Fundația Șoros Romania, 2009 și Departamentul pentru Afaceri Europene, 2009)

Also can be noticed the lack of a methodology for implementation of funding programs adapted to the Romanian realities. Another major problem is that most financial programs lack correlation of economic and financial indicators of the European Commission to those requested by the banking sector, so that the beneficiaries of European structural funding are finding themselves in the situation where they are unable to access bank credit which is needed to secure co-financing or fund its cash-flows required to implement the proposed investments.

In this context the current paper is dealing with analysing the linkages between the cost benefit analysis requested by the EU management authorities and the credit analysis, performed by the banks. This constitutes a topic of major interest for both potential beneficiaries and the management bodies, and the banks so they can prepare specific to banking products. From the vast field of study concerning structural funds we proposed to approach as the main themes in this research paper the following: identification of a European funding programme operating in Romania, realization of a correlation between the performance indicators within the benefit-cost analysis requested by European and those requested by the banking sector.

2. Considerations over the Cost Benefit Analysis and its linkage with the banking sector– Literature Review and Research methodology

One of the main goals of these European Funding programmes are to implement the European Union Cohesion policies. As its main instruments and for improvement of the competiveness of the "weaker" regions were established the European Regional Development Fund (ERDF) and the European Social Fund (ESF), otherwise known as the Structural Funds, as well as the Cohesion Fund. Through these instruments European Commission invests in thousands of projects across all of Europe's regions to achieve its primary task: to promote economic and social cohesion by reducing these disparities between Member States and regions (European Commission, 2009).

In this context, the private companies benefit of increased opportunities for accessing European Funding which gives them a better chance for increasing their competitiveness and for extending distribution of their products and services on the entire European market and beyond. The most important production infrastructure financing programme for the Small and Medium Enterprises(SME) operating in Romania is considered to be the Sectorial Operational Programme "Increase of Economic Competitiveness" (further referred to as SOP IEC) which offers financial

support for the consolidation and modernization of productive sector through investments(Guvernul României, 2009).

Even in 2008 edition of the "*Guide to COST-BENEFIT ANALYSIS of investment projects - Structural Funds, Cohesion Fund and Instrument for Pre-Accession*" edited by the European Commission(2008) is highlighted that cost-benefit analysis can help public decision makers to identify projects that will maximize net social benefits and thus determine the order of priority infrastructure works will be made and how public policy decision making.

As it is mentioned in the above referred document the investment decisions are at the core of any development strategy, all other elements such as: economic growth and welfare depends on productive capital, infrastructure, human capital, knowledge, total factor productivity and the quality of institutions (European Commission, 2008).All these elements involve – in a certain measure – decision making regarding investing financial sources at present time in the hope of obtaining future uncertain benefits.

In order to take the decisions, the decision makers need appropriate tools for comparing costs and benefits of various types: economic, social or ecological investment projects that are ongoing over several years. Cost-benefit analysis is not an exact science, is seen as having many limitations which are generally based on approximations, working hypotheses and estimates due to missing data or due to inability providing all possible situations. The financial analysis is considered the key element of the Cost Benefit Analysis both by the financing organization and the banks (Trenca 2006, Trenca 2008 and Stancu 2006) or by other financial institutions which will ensure the co-financing of the investment. The goal of the financial analysis is to use the predictions such as cash-flows to calculate relevant indicators especially the Financial Net Present Value (FNPV) and the Financial Internal Rate of Return (FRR), respectively in terms of return on the investment cost, FNPV(K) and FRR(K).

While Cost-benefit analysis goes well beyond financial ratios considering the project, most project data on costs and benefits is provided by financial analysis. This analysis provides decision makers information on inputs and outputs, their prices and the structure of income and expenditure over the analyzed period (European Commission, 2008).

The methodology used for the determination of the financial return is the Discounted Cash Flow (DCF) approach. This implies some assumptions as are mentioned in the methodology:

- Only cash inflows and outflows are considered;
- The project cash flows it should be based on the incremental approach;
- After the aggregation of cash flows occurring during different years it is adopted an applied an appropriate financial discount rate in order to calculate the present value of the future cash flows.

According to the methodology (European Commission, 2008) the Net Present Value of a project is the sum of the discounted net flows of a project. The NPV is a very concise performance indicator of an investment project: it represents the present amount of the net benefits flow generated by the investment expressed in one single value with the same unit of measurement used in the accounting tables.

$$(1) \ NPV = \sum_{t=0}^{n} a_t S_t = \frac{S_0}{(1+i)^0} + \frac{S_1}{(1+i)^1} + \cdots + \frac{S_n}{(1+i)^n}$$

The Internal Rate of Return (FRR) is defined as the discount rate that zeroes out the net present value of flows of costs and benefits of an investment, that is to say the discount rate of the equation below(European Commission, 2008:212):

$$(2) \ NPV(s) = \sum [S_t/(1+IRR^t)] = 0$$

Since the goal of this study is to use the ACB-MININD software in CBA analysis for financing investment projects through European funding in correlation with the financing from the banking

system in the following chapter we will set a case study using a project proposed by a Romanian production company which tries to access SOP IEC funding in 2011.

3. Case study – Usage of ACB-MININD Software in the CBA analysis for financing investment projects through European funding in correlation with the financing from the banking system

As mentioned above we selected a test company, which intended to access European funding to co-finance its infrastructure investments. The company is a market leader in its field of activity: plastic manufacturing and intends to increase its production capacity and to improve its competitive advantages on the Romanian market. In order to realize this an ambitious investment programme was started to build a new production facility and to increase the quality of their products. The project was proposed to be financed under SOP IEC and was based on the data provided by a detailed the technical project and by the price offers. The company performed a financial analysis using the official software provided by the management authorities within the programme: ACB-MININD Software which is available online at: http://acb.minind.ro/ACB/index.php (Guvernul României, 2012). These results were later compared with the bankability analysis, in order to ensure future bankability of the project. The particularities of this software is that it requests and processes information which is delivered by the banking institutions regarding proposed co-financing or implementation loans.

In order to secure financing of its investment the selected company has to fulfil several financial criteria established by the SOP IEC Programme. According to the Guide of SOP IEC Programme, in order to obtain financing for an investment project FNPV(K) is requested to be higher than 0 and FRR(K) to be between 0 and 9. For the mentioned project the mandatory discount rate was established to 5%. The analysis was realized both on the implementation period of the project (2 years) and on the operation period of the investment realized within the project(7 years). A challenge was made to obtain both the financial sustainability of the project and also to ensure its bankability.

The first step was to analyse its bankability and to establish the maximum eligible loan and to analyze the loan payment using the bankability software provided by the bank. Once these information were established were introduced in the ACB-MININD Online application. The first step was to analyse its bankability and to establish the maximum eligible loan and to analyze the loan payment using the bankability software provided by the bank. These can be seen in the above figure. Once these information were established were introduced in the ACB-MININD Online application. In this circumstance all the financial sources and the equivalent financial costs are introduced in the financial analysis including the loan payment, the interest payment, royalties, income tax.

Cumulative Cash Flow	13858.1	18460.9	27873.7	37040.6	46247.9	55492.6	65008.3	74943.3	85865.0
Conclusion of the Cumulative Cash Flow Analysis	THE PROJECT IS SUSTAINABLE!								

<div align="center">**Source: Made by the author**</div>

In figure 3 the Financial Sustainability of the project is analyzed by using also the information provided by the credit analysis from the banking system. As observed all elements of financial sustainability were considered: since in the beginning only operational expenses were presented in this stage were included also other payments and was analyzed the real capacity of the company to ensure financing resources for loans payments, interest payments, income tax or royalties. Afterwards the project is declared sustainable both by the management authorities of the programme and by the banking system.

4. Conclusions

Since, in the past, the financial analysis performed according to CBA methodology had several inconsistencies with the bankability analysis, an important step seems to be taken by using practical bankability financial information within the ACB analysis. As can be seen from the

presented test case the authors consider that, in this context the ACB Minind application can only be the beginning of reforming the ACB methodology and in the future this approach should be further extended and common solutions accepted by all stakeholders: structural funds management authorities, banking sector and private/public beneficiaries to create common indicators or analysis methodology in order to ensure both the financial sustainability, according to EU regulations and fulfilment of bankability criteria which is requested by the banking sector in order to ensure co-financing of the projects. This research should be further continued by development of a set of common indicators based on both methodologies.

AN INTRODUCTION TO BEHAVIORAL CORPORATE FINANCE

Dedu Vasile
The Bucharest Academy of Economic Studies

Turcan Ciprian Sebastian
The Bucharest Academy of Economic Studies

Turcan Radu
University of Oradea

The purpose of this paper is to reflect the behavioral aspects that govern corporations. The paper briefly presents some of the main pillars of behavioral corporate finance: management, closed – end funds puzzle, dividends and the importance of aggregate earnings releases. The first pillar consists in a brief presentation of the behavioral factors related to the management of corporations, such as the fact that independent directors are not that independent as they should be, they do not have the prerequisite expertise for assessing complex financial risks, the importance of ethics and having a corporate culture that nurtures doing the right thing above anything else and the fact that CEO's decisions reflect in good part, their personal style rather than a set of criteria determined by the company. In the second part of the paper, it is treated the puzzle why would investors buy a closed-end fund at its IPO price, knowing that it is likely to fall to a discount, when they could buy instead an open-end fund that is guaranteed always to trade at par and some mentions about the way that dividend policy may be influenced by managers "catering" to the demands of investors and also the effects of aggregate earnings announcements over the market returns.
Keywords: Behavioral finance, conflicts of interests, corporate finance, managers, dividends, closed-end fund puzzle, aggregate earnings
Jel Classification: D22, D23, D82, G20, G32, G34, G35, M12

Conventional finance theories are based on the assumptions that people act rationally and consider all available information in their decisions related to investments. Over the last few decades, we have discovered many irrational errors and behaviors related to investment judgment, contrary to the assumptions and theories of conventional finance. Behavioral finance offers complementary points of view, explanations in response to the difficulties faced by the conventional finance, until recently considered to be "*proved beyond doubt*". Behavioral corporate finance brings in discussion conventional ideas about corporate finance and compensation strategies. *"Behavioral corporate finance argues that in many senses, corporations are natural arbitrageurs"* (David Adler). Theories from behavioral finance are in the position to explain the differences in corporate financial policies and capital structures. Behavioral corporate finance study how investors and managers behave. Studies indicated that investors suffer from overconfidence; they tend to overestimate their own abilities and chances for success, driving stock prices away from normal levels. The main psychological traps met in behavioral corporate finance are: narrow framing, confirmation bias, hindsight bias, herding behavior conservatism, the role of affects, wishful thinking, opaque framing, representativeness bias and overconfidence. Overconfident managers over estimate cash flows on projects, use too much debt and tend to feel that their stocks are mispriced by the market. Below, I will realize a brief discussion about some of the pillars of behavioral corporate finance: management, closed-end funds puzzle, aggregate earnings guidance and the role of dividends.

Management
Conflicts of interests among employees, shareholders, regulators and external evaluators (failures and weaknesses in corporate governance) represent an important cause of the latest global financial crisis. The problem is conflict of interest, an issue that is global not local. The mimic philosophy among boards of directors, made them fail miserably in their fiduciary duties to their

shareholders. Moreover, the cash bonuses for short-term performance seemed to be more appealing than stock ownership or stock options. Milgram (1974) suggests that individuals have a sensibility to conform to an authority, to be cut off by their peers. Morck (2007) has reason to say that corporate officers and directors are more loyal to their direct boss (CEO) than to their shareholders and to the law (Enron, Worldcom, Hollinger, AIG), even under clear signs of impending financial doom. Corporate governance reforms stimulate instituting independent directors or non-executive board members, committees composed of independent directors. They are supposed to induce more rationality, ethics in corporate governance and a fostering debate of flawed exposures policies before they become lethal – render corporate disasters rarer. That's in theory at least, because there is evidence that they are tied to CEOs in other informal ways. According to him, many corporate governance failures could have been averted if directors asked serious questions and demanded clear answers. Behavioral factors, such as cognitive dissonance, reciprocal favor trading or group conformity have smashed the independence and the authority of so called independent directors. Higgs report reviewed the role and effectiveness of non-executive directors and of the audit committee, aiming at improving and strengthening the existing Combined Code. *Higgs strongly backed the existing non-prescriptive approach to corporate governance: "comply or explain"*[60]. According to the report, "*almost half the so-called independent directors on British boards were recruited by the CEO through personal contacts or friendships. A mere four percent had a formal interview[61]*". Taking in consideration this, it is easy to understand that the independence of the directors is compromised. The actual financial crisis has revealed the severe problems that financial companies have regarding the risk management practices. Some of the risks were too complicated and complex (too specialist) to be assessed by the board - many of them did not understand exactly the instruments their banks were trading. Many board members have not the necessary technical financial expertise or business experience in order to fully assess the consequences of their decisions. Nowadays, many of them are reputed teachers (globally recognized) but with no previous business experience or expertise. Kirkpatrick Grant[62] (2010) emphasize that "*four of the ten members of the board were over 75 years old*"[63] and had no previous banking experience - suggesting the idea that boards might be "retirement home for the great and the good" may have a grain of truth. Even if in large financial companies, there are risk committees, their voice is barely left to be heard and assessed. Stockownership represents probably the best way to link shareholders interests with CEOs interests and wealth. Traders, salesmen and executives are not enough motivated / remunerated to focus too much on long lasting sustainability, sustainability, over decades. There is the same problem with remuneration at both levels: sales and trading. In a study, realized by Fahlenbrach and Stulz (2010), it is shown that Bank CEOs did not reduce their holdings of shares in anticipation of the crisis or during the crisis. Consequently, they suffered extremely large wealth losses in the wake of the crisis. With this tremendous financial sophistication, it is pretty difficult to find nowadays financial specialists in supervisory boards, capable to fully assess the risks, the business model and the consequences of their decisions.

Optimist managers tend to have better investment cash flow sensitivity than their peers. Kross and Souk (2009) found that managers of firms that have achieved a string of increasing earnings issue more optimistic earnings forecasts, compared to firms without such a string. The optimism in management forecast for these firms seems to dissipate after the string of earnings increases is broken. These results are consistent with the argument that managers are overly optimistic after

experiencing earnings growth for several consecutive years, but this optimism does not persist after the earnings performance declines. The decrease of such optimism after the several earnings growth years indicates that managerial sentiment can change within a relatively short period of time. CEO's decisions reflect in good part, the chief executive's personal style rather than a set of criteria determined by the firm. Aggressive CEOs tend to misuse leverage, over indebt their companies and tend to expand through acquisitions. On the contrary, the conservative CEOs tend to maintain more cash and tend to grow independently, organically in a sustainable manner (excluding acquisitions) (see David Adler). Itzhak Ben David, Graham and Harvey (2007) show that companies with overconfident CFOs invest more and engage in more acquisitions. Moreover, overconfident managers are less likely to pay dividends, instead using the funds to make investments and have higher debt ratios and rely more heavily on long term debt. Their result indicates that miscalibration depends on personal skills, in addition to corporate characteristics. Baker and Wugler (2004) suggest that is much easier for a chief financial officer to issue more shares when a company is overvalued than it is for a hedge fund to short overvalued shares; if the shares are not truly overvalued, the consequences to the CFO's own job are relatively modest compared to those for the hedge fund manager. Overvalued companies tend to increase capital while the cheap companies tend to repurchase their share.

Standards of ethics in the decision making process is very important, especially in the financial system. It is well known that banks sell confidence, not money. Oberlechner (2007) claims that ethics goes beyond restraining from unethical behavior because of the potential costs of exposure. Heuristic biases or cognitive dissonance, for example, can also affect ethical decision making. Culture has a great importance for the attitudes of employees. The culture of doing the right thing no matter the cost makes companies less vulnerable especially when comes to trading. Traders are given strong incentives to make great profits, but if they don't do well, actually they make losses, they don't have to repay losses, and the worst thing that might happen to them is just to be fired. Practically, there is almost no incentive for respecting sound trading practices and having a prudent money management. Many banks did not develop sufficient operational limits that would restrict the bank's overall exposure to derivatives, securities or subprime loans. Did banks ignore risks because ignorance, psychological reasons or because they really did not know? How come their risk managers failed to address the real issues? Why did banks hold the most risky assets, insufficient focusing on fundamentals? According to Shefrin (2009), narrow framing and opaque framing were the two psychological traps that banks confronted with. They presented risk incompletely, did not disclose information with those who needed and netted long and short positions, obscuring the manner in which positions were structured. Another cause for distress in financial sector might be the compensation structure that made little recognition of risk issues (employees had no direct incentive to focus on risk when making decisions, establishing unrealistic profit goals and short term profit orientation).

Closed-End Funds Puzzle

The job of professional portfolio managers has always been a subject for controversial discussions among pundits over time. Weiss (1989) asserts that younger funds tend to underperform but it remains a mystery why investors have a greater will to invest in younger funds. The impact of managerial turnover would be that new funds (and funds that have recently changed their management team) should exhibit above normal NAV returns; Funds with longer managerial experience should exhibit below normal NAV returns. Only good managers would be willing to leave voluntarily, meaning the discount should *increase* (if the fund is trading at a premium the premium should decrease) around voluntary separations or pay increases. As the time goes by, the fund may be traded either at premium or at discount, depending on the managerial abilities and the expectations of shareholders. In case that management fees equal the value added (at least these are the expectations of shareholders), the funds are traded at par. Berk

et al (2003) wonder why would investors buy a closed-end fund at its IPO price, knowing that it is likely to fall to a discount, when they could buy instead an open-end fund that is guaranteed always to trade at par. Investors' irrationality might be a possible explanation. Fees represent a cost for the fund and they are subtracted from the net asset values of the funds. If managers do not generate enough value added, over the value of the fees, the fund shall be traded at discount. Depending on which one is greater, the value added or the fees, the fund shall be purchased at premium or discount. Bear in mind I said "shall". The things are a little bit more complicated, it's all about the market sentiment. If a fund is purchased at a discount, the discount might widen if the sentiment of the irrational investors turns pessimistic. The discount changes over time as investors change their beliefs about the manager's ability to create wealth.

Aggregate earnings guidance

Aggregate earning affect market returns especially in periods of profit "warnings". Profit warnings are very good informative instruments for investors, because they have a direct influence on the expected future cash flows and expected returns. Anilowski and Feng (2004) assert that important economic aggregates are increasingly dominated by the fortunes of a relatively small number of very large firms. Kothary, Lewellen and Warner (2003) conclude that the strong negative reaction to aggregate earnings news suggests that discount rates rise when earnings are unexpectedly high. They find that earnings are strongly correlated with discount rates. However, these variables only partially explain the market's negative reaction to earnings news. The results contradict the conventional knowledge affirming that discount rates and cash flows should move in opposite directions. A study of Hirshleifer, Lim and Teoh (2007) indicates that the effects of the earnings announcement for a company may be weaker in busy periods with a large number of other companies releasing earnings results. According to them, the company may record a lower volume reaction and a stronger further post - earnings announcement float. The distraction effect is even larger for positive news than for negative news. Barber and Odean (2005) claim the investor distraction hypothesis, suggesting that investors' limited attention may drive market under react to public news such as post-earnings announcement drift. Chandra, Wasley and Waymire (2004) found that technology sector companies pursue a higher degree of conservatism related to earnings, mostly due of conservative accounting rules for R&D expenses rather than shareholders litigation risk. It is well known that investors may sue managers for excessive volatility of the stock prices; that is why managers tend to be more conservative in their actions and strategies.

Dividends

It is well known that companies prefer increase their capital when stock prices are high and interest rates are low and do the opposite for repurchasing their own shares or for repaying debts when interest rates are high and stock prices are cheap. As Malcolm Baker puts it, when it comes to supply capital effects, it's all about the combination between the "*investor tastes, limited intermediation and corporate opportunism*". The informational advantage over the company earnings help corporate managers get the right mix between the three factors mentioned above. Hoberg and Prabhala (2007) suggest that that risk is the factor that explains (for about a third to almost a half of the times) the Fama-French disappearing dividends puzzle. Fama and French (2001) show that the inclination to pay dividends has declined over time. According to them, long-term returns are univocally positive and institutional (not retail) ownership increases the release of dividends. Baker and Wurgler (2004) argue that dividend policy may be influenced by managers "catering" to the demands of investors. "Catering" refers to realizing any actions intended to boost share prices above fundamental value. According to them, managers rationally cater investors' demand, by paying dividends when investors put higher prices on payers and not paying when investors prefer non-payers. In order to represent the company's long term interests,

managers need to have the flexibility of taking unpopular decisions in the market place. But that interest is merely followed. Managers are congratulated when the stock prices rise (even it is a short term rise), not when a sustainable growth long term managerial program is implemented. Remember the financial companies' way of doing business before 2007. Bankers were more interested in short term profits, regardless of risks. Investors' preferences vary overtime: in the periods with high dividends, they tend to fly for quality, they orientate themselves to less risky instruments (bonds, bank deposits) or defensive stocks, while the jump in for great growth potential stocks in periods with lower dividends.

Conclusions

As a conclusion, corporations need a lot of improvement in some of those aspects referring to management and corporate governance: sensible incentives that mix the personal interest with corporate risk and reward, control & communication systems, risk management systems, accounting standards and procedures and human resources. As investors, we also need to take in consideration aspects like dividends, earnings announcements and the evolution of closed-end funds industry in order to understand better the investors and the market's sentiment, the price momentum and price reversal so we may increase further our wealth.

COMPETITION VERSUS COLLUSION: THE PARALLEL BEHAVIOUR IN THE ABSENCE OF THE SYMETRY ASSUMPTION

DRAGOI Ionut
Romanian Competition Council

MOSTEANU Tatiana
Bucharest Academy of Economic Studies, Faculty of Finance, Assurance, Banking and Stock Exchanges

ROMANO Oana Maria
Bucharest Academy of Economic Studies, Faculty of Finance, Assurance, Banking and Stock Exchanges

Cartel detection is usually viewed as a key task of competition authorities. A special case of cartel is the parallel behaviour in terms of price selling. This type of behaviour is difficult to assess and its analysis has not always conclusive results. For evaluating such behaviour the data available are compared with theoretical values obtained by using a competitive or a collusive model. When different competitive or collusive models are considered, for the simplicity of calculations the economists use the symmetry assumption of costs and quantities produced / sold. This assumption has the disadvantage that the theoretical values obtained may deviate significantly from actual values (the real values on the market), which can sometimes lead to ambiguous results.
The present paper analyses the parallel behaviour of economic agents in the absence of the symmetry assumption and study the identification of the model in this conditions.
Keywords: parallel behaviour, Cournot competition, collusion, identification symmetry hipothesis
JEL Classification codes: D 43, K21, L13, L41

In the context of economic globalization, the emergence of European economic area, the abolition of duties assigned to this area, the economic crisis and other such factors, the competitiveness of companies is increasingly important. To meet the competitive pressures and the economic crisis, companies should consider a significant reduction in production costs, a more active concern for innovation for a better adaptation to consumer demands, in other words to improve their competitiveness.

Besides the development of the competitiveness, the companies have another solution to deal with these pressures: making anticompetitive agreements aimed at fixing prices, sharing markets, limiting production etc. These agreements are particularly harmful because the companies involved do not act differently but as a single entity thus seeking to extract as much as possible from the consumer surplus to increase their own profits.

Even if today we can say the economic crisis is ended and it will follow a period of economic growth, the competition authorities should pay attention to possible anticompetitive agreements made during the crisis and that are maintained today. The globalization of the economy gives many companies the opportunity to motivate that prices charged are at the same level as in other countries, without taking into account the specificities of each market and the costs of / the opportunities for export activities, including the effects of these activities on the price level of the foreign markets.

The parallel behaviour in terms of price evolution is explained by the companies, generally by factors such as prices of similar products on foreign markets or shocks to the costs of production / sales on the background of charges approximately identical to those of the rival firms. Such arguments do not take into account the independence of the economic strategies of the firms or their motivation to develop their business and to maximize their individual profits. For example, due to a high degree of substitutability an operator can keep unchanged the selling price while its

competitors decide to operate a price increasing. This decision would result in an increase in the quantity sold which will result in a reduction in production costs due to the scale effect.

Because the lack of competition due to a parallel behaviour has always economic arguments more or less strong, the anticompetitive agreements that have as object such behaviour are very difficult to prove.

Literature review

The *Wood Pulp*[64] case is one of the cases in which the European Commission attempted to analyse the parallel behaviour of the companies. . Such cases have a high degree of difficulty as the competition law does not prohibit an intelligent adaptation of the companies to the market conditions.

The European Court of Justice (ECJ) has stated that it is not prohibited to the economic operators to adapt "intelligently" to certain situations which exist on the market or which may be presumed to exist in the future (the case *Wood Pulp II*).

In 1981, forty-three defendants (six Canadian wood pulp producers, ten American, eleven Finnish, ten Swedish, one Norwegian, one Portuguese and one Spanish producer, plus the US Pulp, Paper and Paperboard Export Association, the Finnish Common Sales Agency and the Swedish Association of Wood Pulp Producers) were informed that the European Commission had found evidence of collusive behaviour with regard to the selling prices to the European paper producers. The main evidence given was the fact that, from 1975 to 1981, these prices moved in a parallel way from quarter to quarter.

On 19 December 1984, the Commission imposed fines on thirty-nine companies, but on 31 March 1993 ECJ annulled the Commission's decision and most of the fines[65]. Later this case has been intensively analysed by economists (both practitioners and theoreticians). All of these analyses are based on the results of the application of a competitive model (generally the Cournot model) and a collusive model on the existing data on the market.

For example Louis Phlips considers more appropriate to use a super game in which the first period is characterized by the existence of a cartel and subsequent periods are characterized by existence of repressive reaction behaviour as a Cournot type competition.

In the economic literature there are many articles and papers that analyse the parallel behaviour and its causes (purely economic or existence of an anticompetitive agreement). All of these papers use the available data and compared them with theoretical values obtained by using a competitive or a collusive model.

As a competitive model, generally is preferred the Cournot model. The Cournot model presumes that the market's players set simultaneously their quantities to be produced. Price is established by the market on the basis of the supply and demand (the sum of the sold quantities).

An important hypothesis used in these papers is the asymmetry assumption which simplifies the calculations necessary to identify further theoretical values but which is a very restrictive one and can leads to ambiguous results.

Methodology

Suppose that the competition authority is considering a market where observes the manifestation of a parallel behaviour (in terms of price evolution) and suspects that it is the result of an anticompetitive agreement between the companies on the market.

When different competitive or collusive models are considered, for the simplicity of calculations the economists use the symmetry assumption of costs and quantities produced / sold. This

assumption simplifies the calculations necessary to identify further theoretical values for the quantities sold, the selling price and profit firms in these models. In addition, its use allows creation of models easy to estimate, regardless of the number of companies suspected of being involved in the anticompetitive agreement.

The symmetry assumption has the disadvantage that the theoretical values obtained may deviate significantly from actual values, which can sometimes lead to ambiguous results (for example results that show the simultaneous existence of a cartel and competitive behaviour, which is impossible as following the working hypothesis).

To make an analogy, we can refer to this two different situations (using or not using the symmetry hypothesis) as to attempt to calculate the geometric mean of three numbers when we know the sum of this numbers. The geometric mean differs a lot if the numbers are equals (we have a maximum value of the geometric mean) or not. For this reason we need more information about these three numbers than their sum in order to have a better estimation of their geometric mean.

As a result of the above, the present paper analyses the parallel behaviour of economic agents in the absence of the symmetry assumption. The main task in such analysis is to study the identification of the model. In other words if the removal of the symmetry assumption has as consequence the impossibility of obtaining values for the models applied on the data, then our model is unidentified and we are unable to distinguish between the parallel behaviour and an anticompetitive agreement.

Cournot Competition

To facilitate the presentation of the economic model we assume that on an oligopolistic market there are 3 companies that produce goods / services, protected by the entry of new competitors and that the inverse demand functions are:

$$p_1 = \alpha - \beta q_1 + \gamma p_2 + \delta p_3$$
$$p_2 = \alpha' - \beta' q_2 + \gamma' p_1 + \delta' p_3$$
$$p_3 = \alpha'' - \beta'' q_3 + \gamma'' p_1 + \delta'' p_2$$

It is obviously that the hypothesis on the number of firms operating in that market is not a restrictive one. The model can be applied to any number of operators but then we should consider individual demand functions for each of these companies so that all of them to form a system of linear equations compatible-determined (number of equations equals the number of variables, where the variables are represented by the selling prices).

The coefficients of this system can be identified by the econometric estimates of individual demand functions. After solving the above system we get that each of the three prices is a function of quantities sold by companies: $p_i = f(q_1, q_2, q_3)$.

If firms compete à la Cournot they aim to maximize their profit, without interest in the total profit obtained by all firms in the market. For this we have to solve the equation resulting from imposing the condition of maximizing the individual profit of the firms (c_i represent the average cost of the company *i* and its value is known):

$$\pi_i(q_i) = q_i(p_i - c_i)$$
$$\pi_i(q_i) = \max \Rightarrow \frac{\partial \pi_i(q_i)}{\partial q_i} = 0$$

After imposing conditions for maximize the individual profit, replacing the variable p_i with its value calculated above we get the following linear system of equations:

$$\begin{cases} q_1 = h_1(c_1, q_2, q_3) \\ q_2 = h_2(c_2, q_1, q_3) \\ q_3 = h_3(c_3, q_1, q_2) \end{cases}$$

Using this system solution, on the basis of the relationships that give the value for the company's i selling price depending on q_1, q_2 and q_3, we obtain the theoretical values of the selling price that would been practiced if the market companies would been compete *à la Cournot*.

Collusive behaviour
In a market where the economic agents conclude anticompetitive agreements, for the analysis of market supply and demand they must be regarded as a single entity. Because the companies act like a single one, for the collusive model is important the total output of the market and not the individual output (the quantity sold by each of the companies).
The objective of this paper is to analyse the absence of the symmetry assumption which affect only the results of the competitive behaviour (Cournot competition). This is why we present the collusive behaviour just for illustrating the entire process of analysis of the parallel behaviour.
We assume that the inverse demand function is:

$$p_m = \alpha - \beta(q_1 + q_2 + q_3)$$

If companies decide to collude, their objective will be to maximize the total profit on the market and to establish market share / production. For this, we have to solve the equation resulting from imposing the condition for maximizing the total profit on the market (p_m and c_m represents the average price on the market, respectively the average cost on the market and they are known):

$$\Pi(Q) = \max \Rightarrow \frac{\partial \Pi(Q)}{\partial Q} = 0$$

$$\Pi(Q) = Q(p_m - c_m)$$

After solving this equation, on the basis of the market quotas existent before the agreement (or other such *initial conditions*) we obtain the theoretical values for the selling price and sold quantity for the situation where the companies on the market collude.

Case study
For study the difference between the results of parallel behaviour analysis with and without the symmetry assumption, we used data generated for an oligopolistic market with three competitors. When data were generated, has been considered a market with Cournot competition.
In a real situation the analyst does not know if the market is characterized by competition between the firms or by an agreement between them. He observes only the parallelism of selling prices, the sold quantities and the costs for each of the companies. Thus, to have a better understanding of the effects of the symmetry assumption's absence, we preferred to generate the data in accordance with a Cournot competition behaviour. The selling prices on this market are $(p_1, p_2, p_3) = (7.87, 8.02, 8.1)$.
The values for theoretical selling prices obtained in the situation when the symmetry hypothesis is used are: $(p_1, p_2, p_3) = (7.26, 7.37, 7.41)$. For this we have to estimate the inverse demand function (as a result of the symmetry assumption we will have a single function, the total demand function) and to impose the condition for maximizing the individual profits (due to the symmetry hypothesis there will result a single equation to solve).
If we eliminate the symmetry assumption, the numbers of unknown parameters is increasing (there are as many different quantities sold as the firms that compose the oligopoly). As we stated

before, to surpass this inconvenient we have to estimate each of the individual inverse demand functions and to solve the obtained system (in variables p_1, p_2 and p_3). After these steps we get:

$$p_1 = 14.8564 - 0.0448q_1 - 0.0049q_2 - 0.0224q_3$$
$$p_2 = 15.0474 - 0.0453q_1 - 0.0051q_2 - 0.0228q_3$$
$$p_3 = 15.1537 - 0.0456q_1 - 0.00502q_2 - 0.0238q_3$$

In order to find the theoretical values of the selling prices we have to find first the theoretical values of the sold quantities. For this we have to impose the conditions for maximizing the individual profits. Solving the new linear system of equations, we are able to calculate the theoretical values for the sold quantities and to substitute them in the above system. Finally we obtained the following values for the selling prices: $(p_1, p_2, p_3) = (7.63, 7.64, 7.69)$.

It is obviously that results obtained in the absence of the symmetry assumption are closer to the real values and they represent a better estimation than the results obtained if the symmetry assumption is maintained.

Conclusions

The use of the symmetry hypothesis in the analysis of the behaviour of market's players is a very restrictive one and the results obtained may differ significantly from the real values. This is why we have to be very careful when we try to assimilate the parallel behaviour observed in the market with a competitive or a collusive one.

We performed an analysis of the parallel behaviour relaxing the symmetry assumption. We proved that the model is still identified in this case and the theoretical values estimated for the selling prices are closer to the real values than if we maintain the symmetry assumption. This aspect is a very important one because sometimes it may represent the difference between assessing the parallel behaviour obtained as a competitive or a collusive one.

GREAT BRITAIN AND GERMANY SUPREME AUDIT INSTITUTIONS

Dobre Cornelia
Christian University "Dimitrie Cantemir" Bucharest

Overall progress recorded in contemporary society, has increased at the same time the aspirations and expectations of the population, marked by phenomena which are based on the financial policy of the Executive. Of course, for the legislature to know the financial activity carried out by the Executive Board, in each State was established a Supreme Audit Institution (SAI), whose independence is guaranteed by the Constitution, as it is in Germany, or by law, as is the case of the United Kingdom. The variety of powers of supreme audit, is the result of various economic areas, each demonstrations through specific activities and suitable approaches to organizational cultures, which gives them their distinct identities. The work is conducted under the public responsibility with an emphasis on developing and improving continuously audit methodologies to present best practices. The two supreme institutions operate according to an annual plan of action which includes financial audit or regularity and performance auditing actions, and additional Federal Court of Audit of Germany practice preventive control institutions contained in its area of activity. By tradition, the role of supreme consists of the evaluation as regards the legality and regularity of financial management and accounting, but since the 80's but it was noticeable trend internationally to audit performance or "value for money" (United Kingdom), since the latter refers to the essence of the problem and is the final attainment of the envisaged at the time of allocation of resources. The topic researched is distinguished by originality, marked being the fact that a area so important as that of external public audit is least known works, and I wish to point out the vacuum bibliographic Supreme Audit Institutions experience in the international arena and beyond. Research methodology consists in the evaluation of resources in the area, using foreign literature. For the study of the subject of this material have been followed the official sites of the Federal Court of Audit of Germany and of the National Audit Office of United Kindom, including consulting on hypothetical case studies submitted by the specialists of the two institutions on the occasion of seminars held at the Romanian Court of Auditors. This work focuses on developing institutional development,role, experience and traditions performed in the field of external public audit, as well as their relationship with the Parliament, including the measures taken as a result of recovery audit reports. Thus, the supreme institutions analysed may constitute "models" for Romania's economic reality. In our opinion, any "model" should be adapted to the situation on the field and in this case the model becomes the solution. An assessment of the current business of the supreme audit institutions, we ask where is heading and how they will look in the future. Perhaps the future will provide this response.
Keywords: Supreme Audit institutions, financial audits, performance audit, annual report, the new public management
JEL classification: M42

1. Introduction

Supreme Audit Institutions (SAI) of all democratic states in the modern world, united in INTOSAI, are fundamental state institutions, have institutional independence, have stability and the activity results are materialized in reports whose format and presentation have evolved in time, with a strong professional character due to the accession to the International Standards of Supreme Audit Institutions (ISSAI). Also the main activity objectives are legality and regularity use of public and private property funds and state economy, efficiency, and effectiveness of financial management, each one of these has the same degree of importance. Legislative and executive knowledge of all economic activities that takes place in the economic systems, as its development conditions, firstly results from the requirement of ensuring a permanent background information, which would provide the constitution basis, structure, practical implementation and tracking decisions, related to actual status of operations approved by the Executive Board. On it's turn, public opinion shows an increased interest for budgetary policy, especially, in the

distribution of resources accordingly to priorities, their use with maximum economic and social efficiency, in order to ensure a balance needs-resources.

From studies performed on the bibliographic resources it appears that the 27 Supreme Audit Institutions from U.E member states, although it varies greatly in structure and as organization and operation manner , the essence of attribution remains the same - the examination and reporting related to use of the public funds. Thus, in the U. E. there are four main categories of SAI, distinguished, primarily, by legal status and the institutional leadership, as follows:

Description category SAI	27 SAI of Members States U.E.
"The Supreme Courts of Audit " with a juridical function	Belgium, France, Greece, Italy, Spain, Portugal
"Collegial Structures" without juridical attributions	Czech Republic, Germany, Luxembourg, Netherlands, Slovakia, Romania
"Independent audit offices" presided by a Chairman or General Auditor.	Bulgaria,Cyprus,Denmark,Estonia,Finland,Ireland,Latvia,Lithuania,Malta,Great Britain, Poland, Sweden, Hungary
"A distinct model", presided by a President and the audit process is performed at central, regional and local level	Austria and Slovenia

Source *: Processed by the author after State Audit in the European Union, The National Audit Office, United Kingdom 2005, p.4.*

Certainly, the 27 SAIs require a comprehensive study, therefore for the current material, the objective of the study is the Federal Court of Audit of Germany (Federal Court), and the National Audit Office of the Great Britain (NAO). The motivation for the two chosen SAI sites consists into the following: its' tradition and experience in the field of audit, its have different judicial structures and in the "Programme of vocational training for the staff of the Court of Auditors of Romania", in 2001 experts of NAO and, in 2006, the Federal Court specialists have shared from their knowledge and experience in financial audit performance domain due to seminars sustained by them in Romania.

2. Supreme Audit institutions organized as   "Collegial Structures" with no juridical responsibilities

Although they are called Courts – Audit Federal Court of Germany, The Court of Auditors of the Grand Duchy of Luxembourg – these are organizations as College" type "with no juridical responsibilities. Because at the EU level there are no glossary of terms concerning the significance of public administration institutions, the ambiguity of the term "Court" attributed to these "Collegial Structures", signifies rather the judicial competences of Supreme Audit Courts.

2.1. The Federal Court of Audit of Germany (Bundesrechnungshof)

It is "The Supreme Federal Authority" specialized on federal public audit domain, responsible for examining government operations and transactions, for reporting on its findings and advisory entities audited on the basis of experience gained, and as " independent institution compared to the legislative, executive and judicial powers shall be subject only to the law". (Bundesrechnungshof Act, 1985: 1). Statute of the Court, the juridical independence of the members in the exercise of its essential functions are sets by art. 114 section 2 of the German Constitution. Basically, the implementation of federal legislation and federal policies are made at the level of the Federal Laender which "have autonomy (its own Constitution containing certain principles laid down in the fundamental law of the German State, Parliament, Government and Administration) and the appropriate finance "(Gunlicks, 2007: 114) but are not sovereign. As the administrative leadership, the eight Federal Audit Offices, accordingly to the official website of the Federal Court (http://bundesrechnungshof.de) have structure, rights and obligations similar to

those of the Central Federal Court. Audit functions, subjects, criteria and procedures are provided in the federal budget Code (sections 88-114) (German federal budget code, 1969: 20-25), in conjunction with section J.Federal Court Audit provided in the budgetary system of the Federal Republic of Germany (Knörzer, T and Bunderministerium der finanzen, 2008: 47-51). According to the last two bibliographic references, the Federal Courts role is to examine the accounts from the federal government which is including all government agencies, special governmental funds and federal government enterprises, and private law enterprises accounts, which is administering federal governmental funds, which are not part of inside administration federal. Principles of activity of Federal Court consists in ex post audit of the entire financial management of public federal state, although Heller Karl and Wolff Hans-Jurgen believes that: "a full examination is not practically possible due to the size annual budget of Germany", and of the relatively low number of officials (about 1300), according to the official website of the Federal Court previously mentioned. Even if it would use samples techniques, it would not cover the whole area of the various fields in order to be audited, or " it may limit the scope of audits, and also and to not audited certain accounts "(Heller and Wolff 1996: 125-127). In order to eliminate de problems which may occur due to exclusion of certain entities auditing, the Federal Court appeals to the preventive control, although among SAIs, the few sites, which apply this type of operation of the institutions included in it's area of activity. We mention here that those SAIs which apply preventive control. These are: Belgium, Greece, Italy, Portugal, all have in the its own structure the jurisdictional component.

Also, given the administrative reform and public finance, based on new public management(NPM), began in mid 1980s, in the English countries such as Great Britain and New Zealand, USA, Canada, Australia; process later extended in northern European States, Including Sweden, Finland and Norway, and the continental states, including the Netherlands and France, the federal Court has decided to implement this theory in Germany too. Certainly, the process took place gradually and was aimed primarily to introduce the idea of efficient management and active in the public sector, as Ogawa & Tanahashi argue that this theory is based on four fundamental principles, listed as follows: 1) decentralization of functions and authorities ; 2)market rules to be extended to public administration settings by introducing public-private partnership (PPP), 3) the approach based on evaluation of performance management on government executive agencies and 4) public accounting system based on engagement (accrual). (Ogawa,H., Tanahashi,K. 2008 : 50-52). Upon this subject, the Federal court specialists shared their experience in a course organized in 2006, at the Romania Accounts Court. As in Romania everything new is seen with skepticism, they must undergo four years to be adopted Law 178 of October 1, 2010, for public-private partnership, published in MO no. 676 of October 5, 2010, and Government Decision no.1239 of 8 December 2010, regarding the approval of Methodological Norms for applying Law 178/2012 as well as for the approval of the reorganization measures relating Central Unit to coordinate public-private partnership in the Ministry of Finance. In our opinion, this model represents a way of relaxation financial public sector, and the two parties involved in the contract (public-private) have limited obligations. However, common activity brings benefits on both sides – on the one hand, the public institution are for the community benefits, and on the other hand, private institutio, are established long term financial benefits (example: highway concessions in France, Italy, Spain).

Regarding the audit activity, the Federal court places "both regular audits of compliance and financial management as well as performance audit" (Bundesrechnungshof 2005: 15) and on the basis of its findings may provide assistance both the Parliament and the Federal Government. In compliance auditing and regularly, the Federal court examines whether the receipt and payments were properly justified and supported by documents, if budget and capital accounts have been properly prepared in accordance with provisions and regulation in force. In recent years, focused on performance audit, particularly because it applies to the programs or other large scale projects,

and analyzes the appropriate use of funds, by providing an acceptable cost-benefits proportion. Activity results of the Federal Court considered as the "fundamental importance" – which refers to matters of general interest and „signifying financial impact on the federal budget" or in any other manner important decisions are contained in users "annual report to both Houses of Parliament and Federal Government "(Germany's SAI, 2005: 31-34) that is submits to discussion and decide to whether or not discharge the institution audited. Additionally, during the year, Federal Court establish "special reports" regarding the problems of great importance that believes that Parliament and federal Government should be informed without delay. The discharge procedure for the federal government is decided in the separate examination by the two Houses of Parliament (Bundestag and Bundesrat), the Federal Courts annual report. The discharge for the Federal Ministries of Lands is granted by the Federal Ministry of Finance and marks the end of fiscal year budget cycle. In our opinion, the Federal Court is a model for discharge in respect, because this is functioning as a college-type body without juridical responsibilities, discharging procedure is decided by specialized committees of both Houses of Parliament after examining the annual report of the Federal Court.

3. "Independent Audit Offices" presided by a Chairman or Auditor General.
In these SAIs, the supreme power and the most important decisions aimed at the institutional issues also the reports made for Parliament are taken by the Chairman or Auditor General.

3.1. The National Audit Office of Great Britain (National Audit Office-NAO)
Contrast to other countries in which the form of institutional organization, rights and obligations SAIs are provided in Constitution in Great Britain, NAO functions on the basis Audit Department Act of 1866, later modified by National Audit Act 1921 and 1983 applicable today. NAO is the supreme audit institution of public funds without jurisdictional responsability, and has as objective "to help the nation spend wisely" (NAO 2011:8). Its main role companies benefiting from subsidies and other public bodies exercising responsabilities regarding administration public finances (NAO 2012:10). It also helps these organizations to improve their managerial performance for public services. Parliament (ie Queen, House of Commons and Lords) closely supervises the administration of public finances through NAO and accounting officers of accounts" personally liable to the Public Accounts Committee (PAC) of the House of Commons for how departmental resources have been engaged in the performing its functions" (Butler, Chris 1999:9) regardless of source of funds (national or European). As a results of the performed examinations, PAC makes a report that contains advises and recommendations which is sending to the government, with a copy of the NAO' s report. The government describes these recommendations and report measures taken. According to the Law department of Audit of 1866, Chapter 39, the head of NAO is heading completely " Comptroller General of the receipts and issues Treasury of His Majesty and Auditor General of public accounts", commonly used names is " Comptroller and Auditor General or C&AG " (National Audit Act 1866:2) suggesting that it plays an important role and wide powers over finances and the most important decisions which relating to the objectives and priorities of the institution in this field are taken unilaterally ,but the responsability of income and expenditure forecast is submitted to Ministry of Finance. The amendments to the Law Audit National in 1983 to the Law in 1866 provided in chapter 44, part I (National Audit Act 1983:4) that the C&AG is head of the NAO , is an officer of the Parliament and in the light of his statutory position he has a high degree of independence. Also he decides upon the annual audit program, on the themes on which NAO will address under the aspect of performance, but accordingly to the 1983 Law he has no right to judge the quality of policy objectives, the examination refers only to the measures taken by departments in order to achieve duties established by the Government and approved by Parliament. NAOs strategy is made based on a 5-year installment plan, which is enhanced all the time as his running.

NAOs activity is carried under the sign of the public responsability , therefore Ioan Bogdan, former President of the Court of Accounts of Romania, said in 1997, that is one of the "top SAIs" (CCR 1997:80), focusing on development and improvement permanently audit methodologies order to present best practices. Engaged exclusively financial audit and performance audit and through its activity aims lead to the saving funds. Financial audit engagement :

- is directed to" formulating independent and credible an opinion" according to International Standards of Supreme Audit Institutions (ISSAI) 1700 in conjunction with International Standard on Auditing (ISA) 700 – *The formation of an opinion and reporting on financial statements*, on the execution accounts and financial statements of public bodies.

- aims to the accurary of financial and accounting documents and the legality and regularity of use of public resources (NAO(2001): 76).

According to the training materials provided by specialist NAO, during seminars held by them at the Court of Accounts of Romania in 2001, each mission like this is scheduled in order to respond broadly to the following two questions, namely: "the funds allocated were used for the purposes approved by Parliament?" ,and "financial operations are in the accordance with applicable law" (NAO(2001): 22, 62). During the financial audit engagement, auditors obtains evidence as convincing as possible, through reality and force of arguments, because the audit opinion formulated is expressed on behalf of C&AG which is signatory to all audit reports prepared by subordinated auditors. The purpose the task is in two ways:

-either the auditee receives letter in which gives the audit findings accompanied by recommendation or

-either the auditee receives "audit certificate" (Sigma Papers no. 20,1997:142) and thus guarantees that the PAC can be based on financial statements.

NAO general practice is to comply with all aspects ISAs and Note practical 10. The latter refers to the " audit financial statements of Great Britain central government sector" and present the context and the key factors of which auditors should consider in the audited financial statements (NAO. October, 2010). Also emphasizes the importance accorded to an audit mission, an objective that emerges from the Chapted 39, Art. 27 of the Act Audit in 1921, which reads: "All accounts of execution will be reviewed by C&AG, which will provide himself a reasonable assurance that incomes were used only within the limits and for destinations approved by Parliament, and cost effective respected the law" (National Audit Act 1921).

Performance audit was introduced in the NAO activity with the Law of 1983, as a response to requests following terms PAC and NAO reports for system weakness or practices which led to charges that ignored the principle of proportionality. Since there is a definition established by law, the NAO has defined the concept of performance audit in elementary form, through phrase "value for money" (NAO 2001:74) but paragraph II, section 6 of the Act since the audit 1983 states that in the practice be respected definitions of " threes E – economy, effectiveness, efficiency " internationally recognized.(National Audit Act 1983:4). By its nature, performance audit is focused directly on performance with emphasis on resources, achievements, results and expected impact. Lonsdale argues that behind the tracking reports, performance missions are quantified, through "influence the government practices, financial savings, and impact on the decisions of Parliament" (Lonsdale 2000:74). Most missions that have the performance theme are focused on a theme, a topic that describe the circumstances and connect in order to reach a conclusion, rasher than a standardized statement, but pursued to several government department according to ISSAI 3100 - *The guidelines of performance audit: key principles.*

The difference of the two type of audit consists in that, through in a financial audit mission is probably be noted that the documents financial and accounting reflect reality and operations that contain respect the specific laws , a negative affirmation appears in the case of a mission performance audit if public organisms audited where not achieved, and final objectives considered account when allocating resources (give an example: storage of IT equipment).

NAO activity are known to PAC from the House of Commons, the first chamber of Parliament, through interim reports (during the year) and annual report. During the Parliament work period, tales place biweekly meetings order to discuss potential impact of the audit, especially in financial terms, as a measure of expected results and affects obtained from previous work. Measuring the impact of the NAO annual activity, take place trough quantitative and qualitative evaluation of the significant changes that have been produced by auditors, as a result of its recommendations. For example, Pollit and Roberts provides some severe criticism of the previous stage reports published by C&AG because "all performance reports must be agreed (literally) the officals accountants…. and disagreements can not be presented PAC, but a report in full compliance" (Pollit and Roberts 1994:541), and examples could continue with a report drawn up in 2002 by the Environment Agency that the auditors have brought strong criticism "on the respect of licensing criteria" and in the final report, these criticisms were "vague suggestion for improving the Agency's work", says Sharma (Sharma 2007:299). On the other hand, Wilkinson says about a report prepared by auditors in June 2006 on the National Programme for IT (NPfIT) established at the department of Health "has been heavily modified" so that the published report described as a "whitewash" findings. (Wilkinson 2006: 1317). In other words, some majors issues included by auditors in their reports, becomes minor points from the clearing and the NAO proceeds to misinformation PAC probably not taking into account risk assessment and issues that may arise after the audit mission, we consider. According to the Author, NAO activity in two types of audit, may be landmark the Court of Accounts of Romania, especially and because the information provided by the specialists of this institution, although as we have noticed is has gaps.

4.Conclusions

As is it obvious, between the two SAIs exist both the similarities and differences marked by socio-economic features of each state. However the essence task remains the same – "verification of the management of public funds". In Germany, Constitutional Law guarantees for Federal Court and give it a place in the system of Government; unlike- the National Audit Office of Great Britain is established by statute, like other national government institutions. The similarities consists that in whatever juridical form are declared "supreme audit institutions" which it operates independently from legislative power, executive and judiciary and are lead each one by an official with extensive powers for the NAO. According to the 1977 Lima Declaration, SAIs have included in the research area as main activity, the two common types of audit – financial or regularly and performance, and additional, Federal Court practices preventive control, the institutions included in the area of its activity. Regarding the relationship between SAI and Parliament, this is done through specialized committees of Parliament, respectively the Public Accounts Committee of the Bundesrat (Germany) and the House of Commons Public Accounts Committee (United Kingdom),which examines the implementing the recommendations status. The results of SAIs activity are necessary for the Parliament and public opinion generally, highlighting thereby "responsability of those responsible" for managing public funds. In our opinion, the Federal Court combined the role of "public accountant" to that of "management consultant " and the equivalent institution in the UK exercising more the role of "public accountant".

FINANCIAL SYSTEM STRUCTURE AND STABILITY DURING TRANSITION

Fîrțescu Bogdan – Narcis
Faculty of Economics Business and Administration
Alexandru Ioan Cuza University of Iasi

The process of transition from socialist economy to market economy was not considered an end in itself, but a necessity, and standing proof to achieve high levels of sustainable development. All former socialist countries are characterized by an early transition recession transformation result of the restructuring, loss of markets, tough competition from foreign products, best quality, or in other cases cheaper. To express the financial system structure in transition we take into discussion data that reflects representatives mutations and restructuring in Central and Eastern European countries, such Bulgaria, Czech Republic, Hungary, Poland and Romania. For all countries we show some important changes of financial system during transition and construct an image matrix that illustrates important indicators of financial system structure and their adjustment.

Financial system functions and its role in assuring stability during transition
Functions of financial system

Modern economic analysis explains the existence of financial intermediation through the banking operation (as financial intermediaries), and specific functions lie in the function of reducing transaction cost, function to reduce information asymmetry by providing liquidity and the economy (Lobez, F., 1997, p. 191). The existence of financial intermediaries in the current economy allows the manifestation of their specific functions that are fulfilled and that the specific functions of the financial system (Fîrțescu, 2010, p. 161). The main functions of financial intermediaries found in the literature, are considered the following: function to transform the structure of attracted funds ("maturity transformation"), function "risk transformation", collection and distribution function (the resource - funds raised)

For the first function attributed the financial system, financial intermediaries can reduce transaction costs by making significant savings that come from specialization benefits financial intermediaries (Andreff, 2007, p. 12). When an intermediary specializing in one type of activity or a sector, this situation allows it to offer cheaper services tailored to customer needs. However, recording of important savings and diversified range of customer services. This is why financial intermediaries (in this case, banks) seeking to diversify their product offerings, so as to optimize the costs of intermediation (Andreff et al., 1998, p. 25),

Regarding the second function - reducing asymmetric information - should be considered the relationship between debtors and creditors, meaning that the latter have more information than the first. However, the financial intermediary guarantees confidentiality, which can be a decisive advantage for creditors. Because of these characteristics, financial intermediaries have a comparative advantage in funding made in the market. Among financial intermediaries, banks have crucial role in reducing asymmetric information as maintain long-term relationships with their customers by the very nature of functions performed.

The third function of providing liquidity concerns that the economy in an uncertain world, businesses need to hold liquid assets to meet two characteristics: their value must be stable and uncontested, respectively, are readily available to be transformed into goods and / or services. Liquidity insurance function, which is characteristic of banking intermediation is not possible unless the banking system has a high degree of organization and regulation, which gives banks a guarantee to the overall lack of liquidity risk, also known as systemic risk (Neave E.H, 2010, p. 10). In the financial system, banks as financial intermediaries perform a range of classic and

traditional features, types of operations aimed at closely linked, namely: loan distribution function, the function of collecting deposits, office management means of payment.

Role of financing during transition

The importance of the financial system is widely discussed in recent literature, being addressed in the interdependence of economic growth, resulting in the conclusion that the proper functioning of financial intermediaries have a significant impact on economic growth. In planned economies, the financing was achieved through administrative measures financial institutions present in the pre-planned economies in transition were banks, which acted as record-keepers for planning and paying agents among state enterprises rather than as financial intermediaries. Although these banks had appearances of real banks, they haven't worked as the banks from a genuine market based economy. There are many modes of financing and different types of institutions to facilitate these. The modes can be grouped into three broad categories (Bonin J, Wachtel, P, 2003, p. 2): entrepreneurial finance; bank lending (bank – based financial system); capital market financing (capital market based financial system). Economic literature discuss same types of financing, namely auto-financing or self-financing financing through banks, or through capital market. Recent approaches discuss the financing with the participation of financial intermediaries, referring at financial through banks.

As a conclusion, important authors suggests that in early stages of transition post-communist countries evolve from a central planned financial system to a bank-based financial system.

Financial system structure during transition and its stability
Data and indicators related to financial system structure

We take into discussion some data that reflects representative mutations and restructuring in Central and Eastern European countries, such Bulgaria, Czech Republic, Hungary, Poland and Romania. For all countries we take into discussion some important changes of financial system during transition and construct an image matrix that shows the most important indicators of financial system structure:

- LIQUID LIABILITIES / GDP
- CENTRAL BANK ASSETS / GDP
- DEPOSIT MONEY BANK ASSETS / GDP
- PRIVATE CREDIT BY DEPOSIT MONEY BANKS / GDP
- PRIVATE CREDIT BY DEPOSIT MONEY BANKS AND OTHER FINANCIAL INSTITUTIONS / GDP
- BANK DEPOSITS / GDP
- FINANCIAL SYSTEM DEPOSITS / GDP
- BANK CREDIT / BANK DEPOSITS
- BANK OVERHEAD COSTS / TOTAL ASSETS
- NET INTEREST MARGIN
- LIFE INSURANCE PREMIUM VOLUME / GDP
- NON-LIFE INSURANCE PREMIUM VOLUME / GDP
- STOCK MARKET CAPITALIZATION / GDP
- STOCK MARKET TOTAL VALUE TRADED / GDP

Bulgaria

The banking system in Bulgaria in the early years of transition faced many serious structural problems. At that time, two specialized banks dominated the banking sector in Bulgaria. Bulbank, state foreign trade bank, did not participate actively in the process of credit, resulting in that less than 1% of its assets were loans for non-financial sector. Spestovna Derzhavna Kassa (DSK), bank and savings institution dominant sector was specialized mainly on transactions in government securities and interbank deposits as assets. Together, these two state banks constituted about half of total banking assets in Bulgaria. A financial sistem structure matrix,

composed by most important financial structure ratios is shown in graphic and table (data only for 2009) below:

Figure 1. Financial system structure in Bulgaria
Some observations results from figure 1: major indicators shows an improvement of financial system structure, and an increase of stock market capitalization - the indicator LIQUID LIABILITIES / GDP fluctuates from a minimum value in 1998 - 0.2822 to a maximum in 2009 - 0.8877 suggesting an increase of overall financial liquidity, indicator FINANCIAL SYSTEM DEPOSITS / GDP is within 0.2067 (1998) and 0.7388 (2009), illustrating an strengthen in bank financing.

Czech Republic

The early recapitalization of the four large state-owned Czech banks was a little avail. Major factor was identified as soft lending practices that continued even though banks passed accumulated bad debts to a newly created "hospital" bank. Some estimates suggest that the final cost of bank bailout in the Czech Republic was 30% of GDP as compared to just over 10 per cent for Hungary. In 1999, classified credits reached 32% of the total. Interestingly, the Czech government's protectionist policy had allowed domestic banks to maintain high spreads and, hence, they had the potential to be profitable. Although the banks could self-capitalize, they did not do so because soft lending practices and poor risk assessment continued. Nor did the several rounds of cleaning up the banks' balance sheets strengthen the big four Czech banks because they did not achieve independence either from the state or from their unrestructured clients. Financial sistem structure matrix indicators is shown in graphic below:

Figure 2. Financial system structure in Czech Republic
As figure 2 suggests indicators shows a lesser improvement of financial system structure, and an increase of stock market capitalization in 2008 and 2009- the indicator LIQUID LIABILITIES / GDP fluctuates from a minimum value in 1994 - 0.651 to a maximum in 2009 - 0.7103 suggesting a small increase of overall financial liquidity, indicator FINANCIAL SYSTEM DEPOSITS / GDP is within 0.5636 (1994) and 0.6228 (2009), illustrating an strengthen in bank financing.

Hungary

Hungarian bank with the largest exposure to loss-making industrial customers was buffet Magyar Bank (MHB). MHB's bad loan portfolio was put into a separate organizational unit, a bank within a bank, in an effort to recoup a portion of the loan. The remaining part of the good bank was privatized with a transaction was structured to attract a foreign strategic investor, which would increase the bank capital. Shortly after purchasing a package of 90%, ABN Amro subsidiary merged with MHB own Hungarian branch. Therefore, now bears the name MHB parent company is Dutch and financially with foreign bank. MHB's experience highlights the importance of shedding unwanted customers.

The largest Hungarian bank is now Kereskedelmi Bank Orszagut Takarékpénztár (OTP), National Savings Bank. OTP was privatized in 1995, but without a dominant strategic foreign investor. When the bank dominated the Hungarian retail market and although its market share declined, is still the largest retail bank and the largest bank in the country.

Figure 3. Financial system structure in Hungary

Source: **World Bank Database**
http://econ.worldbank.org/WBSITE/EXTERNAL/EXTDEC/EXTRESEARCH/0,,contentMDK:20696167~pagePK:64214825~piPK:64214943~theSitePK:469382,00.html
In concordance with Figure 3, in Hungarian financial system, a set of indicators almost double their an value: LIQUID LIABILITIES / GDP fluctuates from a minimum value in 1994 - 0.395 to a maximum in 2009 - 0.651 suggesting a boost increase of overall financial liquidity, indicator FINANCIAL SYSTEM DEPOSITS / GDP is within 0.286 (1989) and 0.4978 (2009), illustrating an strengthen in bank financing, suggesting that actions during transition had achieved their goals.

Poland

Polish banking sector entered a second phase in the late 1990s with a series of post-privatization consolidations (see Kokoszczynski, 2000). A series of mergers took place 1999 - 2001, in two of the four cases, foreign banks acquiring a portfolio of minority as part of the initial privatization process, then followed further acquisitions of shares before the merger. Poland has allowed foreign strategic investors to take controlling interests in the large commercial banks. At the end of 1994, foreign institutions controlled only 2.1% of Polish banking assets. By 2000, 63.7% of commercial bank assets in Poland were held by banks controlled by foreign owners. The evolution of fsi is presented in Figure 4.

Figure 4. Financial system structure in Poland
As displayed in Figure 4, a set of Polish financial system indicators almost double their an value: LIQUID LIABILITIES / GDP fluctuates from a minimum value in 1994 - 0.2672 to a maximum in 2009 - 0.651 suggesting a boost increase of overall financial liquidity, indicator FINANCIAL SYSTEM DEPOSITS / GDP is within 0.214 (1989) and 0.4164 (2009), illustrating an strengthen in bank financing and largest improvement (of all analyzed countries related to stock market capitalization to GDP – 0,6149.

Romania

The structure of the financial system, before 1990, in Romania was similar to that of other centralized economies. Since 1991 the Romanian financial system metamorphosis took place at the changes taking that premise to introduce a system organized on two levels - National Bank of Romania, the central bank independent, commercial banks - and banking legislation that boosted the role of commercial banks in the economy, a role closely related to their role as principal intermediary in relation to savings - investment, crucial to economic growth relationship. In Romania, the funding system was heavily dominated by the banking sector, here manifested prominent financial intermediation. Dominance of the banking sector in financing the economy is explained by several factors such as underdevelopment of capital markets, taxation still disadvantageous exchange, saving more attractive offers banking, investment culture, etc. Financial market development and growth is observed market capitalization to GDP. An overview of financial system structure is presented below:

Figure 5. Financial system structure in Romania
As displayed in Figure 5, indicators in 2009 are closer to values from 1991: LIQUID LIABILITIES / GDP fluctuates from 0.3804 in 1991 depreciated to 0,3454 in 2009 - 0.651 suggesting a boost increase of overall financial liquidity, indicator FINANCIAL SYSTEM DEPOSITS / GDP is within 0.2932 (1989) and 0.3212 (2009).

Conclusions

An important conclusion concerns the need of breaking the linkage between banks and uncertain customers. For small countries, Hungarian experience indicates that foreign participation in bank privatization is an effective approach to a strong financial system. Hungary was the first to apply this rule, followed by Poland, which experienced a series of bad experiences and the Czech Republic that finally focused in this direction. Another conclusion refers to the importance of proper control of banking institutions. Experiences indicate the importance of developing the regulatory structure, especially in unstable macroeconomic environment. Hyperinflation leads to disintermediation and a significant contraction of the monetary base of the economy. Macroeconomic stability and stronger banking supervision are necessary conditions for the restoration of banking sectors in these countries. The experience of transition economies, large and small, fast or not, indicates that the entry of many private banks undercapitalized promote systemic instability. For small countries, open foreign participation in domestic banking sector is a more effective means of promoting both competition and sector development. However, stability is a prerequisite for sufficient foreign capital entry and strong regulation is a necessary condition for effective supervision, but also require large amount of resources and know-how to complement legislation. Larger economies have greater flexibility in designing efficient banking sectors. Bulgaria or Romania were forced to a quick reform their banking systems as quickly as possible to meet the major objective of EU accession. This objective required the development of a regulatory system that respects the guidelines of the EU and opening the domestic banking sector to foreign competition.

AGENCY PROBLEMS IN PUBLIC SECTOR

György Attila
Bucharest Academy of Economic Studies
Faculty of Finance, Assurance, Banks and Stock Exchange

Agency theory analyses the effects of contractual behaviour between two parties: principal(s) and agent(s). This relation is inevitably characterized by information asymmetry because agent holds a substantially larger volume of information than the principal. Due the negative effects of information asymmetry for the principal, this should cover supplementary costs with monitoring agents and/or grant incentives. The first objective of this paper is to emphasize the effects of information asymmetry, particularly on adverse selection and moral hazard. The second objective is to evaluate the negative effects of information asymmetry and to assess the viability of solutions proposed by scholars for mitigation. The third objective is linked with personal contribution, respectively to highlight specificity of agency theory in public sector and the mechanisms of action in this particular field. In this paper, literature is mainly based on scholars' contribution to the proposed theme. Little literature approaches agency theory in public sector, in most cases the analysis being restricted to general issues. Research methodology is based on synthesizing relevant information from literature and adapting them to public sector particularities. The results reflect some threats for public bodies in their contracting activity. Conclusions present also a set of solutions which could be used by public institutions to optimize their activity of mitigating information asymmetry's effects. These solution guidelines could represent a useful instrument for make more efficient public money spending. Personal contribution and the novelty of this paper consist in presenting a new approach regarding mechanisms of managing information by agents. In case of public institutions, principals have more opportunities the take possession over the information managed by the agent. Nevertheless, agents can limit the principal's access to vital information by offering excessively much information, combining few vital data with numerous unimportant information. For further research, agent's information management should be depth and analyzed in which manner principal can control it.
Keywords: agency theory, information asymmetry, adverse selection, moral hayard, public resources

Introduction

Studying the current economic phenomena is a concern that arose from the need of understanding the economic reality and find levers, instruments with which to intervene for the control of this dysfunction (Câmpeanu et al. 2011: 42). Some distortions are generated by the behaviour of participants in economy which establish in contracts the mutual rights and obligations. The financial perspective over the contracting in economy, known as agency problems, presumes a monetization which can be made using costs supported by all parties. Agency theory has been used in numerous fields such as accounting, economics, finance, marketing, political science, organizational behaviour, sociology (Eisenhardt 1989: 57), which recommend it as a complex analyse tool. Agency costs arise from many sources: the costs of recruitment, adverse selection, specifying and discerning preferences, providing incentives, moral hazard, shirking, stealing, self-dealing, corruption, monitoring and policing, self-regulation, bonding and insurance, agents who oversee agents, as well as failures in these costly corrective devices (Shapiro 2005: 281). Agency costs are strongly related to information problems, three of them deserving close consideration: adverse selection, moral hazard and non-verifiability because each of those informational problems leads to a different paradigm and, possibly, to a different kind of agency costs (Laffont and Martimort 2001: 14). Non-verifiability can be associated with moral hazard because it inseparably linked with unobservability.

In most cases, the public sector principals contract a certain quantity of public services from their agents. These quantities are derived from public policies and should be fulfilled without exceeding them. In order to maximize efficiency, principals should monitor agents in order to obtain minimal resource consumption for offering contracted quantity of public services.

Optimization of agency problems requires new categories of costs in order to reduce significantly the negative effects on costs produced directly by agents. Thus, agency problems may be solved, at a cost, with the use of incentive compensation, monitoring, and signalling by the agent (Chua et al. 2009: 359).

Adverse selection
The adverse selection models present situations where the decisions of player (named the Agent) having private information depend on private information and could negatively affect others participants; the party making the contractual offer and who doesn't know the Agent' private information is attempting to reduce this informational disadvantage (Marinescu and Marin 2011: 34). Although the agent has private information, his advantage is limited because the actions it performs can be observed (Zhang and Stefanos 2008: 1).

The relationship between the principal and the agent(s) involves two main types of variables: the first type is associated with a decision (or action) and is observable. The variable of the second type has generally the meaning of money transfer from the principal to the agent (Araujo and Moreira 2000: 7).

In public sector, adverse selection has some specific valences. The contractual relation is set up mainly between an agent which is subordinated to the principal. The subordination relationship could be different, a large scale of parameters being possible to be meet. Mostly, the agent is created by the principal and is supported by it. The management of the agent could be designated by the principal or should be approved by it (in case of more democratic and independent organizational structures). If we look at financial issues, the general rule is that of principal's supervision on agent's financial activity. If agent is granted with fiscal public resources, the granting operation is coordinated entirely by the principal.

As presented above, the situation looks to advantage principal's position and to contribute to easily minimize the information asymmetry's effects. In reality, it seems that adverse selection is due to: bureaucratic procedures, overwhelming volume of paperwork which accompanies every step of agents' activity and principal's conviction regarding the large possibility scale of monitoring agents.

A different approach of adverse selection in public sector can be met when public authorities buy goods and services. Public procurement rules can not diminish until disappearance the information asymmetry. Adverse selection occurs when the government accepts the bid of an inefficient producer because it cannot observe the bidders' expected production costs before awarding the contract (Cox et al. 1996: 148).

Adverse selection's profile in private and public sector seems to be different although the causes and mechanisms are similar. Information asymmetry appears not only due to holding private information (as in private sector often is meet), but also due to bureaucratic procedures which hinder to pierce basic information from a multitude papers and facts with low interest level for the principal.

Moral hazard
Moral hazard has an economic equivalent in a rational behaviour in terms of organization or person. Moral hazard involves a rational behaviour, namely self-interest, which could be characterized as opportunistic because it takes advantage of an opportunity for personal benefit, even if it is detrimental to others. Personal benefit is to be read more generally to refer to the benefit of the active party, whether an individual or a company (Dow 2010: 2).

Moral hazard (hidden action) appears when agents may not deliver on they tasks properly due to an imperfect monitoring by the principal (Barbagallo and Comuzzi 2008: 8) and abusing of information which is only in its possession. Under these information asymmetry, the principal should spend supplementary resources in order to control agent by supervision. Soft supervisory

information helps the principal even though the supervisor and the supervised agent collude if this collusion takes place under asymmetric information (Faure-Grimaud, Laffont and Martimort 2003: 272). In adverse selection models, it is not the informed party (the agent) that moves first, but instead the uninformed party takes action first (Wahrenburg 1999:3).

When the agent's action is not observable, the parties design the optimal contract to maximize their joint benefits while mitigating moral hazard (Pobletey and Spulber 2011: 3). Gifford (1999: 427) consider that one of the primary conclusions of the principal-agent model of moral hazard is that, because the agent receives only a partial share of the benefits generated from the agent's effort, which is not perfectly observed by the principal, and yet bears the entire cost of that effort, the optimal incentive contract between the principal and agent cannot achieve a first-best outcome. That is, the agent will not maximize the total value of the endeavour.

In case of public procurements, moral hazard is also observable after the contract is entering into force. Moral hazard arises after the contract has been awarded because the government cannot observe all aspects of the firm's efforts to hold down production costs, and hence the enforceable terms of the contract may not provide sufficient incentive for the firm to adopt the efficient level of cost-reducing effort (Cox et al. 1996: 148).

In public sector, moral hazard is increased by the financial mechanisms which are set to supply public institutions which become agents in their contractual relations. Budgetary ex-ante allotments allow agents to feel a certainty which generate a different behaviour than rational and optimal from principal point of view.

Information asymmetry causing adverse selection and moral hazard

In practice, the relation between principal and agent is not divided in two components, respectively adverse selection and moral hazard. The theory, trying to explain the complexity of the situation, describes separately these information asymmetry effects. Adverse selection problems arise from information asymmetry before and/or after contracting, while moral hazard problems stem from the unobservability of managerial effort only after contracting (Sung 2005: 1021).

Both, adverse selection and moral hazard have the origin in information asymmetry. If cause could be controlled or even annihilated, the pernicious effects will not appear with same raised intensity.

Incentives are mechanisms which contribute to limit negative effects of information asymmetry. These mechanisms should not action individually. Some scholars consider that incentives cold be partially replaced by the forces of market which can control moral hazard (Jeon 1996: 298). In no situation, market can correct information asymmetry's pernicious effects. In these circumstances, incentives are welcomed. The existence of incentives implies new costs for the principal. The principal–agent model could be used to model incentives in organizations (de la Rosa 2011: 429). The main costs come to the principal in terms of the incentive he provides the agent to act in the principal's interest (Van Horn 2011: 14). Scholars concluded that incentive allotment is the best solution if we compare effects with efforts. The incentives can be designed in various forms, but main options remains financial incentives. Itoh (1993: 31) stresses on non-financial incentives which could help principal in supervising agent's behaviour. These kinds of incentives could not be used in a large scale, but in particular situations it represents a viable alternative. Itoh propose promotion to more visible tasks and evaluation of supervisors based on their subordinates' future performance could alleviate their incentives to misrepresent information via collusion, without losing benefits from cooperation among agents. Another possibility is the use of job rotations both within and across work groups.

Exclusively referring to the public sector, we can observe that this field is excessively regulated. The explanation of this degree of regulation can be found in the numerous attempts to use incorrectly and inefficiently the public money. Under these circumstances, information

asymmetry is met also as an effect of excessive bureaucratic paperwork which hinders monitoring activity.

Principals should organize information asymmetry mitigation. The two main instruments recommended to be used, as presented above, are monitoring and incentives. Both of them are costly for the principal. Under these conditions, the main challenge for the principal is to find the optimal ratio between these two instruments in comparison with results obtained in information asymmetry diminishes.

For further research, stress should be put on the management of information at agent level. Principal will optimize supervision and information asymmetry diminishing when will be able to receive only vital and relevant data from the agent.

Conclusion

Contractual relations generate agency problems (adverse selection and moral hazard) which have the origin in information asymmetry between the parties. This information asymmetry causes negative repercussions on principal because agent will not be interested to maximize principal's welfare, but its own prosperity. In order to mitigate information asymmetry's effects, principal will support supplementary costs with monitoring agent or granting incentives. The big challenge for the principal is to find the optimal ratio between these categories of costs in comparison with the beneficial effects of controlling agent's activity.

In case of public sector there are some particularities regarding the relation between principals and agents. This excessively regulated field tends to accentuate information asymmetry due to the enormous volume of bureaucratic paperwork which requires costs to be assessed and used in monitoring activity.

THEORETICAL CONSIDERATIONS REGARDING THE AUTOMATIC FISCAL STABILIZERS OPERATING MECHANISM

Göndör Mihaela
Petru MaiorUniversity of Tirgu Mures, Faculty of Economics, Law and Administrative Sciences

This paper examines the role of Automatic Fiscal Stabilizers (AFS) for stabilizing the cyclical fluctuations of macroeconomic output as an alternative to discretionary fiscal policy, admitting its huge potential of being an anti crisis solution. The objectives of the study are the identification of the general features of the concept of automatic fiscal stabilizers and the logical assessment of them from economic perspectives. Based on the literature in the field, this paper points out the disadvantages of fiscal discretionary policy and argue the need of using Automatic Fiscal Stabilizers in order to provide a faster decision making process, shielded from political interference, and reduced uncertainty for households and business environment. The paper conclude about the need of using fiscal policy for smoothing the economic cycle, but in a way which includes among its features transparency, responsibility and clear operating mechanisms. Based on the research results the present paper assumes that pro-cyclicality reduces de effectiveness of the Automatic Fiscal Stabilizer and as a result concludes that it is very important to avoid the pro-cyclicality in fiscal rule design. Moreover, by committing in advance to specific fiscal policy action contingent on economic developments, uncertainty about the fiscal policy framework during a recession should be reduced. Being based on logical analysis and not focused on empirical, contextualized one, the paper presents some features of AFS operating mechanism and also identifies and systematizes the factors which provide its importance and national individuality. Reaching common understanding on the Automatic Fiscal Stabilizer concept as a institutional device for smoothing the gap of the economic cycles across different countries, particularly for the European Union Member States, will facilitate efforts to coordinate fiscal policy responses during a crisis, especially in the context of the fiscal harmonization. The main result of this study is the developing of the definition of Automatic Fiscal Stabilizer.
Key Words Automatic Fiscal Stabilizers, Discretionary Fiscal Policy, Non-discretionary Fiscal Policy, Economic Cycle, Economic Crisis

I. Introduction

The contemporary economic crisis demonstrated that fiscal policy can be used by the governments as a macroeconomic tool in keeping the public deficit and debt under the Stability and Growing Pact (SGP) thresholds. By using the rights incentives, fiscal policy can have longer-term effects. In the same time, the contemporary economic crisis demonstrated the fact that the mistakes in fiscal policy can have severe consequences both economic and social with high recovering costs. The effectiveness of using fiscal policy for balancing the Gross Domestic Product (GDP) gap depends on policy makers' ability to correctly time policy changes and on the impact that fiscal policy changes have on the economy. By the mean of SGP, governments are free to use both discretionary and non-discretionary fiscal policies. By introducing a third threshold with referring to the national output to be respected from all the member states, SGP will give more importance to the non-discretionary component of the national fiscal policy, becoming a real instrument for achieving the UE economic growth and long term sustainability and stability.

The Automatic Fiscal Stabilizers (AFS) reflect some revenue and expenditure items which adjust automatically to cyclical changes in the economy. These changes will have a direct impact on the

income of businesses and households. The effectiveness of the Automatic Fiscal Stabilizers depends on how responsive taxes and expenditures are to cyclical changes, i.e. the progressive tax system. The Automatic Fiscal Stabilizers balance the fiscal budget when the macroeconomic output gap (GDP) increases or decreases. The fiscal relaxation in crisis time is automatically followed by a fiscal tightening in boom time. This provides an appropriate fiscal response when the GDP gap is caused by demand shocks. How to estimate the size of Automatic Fiscal Stabilizers is an important issue. Reaching common understanding on the methodology for estimating the Automatic Fiscal Stabilizers across different countries, particularly for the European Union Member States, will facilitate efforts to coordinate fiscal policy responses during a crisis, especially in the context of the fiscal harmonization.

Reviewing the literature in the research field the conclusion is that the mistrust on discretionary fiscal policy generated by actual economic crisis has called into question the automatic fiscal stabilizers concept, increasing the researcher interest in this issue, admitting its huge potential of being an anti crisis solution. However the current design of national fiscal policies is almost entirely discretionary type. There are no serious attempts to introduce fiscal stabilizers to automatically react without any lag and any extra costs for stabilizing the cyclical fluctuations by making desirable adjustments for the real economy instead of discretionary public fiscal policy to smooth the economic cycle. Furthermore, there are no systematic preoccupations for making a connection between the fiscal harmonization trend and the level of non-discretionary of national fiscal policy of European Union States.

In this context, the objectives of the study are the identification of the general features of the concept of automatic fiscal stabilizers and the logical assessment of them from economic perspectives. In this purpose the paper intends to answer to the following questions: How works the Automatic Fiscal Stabilizers? Which is the component of the public budget through the AFS has its largest effect on macroeconomic output: the expenditures or the revenues? Which is the importance of automatic stabilizers on the demand and supply sides? Does the automatic nature provide a timely reversal of any fiscal expansion? The nature of the Automatic Fiscal Stabilizer can be entirely non-discretionary type or it also involves discretionary actions? Which are the factors with influence on the Automatic Fiscal Stabilizers mechanism?

The result of this study is the developing of the definition of automatic fiscal stabilizer.

II. Literature analysis

The Automatic Fiscal Stabilizers may be defined as those types of public income and expenditure which are directly linked with the economic cycle. (Martner 2000: 32) The Automatic Fiscal Stabilizers represents an institutional device which provides the non-discretionary character for the fiscal instruments which are operationalized through it (Dinga 2009: 1-69). Its finality is to reduce the volatility of the macroeconomic output. AFS represent a structural institutional device, with a negative feed-back, stimulating the economy in periods of recession and moderating in booms, thus exercising a regulatory function. Its effectiveness depends on its rate and base of action. (Dinga 2009: 22)

Although the Automatic Fiscal Stabilizers are a Keynesian idea (Blanchard 2000: 69), in the last ten years before actual economic crisis, it has been not much discussed by researchers. Some authors suggest that discretionary fiscal policy can be stabilizing but the effects are small (Perotti 2002: 3-63; Blanchard and Perotti 2002; Romer and Romer 1994: 13-80). Some authors consider that automatic fiscal stabilizers are more effective in damping cyclical volatility although the effects are also small (Auerbach 2002: 1-50; Van den Noord 2000: 137-150; Comley, Anthony and Ferguson 2002: 45-73). In an empirical study of the effects of the fiscal policy, analyzing the importance of the Automatic Fiscal Stabilizers, some researchers found strong effects of changes in fiscal policy on economic activity (Fatas and Mihov 2000: 1-37).

Between very few authors who considered the real importance of Automatic Fiscal Stabilizers, Martner demonstrated in 2000 that the Automatic Fiscal Stabilizers help to stimulate the economy in periods of recession and moderate it in booms, thus exercising a regulatory function, also showing that Governments have the option of allowing these automatic stabilizers to operate without intervention, or strengthening or restricting their effects through discretional polices (Martner 2000: 32-54). According to the same author, (Martner 2000: 32-54) the automatic fiscal stabilizers are the main tool for obtaining a national balanced budget in "normal" economic conditions. Another author (Auerbach 2002: 1-50) demonstrates that the most obvious problem with looking at fluctuations in tax revenues, spending, or their difference is that each of these aggregates, especially tax revenues, is sensitive to the economic cycle and changes occur without any active policy decisions. The author concluded that these changes may serve as automatic stabilizers, "but they need to be left aside in attempting to measure active policy changes". According to Auerbach, the automatic fiscal stabilizers offer an alternative to discretionary fiscal policy. Some researcher's studies demonstrate that revenues are more responsive to variations in output than expenditures, suggesting that it is through tax policy settings that automatic stabilizers have their largest effects on output and pointing that automatic stabilizers play only a very small role in the accumulation of net public debt (Kennedy et all 2004: 1-50).

According to some researchers, the contemporary economic crisis has shown that monetary policy may not provide a sufficient response. In this case discretionary fiscal policy may be used, but it has at least two disadvantages: it suffers from implementation lags, including a political decision-making process influenced by multiple (possibly contradictory) considerations and is not automatically reversed when the economic cycle improves, giving rise to a potential deficit bias (Baunsgaard and Symansky 2009: 1-26). According to some researchers, automatic stabilizers do not suffer from these shortcomings, ensuring in contrast a prompter and self-correcting fiscal response (Baunsgaard and Symansky 2009: 1-26; Fedelino, Ivanovna and Horton 2009: 1-15; Kennedy et all 2004: 1-50; Brondolo 2009: 3-38; Follette and Lutz 2010: 1-40). The conclusions of such studies is that the countries should avoid introducing procyclicality as a result of fiscal rules, as these would offset the effect of existing automatic stabilizers (Baunsgaard and Symansky 2009: 1-26). In the same year, some paper works provides guidance on how to decompose overall fiscal balances into cyclical and cyclically adjusted components, and how to interpret automatic fiscal stabilizers, clarifying the methodology for decomposing changes in overall fiscal balances into discretionary and "automatic" effects (Fedelino, Ivanovna and Horton 2009: 1-15).

The scientific literature provides quantitative estimates of the effects of the automatic stabilizers on the government budget and on the economy in The United States, for 2008-2009. (Follette and Lutz 2010: 1-40). The Automatic Fiscal Stabilizers are most commonly estimated with the elasticity approach. (Fedelino, Ivanovna and Horton 2009: 1-15).

Regarding the Romanian literature in the research field, it is notable the contribution of Dinga Emil, 2009 in identifying the logical properties of a discretionary public policy and of a non-discretionary public policy, in clarifying the criteria for determining and identification of it. It is also notable his contribution in identifying the sufficient predicates (attributes) which ensure the quality of the automatic fiscal stabilizer. A particularly important aspect of which the Romanian researcher was concerned is the formal description of the generic action of the automatic fiscal stabilizer in different assumptions of the variation rate action, and of the variation of the base action of this special institutional device (Dinga 2009: 1-69).

III. Research methodology

Considering important to clarify some conceptual issues general valid related on automatic fiscal stabilizers, this study is based on logical analysis and not focused on empirical, contextualized one. The study of the automatic fiscal stabilizers actions was made in an abstract way, generally

valid. As a result, the methodology used in this study has an abstract character, based on evaluations of consistency, completeness and consistency of concepts, notions, classifications and interpretations. The use of formality in logical analysis of Automatic Fiscal Stabilizers, which may be thought of primarily as permitting the detailed mechanical checking of deductive arguments, is in fact much more significant in enabling the meaning of new concepts and notations to be located more precisely than they can be by informal means. The author considers this methodology being relevant in the AFS study because in all areas of knowledge, advances are dependent on the development of new terminology, concepts, or notations. These permit expression of those finer distinctions upon which the advance of knowledge so often depends.

IV. The results of the research

As argued above, discretionary fiscal policy is subject to potentially long inside lags, the delays between recognition of the need for fiscal stimulus or restraint and the design and implementation of the appropriate fiscal measures. Some of these inside lags occur administrative reasons, other inside lags occurs for political reasons. Administrative or political, long lags must be a strong argument against discretionary fiscal policy. The based on AFS non-discretionary fiscal policy can provide a faster decision making process, shielded from political interference, ensuring a timely fiscal response.

As the cyclical component of expenditure is smaller than that of revenue and the fluctuations in the cyclical component of the overall budget balance are largely explained by cyclical movements in revenue given the higher elasticity on revenues compared to expenditures (Martner 2000: 32-54), it means that revenues respond relatively more to variations in the macroeconomic output gap compared to expenditures. Among expenditures, only the transfers who are oriented toward income support like unemployment insurance benefits respond automatically to changes in economic activity. Result that it is through fiscal policy that Automatic Fiscal Stabilizers have their largest effect on macroeconomic output.

A tax system with rates rising with respect to income might, i.e. a progressive tax system, serve to stabilize output. Falling output, reducing marginal tax rates, could encourage business resulting greater labor supply which will raise public revenues in order to balance public budget. Raising output and marginal tax rates would have the opposite effect. Despite recent contributions to the literature, the strength of these effects is still not clear. The relative importance of automatic stabilizers on the demand and supply sides remains to be determined.

With large fiscal stabilizers, implementation is timely and gradual as tax react in a countercyclical manner for changing economic conditions. Political decisions are not required. The implementation lags are minimized. The fiscal relaxation in crisis time is automatically followed by a fiscal tightening in boom time. According to some researchers (Baunsgaard and Symansky 2009: 1-26), this may enhance the impact of a fiscal expansion on demand with respect to discretionary action, as the latter may raise solvency concerns and affect interest rates. This means that the automatic nature also provides a timely reversal of any fiscal expansion.

The Automatic Fiscal Stabilizer can be a byproduct of tax systems, which can have a different set of objectives relative to cyclical stabilization, depending of the policy maker ability which might reduce or delay the responsiveness of the economy to shocks. Even by its definition the Automatic Fiscal Stabilizer has a non-discretionary character, through the way it is designed, implemented and adapted on the needs of the economy, it reflects the policy maker ability, thus gaining a discretionary character. An increase in the Automatic Fiscal Stabilizers can be achieved through tax policy changes or by an appropriate design of fiscal rules which also involve discretionary actions.

The importance of Automatic Fiscal Stabilizers mechanisms depends on many factors. Based on the literature in the field, I have identified and systematized the fallowing main factors:
- the size of government, which means the weight of the public sector in the economy,

- the structure of public revenue
- the structure of public expenditures,
- the nature of the tax system i.e. the progressiveness of the tax system,
- fiscal rules,
- the transfer system,
- the unemployment benefit schemes,
- the degree of openness of the economy, etc.

All these factors imply structural characteristics which widely vary from country to country, and also over time. The size of Automatic Fiscal Stabilizers reflects not only the elasticity on revenues and expenditures but also the sensitivity of tax bases to changes in macroeconomic output. It results that reducing the progressiveness of the tax system means to decrease the effectiveness of Automatic Fiscal Stabilizers in smoothing the output gap. That's why the degree of smoothing of the economic cycle through the automatic fiscal stabilizers differs widely from country to country.

Fiscal rules can be an important factor for the functioning of the Automatic Fiscal Stabilizers mechanisms. Some authors agree that simple rules on the fiscal balance will act against the Automatic Fiscal Stabilizers (Baunsgaard and Symansky 2009: 1-26). This means the effect of debt ceilings, for instance, depends on whether they are initially binding. If debt is smaller then the ceiling, there is no immediate constraint on the Automatic Fiscal Stabilizers. If debt is close to the ceiling, a weakening in the cyclical balance would require offsetting discretionary tightening, limiting the stabilizers. We can use the same reasoning regarding the effect of introducing the fiscal balance ceiling. The Maastricht Treaty established a ceiling of 3% of GDP for the public budget deficit. As a result, if the cyclical fiscal balance deteriorates, this balance rule (or any rule involving a ceiling of the balance in nominal terms or in percent of GDP) will require offsetting discretionary tightening. The rule ensures that fiscal policy is countercyclical by allowing the automatic fiscal stabilizers to act freely. Discretionary fiscal interventions are allowed, too. Government is free to increase taxes or/and reduce expenditure every time the macroeconomic output goes down. This type of discretionary intervention is not an efficient one mainly because it generates uncertainty of the private environment. This seems to me not a surprising assertion, given that by definition an Automatic Fiscal Stabilizer must have a negative feed-back, so, logical, it must work countercyclical. Logic going on, we can assume that pro-cyclicality reduces de effectiveness of the Automatic Fiscal Stabilizer. **As a result we can assume that it is very important to avoid the pro-cyclicality in fiscal rule design.** However, the problem in this case would be the design of such a system for being able to react in a desirable manner, without supplementary costs and without delay, for smoothing the economic cycle.

V. Conclusions

Based on the researcher's results regarding the AFS operating mechanism, the paper conclude that the revenues respond relatively more to variations in the macroeconomic output gap compared to the expenditures. Logically going on, the conclusion is that the Automatic Fiscal Stabilizers have their largest effect on macroeconomic output through fiscal policy. An efficient fiscal policy must give priority to sustainability over time, also being able to adapt the budget balance to the economy movements. This is the reason we stand for a flexible institutional device (for instance a progressive tax system) with a constant rate of taxation instead of an annual budget balance rule. Constant taxes rates over the economic cycle can minimize the costs arising from distort taxes.

The conclusion of such a study is that the fiscal policy can and must be used for smoothing the economic cycle, but in a way which includes among its features transparency, responsibility and clear operating mechanisms. As the pro-cyclicality reduces de effectiveness of the Automatic

Fiscal Stabilizer, it is very important to avoid the pro-cyclicality in fiscal rule design. In the author's opinion only non-discretionary fiscal policy through Automatic Fiscal Stabilizers can provide a faster decision making process, shielded from political interference, which ensures a timely fiscal response. Political decisions are not required. Moreover, by committing in advance to specific fiscal policy action contingent on economic developments, uncertainty about the fiscal policy framework during a recession should be reduced.

Although investing may depend to a certain extent on current after-tax cash flow, it also depends on expectations of future profitability and future fiscal policy. Instead, the progressive tax system would not deep the uncertainty of the private environment, providing the balancing of the budget, acting like an Automatic Fiscal Stabilizers, in a counter-cyclical manner. Temporary job creation tax credits when unemployment exceeds a certain level would act like an AFS too. Anyway, to avoid adding to the deficit bias, the automatic measures could be symmetric, countercyclical: An expansionary measure during a recession could be offset by a tightening during the cyclical boom, leaving the fiscal balance unchanged over the cycle. The advantages of such transparent mechanism must be weighted against the cost of too often tax policy changes.

The fiscal policy do needs rules for controlling possible excesses in the management of public expenditure and tax rates, because of the dangers of populism and fiscal irresponsibility that may involves a discretionary fiscal measure. The disadvantages we discussed in this paper generate the need for continued precaution in the use of discretionary policy, deep concern for implementation of Automatic Fiscal Stabilizers, the objective of making automatic stabilizers more effective and the integration of better measures of fiscal balance into the discretionary policy process.

In the future paper we intend to decompose the fiscal policy into discretionary and nondiscretionary components to understand how the budget moves with output cycles and to design the operating mechanism of such institutional device which is the AFS.

TAXATION OF FINANCIAL SECTOR AFTER THE CRISIS IN THE EUROPEAN UNION

Mara Eugenia-Ramona
Babes-Bolyai University Cluj-Napoca
Faculty of Economics Science and Business Administration

Taxation of financial sector is an important issue of the actual fiscal policy, especially after the economic crisis impact. By taxing the financial sector, it is intended taxation of financial transactions, and financial activities. European Union supports the taxation of the financial system and makes proposals in this regard. This paper tries to reveal the major aspects concerning the taxation of financial sector, both theoretical and empirical aspects. It will analyze the reasons which justify the application of such taxes, but also difficulties involved in practice. Another major objective of this paper is to examine the role of taxation in the financial sector as important regulatory instrument. This subject is debated in European Commission papers and by many economists. There are underlined the necessity of such tax, the impact and the economic efficiency. Our purpose is to identify if this kind of tax is good for our economy and what can be the impact from budgetary point of view. For finding this answers the paper realize a complex analysis of the types of taxes applied on financial sector in countries which already adopted this kind of taxes, like United Kingdom, Austria, Hungary, Cyprus. We believe that the financial sector should be charged, because was responsible in great measure the economic crisis impact. A potential tax applied to financial sector is considered as an important source of budget revenues. This article tries to explore the possible tax measures for financial sector according to the major principle of public finance –equity and efficiency. Special attention will be given to the need to implement financial sector taxation in Romania. In the years before the crisis banks and entire financial sector in Romania recorded significant profits. For this reason such tax is justified given that this sector is exempt from VAT. Applying such a tax would reduce the budget deficit and on the long term will reduce the public debt.
Keywords: financial sector taxation, fiscal policy, financial transactions
JEL Classification: E62, H25, H12.

Introduction

The global economic and financial crisis has a major negative impact on public finance because the tax revenues are decreasing and budget deficits increases for most of all countries. In this context the fiscal consolidation requires some measures like increasing the tax rates or even introducing new taxes. As a consequence of this fact many countries (European Union member states) choose to increase value added tax rates or excises for reducing the budget deficit.

Taxing the financial sector is a current topic imposed mainly by the negative impact of financial crisis since 2008. In European Union countries, in recent years concerns the taxation of the financial sector have increased, more and more states consider implementing a taxation of financial capital for several reasons.

A potential tax applied to financial sector is considered as an important source of budget revenues. Another consideration that justifies this tax would be that the financial capital is taxed far less than consumption, labor or property. The financial sector is considered to find under-taxed compared with other economic segments because the financial activities often are exempt from VAT.

It is generally accepted that the financial sector was a major cause of the crisis and received substantial government support over the past few years. To ensure that the sector makes a fair contribution to public finances and for the benefit of citizens, enterprises and Member States, the European Commission initiated a few proposals of financial sector taxation. The financial sector had an important role in the spreading of economic crisis and the governments have to finance bank failures through fees paid by taxpayers.

In this context we can underline the major reasons that may justify the financial sector taxation:
-    source of budgetary revenues;

- equity of taxation comparative with other sectors;
- regulatory instrument for correct negative externalities stemming from the activities of the financial sector, which include the effects of excessive risk-taking;
- a fair contribution of the financial sector to public finances, in particular with regard to the economic and financial crisis;

In some EU member states already operate different forms of taxation of the financial sector, with different rates. The paper realize a complex analysis of the types of taxes applied on financial sector in countries which already adopted this kind of taxes, like United Kingdom, Austria, Hungary, Cyprus. It is necessary to take measures to harmonize the taxation of the financial sector to avoid any single market imbalances.

Taxing the financial sector could contribute substantially to reducing public debt faced by many countries at this moment only if there is an effective enforcement mechanism. European Commission proposals have considered the following types of instruments, namely *financial transactions tax (FTT)* and *financial activities tax (FAT)*. Financial transactions tax (FTT) will be paid on each purchase or sale of stocks, bonds or other financial instruments or when is trade one currency.

Financial activities tax (FAT) was proposed by the IMF and is a tax on profits and total remuneration of financial institutions, so that may be considered as a value-added, which is somewhat fair since financial services are not imposed with VAT.

The main cause of economic crisis was the lack of regulation and supervision of the financial sector. Taxing the financial sector could be used as a lever to regulate this sector without using direct intervention; the more effective the more powerful tax is imposed on toxic financial instruments. For this reason the financial sector taxation could be considered as a technique to solve negative externalities generated by the financial sector especially during the economic crisis, but also before and after the economic crisis.

Taxing the financial sector involves a number of practical difficulties concerning the tax rate, defining the taxable base and object, categories of taxpayers, scope and place of taxation. It is necessary a harmonized tax for EU space for avoiding migration of financial capital to countries that do not apply such taxes or have a very low rate.

Literature review

Keen (2010), makes a comprehensive analysis of current issues: imposing a tax on financial sector in terms of the role and potential implications. This fee is seen as a corrective role - "pigovian tax", which the author underline systematic externalities to which financial sector taxation can have an impact. The last years proved that it is not enough a prudential regulatory at microeconomic level, but also a macroeconomic regulatory and taxation can be used as an important tool in this respect.

Keen, Krelove, and Norregaard (2010) address the underlying rationale of the tax on financial activities and income and potential models obtained by applying the proposed fee G20 report. This fee is seen as a way to correct market imperfections and requires all long-term economic rents generated by the financial sector or only those generated in excess.

Shackelford, Shaviro, and Slemrod, (2010) propose some solutions for the implementation of new taxes on the financial sector: tax on financial transactions, taxation of bonuses and two types of taxes on financial institutions: a tax on the excessive profits and a tax on financial activities - proposed IMF (2010). These proposals are analyzed in terms efficiency considerations, and the authors anticipate these fees to be quite inefficient comparing costs it will involve large and small receipts that will bring to the budget and in terms of correcting externalities cannot identify a clear impact, because of low rates that would apply.

Buckley, and North (2011) argue that the introduction of a low level global financial transaction tax as part of an integrated policy framework would promote greater alignment between capital

market and economic activity to the real benefit of entire economies and the people who live in them. Considering the technical issues of financial transaction tax their proposal is for applying low rate initially, with an agreed review period of five years. The tax should be a small impost of between 0.005 percent and 0.05 percent. Also it is necessary some differential rates applied to instruments or asset classes to reflect the varying transaction costs and the extent to which the tax is intended to discourage trading in particular instruments or classes. The tax should be calculated on the notional values of the underlying security and should be adjusted for the term of the security.

The major benefits of the financial sector taxation are mentioned by Meussen (2011): enhancing the efficiency and the stability of the financial markets, reducing the excessive risk-taking producing negative externalities for the rest of the economy and volatility of the financial markets.

Financial transactions tax

This kind of tax it the subject of European Commission's proposals. Under these proposals we will summarize the major directions agreed by the European Commission.

Products and transactions covered are: stocks, bonds, currencies, derivatives, options, spot transactions. Chargeable event takes into account the principle of commitment (contract entry into force) or cash principle when actual payment is made or the two combined.

Place of taxation can be set differently for each jurisdiction and can be done according to the residence of the parties, the place of operation or depending on where it is issued financial instrument.

Taxable persons can be subjects or institutions arranging the transaction. The tax base is a particularly difficult concept to clarify for those financial instruments as derivative or spot. The tax can be a flat rate or differentiated. The flat enjoys the advantage that is easily applied and managed, while the differentiated rates are more complex and difficult to manage. The latest proposals were for very low rate between 0.01% and 0.1% to avoid a negative impact on markets and discourage tax evasion.

European Commission and the IMF have developed and implemented several proposals for studies on the taxation implications of financial sector. There are also studies that deal with this issue in many respects: the proposals on the application of VAT on financial sector tax to a separate application.

In the experience of EU Member States taxing the financial sector are already in place certain measures or will in the near future to take effect.

Some states have turned to tax on financial transfers. In this case are some examples. Finland applies a transfer fee over the selling price of shares at a rate of 1.6%. Greece also applies to a transfer fee of 0.2% over the shares listed. In Poland is imposed the sale of shares or derivatives of 1% of market value.

But the main drawback of financial transaction tax is underlined by Nerudova (2011). This kind of tax would generate revenues mainly in the very narrow group of states, where the big financial centers are situated. This disproportion would be further deepened by the inclusion of derivates into the tax base. It would therefore be necessary to apply the tax globally, for the investors all around the world use those financial centers and therefore all the users of the financial centers participate on the tax revenue.

The Financial Activities Tax

A Financial Activities Tax would be levied on the sum of profit and remuneration of financial institutions. The rationale for the FAT is to target specifically financial sector activities, without affecting the operations developed on financial markets. This kind of tax can be considered as a measure to limit the risk on the financial market. The question is – how fair is that financial

institution to pay an additional tax comparative with other companies? Considering the benefit principle paying taxes has to be in accordance with the benefits received from the state. If the governments have supported the banks in crisis time, then such additional tax for financial sector is justified.

Financial activity tax can applied in three different forms:

- FAT 1: as a value added tax imposed on wages and profits;
- FAT 2: as a tax on economic rents in the financial sector (paid for supernormal wages and profits);
- FAT 3: a tax levy on very high wages and profits for discourage risk taking.

European Union countries experiences

A few EU countries choose to introduce financial sector taxation in 2010 and 2011 and this trend will continue in 2012 because the increasing tax receipts represent a priority of the fiscal policy for all EU countries after the economic crisis. Countries like Hungary applied the financial activity tax since 2010 with different rates. In Austria, Hungary and Portugal, financial activity tax is implemented in the form of a bank levy based on the balance sheet total (excluding own capital and secured deposits). Also, in Cyprus, a levy on the total deposits in banks was introduced and France introduced a levy based on consolidated risk weighted assets.

Tabel no. 1. Forms of taxes on financial activity imposed after crisis in EU countries

COUNTRY	TYPE OF TAXES	TAX RATES
Hungary 2010/09/27*	Special tax on financial institutions	1. credit institutions: 0.15% - 0.53%; 2. insurance companies: 1.5% - 6.4%; 3. financial enterprises: 6.5%; 4. investment firms: 5.6 %; 5. exchange market operators: 5.6% per cents 6. investment fund management companies 0.028%.
UK 2011/01/01*	The Bank Levy	The standard rate was originally set at 0.075%, but it was raised slightly in March to 0.078%, and again, to 0.088%, from January, 2012.
Cyprus 2011/04/29*	Special tax for financial institutions	0.095% of the deposits held in Financial Institutions restricted to a maximum of 20% of the total taxable profits of the Financial Institution
Austria 2011/01/01*	Levy on banks	The levy is structured progressively, with a rate of 0 per cent for the bracket up to € 1,000 million, 0.055 per cent for the bracket up to € 20,000 million, and 0.085 per cent for any amount exceeding this threshold.

*Note: Date of introduction

Source: realized by author based on European Commission on-line database Taxes in Europe

Denmark increased its financial activity tax (FAT) in 2011, which is a duty on wage and salary costs for businesses engaged in financial services. The rate was raised from effectively 9.13 % to 10.5 %.

In the United Kingdom the financial sector has a major contribution to the economy and for this reason a special attention was given to the taxation issue. The most important measure was introducing, both a bank levy and a one-off bank payroll tax (i.e. bonus tax) of 50 % on bonuses over £ 25 000 paid by banks and building societies between 9 December 2009 and 5 April 2010. The purpose of the levy bank is to ensure that the banking sector makes a fair contribution, reflecting the risks they pose to the financial system and the wider economy. Another purpose is

to encourage banks to move away from risky funding models that threaten the stability of the financial sector and the wider economy.

For revealing the efficiency of this tax we try to reflect the budgetary receipts of this tax in Hungary and United Kingdom. Because Hungary has applied the highest tax rates there was registered the high level of tax receipts, almost 2 % of the total revenue.

Tabel no. 2. Tax receipts from financial sector taxation in 2011

COUNTRY	TYPE OF TAXES	TAX RECEIPTS AS % OF GDP	TAX RECEIPTS AS % OF TOTAL REVENUES
Hungary	Special tax on financial institutions	0.7	1.85
UK	The Bank Levy	0.08	

Source: realized by author based on European Commission data

Some countries like Denmark, France choose to apply financial sector taxation included in labor taxation through progressive tax rates.

In countries like UK or Luxemburg the financial sector is very important because is assuring many jobs and an important part of gross domestic product. If the financial sector taxation is increase it is expected a tax receipts increase, but on the other hand also tax competition increase. Generally speaking the major financial centers have the most powerful financial capitals, but in the same time there is an alternative – tax havens - preferred just for no existing taxes.

Perspectives on taxation of financial sector in Romania

How necessary is the financial sector taxation in Romania? Our country's situation is similar with the other EU countries about the introduction of such a tax? Financial sector in Romania hasn't recorded transactions with high risk like other countries, has been more a phenomenon of contamination. Regarding financial support offered by the government to financial sector was quite lower. But as a member of the European Union, Romania has to adopt harmonized tax measures about financial sector and should apply these measures. If applied financial sector taxation the main concern of the government has to be avoiding measures that could lead to transmission of the tax burden on customers. It should also be severely taxed highly speculative risk, and operations considered toxic. Tax burden is unfairly distributed in Romania; this burden is supported by the consumers most of all, namely individuals and less by the companies. We must avoid a new burden for individuals by applying financial sector taxation. In the years before the crisis banks and entire financial sector in Romania recorded significant profits. For this reason such tax is justified given that this sector is exempt from VAT. Applying such a tax would reduce the budget deficit and on the long term will reduce the public debt.

Conclusions

This issue of financial sector taxation is and will be a controversial issue at European Union level. A possible solution is to implement a unique tax for financial activities for all EU countries with the same tax rate for avoiding financial capital migration between EU member states. It is important to implement a low tax rate because for preventing capital migration out of EU. Concerning the financial transaction tax in this case the best solution has to be choose by every state in respect with some particular characteristics of own financial sector. It is not equitable to impose the same tax or the same rules on financial transaction for all EU states because the financial sector pattern is quite different between EU member states.

In this light the European Commission considers that there is greater potential for a Financial Activities Tax at EU-level. This option could deal with the current VAT exemption of the

financial sector and raise substantial revenues. Considering the innovative nature of this kind of tax there is a need for further technical work on how it might be implemented.

This paper aims to make a review of the Romanian fiscal policy appropriateness to the new conditions imposed by socio-economic catching separating us from the developed countries of the European Union. In the last three decades we are witnessing due to changes in national economies trade liberalization in the context of globalization. The analysis deals with issues of budget deficits, which are the main cause of sovereign debt crisis in Europe and solutions to rebalance the budget. The Keynesian and the multiplier mechanism solution is considered in economy, proposed by using public savings spending. The automatic stabilizers and their degree of efficiency in emerging economies solution is also considered. Finally, we show an analysis of tax rate systems used in three of the most developed EU countries compared with the tax rate used in Romania. Although facing large state budget deficits, Romania, in years of economic crisis, has made spending mitigation measures, which led to the contraction of consumption, the measures having a pro-cyclical nature. The analysis is considering a restructuring of the tax system in order to rearrange the tax burden as a means of mitigating the economic crisis.
Keywords: globalization, fiscal policy, budget deficits, tax rates
Cod JEL: E62

I. Introduction

The last decade has seen many changes in tax policy that deserve consideration when trying to do an analysis of the current situation and to trace some lines of development for the future. Changes due to globalization, a process in which all countries are involved, voluntarily or not, affect Romania because of the late start its felt in this race. Romania joined the EU on January 1, 2007, the event marking a new beginning for practical economic life but its membership was deeply marked by the largely obsolete industrial base and the new economic model that has proven to be inadequate for the country's needs.

The road for the EU membership mostly began in 2000 when Romania managed to get out of the recession after it had entered the market economy. Domestic consumption and investment have fueled strong growth in GDP by the cost of a current account imbalance. Earnings growth has stimulated the creation of a middle class and contributed significantly to combating poverty but also in rising inflation, especially between 2007-2008, driven by strong growth in consumption and wages, accompanied by a corresponding increase in labor productivity. Increased energy costs and bureaucracy and corruption have continued to exist in the Romanian business environment. On the other hand, a relaxation of fiscal discipline, superimposed on the global financial crisis has reduced GDP by about 7% in 2009, prompting a contracting emergency financial assistance package of 20 billion euro to IMF and European Union together with the obligation to take drastic austerity measures, which led to another Romanian GDP contraction of 1.6% in 2010. 2011 brought an increase in the Romanian economy, GDP is nearly 2.5% higher than the previous year due to rising exports and agricultural production increased by 11.3%, but in a deflationary environment due to a request internal weak. This led to signing a stand-by detention on 2 years, from Romania, IMF (about 3.5 billion), EU (1.4 billion) and World Bank (1.15 billion euro) to ensure that the objectives of fiscal policy, structural reforms and financial sector stability. This is a short course on the way of the Romanian economy integration into the European family.

This paper aims to analyze the adequacy of current fiscal policy decisions taken in Romania in recent years, manifested by developments at European level, while targeting a broader context, that of globalization. Starting such a study is important as the financial crisis turned into an economic one, it changed the old paradigm that governed fiscal policy. We are witnessing the last three decades due to changes in national economies trade liberalization in the context of increasing globalization of markets. But free trade is not always fair, and therefore we must study fiscal mechanisms leading to the international economic system in which the development and modernization of poor countries becomes a constant.

II. Theoretical approaches on fiscal policy adjustment mechanisms

Fiscal policy is an important part of the financial policy, but its definition meets different views. Very common is the fiscal policy approach through the collection of public funds as taxes. George Manolescu argues that "fiscal policy is determined by the amount and source of feeding resources of public funds, the sampling methods to be used, objectives and means of achieving them." (Manolescu 1997, 265) Such a definition draws many critics of those who share the common view in the Anglo-Saxon literature, like the assessment made by Mihaela Onofrei, who believes that "the main deficiency is that the content of fiscal policy is not in any reference to public expenditure and collects a certain amount of financial resources available to public authorities, without determination of public expenditure financed form, an option may be unrealistic and doomed to failure." (Onofrei 2000, 22) The close connection between taxes and government spending is also emphasized by Paul Samuelson and William Nordhaus defining fiscal policy as "a process consisting in handling taxes and public spending", adding that taxes and government spending have three major effects: affect the general distribution national product between public consumption and investment, production and price are influenced in various fields achieved through direct expenditure and indirect incentives is influenced fluctuation aggregate production, prices and unemployment. (Samuelson and Nordhaus 1995, 364) Based on these ideas, we make an approach that considers the related influences of the two instruments to influence the economy is more appropriate today the tax authorities is oriented mainly to reduce costs than to change the tax system.

In another point of view, political leaders from 25 European Union member states in Brussels signed a treaty of fiscal governance. This treaty is a new effort by the authorities responsible for the implementation of macroeconomic adjustment policies for sovereign debt crisis, which affects mainly the Eurozone. This Agreement shall continue in practice the spirit of the Stability and Growth Pact, adopted at the initiative of Germany, who consider control of public spending in countries that use the euro. Early stages of existence European Union, the idea that tax harmonization is essential for the stability of monetary union was often circulated. Fiscal policy because it directly affects the allocation of resources between the public and private sector consumption and saving behavior and, indirectly, affect the evolution of business cycles.

The need for harmonization is especially within the euro area as macroeconomic stabilization policy rests entirely with national tax by reason of national monetary policy together with the use of the euro. The role of fiscal policy has grown exponentially along with giving up the instrument to adjust the exchange rate economies asymmetric shocks. A first set of rules has been introduced with the Stability and Growth Pact requires to support fiscal discipline. Inflexible rules, omission structure and causes deficits and focus only on the nominal setting limits has led to the imposition of a set of fiscal rules that are based on the working of automatic stabilizers.

A discretionary fiscal policy is not automatically reversed when crises occur, but applying the automatic fiscal stabilizers can in fact stabilize fiscal policy. Improving the effectiveness of automatic stabilizers and a structural deficit which tends to zero are the conditions for obtaining macroeconomic balances in the Eurozone. (Buti, et al. 2003) In this sense, is often recommended as a suitable target for fiscal policy to maintain a constant structural budget balance to a level

close to zero. This valence is particularly relevant as the EU Treaty in the context of the existence of fiscal governance which requires states to not exceed a deficit of 0.5% of GDP.

Automatic fiscal stabilizers can be negatively influenced by the constraints on fiscal space and debt sustainability and these constraints are typically found in emerging economies with large public debt or limited access to external financing. This leads to caution in the use of automatic stabilizers in countries subject to shocks that may arise from the aggregate supply, as automatic stabilizers can have effects on other objectives of fiscal policy. (Baunsgaard and Symansky 2009) The analyses made on Romania show an improvement in size automatic fiscal stabilizers in the current period from 2000-2007, around 0.40 but their level is lower than the level considered for the Eurozone countries. (Socol and Socol 2012) This has resulted in considerable variation in the budget deficit in Romania to the EU average and the average Euro area (fig. no. 1).

Source: Eurostat, http://epp.eurostat.ec.europa.eu
Fig. no. 1 Evolution of budget deficit (% of GDP)

A simple solution to the current crisis was the Keynesian inspiration, which referred to increasing public spending and reduced tax burden. But under present conditions, this approach to taxation not generate the same positive effects as increased consumption, reduced unemployment, increase of incomes, because they are subject to reaction to fiscal stimuli private economic agents. Tax reduction does not generate, in present conditions, a significant increase in consumption in the economy for the propagation of the multiplier effect, if present sense of insecurity, lack of confidence or access to credit is difficult to place. In Keynesian economics, public expenditures have a greater impact on GDP compared to the impact of taxes, since the latter does not generate a direct influence on production, but the income available only to a lesser extent on the level of private consumption. Therefore the effectiveness of fiscal policy depends not only on the size of the fiscal package, but its structure, the way a choice between reducing taxes or increasing public spending. However, the effectiveness of fiscal policy in stimulating economic recovery is affected by adoption. Decisions must be taken immediately after the fall of the economy, to be significant as a share of GDP, does not adversely affect public finances and to be focused on supporting consumption. (Marinaş 2010)

But classical theory has imposed for years the balance between revenue and expenditure. Tackling the budget balance works closely with the budget side and the role of fiscal policy is the acceptance of budgetary imbalances for the occurrence and persistence of budget deficits, due to expansion of public spending and high tax pressure, should found ways to finance it. Loans can carry a stimulating role if used for productive purposes, thereby increasing GDP while ensuring the necessary resources for repayment. But if it is used for productive, they may only have deferred taxes (Barro-Ricardo conception), having only serve to delay the time to be passed on to taxpayers. (Barro 1974) In contrast to Barro's argument, Blinder has shown that short-term tax cuts tend to generate increased current consumption, not reduce it because consumers prefer

current consumption at the expense of future consumption. (Blinder 2004) Linnemann also showed that the negative effect of increasing taxes to repay loans on assets increases the number of hours worked and reduced preference for leisure, such consumption, hours worked and production will increase. (Linnemann and Schabert 2005)

Another important aspect in assessing the impact of fiscal policy is the pressure of globalization, which is present in the idea that national decision space is very low because global markets would punish governments. Daniel Dăianu questions the nature of global financial markets, which are products people's decisions to establish rules for finance, trade and investment and claim that you can not do anything about financial flows when crises cause a deemed inconclusive and put in support packages discussed in the financial industry in the European Union, concerning essentially the Eurozone countries. (Dăianu 2009, 87-88) New member states are often ignored when discussing these issues because it invokes the argument of the financial rescue of major banks and supports the emerging European Union. But bear in mind that these economies do not have their own reserve currency advantage, presents significant current account deficits are affected in times of crisis by redirecting capital to safer investments. As such emerging European Union, such as Romania could become a victim of this crisis safely.

III. Fiscal policy in Romania vs. fiscal policy in some EU countries

On November 7, 2011, the joint mission of the IMF and the European Union said that the Romanian economic program to strengthen economic growth, maintain financial stability and macroeconomic stability should continue. In 2009-2011, the surge in risk aversion during the financial crisis has caused many internal and external imbalances, leading to budget deficits over 7% of GDP and current account deficits of over 11% of GDP. As a result, capital inflows have declined considerably, and the exchange rate of MDL against EUR depreciated by more than 30% between August 2007 and January 2009. Therefore, the Romanian authorities have resorted, in spring 2009, a loan from the European Union, IMF and other international financial institutions. In May 2009 an agreement to provide financial assistance to Romania, with a total of 20 billion euro. In February 2011, following the joint visit of European Union and the IMF in Bucharest, was applied for a new financial assistance program of prevention, to help boost growth, with emphasis on structural reforms, while improving the sustainability of fiscal policy and strengthening financial stability. In exchange for these agreements, the Romanian state has increased the standard rate of VAT from 19% to 24% and resorted to drastic reductions in spending to meet budget deficit threshold. We believe that decreasing the high is fundamentally correct. But how this is done is extremely important. The question is whether the deficit should be reduced by restricting the price of private sector activity. Pro-cyclical character of fiscal policy decisions should be avoided both in times of economic expansion and recession periods. Support this idea because government deficits are the main cause of the current crisis and the drastic reduction of expenditures will be helpful in this regard. Instead a rethinking of the mechanisms of taxation believe that can give better results.

Starting January 1, 2005, 16% replaced the progressive tax on income between 18% and 40%. This rate replaced and tax of 25%, setting a single tax rate for both labor income and profit. The drawback of this system was that "the sea of social division and increasing social polarization between rich and poor." (Buziernescu 2006) Its advantage was in excess of cash left in the Romanian economy, both in population and the company, apparently at the expense of state budget. Following this advantage was increased consumption, which occurred immediately, and the influence that rate was not sufficient to make a major contribution on fostering labor it must be accompanied by reduction of social contributions in our country are among the most highest in Europe.

An analysis of three of the most developed EU countries can allow us to properly assess our position in relation to the tax systems of other Member States, in view of the general

harmonization of tax systems, a process initiated by the joint project for calculating consolidated tax tax at EU level. We will look broadly, two categories of taxes, direct and indirect, in France, Germany and Britain, to see differences of view between the fiscal policies of these countries. This analysis should consider because it is often confusion between the tax burden, defined as the share of public revenues in GDP and the fiscal burden represented by the degree of affordability of taxes. Another relevant aspect in this analysis is that, as I said, fiscal policy should consider the interrelationship between taxes and public spending and tax burden does not consider only a little influence spending through their influence on denominator of the fraction. On the other hand the tax burden is greatly mitigated by a system of deductions for income and expenditure taking into account the nature of social or support from the state firms addressed. Tax burden in Romania can be considered small if one takes into account the EU average of 44% of GDP, Romania with a tax burden of only 34% lower than that of Bulgaria, according to Eurostat in 2010 recorded 34.9% of GDP. The highest tax burden in the European Union is registered in Norway, 57.1% of GDP. Of the countries analyzed, only France is above the European average, with a tax burden of 49.5% of GDP, Germany registered 43.6% and 40.3% of UK GDP.

As regards indirect taxation, while VAT is harmonized system are still large differences regarding tax rates. In France, the standard rate is 19.6%, in Germany the standard rate is 19% and in the UK is 20% lower compared to the rate practiced in Romania. However, reduced rates apply to commodity tax which reduces affordability. In France quota of 5.5% for the sale of food (including beverages but excluding alcoholic beverages) for supply of water, pharmaceutical products of a kind used for health care, medical equipment, passenger transport, delivery books on all physical, newspapers and periodicals, construction and refurbishment, as part of the social, restaurant and catering services, supplying gas and electricity. Another share of 2.1% applies to certain pharmaceutical products. These rates apply not uniform across France, with areas such as Corsica, where applicable rate of 8% and 13% for certain categories of economic activity. In Germany we apply a reduced rate of 7% for the sale of food (including beverages but excluding alcoholic beverages), medical equipment, passenger transport, delivery of books, newspapers and periodicals, accommodation in hotels and similar establishments.

The most obvious differentiation in terms of endurance tax on income taxes is observed in the countries analyzed because the focus is on tax fairness and equality rather than tax, such as Romania. In France, individuals pay income tax in installments progressive rates ranging between 0:41%. The charges also additional 3% tax for income between EUR 250,000 and EUR 500,000 and 4% for incomes over € 500,000. In Germany, tax is progressive personal income tax cuts, rates ranging from 0% to 45%. Single persons who have an income greater than 250,731 per year or couples with income exceeding 501,462 per year, paying income tax of 45%, prior 5.5% solidarity tax and church tax to 8% - 9%, according to tax class that is. UK income tax is calculated on all the installments of income, the shares being 10%, 20%, 40% and 50%. Additional tax rate of 50% was introduced in April 2010 for income over £ 150,000 and its purpose was to generate a surplus of 1.3 billion pounds of income tax in fiscal year 2011. Also there are some exceptions to the rule regarding British untaxed income and dividend income. The first tax rate of 10% refers only to income from savings of up to 2440 pounds salary income not exceeding this limit are not taxed. The dividend income below £ 37,400 is taxed separately from other income at a rate of 10% and those between £ 37,400 and £ 150,000 are taxed at a rate of 32.5%. Dividend income over £ 150,000 is taxed at 42.5%. In Romania, most income is taxed at 16%.

If we relate the cut came from the three countries at the average exchange rate for 2011, which was 4.2379 lei to the euro and pound sterling 4.8845 (http://cursvalutar.dailybusiness.ro), get 11 installments of income equivalent lei (Table no. 1.). A simple analysis of these tax cuts we can point out the position the employee in Romania in relation to employees in the countries under consideration. With reference to our annual average gross income in Romania, according to the

National Institute of Statistics (Statistics), for 2011 was 24,383 lei/employee, minus the individual contribution of 10.5% for social security, health individual contribution of 5, 5% and individual contribution of 0.5% unemployment, achieve average annual taxable income of 20,359 lei, corresponding tranche no. two. This portion corresponds to a tax rate in Romania to 16% applicable to the entire taxable income in the United Kingdom of progressive rates of 10%, applicable to the first installment of income and 20%, applicable income gap between upper income and first installment.

Table no. 1. Comparison between tranches of income and tax rates

No. installment	Taxable income (lei)		Tax rate			
	Minimum level	Maximum level	France	Germany	Great Britain	Romania
1	0	11.918	0	0	10%	16%
2	**11.919**	**25.266**			20%	
3	25.267	33.920	5,5%			
4	33.921	50.410		14%		
5	50.411	111.961	14%			
6	111.962	182.680	30%			
7	182.681	224.104			40%	
8	224.105	300.166		42%		
9	300.105	732.675	41%			
10	732.676	1.062.569			50%	
11	1.062.569	***		45%		

Source: authors' calculations based on data provided by the European Commission, Law no. 571/2003 on Fiscal Code of Romania and http://www.worldwide-tax.com/

Regarding the second largest category of direct taxes, income taxes, the situation is similar, the differences between our country and those taken in the analysis are remarkable. The standard rate of corporation tax in France is 33.33%, but there is specific rates of 15% applicable to small companies have a profit of up to 38,120 euro. Instead apply a surcharge of 3.3% for large companies, where profits more than 763,000 euro. To stimulate investment there an exemption for gains from the sale of shares held at least two years and dividends are taxed at 1.7%, only if the participation exceeds 5%. The standard rate of corporation tax in Germany is 15% but there is a reduced rate for some of the companies revenues. Also apply a surcharge, of solidarity, of 5.5%, designed to cover the costs of unification of both parts of the country. In Britain, the tax rate is 26%, it will fall to 23% in 2014 to stimulate investment, leading Britain to the lowest in the G7. For small companies tax rate is lower than 20%.

IV. Conclusions

This paper aims to take stock of the appropriateness of fiscal policy in response to the distortions that occurred in the European economies once the economic crisis. Fiscal policy, referring to taxes and public spending aimed at, together with monetary policy, ensuring rapid economic growth amid a highly labor employment and price stability. Debt crisis brought about a crisis of budget deficits. The state budget deficit is actually a tool to reach government economic policy. But this theory must be applied with caution. We believe that the role of the budget deficit is merely to revive a stagnant economy. After starting economic production is gradually reduced, public spending and tax incentives to encourage suppressed work. Also consider dangerous deficit systematic method. Deficit should be limited to short periods and under strict state control. And there have to grasp a problem: the state does not appreciate exactly how large public

investments should be set to balance the national economy. The recent experience of sovereign debt crisis shows that the use of public loans for deficits systematic does nothing to hasten the emergence of national bankruptcy. And the option to raise taxes to repay loans reduces the purchasing power of population and reduces solvent demand in the economy. Therefore we argue that a budget deficit, although beneficial for national economic recovery, balancing the level of economic cycle.

Another way to restore balance state budget and general economic equilibrium is also more closely reflect the revenues. They depend on several factors such as tax base and tax amount of taxable matters, applicable rates and no less important level of tax evasion. Although facing large deficits, the state budget and current account, Romania has made in years of economic crisis measures to limit the scope of the budget by spending reductions and shrinking consumption. We consider these measures as being pro-cyclical in nature and that led to financial resources towards the loan, increasing further debt.

Although Romania has a low tax burden compared to other EU countries, it is incorrectly assigned, fiscal policy decisions moving towards equality and not to tax fairness. It should be noted that Romania has a GDP/capita at half the European average and can not allow very large tax cuts but we think that giving up general rate of 16% and introducing a system that takes into account a progressive income tax large, coupled with increased personal deductions or setting a minimum income tax, combined with administrative actions to reduce fraud in obtaining assistance from the state, can rebalance the state budget. From our analysis we conclude that developed countries from European Union have a VAT regime less oppressive than Romania, taxing less the food and commodities and also requiring the odds higher profits without discouraging any investment. Another important aspect is the contributions to public social security funds. We find that direct taxation discourages investment income or profit, but especially the aggregate cost of labor, determined by contributions paid by employers.

THE IMPACT OF MACROECONOMIC FACTORS ON COMPETITION POLICY EFFECTIVENESS WITHIN EUROPEAN UNION

Mosteanu Tatiana
Bucharest Academy of Economic Studies, Faculty of Finance, Insurance, Banking and Stock Exchanges

Romano Oana Maria
Bucharest Academy of Economic Studies, Faculty of Finance, Insurance, Banking and Stock Exchanges

Dragoi Ionut
Romanian Competition Council

In the last decades, more and more countries have enacted competition laws, understanding the importance of this process in providing a normal functioning of the economy. Analyzing competition policy effectiveness is important not only because of the recent extent of the phenomenon, but also because of the impact of competition policy effectiveness on economic development and, in the current economic climate, on the economic recovery process. For this reason, quantitative evaluation for competition policy effectiveness became very useful as data handling and understanding the whole phenomenon are easier this way and an international perspective is provided. This was made possible by various international institutions that have created a system of aggregated indicators for the evaluation of competition law enforcement and competition advocacy (perceived effectiveness). The purpose of our research is to identify the macroeconomic factors that influence the effectiveness of competition law implementation within the European Union Member States. We have tasted the influence of 13 macroeconomic, using panel data methodology and data from the last four years. We obtained ß coefficients statistically significant only for 11 of them. The results are consistent with prior analyzed studies and economic logic: positive influence from market division, intensity of local competition, ethical behavior of firms, strength of auditing and reporting standards, efficiency of legal framework in settling disputes, protection of minority shareholders' interests, public trust of politicians, economic dimension and market size and negative influence from corruption level and diversion of public funds. Based on the achieved results we can perform an analysis of principal components leading to causal space reduction with minimal information loss and without informational redundancy, creating the premises for building a model that explains competition policy effectiveness through macroeconomic factors.
Keywords: competition, antitrust policy, economic efficiency, financial crisis, regulations
JEL Classification: K21, L44, R58

I. The concept of competition policy effectiveness

When defining competition policy and competition law, specialists have different views. But one thing is certain. All definitions converge to the idea of providing a functional competitive environment.

Massimo Motta defines competition policy as a set of policies and laws which ensure that competition in the market place is not restricted, in a way that is detrimental to society (Motta 2004: 28).

Competition law and competition policy are not synonymous concepts. Competition policy refers not only to competition law but also to institutions that enforce competition law, to competition advocacy and to industrial policy concerns (Papadopoulos 2010: 30).

Competition policy role has increased significantly in recent decades. Both at national and international level, competition policies have gained an increasingly important role. In the last decades, more and more countries have enacted competition laws, understanding the importance of this process in providing a normal functioning of the economy. Specifically, over half of all the countries that have legalized the competition field so far, have adopted the first law after 1990.

For this reason, quantitative evaluation for competition policy effectiveness became very useful as data handling and understanding the whole phenomenon are easier this way and an international perspective is provided. This was made possible by various international institutions that have created a system of aggregated indicators for the evaluation of competition law enforcement and competition advocacy (perceived effectiveness). The main indicators are: effectiveness of antitrust policy (World Economic Forum), effectiveness of competition law (International Institute for Management Development) and EBRD competition policy indicator (European Bank for Reconstruction and Development).

Although there are many obstacles in realizing such a valuation caused by the heterogeneous content of competition policies, the implementation mechanisms, types of regulated anti-competitive practices these institutions have developed methodologies meant to outline a clearer picture of countries position in the global economic system and capture competition policy implementation effects on business environment performance (Vass 2010: 10).

In this paper we analyze the competition policy effectiveness in the European Union Member States in terms of macroeconomic factors that influence it. Within the European Union, competition policy is aimed to maintain a normal competitive framework in member states.

This research is important not only because of the recent extent of the phenomenon, but also because of the impact of competition policy effectiveness on economic development and, in the current economic climate, on the economic recovery process.

Regarding this last aspect, competition policy is seen as an economic instrument during the current crisis. More than ever, companies are tempted to resort to anti-competitive practices in order to survive or for profit purposes, therefore ensuring a fair competitive framework eventually leads to maintenance of or reduce of prices and survival of companies that could not function if there are price agreements between big sellers on the market. On June 26, 2009, at Chatham House Conference, European Commissioner for Competition at the time, Neelie Kroes has stated that competition policy is now "part of the solution, rather than the problem, by bringing parties together, put a stop to potential subsidy races and being as flexible as we can without undoing the basic principles of competition policy".

II. Literature Review

Researches related to factors influencing competition policy effectiveness include both directly dependent variables (such as: clarity of competition law content, competition authorities budget, number of the personnel and level of qualification - as input and number of cases - as output), various explicative macroeconomic variables such as: commercial openness (measured as the ratio between exports plus imports and GDP), economic dimension, economic reforms in transition countries (index of economic freedom), foreign direct investments (net inflows as a share of gross capital formation), sector structure (relevant in this case is the share of industry in GDP), government policy effectiveness, corruption level, effectiveness and independence of legal institutions etc. The main studies on the impact of macroeconomic factors on competition policy effectiveness are briefly presented below.

Palim (Palim 1998: 105-145) studies the factors influencing competition policy, through the process of enacting a competition law. Main results obtained using empirical tests are: a positive and significant relation between economic development and the decision of enacting a competition law; a positive relation between economic size and the probability to legislate competition framework; an increase in government spending reduces the enacting probability. The factors that determine adoption of competition law are, after all, further drivers of competition policy effectiveness.

Evenett (2003: 9-89) tests, on the same sample of countries as WEF, the influence of several factors centralized from previous studies. Several determinants of competition policy effectiveness witch impact on law enacting are identified. Those with a positive influence are:

economic development, economy dimension, degree of economic freedom, intensity of imports, openness to foreign direct investments, dependence on international organizations and social security system development level. The factors with negative influence are: the level of industrialization, government intervention, export and import restrictions and corruption level.

Kronthaler (2007: 4-19) analyzes a sample of 71 countries that have enacted competition laws after 1990 in the time span between 1995 and 2005. Then, he extended the study to all countries with competition laws since the '80s and '70s. The empirical results suggest that the perceived effectiveness of competition law implementation, rather than its actual effectiveness, depends positively on the economic development level, commercial openness, legislative experience and negatively on economic size and corruption level.

Borrell and Jiménez (2007: 69-88) also tested various factors considered to have influence on competition policy effectiveness on a sample of 57 countries and concluded that among tested factors the following are significant: commercial openness (positive influence), corruption level (negative influence), market division (positive influence) and intensity of local competition (positive influence).

III. Research methodology, data and results

The purpose of our research is to identify the macroeconomic factors that influence the effectiveness of competition law implementation within the European Union member states.

Thus, we will use WEF competition policy effectiveness indicator as proxy variable for effectiveness implementation of competition policy. The indicator takes values between 1 (lowest - competition policy is lax and ineffective in promoting competition) and 7 (highest value - competition policy effectively promotes competition). It has been shown that this indicator is the most comprehensive indicator available in terms of sampled countries and covered period of time. Among scientists this is considered a useful measure for comparisons between countries (Nicholson 2004: 5-12).

We have chosen the endogenous variables taking into account the existing studies as well as regional aspects in competition field. Therefore, the macroeconomic factors included in analysis will be: market division (not. div), intensity of local competition (not. loc_comp), corruption level (not. corr), diversion of public funds (not. dpf), ethical behavior of firms (not. ethics), strength of auditing and reporting standards (not. reporting), efficiency of legal framework in settling disputes (not. legal), protection of minority shareholders' interests (not. protection), and public trust of politicians (not. publ_trust), all these indicators being published by the World Economic Forum and scale from 1 to 7. To these we add the national market size index (calculated as follows: GDP + value of imports of goods and services - exports of goods and services, normalized on the 1-7 scale; not. nms), commercial openness (measured as the ratio of exports plus imports and GDP; not. opp), the economy dimension (national GDP as a percentage of world GDP, not. gdp_m) and population (in millions; not. pop).

Data source is represented by World Economic Forum and World Bank.

In order to study the impact of macroeconomic factors on the effectiveness of competition policy we will use panel data methodology. Panel data models consist of estimation of regression equations using both time series and cross sectional data simultaneously.

We have collected data from the last four years for the 27 European Union member states for the WEF indicator and the 13 exogenous variables, which is a total of 108 observations per variable.

Data was log-transformed before use in order to provide homogeneity for our data series. This procedure is widely used in econometric analysis.

The general regression formula we are going to use to estimate parameters using EViews software is:

$$l\_ef_{it} = \alpha + \beta * l\_x_{zit} + \varepsilon_{it} \quad (1)$$

where i is the section (country in our case); t is the year; l_ef is the natural logarithm of WEF indicator for competition policy effectiveness; l_xz is the natural logarithm of proxy variable for initial variable z; ε_t is the residual variable.

We will use Least Squares Method (NLS and ARMA) for panel data in order to estimate the parameters.

Unifactorial regression parameters estimation results on panel data and corresponding p-value are summarized in the table below.

Table no. 1. Unifactorial regressions parameters estimated using panel data when competition policy effectiveness is the endogenous variable

No.	Endogenous Variables	α	β	No.	Endogenous Variables	α	β
1	l_div	0,3676 (0.000)	0,7759 (0.000)	8	l_publ_trust	1,1596 (0.000)	0,329 (0.000)
2	l_loc_comp	-0,786 (0.064)	1,3794 (0.000)	9	l_legal	0,8536 (0.000)	0,4903 (0.000)
3	l_corr	0,4079 (0.000)	0,6827 (0.000)	10	l_gdp_m	1,5702 (0.000)	0,0304 (0.002)
4	l_op	1,4473 (0.000)	0,0186 (0.586)	11	l_pop	1,5116 (0.000)	0,0108 (0.313)
5	l_dpf	0,8692 (0.000)	0,4545 (0.000)	12	l_protection	0,1932 (0.029)	0,8698 (0.000)
6	l_nms	1,3294 (0.000)	0,1484 (0.010)	13	l_reporting	-0,35 (0.007)	1,1295 (0.000)
7	l_ethics	0,5797 (0.000)	0,6115 (0.000)				

α is the intercept and **β** is the estimated parameter corresponding to a factor

With the exception of commercial openness and population, all other factors prove to have a significant influence on the effectiveness of competition policy implementation.

The influence of economic dimension and market size resulted as positive. Comparing this result with previous studies does not lead us to a definite conclusion. For example, Kronthaler (Kronthaler 2007: 6, 14-15) concludes that the relation is a negative one.

On one hand, it is assumed that in small economies the competitive strength of imports is higher than competition legislation, but on the other, small economies have the ability to easily develop an appropriate competition culture, which leads to greater efficiency of its implementation (the range of analyzed anticompetitive practices is smaller, as the number of actors is also smaller as well as domestic market).

Other significant macroeconomic factors with positive influence are: market division, intensity of local competition, ethical behavior of firms, strength of auditing and reporting standards, efficiency of legal framework in settling disputes, protection of minority shareholders' interests and public trust of politicians.

The significant factors with negative influence are: corruption level and diversion of public funds.

IV. Short conclusion and further researches

We are experiencing a period when, more than ever, ensuring a functional competitive framework is absolutely necessary. The focus is on the quality of competition policy, on its

effective implementation. The existence of a legal framework is not the key. We intuit from the start the positive effects of an effective conceived competition policy and, especially, effectively applied. In fact, this is the objective, to ensure the normal functioning of market economy.

Figure no. 1. WEF competition policy effectiveness indicator for EU member states
In the European Union competition policy has a central role in common policies. The indicators published by World Economic Forum for 2011 outline relatively high values of effectiveness, but not always above world average (Figure no. 1).

Based on the achieved results we can perform an analysis of principal components leading to causal space reduction with minimal information loss and without informational redundancy, creating the premises for building a model that explains competition policy effectiveness through macroeconomic factors.

SEVERAL MEASURES OF BUDGETARY POLICY

Morar Ioan Dan
University of Oradea
Faculty of Economics

Budget policy for the funding and sometimes care about the public sector, certain actions and utilities on the private sector within limits set by the strategies, tactics and operational deciyiile promoted executive.
Phenomenon budget includes both revenues and expenditure side edge contained in the public budget. Often, perhaps excessive zeal in translating domain-specific phrases are even officially speak about "fiscal policy measures", with reference to all areas of the budget, containing and thus the budget expenditure.
Budgetary policy has several specific policy budget subdomains like Cookie fiscal policy, budget expenditure allocation Polti, policy and public loans.

The public budget is structured vision of hierarchical levels to finance general government needs, collective territorial administrative entities and financing needs of public-owned economic entities, and private capital for certain objectives, such as selective subsidies. Fiscal policy designed to cover the need for funding of these services and public utilities, the hierarchical levels of public administration established by specific laws. In the specialty literature, fiscal policy is presented as consisting of specific policies on budgetary subdomains, namely, fiscal policy, policy, resource allocation, policy or policies finnatare antideficitare budget deficit, public borrowing policy and possibly also other groups of targets and specific means to the budget.

Literature generally accept this group of budget policies and treat such problems specific to each subdomain.

However, in various official documents or official position or programs, even the notion specific budgetary and fiscal policy, consolidated budget position, budget fiscal responsibility law (Law 69/2010), budget and other fiscal pact in the context of domain budget. (Source: Strategy for the 2011-2013 fiscal budget, www. anaf.ro)

The content of these phrases are known and accepted caatare and even appear in official documents as conceptual, just as the literature provides the tools, concepts and phrases such more selective and scientifically defined. On the other explanatory dictionary of the Romanian language also provides explanation enough for use caatare. In this context reference is not acceptable nor any notions that are taken from other languages as long as our language gives us the possibility to differentiate the concepts of "budget policy" and "tax policy".

Besides these issues ligvistice you do not wish to invoke and the cause of the lack of specialized, are questionable interpretations and azanta these phrases. Namely, if we accept that the public purse in terms of form has two parts, the revenue and expenditure side, then fiscal policy, if we are consistent can be divided on two sides, namely common revenues and especially fiscal policy and spending policy and budgetary allocations policy. If we accept that fiscal policy aimed at both sides of the budget it seems unnecessary to pronounce the words "budget fiscal policy". We know that relationships are relationships fiscal budget through their economic content, and then repeat a part of the whole is to superimpose over the entire tautological.

From another perspective, if we analyze the formal content of such phrases in official documents d times, we expect "budget fiscal strategy" to include specific measures, if not entirely, at least mainly fiscal measures, but under this concept we find the mainly on public spending measures and especially about the budget deficit limit.

If such notions can be covered d political actions specific to the budget in the literature is necessary to develop a specific critical area, even to prevent offensive concepts known and accepted by most specialists in the field, the field having a solid theoretical basis, but we appear to our language valence, which gives us many possibilities di conceptualization, provided consistent use of words.

The necessary clarifications are doubled in the following of some assertions on the fiscal policy measures contained in the "Strategy for 2011-2013 fiscal budget," government official document, download the source shown above me.

This document is particularly complex projective tinnd enrolled into account economic indicators and especially the extent intransul obiectivelorpropuse.

Namely, "economic and fiscal objectives" of the Government in this period are grouped as follows: - "ensuring sustainable public finances in the medium and long ....;

-equitable distribution of tax burden between generations and expenses;

 -supporting monetary policy, in particular the sustainable operation of automatic stabilizers to limit the volatility of economic activity .....;

-budget policy will consider the reform of public spending while attracting massive EU funds, which can supplement the national budget, which could help the economy to increase its growth potential; ..... "x.

These measures and others that do not quote as "consolidated budget position" is quantified in the next table

% Of GDP

	2008 achievements	2009 achievements	2010 estimates	2011 estimates	2012 estimates	2013 estimates
Budget revenue	32,2	32,0	32,3	32,5	32,8	32,3
Budget expenditures	37,0	39,4	39,1	36,9	35,8	34,8
Balance	-4,8	-7,4	-6,8	-4,4	-3,0	-2,5

 Source: www.anaf.ro-fiscal-budgetary   strategy   for   2011-2013:

Handy craft and f so the deficit adjustment provided in this table is proposed to be achieved through fiscal consolidation measures, and not only through measures to reduce spending. Of these the most important in this document seems to be:

1.-strengthening fiscal discipline through the implementation of budget and fiscal responsibility law (Law 69/2010). This law establishes procedures for multiyear budgeting, setting limits on budget revisions during the year, includes rules on budget and deficit spending, creates -Council Tax-(Composed of five members appointed by Parliament on proposal BNR, Romanian Academy, Academy, Romanian Banking Institute and the Romanian Banks Association); x-www.anaf.ro-fiscal-budgetary strategy for 2011-2013

2.-measures in terms of local public-finance-through no.273/2006 amending Law on Local Public Finance, regarding: planning investment costs over a period of three years, providing amounts from the Fund reserve to be conditioned by the absence of arrears, the refusal of new loans to local authorities registered arrears in the last financial year, multi-annual planning of national allocations, transfers and the amounts deducted from the revenue budget.

3.In addition have proposed measures to improve tax collection primarily those from the VAT, then those from high income individuals, namely NAFA entitlement to have access to bank records and the records of third parties in order to determine the correct taxable income; review-definition-independent activities, to enable the taxation of income from any source, strengthening the right to control the tax authorities and the like for improving fiscal control.

4 - In the project aims to strengthen spending discipline on the assessment of investment costs and in terms of co-financing from European funds.

Some special objectives embodied in legislation affecting the budget, others as goals the entire time horizon considered, namely the 2013 budget year, which were made more or less and the effects these achievements and delay can analyze the ratio of expenses and revenues, specifically the evolution of budget deficits and in particular the result of these policies are validated by how the size of budget deficit financing sources.

If in 2008-2010, saw revenues in GDP which stood at around 32%, the expenditure share in GDP registered increasingly higher, being situated between 37% and 39%.

In these conditions, analysis of causes of the lack of effect of government measures taken is even more important as the relationship with the executive European Commission and international financial organizations have highlighted the need to determine the size deficituli annual structural deficit next nominal eliminating influence of what numim-excesu/deficitul application.

It is important in these circumstances to consider the advisability of improving budgetary measures and their effects on deficituli structural peseama reaactie lack of the real economy, the economic environment, the process of adjusting public finances through the use of foreign loans in the perioeda.

ABOUT TAX NEUTRALITY AND NON-DISCRIMINATION

Morar Ioan Dan
University of Oradea
Faculty of Economics

Summary;
Taxpayers are required to pay taxes to the state budget by virtue of their position subject to the state, the latter in its capacity as sovereign person of public law.
This quality gives them the right to impose against taxpayers by administrative means known, or sometimes with justice, respecting a certain extent the principles and traditions specific to tax. Principles of neutrality and non-discrimination are relevant in terms of describing the relations between public authorities and taxpayers.
Although taxpayers are divided into official and legal persons, in fact individuals are those who support the ultimate tax burden.
Neutral may be imposed? This is a question as simple as it is delicate.
The first impulse response would be simple enough given that we have available sufficient interpretations in the literature.
Reiterating its imposing peaks, of Adam Smith put it more fiscal the neutrality principle, along with other rules or principles grouped asazisele tax equity principles, or group of economic and social policy principles, among other principles, such as imposing non-discrimination, the legitimacy of imposing and sometimes appear even lack some confusion with the principle of arbitrariness in matters of taxation.
The answer is sometimes explanatory actually deviating from the content problem, and in this case we know from the literature explanations specialties, namely neutrality is manifested by a lack of offensive tax, namely that taxes should be stowed the criteria is not to reach taxpayers, on whose account you choose to invest in the real economy or advantage by placing their resources or financial banking market. Taxes should not be established and criteria to which the taxpayer due to refrain from consuming or saving.

Top of Form

In order to allow such a response, I think it is necessary to emphasize the beginning the place and role in the relationship between the state and tax payers, which is essentially this..We must have to remember that in fact the tax is interposed between the sovereign state as person of public law and its subjects.

Regardless of the evolution of modern societies and the model of social order, report tax returns us to reality, namely that the subject state, as a taxpayer is obliged and forced to pay tax on time and under set.

There fore, the conditions imposed by the sovereign subjects, there would be room for interpretation ideological, and more for law enforcements not fit interpretations than in relation to the law.

In these conditions, otherwise equivocal imposed by tax law and other restrictions jurisdictional neutrality of taxation would be promoted by a low tax burden that its payment will not affect the taxpayer as little judgment. How such a situation today is excluded, the problem size remains to put the tax burden, a problem that affects the taxpayer discriminatory and thus to treat this problem in common with the dissertation on the principle of discrimination or imposing non-discrimination in the following.

The idea issued, that the size of the tax burden largely determine the neutrality of the tax law disarms the obvious today when the tax burden is quite high and unfortunately quite differently on different categories of taxpayers.

So we know the size of the tax burden is determined in terms of relative and absolute except in having available in the literature and practice fiscal indicator called taxation rate, or level of taxation. This indicator is calculated and statistical highlights macroeconomic regulation, and sometimes even narrower in the central state budget. Perhaps for reasons of image, the need to pimp so-called macro indicators.

Specifically,, rate is calculated rgula taxation, reporting of State income tax (VF) to gross domestic product (GDP).

GRF-level of taxation

$$GRF = \frac{V.F.}{P.I.B.}$$

From this point it is necessary to raise the old problem of economic calculation veracity. One can question the intent and even failure lies in omisiune.Probleme on how serious the general public so insignificant in reality and taxpayer, and will you and aware of the tax burden on that support.
Criticize of this synthetic indicator asazis starts without taking into account any ideological springs as it promotes the content of the denominator, namely the dull gross product. GDP includes income tax along the central budget and local budgets ones, and those special funds. And also includes contributions and social contributions, para obligations as they call in some experts in taxation.
In this context the social budget management believe it is necessary to critically view as long as these funds are managed independently d state budget, more are put together with the central state budget in what we call "the state budget"
Level of taxation can be calculated and the taxpayer, legal person or individual. If we consider the number of fiscal and social obligations of legal entities, and their volume of business it is to relate the figure, we can determine the organizational entity level tax, the taxpayer, as a legal entity. Fiscal and social obligations of legal entities are easily defined, they are included in costs and eventually the entity's financial results.
If we extend this calculation and the individual level, the ratio between the taxpayer's tax liability, the individual and his income (V), obtinen the tax burden per person, per capita, a term used since the Roman Empire.
Numerator of this ratio is quite difficult to calculate, given that we consider and consumption taxes (ic) borne by taxpayers-individuals from their earnings nete.Tot of these gains are incurred and local taxes (ITL).

Grfi-level of taxation per individual

$$Grfi = \frac{BC + i.t.l.}{V}$$

Some authorities include advertising on consumption in calculating the level of taxation on the grounds that they were taken when determining the tax on the macro level, in their capacity as state tax revenue. Actually more than true, only that the state "we", and the tax burden is borne by individuals, taxpayers sometimes excessive pressure on the load weight back.
Eloquent and illustrative calculation seems to be the one obtained by the job, ie to calculate the fiscal job.

In this case we must take into account the tax obligations of employers and those of the employee, who then report them to the total cost of maintaining a job.

Namely, the counter has accumulated the following obligations: payroll taxes owed by the employee (is), social security contributions payable by the employee (cas-s), social health insurance contribution payable by the employee (cass-s) contribution to unemployment fund due to the employee (CFS-S), and possibly contributions to occupational pensions (CPO), if applicable, social security contribution payable by the employer (the house), social health insurance contribution payable by the employer (cass -a), the contribution to unemployment fund due to the employer (the CFS), contributions to special funds (CFS) on a case by case. The denominator aggregate wage bill (CS) and cheltuieleile with social contributions and other similar fees related to the maintenance wage job in question (Cas.S).

The fiscal Grfm-degree work

$$Grfm = \frac{(cas\text{-}a + cass\text{-}a + cfs\text{-}a + cfs) + (\ i.s. + cas\text{-}s + cass\text{-}s + cfs\text{-}s + cpo)}{CS + Cas.S}$$

Exemplifying, with the figures, the size of the wage differential in the conclusion that the fiscal degree of labor is much higher than the fiscal level of capital, given the legal personal income tax and tax on dividends.

Top of Form

This differentiation is discriminatory and an idea to use it in the following taxation on non-discrimination principle.

Differences of treatment option is the criterion for the taxpayer and thus imposing neutrality is canceled by size and by differentiating the tax burden. Signal this phenomenon is the phenomenon of mass migration from taxable capital taxation to labor taxation.

You could say so no discrimination in terms VDE generates tax neutrality. The fiscal differentiated labor from the capital,

 differentiated treatment of personal income from the corporate, personal income treated differently depending on its source, differential treatment of income from the sale of real estate, compared to those from the sale of securities.

These differences can be filled with exceptions reclaiming fiscal constraints as su form of tax advantages. Namely, non-recognition of costs incurred by different tax law for legal persons from freelancers, and even not recognize the deductibility of expenses are as many exceptions generators d discrimination.

Discrimination can also be positive in fiscal matters, as are granted tax avantje to tax exemption for those who reinvested some of the results, up to this level, compared to other economic agents who use other investment strategies. Common is the situation seems hopeless when businesses that are forced realzeaza financial results, and those with no negative financial results.

Discriminatory tax treatment, and that without neutrality promotes social inequities and different tax burden for taxpayers, in their capacity as sovereign subject.

SUSTAINABILITY OF PENSIONS WITHIN THE EUROPEAN UNION MEMBER STATES

Milos Marius Cristian
University "Eftimie Murgu" of Resita
Faculty of Economics

The demographic changes that are likely to be experienced in the European Union in the coming decades determine governments to find solutions in order to provide the sustainability of social public expenditures. We consider that the main aims of future policies should be creating better job opportunities and working conditions for the growing number of older people in Europe. It is very important to help older people play an active role in society. The literature usually focuses on elements which underline the effects of macroeconomic parameters on the size of public pension expenditure: Samuelson (1958), Cass and Yaari (1966), Blanchard (1985), and Gertler (1999). However demographic effects, notably fertility rate and old-age dependency ratio, are also key elemets which affect the sustainability of social security expenditures according to Miroslav Verbic and Rok Spruk (2011). Our econometric testing confirms the high relevance of old age dependency ratio and of the fertility rate upon public pension expenditures, both demographic variables proving to influence the size of public pension expenditure. Considering these results we propose some measures which governments should include in future public policies. Retirement should happen at an older age but only if appropriate jobs are available for older generations. The key to tackling the challenges of an increasing proportion of older people in our societies is "active ageing": encouraging older people to remain active by working longer and retiring later, by engaging in volunteer work after retirement, and by leading healthy and autonomous lives.' Active ageing is defined by the World Health Organisation (WHO) as 'the process of optimizing opportunities for health, participation and security in order to enhance quality of life as people age'. The definition therefore includes the notion of extending the activity of older persons, both within the labour force, through delaying their retirement but also within society, through participation in a range of social, economic, civic or cultural activities. Employment policy also seeks to improve human capital through better education and skills. As such, efficient lifelong learning strategies including workplace training may enhance the prospects of older workers to remain in the workforce. The EU's employment strategy seeks to establish a lifecycle approach, putting in place conditions that allow people to prolong their working lives, such that employment rates for older workers and average exit ages are raised.
Key words: demography, pensions, public expenditures, sustainability, governments,
JEL classification: H00, H55

1. Introduction

Within the current paper we are revealing the main issues regarding the ageing of the EU-27 population by focusing mainly on the facts offered by the European Commission, Eurostat (2012) through a very interesting statistical portrait, entitled ''Active ageing and solidarity between generations A statistical portrait of the European Union''. The European Union's (EU's) population structure is changing and statistical data proves that population is becoming older and older – there were slightly more than 87 million persons aged 65 and over on 1 January 2010 in the EU‑27, some 17.4 % of the total population. These latest figures can be compared with data

from 1 January 1985, when there were 59.3 million persons aged 65 and over in the EU‑27 (12.8 % of the total population) (Eurostat, 2012).

An increase in life expectancy across the EU during the last century led to increased longevity, while in more recent decades – from the 1970s onwards – the EU has experienced falling fertility rates. Those demographic changes had very strong effects regarding ageing in the last 30 or 40 years and it is expected, by many, that the ageing process will further affect society during the next half century, as the absolute number of older people and the percentage in total population of older persons are still growing. These demographic changes will lead to significant challenges for families and individuals. For example, it could become usual for people to move into retirement while still having one or both of their parents alive.

This process should be mainly considered by governments as the ageing of the population could determine implications for public policies and budgets. At present, there are severe constraints on fiscal policies and a strong need for fiscal consolidation over a number of years in the EU, all this happening also because social security expenditures are influencing policies and the pressure regarding the sustainability of pension expenditures is steadly growing.

2. Literature review

Usually focusing on the main literature regarding the challenges with which governments are being confrunted we could see mainly those elements which underline the effects of macroeconomic parameters on the size of public pension expenditure: Samuelson (1958), Cass and Yaari (1966), Diamond (1965), Blanchard (1985), and Gertler (1999). Demographic effects, notably fertility rate and old-age dependency ratio, are also key elemets which affect the sustainability of social security expenditures. Consequently we underline the paper of Miroslav Verbic and Rok Spruk (2011) who reveal that demographic processes play a significant role, much more important than the role of macroeconomic parameters, explaining the long-run pressure of ageing.

The changes in the demographic profile of the EU will also affect the labour and product markets, families and individuals. In order to defeat the obstacles occured by population ageing, a long-term view seems necessary, well beyond the horizon of electoral cycles. Many of the challenges that arise from population ageing are universal and include (Eurostat, 2012) :
• pressure on public budgets and fiscal systems;
• strains on pension and social security systems;
• adjusting the economy and in particular workplaces to an ageing labour force;
• possible labour market shortages as the number of working age persons decreases;
• the likely need for increased numbers of trained healthcare professionals;
• higher demand for healthcare services and long-term (institutionalised) care;
• potential conflict between generations over the distribution of resources.

It is hopeful to state the fact that many people lead active, healthy and participative lives after the retirement age, which is often referred to as the 'third age', but many Europeans are faced with problems, such as poverty, illness or disability, all this restricting and harming their lifestyles.

An other important aspect is to limit unemployment and to determine active living within the European Union. One of the targets for the time horizon 2020 is to reach an EU‑27 employment rate of 75 % for those aged 20-64 by. If this target is to be achieved then a higher proportion of the population needs to remain in employment up to a later age. This will be particularly important given, that as of 2012, the size of the working age population in the EU is projected to start shrinking. The European Employment Strategy (EES) has a range of actions and guidelines targeted at older people, including measures calling for improved (occupational) health status and incentives to remain in work and discourage early retirement (Eurostat, 2012).

The European Commission proposed a new set of rules relating to how the ESF might work during the period 2014 to 2020. The goals of the ESF during this programming period are to

improve employment opportunities, promote education and lifelong learning, enhance social inclusion and contribute to combating poverty. In order to achieve these goals, greater emphasis will be placed, among others, on promoting active and healthy ageing and supporting the most disadvantaged groups and marginalised communities (Eurostat, 2012).

Eurostat population statistics shows that the median age has grown in the latest decades (Table no. 1). By 2060 the median age of the EU‑27 population is projected to stabilise at 47.6 years, around 15 years higher than a century before. The EU‑27 population stood at an estimated 501.1 million persons on the 1 January 2010; of these some 87.1 million were aged 65 or over. As well as being two of the largest Member States in terms of absolute population numbers, Germany and Italy are also characterised as having relatively old populations. There were 16.9 million persons aged 65 or more in Germany on the 1 January 2010, while there were 12.2 million in Italy.

Source: Eurostat (2012)

Eurostat's population projections suggest that there will be less than two people of working age (15 to 64 years) for every older person aged 65 or more in the EU‑27 by 2060, compared with a

ratio of almost four to one today; it is important to note that demographic dependency ratios such as these may be further influenced by underemployment or unemployment (which have the potential to reduce further the number of persons actually in work and supporting the remainder of society). The most rapid changes in the size of the working age population are expected to take place during the period from 2015 to 2035, when a large part of the babyboom cohorts are projected to retire.

Population projections foresee little overall change in the total number of inhabitants in the EU‑27 between 2010 and 2060 (Figure no. 1). However, the structure of the population is expected to become much older, with a marked change in its age profile, as the older sections of the population account for an increasing share of the total number of inhabitants. The changes that are foreseen are unprecedented, as there are no historical examples of age distributions being shaped like inversed pyramids, with the oldest age classes bigger than the youngest ones.
(¹) Population aged 65+ in relation to the population aged 15-64; projections, 2015-2060.

Figure 1 – Old age dependency ratio EU-27
Source: Eurostat (2012)

As discussed earlier, the impact of fertility on public pension expenditure is unambiguous (Barro and Becker 1989; Meier and Wrede 2010). The empirical evidence suggests a negative relationship between age-related government spending and equilibrium fertility rates. The literature suggests (Stensnes and Stølen 2007) that public pensions should respond strongly to the increases in old-age dependency ratio.

3. Methodology and Results

The econometrical model we have chosen in order to prove the existing relation between total pension expenditure and demographic elements is a multifactorial regression and focuses on the following variables:

- Dependent variable: Total pension expenditure (mill. Euro): old age pension, anticipated old age pension, partial pension, disability pension
- Independent variables: old-age dependency ratio (population aged 65 and over/population between 15 and 64), fertility rate, migration (net migration).

The source of the data is Eurostat, the time period 2000-2009 and the sample of countries is EU-27.

The results of our model can be seen in the table below (Table no. 2):

Table 2 – Results of the econometric model

EXPLANATORY VARIABLES		*Pooled EGLS Fixed effects (cross-section)*
OADR		3030.302*
		(1300.896)
FERT		-17124.57**
		(9020.553)
Observations	140	
Number of countries	27	
R-quared	0.9971	
Adjusted R-squared	0.9964	
F-test	1332.3680	
p-value	0.0000	
Durbin-Watson	1.66	

Notes: **Public pension expenditure** is the endogenous variable of the model. Standard errors are given in parantheses. Asterisks * and ** denote significance at 5 percent and 10 percent level, respectively.

Source: Author's calculation

The results seem to confirm the fact that **aging** is positively associated with the level of pension expenditures while the **rate of fertility** has a negative effect. **Migration** seems not to be a key variable for the pension expenditure dynamics as the results were not statistically significant. Positive implications of our empirical findings suggest that aging population and diminishing fertility rates shall impose considerable pressure on longterm sustainability of public pension expenditure. We consider that the main aims of future policies should be creating better job opportunities and working conditions for the growing number of older people in Europe. Retirement should happen at an older age but only if appropriate jobs are available for older generations.

Future research will consider:

- more control variables
- a delimitation of the whole sample of countries (ex. EU-12, EU-15)
- more tests in order to establish the right estimation method.

4. Conclusions

Considering all the aspects mentioned above, we think that urgent and useful measures are necessary in order to keep social expenditures sustainable and to hinder the potential suffering of ageing people. It is important to promote the active participation of older persons and to increase pension ages according to life expectancy, while early retirement schemes should be reduced. Furthermore providing accessible and effective healthcare services that promote early detection of diseases and help older people to maintain their health and capacity to live independently is also a main political target but it is also necessary to ensure that healthcare spending remains under control. An other public objective refers to the fact that older persons have adequate incomes generally through pensions systems and support mechanisms that seek to reduce the proportion of older persons that are at-riskof- poverty.

The development of new products and services which are constructed in order to serve older people may allow older people to stay autonomous and live longer in their own homes, avoid the delivery of assistance from other employees and save public or private money.

PENSION FUNDS AND THE FINANCIAL CRISIS IN THE CEE COUNTRIES

Miloş Marius Cristian
Üniversity "Eftimie Murgu" of Resita, Faculty of Economics

Miloş Laura Raisa
University "Eftimie Murgu" of Resita, Faculty of Economics

In this paper, the authors analyze the influence of the international financial crisis on the current architecture of the CEE pension systems and their further reforms. As a consequence of the financial crisis, the very fragile pension reform has been subject of debate in the new member states of European Union, given their deep recession and registered fiscal deficits. In many of the CEE countries, which have adopted/developed later the second pillar, the financial crisis has raised questions in what concerns the benefit of moving to a mixed pension system, in comparison with the former one, which relied exclusively on public pay-as-you-go schemes. The current literature analyses the situation in each of the CEE countries, but does not make an overall analysis of the situation of the CEE countries, member of the European Union. The authors show the short-term negative effects of the financial crisis on the pension reform in these countries, but also the longer run effects, on the continuing deteriorating finances of these pension systems, in the context of the aging of population and unsustainable pension schemes. Alongside reviewing and commenting the national authorities' responses to the financial crisis, we are proposing also some measures meant to enhance the further pension system reform and to improve the performance of the private pension funds. Pensions have a long-time horizon and it would be very wrong to produce a reversal of the past reforms since the main problems of adequacy and sustainability remain vivid (demographic challenge and population aging). It is also true though that, while shifting from an exclusively public pay-as-you-go system towards a mixed pension system, especially in times of financial crisis, authorities must pay increased attention to the management and supervision of the DC pension plans, to the risk management standards and regulations of the private pension funds, alongside other measures meant to enhance further pension system reform.

Keywords: financial crisis, pension funds, CEE countries, reform, pillars
JEL codes: G01,G23, H55

1. Introduction

As a consequence of the financial crisis, the very fragile pension reform has been subject of debate in the new member states of European Union, given their deep recession and registered fiscal deficits. The main benefits that a functional reformed pension system was promising to bring are exactly the reasons why this reform is under critique nowadays (instead of a reduced public burden we have a public debt that reaches worrying levels, instead of attractive returns, translated into higher benefits for the pensioners, we have lower returns due to the collapse of financial markets and the economic conditions in general). The paper makes an analysis of the influence of the international financial crisis on the reform of the pension system, analyzing the measures taken by national authorities as response to the financial crisis and outlining some concrete measures for supporting the future reform of the pension system.

The paper is organized as follows. Section 2 describes the manner in which the financial crisis can exert negative influence on the pension system, analyzing the determinants that can trigger a larger impact of the financial crisis on the pension reform, in the case of the considered CEE countries. Section 3 makes a short review of the national authorities' responses to the financial crisis in what concerns the pension policy. Section 4 concludes, outlining the reasons for further pension reform, considering also some valuable lessons that need to be learned from the financial crisis and proposing some measures in order to support pension reform.

2. Channels through which the financial crisis exerts negative influence on the pension system

The financial crisis which occurred in the second half of 2008 generated worries among the beneficiaries of the pension systems. This was a normal reaction, taking into consideration the fact that, beginning with 1998 (when the first CEE country, Hungary, implemented the 2nd pillar), millions of people have directed a part of their social security contributions towards private pension funds, which have invested their savings on financial markets, deeply affected by the crisis. Without any doubt though, there were individuals more affected by the crisis than others. This was probably caused by the following three issues: a) whether in the country of reference was implemented a minimum social pension or there were guarantees in the architecture of the private pension system; b) the importance of the second pillar in the economy; c) the existence of some limits concerning the structure of the investments made by pension funds.

As far as concerns the first factor of influence, the CEE considered countries were somehow protected, since they all have established a minimum social pension, still with differences regarding the assurance of a performance guarantee in the private pension provision. Some of the countries have established: *minimum relative guarantees*, computed in function of the performance rates obtained by different type of pension funds (conservative, balanced and growth funds) in a certain period, usually two or three years (Slovakia, Romania, Bulgaria, Poland) or in function of the interest rate for long-term state bonds (Slovenia); *minimum absolute guarantees*, which are designed to guarantee the net contributions of participants (Romania, Slovakia) or to ensure a positive performance rate and in case of failure, covering from the reserve fund of each pension fund (Czech republic- for the third pillar); *no performance guarantees* (Estonia, Hungary, Latvia, Lithuania).

Regarding the importance of the second pillar in the architecture of the pension system, it can be assumed that those countries which very developed second pillars would be harder hit by the financial crisis than the other ones, which are not depending on the dynamics of the financial markets.

Table no. 1: The importance of the 2nd Pillar in the pension system (2010)

	BG	CZ	HU	ES	LV	LI	PL	RO	SK	SL
Contribution (% gross income)	5	No 2nd Pillar; 3(from 2013)	8	2	4	5.5	7.3	2.5	9	No 2nd Pillar; DC mandatory occupational pensions for some sectors
Size (% GDP)	3.97	5.5 (3rd Pillar)	10.34	6.88	5.36	3.55	14.11	0.49	4.58	3.15

Source: realized by authors, data supplied by ISSA, web pages of national commissions of surveillance of the private pension systems

We can see that, as far as concerns the CEE countries, the second pillar market is at the beginning, fact that diminishes the potential impact of the financial crisis, the second pillar market varying in its importance from 0.49 % of GDP in Romania to 14.11 % of GDP in Poland

(the biggest market in the region, counting also on one of the biggest contribution rates, of 7.3 % from the gross income).

On the other hand, it is also logical to presume that the existence of some limits in the structure of the portfolios chosen by pension funds may determine a different influence of the financial crisis on the pension benefits. In the considered CEE countries, there is no unique set of rules regarding the structure of the investment made by private pension funds, the pension schemes vary across countries, alongside with the proportion from wage dedicated to the funded scheme. The greatest freedom in investing in high-risk financial instruments is experienced by pension funds in Slovakia (where pension funds can invest up to 80 % of their assets in shares if they are a growth fund) and the most limited investment is applied to the pension funds from Bulgaria, which are allowed to invest only up to 20 % of their assets in shares. Regardless the legislation, the practice shows that the situation is reversed in what concerns the asset allocation of the pension funds (for instance, in Slovakia, where we have the greatest freedom of investing in shares, this instruments only account for 1.4 % of portfolio, one of the lowest registered (Fig. no. 1). In general, we can observe, a policy of investing in low-risk financial instruments (state bonds on medium and long term, bank deposits), rather than in more risky financial instruments, like equities, where the allocated percentage is quite low (up to a maximum level of 36.6 % in Poland). This fact proves once again that the pension reform is in its first operation years, maintaining a rather conservative policy which creates a shield against the financial crisis.
Figure no. 1: Pension funds' asset allocation for investment in CEE countries (2010)
Source: realized by authors, data provided by OECD Global pension statistics

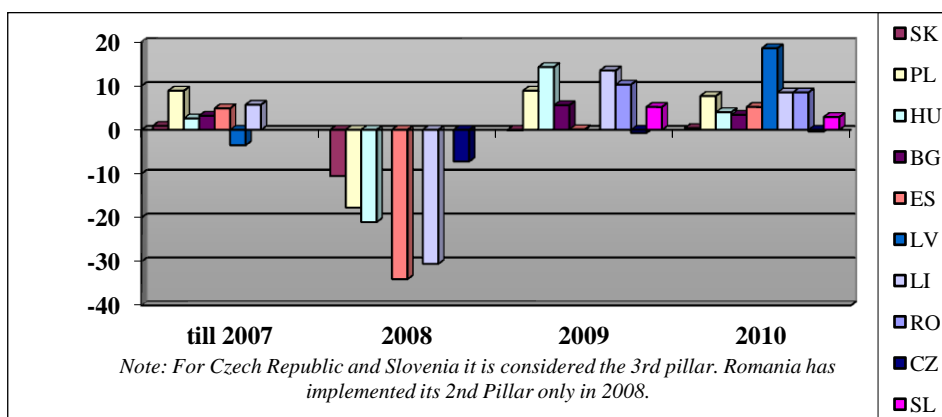
When a financial crisis occurs, it often produces a devaluation of the accumulated funds (European Commission, 2010). Though, the extent of the devaluation is depending strongly on the pension scheme which private pension funds may apply. A growth fund, with an aggressive investment policy, which rather places their assets in shares than in bonds, is likely to be more affected by a financial crisis. In all CEE countries, 2008 was a year of adverse capital market performance, translated into negative real returns for the private pension funds (Figure no. 2). Hence the impact of the crisis on pension funds was felt different in the CEE countries, from a loss of more than 30 % in Estonia to a loss of only 10.5 % in Slovakia. The following years have brought though a recovery, not reaching yet though the pre-crisis level.


Figure no. 2: Real rate of return of pension funds before/after the financial crisis
Source: realized by authors, data provided by OECD Global pension statistics

The decline in the rate of returns was more difficult for those individuals at retirement age. Fortunately, in the CEE countries, the second pillar was introduced only recently, and excluded older employees, hence very few individuals are currently retiring with benefits from the private pension funds. If we consider the oldest second pillar countries in the region (Hungary, followed by Poland), only new entrants in the working field were obliged to join the second pillar, for the others it was voluntary. Moreover, due to the financial crisis, Hungary has allowed the return of those individuals older than 51 in 2008 to the public system, resulting even fewer employees in this situation.

Regardless the magnitude of the influence of the financial crisis upon the pension systems in some countries, it remains clear that it had a negative impact on both pension pillars. Given the volatile nature of the investments made by private pension funds, the second pillar was more affected given the financial risk at which financial markets are exposed. Although less affected, the first pillar was also negatively influenced by the financial crisis, once with the reduction of the aggregate national income, since it relies on the principle that the current generation of employees pays for the current generation of pensioners. The national income experienced a dramatic fall in almost every CEE country, which lasted till 2011.

3. Pension policy responses to the financial crisis in the CEE countries

In many of the CEE countries which have developed later the 2nd pillar, the financial crisis has raised questions in what concerns the benefit of moving to a mixed pension system, in comparison with the former one, which relied exclusively on public PAYG schemes. Some of them have even taken some concrete actions in this respect. Some of them have modified the overall contribution rate. Some increased it in order to alleviate the fiscal deficit (Romania), others have reduced it, with the aim of fostering the employment and incomes (Bulgaria). Some countries have frozen or adjusted differently in comparison with the prior calendar the 2nd Pillar contribution rate (Estonia, Lithuania, Latvia, Romania, Estonia). Even more radical measures have been taken by some CEE countries, allowing individuals to switch back to the old system, getting out of the 2nd Pillar (Hungary, Slovakia) or making the 2nd pillar voluntary to new entrants on the labor market (Slovakia). Finally, some have taken some measures in order to prevent early retirement (Hungary, Poland, Latvia) or they increase the retirement age (Hungary, Romania, Poland). A more detailed view of all these measures is described below (Table no. 2).

Table no. 2: Concrete measures taken by the CEE authorities in response to the financial crisis

	MEASURES
BG	- The government reduced the overall contribution rate to the pension system from 23% to 21% in 2010 (1.1 % for the employer and 0.9 % for the employee) and then gradually to 18% by 2013; - From 2012, the years of service for retirement will increase with four months per year.
CZ	- Delaying the introduction of the 2nd Pillar: 1st January 2013.
HU	- The government allowed the return from the private to public pillar during 2009 for those who are older than 51 at the end of 2008; - Elimination of 13th month pension; - In the future, the pension growth will be established according to an algorithm depending on the GDP growth as follows: GDP growth < 3%, 100% inflation; GDP growth between 3-4%, 20% wages, 80% inflation; GDP growth between 4-5%, 40% wages, 60% inflation ; GDP growth >5%, Swiss indexation; - Increase in retirement age from 57 to 62 years in 2010 and to 65 by 2012; - Increase in penalties for early retirement and giving bonuses for delayed retirement.
ES	- The contribution to the pension funds comprised in 2009 6 % of the gross income (2 % from the part of the employee + 4 % from the part of the state). The Estonian government has then diverted its 2nd pillar contributions (of 4%) to 1st pillar for two years (2009 and 2010); In 2011 there was a moving back to a 2% contribution to the 2nd Pillar, that is expected to rose gradually at 4% in 2012, with the possibility of higher 2nd pillar contributions of 6% in the period 2014-2017.
LV	-Contribution rates to the 2nd pillar reduced from 8% to 2% in May 2009; increasing to 4% in January 2010 and to 6% in January 2011and remaining at this level (2nd pillar contribution rate was to rise to 10% in 2010 prior to the amendment) - First pillar benefits cut - Reduction of early retirement pensions from 80% of normal retirement pension, to 50% of normal retirement pension. - Early retirement will no longer be an option from January 1, 2012
LI	- Reduced the contribution rate to 2nd pillar from 5.5 % to 3 % in 2011 for two years. In 2011, compensation will take place by raising the contribution to 6 %. - The overall contribution rate was increased by 2% starting in January 2010. - Benefits cuts – all state-pensions were recalculated from 1st January 2010.
PL	- The government took the decision of reducing the contribution rate to the private mandatory pension funds in January 2011, from 7.3 % to 2.5 % (although with the possibility of rising the contribution to 3.5 % in the near future). - Elimination of numerous early retirement schemes (previously available to some 1 million people) . - Increase in retirement age for men and women to 67 by 2030

RO	-The overall rate contribution increased from 27.5% in 2008 to 31.3% in 2009, remaining stable in the present period.
	- Although the contribution rate to the 2nd pillar should have experienced an increase of 0.5 %, from 2 % in 2008 to 2.5 % in 2009, the level was frozen at 2% in 2009; the increase was realized only in 2010 (to 2.5 %) and then in 2011 (to 3 % of the gross income).
	- Equalizing gradually the retirement age of women with men at 65:
	   - in 2011-2015, for women from 59 to 60 and for men from 64 to 65;
	   - from 2016-2030, for women till 65.
	- Elimination of special pension schemes, integrating them in a public pension system and prohibition of early retirement for a period of 6 months (from July 2010 to 1st January 2011)

SK	- From a new defined-contribution scheme, the workers have been allowed to switch to the public system, having two options for this: January –June 2008 and November 2008 – June 2009; As far as concerns the 2nd Pillar participation for new participants, it was made voluntary as of January 2008.

4. Conclusions

Although the global financial crisis has generated difficult moments for all CEE countries, its influence pales in comparison with the "demographic time-bomb". Like Börsch-Supan (2009) observes, while the financial crisis is just one crisis among others, a century event, population aging is not just a phase; it will not go away, not even after the baby boom generation after 2050. We believe that all these actions are short-term solutions taken by the authorities in order to alleviate the budget tensions, but the reform of the pension system must be continued. The architecture of the pension systems is thought on a long run basis, hence taking these actions to avoid immediate circumstances can have negative long-term effects on the system. While the financial crisis is decreasing in its intensity, the current problems of adequacy and sustainability of the pension systems remain. Like Jarrett (2011) pointed out, trying to solve the problem of public finance sustainability by radically shrinking the 2nd tier of the pension system has obvious costs in terms of poverty among old-age pensioners. Their benefits will be considerably lower than the ones of working age and their confidence in the multi-pillar system would be strongly affected.

Moreover, some other valuable lessons learned from the financial crisis involve:

-Multi-pillar systems, in which private pension provision has a greater economic significance, are more exposed to financial turmoil, but they represent a necessity;

-The transition from DB to DC pension plan is a must, but since it brings a shift for the risk from employer towards individuals, a special attention must be paid to the management and supervision of the DC pension plans;

-Better regulation, increased transparency is required, allowing future pensioners to know precisely which is the investment strategy, which is their risk and their expected rate of return;

-Establishing a public-private campaign, to restore people's faith in private pension funds and to increase their financial education;

-Establishing the right balance between public and private tiers, in order to guarantee minimum retirement income; like Chybalski (2009) points out, "it appears that in the post communist countries, whose populations still have a low propensity to save, and in any case have much less opportunity to save voluntarily than in Western Europe due to their level of earnings; the pensions system must be based on compulsory pension cover, in order to prevent the "free riders" phenomenon";

-Allowing private pension funds to invest abroad and beneficiate from the portfolio diversification;

-Increasing further the retirement age, up to 70, equalize it across the two sexes to deal with the long-run demographic threat, reduce access to early retirement;

-Complementing pension reforms with labor market reforms (giving incentives for actively looking for a job, re-entering the working field after maternity leave, hiring elderly).

THE IMPLICATIONS OF TAX MORALE ON TAX COMPLIANCE BEHAVIOR

Nichita Ramona-Anca[1]

Bătrâncea Larissa-Margareta[2]
Babeş-Bolyai University Cluj-Napoca
Faculty of Business

The present paper focuses on the analysis of tax compliance behavior from the tax morale standpoint. We grounded our research on the idea that empirical studies constantly invalidating the assumptions of theoretical models of tax evasion show there are more factors influencing compliance than just the economic ones (e.g., audit probability, fine, tax rate, income). Giving the fact that audit probabilities are generally very low and that tax evasion is not as high as one could expect, tax morale might have to do with the high degrees of tax compliance registered around the world. In a stream of articles on taxation published beginning with the late 60's, tax morale defined as the intrinsic motivation to comply or "internalised obligation to pay tax" (Braithwaite and Ahmed 2005) has been found to positively relate to tax compliance and negatively relate to shadow economy. This paper attempts to offer a broader view on the influence of tax morale on compliance behavior, covering articles ranging from national and cross-cultural surveys to experimental games. Moreover, the aim of the article is to emphasize the policy implications of tax morale research and the changes governments could make in order to raise the amount of public levies.
Keywords: tax morale, tax compliance, shadow economy, corruption index
JEL Codes: G02; G28; H26

1. Introduction

The concerns for taxation and the implications of tax compliance behavior on society development are as old as mankind. As Torgler (2007: 3) emphasizes, the very first details about taxation came from Ancient Egypt where pharaohs, much like today's policy makers, were trying to reduce corruption among the tax collectors called *scribes*. The methods applied by the Egyptians rulers can find correspondence nowadays: tax collectors were given high salaries to be less tempted to cheat on taxpayers; tax collectors working in the field were supervised by special tax collectors. Furthermore, the Rosetta Stone (the artifact that decoded the hieroglyphic writing system, carved in the times of king Ptolemy V) is the first tax-related document ever to mention a tax amnesty. Besides watching over the tax system, some pharaohs cared about how taxpayers' were treated. Adams (1994: 8) reports that tax collectors were taught to act kindly towards taxpayers, especially the needy ones: "If a poor farmer is in arrears with his taxes, remit two-thirds of them"; "cheer up everyone and put them in good humor"; "if anyone is suffering under the pressure of taxation or is at the end of his means, you must let the case go unchecked". According to CPA Marc Gilfillan, the last lenient policy abovementioned was called "philanthropa", from which later derived the word "philanthropy". Since then, even though tax authorities have changed the way they relate toward needy taxpayers (by offering tax incentives but not remitting tax liabilities), compliance behavior remained the same, with some taxpayers searching for loopholes into the law to *avoid* taxes or deliberately breaking the law to *evade* taxes and others doing the right thing by *paying* their tax liabilities.

Tax compliance decisions have always been of interest to researchers trying to answer one of the most puzzling questions: why people pay taxes (Cullis and Lewis 1997; Andreoni et al. 1998; Alm and Torgler 2011). According to the assumptions of the classical tax evasion model (Allingham and Sandmo 1972; Srinivasan 1973), deterrence policies are the key in increasing tax

compliance because tax evasion is negatively correlated with the audit probability and punishment degree. The studies that followed (Yitzhaki 1974; Erard and Feinstein 1994) solved some of the inconsistencies of this model but not its main shortcoming: the model predicts too much tax evasion and too little compliance. Observing the high levels of tax compliance registered around the world, some researchers assumed it is due to factors other than economic ones (e.g., audit probabilities, tax rates, penalty rates, income). Hence, they singled out tax morale as one important determinant of tax behavior. The remainder of the paper is as follows. Part 2 presents a stream of surveys and experiments which analyze tax compliance behavior with focus on tax morale. Part 3 stresses some policy implications of the results reported by the tax literature. Part 4 summarizes the main ideas of the paper.

2. Tax morale related studies: surveys and experiments

The term "tax morale" was coined by Schmölders back in 1960 who defined it as "the attitude of a group or the whole population of taxpayers regarding the question of accomplishment or neglect of their tax duties; it is anchored in citizens' tax mentality and in their consciousness to be citizens, which is the base of their inner acceptance of tax duties and acknowledgement of the sovereignty of the state" (Schmölders 1960: 97-98). Despite the definition given by Schmölders, tax morale is still a debated notion with different meanings. According to Feld and Frey (2002) or Braithwaite and Ahmed (2005), tax morale is perceived as the "internalized obligation to pay tax". Alm and Torgler (2006) see it as the "intrinsic motivation" to pay tax liabilities, Orviska and Hudson (2002) relate it to civic duty, whereas Torgler and Murphy (2004) link it to tax ethics. The various opinions about tax morale are understandable in the light that morale poses a problem for economic analysis: it cannot be observed directly, therefore it can be assessed only by looking at its effects (Pommerehne et al. 1994).

One of the most popular research methods to elicit and analyze tax morale is through surveys. Respondents are usually presented with taxpaying situations which have to be assessed according to their system of beliefs or different variables of interest. In this sense, the World Values Survey (WVS) database is a valuable source of comprehensive information on different political and socio-cultural issues, including taxation. Assuming that tax morale is an important determinant of tax compliance behavior, it is necessary to understand the factors that shape one's level of tax morale. Relative to this, Torgler and Murphy (2004) investigate the level of tax morale among Australian citizens using WVS data collected between 1981 and 1995. According to their analyses, trust (i.e., in Parliament or the legal system) and moral beliefs (i.e., religiosity) are key determinants of the tax morale degree in Australia. Besides reporting a significant increase in tax morale since the beginning of the 1980s, the authors also note that the rate of increase is higher compared to other OECD countries. Alm and Torgler (2006) study the link between tax morale and the size of the shadow economy in USA and 15 European countries across several years using World Values Survey data. The authors report a strong negative correlation between the size of the shadow economy and the degree of tax morale in the respective countries. The highest degree of tax morale is reached in the USA, followed by Austria and Switzerland. Stepping out of the research trend focused on assessing individuals' tax morale degree, Alm and McClellan (2012) analyze the effect of tax morale on tax compliance behavior using data from Business Environment and Enterprise Performance Surveys (BEEPS) and the World Enterprise Survey (WES) on 8,500 firms in 34 countries, during a period of 8 years. The reported results show that tax morale considerations are the same for individuals and firms: firms having higher tax morale evade less than those with lower tax morale. Moreover, as foreign firms and state owned forms seem to evade less than domestic firms, the authors suggest that governments should increase audit probabilities for domestic firms.

Investigating the link between the inefficiency of public spending and tax morale, Barone and Mocetti (2011) report that the attitude towards paying taxes (i.e., tax morale) improves when

public resources are spent more efficiently. In addition, the authors show that the negative effect of inefficiency is even more significant when the level of public spending is lower and/or fiscal autonomy is higher. In the same vein, Torgler and Werner (2005) bring strong evidence supporting the idea that higher fiscal autonomy generates higher tax morale, therefore more tax compliance. Dell'Anno (2009) shows that tax morale can account for the level of aggregate tax evasion and it depends on taxpayers' inner attitudes toward honesty and social stigma. Torgler (2005) suggests that direct democracy positively influences tax morale. Torgler et al. (2008) find a significant correlation between tax evasion and tax morale after controlling for various factors: tax administration; tax system and the perceived tax burden; tax awareness; compliance perceptions; trust in authorities and other citizens; corruption; willingness to obey the law and religiosity.

Besides assessing the degree of tax morale from self-reported attitudes, it can also be assessed through experimental games with monetary incentives in which participants are exposed to frameworks resembling real-life taxpaying situations. Generally, behavioral patterns elicited through experiments are somewhat different from the self-reported ones because surveys analyze what people would do in a certain situation while experiments analyze what people actually do in a certain situation. Feld and Tyran (2002) report results from a one-shot tax evasion game on the impact of voting on tax compliance. According to their experiment, tax morale is higher when participants have the possibility of approving or rejecting the proposal of a fine. In a two-treatment public goods game experiment depicting an economy composed of two regions, Güth, Levati and Sausgruber (2005) test the effect of centralization versus decentralization on tax morale. In the decentralization treatment, taxes are levied locally and used exclusively for the benefit of the members from a specific region. In the centralization treatment, taxes are levied globally and divided between the two regions on a per capita basis. The authors report that centralization generates a lower degree of tax morale and inefficient outcomes.

3. Policy implications of tax morale research

As shown by the manifold of empirical studies, there is a strong positive correlation between tax morale and tax compliance: the higher the degree of tax morale, the higher the level of tax compliance. Based on these results, tax authorities could develop fiscal policies to foster tax morale and eventually compliance, without disregarding the words of Martin Luther King: "Morality cannot be legislated but behavior can be regulated. Judicial decrees may not change the heart, but they can restrain the heartless". Some aspects concerning policy implications of tax morale studies will be presented as follows. In a hypothetical evolutionary model of economy with a dynamic setting, Pommerehne et al. (1994) investigate the link between tax morale and the performance of different political systems. Particularly, they focus on representative democracies (people vote for representatives who then vote on bills and policy initiatives) and direct democracies (people vote on bills and policy initiatives directly, without being represented). The study reports that tax morale is higher in direct democracies. Concerning the elements of deterrent policies, representative democracies are more prone towards intensive audits whereas direct democracies favor higher fines. According to the authors, the reported results show that the performances of direct democracies (degrees of tax morale and tax compliance) are better than the performances of representative democracies, due to the fact that direct democratic systems have a higher probability of survival in an evolutionary process.

Taking into account the fact that tax morale encompasses taxpayers' inner motivation to pay taxes, tax authorities should apply different strategies other than deterrent ones in order to raise compliance. Two notable examples come from the Australian Taxation Office and the New Zealand Inland Revenue which use a set of various strategies depending on the type of taxpayers: "make it easy" compliance strategy for taxpayers willing to do the right thing; "assist to comply" for taxpayers who try but don't always succeed; "deter by detection" for taxpayers who don't

want to comply; "use full force of the law" for taxpayers who have decided not to comply (Morris and Lonsdale 2004). Moreover, they provide professional assistance to first-time business owners in order to raise awareness about the importance of taxpaying and the sanctions they face for disregarding tax law. These strategies proved to be very efficient. For example, in New Zealand, the self-employed group registered better taxpaying performance in 2003 compared to 2002: 43% decrease in the number of outstanding returns; 22% decrease in the number of debt cases; 16% decrease in the amount of outstanding debt (Morris and Lonsdale 2004: 69). Among the four abovementioned strategies, two were applied also by the Romanian tax office, i.e., "make it easy" and "assist to comply". In 2009, authorities set up a national campaign called "The tax office gets out on the street" to increase the degree of tax morale and compliance level. As an immediate consequence of the campaign, the number of income tax returns increased by 15% compared to the same period in 2008. Furthermore, the national online tax payment system launched in 2011 with the aim of facilitating compliance process and mitigating bureaucracy proved to be rather successful: online tax payments totaled 400,000 Euros in 2012, out of which 10% were payments performed from outside the country.

Bearing in mind the reported negative correlation between the degree of tax morale and the level of the shadow economy (Torgler and Schneider 2007, 2009), governments could design policies that foster tax morale and hinder taxpayers' propensity to engage in cash transactions. Generally, higher tax morale brings nothing but benefits for the entire society because it: ensures financial resources for the provision of high quality public goods; decreases the costs with implementing deterrent policies for identifying tax avoiders, chasing and prosecuting tax evaders (qualified tax officers, state-of-the-art monitoring systems, abstruse tax law); helps creating a stable business environment as a prerequisite for economic growth. By analyzing the abovementioned positive effects generated by tax morale and by corroborating them with the most recent corruption perception index, it is easily observed that the countries with the highest tax morale, highest tax compliance level and the most stable economic environments are developed democratic ones. The explanation is straightforward: democracy fosters social responsibility, which is mandatory for the emergence of tax morale. In a comprehensive study, Alm (2011) stresses various policies governments could ultimately adopt in order to improve tax compliance: increase taxpayers' awareness that paying taxes is the right thing to do and assures the provision of high quality public goods; display publicly the tax evaders; avoid policies which imply that tax evasion is morally acceptable; increase taxpayers' involvement in the allocation process of tax money; solve the issue of perceived inequities in the tax system.

4. Conclusion

Noticing the failure of the standard economic model of tax evasion in predicting tax behavior, researchers looked for an explanation to the high degree of tax compliance found at global level. As Alm and Torgler (2011: 635) noticed: "Still, the puzzle of tax compliance is not why there is so much cheating. Instead, the real puzzle is why there is so little cheating. Typically, the percent of all individual income tax returns that are audited is often less than 1% and the penalties on even fraudulent evasion are only a fraction of unpaid taxes. Virtually all economic models of taxpayer behavior conclude that there should be much more tax evasion than is actually observed. However, most people pay most of their taxes most of the time". Based on extensive evidence from surveys and experimental games, researchers consider tax morale to be one of the main determinants of tax compliance. The literature focused on the link between tax morale and compliance behavior consistently reports a positive correlation of the two elements. Generally, countries with a high degree of tax morale register a high degree of tax compliance and a low shadow economy. Hence, governments are called to perform several policy changes in order to corroborate scientific research and economic reality and ultimately increase tax compliance levels, among which: simplify taxpaying procedure; make taxpayers aware that paying taxes is

the right thing to do; promote fair tax systems; focus more on cooperative rather than deterrent policies.

EMPIRICAL RESEARCH ON THE STRUCTURE OF A SYSTEM FOR ASSESSMENT OF THE GLOBAL PERFORMANCE OF ECONOMIC ENTITIES

Pintea Mirela-Oana

Babeş-Bolyai University, Cluj-Napoca, Faculty of Economic Sciences and Business Administration

Sustainable development and, therefore, globalization require new standards of performance that exceeds the economic field, both for domestic companies as well as international ones. So, these standards should be integrated into corporate strategy development to ensure sustainability of activities undertaken by harmonizing the economic, social and environmental objectives. For sustainable development of an entity, value creation can not be seen in strictly financial terms, therefore any strategies that are defined by entities concerns not only the quantitative aspects (economic-financial) but also qualitative aspects (social and environmental).

This study attempts to address the issue of building a set of indicators to assess overall performance and it stops at each of the three dimensions of performance, namely economic performance, social performance and environmental performance. In this scientific approach we try to stop on one of the priorities of economic research that is finding indicators that better reflect the three dimensions of performance. What indicators would best represent the overall performance?, What indicators would best represent the financial performance?, What indicators would best represent social performance?, What would be the best indicators of environmental performance? During this scientific approach will try to answer each of these questions through the empirical research conducted.

To do this research we focused on statistical population consisting of the following categories of analysts: analysts from academic environment (Cluj-Napoca, Bucharest, Timisoara, Iasi, Craiova, Sibiu, Pitesti, Galati) and financial analysts from the specific departments of the Financial Investment Services Company (Broker SA, BT Securities, Target Capital, Tradeville, Estinvest, Intercapital, KBC Securities, etc.). This distinction was made because we believe that in determining the optimal structure of such a model we need the views of both academicians and practitioners. The method used for data collection was the questionnaire method. The result of this study is represented by a system of 20 indicators (financial and non-financial) selected to evaluate the global performance of an entity.

Key words: global performance, sustainable development, environmental performance, social performance, performance indicators;

JEL Classification Code: G00, G30

1.Introduction

If in the last century financial performance was on the top of the priorities, companies have now realized that this is only the outcome of the race, but the race itself and the vector for success is what today, in the context of sustainable development of society, we call global performance. Each entity should consider for a "fair evaluation" of performance: the economic dimension, the social dimension and the ecological dimension. Global performance of the entity is defined as the aggregation of economic performance, social and environmental performane. So always, the global performance of an entity will be valued by the exchange with the environment.

The concept of global performance is used in the literature to evaluate the implementation of economic entities' strategies of in the context of sustainable development. So, we can interpret this concept as the reflection in the entity management system of the macroeconomic concept of sustainable development (Capron and Quairel, 2005). Marc Lepetit (1997:64) defined the global performance as "a multidimensional, economic, social and societal, financial and environmental concept, which refers both to the economic entity and to human society, to employees and to citizens". For Reynaud (2003) and Baret (2006) the global performance is the aggregation of economic performance, social performance and environmental performance.

This study attempts to address the issue of building a set of indicators to assess global performance and it stops at each of the three dimensions of performance, namely economic

performance, social performance and environmental performance. Why we chosen this research topic? Demarcation of the research was determined by the following factors:

-clarification of the central theme of the work - assessment of a company's global performance;

-the need for such a model (set) of indicators with which to assess all three dimensions of performance;

-societal responsibility in Romania is seen today more as a fashion than as a responsibility of each organization brought by the subsidiaries of large international corporations.

The structure of this research was conducted on the following levels of interest:

-to determine the optimal structure of global performance assessment system, aiming in this context to make the distinction between financial and non-financial indicators to determine the weight of each dimension of performance indicators in the model's structure;

-setting (for each dimension of performance) all the indicators included in the model to be built.

For sustainable development of an entity, value creation can not be seen in strictly financial terms, therefore any strategies that are defined by entities concerns not only the quantitative aspects (economic-financial) but also qualitative aspects (social and environmental). So, the entities have to apply the principle of balanced development, based on various aspects in order to be efficient, given the new coordinates. In a way, it should mention the concept of multidimensional performance evaluation focused on the theory of Triple Bottom Line. Triple Bottom Line Theory aims to enhance the non-financial and non-accounting dimensions of performance and accountability of an entity as it submits to entities attention not only the economice value added, but in particular the social and environmental values that they are creating or destroing (Elkington 1997). Triple Bottom Line concept involves "economic prosperity, environmental compliance, compliance and improving social cohesion" (Pesqueux 2002:157).

2. Literature review

The new approach to performance is now known as sustainable development, which has three objectives: increasing economic entity's financial performance, development of environment effectiveness and encouraging social development. Thus, we can say that overall performance is the sum of economic and financial performance, environmental and social performance. According to Romanian authors the concept of global performance is used to evaluate sustainable development strategies and to report on the societal responsibilities of different partners (Tabără, et al. 2007:46).

According to Mathews TBL performance also requires involvement in all three dimensions of the reporting: economic performance, social performance and environmental performance (Mathews 2007). Economic dimension of performance covers all aspects of the economic entity and includes interactions with financial issues. Traditionally financial indicators refer to an entity's profitability and thus provide useful information both for management and for its shareholders. In the context of sustainable development and sustainability reporting information, and taking account of stakeholder theory, economic and financial indicators are used to highlight how an entity is affecting economically its relevant partners that interact directly or indirectly with the entity.

In Romania, there were also concerns towards the approach on performance from a global perspective, especially in the context of national economic approaches on the line of joining the European Union. We recall in this regard concerns of authors such as Niculescu (2003), Stancu and Orzan (2006), Ciobanu (2004, 2005, 2006), Mironiuc (2009), Tabără (2007). In the context of global sustainable development performance can be defined as a multidimensional, economic, social and societal, financial and economic, environment effect regarding both entities and employees, human communities and citizens (Tabără et al. 2007:49)

Founder of the principles of management, Peter Drucker (1954) considers that "few things are important to a firm's performance as performance measurement", which tells us that it could represent a vulnerability for management today. Performance management includes and precedes performance measurement.

Marr (2004) distinguishes the following activities in the process of measuring performance: (1) building a model of performance for each business separately, (2) data collection, (3) data analysis and interpretation, (4) retrieval and communication information. Such a definition of performance measurement is more comprehensive than those mentioned above. Thus, Marr manages to emphasize that performance measurement is a structured process, focused on results.

Performance measurement tools are established to be the indicators. The economic literature can account for dozens of definitions of indicators. Un indicator is „an element or a set of information elements, representative in relation to a concern or an objective, resulted from tangible measuring or observing a state of a phenomenon or an output" (Boldeanu 2008:24).

The measure "financial" or "non-financial" has not such a great importance and there is no strict rule on the matter. Relevant criteria are different (strategic relevance, operational efficiency) and can be met, as appropriate, by the financial indicators and / or non-financial ones (Lorino 2002: 237). The so-called "non-financial indicators", even if they can not always be expressed in monetary units, their effect is reflected in other indicators of economic and financial dimension whose size is easily translated in monetary units. Improving the quality of the entity's activity is acting on the entity's image (non-financial indicator), but also on the size of turnover.

According to Epstein and Manzoni "systems (models) for measuring performance should include more non-financial indicators to complement the financial ones, in particular with regard to customer perception and performance of internal processes" (Epstein and Manzoni, 1997).

3. Research methodology

In order to achieve our overall objective of the study – building a model for assessing the global performance of companies in Romania - we focused on statistical population consisting of the following categories of analysts: analysts from academic environment (Cluj-Napoca, Bucharest, Timisoara, Iasi, Craiova, Sibiu, Pitesti, Galati) and financial analysts from the specific departments of the Financial Investment Services Company (Broker SA, BT Securities, Target Capital, Tradeville, Estinvest, Intercapital, KBC Securities, etc.). This distinction was made because we believe that in determining the optimal structure of such a model we need the views of both academicians and practitioners.

The method used for data collection was the questionnaire method, which is a technique of gathering information, which includes a set of questions, constructed in a manner that through the analysis of results we can achieve the objectives set out above. The distribution of this questionnaire was performed via electronic mail because the statistical sample population is spread throughout our country and also by addressing the respondents directly.

The questionnaire developed for the study consists of 19 questions and the types of questions used were: opened questions, closed questions, identification questions and questions split rings. Although the use of the questionnaire via electronic mail has some important advantages (eg. reduced financial costs, time, etc..), we still need to mention the disadvantages characteristic of this method, disadvantages translated into limits of this research and the most important is the small percentage of response to which we add the failure to develop certain issues raised by various questions.

This questionnaire was distributed to 30 teachers, members of SRAEF present at the meeting of financial analysts conducted in May 2010 and sent electronically for 57 financial investment services companies, assuming the existence of an analyst in each company. Questionnaires were sent în electronic format on July 1 2010 and the last response came on 27 February 2011, noting that questionnaires were sent three times, the last time being in February 2011.

Of the 30 teachers interviewed so far have answered the questionnaire 23 persons and from financial analysts so far we have received a total number of 20 responses. Therefore for the first category of respondents we obtained a response rate of approximately 76.66% and for the second class the rate of 35.08% of responses.

We appreciate the response rate as an acceptable one bringing the argument that, as we mentioned in previous paragraphs, the disadvantage of the research method used is the very low response rate, an aspect highlighted both abroad (Blankenship, quoted by Chelcea, 2007) and in our literature (Boţa-Avram 2009). Authors mentioned noted that in the U.S. about 15% of polls released return and they concluded that to achieve a response rate of 30-40% extra effort is needed such as questionnaires forwarded and others.

The questionnaire was structured as follows in five parts. **The introductory part** on general information, where we have used the so-called identification questions with which we wanted to get information about the institution where the respondents work. In **Part 1** named **"General structure of a system of performance evaluation "** we sought to obtain data on the importance of using financial and non-financial indicators to build a system to assess a company's performance, the hierarchy of performance dimensions and to identify performance indicators by which we can better assess performance.

We raised this issue because in literature are different views on the share of various categories of indicators in such a performance evaluation system. Authors such Bătrâncea Maria and Bătrâncea Larisa proposed two models of financial standing "Model A" and "Model B" where quantitative criteria account for 75% share and qualitative criteria have 25% share (Bătrâncea et al. 2010).

In **Part 2 "Aspects regarding the indicators for assessing the financial performance of entities"**, **Part 3. "Aspects regarding the indicators for assessing the social performance of entities"** and **Part 4. "Aspects regarding the indicators for assessing the environmental performance of entities"** tried to identify the most important indicators for assessing financial performance, social performance and environmental performance, to realize their hierarchy and to identify the areas of activity where it is necessary to assess social and environmental performance.

4. Results of the research

Out of the 43 responses received and validated, 53.49% of them we received from people working in the public sector as teachers in higher education institutions and the remaining 46.51% were from persons working in the private sector. Of the total amount of respondents the largest share is owned by the 16 persons who hold a position of financial analyst that means a rate of 36.40%, followed by persons holding the position of professor and assistant professor with an equal share of total respondents of 18.20%.

Given the results obtained about the construction of the system of indicators we will give equal shares for the two categories of indicators, namely: 50% for financial indicators and 50% for non-financial indicators.

In system construction, we will give equal weight to social and environmental indicators so the system structure will be as follows: financial indicators 50%, social indicators 25% and environmental indicators 25%.

The second part of the questionnaire "Aspects regarding indicators for assessing the financial performance of entities", was devoted to measures used to evaluate financial performance such as the financial ratios. In this part of the questionnaire we aimed to test the respondents view of the types of indicators used to assess financial performance, including in the structure of survey questions to identify 10 most important indicators for assessing financial performance and realize their hierarchy and to select an indicator which best captures the financial performance of an entity.

To identify the 10 indicators we will use the average mean because it remains the parameter that highlights the essential out of a statistic population (Buiga et al. 2004:96). So, we associated points for each response (from 1- no importance- to 5 – very important) depending on the relevance of the indicator in assessing financial performance requirements. Scores obtained by each indicator is the average value of the options of respondents. In the following table we present our findings.

Table no 1. Scores given to financial indicators

Indicator	Score	Pearson coefficient
Economic Value Added	4.26	22.17%
Return on Investment	4.16	21.33%
Return on Equity	4.14	20.53%
Operational CF	4.14	18.67%
Net profit per share	4.12	18.55%
Immediate liquidity	4.12	21.21%
Indebtedness	4.05	16.53%
Total Shareholder Return	4.02	23.96%
Total profit	3.93	22.98%
Turnover	3.91	29.03%

Source: analyze of the authors)

Given the overall approach to performance we devoted the third part of the questionnaire to social performance. In this part of the questionnaire we intended to test respondents' opinion on the inclusion of social responsibility among the current objectives of organizations, including in the structure of survey questions to identify five most important social indicators for assessing performance and to realize their hierarchy and the areas where it is necessary to assess social performance.

The first question was aimed at testing respondents on social responsibility as one of the current objectives of the entity. So 51.50% of the respondents considered it is important for any entity for social responsibility to become a current target, while 33.30% considered it as very important to be included among the objectives of companies.

Social indicators chosen based on the average are:

Table no 2. Selected social indicators

Social indicators	Score	Pearson coefficient
Degree of customer satisfaction	4.40	22.19%
Job satisfaction	4.38	18.67%
Motivation at work	4.26	18.55%
Number of complaints	4.21	21.33%
Organizational climate	4.12	20.53%

Source: the authors

The last question of this part wants to identify areas of activity where social indicators are essential in assessing the performance of the entity. So, we found that the proportion of 33.30% respondents believes that social indicators are essential for assessing the performance of entities in all fields. The areas mentioned most often were: mining and quarrying, manufacturing, finance and banking and public services.

Given the overall approach to performance we devoted a fourth part of the survey on environmental performance. In this part of the questionnaire we intended to test respondents

opinion on the inclusion of environmental protection among the current objectives of organizations, including in the structure of survey questions to identify 5 most important indicators for assessing environmental performance and to realize their hierarchy and the areas where it is necessary to evaluate environmental performance.

So the first question in this part asks respondents to express their views on the inclusion of environmental objectives in the current list of entity's objectives. According to responses received 48.50% of respondents consider important to include environmental protection among the current objectives of an entity, while 30.30% considered this as very important.

Table no 3. Selected environmental indicators

Environmental indicators	Score	Pearson coefficient
Degree of pollution	4.53	20.54%
Compliance with environmental rules	4.33	21.43%
Emissions	4.33	18.65%
Recyclable materials	4.19	18.77%
Initiatives to reduce emissions	4.00	22.31%

Source: the author

The last question of this part wanted to identify areas of activity where environmental performance indicators are essential in assessing entity's performance. From the analysis of responses to the last question we reached the following conclusions:

    -27.30% of respondents said oil industry, mining and quarrying;
    -21.20% of the respondents mentioned all areas;
    -15.20% mentioned the chemical and pharmaceutical industry;
    -15.20% mentioned the industry in general.

5. Conclusions

The exigencies of communication occurred on the growing number of phenomena that marked the global economy in recent decades (internationalization and relocation of business crises and turmoil in financial markets), demand performance measurement to be made in a comprehensive way by financial and non-financial criteria. Non-financial criteria take into account the entity's long-term orientation and they derive from aspects such as social responsibility.

Why is needed the evaluation of global performance? Because, as we have seen, exclusive reporting of financial performance limits the given information which is why it was necessary to report information on global performance thus distinguished the financial and non-financial aspects. In this context, TBL reporting has become an invaluable tool because it captures the three dimensions of performance: social, environmental and economic.

In today's macroeconomic environment, ignoring the social and ecological issues can lead to loss of international market shares of large corporations, moreover, they are forced to bear costs of greening the area of activity and spend considerable sums on loss control to regain consumer confidence.

So, we find the need to integrate social and environmental requirements in a management system for global performance through performance indicators measuring social and environmental aspects. Performance measurement should be done through various indicators to reduce their limits, both financial and non-financial.

For a good outline of the entity's performance is absolutely necessary to use a system of indicators that expresses its strategic orientation, characterizing its internal and external relations, the efficiency, the entity's ability to adapt to market requirements. For each dimension of performance that is intended to be measured the set of indicators should include specific measures.

Thus we can conclude that the structure of our system of indicators for assessing global performance will include the following indicators to capture non-financial and financial aspects:

Table no 4. The structure of the system

Financial indicators		Social indicators	Enviromental indicators
Economic Valu Added	Immediate liquidity	Degree of customer satisfaction	Pollution degree
Return Investment	Indebtedness	Job satisfaction	Emissions
Return on Equi	Total Shareho Return	Organizational climate	Recyclable materials
Operational CF	Total profit	Number of complaints	Energy consumption and its origin
Net profit per sl	Turnover	Motivation at work	Compliance with environmental rules

PERFORMANCE EVALUATION: LITERATURE REVIEW AND TIME EVOLUTION.

Pintea Mirela-Oana

Babeş-Bolyai University, Cluj-Napoca, Faculty of Economic Sciences and Business Administration

Performance evaluation of an economic entity requires approaching several criteria, such as industry and economic entity type, managerial and entrepreneurial strategy, competitive environment, human and material resources available, using a system of appropriate performance indicators for this purpose.The exigencies of communication occurred on the growing number of phenomena that marked the global economy in recent decades (internationalization and relocation of business crises and turmoil in financial markets), demand performance measurement to be made in a comprehensive way by financial and non-financial criteria.

Indicators are measures of performance used by management to measure, report and improve performance of the economic entity. The relationship between indicators and management is ensured by the existence of performance measurement systems. Studies to date indicate that economic entities using balanced performance measurement systems as a key management tool registered superior performance compared to entities not using such systems.

This study attempts to address the issue of performance evaluation by presenting opinions of different authors concerning the process of performance measurement and to present, after revising the literature, the evolution of the performance evaluation systems.

We tried to do this literature review because sustainable development and, therefore, globalization require new standards of performance that exceeds the economic field, both for domestic companies as well as international ones. So, these standards should be integrated into corporate strategy development to ensure sustainability of activities undertaken by harmonizing the economic, social and environmental objectives.

To assess the performance of economic entities it is required that performance evaluation to be done with a balanced multidimensional system, including both financial ratios and non-financial indicators in order to reduce the limits of the two categories of indicators.

Performance measurement and management can't be separated; performance management is a philosophy that is supported by performance measurement. Performance management precedes performance measurement and creates the context for performance measurement.

Key words: performance, performance measurement, indicators, sustainable development, global performance.

JEL Classification Code: G00, G30

1. Introduction

Because performance "represents the aggregation of basic stages of action, from intention to result" (Lebas 1995), we can't separe the result, namely the performance obtained, of the resources and activities through which it was obtained, of the objectives to be achieved because a result doesn't mean anything if is analyzed by itself. Moreover, "If you can't measure, you can't control. If you can't control, you can't manage. If you can't manage, you can't improve and can't be efficient" (Kuegen and Krahn 1999 quoted by Albu and Albu 2005:41).

Founder of the principles of management, Peter Drucker (1954) considers that "few things are important to a firm's performance as performance measurement", which tells us that it could represent a vulnerability for management today. Performance management includes and precedes performance measurement.

2.Literature review

There are several theories on how the concept of performance measurement appeared. Morgan (2004) believes that modern performance measurement appeared in Venice in the fifteenth century, with the appearance of the double entry accounting. Another view is that of the authors

Johnson and Kaplan (1987) that consider that performance measurement appeared during the industrial revolution. Either way we can say with fair certainty that performance management has emerged as the dominant research area in the early '50s, when academics and practitioners have become interested in the need to measure performance and measurement consequences (Argyris, 1952, Ridgway, 1956).

Interest in management and performance measurement has increased considerably in the last 20 years (Taticchi, 2008). Number of publications on this topic has grown significantly over the last decade (Beamon 1999, Lohman et al. 2004, Gunasekaran et al. 2004). We believe that this is mainly due to a fundamental change in business. Furthermore, performance is not a subject easily addressed. It is clear the need to study and rethink the concept and, in this context, to rethink how performance measurement it is done.

According to Atkinson et al. (1997) performance measurement should help the economic entity to understand and assess the value received from suppliers and employees, the value provided by the stakeholders and the effectiveness of processes implemented in the economic entity and its strategic properties. Therefore, we can say that performance measurement plays the role of coordination, monitoring and diagnosis of economic entity's activities.

Marr (2004) distinguishes the following activities in the process of measuring performance: (1) building a model of performance for each business separately, (2) data collection, (3) data analysis and interpretation, (4) retrieval and communication information. Such a definition of performance measurement is more comprehensive than those mentioned above. Thus, Marr manages to emphasize that performance measurement is a structured process, focused on results.

Another answer to the question "What is performance evaluation?" is provided by Maria Niculescu in "Global Strategic Diagnostics", where it considers that "performance measurement is a process that allows you to connect an abstract concept to empirical indicators" (Niculescu 2005:246). So, performance measurement tools are established to be the indicators. The economic literature can account for dozens of definitions of indicators. Un indicator is an element or a set of information elements, representative in relation to a concern or an objective, resulted from tangible measuring or observing a state of a phenomenon or an output (Boldeanu, 2008:24).

Since the performance of an economic entity is influenced by various factors we consider that the indicators used to assess the performance have to cover all performance determinants and their influence on performance by highlighting the quantifiable aspects and also the unquantifiable ones. The measure "financial" or "non-financial" has not such a great importance and there is no strict rule on the matter. Relevant criteria are different (strategic relevance, operational efficiency) and can be met, as appropriate, by the financial indicators and / or non-financial (Lorino 2002: 237). The so-called "non-financial indicators", even if they can't always be expressed in monetary units, their effect is reflected in other indicators of economic and financial dimension whose size is easily translated in monetary units. Improving the quality of the entity's activity is acting on the entity's image (non-financial indicator), but also on the size of turnover.

Currently performance measures should meet the following requirements (Maskell 1992:44-48): to use primarily the non-financial techniques; to vary from one location to another, from one region to another; to change over time, as entity needs change and to improve performance, not just monitor performance.

Performance evaluation of an economic entity requires approaching several criteria, such as industry and economic entity type, managerial and entrepreneurial strategy, competitive environment, human and material resources available, using a system of appropriate performance indicators for this purpose (Petrescu 2008:281).

The management of an economic entity uses indicators to measure, report and improve entity's performance. The relationship between indicators and management is ensured by the existence of performance measurement and can be captured as in figure number 1.

Figure no. 1 Relationship between performance indicators and performance management
Source: the author

The exigencies of communication occurred on the growing number of phenomena that marked the global economy in recent decades (internationalization and relocation of business crises and turmoil in financial markets), demand performance measurement to be made in a comprehensive way by financial and non-financial criteria. Non-financial criteria take into account the entity's long-term orientation and they derive from aspects such as social responsibility (Mironiuc 2009:152).

In the current context of sustainable development, performance evaluation process should take into account the interests of all parties involved (Kubiak 2003:41): internal and external customers, suppliers, partners, investors, society as a whole. Thus, indicators of the economic entity's performance evaluation that should be included in the set of indicators indicated by Evans (2005) can be divided into the following categories (Paunescu 2007:19): "financial indicators; indicators reflecting the overall performance of an economic entity; indicators reflecting on the market performance of the entity; indicators for quality of products and services; indicators on customer relationships; indicators on human resources and indicators for social responsibility and ethical behavior."

As we have seen during the literature revised, research to date in order to identify the appropriate structure of a system for assessing the performance of economic entities have found that it takes a "set of indicators that reflect a balanced picture of entities' performance" (Ciobanu 2006:13) and reflecting the multidimensional nature of performance. An example is provided by Kaplan and Norton that offer the Balanced Scorecard in 1996, which is a balanced assessment of the economic entity's performance, including both financial and non-financial indicators.

According to Epstein and Manzoni "systems (models) for measuring performance should include more non-financial indicators to complement the financial ones, in particular with regard to customer perception and performance of internal processes" (Epstein and Manzoni, 1997).

For sustainable development of an entity, value creation can't be seen in strictly financial terms, therefore any strategies that are defined by entities concerns not only the quantitative aspects (economic-financial) but also qualitative aspects (social and environmental). Based on these aspects Global Reporting Initiative proposed a set of performance measures covering the three dimensions of overall performance, divided into: environmental indicators, social indicators and economic indicators.

3. Research methodology

In terms of working tools for collecting data, the most used method of research was the longitudinal method, by presenting the time evolution of the concepts discussed in the paper. In terms of research techniques and procedures used most frequently was reviewing the literature regarding the concept of performance measurement and the systems for performance evaluation.

4. Results of the research

For an economic entity to achieve higher performance is necessary to implement an effective performance measurement system that "would allow for reaching decisions and acting accordingly because it quantifies the efficiency and effectiveness of past actions through the

acquisition, collection, sorting, analyzing, interpreting and dissemination of appropriate data" (Neely 1998:5-6). This definition is important because it indicates that a performance measurement system has several components, namely: individual measures that quantify the efficiency and effectiveness of actions; a set of measures that combined assess overall performance of an economic entity and the support infrastructure that allows data to be obtained, collected, sorted, analyzed, interpreted and disseminated.

In the next table we present the evolution of performance measurement systems while achieving a review of the literature. The main purpose of such systems is to support the economic entity's management to measure performance, analyze and improve operational efficiency by improving decision-making process. Most systems had empirical testing and some of them have been developed only in theory.

Table no. 1 Systems for measuring performance

Period	Model (System)	Author(s)
Before the '80	ROI, ROE, ROCE, derivate	Simons (2000)
1980	Economic Value Added (EVA)	Stewart (2007)
1988	Activity Based Costing (ABC) şi Activity Based Management (ABM)	Cooper and Kaplan (1988)
1988	Strategic Measurement Analysis and Reporting Technique (SMART)	Cross and Lynch (1988)
1989	Supportive Performance Measures (SPA)	Keegan et al. (1989)
1990	Customer Value Analysis (CVA)	Customer Value Inc. (2007)
1990	Performance Measurement Questionnaire (PMQ)	Dixon et al. (1990)
1991	Results and Determinants Framework (RDF)	Fitzgerald et al. (1991)
1992	Balanced Scorecard (BSC)	Kaplan and Norton (1992)
1994	Service-Profit Chain (SPC)	Heskett et al. (1994)
1995	Return on Quality Approach (ROQ)	Rust et al. (1995)
1996	Cambridge Performance Measurement Framework (CPMF)	Neely et al. (1996)
1996	Consistent Performance Measurement System (CPMS)	Flapper et al. (1996)
1997	Integrated Performance Measurement System (IPMS)	Bititci et al. (1997)
1998	Comparative Business Scorecard (CBS)	Kanji (1998)
1998	Integrated Performance Measurement Framework (IPMF)	Medori and Steeple (2000)

In the '80 the SMART model, developed in 1988, is a significant change in the literature on performance measurement, focusing first on linking strategy to operations by internal and external performance measures, and modeling the economic entity as an integrated system. The next, the SPA model, is characterized by the introduction of two innovations, which are: the concept of balanced measures and use of non-financial indicators.

In the 1990s, many performance measurement systems have emerged attempting to provide integrated solutions (RDF, BSC, SPC, IPMS, CBS, IPMF and BEM) or only specific methodologies to solve problems (PMQ, ROQ, CPMF and CPM s). These were followed by BSC

model that included more features, such as financial and non-financial, to bring into focus a mix of performance measures.

Systems that have emerged since 2000 are continuing to improve understanding of performance measurement process. Recently developed systems have specific features to connect strategy to operations carried out, providing a balanced set of measures (both financial and non-financial), in an attempt to create quantitative relations incorporating performance indicators and addressing performance measurement as a cognitive process.

5. Conclusions

In the '80s and early '90s various authors have suggested different systems to manage performance of economic entities among which the following: performance measurement matrix (Keegan et al. 1989), performance pyramid (Lynch and Cross 1991), results and determinants matrix (Fitzgerald et al. 1991), balanced scorecard (Kaplan and Norton 1992), performance measurement process developed at Cambridge University (Neely et al. 1995) and, more recently, there was the performance prism (Neely et al. 2001, 2002). All these have led to a relevant research area related to how these performance measurement systems can be developed and improved.

From the literature review we found that there is a continuing concern about the performance measures and its measure in all areas of activity, wanting to capture the performance of an economic entity it in a comprehensible form. To obtain a relevant and coherent picture on the performance of an economic entity is necessary to use a system of indicators. The performance indicators of its structure must reflect in the same time, at least the following aspects: entity's objectives, its strategy, efficiency and effectiveness of the entity's activities, the ability to adapt to the market in which it operates.

In this study, on the basis of the accounting data for the last few years, we analyse the change of competitiveness the Hungarian dairy companies which have the largest revenues. In 2010, 5 enterprises of the 50 food industrial ones having the largest revenues were working in the dairy sector. This concentrated competitive environment offers reasons for the comparative review of the short term liquidity factors as the most important indicators of remaining in the competition or market survival.

For the research we use the balance sheets, income statements and cash flow statements from the financial reports concerning 2008-2009-2010 economical periods. The research methods of our analysis are based on the internationally accepted and applied system of financial indicators. This study includes the analysis of the liquidity ratios coming from the balance sheet and the cash flow statement as well as the analysis of the cash cycle which indicates the effectiveness of the current assets management.

We examine the change of the liquidity position of competitors belonging to the selected group during the economic crisis. We form company orders on the basis of the revenues, the liquidity indicators, the capital structure indicators, the financial strength and the cash conversion cycle. Basically, we search the answers for the following questions:

- Which company's market position is the strongest on the grounds of liquidity factors?

- Which company can be considered as market leader by its competitiveness?

- Is there any connection between the value or tendency of the change of the revenues and the liquidity situation of the analysed companies calculated on the basis of the above mentioned financial indicators?

Finally, we summarise our conclusions concerning the most important liquidity features of the leading Hungarian dairy industrial companies. Comparative sector analyses on national or European level may fill a gap, because only a few professional papers have appeared in this subject. In our opinion, this kind of studies has outstanding importance in the field of applied economics, business economics and practical economic life as well; consequently, our results can be used by companies immediately.

Our analysis can be widened, and similar researches can be accomplished for different regions or different sectors. This study is also convenient for the international popularization of competitiveness analysis from financial point of view.

Keywords: competitiveness, financial analysis, liquidity, dairy industry, Hungary
JEL Classification Codes: M21, L66

Introduction

In our study we set the aim to analyse the competitiveness of leading companies in Hungarian dairy industry by liquidity. Choosing the dairy sector can be justified by its national economical importance, very strong market competition, and potential analytical curiosities.

Dairy sector is a part of food industry, and food industry belongs to processing industry, and processing industry is an important part of agricultural sector in a wider sense. Agricultural sector is also important in respect of the output, the gross domestic product and the employment. In the last two terms the processing–distributing–catering sectors represent more than 50%. Beyond its national economic proportion, food industry is an important sector on the basis of public expenses as well. In the last few years 20-25% of the total public expenses was spent on food and non-alcoholic beverages; moreover, the export proportion of agricultural and food industrial products is also significant, 6,0-6,5% (Kovács 2010: 466-478). Within the food industry the importance of milk processing and the economical characteristics of milk processing companies can be analysed as well. The concentration of dairy industrial companies is relatively high in comparison to the fact that there are many of them on the market. The bargaining power of processing companies is strong opposite to the manufacturers, and most of the companies aim to enlarge its revenues. The companies think that it is possible to enlarge their revenues merely through effective utilization of capacities, without mergers and acquisitions. Moreover, the companies make an effort to reduce their costs, and to enlarge the production of the products with higher processing stage. These Hungarian enterprises are backward in the field of innovation and investment willingness in comparison with their foreign competitors. One reason for this is, that the bigger companies entrust the product development not to the national subsidiary companies, and the smaller companies are not enough capital-intensive for the developments. The other reason is that there is no demand for new products of higher price, because the consumers are price-sensitive (Popp, Potori and Papp 2010: 81-91).

The degree of the concentration of the Hungarian dairy industry and the size of the competition on the market can be well demonstrated on the basis of our sample used in this study. According to the "Opten" company information database there are 147 companies in Hungary now, whose main activity is „producing dairy products". Within the companies only 23 have more than 100 million HUF capital stock value, and only 15 companies (10% of the whole sample) have more than 250 million HUF capital stock. On the basis of the capital stock and the revenues in 2010 it can be stated that the total revenues of the previous 15 companies is 170 billion HUF, and the summarized revenues of the 5 leading companies according to the revenues exceed the 75% of the 170 million HUF. Consequently, the high market concentration can be considered as verified, and the analysis of the strong competition situation involved by the concentration is justified. The sample of our research is this group of 5 leading companies.

The economic crisis influences first of all the revenue, the profit and the liquidity through the decreasing demand. In this study we analyse the change of liquidity of selected 5 leading companies during the crisis, and determine which company has the strongest competitive position.

Literature review and research methodology

The long term financial goal of all companies is the continuous increase of the firm's value and the maximization of the shareholder's wealth. The primary condition of it is a stable and sustainable liquidity. During the crisis, the continuous control of liquidity indicators is especially important in order to escape the bankruptcy situation (Brealey and Myers 2003: 24-27; Gitman 2002: 14-16).

The basic methodology of the individual and comparative analysis is the system of financial indicators (Damodaran 2002: 26-57; Bodie, Kane and Marcus 2002: 606-620). In this study, we

apply those names, financial contents and evaluation point of views of the financial ratios which are customary in international literature (Gitman 2002: 54-61).

Moreover, we emphasize the importance of Hungarian similar studies (Pitti 2010a: 2-23; Pitti 2010b: 29-44) and professional books which fit in with this subject (Katits 2002: 76-92; Bélyácz 2006: 60-68).

The following table demonstrates the companies involved in this analysis as well as their revenues, and the effects of the economic crisis on the change of the revenues.

Table 1: The target group of the analysis (data in 1000 HUF)

Name of the company	Revenues 2008	Revenues 2009	Revenues 2010	Average revenues
SoleMizo (SM)	43 144 733	37 849 216	37 247 841	39 413 930
Friesland (F)	36 499 660	28 930 657	29 416 093	31 615 470
Danone (D)	30 425 582	28 173 745	28 976 262	29 191 863
Tolnatej (T)	15 948 401	15 695 535	17 046 245	16 563 394
Kőröstej (K)	40 487 619	12 083 687	15 527 873	22 699 726

Source: made by the author

Hereafter we enumerate the selected liquidity indicators involved into our analytical frame (Table 2). We also give reasons for choosing these ratios.

Table 2: The analytic frame of the research

Financial indicators	Average values of 2008-2010					Values in 2010				
	SM	F	D	T	K	SM	F	D	T	K
Quick ratio										
Debt-to-asset ratio										
Debt repayment strength (year)										
Cash cycle (day)										

Source: made by the author

Among the short term liquidity indicators based on balance sheet data we chose the quick ratio to eliminate the possible distortional effect of inventories. From the long term liquidity indicators based on balance sheet data we prefer the debt-to-asset ratio because the other capital structure indicators (debt-to-equity and total assets/equity) can be determined by using this rate. We define debt as the sum of short and long term liabilities.

After the static analysis concerning one date we change over to dynamic analysis based on cash flow statement concerning a period. Supposing that the current operating cash flow remains constant in the following years, the debt repayment strength expresses how many years are necessary for repayment of all liabilities (Katits 2002: 90); and its calculation is: 1/ (debt / operating cash flow).

The cash conversion cycle refers to the fact that the firm needs financial sources to manage the time differences potentially occur in the logistical processes. Consequently, cash cycle indicates the period between the firm's operating cycle and turnover of accounts payable in days (Banomyong 2005: 30), and its calculation is: inventory turnover in days + accounts receivable turnover in days – accounts payable turnover in days.

On the basis of the accomplished calculations we create company orders according to the average values of 2008-2010, and to the values in 2010 as well. Based on company orders we formulate our conclusions concerning competitiveness.

The results of the research

In this part, as a result of our research, we present the values calculated on the basis of annual report data concerning the years 2008, 2009, and 2010. On the basis of the values, we create company orders, and, according to these two viewpoints, we evaluate the competitiveness of companies within the sector.

Table 3: The values of the selected ratios

Financial indicators	Average values 2008-2010					Values in 2010				
	SM	F	D	T	K	SM	F	D	T	K
Quick ratio	0,97	2,65	0,55	2,87	0,98	0,67	2,44	0,62	2,7	1,1
Debt-to-asset ratio	0,78	0,69	0,68	0,20	0,57	0,87	0,89	0,73	0,22	0,56
Debt repayment strength (year)	16	31	7	2	NV	34	66	8	2	NV
Cash cycle (day)	-	-	-	-	-	26	35	17	34	49

Source: made by the author

We illustrate company orders with the help of tables. We listed the firms according to their average values for the period 2008-2010 and to the values in 2010, respectively (Tables 4 and 5). The numbers show the advance from the most favourable value (1) to the less favourable one (5) for every indicator. In the case of the quick ratio the bigger value refers to the better competitive position, i.e. bigger part of the short term liabilities (or even its multiple values) is covered by the value of the current assets reduced by the inventories. In the cases of debt-to-asset, debt repayment strength and cash conversion cycle the situation is reversed: the smaller values indicate the better competitive position, i.e. the smaller the indicator value, the better the liquidity status of the company.

Table 4: The company orders for the period 2008-2010

Financial indicators	company orders based on average values				
	1	2	3	4	5
Quick ratio	T	F	K	SM	D
Debt-to-asset ratio	T	K	D	F	SM
Debt repayment strength (year)	T	D	SM	F	K
Cash cycle (day)	↓	↓	↓	↓	↓

Source: made by the author

Table 5: The company orders for the year 2010

Financial indicators	company orders based on values in 2010				
	1	2	3	4	5
Quick ratio	T	F	K	SM	D
Debt-to-asset ratio	T	K	D	SM	F
Debt repayment strength (year)	T	D	SM	F	K
Cash cycle (day)	D	SM	T	F	K

Source: made by the author

By evaluating the change of company orders, an interesting characteristic can be noticed, namely, the company orders based on the average values for 2008-2010 as well as on the values in 2010 are almost the same. Evaluating the indicators separately, it can be stated that we can divided the companies into two groups according to their quick ratios: firms with acceptable and with less favourable (below 1,00) values. In the first group the values decrease (SM, F, T), while in the second group they increase (D, K), which can also be pointed out by the relation of the average values and the data in 2010. Quick ratio data of SoleMizo and Danone become to be critical in 2010.

The characteristic change for the 3 years time series of debt/total assets is the increase; the only exception is Kőröstej, which was able to decrease a bit this indicator. In the case of the three companies of the largest revenues the value is over 70%, which definitely indicates financing problems. In the case of SoleMizo and Friesland, beside the unfavourable capital structure, the increasing amount of loss also weakens their competitiveness.

Changes of debt repayment strength indicator show no tendency: there are big changes even within the companies in the period of 2008-2010. Tolnatej has favourable and stable values. Danone normalized the value of this indicator, and, in this way, compensated the unfavourable values based on balance sheet. In the case of SoleMizo and Friesland the values of this category, similarly to the former ones, are worse and worse, and the values in 2010 are critical. Concerning Kőröstej we applied 'NV' to sign that indicator has no financial content because the value would be -46 for 2010 due to the negative value of operating cash flow. Therefore, we did not calculate average value, because the negative operating cash flow itself indicates a very unfavourable liquidity position.

Because of the calculation method, we have cash conversion cycle data only for 2009 and 2010, therefore we did not estimate average values in this case, but we marked only the increase (↑) or the decrease (↓). Every enterprise decreased its cash cycle, which was a necessary requirement because of the general increase of debt-to-asset ratio. Regarding the cash cycle values in 2010 the firms show no large differences, although Danone and Kőröstej differ a bit from the mean of the sample, which is 32 days. In the case of Danone this value suggests that the firm makes the necessary efforts to improve its short term liquidity position.

Conclusions

In our study we set the aim to analyse the competitiveness of the leading Hungarian dairy industrial companies based on liquidity indicators. We justified the industrial concentration and the strong competition, and accomplished the comparative analysis of the selected 5 companies based on internationally applied liquidity indicators, creating our analytical frame. On the basis of the orders created from the calculated values the following conclusion can be formulated:

- The liquidity position of Tolnatej (T) is the strongest among the 5 companies. Concerning the first three points of view it is market leader, and regarding the fourth one it has an average position.
- Danone (D) can be considered as the second company. This firm is able to compensate the unfavourable values of static indicators (quick ratio and high debt-to-asset ratio) with the better values of dynamic, consequently more important, parameters (debt repayment strength and cash cycle).
- The complex competitive position of SoleMizo (SM), Friesland (F) and Kőröstej (K) is weaker, which is even declined by continuous loss in the case of SM and F. In spite of its favourable values based on balance sheet, Kőröstej (K) is the last, because its cash cycle and its liquidity based on cash flow (because of the negative operating cash flow) is the most unfavourable among the examined firms.

- Based on the results of the competitiveness analysis by liquidity, it can be stated that neither the size of the revenues nor their changing tendency can be directly connected to the liquidity positions of the firms. According to their complex liquidity, the two companies of the biggest revenues have more unfavourable competitive positions than their competitors with smaller revenues.

INNOVATION – THE MAIN COMPONENT OF THE „KNOWLEDGE TRIANGLE"

Rus Mircea-Iosif
Babeş-Bolyai University
Faculty of Economic Sciences and Business Administration

Radu Ioana
Babeş-Bolyai University
Faculty of Economic Sciences and Business Administration

Science has begun to play an increasing role in industrial development not only as a major source of knowledge for new technological activities or scientointensive industries (medicine industry, chemistry, electronics), but also as essential input in testing, evaluation and quality control. Innovation is one of the activities that can generate economic and social progress. Therefore, this paper also approaches the significance of innovative information dissemination, as well as the objectives of this activity in view of the EU Member States. The European Union has prepared two funding programs for innovation activity, Europe 2020 and Horizon 2020.
Key words: R & D and innovation, finance, technology dissemination
JEL Code: G28, G29, O30,O31

1.Introduction

Innovative activity is as old as human history. From his earliest attempts to change and adapt nature to his needs, man has never ceased to innovate, that is to introduce something new into his material or spiritual existence. Metallurgy, the mirror, porcelain, the gear, suspension bridges, the loom, the scales, the calculating machines, cartography, the clock, the compass, the decimal system, geometry, the square root, the sterilization system, vaccines are just a few of the findings of anonymous inventors of antiquity in Babylon, Mesopotamia or China.

Innovation's main goal is not only to improve the stock of knowledge, inventions and patents, but also to disseminate them on a large scale, in other words the dissemination stage of new and improved knowledge, products, technologies and services. This process is becoming more and more interesting area of study for the understanding, influencing and adjusting of the competitive market mechanisms market economy countries or in countries in transition to such economy.

2. Technology dissemination

Technology dissemination has gained increasing importance in the policy goals of science and technology due to the fact that financial support in this area is increasingly conditioned by rigorous and pragmatic evaluations in terms of real economic effects.

A series of aspects concerning micro and macroeconomic efficiency (increase in capital efficiency, labor productivity and competitiveness, operation of structural adjustment) are related to high hopes, especially for developing countries, for programs with consistent objectives of technological diffusion.

Technology dissemination is narrowly considered as a large-scale application of any available technology. The area of dissemination of these technologies may refer to various fields and sectors and, of course, to both public and private sectors. Technology dissemination doesn't only pursue goals directly related to improving the parameters of productive process efficiency, but also the elimination of duplication in innovative activities that would discover things already known in another part of the country or in other institutions.

Technology dissemination is also dependant on economy's, and especially industry's structural characteristic, on their complexity and intensity. In this respect it is worth noting the role that

large companies (machinery constructions, electrical, electronics, metallurgy, chemistry, etc.) that have greater opportunities to invest and operate machinery, equipment and new equipment, have. Close connections between the various companies in supply, production and marketing, horizontal cooperation, involving sales and purchases of intermediate goods, create a proper framework for encouraging the expansion of technical progress for all participants. (Radu M. *et at*., 2008)

Profitable achievements in technology dissemination are however conditioned by the level of the employees' professional qualification, their competent and adherent responsiveness, trade unions includes, to technological and organizational novelties. For adopting superior technologies, the level and structure of wage costs, as well as other statutory obligations of the company have a significant importance. In case of high productivity and wages, of effective operation of labor relations systems, of the labor market and information fluxes, technological diffusion rate can benefit from considerable human support.

3. Knowledge and technology transfer from research to industry

Theoretical studies approaching the variety of aspects in business life conducted in the academic environment are circumscribed to the subject known in the specialized literature as „Academy-Industry Relations", area of research that theorizes particular or common aspects of the concrete forms of manifestation of research interest, especially in universities, to develop efficient contacts with economy in general and industry in particular. Most of these papers describe or analyze in detail the causes and factors of success or failure of various initiatives that have occurred locally or regionally, evaluate their performance and impact, perform statistical and sociological surveys and forecasts etc.., being less concerned with conceptualization, theoretical debates or semantic controversies.

Therefore, the notions used by this area of research, like business incubation center or incubator, science park, spin-off, technology transfer center, research park, technology center, etc.., don't have a clear conceptual distinction, being used in practice without too much exigency and rigor, often being considered as substitutable, complementary or synonyms.

The specialized literature has a variety of definitions of the same concepts. Thus, the *Science Park* is characterized by its territorial vicinity to a, institution of higher education or an advanced research center, with which it has close relations. It aims to: supporting the development of companies, facilitating technology transfer from research and education to companies and organizations within the park or surrounding areas, encouraging businesses based on research results of R&D university departments or research institutes. The main objective of these parks is researching and designing new products and their development to prototype stage, production for market being achieved in separate units.

The Research Park is usually located within a university or research institute and has a predominantly scientific activity in which students and academics are working together. Production concerns are usually excluded.

The *Technology Center* helps develop an enterprise engaged in applying advanced technologies based on research that should not necessarily be carried out within the university, offering also a range of facilities and services, including the sale of products. It is distinguished from *the Science Park* by accentuating aspects concerning production and by the optional involvement of academic research. The selection of "residents" uses rigorous criteria concerning the inclination to use research or products requiring a high technological level.

The Innovation Center provides a range of facilities to new small and medium companies that engage in high technological level products (by taking a large risk to their market launch): office equipment, different services, access to considerable network of research, consulting and financing institutions etc. They can often be part of Science Parks.

Business incubators concentrate in a limited space a number of newly-created companies for the purpose of helping them increase their chances of survival by providing them with modular construction, shared facilities (telephone, computer, secretarial, etc.) and with managerial support and other support services. Their main goal is both the orientation towards new technologies, as well as local development and the creation of new jobs.

Industrial or business parks provide an environment of high qualification, suitable for a wide range of activities including manufacturing, sales, exhibitions, etc., without necessarily having to be in the vicinity of academic institutions.

The Managerial Workshop provides a multitude of consultancy and financing services to industrial business activities, taking place in new or existing units. By dealing with improving the quality of common services and imposing strict admission and output rules, a series of managerial workshops have become innovation centers or business incubators. (Gheorghe C.M. *et al*, 2009)

4. Strategies for stimulating the innovation process

Strategies in R&D and innovation evolved after a trajectory described by combining in different proportions two different types of policies, namely the policies of science and industry, sensibly influenced by the company's behavior. Innovation strategies relied on the explicit recognition of the fact that the success of creating and marketing new products is due to a set of factors, far more numerous than the R&D activity that was, until recently, taking all the credit. Of these factors, the market of products and technologies plays a significant role. (Sandu S., 2002)

Provided that economic competitiveness has become a major focus, increasing attention has been given to research conducted in industry, reflected in increased collaboration between industry and universities, as well as to the development of human resources potential for research. Maintaining a high quality in basic research remains an important objective, regardless of the levels of economic development of different European Union Member States.

A special attention is paid to participation in international research and development programs (particularly the Community Framework Programme for R & D) and to increasing the number of networks, consisting of public and private participants of the EU Member States. Another series of objectives in research and development tend to be shared in a growing number of EU Member States. (Gheorghiu R. *et al*., 2004)

The issue of public interest research has been treated, in the last few years, both in theory and in the practice of the developed European countries, with much more nuance and flexibility, observing a sensitive mutation from the interest in R&D public or government institutions to public interest strategic fields or R&D programs. These changes most strongly are reflected in the prevalence of R&D funding in comparison with institutional funding, mechanism also adopted by countries in transition to market economy, whose systems of science and technology are in full process of reform.

The experiences of developed countries are particularly relevant in terms of forming inter-institutional research networks, promoting research in collaboration between teams from public institutions and teams from private enterprises or institutions.

Table 1. General objectives of the EU Member States in the field of science and technology strategies

	Objectives
Objectives common to most Member States	-Developing training and mobility for researchers; - Promoting innovation and technology transfer (exploitation of results, especially in small and medium companies) - Increasing collaboration and cooperation between industry and higher education and, in general, improving cooperation between private companies and public research sector; - Supporting and promoting industrial research both financially and in implementation; - Sustaining and developing high quality basic research; - Boosting economic competitiveness and stimulating economic growth; - Increasing R&D contribution to regional development; - Intensifying international cooperation, especially within Europe.
Objectives that tend to become common to Member States	- Developing programs containing socio-economic objectives of major importance; - Promoting public acceptance of science and technology; - Assessing the ethical and social aspects of technological development; - Improving the mechanisms and methods for program evaluation; - Developing the capacities of strategic deliberation in selecting priorities in science and technology.

(Source: Sandu S., 2002)

5. Europe 2020 and "Innovation Union"

As other states adhered to the European Union, the creation of common policies insuring the Union's development became more and more necessary. Thus, common policies were created in fields like agriculture, trade, fishing, taxation, justice, internal affairs, etc. Research policy in the European Union is part of a broader policy of the European construct, namely, "Science and Technology". Policies in the field of information society arise from this, concerning audiovisual, media, space, life sciences and biotechnology.

The reason for a policy in research and innovation is justified by satisfying two needs. Firstly, the need of coordination for the member states' activity in increasing efficiency and reducing costs, and secondly the need to strengthen the international competitiveness of European economy. Also, research and development develops economy and creates new jobs, and technological innovation can fight or diminish social problems like poverty, certain diseases or environmental degradation.

In 2009, the EU allocated an average 2% of GDP to R&D and innovation, while the US allocated 2.8% and Japan 3.4%. For 2010; the average for the EU countries was 2.7-2.8%. Also, we should not ignore the fact that in 2014, China's net RDI expenditure will surpass the EU.
TN: GDB Percentage (%)

Fig. 1. *2009RDI budget*
(Source: http://www.ec.europa.eu/innovation)
TN: Total population percentage (%)

Fig. 2. *People with university degree in the population aged 25-34 years*
(Source: http://www.ec.europa.eu/innovation)

However, the rate of people aged 25-34 who have a university degree, in the year 2009, shows they Europe does not lack potential. It has researchers, entrepreneurs and world-class companies as well as high quality in terms of values, traditions, creativity and diversity. European companies and civil society are actively engaged in emerging and developing economies all over the world. Many innovations that changed the world occurred in Europe.

The biggest challenge for the EU and Member States is probably a more strategic approach to innovation. An approach where innovation is the primary policy objective, that would consider a medium and long-term perspective, where the measures and funding are designed so that they contribute to innovation, where EU and national / regional policies closely aligned and mutually

consolidated and last, but not least, where the highest political level sets a strategic program and regularly monitors its progress.

The initiative," Innovation Union established such an ambitious, integrated and strategic approach, exploiting and enhancing our strengths by using new and productive ways, preserving therefore the economic foundation that supports our quality of life and social model in the conditions of population aging. ''Business as usual'' is equivalent to a gradual loss of the competitive advantages that we possess and accepting Europe's constant decline. (Rus M.I., 2011)

More specifically, in order to achieve," Innovation Union, among other things, the following are required:

a) In times of budgetary restrictions, the EU and Member States should continue to invest in education, research, development, innovation and ICT. Such investment should, if possible, not only be protected by budget cuts, but should they receive additional funding.

b) They should be accompanied by reforms that would increase the return on investment and approach the issue of fragmentation. The systems of research and innovation in the EU and Member states should be better coordinated and their performance must be improved.

c) Researchers and innovators must be able to work and cooperate across the EU as easily as at national level. The European Research Area must be completed within four years, establishing therefore a framework for a genuine free movement of knowledge.

d) Access to EU programs should be simplified and their leverage effect on private sector investments should be increased, with the support of the European Investment Bank. The contribution of the development framework program to fast-growing SMEs should be intensified. The European Regional Development Fund should be fully exploited for the development of research and innovation capacity throughout Europe, based on intelligent specialized regional strategies.

6. Conclusions

The European Union has an extraordinary potential for innovation. Europe has a long tradition of determined inventions. It has a variety of creative talents and it can rely on its It has a variety of creative talents. We should not forget that Europe founded one of the largest single markets in the world, where innovative products and services can be widely marketed. The Union also has a tradition of a strong and responsible public sector, which must be exploited.

Almost all EU Member States have improved their performance in research. However, the increase of performances in innovation has slowed down, and the EU is not covering the persistent gap in relation to the world leaders in innovation, U.S., Japan and South Korea. For EU-27, the largest gap remains for innovation in the private sector. EU still has a clear lead from the emerging economies of China, Brazil, India, Russia and South Africa. However, China is improving its innovation performances and continuously reduces the gap.

In the EU and the developed European countries, innovation has been seen for several years as an engine of economic and social progress, and the EU budget for 2014-2020 provides for the allocation of large sums of money to technological research and inventions within the "Horizon 2020" program, which will have a budget of over 80 billion euro. THE RESEARCH SYSTEM IN ROMANIA – REFORMING AND FUNDING IT THROUGH PROGRAMS

Rus Mircea-Iosif
Babeş-Bolyai University
Faculty of Economic Sciences and Business Administration

Radu Ioana
Babeş-Bolyai University
Faculty of Economic Sciences and Business Administration

Scientific research represents today the most important lever for improving the living standard, health, culture and, in general, the wealth of a society. Therefore, this paper attempts to present the current state of the research system in Romania, as well as several proposals for reforming this system, which would, consequently, lead to a better use of research results, as well as the presentation of ways of funding for research through research programs, both national and European. We should not omit the fact that adequate funding for the research system also has a social impact, by creating new jobs, especially if the research results are implemented in industry.
Key-words: R & D and innovation, reform, funding, programs
JEL code: G28, G29, O30, O31

1. Introduction

The research activity aims to produce knowledge, being primarily expressed in publications. Scientific research distinguishes between basic research, applied research and development and innovation research. Therefore, if knowledge refers to rules and principles, we may speak of knowledge as result of basic research, expressed in publications. If knowledge refers to procedures or to applying the knowledge resulted from basic research to specific contexts, we may speak of applied science research, whose result is to be implemented in production.

2. Current situation

Currently, Romania primarily has three systems of R & D and innovation:
- the academic system (the Romanian Academy and the branch academies);
- the public institutes system (subordinated to / coordinated by the ministries);
- the university system.
Also, the current national RDI system also has the following research-development-innovation structures:
- state-owned companies, from the former branch institutes;
- private companies;
- private foundations and associations. (Văcărel. I. *et al.*, 2006)
The research, development and innovation (RDI) system existing in Romania is not able to ensure the promotion of industrial development because of its weaknesses, among which the most important ones are:
- extremely low RDI expenses, compared with industrialized countries,
- the total or almost total absence of R & D in the business sector, that is, in fact, the main factor of innovation,
- excessive priority given by some of these institutes to basic research, in the detriment of applied research, the fragmentation of scientific research, affecting the structure of non-specific means of financing of universities and academic sectors;
- the attitude and mentality of researchers in these institutes, which are more concerned with career prospects than with national industry needs;
- the mismanagement of research funds (scientific events, exhibitions etc.);

- the superficial capitalization of RDI results;
- the precarious equipment of the RDI activity;
- the lack of a regular analysis of the real correlation between the Romanian society needs and the priority programs as a research direction for the National Research, Development and Innovation Plan (NRDIP), as to ensure an increasing share of priority projects to be awarded by public tender and particularly those of community interest (ex. drinking water, wastewater, waste management, air and soil pollution, energy, health).

On the other hand, in Romania there is still a technical and material for base for RDI, created after the anticommunist revolution, but also an industry of innovation. However, the innovative process was much hampered by the gradual disappearance of human and institutional actors, as well as by reducing RDI investment and expenditure. (Radu M. *et al*., 2009)

3. The reform of the national research-development-innovation system

In order to change the current state of affairs, it is necessary to catalyze the structuring of relations and mechanisms of the scientific community, of the civil society and of international cooperation, for promoting innovation and stimulating excellence, based on a real and efficient reform of the RDI system.

3.1. General principles of the national research-development-innovation system reform

They are:

I. The current RDI system has been developing gradually after 1948, in the context of a planned economy. This system is rigid, anachronistic and incompatible with market economy and economic globalization.

II. The main mission of RDI activities is to address the important issues of transition and socioeconomic development. In general, RDI projects should be conducted in accordance with market needs, as dictated by the economic actors.

III. RDI reform should be carried out in order to facilitate the development of this activity, especially by stimulating competition mechanisms.

IV. Priority must be given to national invention, so that RDI results may turn into production capacities and that Romania may become an exporter of technology and products.

V. We must structure a balance between achieving short-term and long-term objectives, as well as between technological development, applied research and basic research.

VI. The limited RDI resources must be managed in such manner as to be oriented towards priorities and major issues. They should focus the key issues of national interest and backed by the industry associations that are apolitical.

VII. Academic democracy and scientific careers will be encouraged and developed.(Radu M. *et al,* 2009)

3.2. The purpose and objectives of the national research-development-innovation system reform

The purpose of the national research-development-innovation system reform is to restructure the connections between science, technology, economy and civil society in such manner as to let the market decide the primary distribution of RDI resources and to accelerate the commercialization of scientific and technological results.

The objectives of the national RDI system reform are:

I. Changing the organizational structure of the national research-development-innovation system.

II. Switching the RDI thematic from the traditional (flawed) model to the emergent model, calling for transdisciplinarity and strategic relevance.

III. Multiplication RDI funding resources and improving the funding system.

IV. Changing the management system of RDI units.

V. Stimulating the formation and operation of new research organizations (public or private capital).

VI. Changing the evaluation system of research results.

VII. Improving the communication and dissemination system of research results.

VIII. Stopping the migration / immigration flow of RDI specialists.

Changing the organizational structure of the national research-development-innovation system is based on a structural vision simplifying the system's components, effectively correlating them and insuring diminished expenses. (Radu M. *et al*., 2009)

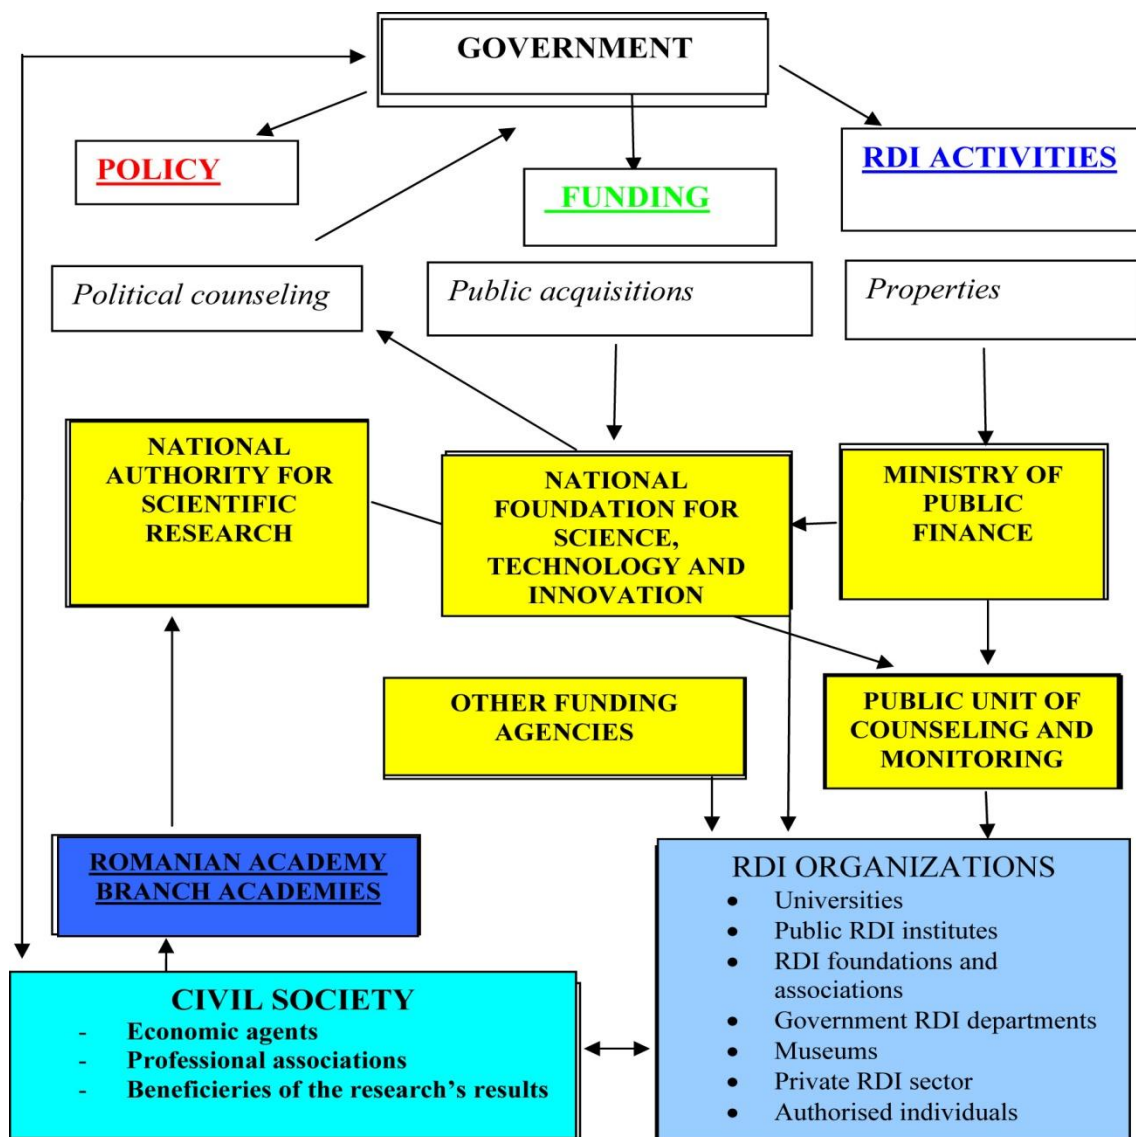
Such a target structure is shown in the figure below:


Fig. 1. The organizational structure of the national research-development-innovation system and its funding (Radu M. et al., 2008)

4. Funding of the research-development-innovation activity

The funds allocated from the budget for the research-development activity in the last 10 years are found in Table 1, which also presents the actual values allocated for this activity (fig. 2 and 3):

Table 1: *Funds allocated for research in 2002-2011*

Year	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011
GDP %	0,21	0,39	0,39	0,41	0,46	0,52	0,58	0,47	0,49	0,50
Expenses (mil. lei)	304	560	696	778	1.119	1.626	2.371	1.649	1.551	1.745

(Source: Author's processing)

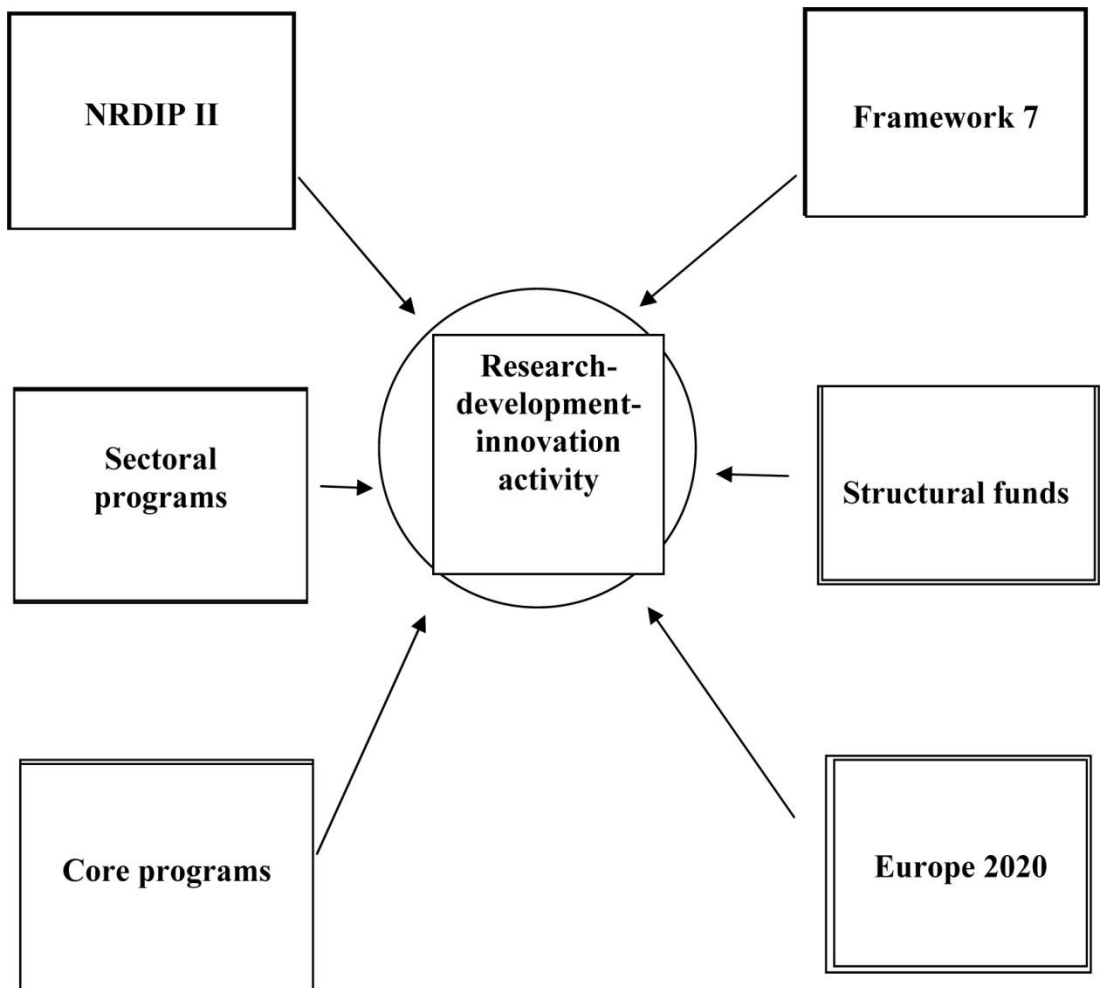
Research and development funding is made by funds allocated from the state budget through programs. Thus, in Figure 4 we illustrated the current funding programs for research and development in Romania.


Fig. 4: *Sources of funding for research-development*
(Source: Author's processing)

The National Authority for Scientific Research (NASR), as a government body with responsibility for developing and harmonizing national research-development-innovation with the EU, aims to align the objectives of the science and technical community and the business environment in Romania to the specific science and technology priorities in the European Union, as well as to their evolution dynamic.

The support for planning and implementing of the RDI policies promoted by NASR in the post-accession period was given by:

- The National Strategy for RDI for 2007-2013 (National Strategy), approved by GD no. 217/2007;

- The National Plan for Research, Development and Innovation for 2007-2013 (National Plan), approved by GD no. 475/2007.

The National Strategy's main objective until 2013 is to bridge the current gaps compared to European countries and to prepare the RDI system to identify and consolidate, through international openness, partnership and competition, those areas where Romania can excel.

5. Conclusions

In recent years, more sources of funding for research and development were sought, but we must stress that the field of RDI does not benefit from external credits or from EU funding under national allocation like, for example, in agriculture. The only exception is represented by the structural funds for this domain. Access to EU funding is based solely on competition within the Community programs. Therefore, to increase the volume, quality and competitiveness of our country RDI activities in line with the evolution and requirements in Europe, is extremely necessary to stimulate them inside the companies. Cooperation between economic agents, universities and / or RDI institutions imposes itself as priority axis in tandem with the emergence of the concept of "entrepreneurial university." (Paul Vass A., 2010).

We must not forget the fact that a research activity does not end with the presentation of its results; these results are either implemented in the production process, seeking material benefits, or are presented as an article or paper to various scientific manifestations and can be the basis for other research activities.

EUROPEAN FISCAL UNION. A SOLUTION TO SAVE THE EURO?

Sabău-Popa Diana
University of Oradea, Faculty of Economic Sciences

A monetary union with strong connections among banking systems but without a fiscal union may pose problems because the national governments may be tempted to increase inefficiently their public debts, which, in case of contagion, may have serious repercussions on other economies.
This article analyses the idea - widespread among specialists - of the integration of fiscal policies in the Euro Area as a solution to overcome the sovereign debt crisis. The situation has become critical for countries such as Greece, Portugal, Ireland, Spain.
Key words: fiscal union, Euro Area, fiscal policies, sovereign debt crisis, fiscal treaty
JEL code: E62, E63, F36

Introduction

The current economic and financial crisis highlighted the fact that the institutional regimes and the EU common policies, more precisely, of the Euro Area, are not adequate. Even before the crisis, the economic growth in the European Union was low, pointing at deep structural problems in the EU Member states. The macroeconomic imbalance created a European Union with divergences in productivity and competitiveness.

The response of the involved countries to the sovereign debt crisis in the Euro Area was slow and weak because of the supranational character of the European Union and of its budget, limited to 1,24% of the community GNI. In the opinion of several specialists, to which I equally subscribe, in order to try to overcome this crisis, it is necessary to promote as soon as possible an initiative to start a political project envisaging the creation of a European Fiscal Union, just like the Economic and Monetary Union was created.

In this scientific research, my objective is to analyze the idea of the European Fiscal Union, mentioned as a long-term solution for the Euro Area to overcome the sovereign debt crisis. I chose to realize this analysis of the idea of a fiscal union because it is a topical issue, taking into account that at the beginning of March 2012 the Fiscal Treaty was signed, introducing new rules concerning the budgetary discipline.

Analyze of the economic literature

For two years, the Euro Area has been confronting with a debts crisis, its long term viability being under question mark. The problem is that the Euro Area doesn't have adequate institutional arrangements to help it manage a major crisis, nor mechanisms for amortizing the asymmetrical shocks and for burden-sharing. The fiscal reactions of the member stated differ according to the level of debt, of budgetary expenditures and of the budgetary revenues as percentage of the GDP (EIR, 2011: 21).

This Monetary Union possesses that € *440* billion **European Financial Stability Facility, created in 2010, and the** € *800* billion *European Stability Mechanism*, created in February 2010. The declared purpose of the *European Financial Stability Facility is to save the Euro Area countries if they cannot solve their economic problems, each country being allowed to borrow up to € 440* billion. The European Stability Mechanism, which will enter into force in July 2012 aims to contribute to the amelioration of confidence and to guarantee the financial stability of the Euro Area.

The Euro Area doesn't yet have a framework for the political cooperation between the European Central Bank and the national governments, even though the single currency creates the need of a tighter cooperation. The absence of a place where a common position for monetary and budgetary policies can be defined makes the institutional organization of the Euro Area more

oriented towards knowledge exchange than towards the identification of guidelines for the coordination of activities.

The European Central Bank, lacking trust concerning the budgetary decisions of the national governments, tends to protect its freedom of action in order to be able, if necessary, to counter-attack their tendencies toward governmental deficits. The national governments, unable to convince the European Central Bank to pay more attention to the specific conditions of their economies and not knowing the budgetary conduct of the other governments are reticent about cooperation, ready to counter-attack any restrictive position of the monetary policy and stubborn in accepting the additional diminishment of their fiscal sovereignty (Panico Carlo &Vazquez Suarez Marta, 2008:16).

But economic theory, based on the *optimum currency area model,* shows that the single currency benefits outweigh its costs only when economic integration – under the form of commercial exchanges, similar conditions and economic cycles - is strong enough.

The German Chancellor Angela Merkel, one of the most appreciated political personalities leading the European Union, publicly specified, more than once, that there is a concord regarding a possible step towards a fiscal union, towards a coordinate approach of the fiscal and economic policies, but on medium or long-term. For the beginning, the basis of the fiscal union must be set up from political and legal point of view. A fiscal union would imply a single ministry of finance and a single treasury, an idea agreed by Germany, France, Holland, Belgium, Luxemburg, but less wanted by countries like Portugal, Italy, Finland and Greece, which face financial difficulties. A viable monetary union supposes the use of tools which amortize the asymmetric shocks and the creation of a federal budget in the Euro Area, which proves to be more than necessary.

In the opinion of several specialists, to which I equally subscribe, in order to try to overcome this sovereign debt crisis, it is necessary to promote as soon as possible an initiative to start a political project envisaging the creation of a European Fiscal Union, just like the Economic and Monetary Union was created.

The first stage, according to Alberto Majocchi (2011) should be the *creation of a European Fiscal Institute*, whose main task should be to save those countries that risk being swept away by the sovereign-debt crisis and to pave the way for the subsequent institutional move toward a Federal Fiscal Union and the institution of a European Treasury.

During a second phase, *an issue of Eurobonds* would be necessary to supply the UE the financial means needed to support the setting up of a recovery plan of the European economy, to favour a productivity and competitiveness increase. The European budget should return to a system of real resources, substituting what is known as the fourth resource, based on member states' GNI, with a European surtax on the national income taxes paid directly by the citizens and the limited liability companies to the European Treasury. Thus, the European Union budget, based on own resources, would be managed by a Federal European Treasury, responsible for the coordination of the EU economic policy and the transition to a sustainable economy. (Alberto Majocchi, 2011: 79).

Therefore, the European Union could and should have a *federal budget,* able to play a counter-cyclical role in case of conjectural "asymmetric" shock. This is the role of the federal budget within a federation: in case of a shock which affects only a part of the federation, the resources originating from this region diminish, while the transfers in its favour increase. In a Union in which the labour-factor is characterized by a low mobility, possessing a federal budget could be a precious advantage, but requires a radical evolution of the budgetary expenditures and revenues: the Union's revenues should be activity-based taxes and its expenditures should be, at least partly, related to conjecture. In these circumstances, in order to have a microeconomic impact, the EU budget should highly exceed the current ceiling of its own resources, in order to represent about 7-8% of the Union GDP. (Sabău-Popa Diana, 2010: 11).

Fiscal implications of the Treaty on Stability, Coordination and Governance in the Economic and Monetary Union

In order to overcome to sovereign debt crisis in the Euro Area, 25 Member states of the European Union signed in Brussels, on the 2nd of March 2012 the *Treaty on Stability, Coordination and Governance in the Economic and Monetary Union*, which introduces a set of golden rules concerning the budgetary discipline. Only two countries of the European Union refused to sign the Treaty: the United Kingdom and the Czech Republic.

Some of the most important provisions of the Treaty on Stability, Coordination and Governance in the Economic and Monetary Union, also called the *Fiscal Treaty* are:

- *The annual structural deficit must not exceed 0.5% of the GDP*; the annual structural deficit of the public administration means the annual cyclically adjusted deficit net one-off and temporary measures.
- *Non-Eurozone countries join the Eurosummits* whenever are discussed issues of general interest with regard to the single market, competitiveness or the modification of the Euro Area strategy.
- Where *the ratio of public debt to GDP is significantly below 60 %* and where risks in terms of long-term sustainability of public finances are low, *the structural deficit can reach at most 1.0 % of the GDP*.
- In the event of significant observed deviations from the maximum ceiling of the structural deficit or the adjustment path towards it, a *correction mechanism* shall be triggered automatically.
- When in one of the 25 Member states which signed the Treaty *the ratio of public debt to GDP exceeds 60%* the state *shall reduce it* at an average rate of *one twentieth per year* as a benchmark.
- *Financial sanctions can be imposed –which may not exceed 0.1% of GDP of the Member State in question* – if, based on its own observations or on the European Commission report, one of the 25 Member states which signed the Treaty concludes that another state failed to comply with the above-mentioned ceilings and brings the matter to the European Court of Justice.

The treaty mentions the necessity to develop ever-closer coordination of economic policies within the Euro Area, therefore it tries to push the governance of the Union toward more integration, going thus beyond the scope of a fiscal treaty. It specifies a very true and important issue – that if a monetary union which doesn't rely on the disciplining of the actual budgetary executions has a very precarious way of functioning.

Actual government deficit has two components: a cyclical one, based on automatic stabilizers and a structural one, based on discretionary policies. Structural government deficit, mentioned in the treaty represents the fiscal position when the GDP is at its potential level, that is the economy is halfway between economic expansion and recession. The annual modification of the structural deficit is due to the effect of discretionary decisions of fiscal policy.

But structural governmental deficit is an indicator lacking transparency and inaccessible to the population, difficult to understand and to verify. Its formula is: Structural deficit=Structural expenditures-Structural revenues=Expenditures*GAP^{ec}-Expenditures*GAP^{ev}. GAP represents the production differential calculated as ratio between the potential GDP (normal rhythm of economic growth in a neutral year, form a cyclical perspective) and the actual GDP.

The new 0.5% of GDP limit of the structural deficit will impose a very strict control on the public finances of the 25 countries, which may have advantages and disadvantages. For Romania, which in the past had a discretionary procyclical fiscal policy, it will make impossible to practice a procyclical fiscal policy, that could be a significant advantage (Ionuţ Dumitru, 2012: 5).

The major disadvantage of the treaty is linked to its reduced capacity to stimulate the economy, especially in recession periods. The automatic stabilizers are the most effective in countries such as Denmark, Holland, Sweden and Finland, their size being closely related to the tax system and the size of the governmental expenditures. In Romania, like in the other Member states of Eastern Europe, the size of the automatic stabilizers is significantly smaller, which requires the possibility to apply some discretionary fiscal stimulus (higher structural deficit), stronger in recession periods (Ionuț Dumitru, 2012: 8).

Some specialists, such as Joseph Stiglitz, recipient of the Nobel Prize in Economic Sciences, strongly criticize this Fiscal Treaty, considering that the strictening of the fiscal policy in the European Union is a wrong way of solving the debt crisis and might lead to a totally opposite result.

Possible stages in the creation of the European Fiscal Union

The purposes of my own research are the analyze of the concept of fiscal union and then the presentation of the possible stages in the creation of the European Fiscal Union.

If we analyze the concept of fiscal union, it refers to the integration of the fiscal policies of the states. In a fiscal union, the decisions concerning the tax collection and spending public money are taken by institutions common to the governments of the participating states. For example, in federal states, such as the USA, the fiscal policy is largely decided by the central government, empowered to increase the taxes, to make public borrowings and to spend public money.

A monetary union with strong connections among banking systems but without a fiscal union may pose problems because the national governments may be tempted to increase inefficiently their public debts, which, in case of contagion, may have serious repercussions on other economies.

The sovereign debt crisis in the Euro Area is due to the breach between the common monetary policy and the national economic and fiscal policies of each Member state. 17 EU Member States are part of the Monetary and Economic Union, based on the Euro currency, but most of the decisions regarding the taxes and public expenditures are taken on a national level, because the fiscal policy belongs to each democratic state as the expression of its sovereignty. But direct taxes, as well as the indirect ones distort the four main freedoms of the single community market.

The European Union has limited fiscal powers. The majority of the European Union Directives refer to VAT, customs duty and excises. The VAT is harmonized at community level, the taxation principle of the VAT is that of the destination of goods; the tax is levied on the delivery of goods and the provisioning of services in the state where they are consumed. Member states can apply the following types of VAT quotas: a normal tax and one or two reduced taxes. The normal VAT tax must not be smaller than 15% and the reduced taxes must not be smaller than 5%. The products to which the harmonized excises are being applied are alcohol and alcohol products, tobacco and tobacco products, energetic products, electricity; the community legislation mentions the existence of a minimum excise applied to each category of products. Starting with 1968 no customs duties are levied on the goods transported within the territories of the European Union Member states, and for the goods entering these states, the common external tariff of the EU is applied. With regard to direct taxes, the community acquis targets the income tax and the tax on capital and less the tax on the natural person income. Most of the provisions concerning the direct taxes are left up to each Member state, as an expression of their sovereignty.

We can identify two possible stages in the creation of the European Fiscal Union. The first stage should be the creation of a European Fiscal Institute, whose main task should be to save those countries that risk being swept away by the sovereign-debt crisis and to pave the way for the subsequent institutional move toward a Federal Fiscal Union and the institution of a European Treasury. The Fiscal Institute could play the role, in the realization of the Fiscal Union, that had been entrusted to the European Monetary Institution as a prerequisite for the start of the

Monetary Union. (Alberto Majocchi, 2011: 91). An important step in this direction was the creation, in February 2012, of a € *800* billion European Stability Mechanism. This European Stability Mechanism aims to contribute to the amelioration of trust and to ensure the financial stability of the Euro Area.

In a second phase it is necessary to start the issue of Eurobonds to contribute to the provision of the necessary financial means to support the realization of the plan for the recovery of the European economy. By issuing Eurobonds, The European Investment Bank could provide the financing of the European public investments (secondary education, research and innovation, new technologies, environmental conservation, renewable energies) that represent a *conditio sine qua non* to guarantee a long term sustainable growth of the European economy (Alberto Majocchi, 2011: 92).

Then, the fourth resource of the European Union budget, based on the GNI of the Member states (representing more than 60% of the EU budget), which is not real own resource, could be substituted by a European surtax on the national income taxes paid directly by the citizens and the limited liability companies to the European Treasury. The European surtax on the national income tax of the natural persons, paid directly by the citizens to the European Treasury would guarantee a greater transparency of the levy and would strengthen the responsibility of those who use the public financial resources. The European surtax on the companies' income would have the effect of neutralizing a little the impact of the company relocations within the European Union and of reducing the fiscal competition among the Member States.

From 2013, the European Union budget could benefit from a new resource from a carbon/energy tax. In a situation where the risks connected to the climate changes are by now more and more clear and the need of replacing the fossil fuels with alternative energy sources is becoming more and more pressing, a tax also in line with the carbon content of the energy sources appears as an adequate instrument to start up the processes of energy-saving and of fuel-switching to renewable energy sources, thus reducing the negative impact of the energy consumption on the environment.

The policy-makers could also consider the European Commission proposal regarding the introduction of tax on the financial operations of a speculative nature, in order to increase the resources of the European Union budget and to guarantee a more orderly development of the international financial system. The financial transaction tax should have a large application field and it would be preferable to be applied to the national markets as well as to the international exchanges. The Financial, Economic and Social Crisis Committee of the European Parliament debated upon the advantages and disadvantages of a possible financial transactions tax, estimating that such a tax, of only 0,05% could eliminate the short-term financial transactions, ensuring a greater stability and contributing with € *300* billion to the European Union revenues (Sabău-Popa Diana, 2010:152).

During the last phase, aimed at creating a real Federal Fiscal Union, the budget, based on own resources, would be managed by a federal European Treasury, responsible for the coordination of the EU economic policy and the transition to a sustainable economy. The European Treasury should be the subject of a decision of the European Council, establishing the deadlines for the different phases and, most of all, the final date that will mark the beginning of Fiscal Union operations.

There is a basic difference between the Fiscal Union and the Monetary Union. The ECB is a constitutional organ whose independence is ratified by the Treaty of Maastricht and whose task – important but limited – is to guarantee price stability. The Treasury would be a constitutional organ of a different nature and should be be subject to the democratic control of the European Parliament (Alberto Majocchi, 2011: 94).

In conclusion, the decision to go ahead with the construction of the Fiscal Union, with a European Treasury, must be backed by a contextual decision fixing the date for the start of the

transformation of the European Union – a supranational organization – into a European Federation.

Conclusions

For a good functioning of the Euro Area, it is necessary that at least the common monetary policy and the common fiscal policy work together. Therefore, in order to avoid the collapse of the Euro Area and eventually the collapse of the European Union, it is extremely necessary to realize as soon as possible the integration of the fiscal policies of the European Union Member states and the creation of a European Treasury. If need be, the common defence policy and the foreign policy of the European Union can wait until the conditions are favourable.

Therefore, the decision-makers of the European Union Member states must understand that they must yield to the Union some of their budgetary and economic powers is order to complete the construction of the Economic and Monetary Union, with the creation of a Federal European Treasury which should guarantee an effective coordination of the national economic and especially fiscal policies.

THE ECONOMIC CRISIS IMPACT ON PUBLIC EXPENDITURES IN EU NEW MEMBER STATES

Sabău-Popa Claudia Diana

Mara Eugenia Ramona
Babes-Bolyai University Cluj-Napoca
Faculty of Economics Science and Business Administration

This article analyzes the main trends of public expenditures in the New Member States 12 in the last decade. We develop a synthetic analysis of the total public expenditures and also an analytical inquiry of major categories of public expenditures according to COFOG. Based on data provided by Eurostat from 2000 to 2010 we try to capture the impact of global financial crisis on the major trends of the public expenditures for new member states. Our purpose is to reveal a global view of the state of public expenditures in this group of EU countries and also we try to make a comparison between Romania and these countries considering that the stance of public finance is quite similar to the new member states. The major findings of this study are the high increase of the public expenditures for all the countries especially in 2009, due to a huge increase of the social protection expenditures. In this context we underline some correlations between the public expenditures evolution and economic growth.
Keywords: public expenditures, fiscal policy; economic growth; budget deficit.
JEL Code: E51; H3; H61.

Introduction

The government role in now days is very complex and important through the major function accomplished by the public finance. The global economic and financial crisis has revealed once again the necessity of state intervention for rebalancing the economy and for recovering after the year 2008. The public sector and the state intervention have to be financed through taxation or if there are not enough revenues borrowing money. The state role increasing was accompanied by the public expenditures increase for the last years, because the public sector size has continuously extended. In this inquiry our purpose is to identify the impact of economic crisis on the public expenditures pattern for the new member states. We choose to realize the analysis only for this group of countries to have a clear view on Romania concerning the public expenditures comparative with similar countries. For this analysis we choose the share of public expenditures in GDP for a better comparative view between countries. Also we use the COFOG classification based on data provided by Eurostat for identifying the public expenditures structure. From this point of view is not only a global analysis, but also a structural analysis. The most important category of public expenditure is social protection with the highest share. The relationship between the economic growth rate and public expenditure is important because is reflecting the impact of economic crisis on the level and the composition of government expenditures.

Literature review

Any government intervention has to be financed through public expenditures. The welfare state existence is based on public revenues from taxes, fees and other forms. The ways in which the governments choose to finance the public sector have major impacts on the economic life.
Brumby, J. and M. Verhoeven (2010) consider that the global crisis has challenged countries to sustain spending that promotes future economic growth and poverty reduction. In particular, countries have made efforts to safeguard expenditure for health, education, and investment. As the crisis was unfolding, the need to support aggregate demand mitigated pressures on public

expenditures. But in the aftermath of the crisis, the need for fiscal consolidation will put renewed pressure on public expenditure in many countries.

The size of the public sector can be expressed by the level of public expenditures. In the last few years the public sector increases, especially in 2008 and 2009. The most important increase is registered for the social protection; for instance in 2007 is 17.6% from GDP and goes to 20% GDP in EU 27. Another important category of public expenditures is health and also we have an increase from 6.7% in 2007 to 7.5% from GDP in EU27, according to data provided by Eurostat Database (Mara, 2012).

According to Hall (2010) there has been a long-term trend for increasing levels of taxation and public spending in OECD countries. Public spending as a proportion of GDP has risen steadily, in line with economic growth, for 150 years. Tax and spending peaked during the two world wars of the 20th century, but the level of state spending and taxation then remained high and rose again in the years after World War II, until around 1990.

The economic crisis from 2008 caused an accelerated increase of public expenditures trend in most of all in countries affected by the crisis.

The social protection expenditures have the most important share in the total expenditures and for this category there is also the highest impact of economic crisis.

Busch (2010) underlines that the global economic crisis affects the funding of social security systems essentially via two channels: on the one hand, due to the higher unemployment, the expenditure of social insurance funds and the state is increasing, while on the other hand, their tax and contribution revenues are falling as a result of lower economic growth or lower wage increases.

Methodology and results

First step in our analysis is revealing the evolution of public expenditures as a % in GDP starting with 2001 until 2010 as average for European Union and for Romania. We choose to compute separately for EU 15 –the old member states and for the NMS 12 –the new member states. In the next figure this evolution is marked for the years of economic crisis when the trend of public expenditures is increasing. The maximum is registered in 2009, more than a half from GDP for EU 27 and EU 15. For the same year the share of public expenditures in GDP is 45% for NMS12 and more than 40% for Romania. For our country there is a different evolution because the trend of public expenditures is increasing before the crisis start, from 2005. After 2009 the governments through successful fiscal policy manage to reduce the public expenditure and this descending trend can be seen for all EU averages.
Figure no. 1. Public expenditures evolution in European Union
Source: realized by author

Considering the particular analysis for every new member states we can observe different trends between these countries. The highest level of public expenditure as percentage in GDP is in Hungary, more than 50%. Also countries like Slovenia and Slovakia registered highest increase of public expenditures in the economic crisis time.
Figure no. 2. Public expenditure evolution in new member states
Source: realized by author

To explain this evolution we have to consider the structural analysis of public expenditure. This structural analysis is based on COFOG classification and data provided by Eurostat for the last decade as average for the NMS 12. In next figure are revealed categories of public expenditures and their evolution. It is important to note that the social protection expenditures count the highest share and starting with 2008 this share is increasing. Two major causes explain this continuously increases: the population ageing and the unemployment increase. Other four major categories follow on this rank: health, education, general public services and economic affairs with similar amounts. First category –social protection – is considered unproductive expenditure, while the last categories are considered productive expenditures. For this reason concerning the economic growth is not an incentive the increase of social protection expenditures, only the other expenditures mentioned above.
Figure no. 3. Structure of public expenditures in NMS 12
Source: realized by author

Expenditure on social protection consists mostly of payments for social protection benefits, which are transfers to individuals or households covering a set of risks or needs. This category of expenditure includes social benefits, operating expenditure and other expenditure incurred by social protection schemes.
Figure no. 4. Social protection expenditures in EU
Source: realized by author

The lowest ration of public expenditures is in Cyprus and Slovakia and the maximum can be finding in Slovenia and Hungary in 2010. But for all NMS 12 the level is below the averages for EU 27 and EU 15. In the EU 15 is the highest ratio because the ageing of population is stronger comparative with NMS 12. Also the welfare state in EU 15 provides plentiful pensions and unemployment allowances comparative with NMS 12.
Figure no. 5 Social protection expenditures in 2010
Source: realized by author
Figure no. 6. Correlation between social protection expenditures and economic growth rate in NMS12
Source: realized by author

For revealing the economic crisis impact we correlate expenditures ratio with the economic growth rate. We choose to test this correlation between the social protection expenditures and economic growth rate using data provided by Eurostat since 1995 until 2010. For NMS 12 are computed the average ratios. Based on the above figure there is a quite powerful correlation of 61% and there is an indirect correlation, fact that confirms the negative impact of economic crisis on this category of expenditure.
Figure no. 7. Correlation between social protection expenditures and
economic growth rate in Romania
Source: realized by author

The same correlation is tested also for Romania for the same time; similar negative impact of economic crisis can be observed but no so powerful like for the average of NMS 12, only 32%.
Figure no. 8. Correlation between total expenditures and economic growth rate in NMS12
Source: realized by author

Concerning the impact of economic crisis on the share of total public expenditures in GDP we can observe similar correlation as in previously case, almost 61% and also a negative impact manifested by increasing of spending on crisis.

Conclusions

The concluding remarks underline this increasing trend of the public expenditures due to economic and financial crisis for all new member states of EU starting with 2008, with a maximum pick in 2009. This evolution is explained by the increasing trend of social protection expenditures –the most important component of total expenditures according to COFOG classification. Another unwanted effect of economic crisis is decreasing of tax revenue because the taxable base (personal income, consumption, profits) was reduced. The major effect of this evolution is revealed by the huge levels of budget deficits of new member states and also increasing the public debt.

In this context the governments try to find solutions for increasing the tax receipt, especially increasing VAT rates for not affecting the economic growth rate and in the same time to reduce the public expenditures. Some countries choose to reduce public expenditures like general public

services (Bulgaria with 4.3 percentage points in 2010 comparative with 2007), economic affairs (Romania and Malta).

But for all EU member states the only solution was to increase the public debt for covering the huge budget deficits, because the impact of global financial crisis was too powerful and unexpected for the national budgets. The economic crisis should be a valuable lesson for the present and future fiscal policy whose coordinates must first be based on a balanced budget to cope with the challenge of future crises.

ADVANTAGES AND RISKS OF USING THE PUBLIC-PRIVATE PARTNERSHIP IN ROMANIA

Sabău-Popa Liviu Mihai
University of Oradea, Faculty of Economic Sciences

This article presents the advantages and risks of the public-private partnership in realizing the public investments in Romania. Public-private partnerships refer to the forms of cooperation between public authorities and private entities and target the regulation of the design, financing, construction, operation, rehabilitation, development, rental and transfer of any public work, asset or public service. It is a formula agreed by the public authorities by which the solving of public problems of general interest is "commissioned" by attracting entrepreneurs from the private sector.
One of the main arguments for supporting the public-private partnerships in case of public investment projects is the transfer of the managerial competencies and of the know-how from the private partner to the public one.
One of the main risks of the public-private partnerships is related to the temptation of using the private-public partnerships as a means of eluding the budgetary pressure, which may lead to their inadequate use.
Key words: knowledge transfer, concession and joint venture, public-private partnerships, public investments.
JEL Code: D23, H54, E60

Introduction

The involvement of the private sector in providing public assets is a longstanding practice in the Organisation for Economic Co-operation and Development countries. Public-private partnerships are effective means to deliver infrastructure projects (which may produce a rapid return to economic growth in the current context), to provide public services and to innovate. Public-private partnerships are attractive to the private sector because the investment is recovered either by governmental transfers and/or by charges applied to the users of the facility. As benefits are obtained by the participation of the private sector (practicing innovative solutions, better allocation of inputs), public-private partnerships can represent a better solution than the traditional public procurements.

In the EU, public-private partnerships have developed in the transport sector, in the area of public buildings and equipment (schools, hospitals, prisons) and the environment. Many EU Member states only have a limited experience of public-private partnerships or none at all (Mihai Petrescu, 2010: 54). In terms of overall management of public services or the construction and operation of public infrastructure in the EU, the spread of public-private partnerships is still rather limited.

Of the entire EU, Great Britain uses the most the public-private partnerships; the total value of the 935 agreements of this type is £66 billion. The sectors preferred in the public-private partnerships in Great Britain are the transport sector (road, rail), building prisons, hospitals and public housing.

In the paper *Public-Private Partnerships and Investment in Infrastructure,* Sónia Araújo and Douglas Sutherland underline that public-private partnerships are best suited when there is a positive externality between the construction and the operating phase, which gives incentives for the private sector to internalise the costs of service provision and asset maintenance in its decisions at the construction phase. To allow the private sector to explore innovative solutions, the contract should lean towards output specification rather than input requirements. In the absence of this positive externality, the government should grant the private sector the ownership of the asset. In this case, public-private partnerships are more suitable for leisure centres and public housing, as the number of buyers is potentially higher, allowing the private sector to enjoy a higher bargaining position relative to a situation where the public sector is the sole buyer.

The recent economic crisis has had a major negative impact on public-private partnerships projects due to the fact that there has been a marked reduction in the availability of bank lending and a significant deterioration of the financial conditions offered for public-private partnerships lending and also some national governments and regional authorities have reduced or put on hold their public-private partnerships programmes.

1. Legislative framework of the public-private partnerships in Romania

Public-private partnerships refer to the forms of cooperation between public authorities and private entities (NGOs, businessmen associations, companies) in order to realize a project with positive effects. These partnerships target the regulation of the design, financing, construction, operation, rehabilitation, development, rental and transfer of any public work, asset or public service. The role of the public partner is to finance and to implement the general interest objectives, to establish the prices. The role of the private investor is to finance, design, realize and operate on economic criteria the objective of the public-private partnership agreement.

Currently, these public-private partnership agreements for public works in various fields of activity are regulated by the much-disputed Law 178/01.10.2010 and by its Application norms, the Government Emergency Ordinance 39/21.04.2011 to amend and complete the Public-Private Partnership Law 178/2010 and the Government Emergency Ordinance 86/17.10.2011 to amend and complete the Public-Private Partnership Law 178/2010.

The public-private partnership agreements had been regulated before by the Government Ordinance 16/2002, which was abrogated once the Government Emergency Ordinance 34/2006 entered into force, concerning the public procurement contract awarding; the notion of "public-private partnership" was replaced with that of "work concession", which led to confusions in the business community. This legislative initiative proved to be an obstacle to the development of public-private partnerships because of several reasons, out of which the most important is, in my opinion, is the fact that not all the ways of realizing the public-private partnerships were regulated. A proof of this is the very small number of public works and public services concessions, where we cannot find the concept of "partnership", as it was replaced with that of "concession".

The Public-Private Partnership Law 178/2010 defines under Art. 4 the *public-private partnership agreement (project agreement) as* the legal document concluded for a definite term between a public authority and a private investor after the whole completion of the stages of preliminary analysis, selection of private investors, conclusion of the project agreement, negotiation. Before concluding this partnership agreement, another legal document must be concluded – *the project agreement*, for the purpose of preparing the public-private partnership agreement.

Art. 4 of the Law 178/2010 also regulates the functioning of the *project company* – the company residing in Romania, having as associates or shareholders both the public and the private partner, which are represented on a pro rata basis according to the quota of participation in the public-private partnership project, the public partner participating with a contribution in kind; The assets of the projects company, classified as non-assets, will be registered in the quarterly and yearly financial statement of the involved public partner, for the only purpose of the public-private partnership development. It will function throughout the period during which the public-private partnership agreement is developed and it will be closed at the date of its end.

Throughout the development of a public- private partnership agreement, the partners' related rights and obligations cannot be assigned. The project company cannot change its subject of activity and cannot develop economical operations which are beyond the precise purpose of the public-private partnership for which it was created or of its development for the community's benefit.

Upon the completion of the public-private partnership agreement, the project company transfers free of charge, the public asset achieved under the public-private partnership agreement, in a

good state, exploitable and free of any charges or obligations. The properties resulted from the implementation of the public-private project and the lands occupied by the project, except for the assets under public property, and that cannot be disposed of or encumbered can be mortgaged, pledged and they can be guarantees for the party financing the public-private project, during the validity period of the agreement.

Since the negotiation procedure initially included in the Law 178/2010 ignored the community norms referring to the obligation to ensure the transparency of the procurement procedure and real remedies for those whose candidateships had been rejected, the Government Emergency Ordinance 39/2011 stipulates only two procedures of awarding the public-private partnership agreement: the open procedure and the competitive dialogue procedure.

The value thresholds for the public-private partnerships agreements, which are actualized by Government Decision are the following (Law 178/2010, art.5 (1)):

- The equivalent in lei of 125.000 Euros without VAT, for assets and services;
- The equivalent in lei of 4.845.000 Euros without VAT for works.

The public-private partnership can be realized by the conclusion of agreements having as object assets, services or works. Art. 4(1) of the Government Emergency Ordinance 86/2011 specifies that these public-private partnerships agreements having as object works, assets and services include the agreements awarded for the execution of a relevant activity in the fields of public utility: natural gas, thermal and electrical energy, sewage, transport, postal services, exploration and extraction of oil, gas, coal or other solid fuels, ports and airports.

Art. 11 of the Law 178/2010 stipulates that the law does not apply to the conclusion of public-private partnership agreements that:

- have as object the purchase or lease, by any financial means, of lands, existing buildings, other immovable assets and rights to the same;
- refer to the purchase, development, production or co-production of programs for broadcasting purposes, by radio and television institutions;
- refer to the provision of arbitration and conciliation services;
- refer to the provision of financial services with respect to the issuance, purchase, sale or transfer of movable assets or other financial instruments;
- refer to the employment of labor force, namely the conclusion of employment contracts;
- refer to the provision of research – development services fully remunerated by the public partner and whose results are not exclusively dedicated to it, for its own benefit.

The Government Decision 1000/20.10.2011 abrogated the whole chapter III which specified the types of public-private partnership agreements. Thus, Romanian legislation does not limit the types of public-private partnership agreements which may be concluded. The partners may establish various types of public-private partnership agreements, provided that the Law 178/2010 is respected, together with its application norms, as subsequently amended and supplemented.

2.Public-private partnership versus concession

The *public-private partnership* is a formula agreed by the public authorities by which the solving of public problems of general interest is "commissioned" by attracting investors from the private sector. Usually in this type of association, the public authority has a contribution in kind (material resources, lands, buildings) and the private investor contributes with the knowledge, logistics, managerial experience and the financial support of the business. The public-private partnership, developed due to the existence of the project company, is characterized by the fact that the public sector and the private sector co-operate according to reciprocity principles, each of them having its own objectives: satisfying the general interest for the local government of municipalities and obtaining profit for the private partner (Marian Stoian, 2010:172).

The main form of public-private partnership used in the EU member states is *concession,* also used in Romania until the Law 178/2010 was passed, stipulating under art.10 that the conclusion of public-private partnerships is not possible if one of the following conditions is met:

- *the public works concession agreements and the services concession agreements* regulated by Government Emergency Ordinance no. 34/2006 on the award of public procurement contracts, of public works concession agreements and of services concession agreements, as approved, as subsequently amended and supplemented by Law 337/2006, as subsequently amended and supplemented, and the related legislation;
- *the agreements on the concession of assets under the public property*, regulated by Government Emergency Ordinance no. 54/2006 on the regime of the concession agreements of assets under public property, as approved, as amended by Law 22/2007, and by the related legislation;
- the joint venture agreements regulated under the law.

I have to mention *the main differences between a public-private partnership agreement and the concession agreement:*

- for the public-private partnership there are only two types of procedures (the open procedure and the competitive dialogue procedure), according to the updated Law 178/2010, compared to the four types of procedures stipulated in the Government Emergency Ordinance 34/2006 for the concession (open tender, restricted tender, competitive dialogue, negotiation with the prior publication of a participation announcement*).*
- For the public-private partnership, according to the updated Law 178/2010, there is no restriction/conditioning to subcontract with third parties some works, while according to art. 225 of the Government Emergency Ordinance 34/2006, the concessionaire must subcontract with third parties at least 30% of the overall value of the works subject to the concession.
- Unlike the concession agreement, the public-private partnership agreement does not entitle the public partner/contracting authority to receive from the public investor payment of a preset amount for the right to exploit for a definite term the services or the achieved asset.
- In case of public-private partnership, the risk of work interruption on a certain project is much smaller than in case of concession, where, as seen before, in some situations, this led to significant delays. Moreover, regardless of the situation of ending the cooperation before the settled term, the works already done remain in the project company patrimony.

3.Advantages of using public-private partnership in Romania

Public-private partnerships refer to the forms of cooperation between public authorities and private entities and target the regulation of the design, financing, construction, operation, rehabilitation, development, rental and transfer of any public work, asset or public service. The role of the public partner is to finance, establish and implement the general interest objectives, to establish the prices and the quality of the assets/works/services. The role of the private investor is to finance, design, realize and operate on economic criteria the objective of the public-private partnership agreement. The sharing of responsibilities and of the financing necessary in order to realize the investment, but also the risk-sharing are stipulated in the agreement.

A first argument for supporting the public-private partnerships in case of investment projects is *the transfer of the managerial competencies and of the know-how from the private partner to the public one.* The contribution of the private sector consists in capital or other assets and in the transfer of managerial competencies to the public sector, ensuring thus a modern management and performant economic models to the public sector, compensating the lack of expertise of the

technical personnel of the public administration. On the other hand, the public sector ensures rules, financial stability and sometimes a redistribution of resources for the private sector.

A second argument for using public-private partnerships is that *they diminish the immediate pressure upon the public financial resources by providing an extra source of capital*. In turn, the participation of the public sector within a project offers serious guarantees to the private investors, regarding the long-term flows of capital, as well as regarding the integration of some social and environmental benefits in the projects (Mihai Petrescu, 2010:53).

A third argument for the development of public-private partnerships in Romania is the fact that *they can reasonably transfer a part of the risks to the private partner*. If the tasks are well distributed, an efficient risk sharing and management decreases the project costs.

A fourth argument is the possibility *to obtain lower long-run costs for the Romanian state* and also the fact that it will not have to make any payment until the service is provisioned according to the agreement. The lower project costs can be explained by the fact that the private partner can borrow funds easier and with lower interest rates than the public authorities. The financing costs of public investments projects are distributed during the whole life of the asset, which determines a diminishment of the immediate pressures upon public budgets,

Moreover, these public-private partnerships realize the mobilization of private financial resources and their association to the public financial resources, which, in the current economic context, when we must maintain the discipline of public finances, is a very important advantage, taking into account that Romania, just like the rest of the EU member states wants to increase the rhythm of the investments.

But, in order to have a positive activity in the PPP field some conditions have to be fulfilled such as: the stability of the cash flows, the punctual and complete provision of services, according to the agreement, the existence of a stable commercial law and of a stable profit rate.

4.Risks associated to the public-private partnership in Romania

The option to deliver infrastructure services by public-private partnerships is not free of risk, as Douglas Sutherland observes in his paper *Public-Private Partnerships and Investment in Infrastructure*.

First of all, *the advantages of the participation of the private sector are not guaranteed in a public-private partnership*. The result depends on several elements, from the correct identification of the most effective offer, to the adequate risk sharing and to the contract relationship established between the public and private partners.

Secondly and probably most importantly, *the temptation of using the public-private partnerships as a means of eluding the budgetary pressure may lead to their inadequate use.* The political decision makers must carefully analyze the option of provisioning infrastructure services by public-private partnerships, taking into account the specificity of the asset as opposed to the traditional public procurements. Because of the corruption existing in our country, the public-private partnerships are the most exposed to become "black holes" for public money if a permanent monitoring from the qualified authorities doesn't take place.

In the third place, in Romania, not all the levels of the public administration have the specific structures for the evaluation of partnership opportunities and projects, and thus the regional development programmes cannot be correlated to the local ones.

In the fourth place, private investors are reticent about concluding public-private partnerships with the Romanian public authorities, given the lack of guarantees for financial risk coverage and investment recovery. The Romanian state can offer financial guarantees for a certain public investment of maximum 49% of its overall value.

Besides these inconvenients, the effective conclusion or implementation of a public-private partnership is affected by the difficulty to harmonize the interests of all the involved partners, by the lack of trust from the initial implementation period of the partnership and by the fear that the

partnership might be transformed into an immediate source of profit (Institute for Public Policy, 2004, 26).

Conclusions

The recent economic crisis has had a major negative impact on public-private partnerships projects, which have been reduced or even put on hold.

The development of public-private partnerships is, therefore, currently being restricted by two factors: the significant increases in the cost of debt for public-private partnership projects and the substantially reduced maturities being offered by banks on their debt.

Romanian public administrations use on a limited scale the public-private partnership as a tool for local development. A strategic approach of local development on a department level and the establishment of a relationship between the local development of the department and the region are necessary for the public administration to be able to promote the partnership system.

Therefore we need a modern and flexible public administration, which can manage the priority public investments for local development, which includes as an implementation tool the public-private partnership.

THE LEVELS OF VALUE IN BUSINESS VALUATION. THE DISCOUNT FOR LACK OF MARKETABILITY

Sacui Violeta
West University Timişoara
Faculty of Economics and Business Administration Timisoara

Miclea Szatmary Camelia
West University Timişoara
Faculty of Economics and Business Administration Timisoara

This paper approaches the subject of levels of value used in business valuation and adjustments (discounts and prime) that enable professional business valuers to relate these in order to determine the value of a business or ownerships interests in a business. Marketability and control over business decision have a profound impact on the value of an ownership interest. Valuators, regularly, reduce the value of an investment interest if it lacks a ready market. In this paper, I highlight the difference between the marketability and liquidity and, the differences between the the discount for lack of marketability and discount for lack of control. A discount for lack of marketability is closely associated with, but, conceptually, distinct from, the discount for lack of control. I present the characteristics of discount for lack of marketability and the rational of applying it in valuation of minority and majority interest.

1. Introduction

When business owners think about the value of their business, they are almost always implicitly thinking about the value of the business in its entirety. In this case the value of a single share, for example, is the value of the whole business divided by the number of shares.

Many times, valuation cases do not imply estimation of the value of a company but the value of the blocks of shares in a company. The determination the value of a stock through dividing the value of the whole business by the number of common shares may not be an accurate method if the block of stock under consideration does not assure the control on the enterprise.

Many times, interests in businesses are often held directly by multiple owners**.** In this case one owner has only a fractional (partial) interest in an entity.

Fractional interest valuation implies determination the value of ownership of a portion of a corporation. A fractional ownership interest may be worth less than its proportional share of the total business. For example, ownership of a 20% share in the business may be worth less than 20% of the entire company value.

The market values of these fractional interests are generally discounted from their proportional share of the whole. The degree of value reduction for fractional interest is determined, primarily, by whether or not it is a controlling interest. Secondly, the degree of value reduction for fractional interest is determined by whether or not it is a marketable interest.

Function of the percentage owed there are two categories of *fractional interest* in a business: *majority (controlling) interest* and *minority interest* (non-controlling interest).

Function of ease with which the interest can be transformed in cash there are, also, two categories of *fractional interest* in a business: *marketable interest* and*, non-marketable interest.*

2. The Levels of Value in Business Valuation. Previous Research

Levels of value are conceptual points at which can be calculated the value of business interest. Marketability and control over business decision have a profound impact on the value of an ownership interest. There are four basic levels of marketability and control:

-the marketable controlling interest (a controlling share in a public company)
-the non-marketable controlling interest (a controlling share in a private company)
-the marketable minority interest (minority share in a public company)
-the non-marketable minority interest (a minority share in a private company)

A majority interest versus minority interest

For valuation purposes, *the concept of control* or, *absence of control*, relates to a shareholder`s ability to influence, respectively, do not influence, the company`s affairs. The determination of whether the valuation should be on **a** controlling interest or minority interest basis is a very important aspect. Shares may be subject to premium or discounts, depending upon whether they represent controlling or minority interests.

The concept of "business value" reflects the value of the 100% interest representing total control (Howitt, Idelle A. 1993). This is a usual indicator of a company value for merger or sales purposes. It is the value of the business as a whole. A" control interest" is defined as ownership of more than 50% of the business. These two positions (100% interest and, more than 50% of the business) also are known as majority interest positions.

The majority interest in a corporation is the ownership of an amount of stock which does enable the holder to exercise the control. *A minority interest* in a corporation is the ownership of an amount of stock which does not enable the holder to exercise the control. Generally, *a minority (non-controlling) interest* is defined as less than 50% of the total equity held. An investor has a minority interest in the firm if he held small blocks of stock that represent less than 50% of the company`s equity, and usually much less than 50%.

A marketable interest versus non-marketable interest

For valuation purposes the concept of *marketability or, lack of marketability,* relates to a shareholder`s ability to transform its interest easily in cash. The determination of whether the valuation should be on a marketable interest or nonmarketable interest basis is other very important aspect. Shares may be subject to discount that adjusts for degree of marketability.

In general, investors value marketability. Therefore, other things being equal, investors will pay more for an asset that is readily marketable than for an otherwise identical asset that is not readily marketable. All other factors being equal, an interest in a publicly traded company is worth more because it is readily marketable (an owner can sell his/her shares on the stock market). Conversely, an interest in a privately held company is worth less because no established market exists.

2.1 The Concept of Marketability. The Marketability versus Liquidity

According with International Glossary of Business Valuation Terms the marketability is defined "the ability to quickly convert property to cash at minimal cost". The concept of marketability centres on the ease with which the holder of a stock ownership interest can convert the security to cash in terms of timing, the reliability of realizing the quoted proceeds, and transaction costs (Ronald D. DiMattia, 2008).

The terms of liquidity and marketability are often used interchangeably, although there is a "technical distinction" between them (DLOM Job Aid, 2009).

Marketability is similar to liquidity, except marketability simply indicates that the security can be bought and sold easily, whereas liquidity implies the value of the security is preserved.

Marketability is the capability and ease of transfer or, saleability of an asset (DLOM Job Aid, 2009). Marketability may be defined as a measure of the ability of a security to be bought and sold and to be converted into cash quickly and at minimal cost. Therefore, if an active marketplace for a security exists, it has good marketability**.** The marketability can be restricted by agreements and regulation (DLOM Job Aid, 2009).

Liquidity is the ability to readily convert the asset into cash without significant loss of principal. Liquidity centres on the ability to find a buyer.

Marketability indicates the fact of "Saleability", while Liquidity indicates how fast that sale can occur at the current price. Between marketability and liquidity there are the following relationships (DLOM Job Aid, 2009)**:**

 - if an asset is liquid, it is marketable;

 - if an asset is not marketable, it is illiquid;

 - if an asset is illiquid does not necessary mean that it is non-marketable – it may still be sellable but not quickly or without loss of value.

Pratt and Reilly (2000) distinguish marketability and liquidity as follows: "…with marketability focusing on finding the appropriate market, preparing the property for sale and executing the trade, and liquidity focusing on realizing cash proceeds**."**

2.2 The Discount for the Lack of Marketability

The control premium and *the marketability discount* are conceptual adjustments enabling professional business valuers to relate the marketable minority level of value with the controlling interest level (control premium) and, nonmarketable minority level (marketability discount). *The minority interest discount* relates the controlling interest and minority levels.

According with the International Glossary of Business Valuation Terms, Discount for Lack of Marketability (DLOM) is "an amount or percentage deducted from the value of an ownership interest to reflect the relative absence of marketability."

The DLOM is a downward adjustment to the value of an investment to reflect its reduced level of marketability. Studies have shown that, because investors are risk averse, they apply a considerable discount to stocks that are not freely tradable. The inability to readily sell a financial interest significantly reduces its value.

Valuators regularly reduce the value of an investment interest if it lacks a ready market. As part of the appraisal process, the appraiser must determine the appropriate discount for lack of marketability that should be applied to a specific business ownership interest (DLOM Job Aid, 2009)**.**The application of the Discount for Lack of Marketability (DLOM) can result in a significant value reduction as compared to the pro rata value of a business interest. The DLOM can be the valuation adjustment with the largest monetary impact on the final determination of value.

 The application of DLOM can be a crucial aspect in the valuation of the stock of a privately held company because many valuation methods used by appraisers determine the obtaining a marketable indication of value (Ronald D. DiMattia, 2008).Values derived from   methods that apply aspects of securities of publicly traded companies result in what is termed a "publicly traded equivalent value".

3. The rationale for DLOM. The comparison of Discount for Lack of Marketability with Discount for Lack of control. The Results of Research

A discount for lack of marketability is closely associated with, but conceptually distinct from, the discount for owning a non-controlling interest. The marketability of stock shares is a concept that is distinct from the level of control, but related to it. It is well known that the shares of the closely held firms do not have the liquidity of the publicly held companies. The level of marketability associated to shares of the closely held companies is influenced by the level of control.

The marketability of a controlling interest in a private company is affected by two factors: *the transaction time* and *the transaction costs*. The owner of a controlling interest in a private company may incur, firstly, a *significant period of time* to sell its part. This situation is due to the fact that there is not a ready market for controlling interest in the companies. The unknown time for a sale is considered the fundamental rationale for discounts for lack of marketability. It may take months or years to sell an entire private business and it is almost impossible to sell minority (less than 50%) interest (Rand M. Curtiss, 2009).

Secondly, the owner of a controlling interest in a private company may incur significant costs associated to selling. These costs will be of two types: direct costs of the sale and, the opportunity costs. *The direct costs of the sale* are represented by *legal, accounting* and *transaction fees*. *The opportunity costs* are represented by the cash-flows on alternative investments that are given up by the seller as result of his incapacity to sell in short time.

The minority interests in closely-held companies tend to be *much* less marketable than majority interests. Frank C. Evans (2011) put the question: „who wants to buy a minority interest in a private company where there may be little or no assurance of any annual cash return on their investment and little or no market available for a resale of those shares?"

The marketability of a minority interest in a private company is, also, affected by the transaction time and transaction costs associated with selling but appear another important element that must be taken into consideration. This is lack of transferability. Ownership interests in closely held businesses are frequently subject to agreements restricting their transfer. Often, transfers are restricted to family members, and other owners are the only permitted buyers of interests. These restrictions limit the pool of available buyers, further reducing liquidity and, implicit, the value. For most minority shareholders, sale must await action by the controlling stockholder, such as sale of the company.

Frank C. Evans (2011) highlighted that:„The 100% control shareholder in the private company possesses relatively high liquidity: he or she can choose to sell the company, with marketability primarily determined by the time required to find a suitable buyer and close the deal and the associated transaction cost. This level of illiquidity often creates a discount that ranges from 3% to 15%. Conversely, the minority shareholder cannot force a sale of the company, frequently faces severe restrictions on the transfer of shares, and must find a buyer willing to invest in the unattractive lack of control interest. The result is severe illiquidity, which usually carries a marketability discount of at least 33% to 50% from a freely traded value."(1).

The Discount for Lack of Marketability is deducted from the value of the entity as a whole. It applies to all shares, not just the minority stake being valued, to reflect the relative illiquidity of the shares compared to those of publicly traded companies. On the other part, the Discount for Lack of control is deducted from the proportionate share of the value of the minority stake being valued, to reflect the absence of control prerogatives.

The DLOM is applied after the minority interest discount or control premium.

Conclusions:

Fractional interest valuation implies determination the value of ownership of a portion of a corporation. A fractional ownership interest may be worth less than its proportional share of the total business. The market values of these fractional interests are generally discounted from their proportional share of the whole. The degree of value reduction for fractional interest is determined by the degree of control and degree of marketability. Levels of value are conceptual points at which can be calculated the value of business interest. Marketability and control over business decision have a profound impact on the value of an ownership interest. The DLOM is a downward adjustment to the value of an investment to reflect its reduced level of marketability.

The marketability of stock shares is a concept that is distinct from the level of control, but related to it. The level of marketability associated to shares of the closely held companies is influenced

by the level of control. The marketability of a controlling interest in a private company is affected by two factors: *the transaction time* and *the transaction costs*. The minority interests in closely-held companies tend to be *much* less marketable than majority interests. The marketability of a minority interest in a private company is, also, affected by the transaction time and transaction costs associated with selling but appear another important element that must be taken into consideration. This is lack of transferability. Ownership interests in closely held businesses are frequently subject to agreements restricting their transfer. Often, transfers are restricted to family members, and other owners are the only permitted buyers of interests. These restrictions limit the pool of available buyers, further reducing liquidity and, implicit, the value.

ROMANIAN INTERNATIONAL TRADE CHARACTERISTICS DURING THE RECENT CRISIS

Sandu Carmen
"Alexandru I. Cuza" University of Iasi, Faculty of Economics and Business Administration

The present paper aims to reflect the main changes in Romanian international trade during recent crisis. Using databases from Eurostat and United Nations Conference on Trade and Development we reflect a sharp decrease in the start of 2009 and an increase during this period to nowadays. The situation is similar in the Central and Eastern Europe countries.
Keywords: international trade, financial crisis, balance of payments, Romania
JEL Codes: F10, F32

I. Introduction

Haidar (2012) reflects that Eurozone recent crisis has shown that current account problems in developing countries affected European Monetary Union partners and have spread the crisis to other European countries. A large number of scientific articles and the most important international financial institutions like International Monetary Fund highlighted exports decrease in 2009, after two years with important imbalances in the financial sector.

II. An analysis on Romanian international trade evolution

In the socialist period, Romanian industrial activity increased and authorities were oriented on exports in order to achieve the full payment of the national debt. The United Nations Conference on Trade and Development (UNCTAD) reflected a higher volume of exports and imports during 1980-2004 periods [graph no. 1].
Source: United Nations Conference on Trade and Development (UNCTAD), 2012

Graph no. 1: Exports and imports volume in Romania during 1980-2004 period (millions of USD)

In 1990, Romanian balance of payment situation was positive after the socialist regime has paid the national debt. After this year, all regulation mechanism on international trade deteriorated and the current account recorded serious imbalances in a context of a higher volume of imports and reduction of international reserves. In these circumstances, in 1998, the balance of payments deficit were 2,6 billions USD. The balance of goods and services deteriorated due to a higher

volume of imports over the capacity of national enterprises, a reduction of border protection and a domestic demand growth due to higher real wages and national currency real appreciation.

After 2000, Central and Eastern Europe countries have recorded a sharp increase in exports relative to that of imports based on lower oil and external materials prices [graph no. 2].
Graph no. 2: Exports of Central and Eastern Eastern Europe countries, European Union members in 1992Q1-2011Q1 periods (millions EUR)

Between Central and Eastern European countries in the European Union the largest volume of exports is registered in Poland (in fact, the only European country that has registered growth in the recession), followed by Czech Republic, Hungary, Greece, Slovakia, Romania , Slovenia and Bulgaria. Beyond that comparison is difficult due to different structure and characteristics of European economies mentioned above, the graph indicates the countries of the region with intensive foreign trade activity. On the other hand, the volume of imports follows a trajectory similar to that of exports [graph no. 3].
Graph no. 3: Imports of Central and Eastern Eastern Europe countries, European Union members in 1992Q1-2011Q1 periods (millions EUR)

It is worth noting that international trade dynamics of the states in the region recorded a decrease during the crisis. However, you can see the increasing trend of imports and exports in most countries in the region since 2009.

Returning to the situation of Romania, a stable national currency in the 2005-2007 periods and a lower inflation rate had no significant effect on the development of exports. During crisis, after a

sudden decrease in 2008, was followed by an increase in both exports and imports volume [graph no. 4].
Graph no. 4: Evolution of imports and exports in Romania during 2003Q1 – 2011Q1

In 2005, we reflect a downward trend for exports and an increase in imports, except for July and September of 2005 when is reflected a slight improvement in the situation of the balance of goods and services.

In 2006 the trade deficit amounted to 11.759 billion euros and GDP ratio increased to 12.1%. The trade deficit deteriorated by 50.6% over 2005 as the exports decreased and imports increased. Trade balance deficit was generated by developed countries (58.4% of which 51.2% of EU trade), followed by trade with developing countries (25.6%) and poor countries (16%). Coverage of imports by exports and openness of the Romanian economy were 68.7% and 68.5%. Exports of goods amounted to 25.85 billion euros, up 16.2% due to foreign price increases for processed products. Imports of goods were 37.609 billion euros, up 25.1% over 2005.

Increasing trade deficit was attributed to internal structural changes and economic catching-up process. Also, the currency appreciation has influenced growth gap between imports and exports. However, exports have had a robust growth rate based on lower prices of Romanian products. In 2007, exports of goods totaled 29.402 billion euros, up by 13.7%, due to the higher external prices, volume and structure changes for exports of capital goods. Imports of goods had a value of 47.067 billion euros, registering a growth rate of 25.1% due to the increase in international prices and domestic demand for capital goods, intermediate goods and consumer goods. Surplus value was generated mainly by the increase in physical volume of imported goods.

EU accession led to sharper's goods and services imports increased to 17.345 billion euro deficit, up by 47.6% over 2006.

In 2008, exports of goods totaled 33.628 billion euros, up 13.8 percent from the previous year due to higher external prices and volume, change the export structure in favor of capital goods and depreciation in real terms national currency against the euro. In 2008, we reflect an increase in the share of capital goods and raw materials. Main source of which is manufacturing provided 94.8% of Romanian exports. Imports of goods amounted to 52 billion euros, up by 9.8% over the previous year. In 2008, the structure of imports by output stage shows the increase of raw materials and consumer goods, while the share of intermediate goods remained unchanged.

Excess of imports was determined in 88% of external price increases as oil products, natural gas, petroleum products, machinery and electrical equipment etc.

In 2009, global economic activity began to shrink due to adjustment of balance sheets of firms and household incomes and the wealth effect of declining confidence. Emerging economies, including Romania, have been affected by the slowdown in developed countries and reduce global trade, due to lower global demand. However, Romania recorded a trade deficit of 7.165 billion euros, down by 61.2% over the previous year. Manufacturing provided 92.3% of Romanian exports. Intra exports represented 74.3% of the total, increasing by 3.8% compared to 2008.

Difficulties that have arisen in the Romanian economy have caused an oscillating evolution of international trade. In 2010, the current account deficit of balance of payments was 4.969 billion euros, the lowest level in the last seven years as a share of GDP (4.1%).

In 2010, exports and imports have resumed growth after the decline recorded in 2009 and early 2011, there is even a favorable situation. Most trade deficit was caused by intra-Community trade. Coverage of imports by exports increased by 5.4% to 86.3% and the openness of the economy increased by 10.7% to 66%. In 2010, exports of goods recorded 37.293 billion euros, up 28.2% as a result of recovery in domestic demand. The increase of exports from the previous year came in 58.6% share of the increase of the cars and the like, while 41.4% was due to foreign prices. Imports of goods totaled EUR 43.199 billion up 20.1% from 2009.

Overall, in recent years several trends have emerged on the international trade of Romania (in line with changes made in the world):

• increasing the share of world exports of manufactured products in the structure;

• an increase in exports of manufactured products at a rate faster than exports of agricultural products.

Table no. 1: Concentration and diversity index of exports and imports of Romania

Exporturi					
2000			**2009**		
Number of exported products	*Diversity index*	*Concentration index*	*Number of exported products*	*Diversity index*	*Concentration index*
242 (**260**)	0,550 (**0,159**)	0,132 (**0,067**)	251 (**260**)	0,431 (**0,207**)	0,097 (**0,060**)
Importuri					
2000			**2009**		
Number of imported products	*Diversity index*	*Concentration index*	*Number of imported products*	*Diversity index*	*Concentration index*
250 (**260**)	0,347 (**0,088**)	0,071 (**0,069**)	252 (**260**)	0,263 (**0,125**)	0,065 (**0,064**)

The observed situation highlighted an increase in the number of products exported by Romania due to the increase and diversification of exported products to the import situation where growth is weak. Compared to 2000 there is a decrease of diversity index on lower differences from the global average. It can be said that the structure of exported products differs by about 43% to the global average. If the difference is less imports, being around 26%.

In Romania, the concentration indices have low values and the structure of products involved in international trade is a less concentrated on certain products.

III. Conclusions

It is worth noting that international trade dynamics of the states in the region recorded a decrease during the crisis. However, you can see the increasing trend of imports and exports in most

countries in the region since 2009. In Romania, automotive was the main incentives that sustained the domestic exports. The overall volumes of imports and exports have been affected by the slowdown in developed countries and a reduced global trade, due to lower global demand.

ECO – FISCAL POLICY IN ROMANIA: MITH OR REALITY?

Vuta Mariana
Bucharest Academy of Economic Studies
Faculty of Finance, Assurance, Banks and Stocks Exchange

Fiscal ecology has become in recent years a very interesting subject in Romania and in the recent European context specialists are filling their agendas with points about the environmental policy and the environmental fiscal policy are top priorities.

But is there the Romanian stat able to use environmental fiscal instruments in order to regulate economical agents behavior or is the state just using them as fiscal instruments with no environmental purpose? In a world that is constantly moving and is facing different problems, states are trying to find new ways to create budgetary resources in a crisis situation. What is Romania's position?

Environmental Romanian fiscal policy has to be though in the general economic context, being included in the general social and economical problems. Thus, the fiscal policy should aim at integrating into costs consumption and production externalities but his causes several effects hard to dimension.

The Romanian fiscal system needs hard coercion measures and a total rethinking of the imposing system in order to become efficient. Therefore, only after 2000 we can state that Romania had real environmental taxes but how are often modified both as way of determination and imposing base, things that have generated lack of trust and even panic among the economic agents.

In this context, the paper aims to underline the environmental fiscal policy characteristics applied in the European Union states and especially Romania, in order to surprise the role of the environmental taxes by comparison with other direct taxes, underlining at the same time the national fiscal policy modifications.

Analyzed data has been coming from different sources. Thus, for international comparisons the European Union site has been used, the Eurostat, the Romanian Finance Ministry site. The research is mainly based upon a synthesis of the reached area in the special literature. The study continues a fundamental research using deductive and inductive research mechanism in order to delimit the used concepts.

Keywords: eco-fiscal policy, environmental taxes, fiscal policy, energy taxes, fiscal burden
JEL classification: H23

Introduction

The human kind is facing the most dramatic crisis since the '29 – 33's one, crisis that does not imply just economical and financial elements but also social and environment ones. Are there still pertinent solutions for the environment sustainability and is there still a way for states to implement fiscal policies with an impact upon the environment? In the European context every state wishes a stable and coherent fiscal policy which will offer the possibility, on one side, to attract new and more foreign investments and, on the other side, to increase the collection degree of taxes. Romania is aiming at the same things but because of some elements, not always related to fiscal factors, it is not able to increase the collection degree but rather to increase the fiscal burden and especially the indirect taxation (the VAT has been modified from 19% to 24% which has lead to a decrease of consumption and not to an increase of VAT encasements).

1. Environmental fiscal policy in Romania: between "can" and "do"
1.1 Environmental fiscal policy general characterization

In a general sense the environmental fiscal policy means all the taxes and royalties applied upon any products and services that can damage the environment or upon polluters by burdening upon renewable or non-renewable resources (OECD 2001: 16). This definition is putting into practice the principle the "polluter must pay" that is specified in the Romania legislation too.

Environmental policy works like an externality internalization instrument, the externalities been considered a cost impose to an economic agent that does not take it into consideration in future decisions (OECD 2001: 22), while others consider that internalizing externalities can't be done without negotiations been parties – the victim and the polluter (Coase 1960: 1-44). Putting this

negotiation into practice is very difficult because cost related un-clarities will emerge and a prohibitive cost may appear and it can be higher than the social gain possible to obtain.

On international level the environmental policy is inciting firms to respect regulations because decreasing pollution will allow the firm to make economies equal to the pollution permit cost or tax, stimulating innovation, research and non-polluting technology. If there is not coherence and consensus in applying these instruments the environmental taxes impact upon competition will not have the expected result.

Although environmental taxes are aiming to make the economical agents and population more responsible as regard to their actions that can damage the environment we have to state that in establishing these policies the state will follow the principle "the polluter pays" because the one responsible for the damage should support the damage cost. The fiscal reform starter in the '90's is, practically, still going on in every state but in different rates and with different reactions. After the '90's Denmark, Finland, Germany, Holland, Switzerland have imposed environmental taxes but at the same time have decreased labor taxes (in order to maintain an constant fiscal pressure and to avoid a double dividend taxation), Slovenia has introduces in 1997 a tax upon CO_2 emissions applied to all energetically products while the Czech Republic has realized the environmental tax reform in 2008 focusing upon increasing tax quota for most energetically products in the period 2008-2012.

1.2 Comparison between Romania's environmental taxes and other countries

In Romania the fiscal reform started after the '90's has had more fazes. In the first period (faze) (1990-2000) the accent has been laid upon the indirect taxation, during which the value added tax has been introduced (1993), excises, and the wage tax was being determined according to a proportionate imposing system but in this period the environmental taxes have had small results. Starting from 2000 and preparing to negotiate with the European Union an eventual future adhesion, Romania is starting to rethink its fiscal policy thus to obtain a better businesses environment, attract more foreign investments, stimulating economical developing and at the same time introduce and modify fuel, bio-diversity, energetically products taxes, etc.

After the adhesion that took place at 1st January 2007 Romania is still in the process of harmonizing its indirect taxes, is rethinking the revenue taxation and introducing modifications regarding environmental taxes (first registration tax or the pollution tax for vehicles being the most often modified). Environmental tax can influence both the economic agent and population decision process and this is way in establishing such a tax there are a few factors that are need to be taken into consideration: fiscal pressure at macro-economic level, economical development degree, inflation rate, public dept percentage into the gross domestic product, new pollution sources, etc.

We do consider that environmental taxes can also have some negative effects upon an economy by increasing administrative costs, social disequilibrium appearances, decreasing competitiveness when tax quotas are high because taxes levied upon production factors will lead to increasing prices, decreasing wages and capital competitiveness (OECD 2002: 12).

A fiscal reform should aim at fiscal or budgetary neutrality thus the social impact will be decreased by a smaller fiscal burden especially upon labor. In this sense, the environmental taxes are characterized by the so- called mechanism "double dividend" (Dyck-Madsen, 2003): significant increase in environmental protection and creation of jobs.

Although the increasing interest in environmental protection, in Romania the revenues from these taxes has increased with a lower rate than the average European Union increasing rate for other taxes. In 2009, in the European Union 27 the environmental revenues were 2.60% from GPB and 7.40% from the total fiscal revenues while in Romania the same revenues were just 1.90% from GDP and 7.00% from the total fiscal revenues. But the evolution of the environmental taxes

should be analyzed by comparison with other budgetary revenues (revenue, capital and labor taxes, figure no. 1)
Fig. 1 Capital, consumption, labor and environmental taxes in GDP in 2009, EU states
Source: Taxation trends in the European Union (2010), European Commission – Taxation and Customs Union, Eurostat Statistical books

At European Union level in 2009 labor taxes have an average of 12.00% from GDP while the environmental taxes have an average of only 2.60%. Furthermore the environmental taxes have the tendency to decrease as percentages from GDP with some exceptions: Cyprus, Malta, and Norway.

For a better comparison between the two taxes - level of revenues collected from the two taxes, figure 2 presents the denominated level of revenues by deduction with the harmonized consumption price index (IAPC) afferent to member states.
Fig. 2 Comparison between environmental and labor taxes in the European Union (real values, millions euro)
Source: Taxation trends in the European Union (2010), European Commission – Taxation and Customs Union, Eurostat Statistical books

An analysis of the different fiscal systems for the European Union countries permits us to asses that fiscal revenues have, in general, three main sources: consumption, capital and labor (fig. 3)
Fig. 3 Fiscal revenues sources (EU, 2009)

Source: Taxation trends in the European Union (2011), European Commission – Taxation and Customs Union, Eurostat Statistical books

We can see that Romania as well as other ex-communist countries has a fiscal policy based upon the indirect taxes that meaning based upon consumption (which are in Romania 38.40% from the total encashment while the same tax has just 22.80% in Italy). As far as the environmental taxes their average has been in Romania of 7.00% while the European average has been 7.40% (Romania is the 14th from the 27 member states being outrun by countries with a waste environmental taxes experience like Denmark, Great Britain, Holland but also by recently adhere countries Poland, Czech Republic, Latvia). Among eco-taxes, the energy tax has the main percentage at European level (EU-27) with 73.00% from the total fiscal revenues followed by transport taxes with 23.00% from the total fiscal revenues while taxes levied upon resources/pollution are not significant, just 0.40% from the total fiscal revenues.

Furthermore, if we continue our research we find out that the real motive for this decrease is that from the market a lot of big polluters have disappeared and so we can not sustain that environmental taxes have reached their purpose in Romania that being to change economical agent's behaviors.

If we analyze the fluctuation for each environmental tax (energy, transport and resources/pollution tax) we can see that the main source of the fluctuation has been the energy tax while transport taxes have been significantly modifying since 2007 when the first registration tax has been introduced.

In Romania after 2003 energy taxes have decreased and this trend has been set by both a low level of excises (the excise level for fuel is most times under the minimum level stipulated in Annex I of the European Directive 2003/96/EC) and a reduced collection degree. Furthermore, between 1995-2011 Romania had had the lowest fuel price in comparison with other European countries, thus in July 2011 this was 1.23 euro/liter face to 1.65 euro/liter in Greece (state facing an acute debt crisis) followed by Bulgaria where the price was 1,16 euro/liter.
Fig. 4 Energy tax revenues (% GDP, evolution 1995-2009)

Source: Taxation trends in the European Union (2011), European Commission – Taxation and Customs Union, Eurostat Statistical books
Fig. 5 Transport tax revenues (% GDP, evolution 1995-2009)

Source: Taxation trends in the European Union (2011), European Commission – Taxation and Customs Union, Eurostat Statistical books

The moderate decrease of the energy tax percentage in GDP over 2000 and 2009 is the result of a structure tax change at the European countries level. For example in Cyprus energy taxes increase is 1.00% form GDP while in Bulgaria, Poland and Estonia is just 0.50%.

2. Conclusions

We can generally state that in states adhered in 2004 and 2007 the small increase in environmental taxes is due to the harmonization process, some of them taking advantage of this in order to increase their level beyond the requested adhesion level. Furthermore we can see, on one hand, the extreme low revenues from environmental taxes in developing states like Cyprus, Estonia, Latvia, Lithuania and on the other hand, the high difference between the real value of environmental taxes and other revenues taxes in develop states like Germany, France, Italy, Spain or Great Britain.

Are the environmental taxes incentive or have they just a fiscal role? In Romania it looks like they are seen just from the possible revenues brought to the states budget and have less a coercive character upon the ones damaging more or less the environment.

Taking into consideration that the existence of such taxes in the energetic sector hasn't had any international competitive advantages, Romania will continue to increase its environmental fiscal taxes at the European Union recommendations. In order for this system to work it has to be put into practice at the same time a policy regarding the revenue tax decrease (Romania has a great labor taxation – in 2009, 35% of the states revenues were direct social contributions).

FISCAL COMPETITION AND DIRECT FOREIGN INVESTMENTS: ROMANIA VERSUS POLAND

Vuta Mihai
Economist

The European Economic Community treaty defines indirect taxation common rules taking into consideration their impact upon free merchandise's circulation and upon international commercial exchanges.
Once the Roma treaty has been signed (1957) the established scope was creating a common market. But, how is it possible to create a common market without any monetary and fiscal instruments? Thus, these instruments have had to be created in order to achieve such an objective. If from the monetary point of view introducing euro as a common currency was a big step ahead, from the fiscal point of view things haven't evolved in such an easy manner. Fiscal objectives are achieved only if the national market is running normally and correctly.
Indirect taxation is harmonized base upon article 113 from the European Union Treaty, while regarding direct taxation legal recommendations and regulations approval we can't talk about harmonization but about fiscal competition. We are stating this because there are 27 states in the European Union and each one is sustaining its own direct taxation system. Furthermore, the taxation system (fiscal system) is influencing member states economical performances through economies, investments and human capital formation by affecting the revenue's distribution, research and development expenses level and type and by fiscal competition – an effect more and more profound. In this context we aim at analyzing the way fiscal competition had had a positive impact upon attracting foreign direct investments in Romania and Poland. We also aim at underlining positive and negative points for fiscal competition taking into consideration that not only a decrease in micro or macro-economic fiscal burden will have a positive impact upon investments in-flows and there are other factors to be taken into consideration, like: infrastructure, labor expenses, research and development expenses, internet access, etc. The research is mainly based upon a synthesis of the reached area in the special literature. The study continues a fundamental research using deductive and inductive research mechanism in order to delimit the used concepts.
Keywords: fiscal competition, foreign direct investments, fiscal systems, tax rate
JEL classification: H3

Introduction

European Union 27 states can make us think not only about fiscal competition but also about fiscal harmonization. But, is there even possible a fiscal harmonization of all 27 fiscal systems? For now at European level only a fiscal harmonization of the indirect taxes, VAT and excises, has been possible. Furthermore, according to the European fiscal policy strategy there is not necessary a total fiscal harmonization, member states being free to have their own fiscal system but within the European practices framework.

Nevertheless the European Union insists upon eliminating fiscal barriers for trans-national economic activities but, at the same time, intensifying the fight against harmful fiscal competition and fiscal fraud (European Commission). These objectives are sustained also by the new European 2020 strategy which states that the European space should become an intelligent and durable economy which favors economical, social and territorial cohesion.

Fiscal competition is an old concept but politically speaking the interest towards this concept has increase significantly in recent years, especially after the economical and financial crisis emerging since 2007. For a very long period of time the differences in tax levels between states were not significant enough to generate mass movements of capital or tax-payers. Starting from the 20th centaury the fiscal burden has increase significantly generating at the same time a series of restrictions fro trans-national movements: high tariffs, capital strict control, low currency convertibility degree and inflexible and harsh immigration regulations. In this context each states aims through its proposed and implemented fiscal regulations to attract at national level as many foreign investors as possible. Fiscal competition is mainly manifested by the way of direct taxation, which is what we aim to underline from this point forward.

Fiscal competition – present developments

The unique European market and the North American Free Trade Accord (NAFTA) have lead to intense capital and labor movements with the possibility of directing the investments flow towards other countries. In the European Union fiscal competition has started to manifest it's self mostly after 2004, when 10 ex-communist countries have adhered to the union.

As a reaction to these adhesions some countries have changed their taxation systems and have started using flat rates instead of progressive rates. The first state to adopt the flat rate was Estonia (the flat rate was 26%) and this has lead to an average economic growth of 4.3% per year. Following this example states like Latvia and Lithuania have adopted flat rates, 25% and 33%.

Describing the fist fiscal competition mechanism is attributed to Zodrow and Miesykowski. The created model was based upon two states with interdependent fiscal policies: fiscal revenues from one state were depending upon the other state tax rate. This is explained by the fact that a high tax rate in the first state will determine a transfer of the mobile tax base in the second state increasing this state's fiscal revenues. This model suggests that states are competing "towards a minimum limit" regarding taxation, each state trying to attract as much capital as possible by decreasing its tax rate. At equilibrium tax rates will be under those from a model with no fiscal competition having as effect a decrease under the optimum for public goods financed by taxes (Zodrow and Miesykowski, 1986: 365:370). Other authors (Bucovetsky and Wilson, 1991 333:350) have underlined that the states dimension can alter significantly the model previsions.

If states have relatively equal dimensions then same decisions regarding the taxation system can be made and the well-being will be equally influenced. When states dimension differ, the smaller state is prone to decrease its tax rate and has less to suffer (Genschel and Schwarz 2001, 339 - 370).

The indirect correlation between the fiscal competition and foreign direct investments has emerged in the context in which attracting more investments to national level has became an important goal for both develop and developing countries. Thus, the study done for EU 25 is demonstrating that the corporate tax is influencing profits repartition and at the same time the foreign direct investments (Wolf 2007, 327 - 346).

Fiscal competition and foreign direct investments flow analysis in Romania and Poland

The fiscal policy analysis realized in 2008 upon 106 states has revealed that the European Union states have the lowest corporate tax rates (KPMG 2008, 14-15). The average tax rate is 23.2% in EU, 26.7% in the OECD countries, 26.6% in Latin America and 28.4% in Pacific Asia; all these rates were lower than the ones from 2007. But a decrease of the direct tax rates has as a direct consequence the increase in indirect taxes. Thus, the average indirect tax rate was 19.5% in the EU, 16.9% in the OECD countries, 14.3% in Latin America and 11.14% in Pacific-Asia (KPMG 2008, 14-15).

In 2008, 7 European states have decrease their corporate tax; in Germany the tax has been decreased until it reached 29.8% and in Italy it was registered a decrease of 5.9 percentage points until it reached 31.4%. None of the European countries has increased their tax rates in the same period.

As goes for Romania and Poland in order to underline if the fiscal policy had had an impact upon attracting foreign direct investments, we will analyze several elements.

In the European fiscal context each of these two states will try, on one hand to increase fiscal revenue percentage in the gross domestic product, thus to finance public expenses and on the other hand will try to attract investors through different facilities like decreasing tax rates for certain taxes.

By comparison the maximum revenue tax rates for both personal and corporate revenues are presented in the following tables.

Table no. 1 maximum tax rate for personal revenues, Poland and Romania

	2000	2010	2011
Poland	40%	32%	32%
Romania	40%	16%	16%

Source: data eurostat

We can see that even the two states had had the same revenue tax rate in 2000 (40%) but Poland has decreased its revenue tax rate to 32% and Romania to 16%. As regarding the corporate tax rate Poland had had a higher decrease than Romania.

Table no. 2 Corporate tax rate evolution in Poland and Romania

	2000	2010	2011
Poland	30%	19%	19%
Romania	25%	16%	16%

Source: data eurostat

Although corporate tax rates have decreased in both countries the percentage from these taxes have registered almost the same evolution: in both countries in the year the corporate tax rate was cut back the percentage in the gross domestic product from these revenues has decreased (figure no 1).
Source: data eurostat

We will next analyze how the modification of the corporate tax rate has influenced the foreign direct investments flow. Thus, Poland and Romania have registered in the period 2008-2010 the following foreign direct investments flow (figure no. 2)

	2004	2005	2006	2007	2008	2009	2010
Poland	10237	8330	15741	17242	10085	9863	6686
Romania	5183	5213	9059	7250	9496	3488	2220
Fig. no 2 Foreign direct investments flow in Poland and Romania, 2008-2010

Source: http://www.bnr.ro/Investitiile-straine-directe-(ISD)-in-Romania-3174.aspx, http://www.paiz.gov.pl/poland_in_figures/foreign_direct_investment, Accessed 18 April, 2012

The difference between the two flows in significant, thus the foreign direct investments value attracted by Poland is higher than the one attracted by Romania with 4,466 million euro, meaning that investors are not always guided by fiscal elements and are interested in other facilities given by the state in which they are trying to relocate their activity. Following the type of investors we will see that in Romania investors coming from Holland have occupied the first position with 20.7% from total flow, while in Poland investors coming from Luxembourg have the first position with a 25.88% from the total flow.

Another important aspect is the deductions system applied by each country. A state fiscal policy can be competitive not only by aiming to a lower tax rate but also by an expense deduction system or by exonerating from payment the reinvested profit. Starting from 2006 in Poland research and development expenses and acquisitions of new technologies expenses are deductible. Another measure to attract investors in Poland is referring to the so called "Special Economic Areas" meaning that companies located here are receiving tax dispensations. As return these companies have to maintain a certain number of employees, invest in fix assets and carry on the economic activity for a fix period of time (usually 5 years).

According to a study realized at European level regarding the fiscal attractiveness of a territory unfold in 10 different countries; the interviewed managers have nominated Poland 4 times the first place and 3 times the second place they would invest.

In Romania the tax rate modification didn't had as effect a significant increase of the foreign direct investments flow, due, in our opinion, to many other factors like: consecutive and

numerous VAT modifications, social contributions, para-fiscal taxes, bureaucracy, the long period of time necessary to create a firm.

Conclusions

We consider that just a decrease of the tax burden is not sufficient in order to increase investment flows, both national and foreign. Other factors like: infrastructure, educational level, labor costs, existing technologies and selling markets are very important when in comes to attracting investments. Thus, when a state is focusing upon increasing corporate tax rates and then uses the fiscal revenues to finance those domains there is the possibility that a positive effect emerges from foreign direct investment flows. Furthermore, a state focused upon increasing foreign direct investments flows should have a fiscal policy aiming to assure a high development of the public services like decreasing the reimbursement time for VAT and an efficient infrastructure.

We do consider that when in comes to fiscal competition we have both favorable and non-favorable effects, as shown in the following schema.

Favorable effects:
- Economy development and economical and social gaps reduction which might lead to decreasing the geographical disadvantage;
- Putting a stop to state's desire to increase fiscal burden;
- Imposing a certain behavior regarding spending public money and financing public expenses;
- Decreases corruption and bureaucracy.

Non-favorable effects:
- Can cause fiscal evasion;
- Taxes are often burdening upon less mobile factors (higher taxes levied upon labor than upon capital, because labor is a less mobile factor).

Schema no. 1 Favorable and non-favorable effects of the fiscal competition
Source: realized by the authors

As regarding attracting foreign direct investments Poland is more prone to be attracting more investments than Romania because of factors like: Poland is much more efficient in dealing with insolvability cases (it occupies the 87th place from 183 economies, while Romania is placed the 97th in the same top), services regarding electricity connection are more efficient in Poland than in Romania (Poland is placed 64th while Romania is placing 165th) and regarding the fiscal policy Poland is placed 128 and Romania just 154 (World Bank, 2012).

CREDIT LEVEL INFLUENCING FACTORS AT HUNGARIAN FARMS

Tóth, József
Corvinus University of Budapest, Department of Agricultural Economics and Rural Development

Tóth, Kristóf
Research Institute of Agricultural Economics (AKI)
Corvinus University of Budapest, Department of Agricultural Economics and Rural Development

In this paper we estimate the impact of different factors on creditability of agricultural farms. According to the literature the collateral (tangible assets), the farm size, productivity, and subsidies should have significant effects on farm loans. We use data from the Hungarian Farm Accountancy Data Network to test our two hypotheses and theoretical assumptions for the period 2001-2010. Because of using panel data, we do our estimations using fixed effects econometrics model to test our assumptions. The results indicate that the chosen factors have significant influence on total liabilities and short- and long-term loans as well. With specially interest of subsidies the growing level of supports decrease the need of other financial tools. At output factors (inclusive farm size) have significant and positive effect, same as collateral (tangible assets).
Keywords: credit, output, collateral, subsidies, farm size
JEL code: G32, H71

I. Introduction

Financial situation of farmers and creditability is a standard and important topic in agricultural economics. For instance the farm productivity, the efficient production methods, the financial strategy are those factors, which could have determining effect on the amount of foreign finance and - of course - on creditability.

The EU accession of Hungary in 2004 have also role in agricultural financing, because of growing supports, which can substitute bank loans with more cheaper and – particularly after the financial crisis – more and easier available subsidies (Ciaian and Pokrivcak 2011:12).

On the other hand subsides (especially direct ones) can also upgrade income and productivity ratios, which could lead to not enough efficient production systems, because it hides efficiency problems at agricultural farms.

The main objective of the paper is to investigate, which factors are influencing the credit level of farms with specially attention to subsidies, output, and farm size. But naturally we take into consideration other elements that also could have role of choosing financial strategy.

During our analysis we would like to confirm our two hypotheses.

Hypothesis 1: If there are available subsidies and farms are not credit constrained and if we assume perfect credit market the subsidies are affecting (reduce) significantly credit level.

Hypothesis 2: If farms are not credit constrained and if we assume perfect credit market, the economic size of farms and amount of output have significant and positive influence on creditability.

To confirm our two hypotheses we divided the total liabilities of farms into short and long-term loans to see the difference of variable's behavior between long and short term financing.

II. Literature review

There are lot of studies, which are dealing with financial aspects of farms in different countries. This question according to the literature can be analyzed from two viewpoints. One is the credit availability of farms (credit access), and the second one is the financial standing of farms (capital structure, support level, productivity, etc.).

Because of high support level (direct or indirect) the agricultural sector's financial standing seems like better compared to other sectors. This could lead to soft budget constraints (Kornai, 2001:1573-1599) on agricultural firms, which can negatively influence farm performance. In concrete terms if a farm get higher level of direct support there is a possibility of sticking in a not enough efficient production system, they spend their budget not efficiently.

The collateral (we use tangible assets for simplification) has lower role in those countries where the financial institutions have closer knowledge of lending firms (Benjamin, 2002:1127). He analyzed France and Great Britain, he found that in France subjective factors have important role in farm financing. So the credit access is easier in this country compared to Great Britain where the sensitivity of collateral was higher. Because of the phenomenon in Great Britain, the level of tangible assets can be an important factor, which determines the level of loan. In addition, for better creditability farmers should improve their willingness to use farm assets for collateral (Pederson and Khitarishvili 1997: 29-30).

There was another study, which analyzed credit availability in Kenya (Carter and Wiebe 1990:1150). It is very far from the Hungarian situation but it should be seen the availability of convenient funds is crucial. They expertise the same in this African country, where the credit availability was higher the development of farms was also better.

Farmers with low debts are liquidity constrained (Bakucs, Ferto and Fogarasi 2002:122-124). Beside this at corporate farms where the budget constraint is soft the debt is higher. We think for this observation can be a reason of higher level of support and other revenues. That is why in our developed model we not just involve support variable, but European size unit (ESU) of farms as well. We assume this should have also significant effect on credit level.

Profitability is a key factor of farm financing. (Swinnen 1999:44-45). If a farm has low profitability, any central corrections to solve inefficiencies are not enough, if the profitability does not improve. So the income (profit) gives relevant information about the need of external financing and about financial standing.

At farm financing the financial managerial style, the financial strategy (conservative, aggressive, etc.) can also determine the future access to bank loans (Bierlen and Featherstone 1998:434). Although it would be important to implement it into the model we do not deal with this aspect, because lack of data.

III. Methodology and Data

In our research we used FADN (Farm Accountancy Data Network) data from 2001 to 2010 for Hungarian farms. This database is compiled and maintained by the Hungarian Research Institute of Agriculture Economics. This is a European Union compulsory system of national surveys, which collect natural, structural and mostly financial data from corporate and incorporate farms. The Hungarian sample size is around 1900 farms per year, which represents almost (it contains farmers bigger than 2 European Size Unit) the total agricultural production of Hungary. The farm level data is confident so we can present in our paper only aggregate information.

The FADN data is a panel dataset that means farms, which stay in whole analyzed period in the database can traced over the 10 years using a special identifier number. So we used panel data to examine the loan level of farms. We did not do special selection of farms at this first stage we put all of them in our models.

We applied eight independent variables (Table 1.) in our three estimations, which according to literature and our expectations can explain the credit level and need of Hungarian FADN farms. According to already in the introduction mentioned reasons support and tangible assets are determining factors of creditability. We put in the model farm size and output variable, because the size of production and farms can determine the total liabilities according to our assumptions.

In our first model we used liabilities not total loans as dependent variable, because there are other financial channels like leasing or factoring, which also very similar to normal loans, and has to

added to the model. The level of inventory and receiver can also determine the level of mainly short-term loans but possibly long-term loans as well. The best would be if creditors (acc_payabl) could finance the debtors (receiver), otherwise there is a need for higher amount of short term loan to finance the farm's operation.

Table 1. Description of data

Variable	Obs	Mean	Std. Dev	Min	Max
esu	19146	86.21778	257.944	1.108638	8391.044
support	19146	12139.71	39253.83	0	1215545
total_output	19146	90692.48	297042.2	-2147	8482212
inventory	19146	25536.61	106594.2	0	3497385
tang_assets	19146	72584.55	199157.2	0	7748015
receiver	19146	6038.246	30089.27	0	1135411
income_btax	19146	7050.054	27451.59	-934141	669385
acc_payab	19146	6173.724	35837.2	0	2657224
loan_long	19146	6557.526	33797.95	0	1971741
loan_short	19146	9208.529	68883.51	0	3388147
liabilities	19146	42176.04	187809.3	-39	9081393

Source: FADN national Hungarian database

We use panel data and estimate fixed effects model. This model helps to control the unobserved heterogeneity component that remains fixed and the effect of omitted variables is lower (Ciaian, Pokrivcak 2011:10).
We estimated three models:

(1)
$$liabilities_{jt} = \beta_0 + b_j + \beta_e*esu_{jt} + \beta_s*support_{jt} + \beta_o*total\_output_{jt} + \beta_a*tang\_assets_{jt} + \beta_r*receiver_{jt} + \beta_i*inventory_{jt} + \beta_p*acc\_payable_{jt} + \varepsilon_{it},$$

(2)
$$loan\_long_{jt} = \beta_0 + b_j + \beta_e*esu_{jt} + \beta_s*support_{jt} + \beta_o*total\_output_{jt} + \beta_a*tang\_assets_{jt} + \beta_r*receiver_{jt} + \beta_p*acc\_payable_{jt} + \varepsilon_{it},$$

(3)
$$loan\_short_{jt} = \beta_0 + b_j + \beta_e*esu_{jt} + \beta_s*support_{jt} + \beta_o*total\_output_{jt} + \beta_a*tang\_assets_{jt} + \beta_r*receiver_{jt} + \beta_i*inventory_{jt} + \beta_p*acc\_payable_{jt} + \varepsilon_{it},$$

where j, t represents farm j and time t, b_j is the fixed effect for farm j, and ε_{it} is the residual term.
We are especially interested in assets, support, and output but the other variables especially inventory at short term loans should have also positive effect.
(As it can be seen we omitted in Model 2 inventory variable, because in the first tests it was insignificant, and distorted the results for the total model.)

IV. Results of research
The results are presented for total liabilities, long-term loans and short term loans (Table 2.). The model R^2's within the model range 0.4 to 0.73. If take a look on variables all of them significant in all of the models presented in the previous section.
On the basis of hypotheses, and literature we focus on support, income (income_btax), European Size Unit (esu), and output (total_output) firstly. In all of the three models these variables are strongly (p<0.10) significant. The support coefficient is negative, which confirms our hypothesis

that support negatively influences loan changes. So if the amount of support is growing the farm need of credit is decreasing. So we can confirm our hypothesis 1. at first and third model.

The esu variable has changing effects across the three models. At the first and third one it is positive as we assumed before. In the second one it is negative, which is the case when the relationship between long-term loans and farm size is non-linear.

The output is significant and positive that indicates if the output is growing the creditability of farms is also increasing. So partly- in the first and third model – we can confirm our hypothesis 2. that means output and firm size has positive and significant effect on creditability.

Although the income (income_btax) variable is significant but is negative. One reason could the non-linearity the other is if the income grows the need of credit is decreasing. So income can be realized as own financial resource.

As in the literature mentioned the level of collateral is very important factor. It is also confirmed by our model, because the tangible (long-term) assets (tang_assets) are also strongly significant and positive in all of the models.

The other variables used in the model give also significant results. The only exception is inventory because this variable was insignificant in the second model. The reason could be that long term financing is less connected to inventory or short term assets so the level of long-term loans is not determined by inventories.

At the creditors (acc_payab) and debtors (receiver) in all model we got significant results. These two variables have decisive role at total liabilities and short term loans. The reason for that if the creditors could not finance debtors, we need more short-term loans or other financial tools to stabilize working and liquidity. If the level of short –term tools is growing the total amount of liabilities is also increasing.

Table 2. Summary of results

	Model 1 (Ind: Liabilities)			Model 2 (Ind: loan_long)			Model 3 (Ind: loan_short)

V. Conclusions

During our research we estimated the impact of output variables, collaterals, subsidies, income on agricultural farm credit. Firstly we analyzed the theoretical background of the research, which factors would be relevant to implement them in the model. In the empirical part we used farm-level panel data from Hungarian FADN database to test our two hypotheses. We created three models, where we differentiated the dependent variable to total liabilities and short or long-term loan. We used fixed effects model for estimation.

In the following we summarize our main implications:

– According to results if the amount of support (subsidies) is growing the farm need of credit is decreasing independently whether it is short-or long-term. So we can confirm our first hypothesis.

– Partly - at total liabilities and short-term loans – we can confirm our hypothesis 2 that means output and firm size has positive and significant effect on creditability and credit level.

– We found that income has negative and significant effect on farm loans. The income could be one form of own finance, so if the own financial tools like income (which are much cheaper than credits) have increasing role, the need of credit is decreasing.

SUB-SECTION: BANKING

ASSESSMENT OF CREDIT INSTITUTIONS' OPERATIONAL RISKS FROM THE PERSPECTIVE OF EXTERNAL AUDIT

Avram Veronel
University of Craiova
Faculty of Economics and Business Administration

Hetes-Gavra Roxana
West University of Timisoara
Faculty of Economics and Business Administration

Avram Alexandru
West University of Timisoara
Faculty of Economics and Business Administration

Credit institution's operational risk should be evaluated by the external auditor cautiously because it is a risk arising from the way in which the bank's global strategy is implemented in practice and how the bank's activity is followed step by step by those charged with governance, internal audit and internal control so to indicate any deviation from the standard rules and procedures and reduce the likelihood of distortions caused by frauds or errors.
International Standards on Auditing require to external auditors to obtain sufficient and appropriate evidences to support the audit opinion, therefore the auditor must first understand the specific banking activities and then identify and properly evaluate the credit institution's operational risks.
Keywords: external audit, operational risk, misstatements, fraud, error.
JEL Classification: G21, M42

1. Introduction

ISA 200 "Objectives and General Principles Governing an Audit of Financial Statements" specifies that the objective of an audit is for the auditor to be able "to express an opinion on financial statements, if they are prepared, in all significant material respects, in accordance with the applicable financial reporting framework" (IFAC 2007: 227). An auditor who conducts a conformity audit must obtain a reasonable assurance that the annual financial statements are free of significant material misstatements, whether due to fraud or errors.

Credit institutions are constantly operating in conditions of risk and uncertainty, being exposed to high range of risks, respectively:
- Financial risks;
- Operational risks;
- Business risks;
- Risks of various events' occurrence.

2. Credit Institutions' Operational Risks

The operational risks are arising for all credit institutions from the practical application of banks' strategic objectives and the functioning of their systems of control and monitoring, including the use of computerized technology.

The main types of operational risks that may occur in banking activity are:
- Internal fraud;
- External fraud;
- trading error;
- malfunction of systems or processes;
- Disturbance or disruption of banking activity;

- Damage to physical assets;
- Violation of information in terms of security, integrity or confidentiality
- Involvement of the bank in money laundering or financing terrorism;
- Forgery of identity, computer piracy or unauthorized transactions.

Credit institutions are obliged to take into account all the possibilities to prevent operational risks by collection and processing of data concerning operational risk, according to the schedule set out in Figure No. 1:

Identification of data regarding operational risk	**Collection** of data regarding operational risk	**Creation** of a history of all data regarding operational	**Calculation** of data regarding operational risk
- Which are the risks? - What data must be collected?	- How do we collect the data? - Which is the cost?	- Is the acknowledgement of data history sufficient?	- Are the backtesting results satisfactory?
	Choosing a number of sufficient and adequate risk factors	Combination of the data collected from both internal and external sources	Reexamination of risks' hierarchy

Source: Own adaptation after Eric Lamarque, *Management de la Banque*, Ed. Pearson Education France, Paris, 2011, page 41

Figure no.1 *Collection and processing of data regarding operational risk*

Credit institutions find themselves facing a variety of operational risks, so that we can only agree with Eric Lamarque when he states that "the real challenge is to integrate these different components of operational risk in a coherent and effective assembly" (Lamarque 2011: 50), which consists of the following:
- a self-assessment instrument, by a careful examination of all aspects regarding operational risks that may occur in the activity of credit institution;
- a consistent database meant to collect information on operational risks;
- a section of key and risk measurement indicators, including scenarios of situations more or less predictable;
- a reporting instrument, for both internal management and supervisory and regulatory authorities;
- a workflow system able to provide sufficient opportunities for reducing losses associated to operational risk.

It is obvious that the top management of credit institution must have a rapid response rate to any occurrence of symptoms indicating a manifestation of a form of operational risk, but a primarily

proactive attitude based on internal rules and reliable procedures, focused on operational risk prevention, is more desirable.

3. Assessment of the Operational Risk from the perspective of International Standards on Auditing

According to ISA 315, „the auditor understands the entity's objectives and strategies and any business risks related that could result in material misstatements of financial statements" (IFAC 2007: 315). The auditor should observe how the leadership was able to identify risks relevant to financial reporting, to assess the significance of those risks and evaluate the possibility of their recurrence but to examine as well how the top management was able to manage risks. When he finds a material misstatement in the risk assessment process of the entity, he will communicate it to those charged with governance. For this, he must previously make a series of tests on internal control and auditing procedures in terms of the effectiveness of these procedures applied by entity.

By analyzing the potential operational risks of credit institutions, it seems fairly normal for auditors to focus on the risk of fraud. ISA 240 "The Auditor's Responsibility to consider fraud in an audit of financial statements" makes a distinction between fraud and error, so "the term of *error* refers to an unintentional distortion occurring in the financial statements, including the omission of an amount or a presentation such as:

-an omission during the collection and processing of data based on which the financial statements are done;

-an incorrect accounting estimation due to overlooking or misinterpreting the facts;

-an error occurring while the accounting policies on assessment, recognition, classification, presentation and description of any information are applied" (IFAC 2007: 288)

Fraud, as defined in ISA 240, is seen as a deliberate action done for obtaining an unjust or illegal advantage. The auditor is interested in fraud only in the measure it can affect the quality of accounting information by generating significant material misstatements. A distinction is usually made between internal and external fraud, meaning that external fraud is caused by third parties, while internal fraud can be caused either by involvement of one or more members of the top management or those charged with governance, in which case we can talk about a "management fraud" or by common employees and then it is called a " staff association fraud ".

In conformity with the International Statement on Auditing Practice 1006, "Audit of the Banks' Financial Statements", the factors that contribute significantly to operational risk include:

-the need to carry out a large volume of transactions in a predetermined period of time;

-the need for electronic transfer of funds or other telecommunications systems for fast transfer of funds;

-the performance of banking operations in a large geographical area;

-the need to monitor and manage significant exposures that can occur over short periods of time;

-taking in large amounts of cash;

-the volatility and the inherent complexity of the financial-banking environment;

-numerous operating restrictions stipulated by law and prudential supervision norms.

4. Risks and other aspects regarding frauds and illegal acts

The risk of fraudulent or illegal acts arises at banks both from the inside and outside of the credit institution. Among the many fraudulent and illegal acts that banks may face with are: fraud related to the issuance of checks, fraudulent crediting and trading, money laundering and misappropriation of bank assets. These fraudulent activities may involve collusion by management of banks and their customers. Those perpetrating fraudulent activities may prepare false and misleading documents to justify inappropriate transactions and hide illegal activities. Fraudulent financial reporting is another serious concern.

In addition, banks are permanently confronted with the threat of computer fraud. Hackers and others who may gain unauthorized access to banks' computer systems and their databases can allocate intentionally funds to their personal accounts and steal private information about the institution and its customers. In the case of all companies for profit, fraud and criminal activity perpetrated by authorized users within the bank are also of particular concern. Fraud is more likely to occur at banks that have serious deficiencies in corporate governance and internal control.

Significant losses from fraud can occur in case of the following categories of deficiencies in corporate governance and internal control:

- Lack of a proper oversight and accountability on behalf of the top management and the absence of a "culture" on strong control manifested in the bank;
- Inadequate recognition and assessment of risk of certain banking activities, either regarding balance sheet or off-balance sheet ones;
- Absence or failure of key control structures and activities, such as segregation of duties, approvals, verifications, reconciliations and reviews of operating performances;
- Inadequate communication of information between different levels of management within the bank, especially in communicating problems at a higher hierarchical level;
- Inadequate and ineffective internal audit programs and monitoring activities.

Table no.1 *Examples of Fraud Risk Factors*

	Acceptance of Deposits	Trading	Crediting
Frauds committed by top management and other personnel	Depositors' camouflage Unrecorded deposits Theft from customers' deposits or investments, especially in the case of inactive accounts	Off-market rings Transactions with affiliated third parties Fees of brokers for bringing in clients False transaction Unrecorded transactions Delayed allocation of transactions Intentional wrong use of discretionary accounts Exploiting the weaknesses of correlation procedures Marking intentionally erroneous the registry Association to commit fraud during an evaluation (assessment rings) Theft or intentional wrong use of guarantees	Loans to fictitious borrowers Use of Nominee Companies Deposits transformation Transactions with affiliates Fees for bringing in clients Use of parallel organizations Funds transformation Selling recovered collaterals at a price below the market price Bribes to obtain the release of collateral or to reduce the amount claimed Theft or intentional use of misleading guarantees
External Frauds	Money laundering Fraudulent instructions Counterfeiting money or assets Fraudulent use of cashing periods (checks uncovered)	Fraudulent custodial sales False information or documents on partners	Impersonation and false information on loan applications and other documents submitted latter Double guarantee with the same good Forged evaluations or Fraudulent or worthless guarantees fraudulent Wrongful use of credit funds

			by representatives / customers Unauthorized sale of securities

5. Case Study – Société Generale 2008

Jerome Kerviel, a trader at Société Generale in a subdivision specialized in financial market operations, managed to avoid internal control and to defraud the bank of 4.9 billion Euros. It is obviously an internal fraud, which can be circumscribed to the issues related to operational risk. Kerviel was selling and buying futures contracts "taking advantage of exchange rate differences recorded by the indexes DAX (Germany), CAC 40 (France) and Footsie (United Kingdom). In principle, the internal procedures imposed covering with the same type of security in order to generate no operational risk (when he sold he had to buy in return, when he bought he had to sell in return).

Before working in the banking sector, Kerviel have worked in internal control and knew how to avoid the organizational procedures, so he managed to remain undetected by creating fictional counterparts with Deutsche Bank. After he closed his position at Société Generale he lost 6.3 billion Euros, which compensated by the 1.4 billion" gains" made by Kerviel in 2007, led to a total fraud of 4.9 billion euro.

Kerviel was found guilty and was sentenced to only three counts:

- Embezzlement;

- Fraudulent introduction of data in an automated system

- Fake and forgery.

Can we consider that Jerome Kerviel was the only guilty part? So how was it possible that:

- No one has answered the request for information made by Eurex Compensation Chamber in November 2007 and has not studied its request?

- No one noticed the disparity between fictitious investments and bank's treasury?

- No one noticed that Jerome Kerviel was always present in the bank, not taking holidays and days off in the last two years?

- Gains of 1.4 billion a year have not drawn attention to potential risks?

6. Conclusions

Credit institutions have some responsibilities in terms of assets they hold but which belong to other persons and entities. Public trust is for bank a capital as important as the equity, therefore they must establish operating procedures and internal controls designed to ensure the public that those assets are treated strictly in conformity with the terms and conditions under which they were transferred to the bank.

A very old banking axiom, which states "when trust is gone, the crisis occurs", requires credit institutions to better manage the risks and to apply consistently the principle of prudential banking. For an external auditor, the challenges of his mission are related to:

- the special nature of the risks associated with the transactions conducted by banks;

- the scale of banking operations, the large exposures and the operations' speed;

- the excessive dependence on IT (with advantages and disadvantages);

- the occurrence of regulations from different jurisdictions (especially when the controlling company has status of a non-resident);

- the occurrence of "financial innovation" and emergence of new banking products and practices more or less compatible with the ability of resilience of internal control and audit.

Determinants of bank fraud may occur in the form of:

-Pressure (inciting a person to commit fraud);

-Opportunities (offered by the knowledge of the bank's internal environment, in case of an internal fraud, or specific technical or relational knowledge, where external fraud occurs)

-Attitudes (generated by the ethical values that guide the person who commits fraud).

Audit evidences should be adequate and sufficient thus the risk of non-detection will decrease when the quality and quantity of proving evidences shall increase which will determine correct conclusion based on which an audit opinion will be issued accordingly.

A MODEL OF RATING FOR BANKS IN ROMANIA

Bătrâncea Ioan
Babeş-Bolyai University, Faculty of Economics and Business Administration, Cluj-Napoca, Romania

Bătrâncea Maria
Bogdan Voda University, Faculty of Economics, Cluj-Napoca, Romania

Popa Anamaria
Bogdan Voda University, Faculty of Economics, Cluj-Napoca, Romania

Abstract.In the paper the authors present a model of rating for the banking system. Thus we took into account the records of 11 banks in Romania, based on annual financial reports. The model classified the banks in seven categories according with notes used by Standard Poor's and Moody's rating Agencies.
Key Words: rating, Basel III, bankruptcy
JEL Classification: G21

1. Introduction

In the recent research many authors tried to develop models of rating for economic entities and also for the banking system. Also the Central Bank classified the Romanian banking system into 5 rating categories, from 1 (maximum) to 5 (minimum).

Thus between 2003 and 2010 non bank was classified in rating 1, around 60% took rating 2. That's why we consider that a new rating model based on Basel III norms will be useful for the bankers.

2. Method and Results

The rating model was developed from tests conducted on 11 banks. In this model have been analyzed many financial indicators that ensure coverage of all financial issues that impact on future business and profits.

Among the analyzed indicators financial ratios for liquidity and performance were selected.

In the model thus created I have established seven rating categories designed based on the new Basel III Norms (Supervision Basel Committee on Banking, 2010: 44) as follows:

	Rating	Score
Minimum Risk	**AAA**	12
Reduced Risk	**AA**	11
Reduced - Medium Risk	**A**	10
Medium Risk	**BBB**	9
Medium - High Risk	**BB**	8
High Risk	**B**	7
Bankruptcy	**CCC**	6

- "AAA" Category - financial performance is *great*, the risk is minimal. It is considered to maintain in the future the financial performance at a high level;
- "AA" Category - financial performance is *good*, thus the risk is reduced, the results of the cooperative are stable in the short term;

- "A" Category – financial performance is *above average*, satisfactory, the risk is fluctuating between low and medium;
- "BBB" Category – financial performance is at an *average* level compared to the optimal result, risk is *medium*;
- "BB" Category – financial performance is reduced *below medium* or records negative results, the risk is increasing from a medium to a higher level;
- "B" Category – financial performance are *weak*, poor, presents a *high* risk;
- "CCC" Category – financial performance is *very weak*, with high risk of bankruptcy.

Classification in any of the above categories is based on financial performance analysis, depending on the score for each indicator presented in the table below.

Financial security intervals and their scores have been established taking into consideration the new Basel III Norms and the banking practice in our country.

Figure no.1 The rating of the analyzed cooperative banks

I can draw the following conclusions from the above table and chart:
- in the period 2007-2010, analyzed banks both per total and on each region fall in the rating of "B", except for banks located in the centre regions (rating "CCC" in 2009) and those located in region southwest which in 2007 registered rating "BBB" and in 2009 have been rated "BB";
- in 2005-2006 period the development was the following:

  - "BB" score has been registered per total banks
  - The banks in the north-west region have been rated "B";
  - The banks in the center region have been rated "BBB" for the entire period, while the - banks in the southwest region showed an improvement of qualification from "BB" in 2005 to "BBB" in 2006;
  - The banks located in the north-east region have downgraded the rating to "B" in 2006 from "BB" in 2005.

3. Conclusion.

Comparing the results obtained using the CAMPL system and the rating model we found that between them there is a similarity in that the rating "3" recorded by CAMEL system and rating "BB" and "B", this meaning a combination of deficiencies that may vary between moderate and severe requiring careful concern from internal organs in charge of supervision and from the Romanian National Bank.

A SEEMINGLY UTOPIAN COMPARATIVE ANALYSIS OF STOCK MARKETS IN THE CONTEXT OF THE GLOBAL FINANCIAL CRISIS

Birău Felicia Ramona [*]
University of Craiova,
Faculty of Economics and Business Administration

This article analyzes in a comparative manner the evolution of an emerging stock market, such as Bucharest Stock Exchange and several developed stock markets in the context of the global financial crisis. The analysis is based on the daily prices of the following indices: BET (Romania), D.J.I.A (U.S.A), Nikkei 225 (Japan) and F.T.S.E 100 (U.K) during the period of January 2007 to April 2011. In this respect, the article aims to highlight if there are certain similarities between these completely different typologies of stock markets due to the extremely turbulent and unstable financial and economic conjuncture.
Keywords : emerging stock market, developed stock market, financial crisis, correlation, index
JEL Classifications : C10, G15, G17

1. Introduction

The global financial crisis that was caused by U.S. subprime crisis affected all the capital markets in the world. The negative impact was reflected by: reduction of the value and volume of transactions, significant reduction in the level of investment, the share price decrease and the unprecedented reduction of the profit opportunities.

The major stock markets indices of developed countries registers significant declines since the beginning of the financial crisis in the second half of 2007, as well as the advance emerging capital markets indices that have evolved in close contact with mature stock markets in the U.S., Europe and Asia.

Stock markets less developed or frontier capital market have not felt immediately the impact of financial crisis that swept the U.S., they recorded an apparent misaligned trend compared to the developed capital markets trend, many of them, such as Saudi Arabia, Pakistan, Nigeria, Colombia or Vietnam, maintaining or registering slight increases during the first months of the crisis. However, the global financial crisis had a strong negative impact on the evolution of Bucharest Stock Exchange (BSE), because Romanian capital market is strongly correlated with the stock exchanges in developed countries, but especially with New York Stock Exchange (NYSE).

The analysis is based on the daily prices of following indices: BET (Romania), D.J.I.A (U.S.A), Nikkei 225 (Japan) and F.T.S.E 100 (U.K) during the period of January 2007 to April 2011. In addition, the framework is focused on the main statistical properties, specifically Skewness and Kurtosis, and to reach an enlightening conclusion I used Unit Root Test, stationary test Augmented Dickey-Fuller and BDS test.

2. Similar implications of the global financial crisis

It is a generally accepted fact that emerging stock markets are less efficient than developed stock markets. For a very long time, a comparative analysis would have seemed utopian, an unrealistic and impossible idea.

It is a certainty that emerging stock markets are very different compared to developed markets. Emerging capital market's unstable and unpredictable behavior is characterized by certain features such as its sharp structural, functional, organizational, legislative, regulatory, infrastructure and institutional dysfunction and underdevelopment.

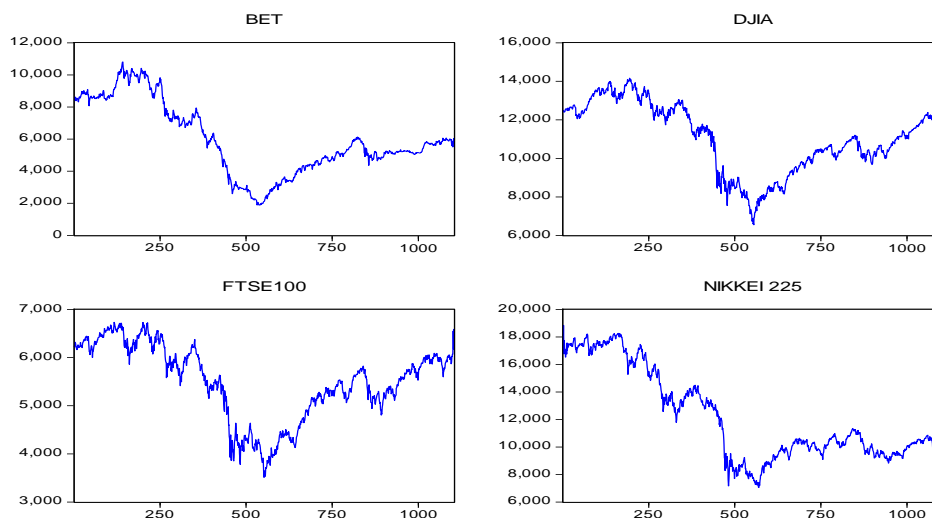
Despite the apparent antagonism between emerging stock markets and developed stock markets, their evolution was quite similar in the analyzed period. The trend of the analyzed indices, namely BET (Romania), D.J.I.A (U.S.A), Nikkei 225 (Japan) and F.T.S.E 100 (U.K) during the period of January 2007 to April 2011 was strongly downwards, in strong correlation with the global financial crisis, as it can be seen in the figures below :


Figure no.1 The trend of BET, D.J.I.A , Nikkei 225 and F.T.S.E 100 indices

The main statistical properties, specifically Skewness and Kurtosis, suggest that historical data are non-normally distributed, especially for BET index. In statistical terms, skewness is a measure of asymmetry of the distribution of a data series around its means. The skewness of a symmetric distribution is zero. In conclusion, in the case of normal distribution, the skewness is null. Positive skewness suggests that the distribution has a long right tail, while negative skewness implies that the distribution has a long left tail. Kurtosis measures the peakedness or flatness of the distribution of a return data series. The kurtosis of a normal distribution is 3, any other value having profound implications in the context of emerging capital markets. Thus, if the kurtosis exceeds 3, the distribution is peaked (Leptokurtic) relative to the normal. In the opposite, if the kurtosis is less than 3, the distribution is flat (Platykurtic) relative to normal.

The BDS test was used to determine whether the residuals are independent and identically distributed. The hypothesis was rejected. In this analysis I used also the Unit Root Test. When running Unit Root Test, the null hypothesis is that the variable has a unit root. I also used the stationary test Augmented Dickey-Fuller. The analysis performed in this article has led to the conclusion that the time series are not stationary in levels, regardless the level of confidence, which is 1%, 5% and 10%. The greatest differences are emphasized throughout in the case of the Bucharest Stock Exchange index, namely BET.

The results are presented in Annexes.

3. Conclusion
In economic literature, the stock market is metaphorically called "economic barometer," because it implies that it anticipated growth in the real economy. However, in the case of the Bucharest Stock Exchange, this phrase remains only an incomplete definition of an economics textbook.

Previous study demonstrates that the stock market development in Romania depends fundamentally on the evolution of mature stock markets.

The financial crisis has had a significant negative impact on capital markets around the world, and of course on the Bucharest Stock Exchange. The magnitude of losses was unprecedented, one of the main explanations is the status of frontier emerging stock market of Bucharest Stock Exchange, which is highly correlated to the evolution of the mature stock markets of the world, but especially with the New York Stock Exchange.

Obviously, under the conditions in which financial markets are globalized, Bucharest Stock Exchange cannot be disconnected from the trend of mature stock markets, but correlation with them is extremly intense.

APPLICATION OF CHAOS THEORY TO EMERGING CAPITAL MARKETS

Birău Felicia Ramona [*]
University of Craiova,
Faculty of Economics and Business Administration

This article provides an analyses of emerging capital markets based on chaos theory. Emerging capital market is characterized by deep functional, structural and institutional malfunctions. This particular category of capital market is characterized by certain particularities such as : high volatility, the existence of bubbles, panic, speculation, anomalies, high-risk investment opportunities, high returns, a low level of liquidity, reduced capitalization, diversification benefits for investors in developed markets, strong correlation with developed capital markets, reduced number of transactions, insufficient development of financial instruments, exchange rate instability and many others also. Chaos theory is a revolutionary concept which analyzes the behavior of complex and unpredictable dynamical systems, such as emerging capital markets. Insignificant variations of the initial condition of a nonlinear dynamical system may produce very sharp variations in the long term behavior of the analyzed system, namely the emerging capital market. Chaos theory provides an effective alternative to traditional models and especially to Efficient Market Hypothesis.

Keywords : chaos theory, fractals, emerging capital market, efficiency, the butterfly effect, R/S analysis

JEL Classifications : C58, G11, G14

1. Introduction

In essence, chaos theory is an antagonistic and controversial manner to expect the unexpected. A more sophisticated way of expressing this is that small changes in the initial conditions lead to drastical changes in the final results. Capital markets are very complex and unpredictable. Capital markets' chaotic behavior and non-liniarities, complication and uncertainty, unexpected booms and crashes are some of the most challenging problems. The chaos theory, which utilizes nonlinear mathematics to identify the underlying rules of evolving systems, provides extraordinary insights into the dynamics of the financial markets [Chorafas, 1994].

The capital market is a complex and dynamic system with noisy, nonstationary and chaotic data series (Peters, 1994). Some researchers are suggesting that such complexity is an intinsic characteristic of such system. The interesting thing about the chaotic dynamics of capital markets is its great ability to generate dramatic movements which appear to be random, with higher frequency than linear models. Obviously, this chaotic behavior of capital markets in general, but especially of emerging capital markets is a non-linear deterministic process, because linear models can only generate four types of behavior : oscillatory and stable, oscillatory and explosive, nonoscillatory and stable and oscillatory and explosive (Hsieh, 1991). The non-linear models are much more complex and can generate a much more varied types of behavior.

The capital market has always been one of the most popular investments due to its high returns (Kuo et al., 1996). Because of that, capital market modeling is an area of interest to capital traders, quantitative finance specialists, investment professionals and applied researchers. One of the most controversial issue in the recent past is probably whether the capital market can be

predict in a satisfactory manner or not. Howerer, there is always some risk to investment in the capital market due to its unpredictable movements. Thus, an appropriate prediction model for capital market forecasting would be highly valued and useful, being an issue of a major interest. [Birău, 2011c]

2. Chaos theory – an unconventional alternative to traditional finance
Chaos theory is a relatively new and provocative paradigm that can be used for modeling nonlinear, dynamic systems as the capital market. It is very difficult, if not even impossible to compress in a brief definition the meanings of chaos theory on the capital markets .

Chaos theory analyzes complex motion and the dynamics of sensitive systems, such as the stock market. In addition, chaos theory is an attempt to demonstrate that order does exist in apparent randomness. Remains to be established whether this theory is actually a solution to the problems of emerging capital market or it is just a complement to traditional theories.

For a long time there was the perception that events are either randoom and completely unpredictable, or deterministic and perfectly predictable. The essence of chaos theory is that chaos and order, determinism and randomness, smoothness and roughness can coexist in an unexplained form of symbiosis.

Chaos theory does not involve the identification of a pattern from the past and applying it to the future. The centre of interests is current stock market behavior, which is generated by the individual fractal behaviour of investors [Birău, 2011b].

According to Kellert : "Chaos theory is the qualitative study of unstable aperiodic behavior in deterministic nonlinear dynamical systems." The idea of chaos is seen as "The property that characterizes a dynamical system in which most orbits exhibit sensitive dependence" [Lorenz, 1993].

According to Eugene Fama, who developed the Efficient Market Hypothesis : "an efficient market is defined as a market where there are large numbers of rational, profit-maximizers actively competing, with each trying to predict future market values of individual securities, and where important current information is almost freely available to all participants".

Efficient Market Hypothesis suggests that any information is available to all investors or market participants, so stock prices always incorporate and reflect all relevant information. In consequence, the price of a stock should reflect the knowledge and expectations of all investors or market participants. An idea widely accepted in this respect was that price changes were independent and, in addition, prices apparently followed random walks.

Technically, in an efficient market, no investment strategy can earn excess risk-adjusted average returns, or average returns greater than are warranted for its risk (Barberis and Thaler, 2003).Thus, a long-term investor has no advantage compared to a short-term investor. The risk is the same in both cases. In opposition, according to chaos theory, a long-term investor incur less risk than a short-term investor.

Fractal Market Hypothesis is an alternative to Efficient Market Hypothesis and it is based on chaos theory. The antagonism between the two theories is more than evident. Actually, Fractal Market Hypothesis is a new and different approach which was developed to provide an alternative solution to the difficulties faced by the traditional theory in explaining certain financial phenomena.

Consequently, it becomes impossible to identify price changes from one period to another, even if it's weeks, days or hours. This feature defines the charts as fractal curves and make available to users a wide range of mathematical and computer analysis methods.

According to Peters, through the Fractal Market Hypothesis, we can understand why self-similar statistical structures exist, as well as how risk is shared distributed among investors.

Fractal Market Hypothesis is based on certain assumption. Thus, is emphasized that investors did not react immediately to the information they receive and of course, the manner in which they interpret that information may be different.

A central concept in the framework of this theory is the stock market liquidity. The Efficient Market Hypothesis does not mention at all liquidity. This aspect is very important considering the fact that the most dramatic crashes were caused by the lack of liquidity. As a consequence, a lack of liquidity constrains investors to accept any price whether it is fair or not.

A liquid stock market is a stable market. However, a stock market is stable when it consists of a large number of investors which have different investment horizons. In contradiction with Efficient Market Hypothesis, the Fractal Market Hypothesis suggests that information is valued according to the investment horizon of the investor [Birău, 2011b].

In another train of thoughts, prices reflect a combination of short-term technical and long-term fundamental valuation (Blackledge and Murphy, 2011). Despite this fact, short-term price changes have a predisposition to be more volatile than long-term price trends.

3. The Butterfly Effect and its implications

In a dynamic system such as the emerging capital market, any change, no matter how insignificant it may seem, can degenerate into a highly unpredictable behavior.

The butterfly effect it is actually a metaphor that explains the reason why dynamic systems like the emerging capital market can't be predicted for a long period of time. It is practical impossible for an investor to anticipate the influence of every single insignificant factor affecting the emerging capital market. Accordingly, it is also useless to believe in a perfect forecasting.

The butterfly effect discovery was itself a hazard. The meteorologist Edward Lorenz developed in the 1960s an unsophisticated meteorological model based on differential equations. He was running simulations of weather on his computer using this model. One day, Lorenz wanted to review a particular sequence of data and to repeat one of the simulations for a longer time, but instead of repeating the whole simulation, he decided to start the second run somewhere in the middle. To achieve that, he used data printouts and inserted the initial conditions at some point near the middle of the previous run and re-started the meteorological model estimation.

The result was impressive but contradictory and inexplicable. Although it should have perfectly coincided, the second run matched at first the data from the first run, but subsequent they had completely divergent paths. The explanation for this bizarre result is very simple. Lorenz had not respected the initial conditions exactly, because the computer stored numbers to an accuracy of six decimal places, while the printout of results reduced the numbers to only three decimal places. The difference was obviously inconsequential. Or rather it seemed to be at first…

The result obtained by Lorenz from the two runs of the model is presented below :

Fig.1 Lorenz experiment

Lorenz's discovery of immense importance refers to the fact that a very small difference, respectively something less than one part in one thousand, in the initial conditions led to great

changes in the weather predicted by his model over time. Actually, sensitivity to initial conditions represents one of the main features of the chaos theory.

Extrapolating this discovery in the field of capital markets, we conclude that the most insignificant perturbation of input parameters can cause a huge change in the outcome because of a high sensitivity to initial conditions.

Lorenz has spotlighted in a very plastic manner this revolutionary discovery, by addressing the following rhetorical question :

"Does the flap of a butterfly's wings in Brazil set off a tornado in Texas?"

It is possible that an seemingly insignificant information to trigger an "earthquake" on the emerging capital market, or even more, a financial crash with global implications?

The emerging capital market equilibrium can be changed very fast and quite facile, so it is very likely that some dramatic event to occur at a particular moment of time.

4. R/S analysis

R/S analysis or Rescaled Range analysis is a statistical methodology used to identify the presence or absence of trend in time series, based on the calculation of the Hurst exponent. By its characteristics, stock market does exhibit the persistence of trends so it is perfect for using this method of analysis.

R/S analysis was originally developed in the early 20th century by the hydrologist H. E. Hurst. At that time he was working on Nile River Dam project, being concerned with the storage capacity of the resulting reservoir.

Dissatisfied with the results obtained with standard analysis, Hurst developed his own methodology. He was aware of Einstein's research on brownian motion, respectively about the way he managed to identify the irregular motion of a particle suspended in a fluid.

Einstein conducted an exhaustive research on brownian motion. He demonstrated that a microscopic particle collided at random from all sides by other particles in the surrounding liquid will accomplish a statistical law according to which the distance the particle passes will increase only by the square root of the time. In other words, the distance covered by the random particle is directly related to the square root of time. The mathematical formula is the following :

$$R = kT^{\frac{1}{2}}$$

where R signify the distance covered, k is a certain constant and T is time index.

Starting from the previous formula, Hurst proposed a generalization of brownian motion. In this respect, he used rescaled range analysis so his methodology can be applied on a time series with extended applicability. Hurst generalized equation is :

$$R/S = kT^{H}$$

where R/S signify the rescaled range, k is a certain constant, T is time index and H is referred to as the Hurst exponent.

The calculation of Hurst exponent enables us to evaluate how chaotic the time series is.

To complete the R/S analysis model, it is necessary to calculate the sample standard deviation :

$$Sr = \sqrt{\frac{1}{r}\sum_{i=1}^{r}(x_i - u)^2} \text{ for r = 1, 2, …,n.}$$

where u is the mean for the time series values : x_1, x_2, x_3…..x_n.

Finally, the adjusted range Rr is now normalized by dividing by S_r

$$(R/S)_r = \frac{R_r}{S_r} \text{ for r = 1, 2, …,n.}$$

The Hurst exponent can be approximated by plotting the log(R/Sn) versus the log(n) and solving for the slope through an ordinary least squares regression :

$$\log(R/S_n) = \log(c) + H \cdot \log(n) \text{ (Peters, 1994)}$$

For obtaining the expected $\{(R/S)_n\}$ values for the analyzed process it is necessary to use the following formula :

$$E(R/S)_n = \left(\frac{n-0.5}{n}\right)\left(n \times \frac{\tau}{2}\right)^{-\frac{1}{2}} \times \sum_{r=1}^{n-1} \sqrt{\frac{n-r}{r}}$$

In addition it is used the V-statistic which estimates the breaks in the R/S plot in an easier manner and serves as an adequate measure of cycle length in the presence of noise. The V-statistic is defined as :

$$V_n = \frac{(R/S)_n}{\sqrt{n}}$$

One aspect worth mentioning is the fact that the influence of the present on the future can be evidenced as a correlation coefficient:

$$C = 2^{2H-1} - 1$$

Regarding the interpretation of Hurst exponent values, some aspects should be highlighted. Obviously, if H=0.50 then the correlation coefficient C=0 so we are dealing with a independent process. This case is characterized by certain particularities, such as : time series is random, events are random and uncorrelated. In other words, the present does not influence the future.

Another situation is that when $0 \leq H < 0.50$ then time series is antipersistent. If the time series has been up in the previous period, it is expected to be down in the next time period. Of course, the converse is also available. The intensity of this antipersistent behavior depends on how close H is to zero. Implicitly, the closer H is to zero, the closer C moves toward –0.50, or negative correlation. (Bohdalová and Greguš, 2010).

If $0.50 < H \leq 1.00$ then then we discuss a situation involving persistent time series. It is important to mention that a persistent time series implies long memory effects. Technically speaking, the present does influence the future. If the time series has been up (or down) in the previous period, it is expected to be up (or down) in the next time period. The intensity of this persistent behavior depends on how close H is to 1, because a high value of H implies less risk.

The R/S analysis was used for distinguishing random and non-random systems, the persistence of trends and duration of cycles [Vacha and Vosvrda, 2005].

5. Conclusion

Capital market in developing countries, known as emerging capital market, represents a distinct category which is generally associated with high returns, explosive volatility and diversification opportunities for investors in developed capital markets. Emerging capital markets are less efficient than the developed market given their functional, structural and institutional malfunctions.

Chaos theory represents a significant progress in understanding a dynamic, complex, unpredictable, nonlinear systems such as the emerging capital market. Assuming that emerging capital market is a chaotic system and not just purely random, chaos theory is in sharp contradiction with Efficient Market Hypothesis. A market in which prices always "fully reflect" available information is called efficient. The most important issue regarding efficient market theory is that it is not possible to outperform the market over the long-term. Chaos theory contradicts deeply and argued this conventional principle of traditional finance.

Emerging capital markets behavior is extremely haotic and difficult to predict, so it is not an unusual or an impossible fact that seemingly minor events can cause major perturbations in the

final outcome. In other words, very small and insignificant variations in initial conditions can generate extremely significant differences in the final event.

DEVELOPMENT PERSPECTIVES OF SECURITIES SECONDARY MARKET IN REPUBLIC OF MOLDOVA

Chetraru Aliona
Moldova State University
Faculty of Economic Sciences

Enicov Igor
Moldova State University
Faculty of Economic Sciences

It's an urgent necessity to determine the specific problems of the securities market in Republic of Moldova, in the context of policies and strategies of accession to the European and International activity standards, performance and quality, along with the implication and effects of the international financial crisis.

Identification of the influence factors with negative on the secondary market will enable the formulation of recommendations, proposals, improvement and refreshing techniques for the capital market as a whole. The analysis of the secondary market indicators allowed concluding on a high degree of uncertainty and predictability of its evolution. Legislative and regulatory issues on the securities secondary market activity of professional participants, admit the interpretation duality of provisions concerned. National Commission of Financial Market activity as a mega-regulator of the financial market, although involving a increased complexity of activities concerning supervision, control and regulation of the financial (non-banking) sector, do not enjoy great efficiency in terms of stabilization and promotion of the financial sector. The appearance of a stock institution as an alternative to the existing one, after 20 years of experience of the latter, theoretically opens new market opportunities, although in practical terms, at this moment of time, the market participants are reserved and undecided on the future development trend of the secondary market.

The study is based on statistical data contained in annual reports of the National Financial Market Commission and published on the official website of JSC „Stock Exchange of Moldova", analysis of legislative and regulatory provisions and international practices. The statistics cover the whole period of operation of the secondary market in Republic of Moldova, that is from 1995 to 2012, as much as the stock market segment and the counter. The research methodology was based on content analysis, scientific observations, classification, and graphic representation of the investigated phenomena.

The paper will contribute to the identification of the secondary market problematic issues and will present a variety of solutions, which will help to review the secondary market development strategies, in particular, and of state policies on financial markets in general.

Keywords – securities secondary market, transactions, stock exchange, finance.

1. Overview concerning the securities market and its reform

Capital markets through financial instruments, makes one of the most important functions in a national economy – funding of it. This is done directly on the primary market through shows of securities, whether public or closed; the secondary market is a movie indirect influence through price, information, expectations, etc. Representing an emerging market, securities market from Republic of Moldova, in the last 20 years has been subject to conceptual and structural reforms, with purpose to enliven the situation and attract more participants.

In this respect, the first reform began in 1996-1997 with the need to determine the fundamental principles of operation of securities markets components and directions of activity of professional

participants prior to the legislative and regulatory framework, having a specific temporary character ensuring the mass privatization of state assets. The key objectives of the National Securities Commission (NSC) (reorganized in 1998 the State Commission for Securities Market) in insuring development of securities markets were:

- connecting of legislative - normative framework, international standards on the movement of securities and activities of professional participants;
- ensuring competitiveness of professional participants both internal and external markets and the possibility to operate - from year to year on external markets to increase its regulatory capital on minimum level of professional participants;
- orientation securities transactions for stock sector, including through the legislative-normative provisions and diversifying types of operations made in; stock;
- promoting information disclosure both by professional participants of securities market, as well as by issuers, investors.

The next reform of the securities market started in 2004 with the launch of the project of reorganization / liquidation of non-specialized non-mutual fund investment, as law successors of privatization investment funds. The tension in society on the inefficiency of investment funds required to initiate proceedings forced or voluntary liquidation of investment funds unable to provide or repurchase its shares from shareholders as provided by law (at least 50% of the nominal value) or reorganization of these in ordinary joint stock companies with the condition of repurchasing the shares from all shareholders who submitted that request. As a result, over several years have gone the investment funds and some elements related to infrastructure (storage investment funds) and it was reviewed the exchange transactions structure, promoting transactions in interactive section, which forms the market price of securities negotiated. Moldova Stock Exchange (MSE) has changed the conditions for admission to stock exchange listing, companies being enrolled in one of two levels (previously three) only if they obtain a positive financial result (before the third level there were no restrictions on the financial result).

A new reform of the securities market started in 2006 with the establishment of inefficient policies and strategies of development of market securities separate from other components of the financial market as a whole. However, financial market can not develop and exploit the situation when its components are managed separately, with no correlation and coordination of policies and development strategies. Thus, international practices directed local authorities toward the idea to form in Moldova Mega (2007) - National Commission of Financial Market (NCFM), the legal successor of the NCSC, whose functions were the segment management in market securities, collective investments, insurance and reinsurance, microfinance and savings and loan operations in the associations. Banking sector remained under the supervision and control of the National Bank, a state body with autonomous status.

At present is projected financial market reform, based on their promotional policies:
- discussing the draft law on capital, which implies some conceptual changes of its key elements and procedures of the securities market;
- developing the concept of a central depository, which would take over the functions independent securities registrars and ensure the storage and clearing and settlement of securities transactions;
- Mega status review to determine the principles of intensive cooperation NCFM and National Bank of Moldova (NBM), to develop unique policy of financial market development.

2. Secondary market indicators
