The main objectives of the state regulatory body, control and supervision of securities market in any period was refreshing secondary market segment, which is the term efficient on functioning of overall economy. The development of national economy determine trends in the securities market, in particular, the value of exchange transactions, trading profitability, market prices,

market attractiveness for domestic and foreign investors exchange, liquidity and safety operations started, etc.

The first stock exchange transactions in Moldova took place in the SA "Stock Exchange of Moldova" on June 26, 1995. Thus far have been negotiated 6035 million titles in the MDL (or 545.4 million USD). OTC in the same period were negotiated about MDL 8924.6 million (or 778.9 million USD)

Dynamic transactions can be viewed in Fig. nr. 1, with separate coverage and off-exchange transactions. Note, the lack of any form of development trend of the indicator analyzed, chaotic oscillating turnover from year to year depending on the spontaneous events. In general aspect, between the years 1998 - 2005 value of transactions fit within the 600 to 800 million, marking a relative stability. Since 2007 the indicator increase sharply, confirmed in 2008, followed by major fluctuations in 2009-2012.
Fig. nr. 1. Dynamics secondary transactions recorded in the Republic of Moldova in 1995 - first quarter 2012.

Source: made by author based on annual reports of NCFM (NSC) for the years 2000-2011, NCFM monthly bulletins for January-March 2012, Newsletter "Stock Exchange of Moldova".

Although, since 1997, NSC promoted policies restricting secondary market OTC market directing the participants to shelf stock, note that from 2000 to 2012 only two years of prevalence of value exchange transactions have been registered on the OTC - 2003 and 2007. We note that only a security transaction determined the outcome of the entire year - through tender offer to

purchase the package of 96.5% shares of "Vitanta-Intravest" SA (Now IM "Vitanta Moldova Efes Brewery" JSC) worth 167.6 million lei (12.69 million USD). The transaction took place in January 2003 and constituted 34.89% of the annual exchange transactions and 20.29% of total secondary market transactions. In 2007 the stock market was revived thanks to the tender offers; public offerings later renamed the secondary direct transactions conducted in the Department of MSE. Their share was 65.5% of all stock transactions, a value of 808.5 million lei (71.49 million USD) in the 582 transactions involving the 27 issuers. 4-fold increase values such tender offer transactions in 2007 compared to 2006 was due to implementing the changes introduced in the Law on securities market, imposing shareholders with majority shares (50% +1 share) to initiate tender offers in order to protect the interests of small shareholders.

OTC transactions are traditionally performed on donated securities, succession and inheritance, honor obligations related collateral, company capital, split, consolidation or conversion of securities, repurchase of shares by the issuer, selling and buying of securities by individuals receipts derived from securities investment property and / or the liquidation of investment funds involved in the patrimony bond privatization, where the cumulative volume of transactions in a period of 12 months, does not exceed 1% of the total securities issued by class time.

A significant prevalence over the counter (OTC) segment is seen in the following years:

- 2000 - February privatization of electricity distribution networks - South Electricity Distribution Networks - Power Networking Centre and Chisinau, as a result entered the local market they formed ICS Spanish investors "Red Union Fenosa" SA, reorganized after the ICS "Natural Gas Fenosa" etc. Transaction value was about 264 million lei (21.85 million USD);

- 2004 - sale purchase in December of stock shares closed JSC "MMT-Bis" worth 283.3 million lei (21.79 million USD), the share transaction was 53.47% of the Total OTC.

- 2009 - recorded higher share purchase and sale transactions of shares in joint stock companies, following amendment to the law on joint stock companies have maintained its statutes purchase-sale of shares the shareholder agreement (in accordance with amendments made in law starting from 01.01.2008 JSC not fall into the closed and open type);

- 2011 - social capital contribution of foreign investors in domestic stock companies was 37.4% and judgments based on transactions - 32.7%, cumulative 70% of OTC.

The reported allow concluding local market participants tend to use all possibilities provided by the segment out of the counter on change of ownership of securities to bypass the shelf stock. As mentioned reasons: the tendency to convey particular individual securities, avoiding the training process of the market price, minimizing transaction costs.

A very important event for the securities market of the Stock Exchange was set up in Chisinau. In November 2011, the Board of the National Commission of Financial Market registered issuance of shares of joint stock companies set up "Chisinau Stock" amounting to 1.5 million and decided to grant license to stock market activity core business of securities with related activities for a period of five years. The Board of Directors meeting of January 12, 2012 NCFM were approved exchange rules, was coordinated size and the perception of taxes, fees and commissions. Exchange rates obtained permission to hold substantial shares in the company for shareholders 7. Exchange broadening of RM system marks a new period in the movement of financial instruments on the domestic market, given the newly created institution intends to trade derivatives brokers to access the trading system of stock exchange out of the shelf, to broaden the typology of transactions in stock exchange to introduce the category of market-maker, etc.

3. Foreign investors on the secondary market

Another indicator of the vitality and efficiency of the secondary market is the fence of participation of foreign investors in the securities business. 2008 financial crisis and political instability in the last three years have resulted in diminished interest foreign investors in the secondary securities market, the value of transactions of purchase and sale of securities is falling

continuously since 2007, registering the lowest 2010 values for over 15 years - purchase transactions - 14.5 million, sales transactions, 55 2 million (Fig. 2). However, 2010 is shaping the tendency of selling packages of shares in domestic companies issuing.
Fig. nr. 2. Dynamics of purchase and sale transactions recorded on the secondary market of RM with participation of foreign investors in the period 2003-9 months, 2011.
Source: made by author based on annual reports of NCFM (NSC) for the years 2003-2011.

A greater share, according to data reported by NCFM for 9 months, 2011 is direct transactions "company capital of the company", or participation of foreign investors in equity securities of companies with limited liability - 1173.1 million lei (102 million) or about 30% of all operations with participation of foreign investors on the secondary market. For the period 2008-2010 the value of this indicator had exceeded 110 million. In this way, foreign investors made in terms of direct transfer of property law, but sale and purchase of securities and, in some cases, information hiding about beneficiary "real" titles.

The presence of certain transactions, unique, due to processes such as privatization of estate state higher minimum regulatory capital required of its banking system, foreign investors entering the local market, investment funds reorganization, re-stock companies generates trends controversial, chaotic and irrelevant in the secondary market in RM.

4. Conclusions - The role of the National Commission of Financial Market

Economic disruptions caused by the influence of recent financial crisis and political instability in the past three years led National Securities Commission to study deeply relevant factors of non-banking financial market failure, particularly securities markets, financial instruments that caused the national economy and guarantor the free movement of capital from an economic entity or individual to another. NCFM developed a strategy on financial unbanking market development in the medium term - 2011-2014, also participating in the development strategy of the country by

2020. Although NCFM aims the reorganization of status holders of securities through a single registrar, forming a central depository, the development of scholarship, creating a system of electronic trading in securities outside the Stock Exchange, itself the status of state regulatory body, supervision and control involving non-bank financial market in the principles of operation, financial market implications, functions and role in determining the policies of development and interaction with other state bodies charged with similar functions in other areas.

Analysis of the practices of countries where financial market mega shows a full control of all financial market segments: securities markets, banking, insurance and reinsurance market, collective investment sector, microfinance, etc. In RM NCFM, as mega does not control the banking system, a fundamental component of the financial market. At present it is necessary to review the principles of interaction between the NCFM and NBM when developing comprehensive policies integrated financial market, comprising both the banking system, as well as non-banking financial market.

Therefore, RM securities market at present is an underdeveloped market, both in terms of infrastructure, as well as the presence of various types of financial instruments, characterized by contradictory trends.

In conclusion, we consider that the situation in the secondary market securities, in particular, and the financial market as a whole could be channeled in a positive trend, if state policies and strategies should provide for concrete measures:

- *political stability, economic and legislative;*
- *review of state tax policy, in order to reduce tax burden and facilitate the work of economic entities;*
- *linking financial market development policies between all components of this market;*
- *review the principles of registration of joint stock companies on stock exchanges, the issuer chooses the category currently quotation - non-listing or listing;*
- *public education viewing on the related opportunities of the market capitalization of equity securities own or obtain additional sources of funding.*

THE IMPACT OF FINANCIAL CRISIS UPON THE INFLATIONARY PROCESS IN ROMANIA

Damian Monica
„Al.I.Cuza " University, Iaşi
Faculty of Economics and Business Administration

The intensification of financial turmoil in September 2008 has determined a contraction of economic activity in most countries around the Globe. Because the real GDP dynamics influence the evolution of consumer prices, the effects of financial crises have been reflected upon inflation rate. The aim of this paper is to estimate the inflationary impact of the financial crisis and to analysis of the channels through which the financial crisis has affected inflation rate in our country.

In order to estimate the inflationary impact of international financial crisis, we have used multifactorial regression model regarding inflation rate and leading factors in which we included a dummy variable. Analyzing the causes of inflation rate in 2007-20011 period, we had found gross average salary being the principal cause of inflation, because its increasing had not been accompanied by the increasing of labour productivity. The growth of the real net salary had been accompanied by the production growth (2007-2008) and on the other hand, by the uncertainty regarding the future evolution of incomes (2009-2010) and, therefore, did not create inflationary pressures upon consumer demand. The results show the positive impact of financial crisis, but a very low one. The effects of financial crisis have revealed upon inflation rate through international prices, consumer demand, leu currency exchange rate fluctuation.

In the context of financial crisis, the financial system has become more vulnerable, and, therefore, the necessity of maintaining financial stability slows down the disinflationary process.

The necessity of maintaining financial stability and reassessing the crediting involves avoiding strong increase of interest rate; we identified a positive and strong relationship between the share of overdue and doubtful loans in the total credit portfolio and interest rate on the interbanking market at the three months. Also, another factor with negative impact upon the quality of credit portfolio is the national currency depreciation. We can state that the financial sector is another channel through which financial crisis influences the inflation rate in Romania.

Keywords: financial crisis, inflation rate, financial stability, recession, depreciation
JEL classification: E31, G01, C32

1.Introduction

Defined by Alan Greenspan as a „tsunami of credits which appears once in a century ", the actual crisis, also called subprime crisis, is a financial crisis determined by the sudden decrease of liquidities in the credit global market and in the bank systems, caused by the failure of companies which invested in subprime mortgage. Being considered as the biggest crisis after the Great Depression from 1929, the current financial crisis entered the acute stage in September 2008, having a major impact upon economy, both on international and Romanian economy level. Most of world economies, especially the ones of the United States, European countries and Japan have registered the most severe economic contraction since 1929.

For example, in Malaysia exports and industrial production and, therefore, investments decreased. The result was that GDP increased only with 0,1% in the forth trimester of 2008 compared to an average of 5,9%, registered in the first nine months of the year (Soo Khoon and Lim Mah-Hui 2010: 8).

Although the economic growth was of 3,2% in Africa, the impact of financial crisis was seen in all its leading factors: the demand and the prices of commodities decreased, the capital flows,

especially the direct foreign investments have registered a significant decrease. As a result of commodities prices decrease for the year 2009, an inflation rate of 8,7% has been predicted, which signifies a decrease with 2,2% towards the year 2008 (Kasekende, Ndikumana şi Rajhi 2009: 5).

2. The empirical evaluation of the leading factors of inflation in Romania in the 2007-2011 period

In our country, the inflationary process was accelerated in the first trimester of the year 2008, reaching its maximum level, of 9,04%, in July, before it was mitigated to 6,3% in December.

The inflation rate changed its decreasing trajectory, registered in the second period of the previous year, reaching the value of 6,71% at the end of the first trimester of the year 2009. The evolution was due to the increase of the oil price on international markets and of pressures posed by volatile prices. Starting with the second semester, the growing rhythm of prices had to slow down until October, the annual inflation rate decreasing with 2,41%. The breakdown of decreasing evolution of inflation rate in the fourth trimester 2009 is due to cigarette producers of bringing forward the inflationist impact of exchange rate, taken into account in excise calculation.

In the first semester of year 2010 we remark a moderation of inflation rate, even if excises increased, so did the administered prices and pressures done by the ascending evolution of oil prices on international markets. The increase of indirect taxes (VAT, excises) has lead to accelerating inflation rate, in July 2010 the increase of consumer prices against the previous month being of 2,58%, the effect disappearing after a year.

To estimate the inflationary impact of international financial crisis, we have used an econometric equation regarding inflation rate and leading factors in which we included a dummy variable:

$$CPI = a + b * gsal + c * rsal + d * CPIext + e * M2 + f * dummy \text{ where, (1)}$$

CPI – consumer price index;
gsal – gross average salary;
rsal – real net average salary;
CPIext – external inflation rate;
M2 – monetary aggregate M2;
dummy – dummy variable which takes into account the value 1 in September 2008 – September 2011 period and 0 for other period of the sample.

To establish the econometric model we have used monthly data which were collected from the monthly bulletins of the National Bank of Romania (NBR), the official statistics of the National Institute of Statistics and Eurostat regarding the consumer prices index, the gross average salary, the net average salary, the euro/leu exchange rate, the consumer price index from EU, the monetary aggregate M2. The external inflation is calculated as a sum between the inflation rate from EU and leu depreciation against the European currency. The series of data used were expressed in indices with fix basis, December 2006 and then logarithmised. Also, the prime difference operator was applied. We have done the estimation of parameters by using the least square method. The values of parameters are shows in Table no. 1.

R- squared coefficient shows us that 66,26% from variation of inflation rate is explained by the variation of factors chosen in model. Prob(F-statistic) < 0,05 signifies the validity of the regression model. The regression coefficients are significant in a confidence level lower than 10%.

The results of the tests show us that rising the average gross salary with 1 percentual point leads to rising inflation rate with 0,6%. The relatively high influence of gross salaries upon consumer prices is explained by the fact that the rising rhythm of labour productivity in the year 2007-2008 has been low (1,84%, respectively 4,59%), while the gross average salary has incresed with 23%,which means an average rising of unitary salary cost with 19,26%. In the year 2009 the rate

of increase of unitary salary cost has decreased at half (10,51%), due mainly to a significant decrease of rhythm of rising salaries, those rising with only 8,45%. The slowdown of economic growth in the year 2010 and the diminishment of budgetary salaries have lead to a reduction of unitary salary cost with 5,10%.

Although in the years 2007-2008 the real net average salary has risen with approximately 15%, the regression coefficient show us a negative relationship between this and inflation rate. But in those years, the consumer demand has been supported by an increase in the aggregate supply and, therefore, it has not created inflationary pressures. The inflation rate has diminished with 0,62%, to 1 percentual point rising of the real salary. The negative relationship between those two variables can be explained by the financial crisis which created uncertainty among population and, therefore, the rising of incomes did not transform into consumer demand. Although in the year 2009 the real net average salary has risen with only 2,01%, the deposits of non-government residential customers have risen in real terms on average with 8,04%, while in the year 2010 there has been a decrease in real terms of the net average salary and an increase of 0,31% of deposits.

The national currency depreciation against the euro in the period July 2007 – January 2008 (17,84%) and August 2008 – February 2009 (21,46%) has lead to an inflation rate increase with 0,04%. Also, the inflation rate variation is explained by the EU inflation rate whose annual values have been between 1% (2009) and 3,7% (2008). The relatively low impact is explained by the share of imports in the consumer basket, of 35% in the analysed period.

According to the quantitative equation of money , the liquidity injection creates deflationary pressures in the moment of rising economic growth in a superior evolution from the money supply. But, the rapport of the rising indices of the two indicators, although it has significantly decreased (compared with the previous years) in the years 2008-2010, it has remained overunitary, the lowest values being registered in the year 2008 (1,09) and in the year 2010 (1,08). The restriction crediting explains the decrease of consumer prices with 0,07% to a decrease with 1% of M2 monetary aggregate. For example, if in the years 2001-2008 the non-government credit has had average annual risings (in real terms) of 42-43%, in the year 2009 the

growth rhythm of non-government credit has decreased to 6,76%, so that in the year 2010 the mass of non-government credit would diminish with 3,88% against to the previous year.

The coefficient associated to the dummy variable suggests the *insignificant influence of financial crisis upon consumer prices*. We notice that *the impact was negative*, leading a *decrease with 0,001% of inflation rate*, despite the strong economic contraction in the year 2009.

The direct impact of financial crisis was minor, because the Romanian bank system has not been exposed to toxic assets, and because the National Bank of Romania has taken action upon time over economic directions. But, indirectly, the international financial crisis, and especially its consequence – the recession – spreads out over the Romanian economy on many channels (Isărescu 2009: 4). On the trade channel, the growing rhythm of rising exports slows down or even reduces. On the financial channel, it limits access to external financing and, therefore, it decreases the crediting volume. On the exchange rate channel, reducing the external financing has reflected the national currency depreciation. On the confidence channel, it has registered a diminishment of investments in the East – European countries. On the wealth and balance channel, it has been a deterioration of the net assets of population and companies, as a result of high share of currency credits and a decrease of assets prices from speculative values.

On one hand, reducing exports and, on the other hand, diminishing credit volume have influence up aggregate demand and, consequently, upon consumer prices.

The intensification and development of crisis have generated a reduction demand on world wide scale, reflected in a sharp decrease of economic activity. The recession registered in most of EU state members was seen also in the Romanian economy in the fourth trimester of the year 2008, Romania having an economic growth of only 3,15%. Starting with the year 2009 the financial crisis impact upon national economy has considerably increased. The massive reduction of internal demand has determined a contraction of economic activity, the negative dynamics of real GDP being of 7,1%.

The worldwide economic downfall from the second half of the year 2008 has lead to a rapid decrease of commodities price, those registering negative values during October 2008 – October 2009. The annual variation of oil price has had a strong downfalling evolution in the period August – December 2008 (from 47,11% to -48,89%), maintaining until July 2009 to over -40% values. Unlike this, the non-energy commodity prices have registered a lower decrease, with the most important one registering in March 2009 (-24,9%).

Therefore, the decrease of commodities prices on the international market has had a positive impact upon inflation rate from Romania in the fourth trimester of the year 2008 and during 2009.

The positive impact of economic activity contraction upon inflation rate was counterbalanced by the negative influence developed by the leu currency depreciation, explaining, thus, the almost null value of the coefficient associated with the dummy variable.

In this context (of economic recession and leu currency depreciation), the financial system has become more vulnerable, with effect upon the disinflationary trend.

3.The analysis of relation between price stability and financial stability
According with the opinion of the National Bank of Romania governor, financial stability has a great importance for price stability, the incapacity of maintaining financial stability leading to an reinflamation of inflation. In order to avoid a conflict with financial stability it is necessary an appropriate rhythm of disinflationary process.

According with *The Report of financial stability* for the year 2005, Romania had a high financial stability, without imminent risks, because the risk of credit was noticed and kept under control by the supervising authorities and the sector of nonbanking financial institutions which have credit activity and could not be a source of systemic risk due to the low volume of this market.

In the year 2009 the bank system has dealt with a major vulnerability, that is the credit risk, as a result of the financial crisis. The impact of financial crisis upon financial stability in Romania was an indirect one, on the channel of real economy and the one of bank liquidity (National Bank of Romania).

Tabak et.al. (2010) analyses the role of monetary policy in assuring financial stability in Brazil in the period 2003-2009. The results show that the increase of interest rate reduces the credits activity and also, increases the volume of non-performing credits.

Calculating the correlation coefficient for the period January 2002 – August 2008 in Romania between the *share of overdue and doubtful loans in the total credits portfolio* and *interest rate on the interbanking market in the three months*, we notice a *strong and positive relationship* between the two indicators (the correlation coefficient being 0.75). Therefore, the slowdown of inflationary process though the increase of interest rate leads to deterioration of quality of credits portfolio, threatening the stability of the financial sector.

On the other hand, rising the interest rate can encourage the foreign currency denominated credit, risking to destabilize the financial system in case of national currency depreciation. Because the interest rate on the national market was relatively high, a level justified by the high rates of inflation, it has stimulated the foreign currency denominated credit.

In the period 2002-2004 the volume of overdue and doubtful loans, calculated as a share in the total credit portfolio, has been between 0,28 and 1, having periods of rises and downfalls. The quality of credit portfolio improves in the following period, registering also a relatively low volatility. This evolution is justified by the national currency appreciation against to the European currency.

We can notice from Figure 1 an acceleration of the indicator in the same time with the financial crisis beginning, in September 2008 due to national currency depreciation. Because approximately 60% from the non-government credit total is represented by foreign currency denominated credit, the leu depreciation has determined a deterioration to the portfolio of receivable having by the banking sector over the nonbanking clients.

Therefore, between the *leu depreciation and the overdue and doubtful loans there is a positive and medium intensity relationship*, the correlation coefficient between the two indicators being of 0,57%.
Figure 11: *The evolution of overdue and doubtful loans in Romania (2002-2010)**
Note: share in total credit portfolio, net value

Consequently, the National Bank of Romania measures of avoiding leu depreciation in order to assure financial stability are in concordance with price stability, the leu depreciation being an essential factor of price increase. In this case, there is no *compromise between the price stability and financial stability.*

Also, the volume increase of overdue and doubtful loans is justified, on one hand, by the increase of unemployment up to 7,8% in the year 2009 and, on the other hand, by slowdown rhythm of increasing real salary in the year 2009 (2,01), respective its decrease in the year 2010 (-3,96%).

Although in the period 2001-2003 the leu currency has registered a significant depreciation against the dollar and the euro, the share of foreign currency denominated credit was between 57,97% and 62,34%. The option for foreign currency denominated credit is justified by the presence of interest differential between the leu and foreign currency denominated credit. For example, in this period, the average difference between ROBOR – 3 L and EURIBOR – 3 L was 25,51%.

4.Conclusions

The effects of financial crisis upon inflation rate have been positive (decreasing commodities prices, economic activity contraction), but also negative (leu currency depreciation). Because the impact of sharp reduction of internal and external demand and significant decrease of commodities prices has been counterbalanced by the leu depreciation against the European currency and dollar, the effect was almost null.

The necessity of maintaining financial stability and reassessing the crediting involves avoiding strong increase of interest rate in the case of inflationary pressures manifestation. Because the overdue and doubtful loans is preponderant, the national currency depreciation represents another factor with negative impact upon the quality of credit portfolio and, implicitly, upon financial stability in Romania.

Therefore, the rising of risks regarding financial stability in the context of financial crisis and the measures adopted by NBR slow down the disinflationary trend. From this point of view, we can state that the financial sector is another channel through which financial crisis influences the inflation rate in Romania.

THE ROMANIAN BANKING SYSTEM – PAST, ACTUALITY, PERSPECTIVES

David Delia[66]
Vasile Goldiş, West University of Arad
Faculty of Economics Science

The way crossed by the Romanian banking system until the present time is one governed by profound reforms which have been made in regards to the European Union. The strategies embraced by Romanian banks, in 1990 and until the present time, are meant to develop and to improve the performances so that they can compete with European banks and they can respond in an efficient manner to the customers' needs. The purpose of this paper is to underline the main stages of evolution of the Romanian banking system since 1990 and to lay emphasize the perspectives on its evolution in the context of the actual economic crisis. By going through the stages previously mentioned in this paper , we can see that the Romanian banking system evolved positively, from the moment of the transition to the market economy, but in order for it to be functional and to contribute to the development of the economy as a whole, aspects related to the the supervision of the financial stability should be taken into consideration and in order to assure the stability of the financial system, the increase of the administrative capacity of the Central Bank should be considered, as well as balancing the structure of the creditation process, on coins, the improvement of the banking assets' quality, the qualitative study of the NBR's surveillance process, managing the contagion risk, etc. In order to achieve these objectives, the documentation by the investigation of a significant volume of works has been done, by scientifically acknowledged publications, analysis being applied, by deduction method and a significant volume of quantitative information was submitted to professional judgment. Concerns regarding this subject have been found in various paper works and in specialized books. We mention here the doctoral thesis of Elena Teodorescu Georgescu "The evaluation pattern of credit institutions' prudential surveillance efficacy", the author of this work David Delia, with the work "Contributions regarding the improvement of the banking accountancy dealing with credits granted to non-financial clients" and so on. An outstanding attention payed to this subject was the one of the governor of the National Bank of Romania, Mugur Isarescu, who issued a series of articles and books on this subject. Also, Silviu Cerna, Aurelian Paul Berea, Vasile Dedu, Nicolae Danila approached in their books the problem regarding the evolution of the Romanian banking system. The National Bank of Romania offers to its users, information regarding the evolution of the banking industry through the Reports of Financial Stability and The Annual Report. The results of the research and the general conclusions regarding the concern on the evolution of the Romanian banking system are presented at the end of the work.
Key words: commercial banks, banking reform, The National Bank of Romania, development perspectives

1.Introduction

The transformations suffered by the Romanian banking system until the present time represent the result of profound reforms which had as purpose to comply to the EU norms. The reform of the banking system started actually in December 1990 (Dedu , 2003: 12) focusing the

commercial banking operations of the National Bank of Romania into a new founded bank, named The Romanian Commercial Bank. The transition of the mono-bank system complied by the NBR and four specialized banks(the Romanian Bank of Exterior Commerce, The Bank for Agriculture and Food industry, The Bank of Investments, Savings and Checks), to a system structured on two levels: The Central Bank and the Commercial Banks founded as joint stock companies, with the right to perform a large number of operations, with the condition of respecting the requirements established by the National Bank of Romania in the regulatory fields and the surveillance ones. The stages of evolution of the Romanian banking system can be summarized as it follows:

First of all, it's the period between 1990 and 1997, when the foundations of the two-level system were laid in accordance with the specificity of the market economy characteristics. At that time, three important laws were issued: the Banking Act, the Act on the Central bank's status and by the end of the period, it was the Law on the privatization of the banks in which the State is a shareholder. In the second stage, after 1997 the central bank acted to improve its banking laws in harmony with European standards. Also, it initiated a process of improving and strengthening the banking system. This was an essential process needed indeed after the serious problems which existed during 1998-1999, when economic recession hit the banking system weak links. The third step can be assimilated into the European Union integration and it reveals the impact it had on the banking sector. The forth period is represented by the influence of the financial crisis on the Romanian banking system. We aim at presenting in synthesis these aspects and to emphasize the development perspectives of the Romanian banking system.

2.The reform of the Romanian banking system

According to the opinions expressed in the specialized literature, both in country and abroad (Corriga, 1982:24), the role of the banks is if not unique, at least a special one, in comparison with other economic agents from the banking industry, the financial development assuring, at last, the necessary structure for the market economy. The transition of Romania, to the market economy, in 1990, generated important changes of the banking industry, these having a significant impact on all the other fields of activity. Until 1997, in terms of the structure of assets, the banking system is characterized by a pronounced focus on the four main state banks - Agricultural Bank, the Romanian Commercial Bank , the Romanian Bank for Foreign Trade (Bancorex) and the Romanian Bank for Development (BRD). This has been a tendency to blur, however, due to the emergence of new private banks. Thus, as a percentage of total assets at a system level, the balance of the four banks decreased from 83 percent in 1991 to 62 percent in 1998. Another feature of the banking system during 1990-1997 has been maintaining a high degree of segmentation - reflected by a priority guidance of the state banks to finance the public sector, of the ones with Romanian private equity, to finance domestic private economic agents while foreign banks worked mainly with large foreign companies which were present in our country. The reform moved on and the transformations were consistent. In order to ensure a healthy economic base of the banking system and its functioning on a competitive basis, the Central Bank adopted a policy of cautious approval, which was a favorable setting to a relatively small number of banks. Even though these banks weren't many, they were strong, with solid capital. The general enthusiasm towards establishing new banks should be taken into consideration when assessing accurately the position of the Romanian National Bank in the issue (a phenomenon recorded in other post-communist countries), and on the other hand, the insufficient knowledge of the risks of the banking industry within Romanian societies. In the 90's, the experience has shown that, apart from the existence of an adequate framework for prudential regulation and supervision, the health of the banking system requires mainly the proper functioning of the economy in general. Structural failures, recorded in the real sector of the economy - especially the high degree of indebtedness to state of a large number of enterprises

and service providers and the decline of 1997-1999 period were reflected in the quality impairment of the banks' loan portfolio, especially of those banks of large exposure. The cases of the Agricultural Bank, the Bancorex Bank and the Column Bank became notorious-like. The solution to protect banks from such influences and to ensure sound corporate governance was provided by privatization. Although through the stand-by agreement for the period 1994-1995, the Romanian authorities have already pledged to the IMF to privatize the two companies with majority state-owned bank within a year, actual results have only appeared a few years later. The stagnation of the privatization process had as reason the interests previously mentioned. Since 1997, when this orientation was given up, the economic has led to substantial changes in the banking system. In the second stage, after 1997 the Central Bank acted to improve banking legislation and to align to the European standards. At this stage, the deed directions were influenced by two major moments: the banking crisis during the years 1998-1999 and the invitation of Romania in Helsinki (December 1999) to start EU accession negotiations. It initiated a process of strengthening and improving the banking system. This was absolutely necessary because of serious problems in the years 1998-1999, when economic recession hit the weak links in the banking system seriously. The main threat to the viability of a banking system was, at the time of 1998, the failure of large banks, the state capital (Bancorex and Agricultural Bank). In 1999, the National Agency for Bank Asset Recovery (AVAB) was founded and it took over the bad loans from these banks and off-balance sheet assets from the same category in order to successfully carry out the restructuring process. The improvement procedures on the banking system led finally to the elimination of nonviable entities, getting in time to a correct assumption of the intermediation function. Since the restructuring of the banking system outran, the restructuring of the real economy and banks, in a first stage (2000 - 2002) have adopted a reserved attitude towards lending to the economy which has drawn complaints from the authorities and the public. The Central Bank intervened in this situation trying to explain that the prudential attitude they have shown is due to the large volume of bad loans accumulated by 1998. Subsequently, the lending activity has evolved both qualitatively and quantitatively. The restructuring activity, which has as purpose to clean up the banking system, was based on the banking supervision function and it was conducted from various points of view: legal regulatory, organizational and from the point of view of the efficiency in checking and sanctioning banks. Despite all this, banks remained the most important financial mediators. In the late 2000's, the Romanian banking system held more than 90% of total assets of domestic financial system. After BRD, Bancpost, the Agricultural Bank and the Commercial Bank of Romania have been successfully privatized by the taking over of the majority shareholding by foreign financial institutions with enhanced reputation, the foreign capital has become dominant in the Romanian banking market. Romania thus falls under the globalization trend although, in this case, "regionalization" would be a more correct term to use because the foreign capital currently in the Romanian banking market comes from European Union countries. From this perspective we can say that we are more integrated than other countries such as Sweden, Ireland, where more than 50% of the banking system is national property. European financial market trends begin to make their presence felt on the national banking market. Also, it is very important the fact that once with the accession to the EU and the market liberalization, a number of 207 foreign institutions have notified their intention to provide and conduct banking business in Romania. The percentage of assets held by banks with majority private capital in the Romanian banking system in the total assets at the end of 2009, 92.7%, while banks with majority state owned or held a share of only 7.3%. After the accession to the EU, the link with modern banking practices provided by the banks with foreign capital together with the increasing customer requirement led to rapid uptake and development of services involving advanced technology. Due to technical progresses, Romania has been able to overcome relatively quickly the period of checks and paper-based instruments and to subscribe to the phase of the electronically processed tools, phase

that took decades to other countries. The influence of the process of regionalization is the trend of innovation shown by local banks, reflected in the continued diversification of product range offered to customers, either by opening branches with a distinct profile (insurance, brokerage, leasing), or by providing new products (credit property, credit for vacations, etc..). At the moment, we notice that banks perform very complex activities and this is the reason why the management of the risk tends to perform "crossover" both in the type of the transactions and in the stored portfolio and the credits managed by the bank. This approach of the risks is familiar for both the banks which perform activities at a national level and the banks which perform activities internationally (Breban, 2006:23). The global economic and financial crisis, manifested intensively in 2009 represented the main negative context in which both the real and the financial sectors operated, in Romania. Due to stable levels of liquidity and solvency indicator, the banking sector has absorbed these shocks better, but the financial performance was much reduced and the risk of growth of bad loans was emphasized.The changes arose in 2009 in the field of the prudential regulatory background, had as goal not only to sort out the immediate effects of the crisis but also to assure long-term stability for the financial system. Therefore, The National Bank changed the manner through which it calculates the liquidity indicator. The methodology issued by the Norma NBR nr. 7/ 2009 determines for 31st of December, 2012 a decrease of the liquidity indicator. This is calculated as a report between the effective liquidity and the necessary liquidity, which records the value of 1,38 in comparison with the level of 2,47, corresponding to the year 2008, superior to the minimal limit(1)., trend influenced mostly by the new methodology of calculation.

Lichiditatea sistemului bancar

- Lichiditate imediată (scala din stanga)
- Indicatorul de lichiditate (scala din dreapta)
Source: NBR

At the end of June, 2011, according to the Report of Stability published by NBR, the liquidity indicators reveal appropriate values. Hence, the liquidity indicator calculated in accordance with the actual regulations had the level of 1,37 being superior to the minimum value of 1. As far as the immediate liquidity is concerned, its value is 36,6% in decrease in comparison with the one existent in December, 2010, when it was of 0,6%. In analytic purpose, the National Bank uses the leverage effect as a measure of the degree in which the resources of the credit institutions finance the banking activity. According to capital requirements Basel III, the indicator was included in the prudential regulatory framework, being applicable at a community level. The analysis of this indicator on groups of banks depending on the criteria of the held assets' size reveals the following: the maintenance of a lower auto-finance degree in the case of large banks(7,1% in June, 2011); equalization in the case of average and small banks (approximately 10% during the current year).

The evolution of the indicator was influenced among others even by the increase of proper funds of level 1 and the restraint of the volume of the banking assets in the case of many banks from the

system because of keeping unsure conditions in the analyzed period. As far as the tendency of globalization is concerned, even though the term of regionalization would be more adequate as the foreign capital existent at the moment on the Romanian banking market comes from countries found in the EU, we can state that we are more integrated than other countries, the foreign shareholding within the structure of the Romanian credit institutions was of 76,9%, at 31.12.2010. In conditions of risk and incertitude manifested abroad, the following conclusions can be reached: in Romania the financial stability remained robust and the levels of capitalization, provisioning and liquidity were maintained at adequate levels by the exclusive effort of the banks. The testing to stress indicates resistance on the behalf of the credit institutions to important economic and financial shocks.

3.Discussions

Looking ahead, the development of the Romanian banking system has some predictable ways and others in which developments may be less reliable. In the category of predictable falls the significant reduction of the bank intermediation costs. First of all, I refer to the reduction of the cost for transfer payments, once with the introduction of the Electronic Payment System (EPS) in order to get an approach of these costs to the level of costs in the European Union. As far as the cost of the large payments is concerned,, it will cut several times per unit of payment. Another measure is related to the obligatory minimal reserves in lei. The fight against inflation had to be led through diverse instruments, which the NBR had to use at a full extent, but with high unavoidable costs, generally for financial consulting, especially for crediting the national currency. The reduction of reserve requirements is a process that has already been initiated, it will continue in the next period and it will result in both cost savings and commercial banks to avoid a dangerous mismatch between main savings in lei and the majority credit still in currency. Within the category of evolutions less certain is the number of banks that will be operating in Romania during 2012-2015. There are contradictory views regarding this issue. On one hand, they say the number of banks will be reduce and this is supported by the argument that, at the moment, half of the existing banks in Romania, have less than 10 percent of assets. It is obvious that something needs to happen here. They will either increase their market share or merge or be acquired. It is less certain that this will reduce the number of banks, as it happened in 2004, there may be new categories of banks (banks specialized in house acquisitions, car purchases). On the other hand, those who believe that banks will not decrease the number come with the argument that the degree of financial intermediation (number of inhabitants per one unit banking) is still small. For example, in Switzerland, there is a bank to 1500 people. This argument is not sufficient because the number of banks may fall, but their territorial network (branches, agencies) can expand strongly. As for the number of banks in Romania, during 2012-2014 (when the euro will be adopted), this will be the result of complex processes in which, not least, the competition among banks as well as the major policy market players will play an important role on the development of regional networks and their credit profile. In the future, quality of service offered by the Romanian banking system will be more important than the number of banks. As far as the next period is concerned, the NBR has as main objective the stability of the prices respectively the reduction of the inflation at a comparable level with the EU member status of the Europen System of Central Banks. In order to assure a discount of the inflation while maintaing the sustained economic growth, the NBR experts, diverse specialists and independent analists calculated that the Romanian economy can maintain the accelerated growth in the conditions of the decrease of an inflational pressure, even with a current account deficit of 8-10% from the PIB. (Dumiter, 2011).Both in present and in the previous periods, the NBR policy assured an appropriate level of the inflational rate, as this is at the moment at a level of 2,59% in comparison with 3%, the estimated level. Another important objective of Romania is to adopt the euro currency. In accordance with the NBR's governor Mugur Isarescu, as far as the economic

situation of Romania and the role that the banking system has in the economic development of the country are concerned, the authorities established as strategic purpose of economic politics to achieve an economic long-term increase through which to "recover rapidly the disparities of socio-economic development in comparison with the UE", one of the goals being to fulfill those conditions which allow the adoption of the euro as national currency in 2014.This is one objective which can be achieved with the condition to adopt and maintain a coherent mix of economic policies, capable to support both the nominal convergence and the real convergence with the countries in the Euro Zone. Reaching nominal levels and framing into the convergence criteria established by the Maastricht Treaty (the stability of the course, low inflation, interest rates similar to the ones of the countries from the Euro Zone, moderate budget deficit and the balances of the public duty) represent at the moment objectives difficult to be reached in the context of the economic crisis which has already affected the Romania economy. Also, the year 2014 shall be discussed about, even in the situation in which the levels stipulated by the Maastricht Treaty, it is possible to resize, as a consequence of the crisis.

4. Conclusions:

In order for the Romanian Banking System to be functional and to contribute to the development of the economy as a whole, we have to take into consideration the following aspects:

-Supervising the financial stability in order to: enhance the capacity of efficient allocation of the resources, the absorption of possible shocks on the real economy;

-The growth of the banking system's administrative capacity which will assure the main objective of this one of assuring the stability of the prices;

-Qualitative study of the surveillance process through: the adaptation of the NBR's regulations to the risk profile specific to each credit institution, giving a greater importance of the role that the management of the institutions has it in managing the bank's risks;

-Managing the contagion risk which manifested due to the evolution of international markets as a consequence of the supreme debt crisis;

-Improving the quality of the banking assets;

-The balance of the on coins structure of the crediting;

-The perspectives of the banking industry and of the national financial system depend mostly on the remaking the trust, on the success of a sustainable release of the economy and not at last on the international evolutions.

THE IMPACT OF THE FINANCIAL CRISIS ON THE EUROPEAN BANKS

David Delia[67]
Vasile Goldiş, West University of Arad
Faculty of Economics Science

The fast innovations existent on financial markets and the internationalization of cash-flows in the last decade led to changes within the banking industry making it unrecognized. The financial innovation within the banking industry, especially the one regarding the off-balance-sheet instruments has effects as the risk focus and the increase of volatility within the entire banking industry. As it is proved by the economic crisis, the financial stability plays an important role within the financial system as well as within the economy as a whole. At the moment, as the number of active financial institutions is getting higher and higher in one or more countries or on one or more continents, the financial stability at a worldwide level became even more important. The objective of this work is to emphasize the way in which the European banks were affected once with the global financial crisis. The economic crisis was triggered by the bankruptcy of the Lehman Brothers ' Investment Bank, in the autumn of 2008 and its effects were felt at the level of the European financial markets, a series of cross-border groups claiming interventions of the state in order for them to be saved. The intensity of the crisis was felt and it affected many states, the impact of these ones being influenced by a series of specific factors which outlined the situation of their financial system, at the moment of the crisis release. At the level of the European Union, a series of measures have been established in order to extinguish the identified dysfunctions at a financial field level, among which we mention: the improvement of the surveillance framework of those financial institutions having cross-border activity, the expansion of the communication and cooperation among the EU surveillance authorities and the ones outside the Union, etc. The conclusions of the study of this paper work in regards to the activity of the main European banks, especially to the ones from Western Europe, is the fact that during the crisis period, they intensified their cross-border activities and increased their incomes. The increase of incomes was generated by both the fast efficient measures taken by the state and the volatility of the emergent markets. All these aspects were detailed in the content of this paper work. As far as this work is concerned, the method used here consist in a deductive-type research, which means that the starting point is represented by general facts in order to get to particular ones, starting from a theory that has as purpose the application of that certain prediction, assuring a wider knowledge area and being more operational. The selection of the pieces of information was done through different methods, as are the quantitative and the qualitative research types. The pieces of information presented here were picked up from different sources, as published articles and specialized books, all being from the financial field.
Keywords: financial crisis, European banks, cross-border activity, the analysis of the indicators, banking activity

1.Introduction

The actual economic crisis took place at two distinct levels: one characterized by tumults and their limited spread, between 2007 and the 15th of September, 2008, and the subsequent period

characterized by a complete failure regarding the reliability on the financial system, fact which contributed to a global propagation of the crisis. The first phase arose when the average correction of the prices of the USA's Real Estate generated a slight increase of the delinquency regarding the mortgage and at the same time it generated the bankruptcy of the financial institutions which held toxic and complex financial instruments, based on "sub-prime" mortgages. The autumn of 2008 brought itself the increase of crisis' propagation velocity as well as a sequence of the financial institution's bankruptcies, a notable one being the bankruptcy of the Lehman Brothers' investment bank. This marked a turning point where financial tumults started a year earlier transformed into the most severe crisis recorded since the one from 1933. Its effects hit European financial markets, a series of cross-border banking groups claiming interventions of the state in order to be saved. As a result of this, at the UE level, it was necessary to adopt a focused action plan, having as main elements: to facilitate funding for banks by different means; injecting extra capital into the financial institutions; recapitalization of the problematic banks, etc. At the same time, this established common rules which the central banks and their governments were supposed to promote within the context of accessing packages of anti-crisis measures, so that, the demarches adopted at a national level don't induce side effects within the functioning of the Unique Market and of the other member states. In the context of this reality (Georgescu, 2010: 35), it was configured the perception of the banking industry in regards to the risks that this confronts with).The magnitude of the crisis was felt and it affected states differently, the impact on these being influenced by a series of specific factors which outlined the situation of the financial system, at the moment of the crisis release. According to the specialized literature (Schildbach , 2010:67), we can talk about the existence of three categories of states whose financial systems were strongly affected by the global financial crisis:

 - States as the USA, the UK, and Ireland, in which banks confronted with a drastic cut within the balance sheet asset value as a result of the diminishment of the collateral and of losses in the granted credits before 2007.

- States as Belgium, Holland, Switzerland and Island, in which the local market was insufficient for the ambition of the financial institutions, which, in consequence built great exposures in products which have been previously structured in other jurisdictions.

- The case of Germany, in which a significant percentage from the banking industry didn't have sustainable business patterns and sufficiently productive, at which is added the employment of banks as "Landesbanks" in transactions with substitutes to credit (example: purchasing secured credits instead of direct crediting).

The banking system of the market economy represents all the banks which perform in a period of time being an interconnected assembly of autonomous banks, authorized and specialized in the circulation of the capital available for lending and they have as target of their activity to achieve profit. (Bercean et all, 2004:73). Unfortunately, as a reason of a tough competition, some of the bankers and some banks tend not to take into consideration the risks which they expose to and the main question regarding risks ("Which is the payment capacity of this client?") isn't asked any longer and it shows up the probability of losing enormously much.(The banks which succeeded in controlling the risks which they are exposed to, reached the conclusion that this process is in tight correlation with their profitability. In order to get higher incomes, a bank needs to assume higher risks, to increase its exposure towards risk and to diminish the operational costs (which leads to increase risks) (Breban , 2006 :23). The losses existent in the banking industry were borne initially by the profit of the banks without being converted to costs borne by the public sector. The profitability of the banks deteriorates fast in case of a systemic crisis governments' need of fiscal support, in order to restructure the financial sector which was strongly affected.

Even though there are still debates on the contribution of the crisis to the first recession of the global economy after World War II and on the increase of the budget deficits respectively of the public debts, it is still unquestionable the fact that this had a determinant role. In a surprising

manner, the economic crisis released in 2007 ended up being 'the cheapest', at least in relative terms. The fiscal costs attributed to the financial crisis until 2009 represented, on average, 5% of the PIB, in comparison with 15% in the case of the previous crisis. The adopted politics with the purpose of supporting the good assets and maintaining losses at a low level, as well as high value and the high speed of the private recapitalization, did so that the public recapitalization to take place at a moment when the banking solvability was much stronger than in the case of the previous crisis. The total value of the capitalization from public sources (Claessens et all, 2011:53) got to be of 441 milliards of USD, from which 245 milliards of USD in the USA, within TARP (the Trouble Asset Relief Program) and 196 milliards of USD in the UE, which, at an average of only 5% from PIB of these, represent approximately one third from the amount involved in the previous crisis (the Nordic crisis: Finland, Norway and Sweden(all in 1991); the crisis from Latin America: Brazil (1994), Mexico(1994) and Jamaica(1996); The Asian crisis: Indonesia, Japan, Korea, Malaysia and Thailand (all in 1997); the crisis of the emergent markets: Columbia(1998), Ecuador(1998), Russia(1998), Turkey(2000), Argentina(2001) and Uruguay (2002).Even though the crisis was released in the USA, it propagated rapidly hitting most of the worldwide economy, respectively the UE. The typology of the most important causes which contributed to the release of the economic crisis can be grouped as it follows:

1)Basic deficiencies of the regulatory framework. As the framework for prudential regulation existent at the moment when the crisis was released didn't succeed to assure solidity and the health of the credit institutions at a level which doesn't put in danger the financial stability of the system, it was necessary to go for the Program of Reform, in which qualified authorities were involved, its main purpose being to create a regulatory framework which allows the financial system and the banking one to act as a stabilizing force of the real economy. Important elements were put in, among which we mention the following (Georgescu, 2009: 25) :

- Inappropriate macro-prudential surveillance;
- Inefficient early warning mechanisms;
- Minuses related to surveillance practices at a cross-border level;
- Insufficient cooperation and the lack of trust among supervisors;

2) Dysfunctions within the cooperation mechanisms. The existence of significant deficiencies in the cooperation field was revealed, of coherent application of the Union Law and of trust among the surveillance authorities. The system of cooperation between the surveillance authorities, existent at the moment of the crisis release whose competences were limited at an individual level, nationally it was proved that they were inefficient.

Taking into consideration the deficiencies indentified above, measures waiting to be taken were outlined in order to eliminate dysfunctions regarding the improvement of the achievement framework of the cooperation between these, in both normal conditions for performing the activity as well as for a crisis situation. Among such measures, we remind the following:

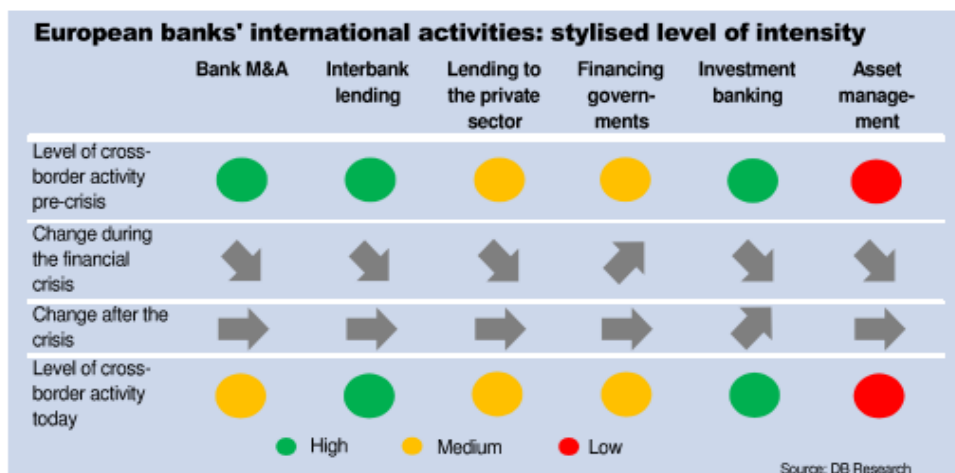
-The improvement of the surveillance framework of the financial institutions which work at a cross-border level;

-The assurance of convergence in the prevention field, managing and sorting out crisis situations; the improvement of the well functioning of the surveillance authorities' network by the delegation of tasks and responsibilities;

-The expansion of dialog and of cooperation between the EU surveillance authorities with the ones out of the EU; the increase of the responsibilities belonging to the EU surveillance authorities in managing coordinates of the crises, as well as in the maintenance process for the financial stability in crisis situations.

The globalization of the financial markets and of nations within a global economy will lead to even a bigger economic interdependence; in this situation it would be inappropriate for the institutional and political agreements not to be exposed to changes in order to accommodate to power and of the different preference of the entities existent on financial markets. (Dumiter,

2011:12). We aim at emphasizing the impact suffered by European banks as a consequence of the global crisis' release in 2007.

2. The effect of the global financial crisis on European Banks
At the moment of the economic crisis' release, the European Banks had already manifested the tendency for internationalization of their activity, the level of this one showing an insignificant variation between countries. It is worthy of remark the fact that the influences on foreign investments had also an important impact on the development of the Romanian economy. According to a study made in June, 2011 by Deutsche Bank, the degrees of evolution regarding the activity of the banks existent in Top 20 European Banks before the moment of the crisis release and until present time are outlined in the following table:


Source : Schildbach, Jan "*Home, sweet home? International banking after the crisis,*" Deutsche Bank Research, June 2011

Even though during the economic crisis the activity of the banks suffered, at the moment it recovered as the level of the cross-border investments having high rates. The same study reveals that the majority of the European banking institutions reached the maximum degree of exposure on the external market between 2007, respectively 2008. This low level went down substantially having a stable value in 2010. Despite this, the evolution of the cross-border activity belonging to European banks proved not to be everywhere the same. According to the graphic presented below, certain countries reached the maximum level of exposure in a previous level, reactive in 2003. The share of the external assets in the total assets for the banks found in Top 20 European Banks is presented in the table below:
External assets of domestic banks
% of total assets

Source : Schildbach, Jan *"Home, sweet home? International banking after the crisis,"* Deutsche Bank Research, June 2011

This situation is the result of the following: the expansion of the cross-border activity, the purchase of foreign banks and also non-profitable investments in securities guaranteed by the USA's subprime mortgage credits. In 2008, the external claims of the European banks suffered a decrease while the banking sectors left behind fighting with the crisis (the case of the Irish and German banks) continued their stabilization process. At the moment, the banks found in top 20 European Banks reported a significant increase of the incomes obtained by performing cross-border activities, especially of the ones done in European countries. These incomes recorded values never recorded before not only for the activities performed in European countries, but also internally. These incomes recorded internally surpassed with almost 30% the course of the last decade.
Source : Schildbach, Jan *"Home, sweet home? International banking after the crisis,"* Deutsche Bank Research, June 2011

The question in such a situation is: which are the factors that determined the increase of incomes? Mainly, it was about the stabilization of the financial markets which took place earlier than it was estimated due to the massive and rapid intervention of the state, short periods of recession by adopting appropriate fiscal measures by the developed countries, the volatility of the emergent markets whose phenomenal increase rate attracted again the banks from Western Europe.
 The tendencies of the European banks for intensifying their cross-border activity depend on the following aspects:
-The longer the huge differences between the industrialized states and the emergent ones will idle, the more irresistible will become the need to get a consolidation of the position in regions

with high increase. The Western European banks will continue to expand their operations in Asia and Latin America;

-The regulatory measures imposed by the Central Banks of the countries;

-Fiscal regulations showed up after the financial crisis show up in Europe and in the entire world. In case the measures imposed by the regulatory authorities prove to be too tough for banks and that it forces them to take back their loan policy (increase) this could lead to a discrimination of the foreign creditors. Confronted with the situation of choosing between activating abroad and submitting to a long term partnership risking to devolve its image, a bank would go for the first alternative. It will depend on politicians and other factors of decision in which new regulations will impede a future cross-border integration of the financial markets;

-In the countries with emergent economy, the entire concept for opening the internal market for foreign financial institutions could be questionable in case the authorities of these foreign countries will use the financial crisis as an argument to block the access of the Western European Banks.

The Western banks had a stabilizing effect on Central Europe and the Eastern Europe and most probably will continue to invest and to expand abroad, especially on emergent markets. Anyway, there will be a higher risk degree because of the dependence of the banking system way of working, of the adopted measures and policies. Despite these aspects, there's no way to go back for the banks and that's because these, resembling other industries which preceded them, underline their certain tendency to become a truly international sector, respectively a global one.

Another problem could be the measure in which the European banks are affected by a potential bankruptcy of Greece. The new president of Bundesbank, Jens Weidmann thinks that "the euro could surpass without problem a possible bankruptcy of Greece" and it refers to the fact that Greek banks have high market rates only in Romania and Bulgaria. We can deduce from this assertion that due to the weak presence of the Greek banks on the banking market of the other European states, the impact could be a minor one. Even though there are Western banks which have exposure on Greece, the biggest part of the Greek crisis stopped to the doors of the Euro area where the Greek banks have the highest rates.

3. Conclusions:

As we can notice from the analysis done above, the European banks, especially the ones from Western Europe recorded increases in incomes from the activity performed during economic crisis, which were obtained as a result of the intensification of the cross-border activity. The reasons of this increase are on one side fast measures and on the other side efficient on the behalf of the state and the volatility of the emergent markets. This volatility allowed banks to have earnings as a consequence of the speculative operations which were performed. Also, the surveillance authorities, at the level of the European Union, regarding the activities from the financial market, adopted a series of measures regarding the improvement of the legislative framework for the banks which perform cross-border activities, as well as the expansion of the communication and cooperation between the EU surveillance authorities with the ones outside the union. The improvement of the legislative framework but also the expansion of the communication between the EU surveillance authorities and the ones outside the union represents important elements when assuring financial stability at the level of the European banking industry.

SPECULATIVE BUBBLES – A BEHAVIORAL APPROACH

Dedu Vasile
PhD Professor - The Bucharest Academy of Economic Studies

Turcan Ciprian Sebastian
PhD Student – The Bucharest Academy of Economic Studies

Turcan Radu
PhD Lecturer – University of Oradea

The purpose of this paper is to explain briefly from a behavioral point of view, the appearance and the development of speculative bubbles in financial markets. In the first part of the paper, we have presented the most known speculative bubbles among the history and the principal factors causing them (structural, cultural and behavioral factors). In the second part of the paper we have briefly presented the four main stages of developing speculative bubbles. In the last part of the paper we have concluded that besides the general opinion that bubbles make more harm to investors and economies, the human history has provided us the lesson that some of the bubbles have offered us genuine collective social gains: Apollo program, Human Genome Project and the Dot.com bubbles in the early 2000s. As some studies reflect, besides of the fact the some investors have lost all their money during those bubbles (Dot.com), nowadays we all enjoy the IT infrastructure realized with all those heaps of money that were frenetically invested in.

"Bull markets are born in despair, grow amid skepticism, mature in optimism, and die amid euphoria" – Sir John Templeton

A speculative bubble represents „a cumulative movement in the price of an asset whose price is high mainly because speculators believe it will rise still further. … at some point a bubble will burst, but it is hard to predict when this will happen[68]" (Oxford Dictionary). According to conventional financial theories, speculative bubbles should never happen. According to EMH, the prices of financial assets should always reflect the intrinsic value, due to the fully informed market participants. A little volatility (for instance the noise effects) is considered normal, but overall the prices should reflect the value of the underlying asset.

Shiller (2000) sees the computational era and such related phenomena as online trading and day trading to contribute too much to the market volatility. He thinks today's New Economy was preceded by earlier "new economies" that were at least as important, generated by the automobile, the telephone, and the interstate highway system, for example. Because it is difficult to assess intrinsic values, bubbles are often identified only hindsight, after the bubble bursts.

Both the boom and the bust phases are considered to be part of the positive feedback mechanism, in contrast to the negative feedback that determines the equilibrium prices under normal market circumstances. Shiller (1989) gives the example of US stock market crash of October 1987 – "84% of institutional investors thought that the market was overpriced; 78% of them thought that this belief was shared by the rest of investors and, still, 93% of them were net buyers" (Bianchi & Jehiel 2007) Investors tend to remain invested longer, on the contrary of their opinion that the market is already overpriced. Investors are overconfident about their skills to anticipate the bubble burst, but the bubble bursts when the least people expect it. It usually happens in regular days with no major events.

[68] Black, John, Hashimzade, Nigar, Myles Gareth, „*Oxford – A dictionary of economics"*, Oxford University Press, 3rd Edition, 2009, pp 44 – Google Books online.

The term „bubble" derives from the 1711-1720 British South Sea Bubble, and originally referred to the company itself rather than to the general phenomena. The term „mania" originates from the Dutch tulip mania (Goldgar 2007). A few of the main bubbles occurred among the human history might be (Wikipedia):

-Tulip mania (1637)
-The South Sea Company (1720)
-Mississippi Company (1720)
-Railway mania (1840s)
-Florida speculative building bubble (1926)
-Roaring Twenties stock-market bubble (circa 1922-1929)
-Poseidon bubble (1970)
-Japanese asset price bubble (1980s)
-1997 Asian Financial Crisis (1997)
-The Dot-com bubble (1995–2000)
-Real estate bubbles in Australia, USA, UK, Ireland, Romania, Spanish, China, India, France (2004 – 2008)
-Commodities bubble: uranium, rhodium, exotic live stocks, gold, crude oil, etc - (2007-2009)

The impact of the bubbles has been debated between many schools of economic thought: Austrian economics, sustains that bursting bubbles can destroy a large amount of wealth and cause economic and psychological / behavioral distress (Great Depression in the 1930s, 1990s for Japan or 2007 – 2010 in USA and Europe). Behavioral distress is due to the impact of the burst, on spending habits. People tend to feel richer having their over valuated assets and are encouraged to spend more. On the contrary, when bubble bursts, they manifest anchoring biases (referring to the highest prices) and feel poorer, so they tend to consume less. Less consumers means less jobs, less loans and an inevitable recession (or even depression), affecting banks, particularly if banks had bought assets (real estate or shares).

Real estate bursting bubbles nearly always damage banks, because properties are mainly financed with money borrowed from banks. So long as property prices continue to rise and interest payments can be made, loans get repaid, everybody is happy. When the process reverses, problems appear. Borrowers are no longer interested in repaying the loans, because their equity becomes negative and may cause further reasons for prices to fall (as banks tend to demand more collateral) – so called the domino effect (Redhead 2008). Many countries have experienced economic slowdown, financial instability, and sometimes large budgetary costs from the recapitalization of the banking systems after a bubble burst.

Behavioral finance suggests that stock market bubbles occur because of the irrational behavior - the positive feedback trading, other behavioral biases. According to Johnsson, Lindblom and Platan (2002), the factors forming speculative bubbles may be grouped into three main categories:

1. Structural factors:
-The development of new technologies capable to sustain economic growth
-Changes of mentality and people's beliefs
-Changes in the money supply (remember the changes in the monetary policy of FEDs after September 11, 2001). A rapid growth in money supply could bring price inflation in stock and property markets (Redhead, K. 2008).
-Demographic development and its effect on the economy - „the baby boom" and its perceived effects on the markets
-The development of communications, telecommunications and business media able to inform and give access ordinary people to financial markets -
-The development of pensions and mutual funds industries

-Inflation and money illusion effect

-Expansion of the online trading volume and access to information (brokers, day traders, one-click trading).

2. Cultural and biological factors:

-Differences among genders (females vs. males)

-Investment and financial education among people (especially among youth). See the major differences between US households that invest directly or indirectly on stock exchanges (through their pension and mutual funds) versus the Eastern European households that merely hold their assets in bank deposits and real estate properties.

-Culture and religion ("Sharia (Islamic) Banking")

3. Psychological traits and behavioral factors (behavioral biases):

-*"The greater fool theory"* - the bubbles continue as long as the fools can find greater fools to pay up for the overvalued asset;

-*Moral hazard causes* - see the TARP Program - bailout for many financial and non-financial institutions who speculated in high-risk financial instruments during the housing boom;

-*Anchoring* – the tendency of people to attach or anchor the beliefs, thoughts and perceptions to a reference point (past event or trend) even if may have no logical relevance at the first sight;

-*Beliefs perseverance* – people are reluctant to search for evidence that contradicts their beliefs and once they find it, they tend to misinterpret everything that goes against their favor;

-*Framing* – mental frames are often linked to the language used, to underline the positive or negative aspects with adequate words. The origins of framing may be internal or outside misinformation (external framing) done involuntarily or voluntarily by the informer in order to manipulate;

-*Ignorance and lack of study* – people invest faster and easier USD 1000 in a stock than pay for a refrigerator or a TV Set. Before buying the refrigerator, they study dozens of models and search different stores for the best market price, instead for a stock they might decide to buy or sell the stock in a matter of minutes.

-*Familiarity biases* – people tend to think that assets they know more about are less risky than the others that do not know much about: for instance, they invest heavily in the company or industry they work for.

-*Representativeness biases* – leading to "sample size neglect" bias, by which the probability of an event is similar to its parent population.

-*Gambler's fallacy effect* – people defectively believe that a certain event is more probably to happen following an event or a string of events.

-*Conservatism* – manifested to people that lag or postpone their decisions much after the recent evidence tells them to act. They underweight the effects and under react to particular news or event.

-*Confirmation Bias* – people tend to filter and pay more attention to information that supports their judgments, ideas, beliefs and positions, while ignoring the rest.

-*Hindsight bias* – people understand better the nature of an event after it has happened.

-*The Role of affects* – investors tend to fall in love with stocks – they hold positions even when all the information "shouts" for close (sell); they don't hit the stock until they run into panic and very often they sell it at the minimum price

*-Herd behavi*or – people tend to mimic gestures of a larger group due to the social pressure of conformity (tulip mania, dot.com bubble or more recently the mania of holding shares of Apple Inc among institutional and retail investors.

-Wishful thinking and *overestimating the abilities* – people tend to overestimate their abilities. Besides of the fact that most of the professional money managers are not able to beat the markets returns, most of the retail investors overestimate their abilities when asked about the returns expected to have;

-Mental accounting bias - may manifest when dealing money differently from sources (hard working money spent or money received from bonuses) and the fact that people tend to put aside money in savings account instead of paying their debts first.

According to Professor Jean Paul Rodrigue, there are **four main phases in a Bubble**[69]:
Main Stages in a Bubble according to Jean Paul Rodriguez
source: http://people.hofstra.edu/jean-paul_rodrigue/jpr_blogs.html

1. Stealth – the period when "smart money" gets in without much noise. In this phase, only very well prepared and skilled people invest. It is usually the market phase where stocks (investments) are considered to be a "dirty word". People usually keep out of the markets and some even confound trading with gambling.

2. Awareness – It is the phase when very few of the initial investors tend to mark their profits, while smart money buy dips.

3. Mania – Everyone is noticing that prices are going up and the public jumps in for this "investment opportunity of a lifetime". There is a large propaganda in magazines, tv-shows, a real fashion develops in buying securities. It is the period when everyone, from the taxi-driver until your dentist asks for investment tips. All persons, no matter of what their professions are, become interested in the stock markets. High short term returns, the "easy money" ways attract many new, inexperienced investors, forming euphoric expectations about the length of the bubble. "*Floods of money come in creating even greater expectations and pushing prices to stratospheric levels. The higher the price, the more investments pour in.*" (Rodrigue, J.P.). Investors seeks even hilarious reasons to justify the actual level of the prices (remember the case of the Romanian Stock Market – the stock prices were justified because of Romania's new membership to European Union and many foreign investors were ready to buy whatever it takes).

Bubbles tend to decrease as the mass of rational investors increases. Moreover, rational investors, so called "smart money" tend to leave earlier when they are many, as they need to have enough investors to buy their stocks. In this period, the prices have risen

---

[69] Rodrigue, Jean Paul – BLOG – "*Bubbles, manias and bears, oh my…*", January 18, 2006 – source: http://people.hofstra.edu/jean-paul_rodrigue/jpr_blogs.html

dramatically, conventional methods of asset valuations are widespread rejected and there are often presented investment schemes that offer high returns very quickly (Bernard Maddoff scheme for instance). There is a widespread enthusiasm regarding the stock market and investments in margin accounts, together with a high trading volume of shares and high selling volume by corporate insiders (Redhead 2008, apud Band 1989). In this period, practicing "short selling" might seem as normal as an extreme sport.

4. Blow-off – It is the moment when suddenly everything has changed. "The house of cards collapses under its own weight and late comers (commonly the general public) are left to hold the bag while the smart money has pulled out a long time ago". (Rodrigue, J.P.) This is the phase when people cannot find explanations why the stock markets crash and continue to dip further.

Conclusions

Besides the general opinion that bubbles make more harm to investors and economies, the human history has provided us the lesson that some of the bubbles produces also social wealth and benefits. Gisler and Sornette (2009, 2010) assert that bubbles constitute an "*essential element in societal processes and in the dynamics of society at large*". They give examples of the Apollo program, the Human Genome Project and other emerging industries that need "animal spirits" and overinvestment in order to sustain innovation. Take example of the Dot.com bubbles, when many technological companies like Yahoo, Google, MSN, and many others have invested extremely amount of money in the IT infrastructure or heavily investments in alternative energy industries that revolutionized technologies in the energy sector. Daniel Gross (2007), asserts that "*most investors in the 'dotcom' episode lost, but their money built the software and infrastructure that runs today's Internet*". Instead of seeing bubbles from a catastrophic point of view, others see bubbles as a collec.

PATHWAYS TO SUSTAINABLE BANKING MANAGEMENT

Dragan (Santamarian) Oana Raluca
"Babes – Bolyai" University, Cluj Napoca, Faculty of Economics and Business Administration

This paper describes one of the major challenges of the future: the sustainable development of the society. Sustainability is now increasingly recognized as central to the growth of emerging market economies. For the banking sector, this represents both a demand for greater social and environmental responsibility as well as a new landscape of business opportunity. Several years ago, the main part of the banks did not consider the social and environmental problems relevant for their operations. Recently, the banks began to realize the major impact of the sustainable development over the way of ulterior development of the society and, implicitly over the way of creating of the banking value in the future. In this context, the development of a banking management system, based on sustainable principles represents one of the provocations of these days.Starting from literature in the sustainable banking management field in this paper are presented several relevant issues related to risk management in the context of sustainable banking financing: the need to implement the sustainable management principles in financial and banking industry; the role of banks in sustainable development of society; social and environmental risk management policies, events that have shaped the role of the banking sector in sustainable development; international standards regarding sustainable banking management such us: Equator Principles for sustainable investment projects' financing or GRI principles for sustainable reporting. Furthermore, we developed a practical case study related to the implementation of sustainable banking management at Bank of America.
Keywords: sustainable development, sustainable banking management, environmental and social risks, Equator Principles, GRI Principles.
JEL Classification: G21

Introduction

Sustainable development is one of the key themes in the twenty-first century and in the same time a problem that need solution as soon as possible. The role of banks in the achievement of sustainable development is significant considering the intermediary role that they play in society. This intermediary role is both quantitative and qualitative. Due to their efficient credit approval systems, banks are well equipped to weigh risks and attach a price to these risks. Through such price differentiation, banks can foster sustainability. Banks can also develop more sustainable products, such as environmental or ethical investment funds. In addition, there is great scope for banks to improve their internal environmental performance.

Literature Review

The literature in the sustainable banking management field is not too rich because the idea of this management is rather new. The main innovation in this field belongs to some researcher such as:
Bouma, J., Jeucken, M. and Klinkers, L. (2001) wrote a book, "***Sustainable Banking – The Greening of Finance"*** with significant impact on banking activity related to sustainable development. In order to understand the banks towards sustainability Jeucken identified four stages: defensive, preventive, offensive and sustainable banking. Jeucken highlighted important differences between regions, countries and banks with regard to sustainable banking. The book looks at perspectives and case studies on how various changes in the financial sector are moving banks in the direction of sustainability. The authors approach five central themes in their book: the policies of banks, transparency and communication, environmental investment funds, environmental risks and their repercussions for banks' products, and the role of governments, NGOs and multilateral banks.
Stigson. B, president of the World Business Council for Sustainable Development (2004) underlines the idea that transparency and communication are relevant to a number of stakeholders, including social investors and necessity for banks to elaborate a system of metrics and reporting

with cross-comparable an indicator which represents the management tool that will allow banks to measure the link between environmental, social and economic performance and shareholder value. **Schaltegger, S. and Figge, F. (2005)** speaks about the necessity and importance of sustainable development funds. They believe that sustainable development funds as financial markets seek to reduce risk by incorporating environmental and social performance into investment decisions. "*Risks that have been turned down by proactive asset managers will end up with those asset managers that do not yet have the appropriate screening and assessment methods in place*" write Schaltegger and Figge.

The International Finance Corporation (IFC) (2007) found that: (a) individual banks had to devise their own business case for sustainable banking, (b) reputation and branding had become the top reason for many banks to integrate sustainability, (c) the benefits outweighed the costs, and social and environmental risk management improved the quality of a bank's portfolio and lowered insurance liabilities and compensation claims.

Scholz, W. R. (2006) investigates decision processes in banking, which are connected with environmental risks and options. He found that incorporating sustainability criteria in lending processes will lead to credit decision processes, which have positive economic, environmental, and social outcomes. Banks - as lenders - have an important influence on economic processes and significant impact on sustainable development. He tried to incorporate sustainability aspects in lending processes by creating implementation models, which are useful for the banker´s day-to-day business.

One of the most known publication in this field is *"The dos and don'ts of sustainable banking"* wrote by **Gelder, J. W.** member of BankTrack. The book provides an overview of actions which the banking sector can take to become more sustainable and in order to achieve a performing sustainable banking management. Also, there are presented methods and guidelines for implementation in practice the principles and commitments of sustainable banking.

Other findings indicated that the Equator Principles contribute to long term sustainable investment (**Seuren, T. 2009**). **Hoepner,** A.(2010) highlighted the importance of social, environmental and ethical issues for the risk management, reputation and performance of banks and other financial institutions.

Regarding Romanian literature in this field, there is no book covering sustainable banking management issues to date. There are only a few papers that approaches the sustainable banking management issue as **Eremia, A. & Stancu, I. (2006) 's** article "Banking Activity for Sustainable Development", and Stancu, I., Armeanu, D. & Bălu, F.(2006) " The role of Banks in the Sustainable Development of Society".

Sustainable development

Over the past 30 years, with the remarkable growth in the global economy, there are also a number of pressing constraints on development, and entrenched negative trends, such as economic disparity and poverty, over-consumption of resources and environmental deterioration (OECD, 2002:5). These social and environmental issues awakened humanity to carefully think how to protect the our planet, this led to the 1972 UN Conference on the Human Environment in Stockholm as well as later the creation of United Nations Environmental Program (UNEP).

Since the 1980s, sustainable development, as a new concept for human development, has been one of the most popular terms in usage due to an ever increasing awareness of social and environmental issues. The World Commission on Environment and Development (WCED), also known as the Brundtland Commission, in its report - "Our Common Future," defined sustainable development as follows: *"Humanity has the ability to make development sustainable - to ensure that it meets the needs of the present without compromising the ability of future generations to meet their own needs."* (WCED, 1987:43).

Sustainable development want to make simultaneous equilibrium between economic effectiveness, social equity and environment for creating a good governance framework aims debate and solve the matters pose by our actual development.

Sustainable banking

The "sustainable banking" concept was introduced in literature by Bouma, J., Jeucken, M. and Klinkers, L. in 2001. The authors choose to define "sustainable banking" in a broad sense. "*The term is dynamic*," and the editors write, "*because its definition changes over time; also, it has no clear borders – the relationships of banks with their stakeholders makes the concept relevant to actors other than just the banks themselves*."

The assessment of sustainable banking management performance takes into account the adoption and implementation of international standards of sustainable development. The main international standards covering financial and banking sector are:

Equator Principles – regarding the financing of sustainable investment projects

Global Report Initiative Principles (GRI Principles) – for reporting of sustainable activities

The Equator Principles are a set of voluntary environmental guidelines created to manage environmental degradation that results from large scale developmental projects. On June 4, 2003, ten international banks adopted these guidelines, and by the end of June 2006 this number has grown to forty. In July 2006, the Equator Principles were revised, increasing their scope and strengthening their processes. According to the revised principle EPFI (Equator Principles Financial Institutions) members are requested to identify and finance only the investment projects that comply with the following ten Equator Principles:

Principle 1: Review and Categorisation
Principle 2: Social and Environmental Assessment
Principle 3: Applicable Social and Environmental Standards
Principle 4: Action Plan and Management System
Principle 5: Consultation and Disclosure
Principle 6: Grievance Mechanism
Principle 7: Independent Review
Principle 8: Covenants
Principle 9: Independent Monitoring and Reporting
Principle 10: EPFI Reporting

EPFIs use a system of social and environmental categorisation, based on IFC's environmental and social screening criteria, to reflect the magnitude of impacts understood as a result of assessment. These categories are A/B/C scoring system like "high, medium or low environmental or social risk".

The **Global Reporting Initiative (GRI)** is a framework of internationally accepted guidelines and principles for companies and organizations to report on corporate responsibility and sustainability performance. The GRI aims to develop a voluntary reporting framework that will elevate sustainability reporting practices to a level equivalent to that of financial reporting in comparability, auditability and general acceptance. This will be a welcome and efficient supplement to the questionnaires, interviews, press releases, media reports and other sources of information traditionally used for screening in investment decision making – social/ethical and mainstream.

Bank of America's Initiatives for Sustainable Development Financing

Bank of America Corporation is an American multinational banking and financial services corporation headquartered in Charlotte, North Carolina. It is the second-largest bank holding company in the United States by assets. Bank of America serves clients in more than 150 countries and has a relationship with 99% of the U.S. Fortune 500 companies and 83% of the Fortune Global 500.

Bank of America has great performance as regards sustainable banking. In 2011 Bank of America was the deserved winner of the Sustainable Bank of the Year Award. This prize was a reward for the dedication in the field of durability and their attention for social, environmental and financial values during their operations. Since 2007, the bank invested over 11,6 billion dollar in the improvement of climate change, as part of their ten-year plan of investing 20 billion dollar. Bank of America is the first large American bank that invests in forest preservation, wind power, ecological housing and organization that combat global warming.

The Equator Principles are a set of voluntary guidelines developed to address the environmental and social issues arising from financing projects. The Principles were adopted by Bank of America, and became a core part of a wider approach to managing sustainability risks in lending and investment. The Bank of America's actions regarding sustainable banking take into consideration two major lines: the social impact and the environmental impact. So, the actions for sustainable banking can be classified in two main categories: *actions with social impact* and *action with environmental impact.*

 Actions with social impact

- organizes training programs for employees, learning and development are essentials in a fast-changing industry and as a result Bank of America regularly revises its training programs;
- conducts some surveys regarding the commitment, motivation and satisfaction of employees;
- bank's employees volunteered over a million hours in nonprofits and community organizations, like Free Arts NYC;
- funds innovative arts and culture organizations, like the North Carolina Dance Theatre in Charlotte;
- supports the revitalization of neighborhoods across the U.S., like Fells Point in Baltimore;
- invests in education for persons outside the company: last year, Bank of America gave over $200 million to nonprofit and community programs like a youth baseball clinic in Boston, part of their 10-year, $2 billion philanthropic goal.

 Actions concerning the environment

- *Energy Efficiency*. Bank of America provides financing for a wide range of construction projects and facility improvements that enhance the energy efficiency of newly constructed and existing commercial buildings, federal, state and local government buildings, hospitals and schools. Bank of America has increased its focus on investing in and financing the development and use of cleaner renewable energies. Recent examples include:

Solar

 - Bank of America's renewable energy finance team arranged the financing for a $23.9 million lease to a major solar company for the installation of photovoltaic solar power generation systems at seven Walmart and Sam's Club retail locations in Southern California. The photovoltaic systems provide enough power to meet up to 30 percent of each location's energy needs. The solar leasing deal helps advance Walmart's commitment to supply its stores with 100 percent renewable energy;

Wind

 - Bank of America provided $43.6 million in tax equity to Peace Garden Wind Funding, a new wind power tax equity partnership managed by NextEra Energy Resources, the largest North American generator of renewable wind and solar energy. Peace Garden Wind consists of two

wind farms in North Dakota capable of generating sufficient power to serve more than 55,000 homes in that and nearby states.

- Carbon Market Services

Bank of America Merrill Lynch operates an active carbon market services business that provides risk management, market access and liquidity, and structured finance to a variety of corporate clients looking to offset carbon emissions or manage their carbon exposure.

- Conserving Water

In 2010, were saved 36 million gallons of water from projects in the U.S., contributing to a 2.67 percent reduction in use from 2008 baseline. Savings from 2010 water projects resulted in a cost savings of $221,000. Fifteen percent of the savings can be attributed to fixture projects, such as sink aerators and updated low-flow bathroom fixtures, while the remaining 85 percent resulted from irrigation projects on the grounds surrounding facilities.

- Recycling

Throughout U.S. operations, were recycled nearly 1,996 metric tons of workplace waste in 2010. By the end of the year, recycling of plastic, aluminum and cardboard was available in 43 million square feet of the owned and leased space. Waste and recycling program enhancements in the U.S. alone resulted in annual cost avoidance of $565,000 in 2010.

- Environmentally Friendly Cleaning

At the end of 2010, Bank of America had sustainable cleaning practices in 77 million square feet of operational real estate in the U.S., nearly two-thirds of their global portfolio.

Bank of America's strategy on sustainable banking provides, among others, the annual publication of a report on the group's activities in this direction.

Conclusions

Under the general global trend toward sustainable development the banking sector, has been involved due to its very significant role in economic life. Therefore, interest in sustainable banking has gradually grown and has come to be regarded as a goal for the banks to pursue. The banking sector has taken some steps to stimulate sustainable development. However, because of the critical role finance plays, much more needs to be done. International institutions must continue to increase the awareness of banks and hence stimulate new product development. The World Bank must draw attention to the relationship between the environmental impacts of investments and financing decisions. And banks themselves must engage further with their customers, rating agencies, insurance companies, competitors and governmental policy-makers.

The study regarding the implementation of Sustainable Banking Management principles at Bank of America, demonstrated that: Sustainable Banking Management is a key aspect of Bank of America's corporate governance and one of the strategic goals of the bank. Bank of America regards sustainable development as a major part of its specialized strategy management and operation for sustainable finance. Focused on the energy conservation and emissions reduction, Bank of America demonstrated to the world that the key to globally sustainable development lies in ensuring that the planet, the people and corporations can benefit on a mutual basis.

USAGE OF ACB-MININD SOFTWARE IN THE CBA ANALYSIS FOR FINANCING INVESTMENT PROJECTS THROUGH EUROPEAN FUNDING IN CORRELATION WITH THE FINANCING FROM THE BANKING SYSTEM

Droj Laurențiu
University of Oradea
Faculty of Economics

Droj Gabriela
University of Oradea
Faculty of Construction and Architecture

The extension of the European Union with the first "wave" of new members in 2004 and later with the second "wave" of members in 2007 brought new opportunities for the countries in Eastern Europe, being obvious that "effective utilisation of EU support can foster the success of their economic performance". Financing investment projects proposed by the SMEs can be realized through several financial sources internal and external, from which two of the most common external sources constitute from subsidies-grants and through banking system. One of the most important financing programme present in Romania, available for SMEs is SOP IEC, which awards grants for investments proposed by production companies. This financing program encourages its beneficiaries to combine the European grant with private funds mostly provided through the banking system. The paper analyzed the methodology used in Cost Benefit Analysis and also The ACB-MININD software which is compulsory to be used for the CBA analysis of these investment projects links for the first time elements of analysis used by the European Commission with elements of analysis used by the banking system. In this context the present article tries to analyze how the ACB-MININD software links the main elements of Cost-Benefit analysis such as NPV or IRR with elements of the bankability software which are mainly used by the banking system such as: cash-flow analysis, loan/interest payment and financial sustainability. Also are presented the links between the banking sector and the external financing sector in the field on investment projects. As final conclusions of this paper we will demonstrate the theoretical and practical role of cost-benefit analysis - financial component to select the best applications that will be proposed for funding under the European grant programs and to link them to the banking system in order to ensure a proper co-financing for these investment projects.
JEL Codes: G17, G21, F35, O16, H43, C63, C61
Key words: Banking, Loans, Grants, Cost Benefit Analysis, NPV, IRR

1. Introduction

A notion which is under debate in the recent years, from economical, social and political point of views: the non-reimbursable funding/grants is quite ignored by the scientific economics community. The grant concept, which is called also external financial assistance, developed initially from free transfer of specialized goods and services to fund transfers (Moger, 1999 and Kanbur, 2003). In the same time Stiglitz (2003) observes that for a long period of time and even now the World Monetary Fund and the World Bank link their strategic grants to reimbursable funding: loans provided by the banking system. Other studies especially Lerick and Meltzer(2002) in Quarterly International Economics Report, Carnegie Mellon - Gailliot Center for Public Poverty, draw attention that in case of loans contracted through World Bank or other institutional banking lenders some of the loans were transformed into grants since some of the beneficiary countries were not able to pay them back, so their debts were finally erased.

The extension of the European Union with the first "wave" of new members in 2004 and later with the second "wave" of members in 2007 brought new opportunities for the countries in Eastern Europe, being obvious that "effective utilisation of EU support can foster the success of their economic performance" as it is considered in a KPMG(2011) report from 2011. Moreover the integration of Romania into European Union brought new opportunities for the Romanian

private enterprises both concerning the accession of their products and services to the single market and also accession of additional co-financing for funding their business infrastructure investments (Droj, 2010).

Under these circumstances most of the specialists consider that access to European funding and its efficient absorption constitute a key issue in these years both at the level of state level decision makers, at the level of financing institutions and at the level of the decision makers within the companies. Financing investment projects proposed by the SMEs can be realized through several financial sources internal and external, from which two of the most common external sources constitute from subsidies-grants and through banking system. In the recent years a very close relations seemed to be established between the banking sector and the financial aid sector.

In the same time the banking sector evolved and created specialized services which are dedicated to the above mentioned beneficiaries with the goal of supporting development, carrying out or co-financing projects implemented under the European Structural Funds. Lack of experience in this field shown by both at the level of the applicants for Structural Funds, at the level of the management authorities and, finally, at the level of the banking system which is requested to ensure additional funding creates serious obstacles to achieving a higher absorption capacity of EU structural funds in Romania. (Fundația Șoros Romania, 2009 și Departamentul pentru Afaceri Europene, 2009)

Also can be noticed the lack of a methodology for implementation of funding programs adapted to the Romanian realities. Another major problem is that most financial programs lack correlation of economic and financial indicators of the European Commission to those requested by the banking sector, so that the beneficiaries of European structural funding are finding themselves in the situation where they are unable to access bank credit which is needed to secure co-financing or fund its cash-flows required to implement the proposed investments.

In this context the current paper is dealing with analysing the linkages between the cost benefit analysis requested by the EU management authorities and the credit analysis, performed by the banks. This constitutes a topic of major interest for both potential beneficiaries and the management bodies, and the banks so they can prepare specific to banking products. From the vast field of study concerning structural funds we proposed to approach as the main themes in this research paper the following: identification of a European funding programme operating in Romania, realization of a correlation between the performance indicators within the benefit-cost analysis requested by European and those requested by the banking sector.

2. Considerations over the Cost Benefit Analysis and its linkage with the banking sector– Literature Review and Research methodology

One of the main goals of these European Funding programmes are to implement the European Union Cohesion policies. As its main instruments and for improvement of the competiveness of the "weaker" regions were established the European Regional Development Fund (ERDF) and the European Social Fund (ESF), otherwise known as the Structural Funds, as well as the Cohesion Fund. Through these instruments European Commission invests in thousands of projects across all of Europe's regions to achieve its primary task: to promote economic and social cohesion by reducing these disparities between Member States and regions (European Commission, 2009).

In this context, the private companies benefit of increased opportunities for accessing European Funding which gives them a better chance for increasing their competitiveness and for extending distribution of their products and services on the entire European market and beyond. The most important production infrastructure financing programme for the Small and Medium Enterprises(SME) operating in Romania is considered to be the Sectorial Operational Programme "Increase of Economic Competitiveness" (further referred to as SOP IEC) which offers financial

support for the consolidation and modernization of productive sector through investments(Guvernul României, 2009).

Even in 2008 edition of the "*Guide to COST-BENEFIT ANALYSIS of investment projects - Structural Funds, Cohesion Fund and Instrument for Pre-Accession*" edited by the European Commission(2008) is highlighted that cost-benefit analysis can help public decision makers to identify projects that will maximize net social benefits and thus determine the order of priority infrastructure works will be made and how public policy decision making.

As it is mentioned in the above referred document the investment decisions are at the core of any development strategy, all other elements such as: economic growth and welfare depends on productive capital, infrastructure, human capital, knowledge, total factor productivity and the quality of institutions (European Commission, 2008).All these elements involve – in a certain measure – decision making regarding investing financial sources at present time in the hope of obtaining future uncertain benefits.

In order to take the decisions, the decision makers need appropriate tools for comparing costs and benefits of various types: economic, social or ecological investment projects that are ongoing over several years. Cost-benefit analysis is not an exact science, is seen as having many limitations which are generally based on approximations, working hypotheses and estimates due to missing data or due to inability providing all possible situations. The financial analysis is considered the key element of the Cost Benefit Analysis both by the financing organization and the banks (Trenca 2006, Trenca 2008 and Stancu 2006) or by other financial institutions which will ensure the co-financing of the investment. The goal of the financial analysis is to use the predictions such as cash-flows to calculate relevant indicators especially the Financial Net Present Value (FNPV) and the Financial Internal Rate of Return (FRR), respectively in terms of return on the investment cost, FNPV(K) and FRR(K).

While Cost-benefit analysis goes well beyond financial ratios considering the project, most project data on costs and benefits is provided by financial analysis. This analysis provides decision makers information on inputs and outputs, their prices and the structure of income and expenditure over the analyzed period (European Commission, 2008).

The methodology used for the determination of the financial return is the Discounted Cash Flow (DCF) approach. This implies some assumptions as are mentioned in the methodology:

   - Only cash inflows and outflows are considered;

   - The project cash flows it should be based on the incremental approach;

   - After the aggregation of cash flows occurring during different years it is adopted an applied an appropriate financial discount rate in order to calculate the present value of the future cash flows.

According to the methodology (European Commission, 2008) the Net Present Value of a project is the sum of the discounted net flows of a project. The NPV is a very concise performance indicator of an investment project: it represents the present amount of the net benefits flow generated by the investment expressed in one single value with the same unit of measurement used in the accounting tables.

$$(1) \ \ NPV = \sum_{t=0}^{n} a_t S_t = \frac{S_0}{(1+i)^0} + \frac{S_1}{(1+i)^1} + \cdots + \frac{S_n}{(1+i)^n}$$

The Internal Rate of Return (FRR) is defined as the discount rate that zeroes out the net present value of flows of costs and benefits of an investment, that is to say the discount rate of the equation below(European Commission, 2008:212):

$$(2) \ NPV(s) = \sum [S_t/(1+IRR^t)] = 0$$

Since the goal of this study is to use the ACB-MININD software in CBA analysis for financing investment projects through European funding in correlation with the financing from the banking

system in the following chapter we will set a case study using a project proposed by a Romanian production company which tries to access SOP IEC funding in 2011.

3. Case study – Usage of ACB-MININD Software in the CBA analysis for financing investment projects through European funding in correlation with the financing from the banking system

As mentioned above we selected a test company, which intended to access European funding to co-finance its infrastructure investments. The company is a market leader in its field of activity: plastic manufacturing and intends to increase its production capacity and to improve its competitive advantages on the Romanian market. In order to realize this an ambitious investment programme was started to build a new production facility and to increase the quality of their products. The project was proposed to be financed under SOP IEC and was based on the data provided by a detailed the technical project and by the price offers. The company performed a financial analysis using the official software provided by the management authorities within the programme: ACB-MININD Software which is available online at: http://acb.minind.ro/ACB/index.php (Guvernul României, 2012). These results were later compared with the bankability analysis, in order to ensure future bankability of the project. The particularities of this software is that it requests and processes information which is delivered by the banking institutions regarding proposed co-financing or implementation loans.

In order to secure financing of its investment the selected company has to fulfil several financial criteria established by the SOP IEC Programme. According to the Guide of SOP IEC Programme, in order to obtain financing for an investment project FNPV(K) is requested to be higher than 0 and FRR(K) to be between 0 and 9. For the mentioned project the mandatory discount rate was established to 5%. The analysis was realized both on the implementation period of the project (2 years) and on the operation period of the investment realized within the project(7 years). A challenge was made to obtain both the financial sustainability of the project and also to ensure its bankability.

Figure 1 Presentation of the Financing sources (Currency: Thousands RON)

Assumptions regarding financing	Year 1	Year 2	Year 3	Year 4	Year 5	Year 6	Year 7	Year 8	Year 9
EU Funds for Financial AID									
Eligible value of the project	4020.2	6691.4							
Non – eligible value of the project	0	0							
Required Financial Aid	2543.5	3813.0							
Private finance

Royalties	28.6	28.6	28.6	28.6	28.6	28.6	28.6	28.6	28.6

Source: Made by the author

The first step was to analyse its bankability and to establish the maximum eligible loan and to analyze the loan payment using the bankability software provided by the bank. Once these information were established were introduced in the ACB-MININD Online application. The first step was to analyse its bankability and to establish the maximum eligible loan and to analyze the loan payment using the bankability software provided by the bank. These can be seen in the above figure. Once these information were established were introduced in the ACB-MININD Online application. In this circumstance all the financial sources and the equivalent financial costs are introduced in the financial analysis including the loan payment, the interest payment, royalties, income tax.

Figure 2 Financial Performance Indicators (Currency: Thousands RON)

Financial Performance Indicators	Year 1	Year 2	Year 3	Year 4	Year 5	Year 6	Year 7	Year 8	Year 9

Cumulative Cash Flow	13858.1	18460.9	27873.7	37040.6	46247.9	55492.6	65008.3	74943.3	85865.0
Conclusion of the Cumulative Cash Flow Analysis	THE PROJECT IS SUSTAINABLE!								

Source: Made by the author

In figure 3 the Financial Sustainability of the project is analyzed by using also the information provided by the credit analysis from the banking system. As observed all elements of financial sustainability were considered: since in the beginning only operational expenses were presented in this stage were included also other payments and was analyzed the real capacity of the company to ensure financing resources for loans payments, interest payments, income tax or royalties. Afterwards the project is declared sustainable both by the management authorities of the programme and by the banking system.

4. Conclusions

Since, in the past, the financial analysis performed according to CBA methodology had several inconsistencies with the bankability analysis, an important step seems to be taken by using practical bankability financial information within the ACB analysis. As can be seen from the

presented test case the authors consider that, in this context the ACB Minind application can only be the beginning of reforming the ACB methodology and in the future this approach should be further extended and common solutions accepted by all stakeholders: structural funds management authorities, banking sector and private/public beneficiaries to create common indicators or analysis methodology in order to ensure both the financial sustainability, according to EU regulations and fulfilment of bankability criteria which is requested by the banking sector in order to ensure co-financing of the projects. This research should be further continued by development of a set of common indicators based on both methodologies.

EMPIRICAL APPROACH UPON THE RELATIONSHIP BETWEEN CENTRAL BANK INDEPENDENCE AND INFLATION IN DEVELOPED AND DEVELOPING COUNTRIES

Dumiter Florin Cornel[70]
Vasile Goldiș Western University of Arad
Faculty of Economic Sciences

Central bank independence has become over time one of the key concepts in modern theory and policy. Most economists agree that central bank independence is desirable because it helps achieving and maintaining the long – term goal of price stability. Although one might think about alternative mechanisms to reach lower inflation rates, central bank independence is clearly the most often recomended. The empirical trends upon a more independent central bank with a more transparent and accountable monetary policy regime has emerged in economic literature regarding central banking and monetary economics. In recent years, starting from the Maastricht Treaty central bank independence has become the panacea of the monetary economics and monetary policy approaches. Moreover it is important to analyze and assess the impact of this key issue in central banking upon the inflation performances of the central banks. In this article we provide a qualitative overview upon some recent trends in the central bank independence field: does it still matter? How can be it evaluate and stress it's impact upon macroeconomic performances, especially upon inflation. As we can observe in the economic literature upon central bank independence there are several approaches to use several indices in order to measure this qualitative and quatitative institutional variables. The most important debate is to eliminate the gap between de jure and de facto independence in order to flatten the measuring of institutional aspects, the legal implication, the constitutional facts and the actual practices of the central banks. Finally, we suggest that according to the new index for measuring central bank independence and inflation targeting index we can evaluate more accurate the degree of the de jure and de facto independence and stress the impact on inflation performance with a case study for ten developed countries and ten developing countries.
Keywords inflation targeting, central bank transparency, communication strategy, decision-making process, inflation level.
JEL Classification E50, E52, E58.

I. Introduction

In the beginning on the 1990's the stipulations of the Maastricht Treaty embedded with the importance of the central bank independence and the positive impact of it upon the macroeconomic performances. It is highlighted by (David 2009: 19) the importance of central bank independence of the romanian central bank and it's assessments in assuring and maintaining the price stability objective.

It is suggested by (Mishkin 2007: 20) the importance of the monetary policy strategies especially inflation targeting with a special focusing of the central bank independence matter. The overall independence notion translated to the central banks as being free from the influence, guidance or control from the rest of the government, meaning the executive and legislative branches (Thisani 2008: 15).

The central banker is subject to explicit influence of elected principals through contracts and the endogenous interest groups (Gabillon and Martimort 2004: 353-355). The authors suggest that

---

political independence increases those agency costs but significantly stabilizes the politically induced fluctuations of inflation.

Studies developed by (Allesandrini, Calcagnini & Zazzaro 2008: 699-700) and (Huang and Wei 2006: 242-243) reveal that central bank independence has an important role for the ultimate design of monetary policy making institutions.

II. Former approaches regarding the relationship between central bank independence and inflation

The most important indicators for measuring central bank independence was developed by (Cukierman 1992: 369-386). At the beginning at it's studies, the author developed LVAU and LVAW *de jure* indicators for measuring central bank legal independence. Later he had developed two behaviour oriented indicators: turn over rate of central bank Governor and the board members for measuring actual practice accuracy of the central banks.

Recent studies of (Haftel and Thompson 2006: 250-275) and (Patel 2008: 27-41) studied the relationship between central bank independence and inflation in developed and developing countries but had registered divergent conclusions and results. It can ne noticed that in cases of high independent central banks it is registered high inflation rates and vice versa: some low inflation level countries exhibit lower scores of central bank independence.

Other authors like (Masciandaro et al. 2008: 833-848) and (Siklos 2008: 802-816) analyzed the connection of different indices for measuring cental bank independence and their impact on the inflation rates and have emerged to the conclusion that the divergent results start from the inaccurate indices with several problems in the contruction and explicit variable stipulations.

III. Measuring central bank independence and it's connection upon inflation in several developed and developing countries

Analyzing the ecomic literature regarding central bank independence we can observe that the different approaches are sometimes divergent regarding the soundness and effectiveness of the indicators for measuring central bank independence. This is because there exist still differences between *de jure* and *de facto* independence and also that in some countries there are still developing reforms regarding modernizing the central banks, especially in the less developing countries of Africa and Asia.

For a more accurate measuring of central bank independence we have adopted the (Dumiter 2009: 83-85) and (Dumiter 2010: 183-184) index for measuring central bank independence and inflation targeting. This index is conceived as a sum of numerical values assigned to thirty eight institutional arrangements both in law and practice of central banks: nine attribute to political and legal central bank independence, fifteen attibute to central bank governance and conduct of monetary policy and fourteen attributes for central bank transparency and accountability.

The index for measuring central bank independence and inflation targeting constructed by Dumiter is considered both a *de jure* and *de facto* index because the aggregated vallue is based noy only on the institutional practices or norms of central banks and also what is written in the central bank laws. However, the new index for central bank independence and inflation targeting is an interpretation based on these laws, which are put into actual practices and those practices that are not embedded oin the central bank statue.

Table 1 presents the connection between central bank independence and inflation in ten developed countries by using the Dumiter's index in the period 1980-2009 and the average inflation rate (average) in the period 1999-2008. Analyzing the empirical results in the developed countries we can observe that according the first pillar – political and legal central bank independence – the most independent central banks are those of France, Sweden, United States and Denmark; these countries central banks' register longer tenures of central bank Governors and the members of the Governing Board, appointment and dismissal procedures

assign by Parliament, lower turnover rates of central bank Governors' and political non-vulnerability of the central bank Governor. At the opposite side are countries as: New Zeeland, Norway and Japan who exhibit lower tenures of the Governor and the Board Members which overlap the political cycle, appoitment and dismissal procedures made by the Government and political vulnerability of the central bank Governor.

Regarding the second pillar – central bank governance and conduct of monetary policy – at the top of the hierarchy are countries as: France, Germany, Denmark and United Kingdom by a clear focusing of the final objective of monetary policy – price stability – the bank prevaillance upon the Government in case of policy conflicts, and the unequivocally prohibition of Government direct and indirect lending. The lowest scores of this pillar register countries as: Canada, Norway, New Zeeland and Japan because of some aspects as: Government prevaillance in case of policy conflicts, establishing the monetary policy objectives and targets in compliance with the Government and granting potential indirect lending to the government in several cases.

Table 1

Measuring central bank independence and its' relationship with the inflation performances in developed countries[1]

Country	P_{PL}[1]	Ranking	P_{GC}[2]	Ranking	P_{TA}[3]	Ranking	I[4]	Ranking	I[5]	Ranking
Canada	7.55	4	6.67	5	10.00	1	8.07	7	2.06	2
Denmark	8.88	2	7.80	2	8.93	3	8.54	4	2.94	5
France	9.44	1	9.33	1	9.64	2	9.47	1	3.15	8
Germany	7.22	5	9.33	1	9.64	2	8.73	3	2.75	4
United Kingdom	8.33	3	7.13	3	9.64	2	8.37	5	2.47	2
Japan	4.33	8	4.33	8	5.71	5	4.79	9	1.39	1
Norway	6.11	7	5.00	6	9.64	2	6.92	8	3.05	7
New Zeeland	7.11	6	4.66	7	10.00	1	7.26	7	3.95	10
Sweden	9.44	1	7.00	4	10.00	1	8.81	2	3.29	9
United States	8.88	2	7.13	3	8.21	4	8.07	6	3.00	6

Note: [1] Measuring central bank independence and inflation targeting in developed countries was made by analyzing central banks websites, government websites, central bank laws and statutes, different norms and regulation and other publication and studies available on the central bank website and on the real practices of the developed central banks in the period 1980 and 2009; the inflation indicator have been estimated by the author as the main average of the inflation variable in the period 1999 – 2008 – the data used by the author is available on: International Monetary Fund – World Economic Outlook Database 2010.

[1] P_{PL} – Pillar I – Political and legal central bank independence.

[2] P_{GC} - Pillar II – Central bank governance and conduct of monetary policy.

[3] P_{TA} - Pillar III – Central bank transparency and accountability.

[4] I – Index for central bank independence and inflation targeting – overall score.

[5] i – inflation – average consumer prices – percent change.

The third pillar – central bank transparency and accountability – reveals the most accountable and transparent developed central bank: Canada, New Zeeland, Sweden because of the inflation targeting strategies embedded with the high disclosure of the macroeconomic models used for policy conflicts and the quarterly publishing of the time series for the main macroeconomic indicators and the complex communication strategies. The less accountable and transparent central banks are those of: Japan and United States because of promoting the *policy mistique*

without any complex and direct explanations of the present and future policy paths and without any transparent and functional communication startegy.

Overall, the corelation with the inflation rate in the developed country group is the following one: the highes score for the final value of the Dumiter's index have countries as France, Sweden, Germany and Denmark, countries who exhibit lower levels of average inflation (between 2.75 percent in Germany and 3.29 percent in Sweden), the lowest score of the final value on the Dumiter's index in the developed country group register: Canada, New Zeeland, Norway and Japan, countries which exhibit different levels of average inflation (lower levels in Japan − 1 percent and Canada – 2 percent and higher levels in Norway – 7 percent and New Zeeland – 10 percent).

Table 2

Measuring central bank independence and its' relationship with the inflation performances in developing countries[1]

Country	P_{PL}[1]	Ran king	P_{GC}[2]	Ran king	P_{TA}[3]	Ran king	I[4]	Ran king	i[5]	Ran king
Armenia	6.33	8	7.13	3	8.93	2	7.46	4	8.96	9

Hungary	7.00	6	7.66	2	9.64	1	8.10	2	8.03	7
Latvia	8.88	1	7.00	4	5.36	5	7.08	6	8.69	8
Lithuania	7.44	4	7.66	2	4.64	6	6.58	7	6.29	4
Poland	7.77	3	6.33	5	8.93	2	7.68	3	5.75	3
Romania	8.22	2	8.00	1	8.93	2	8.38	1	26.82	10

Note: [1] Measuring central bank independence and inflation targeting in developed countries was made by analyzing central banks websites, government websites, central bank laws and statutes, different norms and regulation and other publication and studies available on the central bank website and on the real practices of the developed central banks in the period 1980 and 2009; the inflation indicator have been estimated by the author as the main average of the inflation variable in the period 1999 – 2008 – the data used by the author is available on: International Monetary Fund – World Economic Outlook Database 2010.

[1] P_{PL} – Pillar I – Political and legal central bank independence.
[2] P_{GC} - Pillar II – Central bank governance and conduct of monetary policy.
[3] P_{TA} - Pillar III – Central bank transparency and accountability.
[4] I – Index for central bank independence and inflation targeting – overall score.
[5] i – inflation – average consumer prices – percent change.

Table 2 reveals the connection between central bank independence and inflation in ten developing countries by using the Dumiter's index in the period 1980-2009 and the average inflation rate (average) in the period 1999-2008. The first pillar – political and legal central bank independence exibits higher levels in: Latvia, Romania, Poland and Lithuania due to the long tenures of the central bank Governor and Board member, lower turnover rates and non-political vulnerability; at the opposite side are: Croatia, Bulgaria, Armenia and Brazilia with lower tenures of the Governor and Board members, political vulnerability and the Goovernment implication in the appointment and dismissal procedures of the Board members.

The second pillar – central bank governance and conduct of monetary policy – applied for the developing country group establisheh higher scores for: Estonia, Croatia, Hungary and Lithuania and lower score for Poland, Brazilia and Bulgaria. The main important variables for the highest score were explicit prioritisation of the price stability objective, the bank's ability to establish the objectives and targets and the exclusive prohibition of government lending. The countries which exhibited lower scores had multiple objectives without any prioritisation, government

interferences in the monetary policy process and providing direct and indirect credit to the government.

Pillar III – central bank transparency and accountability – registered highest score in: Hungary, Poland, Romania, Armenia due to the inflation targeting monetary policy strategy with clear objectives and targets, a special communication upon the future paths of monetary policy, explicit direction inclination after the Board decision and *forward-looking* analyzes and approaches. The less transparent and accountable central banks are those of: Bulgaria, Croatia, Brazilia and Lithuania because of less developed central bank websites, unpublic disclosure of important information about the current and future paths of monetary policy, and the Governor's accountability before Government.

The correlation between central bank independence and inflation in the less developing countries shows that the most independent central banks: Romania, Hungary, Poland, Armenia exhibit higher average inflation rates (the lowest rate – Poland – 5.75 percent and the highest Romania – 10 percent) and the less independent central banks: Bulgaria, Croatia, Brazilia and Lithuania exhibit medium averare inflation rates (the lowest rate – Croatia – 5.04 percent and the higher rate – Bulgaria – 7.26 percent).

IV. Conclusions

The empirical observed trends upon a more independent central bank and a more transparent monetary policy regime is sustained by a large extent of the theory and practices of the central banks. Moreover, the importance upon the relationship between central bank independence and inflation rate has to undergone the institutional shifts from the past.

In our article we provided a qualitative overview regarding the connection between central bank independence and inflation in 10 developed and 10 developing countries using the new index for measuring central bank independence and inflation targeting based on three pillars: political and legal central bank independence, central bank governance and conduct of monetary policy and central bank transparency and accountability.

In the developed country group we can observe a direct connection between central bank independence and inflation because the most independent central banks: France, Sweden, Germany and Denmark exhibit moderate levels of inflation. This suggest that in the developing countries central bank independence is neither significant nor mandatory for register lower inflation rates.

In the developing country group the final measurements show the following results: the most independent central banks'are those of: Romania, Hungary, Poland and Armenia which exhibit higher average inflation rates, but the rest of the developing countries registered different connections with the average inflation rate.

The conclusion for measuring the impact of central bank independence on the inflation rate is to reconsider constructing a new index for independence, transparency and accountability with different time variant variables and for inflation the importance of adopting the monetary conditions index.

THE CRUCIAL ROLE OF CENTRAL BANK TRANSPARENCY IN ASSESSING THE MONETARY POLICY COMMITTEE MECHANISM

Dumiter Florin Cornel[71]
Vasile Goldiș Western University of Arad
Faculty of Economic Sciences

In the past, central banks used to be very reserved regarding their activities, strategies and monetary policy decisions and actions. As central banks become more and more independent, transparency gained importance based upon accountability arguments. An important fact for adopting an increasing central bank transparency lies in its importance of influencing the development of expectations. The concept of central bank transparency has emerged in the economic literature relatively later than some other key concepts. The widespread agreement of an inflation targeting regime and a more transparent central bank is desired by the most central banks around the world in the context of the need of the public disclosure of macroeconomic models, the quarterly time series for indicators like: inflation, output, budgetary deficit, public debt, interest rate, inflation expectations, the public announcement of the monetary policy decisions, objectives and targets, the publication of some key monetary tools like: inflation report, financial stability report, monetary policy committee report, annual report. These are all key issues in the construction of a more transparent and independent central bank in the context of a good global governance. Moreover, for the fruitful success of the central bank, latum sensu, and monetary policy, stricto sensu, it must be encompassed a complex monetary policy committee mechanism. This complex mechanism must by edowed with the collegial approach of the monetary policy committee, structure of the voting mechanism within the committee, the importance of the person which announces the changes within the interest rates and the public disclosure of these information's enriched in a communication strategy. This communication strategy is very important for assessing and public understanding of the central bank's actions but also for communicating the objectives, targets and forward looking approaches of the monetary policy in the global context of the transmission mechanism.
Keywords monetary policy strategy, collegial entity, central bank independence, democratic accountability, transmission mechanism

I. Introduction

Transparency has become a prominent feature of the monetary policy during the last twenty years, but the systematic evidence on central bank transparency has been elusive due to the lack of data. In recent years, specialists from the academic field and central banks' analyze and assess the most important trends towards a more transparent and open central bank.

Authors like (Touffut 2008: 2) emphasis that in recent years, a great number of central banks have moved in the direction of greater transparency about their objectives, procedures, rationales, models and data. The author suggests that the problem is whether this trend is widespread and whether it is likely to be transitory or enduring.

Other authors like (David 2009: 19) suggest that within increasing the independence of the National Bank of Romania, and by adoption of the inflation targeting strategy in 2005 the Romanian central bank have become more transparent and accountable.

In the view of (Nier 2005: 343-344) while the hope is that enhanced transparency may improve incentives, *ex ante*, it is less clear whether transparency is necessarily a good thing, *ex post*, when a bank might have hard time and provision on information might have a destabilizing effect.

One of the most comprehensive studies regarding central bank transparency is the one of (Eijffinger and Geraats 2006: 1-21) and presents a transparency index for monetary policy that is based on the disclosure of information relevant for the monetary policymaking process. The authors have come to the conclusion that central bank transparency exhibit important dynamics because the scores for several central banks' have increased significantly over time, especially for economic and policy transparency.

II. Theoretical approach regarding the need of central bank transparency within the communication mechanism

Transparency refers to the physical property of an object to transmit light, which means one can see through it. When applied to concepts, transparent means clear; so colloquially it conveys a positive attitude. In an economic context, a useful economic definition of transparency can be formulated as the presence of information; lack of transparency, or opacity and finally to asymmetrical information.

The study of (Neuenkirk 2011: 1-13) examine the influence of central bank transparency and informal central bank communication on the formation of market expectation. The author have come to the conclusion that using the Eijffinger & Geraats transparency index lead to a smaller bias in expectations and to a reduction in the variation of expectations. Specialist as (de Haan et al. 2007: 1-8) conclude that the trend towards a greater transparency by the central banks it is justified by central bank accountability, because central bank transparency is beneficial from the economic point of view, but it is not clear what constitutes an optimal communication strategy.

Regarding the monetary policy communication mechanism (Farvaque et al. 2009: 534-536) reveal the collective decision approach of today's monetary policy. This feature of modern central banks' implies that a decision has to be taken among committee members' which is likely to affect policy rates, especially if monetary policy committees are heterogenous. Other authors like (Berk and Beirut 2011: 800-801) emphasis that when monetary policy committee members' disclose and discuss the arguments behind their view on interest rate, the quality of the collective decision should be higher compared to merely taking a simultaneous vote.

Despite pursuing monetary policy based on inflation targeting strategies, central banks in Czech Republic, Hungary and Poland have adopted very different communication styles (Rozkrut et al. 2007: 178-200). However, the authors conclude that central bank "talk" does influence the behavior of the financial markets. Other authors like (Ehrmann and Fratzscher 2007: 143-144) suggest that the communication at the Federal Reserve, Bank of England and European Central Bank is generally seen as a tool to prepare markets for upcoming decisions, as it becomes more intense before committee meetings and particularly so prior to interest rate changes.

III. The impact of central bank transparency upon the monetary policy committee

As the central banks' become more independent, the importance of central bank transparency and accountability and their degree of openness about the decision-making process emerged. This is the reason behind the recent reform undertaken by the central banks in increasing the degree of transparency in their monetary policy process. Consequently, it was established the importance of the collegial approach of the decision-making entities of the central banks. For those reasons, in recent year many central banks', especially in developed and industrialized countries, have

established Monetary Policy Committees for the collegial approach of the decision-making process.

Table 1 reveals and highlights the most important central bank transparency indices in a chronological manner measured by the author in some developed and industrialized countries. Moreover, table 1 presents also some key aspects in the monetary policy committee design and mechanism with a possible implication for a good global governance of the central banks. We must suggest that this approach was addressed only in the developed countries, because of the studies made by the authors in this direction, but also because of the transition process regarding the monetary policy committee in the emerging and the developing country group.

The indices for measuring central bank transparency has those of the (Siklos 2002: 10), (de Haan and Antembrink 2003: 5-6), (Eijffinger and Geraats 2002: 17-18) and (Dumiter 2009: 88-89). Analyzing the empirical results of these indices we can observe that the most transparent central banks' are those of Canada, New Zeeland, Sweden, United Kingdom and European Central Bank. At the opposite side are countries as: Australia, Japan, Norway, United States of America.

Table 1

Measuring central bank transparency and it's comparison with the technical variables of a performing monetary policy committee framework

Source: Author's elaboration based on Siklos (2002), de Haan & Antembrink (2003), Eijfffinger & Geraats (2002[2004]), Siklos, Bohl & Wohar (2010).

The four most transparent central banks according to these indices exhibit, in general, *inflation targeting* strategies with a more complex and comprehensive approaches on disclosing macroeconomic data and models, proving information on a timelier basis presenting *forward-looking* analyzes of monetary policy and a complex communication strategy. These central banks have also complex monetary policy committees with a special focusing on: medium sizes of their monetary policy committee (minimum of 6 members in Canada and maximum 18 members in ECB), the backgrounds of their monetary policy committee members suggest that they derive, in general, from the central bank (CB) and academics (ACA), there is, in general, no fixed order in the organization of the meeting, the Governor makes the interest rates proposals and there is a *room to maneuver* regarding the independence of the monetary policy committee members, these members can make speeches and appear in front of Parliament.

In the less transparent countries we can observe that these central banks haven't a transparent monetary policy strategies, because of non-adopting the *inflation targeting* strategy, promoting a very secretive monetary policy, with a very complexes websites and hard to find information or to access document and a lower degree of openness. Regarding the structure of the monetary policy committee mechanism we can observe the following: the monetary policy committee members derive from central bank (CB), academics (ACA), commercial banking sector of financial sector (BC), there is, in general, no fixed order in the organization of the meeting or this order in change at every meeting of the committee, the Governor makes proposals regarding the interest rate proposals, and it is encouraged free discussions between the committee members regarding the independence and openness of the monetary policy committee.

IV. Conclusions

Over the last five years it can be noticed that many central banks around the world reported major reforms in the filed of communication: the publication of endogenous interest rate forecasts, votes of minutes, a reduction in the release time of minutes, a higher frequency of communications, more frequent appearance to legislative bodies. Moreover, we can observe that, in some instances, there has been made a reduction in the number of policy meetings in order to make them coincide more closely with the release of key economic data, and the phasing – out of *forward guidance* – in favor of more direct means of communication.

Central bank communication can be identified as the provision of information by the central bank to the public regarding such matters as the objective of the monetary policy, the monetary policy strategy, the economic outlook, the outlook for future policy decisions.

Many central banks with similar monetary policy objective follow, nonetheless, fundamentally different communication policies; these policies have been developed over time. It is notable to

focus upon the current practices by examining the different types of central bank signals first by *content* and last by *sender*.

Our study wanted to reveal the importance of central bank transparency with a special focusing on the degree of openness of the central banks and its' impact upon monetary policy committee design and mechanism. The results show that the more transparent central bank, more easier it will be to implement and assess a more complex and versatile monetary policy committee which will be able to ease and facilitate the right monetary policy decisions. However, we can observe that central bank transparency was especially quantified in the developed countries with a special focus on the Euro zone, but also on some other developed countries like: United States and Canada. These results suggest that the future studies regarding central bank transparency and its' impact upon the monetary policy committee mechanism must focus also upon some emerging and developing countries for evaluating the transition upon a more transparent and open central bank and of the construction of a suitable monetary policy committee design and mechanism.

THE CORRELATION BETWEEN THE EXCHANGE RATE AND THE DIRECT FOREIGN INVESTMENTS

Halmi Mirela
Carpatica Bank Satu Mare Branch, Romania

Since the fall of the monetary system from Bretton Woods, based on a system of fixed rates, numerous theoretical and empirical articles have emerged through which the volatility of the exchange rate and the commercial influxes was analyzed and the identification of specific connections regarding the transmission of the effects of the modification of the exchange rapport of a currency in economy was tried. The general idea from these works start from the uncertainties regarding the evolution of a currency in comparison to another and their effects on the goods and services balance of a state.

Important works from the domain are evaluated. The authors are renowned researchers in the area of international finances and some of them are part of the personnel of the most important international finance-banking institutions such as the International Monetary Fund and the Bank of International Settlements. The studies regarding the relation between the exchange rates and the direct foreign investments are contradictory: some do not find a significant influence of the exchange rate and other demonstrate that there is a strong connection between the two variables. If a connection between the two variables is established, it remains to be settled if the connection is direct or reversed.

The Granger causality test identified the characteristics of the relation between the direct foreign investments and the exchange rate. The conclusions of the research mark out the complex nature of the relation between the two variables, the results being extremely heterogeneous from one country to another.

Keywords: direct foreign investments, exchange rate, volatility, correlation,   impact
J.E.L. classification : E20, E22, E43, E30, G10

Introduction

In the specialty literature, there have been many theories that mark out the bidirectional relation exchange rate-direct foreign investments. The classical theories highlight the fact that the volume of direct foreign investments is influenced by the exchange rate; a depreciated currency encourages the investors to delocalize their operations in the geographical areas where the workforce cost is more reduced.

The exchange rate is influenced by a series of factors, marking out a high interdependence degree and heterogeneous determination degrees. For these reasons, different approaches marking out a holographic dimension of the exchange rate (in terms of exporters/importers, investors or speculators) can demonstrate that on short or longer periods of time, a number of determinant factors can become dominant.

The exchange rate is actually the most synthetic price in economy, being the expression of a generalized equilibrium from the real economy, on one hand, and from the monetary-financial one, on the other hand.

1.Theoretical approaches regarding the causality relation between the exchange rate and direct foreign investments

A debate regarding the advantages and disadvantages of the impact exerted by the floating exchange rate on the international commerce appeared after the fall of the system of fixed rates established at the Bretton Woods Conference.

The volume of transactions on the exchange market increased exponentially based on the role that the American dollar played as pattern gold-specie set by the Bretton Woods Act in 1944 and the proliferation of floating exchange rates, after the fall of the system of fixed rates in 1971. It was due both to the intensification of the globalization process of the financial markets from the last decades and to the explosive development of derived operations in *leverage*. The gap between the Global Brut Product and the market of derived financial products. In this way, the

currency market came to be dominated by speculation operations and the factors that influence the exchange rates diversified and become more and more complicated to quantify.

The opponents of the flexible regime considered that the volatility of the exchange rate has a negative effect on commercial exchanges. In 1973, Wilfred Ethier substantiated a model in which "the behaviour of the merchants implies simultaneously both cover techniques and speculations, both of them correlated in an essential way." There have been various critiques addressed to term markets regarding a series of deficiencies linked to the incapacity of the term markets to act as a convenient cover tool for the volatility of the exchange rate.

The first refers to the fact that term markets are not deep enough to assure an adequate cover against the uncertainty of the exchange rate. The second comprises a complex relation between the exchange rate and prices in which the foreign exchange variations can affect the participants at the operations of international commerce in two ways: - the modification of the pay or cash in sum denominated in the own currency, respectively the modification of the prices of the exported or imported goods denominated in the own currency.

From this perspective, this type of model leads to a double role played by the participants to the international commerce operations – speculators and arbitrators. On the other hand, more studies marked out that the access to term market implies a cost; in this way the access is limited. At the same time, the effect is known by all market participants, but its intensity remains unknown.

Globally, the literature reveals 2 theories regarding the relation between the exchange rate and the direct foreign investments, reflected in 2 corresponding phases: the first comprises models that affirm that the uncertainty/the volatility of the exchange rate can fully be balanced by cover operations (Kogut (1983), Krugman, (1989).

The second phase includes a series of studies with contradictory results (Cushman (1985, 1988) as well as Goldberg and Kolstadt (1995)). Cushman analyzed the percentage modifications at the level of the exchange rate to avoid difficulties implied by non-stationarity and, additionally, he used the real exchange rate and not the nominally rate. Cushman identified a positive relation between the direct foreign investments (ISD) and the volatility of the exchange rate. He explained this finding by the fact that a multinational corporation reduces the exports as response to the exchange risk, but kind of balances this by increasing the foreign capital and production entries. Cushman's conclusions were criticized afterwards because "although innovative at the publication moment…his predictions are surely not compatible with the latest researches" (Jeanneret, 2007). Jeanneret underlined some of the deficiencies of the study conducted by Cushman; the volatility of the exchange rate was probably overestimated because the author counted the standard aberration that corresponds to the level values and not the one that corresponds to the first differences (Jeanneret, 2007).

A more recent study conducted by Chakrabarti and Scholnik (2002) did not mark out a negative relation between the variation of the exchange rate and the direct foreign investments. The author revealed the fact that a significant relation between the two variables cannot be estimated econometrically using the data regarding the influxes of direct foreign investments directed from USA to 20 Organization for Economic Co-operation and Development countries during the period 1982-1995, and to estimate the volatility of the exchange rate in the form of standard deviation at the level of the monthly exchange rate registered during the previous year (for example, in the shape of a panel type regression with fixed or chance effects).

In 2007, Jeanneret revealed a U type curve relation between the volatility of the exchange rate and the direct foreign investments, to create a model of multidimensional real options, based on his empirical findings afterwards.

The degree of financial development of a state is a strong argument that is taken into account when the type of suitable exchange regime is established and chosen, with implications on the fluctuation margin in which the exchange rate of the national currency will be en-framed. Depending on the development degree of the capital market, the participants involved in the

international commercial exchanges can protect themselves through hedging operations from the modification of the exchange rate. In these conditions, the volatility of the rate has stronger implications on the international commercial exchanges if the development degree of the financial market is more reduced (Aghion et al., 2009, p.496).

The same idea is developed by Rahman in 2009, paying a special attention to the position towards the exchange risk of the partners involved in the international commercial relations. The same author presents other factors that are worth to be taken into account when realizing the analysis regarding the relation between the foreign exchange and the exports: the existence of multinational corporations involved in international commercial exchanges and the anticipations of the partners regarding the implications linked to the rate modification. Other economists approach the volatility effects from 2 perspectives: the first is the microeconomic one – the activity of the exporting firms depends on the level of the transaction costs influenced, in turn, by the exchange rate, and the second is macroeconomic – the fluctuations of the exchange on long term affects the competitiveness of the products designed for export (Schnabl, 2008, p.74).

The firms register additional costs pertaining to the protection from the exchange risk, the earnings of the partners implied in international commercial relations reducing in this way. The existence of instruments on the financial market allows, in a certain measure, the realization of a certain protection from the exchange risk by paying a bonus according to the value of the contract. Unfortunately, these tools are not used on a large scale, many operators preferring not to protect themselves from the exchange risk.

The biggest part of the works that deal with this subject bring *a reverse connection between the volatility of the exchange rate and the influxes from the balance of goods and services of a certain state* in the forefront. Still, some authors consider that the depreciation of the exchange rate is not enough to reduce the current account deficit if the modification of the rate is not consistent (Gust, 2009, p.173).

2.The effects of the volatility of the exchange rate on direct foreign investments

The reduced volatility of the exchange rate is associated by most economists with high degrees of economic growth, an important volume of direct foreign investments, big deficits of current account and an excess in the credit activity (Arratibel et al., 2010, p.1).

The modern theories underline that foreign investments manifest an impact on the exchange rate, from the financial influxes perspective, a consistent volume of financial influxes denominated in specie determines a stabilization of national currency.

Considering the weight of net capital entries (the difference between the volume of financial influxes direct by the foreign investors in the countries from Central and Eastern Europe and the financial influxes repatriated in their own countries) in Gross Domestic Product as important indicator for the analysis of direct foreign investments, meant to allow the highlight of a proportional relation between Gross Domestic Product and direct foreign investments.

The empirical researches based on Granger's model test a few hypotheses:

(1) The exchange rate has an impact on direct foreign investments

In the context of a weak currency which will probably balance in the future due to a potential stabilization/improvement of the macroeconomic background, the foreign investors will have the motivation to direct the financial influxes to that country because a potential stabilization offers the opportunity to raise the value of the investment.

(2) The direct foreign investments influence the exchange rate

The significant financial influxes directed by foreign investors and denominated in currency encouraged the stabilization of the national currency as a result of the increase of the foreign currency volume.

The statistical results that correspond to the Granger test realized at the level of the countries from Central and Eastern Europe reveal important aspects as far as the relation between the

exchange rate and the direct foreign investments is concerned. The probability that corresponds to the null hypothesis allows the acceptance of an impact exerted by direct foreign investments on the exchange rate; on the contrary, the exchange rate does not appear in the shape of a variable that manifests an impact on direct foreign investments. So, the direct foreign investments manifest an impact on the exchange rate in the case of certain countries, whereas in other case, the relation is not validated which marks out that the direct foreign investments and the exchange rate are not linked.

The research has allowed the issuance of an important conclusion regarding the role played by foreign investments in the process to determine the dynamics of the exchange rate at the level of the countries from Central and Eastern Europe.

Although the transition process followed by these countries implies periods of significant depreciation of their national currency, it didn't represent the main stimulus for the delocalization of the foreign investments; on the contrary, the exchange rate seems to be strongly affected by the volume of financial influxes.

The countries in whose case the fact that the direct foreign investments manifest an impact on the exchange rate was confirmed are precisely the ones that managed to attract the highest level of direct foreign investments. This ascertainment is in concordance with the latest research realized at the level of the macroeconomic environment from Central and Eastern Europe. More studies (Yartey, 2007) marked out the fact that during 2004-2007 the registered economic growth took place mainly in the context of the positive effects of the direct foreign investments and of the stabilization of the national currency which gave the possibility to create workplaces, to extend the range of services and products.

The authors marked out that the stabilization of the national currencies was partly artificial, in the sense that it was not based on economic grounds but on external financial influxes that determined the growth of the volume of foreign exchange (Triandafil and Brezeanu, 2009).

In conformity with this idea, we can assess that the foreign investors were mainly motivated by the advantages regarding the reduced cost of the workforce, the high qualification level or a permissive financial fiscal offered by the countries from this area (Kiyota and Urata, 2004).

The conclusions of the study reveal o strong dependence not only of the currencies of these countries but also of the macroeconomic background in rapport with the external financial influxes. In fact, there are some chain propagation effects that can be underlined in: Central and Eastern Europe, the stability of the macroeconomic environment depends on the volatility on the exchange rate very much which, in turns, depends on the volume of financial influxes. This aspect determined real imbalances after the triggering of the financial crisis. The retreat of the financial influxes took place in the context of a strong aversion towards the risk which suddenly led to the depreciation of the national currencies.

The specialty literature has identified by choice 4 factors as determiners that explain the evolution on medium-long term of the real exchange rate:
• the productivity differential (the Harrod-Balassa-Samuelson phenomenon)
• the stockpile of net external actives
• governmental costs
• the exchange rate

The importance of net external actives as determiner of real exchange rate was recently marked out by Lane and Milesi-Ferretti (2000). A country with an increased negative level of net external actives cannot easily finance the current account deficit and cannot support a competitiveness loss associated with a more stabilized real exchange rate.

As a generally valid rule, the level of long term equilibrium of the exchange rate should be consistent with a stable weight of international investment position in Gross Domestic Product. The action way of the net external actives as weight in Gross Domestic Product manifest by means of 2 channels: (i) the risk bonus and (ii) the payment balance.

The first channel is linked to the portfolio theory and it states that because of the worsening of the international investment position (as Gross Domestic Product weight) of a country, international investors will ask for a higher capacity to provide the capital influxes that are necessary to finance the current account deficit. If the interest rates do not change, the higher risk bonus will determine the depreciation of the currency of the country with net debt to the exterior. So, the interest rate that has to be paid for the accumulated duty as result of consecutive current account deficits has to be counter-balanced by excesses of the commercial balance on long term. This excess can be obtained by depreciating the national currency which will make exports more attractive.

The data series regarding the international investment position are generally relatively short, and even more in Romania's case (there isn't a continuous series in fact). As a result, a frequently used proxy in estimates is obtained by the accumulation of the current account stock – although this way presents drawbacks. Fiscal variables can have a significant influence on the real exchange rate. On long term, the increase of governmental expenses is simultaneously associated with am increase of budget deficit. The general level of economies will reduce supposing that the population does not increase its savings to compensate the decrease from the level of public authorities. As a result, both the current account and the net external actives will worsen. The channels that were earlier described act further on.

From a broader perspective, excessive governmental expenses were interpreted as variable that surprises a multitude of economic distortions, having a negative impact on the perspectives of economic growth and on the real rate. This approach has the hypothesis according to which the increase of governmental expenses and excessive indebtedness will erode the confidence in the national currency as result of the waiting regarding taxes increases in the future at its basis. On short term, though, the effect can be a stabilization of the national currency one both through the effect on the aggregated demand and through the rate of interest increase. The exchange rapport has significant structural implications as, although the workforce from an emerging country is weakly trained, it recovers this gap compared to a developed country through education, international know-how transfer in time; it is very likely that this process improve the competitiveness of exports and to allow the practice of bigger prices as result of a higher quality of goods and services.

As a result, the exchange rapport has a considerable impact on the commercial balance – the most important component of the current account. The worsening of the exchange rapport (that resulted from the modification of the consumers' preferences or from increases of the goods price) should determine the depreciation of the real exchange rate in order to keep the competitiveness of the exports. Since preferences are hard to quantify, the exchange rapport is often approximated with the oil price in literature. The increase of oil price improves the international competitiveness of a country that is dependant on oil imports in a small measure. If this approximation is used in assessments the effect on medium term must be commented because the oil price can float considerably on short term.

Although the under-evaluation of the national currency has positive effects on short term leading to the export increase, to the improvement of the current account situation and to the rise of economic competitiveness, the situation has to be analyzed with the utmost prudence on long term. It needs to be done especially by the countries that recently adhered to the European Union or about do adhere. These countries are to adhere to the Economic and Monetary Union in a future phase and they will have to adopt a fixed rate consequently.

A real stabilization of the national currency realized in the conditions of an exchange market characterized by reduced interventions of the central bank did not affect the external competitiveness due to the fact that the productivity in the tradable sector increased. The rate under-evaluation from 1999 as result of the strong depreciation of the nominal rate had as

consequence an export growth. The imports adjustment due to the decrease of internal demand and the exports increase led to the improvement of the commercial balance account.

The massive capital entries both from direct foreign investments and from other capitals as well starting from 2003 determined a stabilization of the equilibrium exchange rate which lead to a sub-evaluation of the national currency, under-evaluation that decreased in the fourth trimester of the year 2004 when BNR changed its exchange rate policy, passing to a bigger flexibilization of the exchange rate. This flexibilization of the exchange rate was necessary as a phase for the preparation of the passing at the aiming of inflation as strategy of economic policy from 2005 and for the passing over the liberalization step of the capital account from April 2005 – the access of non-residentials to term deposits in lei.

The massive capital entries from the last years due to the improvement of the country rating and the integration in the European Union as well as the stabilization feeling that prevailed in the actions of the participants at the exchange market strongly stabilized the exchange rate.

As far as the exchange rate is concerned, it is estimated a moderate stabilization of the exchange rate for 2012, but it will still contribute to the decrease of import and operated prices wired to the euro currency.

These expectations in the dynamics of the exchange rate are also sustained by a favourable evolution as far as the direct foreign investments are concerned also in the next period and by the keeping of structural tendencies of economic growth, concomitantly with a slowing down in the consumption rhythm.

Conclusions

It is very important to surpass the maximum moment of the capital entries that are envisioned to continue also after the entrance in the European Union from the perspective of correct choosing of central par of exchange at the entrance in the exchange rates Mechanism and ulterior Euro embracement by Romania programmed in the period 2012-2014). This thing is motivated by the capacity to estimate the balanced exchange rate as precisely as possible to have a good foundation of central parity of exchange. The results obtained by econometrical techniques of co-integration in the work lead to the conclusion that a differential increase between the relative prices of the non-tradable goods in comparison to tradable ones in Romania with regard to EU-12 and an increase in the net external actives of the banking system appreciate the equilibrium exchange rate. The national currency had both periods in which it was under-evaluated and periods when it was over-evaluated on the basis of the estimation of the real equilibrium exchange rate. Although the under-evaluation of the national currency has positive effects on short term leading to the export increase, to the improvement of the current account situation and to the rise of economic competitiveness, the situation has to be analyzed with the utmost prudence on long term.

The liberalization of capital accounts and the increase of the volume of international transactions lead to the amplification of the volatility of the exchange rate. At the same time, the proliferation of hedging operations reduced from the vulnerability of the partners implied in the international commerce in the face of exchange risk.

Some particularities, ideas, opinions from the specialty literature regarding the relation between the exchange rate and the direct foreign investments were marked out taking these considerations into account. The theoretical and practical contributions of the authors mark out the preponderance of the negative link between the 2 variables but the relation is not cogent. The obtained results depend on a series of factors: the region about which the analysis is made, the development degree of the capital market, the considered period, the economy cycle.

THE DIMENSION OF THE DETERMINATION OF THE RISK OF THE DIRECT FOREIGN INVESTMENTS IN ROMANIA

Halmi Mirela
Carpatica Bank Satu Mare Branch, Romania

It was marked out that the investors should be prepared for permanent changes of the forms in which the risk can manifest itself from the evolution of market economy grounded in the industrialized countries: operational, financial, strategic risks are also added to the traditional exposition to chance, caused by a series of factors, as legislation modifications, certain standards and European codes, the risks imposed by the evolution of the new economy, pressures that emerge in the personnel policy domain, the new needs for technical equipment, the costs efficiency, the spontaneous (unexpected, unplanned) economical events.
It is interesting to analyze in what measure one can talk about the risk management in the strategies to attract the foreign investors in this context. This supposes an additional effort of the authorities to identify and subsequently eradicate the risk that could emerge in the case of some direct foreign investments in Romania.
Keywords: direct foreign investments, risk, risk management, uncertainty
J.E.L. classification: E20, E22, G32, D81

Introduction

The reality proved us repeatedly that any human activity is deployed in conditions of risks, these risks being more or less serious, more or less known, easier or more difficult to avoid. The deficient knowledge of risks, their wrong evaluation, the lack of an adequate protection against them will affect the result of the activity directly.

The risk, that is one of the key elements of the evolution of economy, represents a concept that wasn't debated enough in the specialty theory, the people being still unable to master its identification and the avoidance techniques during their deployment.

The risk is regarded as a phenomenon that come from circumstances for which the decision maker is in measure to identify possible evolutions/events, and even the probability of their production (materialization), without being able though to specify which of these events will effectively occur. So, one can say that the risk derives from the impossibility to ascertain with a certain accuracy which is the possible event, identified as such by the decision maker that will effectively materialize and will determine a certain risk level. The decision maker cannot be sure if that event is the one that will occur certainly and not another even if the estimated probability for the effective materialization of a certain factor that generates risk is high; it is possible that a phenomenon whose probability was assessed at a reduced level or even an unexpected event be produced.

It has been assessed that "the risk is constituted by the possibility that a fact with unwanted consequences can be produced" in the definition given by the Organization for Economic Co-operation and Development in 1983 ; this definition has the eventuality that an (anticipated with a certain probability or a not predicted by the decision maker) event materialize and negatively affect certain aspects of the economic activity (the investment process) at its basis. In fact, the accent falls on the effects that the respective event trigger in this concept.

There is a great number of definitions of risk through which the finding of new valences and significances of it on the investment activity are tried: "the risk represents the variability of the possible result depending on an uncertain event"; "the risk is the uncertainty with regard to a loss"; "the risk can be defined as the possibility that losses be bigger than expected"; "the risk represent the uncertainty with regard to the production of a damage" or "the risk is that situation in which there is the possibility of a deviation withstander to the hoped result".

One can notice certain common characteristics, certain criteria to define the risk by analyzing all these definitions. Firstly, one can say that the risk derives from uncertainty: the adoption of the

decision takes place presently and its implementation and the generated results will produce in the future. The uncertainty comes from not knowing regarding which event of the identified ones will happen and when, which will be the real effects and the amplitude of its production. Secondly, the risk implies the idea of potential loss (of any type), generated by an evolution of the risk factor contrary to the decision-maker's expectations.

1. The risk – essential factor in the investment decision

The risk is a multi-dimensional concept whose level cannot be reduced to a single element, to a cipher. It is important for any firm that an acceptable level of the investment risks that it is willing to take be determined. The acceptable risk level refers to the "maximum" risk that the investor is willing to take: it is necessary that the obtaining of a minimum capitalization to justify the operation costs be certain. There isn't a unique acceptable level, but it differs from the concrete conditions of each economic activity / investment and the decision maker's attitude regarding risk.

The uncertainty has two components: an objective component – the objective uncertainty (identified with the risk concept not few times) – and a subjective component – the subjective uncertainty. The distinction between these two concepts is important in the case of direct foreign investments (and of international affairs generally). The subjective character of the uncertainty has to be assessed in the sense that the estimates regarding the production of a certain event that generates risk is based on the decision maker's own appreciations and perceptions depending on the pieces of information he has at the respective moment, and the experience he has in the respective domain. The objective uncertainty can be assimilated to the situation in which all possible results are known and most of those implied in the decision process are unanimous in the estimation of the same production possibility of each of the identified effects on the basis of data delivered by previous evolutions.

The managers' evaluations regarding the future deployment conditions of a business have a predominantly subjective character. An improvement of the quantity and quality of the pieces of information has to be imposed for a foundation of the decision of investments and the reduction of the number of "unfamiliar" with which one operates as good as possible, and a "a conversion of the unfamiliar into risk" has to be realized.

The risk represents that probability factor that can be associated to a possible result when the decision factor knows all the possible future effects of the taken decision. The uncertainty emerges when the decision factor knows all the possible future effects but it cannot associate them, for various reasons, to no probability factor of the possible result. The uncertainty is "more drastic" than the risk and comes in most cases from the lack of information, the precarious quality of the information or as a result of certain dysfunctionalities of the decision maker's information system.

In the Romanian economy, the risks to which economic agents expose themselves are the risk caused by inflation, the evolution of the exchange rate and the economic-financial blocking, that is the non-payment risk.

The risk management represents a complex process that comprises a series of activities meant to diminish the risk that could appear once with the entrepreneur's initiative. The risk management implies the identification of risks, the analysis of risks (the ranking of their importance and their impact on the company), the treating of the risks, that is by the financed or non-financed retention of risks, by the risks transfer, by contract or through insurances and capital markets, by reducing risks and by changing the activity, if it is the case.

The diverse types of exposures specific both to the banking sector and to the commercial companies include all the financial risks – the currency risk, the price risk, the credit risk, the liquidity risk, the operational risk, the legal risk.

An explosive development of projects to control risks was registered in the developed countries in the last years. A great variety of tools was used or revised to respond to the demands of the controlling risks management. The main economic function of futures markets is hedging (the cover of risks). Hedging represents the buy and sale of futures contracts to compensate the risk of the emergence of some price changes on the spot market. This mechanism of risk transfer made the futures contracts indispensable to the companies and institutions from the entire world.

The risk management is an attribution not only of the entrepreneur but also of the state that whose intervention should be as righteous as possible, without creating unilateral precedent.

The attraction of direct foreign investments is an important source of efficient reorganization of the regions and implicitly of the national economy. Financial capital, efficient management methods, assurance of unfolded retail sales markets, capacity of placement on the European and global market are a few of the benefits of the entrance of foreign capital.

We have to know the foreign investors' criteria to estimate the risk to invest in Romania in order to create an attractive environment for them and these criteria will have to assure a correct use of the community funds meant for economic reorganization and to exploit the created, legal, institutional background efficiently to ensure a stable and attractive environment for the foreign investors.

2. The direct foreign investments in Romania

The net influx of direct foreign investments reached the level of 2,22 billion Euro, from which 1,824 billion Euro capital participations (82,2 %) and 396 million Euro net credit received from the foreign investors (17,8%), according to the statistical research conducted by the National Bank of Romania in collaboration with the National Statistics Institute.
Source: Report of the National Bank of Romania

Figure 1. The evolution of direct foreign investments in Romania

The final balance account of direct foreign investments on the 31st of December 2010 registered the value of 52,585 billion Euro, from which 35,529 billion Euro capital participations, including

reinvested profit (67,6%) and 17,056 billion Euro net credit received from the foreign investors (32,4%).

Figure 3. The distribution of the foreign direct investments balance of current account on the main economic activities

From the point of view of the foreign investors' orientation to economic branches (according to CAEN Rev.2), the direct foreign investments located mainly in the manufacturing industry (32% of the total amount). The best represented branches within this industry are: the oil processing, chemical products, rubber and plastic masses (6,9% of the total), metallurgy (5,3%), the means of transportation industry (4,9%), the aliment, beverages and tobacco industry (3,9%) and cement, glass, ceramics (3,2%).

Figure 6. The foreign direct investments by countries of provenience

The first 5 countries that came out according to the weight held in the direct foreign investments balance on current account are: the Netherlands (10,903 billion Euro – 20,7% of direct foreign investments balance on current account at the end of the year 2010), Austria (9,346 billion Euro – 17,8 %), Germany (6,398 billion Euro – 12,2%), France (4,384 billion Euro – 8,3%) and Greece (3,0016 billion Euro – 5,7%), hierarchy also registered in the year 2009.

Corporal and non-corporal immobilisations, with a balance on current account in value of 24,309 billion Euro at the end of the year 2010 represent 46,2% of the total direct foreign investments balance on current account, inducing a significant stability degree of the direct foreign investment.

The influx of capital participations in the direct foreign investments companies in value of 4,067 billion Euro is differenced in green field, merger & acquisition, and firms development.

In the year 2010, the greenfield investments registered a very reduced level, of only 46 million Euro, representing 1,1% from the capital participations in the direct foreign investments companies in the year 2010, in the same category being the investments from the merger & acquisition (M&A) category with 93 million Euro; the dominant weight in the influx of capital participations in 2010 is represented by the developments of firms with a value of 3928 million Euro, respectively 96,6 % of the participations.

The accumulations of direct foreign investments (balances on current account) in the companies established through greenfield investments named greenfield companies were also marked out to appreciate the duration impact of greenfield investments.

The activity of the direct foreign investments companies, in its ensemble, has a positive impact on Romania's external commerce, the contribution to exports being of 72,4%, while at the imports it is of 62,5%. The direct foreign investments will decrease by 20% in 2012, while the exports dynamics will be decelerated to an increase of approximately 10%, according to the surveys conducted by the Romanian Institute for Evaluation and Strategy.

As far as the workforce is concerned, according to IRES surveys, the migration risk to other European Union countries is of 77%, being one of the biggest risks registered in the last years

and there is a decrease of confidence in the European Union, only 46% of the Romanians having expectations to improve the standards of living from the European Community.

3. The evolution of direct foreign investments in crisis conditions

The impact of the economic and financial crisis on direct foreign investments occupies a primary position, but various positive factors will trigger a recurrence of the influxes of international investments sooner or later. The actual financial crisis is different from the previous ones for the following reasons:

-it was triggered in the developed countries, it had a rapid impact in the entire global economy because of the existence of various spreading channels of the globalisation effects;

-it is not part of a normal business cycle, marking out the weaknesses of the regulations of the global financial system as the lack of transparency and control mechanisms and the inability to prevent abnormal states, regulations that are excessively based upon obtaining short term profits;

-it should also mark out the changes within the economic power between the advanced economies and the emerging countries.

This situation could have a negative effect on the dynamics of investments influxes and the spread of an uncertainty state regarding the future evolution of direct foreign investments.

The crisis period can offer the companies the opportunity to buy actives at reasonable prices. The acquisition of under-evaluated actives can increase the investments. The evolution of the exchange rate and the prices decrease of the actions can lead to a series of acquisitions that aim at transactions and the possibility of consolidations in certain areas such as petroleum, the mining industry, the car industry and the financial services.

On medium term, companies are tempted to increase their internationalization degree, an aspect that represents a significant indicator in the evolution of investments influxes.

The actual crisis could be both a source of threats but also of opportunities for the public policies of direct foreign investments. The crisis could offer the chance for global policies to be implemented to consolidate the stability of the financial system and to stimulate the economic growth.

The specific measures can be adapted to stimulate the investments and maintain a favourable business and investment climate, far from protectionist measures at the level of each country.

According to a Deloitte study, Romania is the most interesting market for fusions and acquisitions from Central and Eastern Europe, a situation that won't change in the years to come. Romania occupies one of the leading positions with respect to the M&A (mergers & acquisitions) specialists for fusions and acquisitions from Belgium, Central Europe, Denmark, Germany, the Netherlands.

In Romania, the most important M&A transactions took place in the manufacturing industry, the sector of financial services, constructions and real estate transactions.

In Europe, a significant part from the merger and acquisition activity took place in the consumption and production sectors, followed by the phone sectors in Western Europe and energy and resources in Central Europe. The tendency was to close more and more cross-border transactions on the basis of the extension of the big retail operators.

The evolution of Merger & Acquisition can register a decrease as multinational companies are forced to reduce their expenses, shows the World Bank.

There is the possibility that some companies opt for the temporary or definite moving of production plants from Romania as a result of the banks bankruptcies from USA and the more and more difficult conditions to face the financial crisis. The reason for this reduction could be the reduction of expenses and the postponement of the expansion plans.

The most difficult part for the investors could be the more and more harsh access to credits to finance the activity if they don't have their own financing sources.

On the other hand, the companies that could be affected by the actual financial crisis could enter in the payment incapacity of the residual credits leading to the worsening of the situation in this way. The possibility of the acquisition by companies or fusions is not excluded in the case of the worsening of the financial situation of the companies. This moment of the economic crisis is a good moment to develop for the companies that have liquidities.

The financial crisis from USA left its mark on Romania. The need to prevent the unfavourable effects is necessary. That is why, the companies from Romania need to re-evaluate the risks to which they are periodically exposed and to carry on the necessary measures to diminish the risks that might appear.

Conclusions

The direct foreign investment in Romania still has symptoms of the relatively reduced level, respectively the imbalance of the influx on short periods. Compared analysis shows that the direct foreign investments dynamics in Romania was among the best in Eastern Europe in the last years, but the level of the yearly influx between Romania's relatively reduced volume as compared to the neighbouring countries' was and still is diminished.

Romania will have to attract capital influxes, including direct foreign investments of 15 billion Euro per year to cover a balance on current account deficit. The variable exchange rate of Romania offered it a greater flexibility and the capacity to use the monetary policies as part of its macroeconomic stabilization program. One of the priorities of the authorities should be the maintenance of Romania's attractiveness for foreign investors, even in crisis conditions.

Romania remains favoured in respect to other countries regarding the attraction of direct foreign investments, by the volume of energetic resources, by the low exports and credits weight within the Gross Domestic Product, by the fact that it doesn't have a fixed rate regime. An intelligent mobilization of the political forces so that the Romanian market remains attractive and stable further on for foreign investor is important now but also in the next period. What should we do to maintain the interest of foreign investors in Romania? A solution would be an increased predictability, for example of the exchange rate, so that investments can be planned. A fiscal stability and predictability, without increases of taxes and excise taxes, is also important.

Romania can consolidate the increasing role for many multinational corporations that operate here also in the period to come, the position of regional pole being bestowed on it not only because of its size, but mainly because of geographical positioning, being the frontier country of the European Union, with opening possibilities towards the Caucasus, Central Asia, the Balkans, Turkey.

Important element of the reorganization strategy of an economy, the attraction of direct foreign investments can have a series of advantages on its evolution, the exploitation of local resources in the benefit of growth and development, the increase of inland competition, the advantages in comparison with other variants of external financing, the improving of the exchange rate of the national currency, welfare effects.

THE COMPARATIVE ANALYSIS OF ROMANIAN AND HUNGARIAN STOCK MARKET INDICES AND EXCHANGE RATES

Kulcsár Edina
University of Oradea, Faculty of Economic Sciences

Tarnóczi Tibor
University of Debrecen, Faculty of Applied Economics and Rural Development

Nowadays, when we are witnessing a serious macro-level changes, to deal with financial and economic indicators becomes more and more important in the economy, in particular to evaluate the changes of these indicators and especially their impact to the private sector. This paper aims to analyze in comparison for two countries, in what extent can explain the changes of the most important stock market indices with the fluctuations of those two countries national currency exchange rates in euro. To determinate the relationship between the macro indicators we've used traditional statistical methods, namely simple linear regression model and the Bayesian statistics. In case of both Romania and Hungary, the analyses show that there is a relationship between exchange rates and the changes of stock indices. If we compare the analysis results of the two countries, we can see that the relationship between the BET index and Lei/EUR exchange rate is much more stronger than between the BUX index and Ft/EUR exchange rate, in the latter case we can see a much weaker relationship.
Keywords: stock indices, exchange rate, financial crisis, macro-indicators, Bayesian statistics
JEL Codes: G01, G15, G18, G19

1. Introduction

Recently evolved world economic-financial crisis revealed many economic and financial problems in several European Union's member states which have led to serious economic crisis in some countries. Especially, there has brought to light serious economic problems in the southern European countries such as Greece, Italy, Spain and Portugal. Romania and Hungary, such as recently joined European Union's ex- socialist member states, has also faced economic and financial problems. The main similarity of these countries is the critical fiscal situation, and the infringements of Stability and Growth Pact rules. Forasmuch, the compliance of the public debt and/or public deficit rule is the current problem of mentioned EU member states, the budget adjustments plays an important role for the economic stability.

Considering the current macro-level changes, we find that it is important to analyze the evolution of these macro-indicators in comparison in mentioned two post-socialist countries. Therefore, we consider that to analyze the relationship between several macro-level indicators has a special importance.

2. Literature analyses

This paper aims to examine the relationship between two macro-indicators, namely the Romanian and Hungarian stock market indices and the national currency exchange rate in euro of these two countries. A number of foreign articles deal with the examination of relationship between two or more macroeconomic indicators. The macroeconomic indicators used most commonly in recent researches, are for example, interest rate, inflation rate, stock market indices, stock prices etc. Ahmad–Rrehman–Raoof (2010) concluded that there is a relationship between the changes of exchange rates and stock market indices. Studying the Istanbul's stock index, a researcher show that the trends of stock market indices are strongly influenced by several factors, such as exchange rate, oil price, money supply. He also concluded that there is no effect between stock index changes and the price of gold as well as the consumer price index (Büyükşalvarci, 2010).

In the most research, the evolution of stock market indices is explained with various macroeconomic indicators. Dimitrova (2005) also tries to explain the reltionships between stock market share prices, exchange rate and economic – fiscal and monetary - policies with using a multivariate model. The research results show that the changes of interest rate and exchange rate affect the stock market share prices. In their 2009's research, Sulaiman–Hussain–Jalil concerned to show by tools of AR and ARIMA models, the relationship between the evolution of stock prices and other macroeconomic indicators such as interest rate, exchange rate and price index. The researchers concluded that there is strong relationship between exchange rate and stock market share prices. In another study, the researchers have founded that except the exchange rate, which has a positive impact on the stock market index, the other indicators such as interest rate, money supply, consumer price index have a negative effect on the evolution of stock market index (Frimpong, 2006).

3. Research methodology

In this research, in the exploration of correlation between two indicators we want to take advantage of the possibilities of both the traditional and the *Bayesian statistics*, and their combination too. The combination of these methods allows that using parameters determined with basic statistics methods, to perform the simulation, in order to a better parameter estimation. This kind of model permits a deeper analysis than the conventional methods alone. Using Bayesian statistics, it is possible to take into account the earlier results, estimations and another advantage of this approach is that the certain assumptions could be incorporated into the model (prior probabilities). The *prior density function* includes the earlier information to a developed model's parameters, which may have a subjective or objective nature. The function based on the information resulting from the sample, we know as *likelihood function.* This function shows that in case of the concrete distribution and various parameters, how credible it is, that the sample results during sampling. The essence of Bayesian statistics is the linkage between the *prior* and *posterior density functions*. The posterior distribution function is proportional with the product of prior probability density function and likelihood function.

The Bayesian statistics is an important tool in modern macro-level analysis, because it insures a special approach for analysis based on macro-data, therefore it is not surprising that the Bayesian statistical models are commonly used in macroeconometrics. The Bayesian statistics may give an answer in explaining of economic time series fluctuations caused by the macroeconomic policies or other factor changes.

A number of foreign articles, through the usage the statistical methods distinguish two main categories of statistical analysis "Bayesian" and "not Bayesian" analysis (Poirier, 2006). Like as any methods, the Bayesian statistics method has also advantages and disadvantages compared to the basic statistical methods. Earlier researches assign many *advantages* for this statistical method, such as: (1) more useful and provide more natural conclusions; (2) it is able to utilize more available information, so that the results obtained are more reliable; (3) it is more suitable for complex problems analysis. The *disadvantages* of Bayesian statistics are the following: (1) involves subjectivity, which the basic statistical methods doesn't; (2) the model is much more complicated and in many cases requires software programs, which sometimes are difficult to access, or there are quite costly (Luce-O' Hagan, 2003).

At the question of how objective is the Bayesian statistics, Berger (2006) write that it would be misleading to talk about objectivity, because the some data analysis process entails subjective choices.

In present research, to determinate the relationships between macro- indicators, we will use simple linear regression model combined with the facilities offered by Bayesian statistics. During the regression analysis, we want to analyze the impact of changes of the two neighboring

countries Lei/EUR and Ft/ EUR exchange rates on their main stock market indices, namely BET (Bucharest Exchange Trading) and BUX (Budapest Stock Exchange).

To determinate the macroeconomic relationships of two countries, we have used the following data Lei/EUR and Ft/EUR exchange rate, like monthly data series, for 6 years, as well as the selected countries main stock market indices. The Romanian data referring to the exchange rate were collected from the databases of National Bank of Romania and Bucharest Stock Exchange. The Hungarian data were also collected from databases of the National Bank of Hungary and Budapest Stock Exchange.

The statistical analysis waa built on the R statistical software system, such as a solving program. In the R statistical system there are available all the packages (modules) which is necessary for this analysis. The R statistical system is open source software, that ensure many analyzing, modeling and visualization facilities and another advantage is that it could be connected with Excel spreadsheet, which facilitates the usage of different databases.

At the first step at the study we apply the linear regression calculation, known by the traditional statistics, which correspond with the original regression and the prior distribution. We assume that the error factor (ε) follows the normal distribution with 0 expected value and constant variance (σ^2).

After the traditional statistics computation, by tools of R statistics program we will simulate from prior distribution the regression coefficient β vector and the error variance (σ^2), so determines the values for σ^2 from its marginal posterior density $g(\sigma^2 \mid y)$ and β values from the conditional posterior density $g(\beta|\sigma^2, y)$. After this operation, the program generates a new σ, based on gamma distribution, then the σ^2 (posterior distribution) is the inverse of gamma distribution, with $((n-k)/2, S/2)$ parameters, where (1) n = number of observation, (2) k = number of explanatory variables, (3) S = ()' (y − Xˆβ) (Albert, 2007).

The previous computation plays a central role in determination of β coefficient. After this, leaving the degree of freedom from the initial distribution, execute the simulation so that the β will be the average, by following a multivariate normal distribution. The posterior distribution of the regression vector β conditional on the error variance σ^2, $g(\beta|y, \sigma^2)$, is multivariate normal with mean βˆ and variance-covariance matrix $V_\beta \sigma^2$ y − Xˆβ, where

$$\beta\hat{} = (X' X)-1\ X'\ y\ and\ V\beta = (X' X)-1.$$

4. Results of the research

By simple linear regression we analyze the relationship between Romanian stock market index, BET and Lei/EUR exchange rate, and the relationship between Hungarian stock market index, BUX and Ft/EUR exchange rate. The regression model for the tested model is:

BET = β_0 + β_1 * Lei/EUR, BUX = β_0 + β_1 * Ft/EUR,

where the question is that the changes of Lei/EUR, Ft/EUR exchange rate can explain the evolution of BET, BUX index. The calculated regression coefficient correspond essentially to the two countries stock market index β coefficient, which shows that the two countries currency in EUR exchange rate changes explain the changes of BET and BUX index.

In the R statistical software system, the regression computation was carried out using the lm() module, and the results of these calculation are the following linear function:

BET$_i$ = 20733,2 - 3878,3 * Lei/EUR$_i$, BUX$_i$ = 49982,99 − 109,79 * Ft/EUR$_i$

For testing the reliability of coefficients of regression model, the software determines the T-test values and associated significance level, which values will be presented into table 1. and 2.

Table 1. shows that in the case of BET the significance level for each coefficient value is around 0, which means that both coefficients has different value from 0, and thus these coefficients can be used to examine the relationship between two variables. The table 2. for BUX index indicates the similar results with table 1., so in this case too, the parameters of regression function can be used to describe the relationship between two variable.

1. table: Estimation the parameters of BET (Romania) function

Statistical attributes	Estimation	Std. Error	T- value	Pr(>|t|)
Intercept	20733,2	1683,7	12,314	< 2e-16 ***
Regression coefficient	-3878,3	438,3	-8,849	8.4e-14 ***
Standar error of regression	1477			
R-squared (R^2)	0.4709			
Correlation coefficient (R)	0.6862			

Source: Own computation

2. table: Estimation the parameters of BUX (Hungary) function

Statistical attributess	Estimation	Std. Error	T- value	Pr(>|t|)
Intercept	49982.99	6698.17	7.462	8.04e-11 ***
Regression coefficient	-109.79	25.29	4.341	4.02e 05 ***
Standar error of regression	3781			
R-squared (R^2)	0.1869			
Correlation coefficient (R)	0.4323			

Source: Own computation

The table 1. and table 2. shows the function coefficients of determination (R^2), which in the case of BET is 0.4709 and in the case of BUX is 0.1869. This means that in the BET case, the dependent variable variance could be explained by independent variable in proportion of 47,09%, while in the case of BUX, this is only 18,69%. With other words, this means that the BUX index evolution could be explained much less by the exchange rate changes. The mentioned tables also shows the correlation coefficient (R), for which in the BET case it is 0,6862 and in the BUX case 0,4323. Therefore in the BET case it means a medium-strong correlation, while in BUX case it we could talk about a moderate-weak correlation. The software performs the variance analysis too, for this regression, which is presented in the tables 3. and 4.

3. table: Variance-analysis / ANOVA table for BET (Romania)

	Degree of freedom Df	Sum of square Sum Sq	Mean of square Mean Sq	F-value	F-test Significance level
BET	1	170720473	170720473	78.305	8.397e-14 ***
Error	88	191856766	2180191		

Source: Own computation

4. table: Variance-analysis / ANOVA table for BUX (Hungary)

	Degree of freedom Df	Sum of square Sum Sq	Mean of square Mean Sq	F-value	F-test Significance level
BUX	1	269443851	269443851	18.848	4.016e-05 ***
Error	82	1172253096	14295769		

Source: Own computation

In the tables 4-5. the BET and BUX indioces means the SSR, that is the regression deviation of Sum of Squares, namely the estimated BET and BUX (y') and the Sum Squares of difference of BET and BUX average ($\bar{y}$), denoted by $SSR = \sum(y'_i - \bar{y})^2$. The Error is not other than SSE (Sum Squares for Error), that is error factor, which could be calculated like difference of Sum

Squares between original (y) value and estimated (y') value $SSE = \sum(y_i - \widetilde{y_i})^2$. From the sum of SSR and SSE we obtained the SST (total sum of squares), so that $SST = \sum(y_i - \bar{y})^2$.

Related with variance analysis, the F-test answer to the question if the model is acceptable in the sense that the independent variables explain satisfactorily the BET and the BUX index. The F-value is equal with: Mean Squares (BUX) / Sum Squares (Error). Because F- value's significance level in both of cases are closed to 0, we can conclude that the explanatory variable effect is significantly greater than the error effect, so the regression function will be useful in the description of this kind of connections, that also shows that we could reject the null hypotesis, so in both of cases, the dependent variable variance could be explained by the variance.of independent variable, the '***' suggest that all that could be determined at a 0,001 significance level.

1.graph: Lei/EUR and Ft/EUR excahnge rates changes between 2005-2011
Source: Own computation

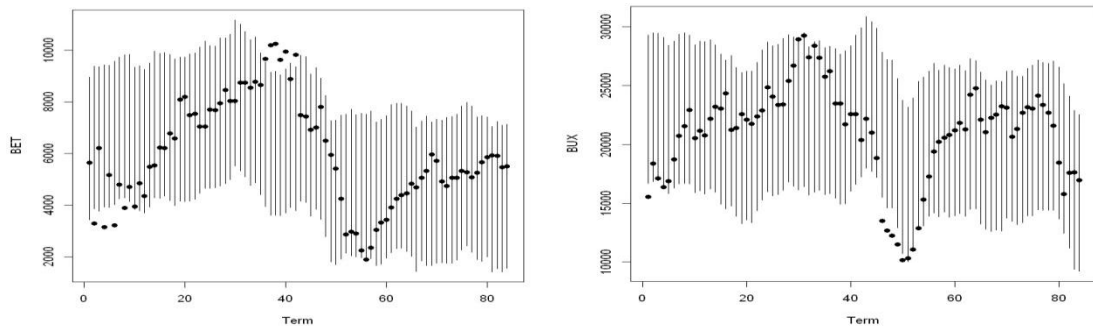
The graph 1. shows that in the analyzed period, between 2005 and 2011, both the Lei/EUR and Ft/EUR exchange rate records a serious fluctuations, but despite the fact that we analyze two neighboring country, exactly their national currency compared to the European currency, the graph shows a very different trends. In the first section of graph we can see a completely opposite trends for these two countries exchange rate, while in the left side, the graph shows a gradually appreciation of Romanian national currency compared to euro, in the right side of graph we can see a depreciation of Hungarian national currency compared to euro, followed by a same degree of appreciation. In the next period the national currency of Hungary depreciates again, but this time to a lesser extent, then in the pre-crisis period appreciated and after that, at the influence of financial crisis, we assist to an Ft/EUR devaluation, touching the bottom. Despite the fact that in time of financial crisis, the trend of both two countries exchange rate was similar, it is clear that the two rates do not move together, so the fluctuation of Ft/EUR is larger , shows a quite rapid changes from one period to another and Ft/EUR depreciation amplitude is also different. In the post crisis period, the Ft/EUR exchange rate registers a suddenly appreciation and in the next period depreciated again. In post crisis period, the Lei/EUR exchange rate fluctuates gradually into limits of a certain band.

For the following analysis we've used Bayesian statistics. The calculations were performed by tools of R statistical system, using LearnBayes module. Using the traditional regression results (prior) we perform new computations (posterior), which is formally similar to the normal sampling model. After the calculation of regression model, the program generate new data (by using the original data), through 5000 runing. The program execut the 5000 running with retaining of original value of σ. The histograms of regression coefficient (β) and standard

deviation (σ) obtained after calculation, based on Bayes statistics posterior distribution, are shown in the next illustration.

2. graph: The distribution of BET and BUX index coefficients and standard error
Source: Own computation

After 5000 running, the results shows that the major part of BET index coefficients are situated between -4000 and -3000, while the values of standard error are situated between 1600 and 2000. In the case of BUX index, the major part of regression coefficients are situated in -150 and -100 interval and the standard error larger part are into 3900-4500 interval. We can also see from this illustration, that the values related to BET index are much more closer to normal distribution which also implies that in the BUX index case also the values of the standard error shows an more uniform distribution. In the case of BET index the values of standard error are more concentrated around average value.

3 graph: The estimated interval for BET and BUX index using Bayesian statistics


Source: Own computation

The graph 3. shows the interval regression calculations performed by the Bayesian methods. The resulted " host range" illustrate with a 95% probability which is the band where the original values falls. We can see from the illustration that with few exceptions, the larger part of analyzed data (points) are within this interval, in the lower, middle or upper limits of this. The resulted "interval-function" could be well used to perform predictions.

In conclusion, it is clearly visible that the values of BUX index moves into a wider range than the BET index, which indicates greater uncertainty. This means that in the case of BUX index the predictions referring to the stock market index may be uncertain.

5. Conclusions

The research results clearly shows that there is a connection between the changes of Lei/EUR and Ft/EUR exchange rate and the BET and BUX stock market index. But if we compare the results of these two countries, we can see that there is a stronger relationship between BET index and Lei/EUR exchange rate, than in the case of Hungary, where the relationship between BUX index and Ft/EUR exchange rate reveals a much weaker connection. The comparison of these two countries national currency compared to the euro exchange rates denote in the analyzed period that in the first half of period, these two exchange rates have a completely opposite running, while in the second half of the period we assist to these two countries national currency devaluation, which was heavily influenced by the global financial crisis.

For the effectiveness of predictions we've exploit the opportunities of Bayesian statistics, with which we determine the interval associated with regression line. The usefulness of Bayesian statistics applied at the regression calculation, derived from the fact that it gives a different approach of statistical analysis. As we have emphasized, a greater advantage of Bayesian statistics compared with the basic statistics, is that in the case of basic statistics we can say with 95% probability that the values falls in the certain band, while according to the Bayesian statistics approach we can say that the 95% of values will be into this certain interval.

THE ROMANIAN CARD MARKET

Magdalena Rădulescu
University of Pitesti

Luigi Popescu ,
University of Pitesti

This paper presents an analysis of the Romanian card market in the last decade, based on the statistic data, against other Eastern European Countries and its perspectives in the next years. The use of cards is important for banks, due to the significant interests and tax gained this way, but Romanian market is still underdeveloped because of the population behavior in the payment area and due to the lack of the card acceptance infrastructure at the merchants for a long period of time. In Romania, there are still many cards with a cash-withdrawals function, but the Romanian card industry has a great potential, because it was underdeveloped. The crisis was an opportunity on the market cards because the credit products have dropped significantly and banks had to develop other banking products, realized the importance of the cards and began to invest in infrastructure.
Keywords: payments cards, Romania, ATMs.
JEL Classification: G20, G35.

1. Introduction

The Romanian card products have adopted many features of similar products offered in Western Europe and North America, but were adapted to the specific Romanian.

The first cards that appeared in Romania were the debit cards. Their role was to accustom the population with the electronic payments and to get rid of the use of the cash. These goals remain valid and will still take several decades before most people will understand this. The main purpose of this paper is to present the development of cards as a payment method in Romania, against other Eastern European countries, if this payment method was largely accepted by the Romanian population and merchants and what commercial banks have succeeded to promote their issued cards. In terms of banks offering debit cards, they are an efficient and inexpensive modality to attract short-term cash in the economy. The card balances, even if in many cases are relatively small, summarized, are a financial resource that can be recovered with a yield higher than interest paid. The success of debit cards was provided by promotion to pay salaries. Payroll cards provide certainty to their regular use by at least one or two feeds with wages and as many withdrawals. Commercial banks often exerted pressure on companies to introduce cards to employees (Dedu and Ganea 2002: 63).

The credit cards have seen a boom in recent years due to diversification of loan products. The success of consumer leads to a greater measure of consideration about the facilities offered by credit cards. Some banks have tried to limit the use of credit cards to withdraw cash withdrawal fees by introducing prohibitive or simply by limiting cash withdrawals to a certain amount (usually a percentage of the amount borrowed).

2. The evolution of the cards market in Romania

The card market in Romania is booming recording, especially in the recent years, outstanding performances in terms of number of users of this payment instrument, but also on the volume or number of transactions.

Although we are close of what is happening in Europe, the use of a smaller measure of cash, Romania is still far behind the rest of European countries in the number of POS terminals and card acceptance network. The cards market development potential in Romania is very high and this will be beneficial for banks, but also for manufacturers of equipment and technologies specific to the cards (Figure 1).

The card is convenient and profitable for the bank customer to a certain level. This is why in 2010 banks go on various promotions for cards, especially for the credit.

For years the bankers tirelessly promoting the use cards instead of cash, but, paradoxically, does not accept electronic payments from their desks even units where utility bills or taxes are paid only in cash. Several banks have installed their own POS cashiers, but can be used only for cash disbursement (an operation similar to withdrawing cash from ATM, just for when these machines are not functional). Banks can not operate as merchant system, for which the POS installed in their agencies can only make cash withdrawals can not accept payments. Theoretically, the customer may withdraw such cash to make payment of the invoice, but such an operation is commissioned as such by not calling card payments segment, which are free.

Romania will very quickly reach a penetration of credit cards as high as in developed countries, where statistics show that per person are about 2.5 to 3 cards in the wallet. On the local cards market, their penetration is currently very low, only 0.6 cards per person, but the market potential is high. Reported active population, every Romanian has 1.2 cards in his wallet. Currently, between 60% and 80% of cards are standard on the Romanian market, being used as a form of payment and cash withdrawal from ATMs, and the rest are part o the Premium cards, including Gold and Platinum cards (Figure 1 and 2).
Figure 1: Evolution of the cards for payments/habita in some Eastern European Countries

Source: www.bnro.ro

All Visa card transactions in Romania increased by 23.2% in number, and 32% in value, while the number of Visa cards increased 5.4% to 6.2 million cards in July 2010 (Figure 3). Also, the Romanians spending at retailers that have a Visa card rose by 43.5%, while the number of transactions of the retailers increased by 42.5%. Percentage of purchases with Visa represented 2.2% of all personal expense this meaning that 1 euro every 45 euros spent in Romania was paid with a Visa card. More than a quarter of Visa transactions were made at retailers in 2010, which is a big step from the previous year, with about a fifth of transactions accounted for card payments in shops.
Figure 2: Evolution of the cards for cash-withdrawals/habita in some Eastern European Countries

Source: www.bnro.ro

In the report of the year (2009 - 2010), 26% of Visa transactions were made to traders, while the volume of expenditure in the Visa stores was 12%. This means a constant success compared to 2008, when merchant transactions represented 22% of total transactions and 11% of the total. The average value of purchase transactions is 45 euros, and at a similar level to 2008. The solid increased of the Visa Europe in Romania was supported by the development of the merchants that accept Visa payment card, where recorded steady increased, reaching a total of 74,479 locations in the whole country, with 23% more compared to 2008. The number of cards issued by banks in Romania amounts to 24.66 million at the end of 2009, according to figures from the National Bank of Romania, however, of these, 22,680,000 were valid and were only 11.45 million active cards
Figure 3. **Evolution of the number and types of cards issuers from VISA and Mastercard**
Source: www.bnro.ro

According to BNR (Figure 3), the number of issuers MasterCard (IFNs) in 2007 was less than 5, keeping the same number for 2008 and in 2009 and early 2010 this figure increased to 5. Regarding Visa (credit institutions) the number of issuers has increased significantly from 24 in 2007 to 27 in 2008, reaching 30 in 2009 and early 2010.MasterCard (credit institutions) had the following evolution: the 20 issuers in 2007, 26 issuers in 2008 and in 2009 and early 2010 a total of 30 issuers. After 13 years of the launching of the first card, in Romania were circulated 21.8 million cards. Regarding the evolution of the number of debit and credit cards, is clearly observed that the flow function has a much higher total number of cards than credit function. Also, debit cards are used in transactions more than credit cards (Figures 4 and 5).
Figure 4 - Evolution of the credit and debit cards in Romania
Source: www.bnro.ro
5 – Evolution of the value of transactions with credit and debit cards

Source: www.bnro.ro

Although BCR ended 2009 with a portfolio of cards below the one of 2008, even fewer signed contracts with merchants to accept, BCR has still ranked first in two indicators (counted seven), being the only issuer that bring this about.
Figure 6. Valid cards evolution in the last decade in Romania (2009 against 2000)

Source: www.bnro.ro

Therefore, regarding the number of ATMs installed and the number of products launched on the market, BCR held first position. Several other banks were market leaders, but only at one criteria: CEC for the number of new cards in circulation – 130.000, Garanti Bank for the number of the POS (2600), UniCredit Tiriac Bank for the number of contracts signed with retailers (over 6400), Transilvania Bank for the number of the open card accounts (117600) and ING for the use of cards, an increase of 6.7 million transactions from the previous year. The crisis did not mean, necessarily, reducing or postponing investment projects but, rather, increase efficiency by reducing unnecessary costs. So it was massive portfolio adjustments by removing those accounts/cards that were inactive and not generating than maintenance costs for banks and traders who did not realize transactions. Figure 6 shows that half of the top 10 issuers - which hold over 80% of the market - signed in 2009 under the 2008 level in the portfolios of valid cards in circulation.

As a business policy, found that banks relied on credit cards have greatly increased acceptance network. The best example is Garanti Bank, an institution that has made the fastest growing credit card portfolio in absolute terms (over 65,000 cards), while tripling the network of traders. We'll see if taking this risk, to credit on card of a population marked by unemployment and pay cuts, will prove a winning card. Regarding utilization, it appears that all issuers have improved performance in 2008. The exception is only Bancpost. Perhaps, after aggregation with

registered credit cards, the result could be comparable to 2008 - which anyway is a great performance, since the card portfolio of Bancpost decreased by almost 300,000 in 2009.
Figure 7. The evolution of the contract signed with the commerciants
Source: www.bnro.ro

From the annual increases related key market indicators cards, it appears that banks expect a change in behavior of the users who ultimately will increasingly exploit the fact that payment to the merchant is not commissioned. Reducing costs is a burning issue for both banks and any family budget. The figures for 2009 show clearly that most investments were made in the development of merchant acceptance, where there is a growth rate of 30%. Basically, the same number of cards, we have the third most merchants where you can make an extremely wide range of shopping (Figure 7).

3. Conclusions

The Romanian cards market has seen growth in the recent years as one of the most active region in all its elements: issuance, dynamic installation of new POS and ATM terminals, volumes of payment transactions or cash withdrawals. Although the first cards were issued to us about 16 years ago, cardholders behavior was still a nascent market, that just 12.5% of transactions are made at merchants (Dedu, Enciu and Ghencea 2008: 45).

The card industry has great potential in the private sector, especially in crisis situations, especially for the survival of SMEs and to finance products on the market. At the population level, there is willingness to replace the payment with cash by electronic payment instruments, especially if there are benefits in use of them (no fees are charged, are offered loyalty programs). In sum, cash payment remains the most commonly used payment method and payment card in stores is becoming more and more appeal to those who resort to this method of payment. However, the benefits of cards are less known by the population, no fees to pay by card in store. The payment of the utilities directly to the ATM is also an interesting option for the customers, and increase from the point of view of the use and the relevance for the customers. Online payments and Internet Banking service are paying less visible ways, and intention to use them in future is lower. Generally, they are perceived as effective and attractive methods, but difficult to use, which inspires little confidence and are less accessible (Radulescu 2007: 137). The crisis was an opportunity on the market cards because, before this moment, the use of these banking products for transactions was at a fairly low level. Banks were not giving much attention to promoting cards and holders were using them only to withdraw money from ATMs. In addition,

the acceptance of these merchant banking products was quite low. However, with the crisis, banks have realized the importance of the cards and begin to invest in infrastructure. Increasingly, many institutions have begun to focus on customer loyalty programs to promote the increased of the use of cards. Overall, 2009 was a good year for specialized market: the number of jobs increased the number of cards and transactions increased. This trend was maintained, in some measure, also in 2010. As a general conclusion, continuous monitoring and adaptation of the market will become necessary. Existing customer is more demanding, more educated and less tolerant in relation to suppliers of all kinds and especially those of financial services.

CAPITAL FLOWS AND THEIR SECTORAL DESTINATIONS

Petriş Sorina
University of Oradea
Facultaty of Economics

Since 2003, New European Union Member States have made large capital inflows, which led to a credit crunch and recession. Whether they are foreign direct investment, or banking flows, capital inflows ultimately affect GDP, depending on how they are invested.

In the specialty literature, analysis of capital flows was done especially in terms of their structure, with a lack of analysis in terms of final destination of capital inflows. Therefore, we analyzed the effect of capital inflows on GDP in the New Member States of the European Union (Bulgaria, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania and Slovakia) over the last economic cycle. Based on experiences of the new Member States during the recent boom and crisis, the paper studies the impact of capital inflows on GDP growth, inflows channeled to economic sectors, such as real estate and corporate investment sector.

The results of this research tries to highlight the extent to which the final destination of capital flows is important for the evolution of GDP.

I.Introduction

Crisis of the new European Union member states shows that sectors where there is capital flows are very important. While many factors have influenced GDP growth during episodes of crisis, growth and sharp decline in capital inflows in new EU member states seems to coincide with GDP growth and sharp decline.

In the last decade before the crisis, capital flows have focused particularly on areas with limited impact on export capacity, leading to economic development focused on sectors producing non-tradables goods, such as: trade, real estate sector, construction. This was a feature specfica for countries in Central and Eastern Europe, especially for new EU member states.

The effect of capital inflows on GDP was influenced by several factors. According to Rodrik and Velasco (1999) and Allen et al. (2002), the major influencing factors were: maturity, currency capital flows, size of capital flows and their transmission channels. Studies of crisis in the new EU Member States indicate that capital inflows into the banking system led to a generous offer of credit and then domestic demand has exploded, which led to large increases in GDP, but these increases were collapsed, with the sudden slowdown in capital inflows.

However, credit growth is not always directly proportional to GDP growth. For example, compared to Romania, Bulgaria had a much higher growth of loans relative to GDP, but the GDP evolution of the two countries was similar, suggesting that other factors may play a role. Capital inflows have led to significant changes in other economic sectors. For example, capital in the real estate market fueled speculative attacks, resulting in high economic growth until the bubble exploded and followed a severe recession.

Whether they are foreign direct investments or banking flows, capital inflows ultimately affect GDP, depending on how they are invested. Foreign capital channeled to the corporate sector affect GDP differently than when it is channeled into real estate sector.

II.Literature review

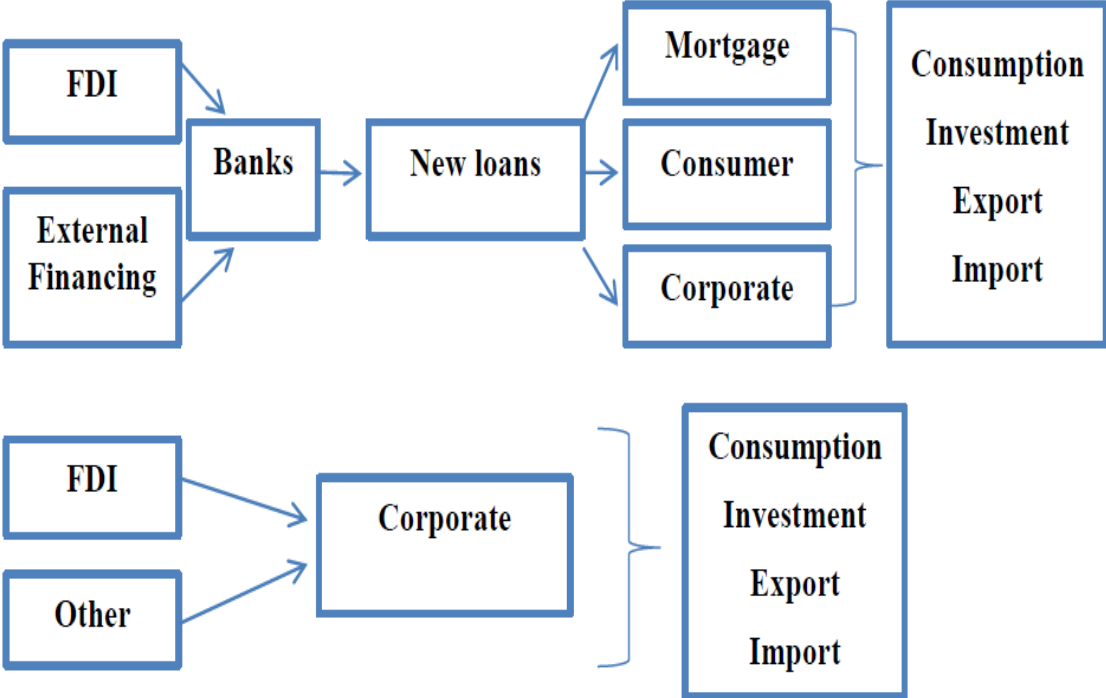
So far, the role of economic sectors, in which capital flows occur, had a limited analysis in empirical research, in financial literature. The positive influence of financial development (often measured as a function of the stock of credit) on GDP is presented in Levine (2005) and Khan

and Senhadji (2003). In recent years, the literature has focused on the impact of credit flows (as opposed to stocks) on GDP.

Cappiello et al. (2010) found a positive relationship, not insignificant, between increased credit flows and GDP growth for the euro area, as opposed to Driscoll (2004), which didn't found similar evidence for the United States of America. From Borensztein et al. (1998), many studies have also found a positive relationship between FDI and economic growth, as summarized in the work of Ozturk (2007). This study contributes to the literature by examining the importance of sectors where there are inflows of bank credit and foreign direct investment.

III The results of the research

Capital inflows have impact on GDP by draining in the economic sectors that affect consumption, investment, exports and imports (Figure 1).

Figure 1. The impact of capital flows on GDP


Source: Mitra, 2011;

The presumption is that capital inflows are directed to:

- Households, through banks, that is offering mortgages and household consumption, so the consumption increase, and therefore GDP. Capital inflows through banks may take the form of FDI, foreign loans and deposits (often the parent bank) in local banks. These flows may have a positive impact on investment - for example, when real estate stocks increase to meet the growing demand in the real estate market.

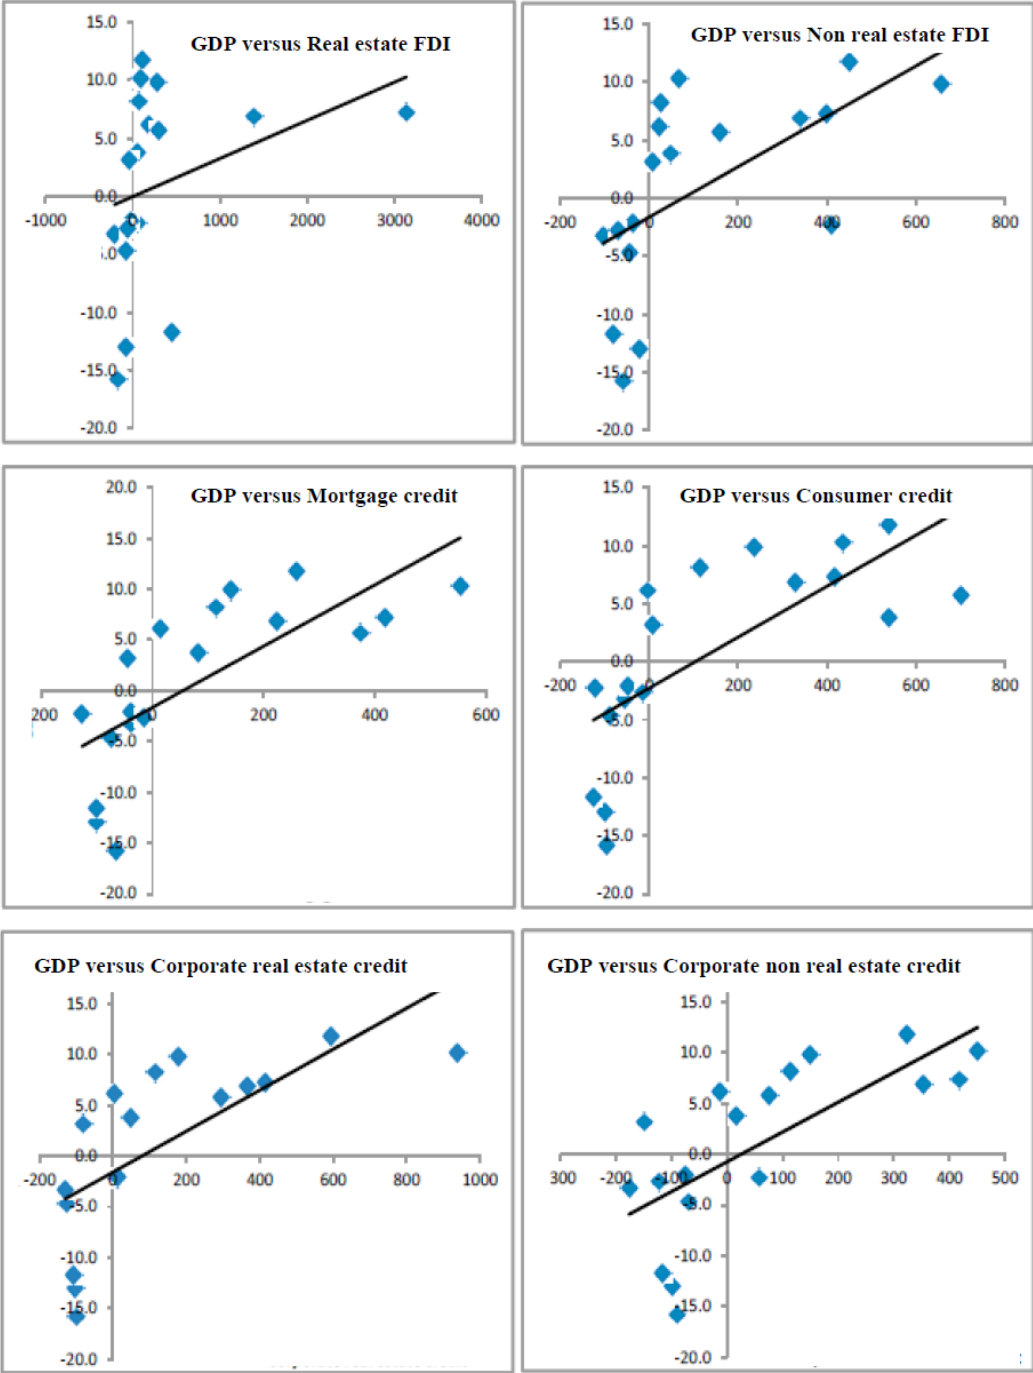
- The real estate properties of the corporate, through bank loans or through foreign direct investment, supporting investment. For example, corporations that build vacation homes, targeting foreigners, have a direct effect on investment, but not on consumption.

- Outside the corporate real estate sectors, both through bank credit and foreign direct investment, increasing investment. Also, exports are positively affected when capital inflows supports investment in export industries (figure 2).

In the analysis, we can detach a few main ideas. Crisis of the new EU member states shows that the sectors where there are capital flows have of great importance. After analyzing the degree that economic sectors, supported by capital flows, had or didn't had an impact on GDP, we noted that large swings in capital inflows in the new Member States coincide with large fluctuations of GDP, there is a proportional relationship . However, these relations depends on the sectors in which there are capital inflows.

Capital inflows in real estate sector seem to have a greater impact on GDP, than in other sectors. In the past seven years, GDP in the new EU member states has been strongly influenced by fluctuations in capital inflows. Most capital inflows consisted of FDI or capital in the banking system, thus fueling credit growth. However, GDP growth is strongly influenced by the destination of capital flows, than by the form of capital inflows.

The empirical analysis shows that capital inflows have been directed towards the real estate sector (in particular through mortgage flows and real estate FDI flows) have the greatest impact on GDP growth. However, this impact is more significant than the impact of capital inflows on growth. However, non-real estate FDI flows have the greatest impact on any single variable. This may reflect one or both FDI flows in non-negotiable, such as restaurants, hotels and retail, which are cycles of consumption or negotiable FDI flows. As the new wave of capital inflows were directed to emerging markets, attention to policies that support flows to production and attention to supporting the growth sectors of the economy, can be useful. Lessons, learned from the recent economic cycle in the new EU member states, can be applied to other emerging markets that have experienced large capital inflows. Although empirical evidence shows that to the capital inflows, fiscal policies have a direct reduced impact on GDP growth, strong fiscal and financial sectors were the key to overcome the experience well from the crisis and to maintain exchange rate stability (Mitra, 2011).

Figure 2. The growth of GDP, credit and FDI flows, during the recent economic cycle, from 9 new EU member states countries: Bulgaria, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania and Slovakia


Source: Mitra, 2011;

In conclusion, there are sectors where capital flows are very important. After analyzing the degree that economic sectors, supported by capital flows, had or didn't had an impact on GDP, have the following results, which we present in the correlation order:

- Highly significant positive correlation between GDP and real estate capital flows;
- Significant positive correlation between GDP and FDI flows in sectors not related to real estate;
- Positive correlation, but less significant flows between GDP and corporate loans and consumer loans;
- Taking into account only the control parameters of the policy, fiscal policy didn't had a significant impact during the recent episode of the economic cycle;
- The exchange rate has no significant impact on GDP growth nor enhances the effects of credit flows and FDI flows on GDP in a given sector.

To reduce fluctuations in GDP growth and to ensure a sustainable growth trend, I think that would be beneficial policies that focus on areas (such as infrastructure and education) to enhance the attractiveness of tradables for capital inflows. Strengthening financial sector supervision and corporate governance in emerging market economies, could also help this process.

IV. Conclusions

Large oscillation in capital inflows in the new EU Member States coincide with large fluctuations of GDP, beeing a proportional relationship. However, these relations depends on the sectors in which there are are capital inflows.

Capital inflows in real estate seem to have a greater impact on GDP than in other sectors. In recent years, GDP in the new EU Member States was strongly influenced by fluctuations in capital inflows. Most capital inflows consisted of foreign direct investment or capital in the banking system, thus fueling credit growth. However, GDP growth is strongly influenced by the destination of capital flows, than by the form of capital inflows.

Capital inflows that have been directed towards the real estate sector have the greatest impact on GDP growth.

CONTROLS ON CAPITAL MOVEMENTS

Petriş Sorina
University of Oradea
Faculty of Economics

Until recently, capital mobility was encouraged across national borders, because it was considered that such capital can seek the highest rate of return. However, recent global financial developments have shown that, due to contagion, the mobility of capital flows can cause severe financial imbalances.
In the context of globalization, liberalization or maintaining controls on capital flows is a current topic, more debated by economists.
This topic is very important, due to the impact of liberalization decision or maintaining controls on capital flows has on the overall macroeconomic framework. The paper analyzes the relationship between capital flows' control and the income per capita, the degree of central bank independence, democracy country, the foreign exchange regime. Also, it analyzes the effectiveness in time of capital controls, taking account of financial system development and potential risks of instability. Over time, it was observed that a period in which they have imposed restrictions on capital movements was followed by a removal of such restrictions, and vice versa. Cyclic change of capital movements regime corresponds to the cyclic evolution of the global economy.
Full capital account liberalization led to the emergence of currency and financial crises, so that the idea of maintaining controls on capital is not rejected by economists. After a full liberalization of capital flows, there is a change in the mentality of an increasing number of economists, who support the maintenance of controls, in a gradual liberalization.

I.Introduction

Liberalization of capital flows is one of the four single market freedoms: free movement of persons, goods, services and capital. Liberalization of capital flows has been undertaken in many countries around the world, the methods used being different.

Periods of restrictions on capital movements were followed by periods of removal of these restrictions, and vice versa.

Thus, the nineteenth-century liberalism was followed by the imposition of severe restrictions on international movement of capital and foreign trade in the interwar period. The post-war period has four distinct phases:

-phase immediately following the end of the war, when they were taken several measures to liberalize capital movements;

-late '60s, when this trend is reversed, and a large number of countries impose new restrictions on capital flows;

-'80s, when orientation changes again to liberalization;

-in 2011, when after the global financial crisis, it was observed that the large capital flows caused severe financial imbalances, thus it seems that the trend is changing, again, to the contrary.

The cyclical change in capital movements regime corresponds to the cyclic evolution of the global economy.

Currency and financial crises arising from full liberalization of capital account have led economists not to reject anymore the possibility of maintaining controls on capital. Thus, the stage of complete liberalization of capital flows is now followed by a phase of maintenance of controls, in a gradual liberalization.

II. The results of the research

Lipschitz, Lane and Mourmouras (2002) believes that "although capital controls can distort inter-temporal allocation of resources and can be used as an excuse to relax macroeconomic discipline, they can provide temporary protection for emerging economies to volatile capital flows, like interbank loans and portfolio investment". Barry Johnston (1998) said that "the full liberalization of capital transactions and transfers does not mean abandoning all rules and regulations related to foreign transactions".

Capital controls are seen as tools used by governments, in order to earn income. Controls limit the residents' ability to direct their funds residents to foreign investment, in order to avoid financial balance domestic inflation (Alesina and Tabellini, 1989). Authorities may raise reserve requirements on domestic financial institutions, thereby reducing the flow of services costs without eroding the rate of inflation. This perspective suggests that most likely controls are used where the domestic financial system is well regulated and reserve requirements can be used to require financial institutions to control public sector obligations. Epstein and Schora (1992), Alesina, Grilli and Milesi - Ferretti (1994), Quinn, Inclan and Toyoda (2001), Milesi - Ferretti and Razin (1998), Bai and Wei (2000), all considered it unlikely to maintain controls in countries where central banks have a high degree of independence.

Most studies show a negative association between controls maintenance and income per capita. Mean, the more developed is the country, the more likely to be removed restrictions on capital flows. In the current period is noted that all countries with high income have already removed controls on capital movement.

Another area of literature examines the association of the controls with the exchange rate regime. Largely, it is recognized that capital mobility increases the difficulty of operating a stable currency. For countries with fixed exchange rates, is unlikely to have an open capital account (Leblang, 1997; Milesi - Ferretti, 1998, Leblang, 1999, Garrett, Guisinger, and Sorens, 2000).

Many economists believe that democracy is positively associated with capital account liberalization (Quinn, 2000; Garrett, Guisinger, and Sorens, 2000). Thus, democracy is seen as a mechanism used to resolve social conflicts, resorting to forced financial repression and inflation. Democracy provides an impetus for recognition of rights, including international economic rights of residents, who have a greater ability to support the removal of restrictions on their investment options (Dailami, 2000).

According to IMF (1999), in the period 1993-1997 were 106 cases that have introduced new controls on capital, the majority of them restricting their most open positions of banks in transactions with non-residents and credit expansion. The reasons are different, or maintain monetary policy autonomy in a fixed rate regime, or limit the volatility of financial markets within a variable course.

Various studies have shown that the effectiveness of controls on capital is limited in time, because there are ways to avoid them (Johnston, 1998). The more developed financial system, the financial intermediaries are easier to avoid some sort of control.

Peter Garber (1998) highlights the risks to avoid prudential controls over capital. He argues that whether a uniform tax on all gross capital inflows, the gross transactions will move offshore and students will eventually apply only net inflows.

Also, if you require different controls that allow investments in shares, but limited short-term investments with fixed interest, then capital flows will enter the path of the least closed. Often, developing countries have preferred a fixed exchange rate regime to control inflation, considering the exchange rate as a nominal anchor for prices. This policy option has its risks, which can be mitigated through controls on capital. In the specific context of fixed exchange rates, capital controls aim is or to improve the effectiveness of monetary policy, or to prevent speculative attacks.

In the mundellian traditional model, the capital controls allow the central bank to hold authority over monetary policy under a fixed exchange rate (Johnston, 1998, Edison and Reinhart, 2001). The cost of capital movement between the host country and the world requires a difference between interest rates in the country and abroad. In particular, a type of aggregate demand crisis, if requires a tax on capital outflows, the central bank may maintain, at least for a time, an interest rate below the international level. Conversely, if the central bank wants to limit capital inflows in an overheated economy, will enter a kind of tax on capital inflows, targeting an interest rate higher than that which would satisfy the interest rate parity condition.

Another issue refers to the controls that want to prevent speculative attacks on exchange rate parity. Incentives for a speculative attack are high: if the attack fails and the central bank manages to defend the parity, the speculator loses only interest for the period, but if the attack succeeds, causing the local currency depreciation, gains can be very large.

To deal with speculative attacks, governments may set ceilings for short-term loans granted by non-resident banks, and limit their interventions term market, they can also limit foreign currency outflows. Offshore markets for its currency, which generally escapes supervision of the central bank, should be closed. These are emergency measures, compared with prudential measures that are used in normal times (Edison and Reinhart, 2001). During the Asian crisis, Malaysia has introduced such emergency measures.

In the context of flexible exchange rates, capital controls motivations differ. Currency fluctuations are usually associated with loss. By imposing a cost on capital inflows and outflows in the short term in a flexible exchange rate regime, can achieve greater stability in capital flows. However, there are risks that cannot be neglected in the fact that reduced volatility of flows can cause high volatility of asset prices (stocks, exchange). Perhaps, controls on capital transfers adjustment costs from quantity to prices (Calvo and Rodriguez, 1979).

If monetary policy is exclusively dedicated to maintaining price stability, the country can only rely on fiscal policy to counter a negative demand shock. However, according to traditional mundelliane analysis, assuming perfect capital mobility, fiscal policy in a small open economy is completely ineffective in a flexible currency regime: any increase in public spending increases the interest rate, rate is estimated and the net exports fall. At the end of adjustment, additional deficit induces a current account deficit further, without real impact. In this context, a tax on capital inflows will limit their volume, will moderate the appreciation and could support a counter-cyclical fiscal policy effectively (Dăianu ed., 2002).

Regardless of the currency regime, capital inflows cause real appreciation of national currency. Net capital inflows have counterbalance the trade deficit. If the trade deficit is used to finance value investment projects, should not be any cause for concern. However, if foreign saving serves financing the budgetary deficit, consumption of imported goods or speculative real estate investments, things can be different. How the two destinations cannot be separated (and even if they could, financial intermediaries would find ways to avoid), it is very difficult to achieve selective controls to prevent speculative flows, but to support good investments (Dăianu ed., 2002).

In general, economists that have conducted empirical research tend to agree that, the controls that are intended to reduce the aggregate capital inflows were not very effective, but have contributed to changing the structure of foreign flows for long-term financing (Montiel and Reinhart, 1999).

Recent financial crises and financial instability reveals major risks that may be associated with short-term capital investments. Economic policy measures, which seek to limit this type of investment seem attractive lately.

One of these measures is the introduction of the Tobin tax. James Tobin, Nobel laureate for economics, suggested that any international transfer of capital would be subject to a small ad valorem taxes and the fees to be inversely proportional to the duration of the investment. For example, a fee of 1% (which means 2% for the round-trip of a particular capital) is equivalent to

an annualized 27% tax, if the funds are only one month in the country, than a fee of 0.2% annualized, if funds are 10 years. Tobin viewed this measure as a means of limiting the mobility of capital, which would allow the central bank to regain a degree of control over monetary policy, in a fixed exchange regime. Note that this tax penalizes both inflows and outflows of capital. Therefore, it may be helpful in reducing the aggregate flows, but not necessarily net flows. However, for a developing country, with little capital outflows, a Tobin tax would reduce the net volume flow.

Another measure of short-term investment is the establishment of the unpaid discriminatory reserve requirements. This measure affects only the capital inflows, not the capital outflows. It is generally imposing different reserve requirements for banks lending to nonresidents, and can be extended to any type of capital. Usually, the regulations define these reserves as a percentage of borrowed capital and impose a minimum interval of time for these deposits. So, stocks are not necessarily the same duration as the loan of which have been established. Reservations are unpaid, so involves an opportunity cost. This can serve to reduce capital inflows, on the whole, or to change the structure of capital inflows, if the distinction between different maturities of financing. Introducing this form of capital control implies an increase in domestic interest rate and a decrease in the forward premium, which could arise from a sharp depreciation of the exchange rate.

If you want to remove all capital inflows, this measure will be applied indiscriminately. If you want to discourage short-term inflows, it may be a short period of deposits in reserve (about one year). Thus, with higher external loan maturity, with the lower cost that the measure it induces the debtor.

As noted, the Tobin tax and deposit formation unpaid, for a year, for any investment, may discourage short-term funding. If short-term loans become more expensive, other forms of financing, such as foreign direct investment (FDI) become more attractive. Do not forget, however, that foreign investors may demand a higher risk premium for long-term loans. In this case, debtors could assume short-term financing risks, than to face a lack of funding at an interest rate that seems reasonable to them (Rogoff, 1999).

III. Conclusions
- Inverse relationship between maintenance checks and income per capita. Mean, how the country is more developed, the more likely to be removed restrictions on capital flows.
- Unlikely to maintain control in countries where central banks have a high degree of independence.
- Democracy is positively associated with capital account liberalization.
- Effectiveness of capital controls is limited in time, because there are ways to avoid them. The more developed financial system, the financial intermediaries are easier to avoid some sort of control.
- Existence of risks, in the case of avoiding prudential controls over capital.
- Regardless of the currency regime, capital inflows cause real appreciation of national currency.
- Overall, controls that intended to reduce the aggregate capital inflows were not very effective, but have contributed to changing the structure of foreign flows in favor for long-term funding.
- Recent financial crises and currency instability reveals major risks that may be associated to short-term capital investments. Measures to limit this type of investment: Tobin tax, unpaid discriminatory to hold minimum reserves.
- After a full liberalization of capital flows, there is a change in the mentality of an increasing number of economists, who support the maintenance of controls, in a gradual liberalization.

THE INFLUENCES OF INFLATION ON THE MONETARY POLICY INTEREST

Popa Coralia – Emilia
University of Craiova, Faculty of Economics and Business Administration

In the context of sovereign debt crisis in Europe, a crisis entirely felt also in the direct relation between credit institutions, the National Bank of Romania (NBR) adopted a monetary policy strategy meant to determine the reinforcement of its image, by initiating in the autumn of 2011 a new series of reduction of the monetary policy interest rate and implicitly the appropriate resizing of liquidity conditions. By increasing the role of liquidity adjustment, the European Central Bank (ECB) succeeded to determine in the money market the decrease of interbank rate interests under the interest rate level of monetary policy.

The direct inflation targeting strategy used by the European Central Bank in applying its monetary policy has the first criterion of implementation the expression of inflation target in terms of „headline inflation" (consumer price index - CPI) given that the economic market in Romania is familiar with this indicator. Also, the main criterion considered by the investment segment of the market to achieve capital infusions in economic transactions is represented by the consumer price index, this one ensuring the necessary transparency related to the effects of inflation phenomenon. A strong argument supporting the use of consumer price index in monetary policy is represented by its upward flexibility towards the limited effectiveness of monetary aggregates in sizing inflationary anticipations.

The downward slope of inflation phenomenon, in whose depreciation the evolution of consumer price index, whose positive trend surprised the European Central Bank, played a significant role, determined adjustments in the monetary policy strategy of the National Bank of Romania and at the same time the achievement of the inflationary target proposed with a direct effect on the monetary policy interest rate.

The same measure to reduce the key interest rate is outlined in the monetary policy of the European Central Bank and it is mainly due to the decrease of inflation phenomenon, although at the end of 2011 important quantities of liquidities were introduced in the financial system. It remains to be analysed to what extent the inflation phenomenon will be possible to manage under the conditions of the renewal of economic instability in the euro area and to which direction this aspect will influence the monetary policy of the National Bank of Romania.

Keywords: inflation, monetary policy, interest rate, monetary policy strategy, CPI
JEL Codes: E31, E42, E52, E58, E63

Introduction

The formal nature of the subject proposed should lead us to a strict analysis of the result of the National Bank of Romania monetary policy after getting over a year, respectively 2011, which exceeded positively the inflation forecast.

In other words, the monetary policy strategy of NBR, respectively targeting inflation had the expected efficiency while the positive response of the real economy, even unexpected in relation to the forecast came to support this strategy.

To what extent the tendency to respect the inflation forecast is sustainable, NBR explains us in the *Inflation Report in February 2012* which includes a more or less relevant analysis of the evolution of inflation in the last year, but synthetic, instead, effective leverages of the analysis of forecast compliance are given only in terms of monetary policy proposals, although as we can see the trend rate of monetary policy is in decline.

On the other hand, with reference to the NBR arguments we are somehow prompted to analyse this decrease, starting with 2nd November 2011 from 6,25% to 6,00% of monetary policy rate and compared to the onsumer price index evolution which at the beginning of 2012 , respectively until March enrolled to a slightly descendent trend.

The credibility of NBR forecasts was slightly shaken by the positive evolution of real economy, but not on the downside, only anticipatively, which determined an immediate reaction of the

European Central Bank in the sense of decreasing the monetary policy rate. We can see thus in the NBR reaction a decisive influence generated by the inflationary phenomenon.

The risks to which we submit in terms of actual inflation need to be treated in the light of euro area, an area where intermediate forecasts are in terms of a moderate recession with signs of stabilization given that the inflation weighted 2, 3% in European Union (EU) and 2,1% in the euro area. It is not insignificant that in this area the forecast was scaled upward due to higher energy prices.

Regarding this matter and the strategy of monetary policy in the euro area the Commission Vice President responsible for Economic and Monetary Affairs, Olli Rehn (2012) declared: „*Although the growth observed recently is stagnating, the European Economy gives signs of stabilization. The overall economic sentiment indicator remains low, but the tension in financial markets began to decline. Many of the key measures were taken to ensure the financial stability and to establish the necessary conditions for the sustainable growth and the creation of jobs. If we take decision actions, we can overcome the situation and move from stabilization to economic growth and employment.*"

Highlights of monetary policy strategy in view of National Bank of Romania and The European Central Bank

The monetary policy practiced over the last seven years by NBR starting with 2005 was based on the declared strategy of inflation targeting. This strategy aims clearly the consumer price stability by respecting a proposed inflation target.

Although the final objective of monetary policy under this approach is the consumer price stability, the intermediate or operational objective is to meet the inflation target in the amount self-imposed or imposed by the government, a key element of this strategy representing the specification of target inflation.

Basically the purpose of monetary policy is to stabilize consumer prices regardless the monetary mass in circulation, the target being the level proposed and accepted of inflation, taking into account the fact that the presentation of inflation forecast allows the controlling of tendencies and inflation expectations and, on the other hand, the real situation of a significant time lag between increasing the amount of money in circulation and accelerating inflationary trends. NBR adopted and maintained a relatively distinct condition in the European Central Bank strategy basically to apply its monetary policy, both before and after Romania entered the EU and which firstly gives a central role to its coin when applying its policy, considering that by controlling monetary mass we can avoid the long-term inflationary phenomenon and secondly, a secondary role in stabilizing prices in the euro area through an assessment of their progress.

It is true that the markets where the two banks perform their duties – NBR and ECB – are differentiated by not using the same monetary standard and the forecasts about the phenomenon of inflation are apparently inconsistent, however, due to the possibility of free movement of goods and services in the European Union, the consumer price index connects the policies practiced by the two institutions.

As we can observe from the evolution of the consumer price indexes, these are used as significant benchmarks in determining the development of inflationary phenomenon while the control policy of inflation and achievement of inflationary threshold in NBR determined the correlation of interest rate with the trends identified in real economy.

The inflation target projected in NBR is to maintain the inflation rate at 3% for 2012 and 2, 5 % for 2013 while the European Commission report estimated that in 2012 the inflation rate of Harmonized Consumer Price Consumer (HCPI) will be of 2, 3% in UE and 2, 1% in euro area.

The evolution of monetary policy interest rate and consumer price index in inflation report

Coming back to monetary policy instruments used by NBR in the strategy that aims to achieve its forecasted inflation threshold we can clearly notice that the monetary policy rate plays a

significant role, its reporting to the inflation being the decision support in the operations used by NBR on the money market.
Chart no 1. Forecasted inflation and interest rate of monetary policy (projection 2012)

Source: National Institute of Statistics (INSSE), projection of NBR in the speech "Targeting the inflation. Quarterly inflation", report – February 2012, Mugur Isărescu - NBR Governor

Also this comparative report of the interest rate of monetary policy to inflation determines the inflation target proposed by the European Central Bank.

For the main open market operations of the National Bank of Romania, which are currently one week repo operations, conducted by fixed rate tender interest, the interest rate is the interest rate of monetary policy.

Also, starting with May 2008 the amount of interest of permanent facilities – deposit facility and credit facility – granted by the National Bank of Romania is circumscribed a margin of +/- 4% with the interest rate of the monetary policy.

It is obviously that the repo operations should be carried within a week because they create the early intervention of the European Central Bank over the level of the interest rate of monetary policy in case the interventions in meetings establishing the exchange rate does not produce the desired effect.

Table no 1. Interest rates of monetary policy and permanent facilities

(% p. a.)			
Valid from:	**Monetary policy**	**Credit facility**	**Deposit facility**
30 March 2012	5.25	9.25	1.25
3 February 2012	5.50	9.50	1.50
6 January 2012	5.75	9.75	1.75
3 November 2011	6.00	10.00	2.00
5 May 2010	6.25	10.25	2.25
30 March 2010	6.50	10.50	2.50
4 February 2010	7.00	11.00	3.00

(% p. a.)			
Valid from:	**Monetary policy**	**Credit facility**	**Deposit facility**
6 January 2010	7.50	11.50	3.50
30 September 2009	8.00	12.00	4.00
5 August 2009	8.50	12.50	4.50
1 July 2009	9.00	13.00	5.00
7 May 2009	9.50	13.50	5.50
5 February 2009	10.00	14.00	6.00

Source: National Bank of Romania

Also as we have shown the inflation impact is given by the evolution of CPI in the same extent that the sizing of ECB is done in relation to the *Harmonised Index of Consumer Prices.*

Table no. 2. Consumer price index for March 2012 totally and on groups of goods and services and the interest rate of inflation

	March 2012 towards:			The averate rate of inflation between 1I- 31III	
	February 2012	December 2011	March 2011	2012	2011
Total	100,42	101,42	102,40	0,5	0,7
Food goods	100,64	102,18	99,06	0,7	1,4
Non food goods	100,32	101,12	103,93	0,4	0,5
Services	100,20	100,70	105,40	0,2	-0,1

Source: INSSE Press release no 85/10.04.2012
Chart no 2. The average unfixed rate of CPI on 12 months
Source: INSSE Press release no 85/10.04.2012

So CPI inflation is closely connected to the evolution of the interest rate of monetary policy used by the European Central Bank in its monetary policy strategy.

Source: The press release of the European Commission: "Intermediate forecasts for the euro area: a moderate recession with stabilizing signs", Brussels, 23.01.2012

Conclusions

The behaviour of the evolution of the interest rate of monetary policy relative to inflation and the fact that the European Central Bank applied a significant correction of this rate following the economy reaction and resizing the real inflation positively led us to realize this analysis.

It must thus consolidate the credibility of the NBR as through the signals of the market, inclusively through establishing an interest rate of monetary policy related to an inflation target strictly forecasted, we can determine the reinforcement of the image of real economy and the development of investment sector.

Through his messages and his goals the NBR will be able to create an accurate picture over the inflationary trends and also over the viability of long-term investment.

The enlargement of investments due to the accurate determination of inflationary expectations generates successive increases in consumption of goods and services and also relocation of available manpower.

LENDING IN FOREIGN CURRENCY AND CURRENT CHALLENGES AT EUROPEAN LEVEL

Roman Angela
"Alexandru Ioan Cuza" University of Iasi, Faculty of Economics and Business Administration

Şargu Alina Camelia
"Alexandru Ioan Cuza" University of Iasi, Faculty of Economics and Business Administration

In recent years, most countries in Central and Eastern Europe, Member States of the EU, that we selected for the analysis (Bulgaria, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania) have recorded a significant expansion of lending in foreign currency, which was one of the major factors of the accelerated growth of loans to economy. Such developments have led to an increase of indebtedness in foreign currency of the non-financial private sector, especially of the households and of the accumulation of major macroeconomics and financial imbalances.

The extremely negative implications of lending in foreign currency on financial stability in most countries under review, outlined clearly in the context of the current crisis, determined the focus of the policymakers concern, both at European and national level, regarding the issue of foreign currency loans, which became one of the most discussed issues on the agenda of the monetary-financial authorities.

The aim of our research is to comparatively underline, based on the example of the panel countries, a few stylized facts about lending in foreign currency, and also the main factors which determined the growing share of loans in foreign currency, the risks for financial stability generated by the loans denominated in foreign currencies and the challenges that arise for the monetary-financial authorities, both at national and European level, in the current context and in the post crisis period.

The methodology used in our paper starts with an extensive literature review in order to underline the importance of the research theme approached. The analysis is based on information and statistical data provided mainly by the official statistics of the ECB, IMF, EBRD, Raiffeisen Research, different reports, studies and researches.

Through the content of our research we want to underline the crucial importance of a rigorous monitoring of the foreign lending activities undertaken by the central banks and the supervisory authorities in order to limit the risks and to ensure the financial stability at EU level.

Key words: foreign currency loans, New EU member states, risks, tools, financial stability
JEL code classification: G21, E44, E51

1. Introduction

In the pre-crisis period, most countries from Central and Eastern Europe, Member States of the EU (Bulgaria, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania), taken in the analysis, experienced a rapid expansion of lending in foreign currency, which was assessed (Unicredit 2011: 19), as one of the engines of the powerful economic growth because without domestic long-term financing sources of local banks and high domestic interest rates, the use of international funding in foreign currency by the domestic banks have supported local economic growth. On the other hand, foreign currency lending has become a source of instability by feeding the unsustainable economic growth and also the consumption boom.

Extremely negative implications of lending in foreign currency on financial stability in most countries under review, outlined clearly in the context of the current crisis, determined the focus of the policymakers concern, both at European and national level, regarding the issue of foreign

currency loans, which became one of the most discussed issues on the agenda of the monetary-financial authorities.

The aim of our research is to comparatively underline, based on the example of the panel countries, a few stylized facts about lending in foreign currency, the main determinants of the growing share of loans in foreign currency, the risks for financial stability generated by the loans denominated in foreign currencies and the challenges that arise for the monetary-financial authorities, both at national and European level, in the current context and in the post crisis period.

The rest of the paper is organized as follows: *the second part* is dedicated to a literature review; *the third part* reflects a few stylized facts about lending in foreign currency and the main determinants of growing share of loans in foreign currency; *the fourth part* discuss the main risks generated by the expansion of lending in foreign currency and current challenges faced by the policymakers, at national and European level. Our study ends with concluding remarks.

2. Literature review

Lending in foreign currency, the determinants and the risks which they present to financial stability were the subject of numerous studies. Thus, Basso, Calvo-Gonzales and Jurgilas (2007) have argued in the performed analysis, on the example of the 24 countries with economies in transition, that the main determinants of lending in foreign currency was the dollarization of loans to the private sector, the presence of foreign banks that had an easy access to external financing and the interest rate differential between local and foreign currency instruments. In a similar way, Rosenberg and Tirpak (2008) using panel regression analysis for the period 1999-2007 show, on the example of new member states from the European Union and Croatia, that between the main factors that caused a significant increase in foreign currency loans was the interest rate differential between loans in domestic and foreign currency and the extent to which lending is based on funding from abroad rather than domestic deposits.

In the study realized by Csajbók-Andras et al. (2010) in which they analyze household foreign currency borrowing in 10 new EU Member States, the authors confirm among the determinants of lending in foreign currency, the importance of the interest rate differential and exchange rate volatility, and also add as a determinant of the foreign currency loans, the institutional features of bank lending, such as the prevalence of variable versus fixed rate loans.

The study realized by Zettelmeyer, Nagy and Jeffrey (2010) on the example of emerging Europe highlights as the main determinants of lending in foreign currency, which are also the best predictors on the share of lending in foreign currency, inflation volatility, the differential between local currency and foreign currency interest rates and foreign financing of domestic banks.

Another significant issue addressed in the literature in this area regarding foreign currency loans refers to the role of the monetary policy in limiting growth of these types of loans. Thus, besides the mentioned authors there are other authors such as Sirtaine and Skamnelos Sirtaine (2007), Hilbers et al. (2006), Brzoza-Brzezina et al. (2010) which showed that foreign currency loans can be problematic for central banks, in terms of a restrictive monetary policy in order to limit excessive credit growth which may lead to increased foreign currency denominated loans.

Our paper complements the specialized literature on the approached subject, in particular, by highlighting and discussing current issues of high interest for policymakers, both at national and European level regarding lending in foreign currency.

3. The dynamic of lending in foreign currency and its determinants

Extremely rapid growth, expressed through two digits, of loans to economy and the majority share of loans in foreign currency was a significant common feature of financial intermediation for all countries analyzed in the study, except the Czech Republic and Poland. In agreement with the literature (ECB 2010a: 162) it seems that there is a strong link between rapid growth of loans

and lending in foreign currency. The data in Fig. no. 1 shows that the countries where there were recorded the highest rates of growth of loans to the economy (i.e. especially Romania, the Baltic countries and Bulgaria, where the average yearly growth rate was about 51%, over 42% and respectively over 38%) are those where foreign currency lending has a majority position. Therefore, we can say that foreign currency lending was a significant determinant of bank lending accelerated growth in most analyzed countries.

Regarding foreign currency lending as a share of total lending (see Fig. no. 1), we remark with reference to 2008, that the countries considered in the study are distributed between two extremes, as follows: at the upper extremity are Latvia and Estonia, where the share of loans in foreign currency was of 88% and 86%, and at the lower end is Czech Republic with a share of loans in foreign currency only of 14%. Between these two extremes lie Lithuania, Hungary, Romania and Bulgaria where the share was above 50%, while in Poland the share was 34.4%.
Source: Own calculations based on data provided by ECB, 2008, 2010b, IMF, Country Reports, Raiffeisen Research, 2010

Fig. no. 1: The relationship between loan growth and foreign currency lending (as a share of total lending)

The dominant position of foreign currency lending in most of the analyzed countries is the result of the action of several factors related to both supply and demand (ECB 2010a: 162; National Bank of Poland 2010: 42). Among this factors stands out in particular: on the supply side, financial market liberalization and the increase share of foreign capital on domestic banking markets, which have contributed to increased competition in banking markets and reduced domestic saving which stimulated the increased funding from international markets; in terms of demand of loans, a significant contribution to the expansion of foreign currency lending had the spreads between the interest rates for foreign currency-denominated loans and the interest rates for domestic currency-denominated loans, and also the exchange rate policy, which especially in countries with particularly currency board arrangements has encouraged borrowers to contract foreign currency-denominated loans because the foreign exchange risk was perceived to be small compared with the countries with flexible exchange rate arrangements.

The significant presence of banks with foreign capital on domestic markets and easy access to international financing, particularly through funding from foreign parent banks had a significant contribution to the expansion of foreign currency lending. Also, easy access of banks to foreign capital determined the more rapid increase of credit expansion compared with the domestic deposits, issue revealed by the loan-to deposit ratio, which in 2008 stood at over 100% in all countries, except the Czech Republic where banks have greater independence from external funding. Based on these claims, but also on the data in Fig. no. 2 we remark the manifestation of certain significant direct link between lending in foreign currency on the one hand, and the asset share of foreign banks, and loan-to deposit ratio, on the other hand.
*measured by the asset share of foreign banks and by loan-to deposit ratio.

Fig. no. 2: The relationship between the expansion of foreign currency lending and the dependence of banking sector on foreign capital*

4. The risks generated by foreign currency lending and current challenges

Compared with domestic currency-denominated loans, foreign currency-denominated loans involve a significant additional risk for both borrowers and lenders and the whole financial system, respective the volatility of exchange rates. Under the depreciation of national currency there is recorded an increase of the value of credit in national currency, which can have major negative implications on financial stability given that many of the borrowers do not obtain regular income in foreign currency or they are not protected from exposure to foreign exchange risk (as is the case of households and SMEs). The significant depreciation of the domestic currency means an increase of the value of debt in domestic currency, which leads to the deterioration of the ability of unhedged borrowers to repay their debt and implicitly to the deterioration of the portfolio of bank loans. In this context, it may increase the losses from loans of the banks; reduce interest income and higher provisions. Therefore, in addition to credit risk, the banks are exposed also to earnings risk.

Another major risk that can be generated by the expansion of lending in foreign currency is the risk of financing (ESRB 2011), which may increase while the banks are financed significantly from international markets, rather than retail deposits. The significant reliance on foreign funding of local banks and the manifestation of significant vulnerabilities in countries where banks have their parent banks can lead to major risks in host countries.

Foreign currency lending has major negative implications in terms of financial stability, in particular by increasing bank exposure to real estate market trends, while the foreign currency-denominated loans have a risky share in the housing loan portfolio, like the countries taken in the study, except the Czech Republic.

The expansion of lending in foreign currency and the macroeconomic and financial vulnerabilities recorded in most countries under review determined the policymakers and regulatory authorities to take, during the pre-crisis period, a series of measures, which focused in particular on offer so that foreign lending to be less attractive for banks. Such measures have resulted, in particular (Brown and Lane 2011) in higher risk weights, provisioning or reserve requirements depending on banks' FX exposure, cross-border supervisory intervention, and monitoring FX risk. In terms of demand, only some countries (notably Poland) have adopted reduction measures targeted in this regard, such as the obligation for banks to inform borrowers on the risks posed by foreign currency loans and tightening of eligibility criteria for such loans. But, overall, the efficiency of these measures was limited; especially if we consider that in the analyzed countries full capital mobility is a reality.

In the context of the crisis in most analyzed countries has been a deterioration of the economic and financial situation of the private non-financial sector, a depreciation of national currencies and increased exchange rate volatility, lower asset values, particularly of the housing, so that some unhedged borrowers could not honor their foreign currency debts, which led to a rapid deterioration in loan portfolio quality and a high percentage of bad loans, especially in Latvia, Lithuania and Romania, with a significant negative impact on the profitability of banks. On the other hand, it is surprising that in most analyzes countries foreign currency indebtedness of the private non-financial sector and especially of households, remains at a high level, fact that may threaten financial stability. These facts highlight the need to focus the efforts of policymakers to adopt new measures to limit lending in foreign currency, and especially the vital importance of the adoption of uniform measures at European level to limit the risks of foreign currency loan growth and increasing resistance in the EU financial system.

The major negative issues that may arise from lending in foreign currency in the analyzed countries, in terms of financial stability at the EU level, have determined the establishment of The European Bank Coordination – Vienna Initiative, a working group, that focus on lending in foreign currency analysis. The report prepared by the Working Group, entitled "Report by the Public-Private Sector Working Group on Local Currency and Capital Market Development" promotes as key measures to limit lending in foreign currency: the reduction of foreign currency lending to unhedged borrowers, developing local capital markets and stimulation of domestic savings.

Also, in terms of concerns for financial stability in the EU and given the systemic risks that may have the high level for lending in foreign currency, The European systemic Risk Board (ESRB) has published in October 2011 a list of seven recommendations, addressing to the EU member states, the national supervisory authorities and the European Banking Authority, in order to prevent excessive lending in foreign currency of unhedged borrowers, by improving the provision of information to borrowers regarding risks and to improve the solvency of borrowers. Regarding the effects of the recommendations made by The European Systemic Risk Board (ESRB) is still early to be able to make judgments because the Member States should, in general, implement the recommendations by December 2013, and the ESRB will monitor their progress by applying the "Comply or explain" (Fiorante 2011).

Under the present circumstances, we may state that the central banks and supervisory authorities are faced with new challenges related to the high share of foreign currency-denominated loans, given the limited domestic savings level. Thus, the authorities should channel their efforts towards designing and implementing solutions meant to develop national currency markets, to strengthen the cooperation with the authorities in the countries of origin of foreign banks, and also to thoroughly promote awareness raising campaigns among households on the risk of foreign currency over-indebtedness. Also, if we consider the significant deterioration of the quality of bank loans portfolio in some of the countries surveyed (especially in Latvia, Lithuania and Romania), we can say that a major challenge for the banking sector is "the cleaning" of the bank loans portfolio in order to ensure the recovery of lending.

Conclusions

In recent years, the extremely rapid growth, expressed through two digits, of loans granted to economy and the largest share of loans in foreign currency was a significant common feature of the financial intermediation in all the studied countries, except the Czech Republic and Poland. In agreement with the literature our paper reflects, based on statistical data, a strong relationship between loans rapid growth and lending in foreign currency, which entitles us to say that foreign currency lending can be considered as an engine of loans growth in most analyzed countries.

The expansion of foreign currency lending in most countries included in our sample was mainly due to the easy access of the banks to external financing, the spreads between the interest rates

for foreign currency-denominated loans and the interest rates for domestic currency-denominated loans and exchange rate policy from some countries, which encourage borrowers to contract foreign currency-denominated loans.

The extremely negative implications of lending in foreign currency in terms of financial stability in most countries under review, outlined clearly in the context of the current crisis, caused the focalization of the interest of policymakers, both at European and national level, to the adoption of new measures, particularly at European level, that will allow the prevention of excessive lending in foreign currency, and therefore limit its risks.

In the current context, we can say that the central banks and the supervisory authorities should target their efforts towards designing and implementing solutions meant to develop national currency markets, to strengthen the cooperation with the authorities in the countries of origin of foreign banks, and also to thoroughly promote awareness raising campaigns among households on the risk of foreign currency over-indebtedness.

Our research has some limitations related to at least the restrictions on statistical data.

In our future research, we aim to develop the issue of foreign currency lending, especially in terms of analytical approach of risks associate to foreign currency loans and the efficiency of the new measures proposed in the current context at European level to limit lending in foreign currency and to ensure financial stability.

OWNERSHIP CONCENTRATION AND CORPORATE GOVERNANCE DISCLOSURE – THE CASE OF FINANCIAL INSTITUTIONS

Ştefănescu Cristina Alexandrina
Babeş-Bolyai University Cluj-Napoca, Romania
Faculty of Economics and Business Administration

Disclosure and the quality of corporate governance system are more often appreciated as closely related concepts - the higher the level of transparency, the better the quality corporate governance practices. As regards disclosure, if in a widely held company (ownership dispersion) its role is to signal that the managers are acting in the best interests of the principals, in a highly concentrated company (ownership concentration), it comes to annihilate the conflicts of interest between "insiders" (controlling shareholders and managers) and outside investors.

Basing on this background, we focused on corporate governance disclosure, analyzing possible influences over it coming from corporate governance dimensions. Therefore, the objective of our paper is to identify possible associations between corporate governance features and the level of disclosure through annual reports in case of banking institutions listed at London Stock Exchange focusing on ownership concentration.

Most empirical studies that have tested the correlation between ownership concentration and the level of disclosure reached to a negative relationship (Barako et al., 2006; Tsamenyi, et al., 2007; Haniffa and Cooke, 2002; Huafang and Jianguo, 2007; Patelli and Prencipe, 2007; Chau and Gray, 2002; Cooke, 1989). However, there are also studies that could not find any association (Arcay and Vazquez, 2005; Ghazali and Weetman, 2006; Holm and Scholer, 2010; Parsa, et al., 2007; Baek, et al., 2009; Makhija and Patton, 2004; Depoers, 2000). Basing both on assertions supported by the agency theory that companies with concentrated ownership do not have to rely on external disclosures to the same extent as companies with dispersed ownership, as well as on most prior empirical findings that provide evidence in this respect, we proposed the following hypothesis:

"(H): There is a negative association between ownership concentration and the extent of disclosure".

The research methodology used for achieving our goal is based on econometric analysis using statistical tools - correlations for identifying the relationships and regressions for assessing them - all of these being performed using SPSS software. In this respect, firstly, we developed a disclosure index made of three sub-indices, one for each type of disclosure: mandatory, recommended and voluntary.

The results of the performed analysis reveal significant negative influences of ownership concentration on the level of disclosure, thus confirming our assumptions that the extent of disclosure is negatively associated with ownership concentration. Thus we can assert that the higher the dispersion of shareholders, the higher the level of transparency, our results being consistent with some general prior literature findings on the same topic (e.g. Barako et al., 2006; Tsamenyi, et al., 2007; Haniffa and Cooke, 2002; Huafang and Jianguo, 2007; Patelli and Prencipe, 2007; Chau and Gray, 2002; Cooke, 1989).

Unlike prior research studies which were focused on similar goals - to test possible influences of corporate governance features over the level of corporate governance disclosure at companies level, our paper provides a particular approach on a specific business field, the banking one that was little explored on this topic before. Thus, we had the chance to enrich the research literature with this empirical study, whose disclosure index developed ensures it as well with originality.

Keywords: corporate governance, disclosure, ownership concentration, banking, UK
M10, G30

1. Introduction

The lack of transparency and disclosure was often considered as one of the major cause of the latest corporate scandals and governance failures, adversely affecting public confidence in the reliability of corporate and financial reporting, too. Thus, while we assisted at a "wake-up" for better corporate governance and transparency all over the world, these also became one of the most attractive, dynamic and challenging research subject.

Moreover, disclosure and the quality of corporate governance system are more often appreciated as closely related concepts - the higher the level of transparency, the better the quality corporate governance practices. Basing on this background, we focused on corporate governance disclosure, analyzing possible influences over it coming from corporate governance dimensions. Therefore, the *objective of our paper* is to identify possible *associations* between *ownership* features and the level of *disclosure* through annual reports in case of *banking institutions*.

Unlike prior research studies which were focused on similar goals - to test possible influences of corporate governance features like board of directors size and independence, CEO duality or various ownership' features over the level of corporate governance disclosure at companies level, our paper provides a particular approach on a specific business field, the banking one that was little explored on this topic before, focusing on one of the most important attribute of corporate governance – *ownership concentration*, thus adding value to research literature on this field.

2. Literature review and hypotheses development

Due to the separation of ownership and control, there is a likelihood of agency conflicts (Jensen and Meckling, 1976) and the probability to incur is higher when shares are widely held than when it is in the hands of a few (Fama and Jensen, 1983). Also, the agency costs of equity are higher where a company's shares are being held by a relatively small number of shareholders (Friedland, 2003).

Thus, diffuse ownership structure yields higher information asymmetry, while information asymmetry is negatively related to corporate disclosures (Warfield et al., 1995). According to the agency theory, in a diffused ownership situation, firms increase disclosure by providing additional information to signal that the managers are acting in the best interests of the principals, in order to reduce information asymmetry, and thereby agency costs.

Consequently, ownership diffusion is appreciated as a required feature for a good corporate governance mechanism, at least from the following reasons: the impossibility of shareholders to influence company's reporting practices (Zeckhauser and Pound, 1990); each shareholder's intention to scrutinize managerial performance, thereby improving corporate governance (Coulton et al. 2003).

In case of a concentrated ownership, the situations becomes more complicated because since managers pursue their own interest, higher management shareholding would imply a larger sharing of the loss, and ultimately, a lower possibility that management would lower corporate value (Jensen and Meckling, 1976). Also, in this case, conflicts of interest are not between managers and shareholders, but between large and small shareholders (Shleifer and Vishny, 1997). When ownership control is high enough to ensure its position, management has the incentive to behave against the interests of other smaller shareholders because of its strong voting power to appoint someone it trusts to be CEO, directors and/or board chairman (Morck, et. al., 1988). Besides expropriating minority interests directly, these controlling shareholders can enrich themselves through connected party transactions in which profits are transferred to other companies they control (Chau and Gray, 2010).

According to prior studies, ownership concentration appreciated as an issue of bad governance, mainly due to:

- the ability and motivation of large stockholders to monitor their interests directly (Shleifer and Vishny, 1997). Thus, it is considered easier for fewer shareholders to voice an opinion to which management will be forced to listen (Yeoh and Jubb 2001);

- the direct access to the information by dominant owners (Cormier et al. 2005). Thus, in a concentrated ownership environment, the flow of information is affected which in turn reduces corporate transparency and increases agency costs (Fan and Wong, 2002). This may lead to increased demands for organizational information that can be used to monitor management (Gelb, 2000).

Ownership concentration appears to be closely linked to managerial ownership. As prior literature reveal, in case of ownership concentration, outside ownership can help reduce agency conflicts because they have the power and incentive to prevent expropriation by insiders (Shleifer and Vishny, 1997) and the extent of voluntary disclosure proved to be higher (Morock 1988), as well as the organizational performances (Gavrea and Stegeran, 2011).

Most empirical studies that have tested the correlation between ownership concentration and the level of disclosure reached to a negative relationship (Barako et al., 2006; Tsamenyi, et al., 2007; Haniffa and Cooke, 2002; Huafang and Jianguo, 2007; Patelli and Prencipe, 2007; Chau and Gray, 2002; Cooke, 1989). However, there are also studies that could not find any association (Arcay and Vazquez, 2005; Ghazali and Weetman, 2006; Holm and Scholer, 2010; Parsa, et al., 2007; Baek, et al., 2009; Makhija and Patton, 2004; Depoers, 2000).

As regards disclosure, if in a widely held company (ownership dispersion) its role is to signal that the managers are acting in the best interests of the principals, in a highly concentrated company (ownership concentration), it comes to annihilate the conflicts of interest between "insiders" (controlling shareholders and managers) and outside investors.

Basing both on assertions supported by the agency theory that companies with concentrated ownership do not have to rely on external disclosures to the same extent as companies with dispersed ownership, as well as on most prior empirical findings that provide evidence in this respect, we proposed the following hypothesis:

H: There is a negative association between ownership concentration and the extent of disclosure.

3. Research methodology

The sample of our paper is made of all credit institutions listed on London Stock Exchange (46 banks according to the information available for the 2011). Data collection was based on information provided by banks' websites, the process being divided into two parts. Firstly, we measured the level of disclosure by using a checklist developed in this respect. For this, we used banks' annual reports for year 2010 by downloading them from their websites. Secondly, we collected data related to banks' governance system by searching in addition through their financial statements and general information provided by their website.

Because the main purpose of our study is to identify possible associations between corporate governance dimensions and the level of disclosure, two sets of dependent and independent variables for performing the correlation analysis are needed.

Thus, for measuring the level of disclosure, which is *the dependent variable*, we made use of a Disclosure Index (TD) especially developed in this respect that mainly consists of three sub-indices, each of them measuring a different type of disclosure, namely: *mandatory (MD), recommended (RD) or voluntary (VD)*. These indices measure the extent of each type of disclosure, being calculated as a ratio of the total number of items disclosed to the maximum possible number obtainable for each category of disclosure. Thus, we compiled three separate lists of disclosure, namely:

- a checklist of *mandatory disclosures* for entities listed at London Stock Exchange, based on the most recently Corporate Governance Disclosure Checklist (Delloite, 2011), considering The Listing Rules and The UK Corporate Governance Code, as well as the recently requirements

supplemented by The Disclosure and Transparency Rules on Audit Committees and Corporate Governance Statements (2008), The Revised Version of the Turnbull Guidance on Internal Control (2005), The Guidance on Audit Committees (2010). This checklist comprises 44 items divided into six main categories of information related to general aspects, leadership, effectiveness, accountability, remuneration and relation with shareholders;

- a checklist of *recommended disclosures* based on OECD Principles, which propose that the corporate governance framework should ensure that timely and accurate disclosure is made on companies' "financial situation, performance, ownership and governance" (OECD, 1999). This checklist comprises 51 items divided into four categories, according to the disclosures required by the principles, as follows: rights of shareholders and key ownership functions, equitable treatment of shareholders, disclosure and transparency, responsibilities of the board;

- a checklist of *voluntary disclosure,* based on the Standard & Poor's list of 98 transparency and disclosure questions used for its study developed for Europe in 2003. This checklist comprises 88 items divided into three categories outlining ownership, company performance and boards (governance). This approach of developing the disclosure index was often used in prior studies aiming on the same goal (Mangena and Tauringana, 2007; Tsamenyi, et al., 2007; Aksu and Kosedag, 2006).

After joining the three separate checklists, a final checklist of 142 items was structured, basing on S&P's study, into 4 main categories: *general provisions (2), ownership structure and investor rights* (43), *financial transparency and information disclosure* (46), *board structure and process* (78). This was supplemented with 8 additional items used in at least one previously published study focused on the same topic and 15 own items, thus resulting a comprehensive checklist list of 167 items consisted of 31 mandatory, 54 recommended and 82 voluntary disclosures.

For developing the disclosure index each item of the checklist was scored using *binary classification*, each issue from the list being treated a dummy variable, where "1" indicates that the annual report discloses the information and '0' indicates that there is not disclosed any information about that issue. The disclosure index was computed using an *un-weighted scoring approach* of the disclosure items, basing on the assumption that each item of information disclosure is of equal importance in the corporate information users' decision-making process. The main reason to do so is related to the subjectivity that might occur when different weights are assigned to reflect the importance of certain types of information. Our approach is supported by most prior studies aimed to develop such an index of disclosure, unlike weighted scores, which were rarely used before (Barako et al., 2006; Cheng and Courtenay, 2006; Patelli and Prencipe, 2007). *The independent variables* consists of one of the most controversial attribute of corporate governance that was widely debated in researchers' world and, according to prior studies proved to have significant influences over the level of disclosure – *ownership concentration (O_Conc)*, measured through the percentage of shares owned by the majority shareholder.

4. Empirical findings

For testing our hypothesis firstly we performed a correlation analysis between each dependent variables – disclosure indices (TD, MD, RD and VD) and the corporate governance attribute tested – *ownership concentration (O_Conc)*, whose results are detailed in Table 1.

Table 1. The correlation matrix between variables

		TD_Index	MD_Index	RD_Index	VD_Index	O_Conc
TD_Index	Pearson Correl.	1	,788[**]	,944[**]	,893[**]	-,555[**]
	Sig. (2-tailed)		,000	,000	,000	,000
MD_Index	Pearson Correl.	,788[**]	1	,694[**]	,513[**]	-,556[**]
	Sig. (2-tailed)	,000		,000	,000	,000

RD_Index	Pearson Correl.	,944[**]	,694[**]	1	,765[**]	-,495[**]
	Sig. (2-tailed)	,000	,000		,000	,000
VD_Index	Pearson Correl.	,893[**]	,513[**]	,765[**]	1	-,450[**]
	Sig. (2-tailed)	,000	,000	,000		,002
	N	46	46	46	46	46
Correlation significant at the 0.01 level / *. Correlation is significant at the 0.05 level						

Source: own results using SPSS software

Basing both on assertions supported by the agency theory that companies with concentrated ownership do not have to rely on external disclosures to the same extent as companies with dispersed ownership, we hypnotizing that

H: There is a negative association between ownership concentration and the extent of disclosure

Pearson coefficient values reveal the existence of a negative correlation between variables tested, having a medium intensity (0,555 in case of total disclosure) and a probability of 99% (Sig. <0,01). Correlation analysis provide a stronger positive correlation in case of mandatory disclosure (0,556), while recommended and voluntary disclosures proved to be less associated with ownership concentration (0,495, respectively 0,450). Moreover, according to the linear regression results presented in table 2, the significant negative correlation of medium intensity and a probability of 99% (Sig. <0,01) identified between variables tested (0,555 in case of total disclosure) is explained in 29,2% of cases.

Table 2. Linear regression analysis results

Coefficients[a]						
		Unstandardized Coeff.		Standardized Coeff.		
Model		B	Std. Error	Beta	t	Sig.
1	(Constant)	66,689	3,251		21,130	,000
	O_Conc	-,249	,056	-,555	-4,427	,000
R Square: .308 Adjusted R Square: .292				F value: 19.597 F significance: .000		
a. Dependent Variable: TD_Index						

Source: own results using SPSS software

Medium intensity associations with the same significance were identified in case of disclosure sub-indices, too, Pearson's values being between 0,450 in case of voluntary disclosures and 0,556 in case of mandatory ones.

In conclusion, our hypothesis will be accepted and consequently we could state that the extent of disclosure is negatively associated with ownership concentration in case of banking institutions listed on London Stock Exchange system, being thus consistent with the prior research findings.

5. Conclusions

The relationship between various attributes of corporate governance and the level of disclosure was a highly debated topic of worldwide research, whose outcomes are mixed. Irrespective of prior studies, which were focused on corporate governance features like board of directors size and independence, CEO duality or various ownership' features, analyzing their possible associations at companies level, our study comes to add value to corporate governance literature by testing one of the most controversial corporate governance attribute – ownership concentration in banking sphere. Thus, because banking system was little explored on this topic before, we had the chance to enrich the research literature with this empirical study, whose disclosure index

developed ensures it as well with originality. The results of the performed analysis reveal negative relationships between ownership concentration and the level of disclosure. Thus we can assert that the higher the dispersion of shareholders, the higher the level of transparency. Our results are consistent with some general prior literature findings on the same topic (e.g. Barako et al., 2006; Tsamenyi, et al., 2007; Haniffa and Cooke, 2002; Huafang and Jianguo, 2007; Patelli and Prencipe, 2007; Chau and Gray, 2002; Cooke, 1989)

Finally, being aware of our study's limitations, coming from the sample of banks, the limited number of factors and the fact that only one year data were considered for analysis, we are appreciating these as a challenge that give us outlooks for future research.

ACCOUNTING PRACTICES FROM FINANCIAL INSTRUMENTS DISCLOSURE PERSPECTIVE – THE CASE OF ROMANIAN BANKING SYSTEM

Ştefănescu Cristina Alexandrina
Babeş-Bolyai University Cluj-Napoca, Romania
Faculty of Economics and Business Administration

International harmonization and convergence of accounting had gradually become one of the most challenging topic of worldwide research and a very hot debated issue in practitioners' sphere, too. Several studies have addressed both formal and material accounting harmonization along time, a wide range of instruments have been developed and various statistical tools have been used in this respect. Basing on this background, we focused our attention on Romanian banking system which is now experiencing a great challenge by finally entirely adopting IFRS after the first step from 2005 when consolidated financial statements in accordance with IFRS were required and the second one from 2009 when informative individual financial statements under IFRS begun compulsory.

Therefore, the objective of our paper is to empirically measure and compare the levels and progress of material accounting harmonization in Romanian banking sector focusing on financial instruments and their related disclosure requirements.

First studies conducted in the measurement of harmonization practices (Nair and Frank, 1981; McKinnon and Janell, 1984; Doupnik and Taylor, 1985) started at the beginning of the 80's, but were merely descriptive, focused on examining how IAS had been adopted in various countries around the world. In the earliest 90's, there were developed the first instruments for measuring material harmonization, namely the concentration indices (H, C and I Index) (Van der Tas, 1988; 1992) and various other forms of these (Archer et al., 1995), which were widely used in various research studies (Herrmann and Thomas, 1995; Aisbitt, 2001; Taplin, 2004).

Basing on these measurement tools and cconsidering the main aim of our study – to measure material accounting harmonization in Romanian banking sector – we stated four hypotheses, thus trying to answer our questions: "Are the accounting practices related to financial instruments disclosure in Romanian banking system harmonized with international requirements? Was there a progress in this respect in the latest years?"

The research methodology used for achieving our goal is based on both static and dynamic analysis using appropriate statistical tools – concentration indices (H or Herfindahl index) for measuring the improvements in financial instruments' disclosure practices,, thus pointing out the degree of material harmonization reached step by step as well as the overall progress. In this respect, firstly, we developed a disclosure checklist structured on three sections dealing with financial instruments' general disclosures, derivatives and hedge accounting and risk disclosures.

The results of the performed analysis reveal that accounting practices in Romanian banking sector as regards disclosures related to financial instruments experienced a continuous improvement both at individual and consolidated level, but the level of material harmonization is still relatively moderate. In case of individual financial reporting this can be explained by the recently introduced requirement of preparing financial statements in accordance with IFRS and only for informative purposes. Thus, by now we can talk about a real material harmonization just in case of consolidated financial reporting.

Unlike prior research studies which were focused on similar goals - to measure accounting harmonization around the world, our paper provides a particular approach on a specific business field, the banking one that was not separately explored on this topic before. Thus, we

considered for analysis its related accounting practices focusing on financial instruments disclosure, which is a particular issue, too, thus enriching the research literature on this field.
Keywords: disclosure, financial instruments, IFRS 7, banking, Romania

1. Introduction

International harmonization and convergence of accounting had gradually become one of the most challenging topic of worldwide research and a very hot debated issue in practitioners' sphere, too. Several studies have addressed both formal and material accounting harmonization along time, a wide range of instruments have been developed and various statistical tools have been used in this respect, but, anyway it has been argued that the assessment of the extent of measurement harmonization itself is not sufficient to determine the overall level of harmonization of accounting practices.

The aim of our study is to empirically measure and compare the levels and progress of material accounting harmonization in Romanian banking sector focusing on financial instruments and their related disclosure requirements. The reason of choosing financial instruments for assessing the extent of disclosure harmonization derives from the economic sector upon which we focused our analysis, namely the banking one, financial instruments being the most representative in any bank's activity. Thus, our analysis comprises both a horizontal and a vertical study providing an overall image upon the development of accounting practices in banking sector along time, beginning with the year 2009, trying to answer the following questions: *"Are the accounting practices related to financial instruments disclosure in Romanian banking system harmonized with international requirements? Was there a progress in this respect in the latest years?"*

For achieving our goal we selected all credit all credit institutions running their activity in our country, where information needed were made publicly available on their official websites, thus including into our study only 7 banking institutions that prepare and publish their financial statements at consolidated level and 15 banking institutions were individual financial statements in accordance with IFRS requirements were available. The reason of choosing the period 2009-2011 for performing our analysis is based on the National Bank of Romania's decision of requesting informative financial statements in accordance with IFRS for all credit institution. Consequently, if until then we should include in our sample only those banks that prepared consolidated financial statement, thus providing just a partial image about material accounting harmonization, after the year 2009, not only the scope of our analysis became wider, but also the conclusions are more representative, providing a comprehensive image upon the preparedness of Romanian banking system to apply IFRS.

Unlike prior research studies which were focused on similar goals - to measure accounting harmonization around the world, our paper provides a particular approach on a specific business field, the banking one that was not explored on this topic before. Thus, we considered for analysis its related accounting practices focusing on financial instruments disclosure, which is a particular issue, too, thus adding value to research literature on this field.

2. Literature review and hypotheses development

Material harmonization is a research where a wide variety of studies have been conducted along time aiming to examine accounting practices especially within the European Union (EU) and the Association for South-East Asian Nations (ASEAN) (Van der Tas, 1988; Emenyonu and Gray, 1992; Van der Tas, 1992; Archer et al., 1995; Herrmann and Thomas, 1995; Archer et al., 1996 Krisement, 1997), but also in the Nordic countries (Aisbitt, 2001), Japan or Australia (Tarca, 2004).

First studies conducted in the measurement of harmonization practices (Nair and Frank, 1981; McKinnon and Janell, 1984; Doupnik and Taylor, 1985) started at the beginning of the 80's, but

were merely descriptive, focused on examining how International Accounting Standards had been adopted in various countries around the world.

In the earliest 90's, there were developed the first instruments for measuring material harmonization, namely the concentration indices (H, C and I Index)(Van der Tas, 1988; Van der Tas, 1992) and various other forms of these (Archer et al., 1995), which were widely used in various research studies (Herrmann and Thomas, 1995; Aisbitt, 2001; Taplin, 2004). As time pass by, new researchers came to enrich accounting literature through comparative analysis of harmonization measurement instruments (Morris and Parker, 1998) or additional tests for measuring the significance of results achieved by using already existing indices (Canibano and Mora, 2000).

Most of these studies aiming to measure material accounting harmonization have been focused almost exclusively on quantifying differences in financial reporting practices between countries, without considering for the analysis any other characteristics of sampled used, namely firms' operating circumstances, such as sector of activity, size, performances or international listing.

Later, applied statistical methods such as: entropy based methodologies (Krisement, 1997) and log linear models (McLeay, et al., 1999; Jaafar and McLeay, 2007) have been used in material harmonization's studies.

Consequently, the results of this studies allows us accepting the tentative conclusion that "rather than a process of convergence, a combination of structural factors at the firm level that demand different accounting treatments and barriers to harmonization at the country level that restrict choice are the likely causes of persistent international differences in accounting" (McLeay, et. al, 1999).

Considering the main aim of our study – measure and compare the levels and progress of material accounting harmonization in Romanian banking sector focusing on financial instruments and their related disclosure requirements – we stated the following hypotheses:

(H1): Accounting practices from financial instruments disclosure perspective are closer to IFRS requirements at consolidated level compared with individual level

(H2): The improvement of accounting practices from financial instruments disclosure perspective in accordance with IFRS was greater at individual level compared with consolidated level

(H3/4)There has been a continuous increasing trend in improving accounting practices from financial instruments disclosure perspective in accordance with IFRS at consolidated level (H3), respectively at individual level (H4)

3. Research methodology

For achieving our goal, firstly we made a list of disclosures required by international regulations dealing with financial instruments, namely IAS 32, IAS 39 and IFRS 7, considering as well the "Disclosure checklist" used by Big Four for assessing the level of applicability of IFRS. The checklist developed ("*Financial instruments related concepts checklist*") comprises a total of 50 items to be disclosed, grouped into three separate sections related to financial instruments' general disclosures (S1), derivatives and hedge accounting (S2), financial instruments' risk concepts (S3), a brief description of these being presented below:

- the first section (S1) mainly refer to *general concepts related to financial instruments*, the accounting policies for these instruments, their main categories of classification, specifications related to reclassifications of financial instruments, reconciliation of the allowance account for credit losses (bad debts), defaults or breaches on loans payable and acceptance of financial assets as pledged or held as collateral;

- the second section (S2) dealing with *derivatives and hedge accounting* mainly refers to the general concept of derivatives and the specific concept of compound financial instruments with multiple embedded derivatives, hedge accounting and its three possible types: fair value hedge, cash flow hedge and hedges of net investments in foreign operations;

- the third section (S3) comprises *disclosures related to risks associated to financial instruments* as the followings: exposure to various risks (credit, market and liquidity risk), concentrations of risk, collateral for risks and various types of analysis related to these risk such as: quality analysis (past due / impaired assets), maturity analysis, sensitivity analysis or "value-at-risk" analysis.

For performing the proposed analysis we used appropriate statistical tools (concentration indices), thus, trying to asses the improvements in disclosure practices by reference to international accounting rules. Accordingly, the *research methodology* used, dealing with numbers and based on adopting statistic analysis for drawing our conclusions is a *quantitative* one, while the interpretation of results reached shows its *qualitative* side. Form the temporal criteria, our empirical analysis provides both static and dynamic results, thus describing the progress achieved in disclosure practices related to financial instruments in Romanian banking system for the past three years.

Considering the purpose of our study – to provide a comprehensive overview of the major improvements in financial instruments' disclosure practices in case of Romanian banking sector by pointing out the degree of material harmonization reached step by step as well the overall progress, we chose *H index (Herfindahl index)* for measuring the level of harmony achieved.

The *H index (or Herfindahl index)* is the first indicator developed by Van der Tas (1988) and used in formal accounting harmonization studies, whose values range between 0 and 1. The "0" value reveals a disharmony state, while the "1" value refers to a perfect harmony because all banking institutions in the sample are disclosing the required issues. The degree of *material (de facto) harmonization* will infer to the extent of comparability. Thus, it was pointed out that there is no benchmark for an acceptable level of harmony for the values between "0" and "1" (Emenyonu and Gray; 1992). Consequently, for result interpretation, generally, the larger the value of concentration, the higher the harmonization level achieved.

4. Empirical findings

For accepting or rejecting our hypotheses we proceeded at determining the concentration index both at individual and consolidated level for period analyzed – the years 2009 and 2010. A synthesis of the H (Herfindahl) Index reached by processing data collected using Excel software is presented In Table, followed by an analysis of results reached.

Table 1 Comparison analysis based on H (Herfindahl) Index

LEVEL:	Consolidated			Individual		
TOPICS:	2009	2010	Dif.	2009	2010	Dif.
Financial instruments - general disclosures	0.614	0.676	*0.062*	0.446	0.480	*0.034*
Derivatives & Hedge accounting	0.532	0.616	*0.084*	0.274	0.364	*0.090*
Risk disclosures	0.663	0.678	*0.015*	0.442	0.486	*0.044*
TOTAL	0.603	0.657	*0.054*	0.387	0.443	*0.056*

Source: own results

Because at the *first stage* of our analysis we proposed to provide just an overall image of Romanian disclosure practices in banking system by reference to IFRS requirements we will focus only on general results achieved on both individual and consolidated level. Thus, as H Index values from the total line of the table reveal we can conclude that even if there is a relatively moderate level of harmonization concerning disclosure practices on both levels, consolidated financial statements provide more disclosures (indices higher than 0,6 on both periods analyzed). Consequently, our first hypothesis (H1) can be accepted. We expected such a result considering that just beginning with the year 2009 all banking institutions were required to prepare their financial statement in accordance with IFRS, too, and only for informative purposes. Thus, their interest in providing the most comprehensive image of their activity was not

their purpose, these sets of financial reporting being just a practice for the real adoption of IFRS beginning with this year. Going further from the static to the dynamic analysis, we expected a greater improvement in case of individual financial statements because these were the newest ones required in accordance with IFRS and usually when you are preparing something from the second time it will certainly be better than the first time. Even if the results achieved are in our consent, thus our second hypothesis (H2) being as well accepted, unfortunately the values did not reached up our expectations, the improvement at individual level (0,056) being just slightly higher than at consolidated one (0,054).

The *second stage* of our analysis goes into details, not only by presenting the results separately for the two considered levels, but also by dividing the accounting practices from financial instruments disclosure perspective into three separate topics according to the sections of the checklist developed for collecting data. When focusing on *consolidated level*, the H index values reveal an increase form one period to another for each of the three topics considered. The highest improvement was recorded in case of disclosures related to derivatives and hedge accounting (0,084), while risk disclosures associated to financial instruments experienced the lowest evolution (0,015). However, transparency on risk information seemed to be the highest one in 2010, H Index reaching the maxim value of all (0,678). Considering the above mentioned issues we appreciate that our third hypothesis (H3) can be accepted. At *individual level*, the results reached are quite similar but an a low scale, considering the lowest level of harmonization in disclosure practices achieved by now due to the newly requirement of preparing financial reporting under IFRS. Thus, while highest improvement was recorded in case of disclosures related to derivatives and hedge accounting (0,090) similar to the above analysis, the lowest evolution appeared to be in case of general disclosures related to financial instruments (0,034). As regards the highest level of transparency ensured by individual financial statements, the values of H Index reached up to 0,486 for risk disclosures. Consequently, we are finally able to accept our last hypothesis (H4), too.

In conclusion, at both levels we identify an improvement in accounting practices related to financial instruments disclosures, which is a good sign for the "real" adoption of IFRS in Romania beginning with the year 2012. However, when looking in depth at the values reached we can assert that there is a relatively moderate level of harmonization in financial instruments' sphere, so further steps have to be taken for increasing transparency.

5. Conclusions

Accounting harmonization in Romania proved to be a difficult process with major implications in theoretical and practical approach. Banking sector is somehow special in this respect because beginning with this year international standards became mandatory for all credit institutions. Conducting an empirical study in this field is not only a topical issue, but also allowed us enriching the related literature with results from an area that was not explored before in this respect.

Aiming to provide an overall image of material accounting harmonization process in Romanian banking sector for the last years, we focused our attention on issues related to financial instruments appreciating them as "the mirror" of banking activity. Three major topics have been considered for our analysis, comprising items beginning with general disclosures of financial instruments, followed by special disclosures about derivatives and hedge accounting and finally ending with risk information disclosures.

Based on our empirical findings and considering the analysis performed for accepting or rejecting the four research hypotheses formulated, we can conclude that accounting practices in Romanian banking sector as regards disclosures related to financial instruments experienced a continuous improvement both at individual and consolidated level, but the level of material harmonization is still relatively moderate. In case of individual financial reporting this can be explained by the

recently introduced requirement of preparing financial statements in accordance with IFRS and only for informative purposes. Thus, by now we can talk about a real material harmonization just in case of consolidated financial reporting. By briefly analyzing the main topics that followed in our study we can conclude that transparency of risk information seemed to be the highest one at both levels, even if it experienced the lowest evolution of all. Also, we identified the highest improvement in case of disclosures related to derivatives and hedge accounting at both levels, too.

In conclusion, accounting for banking sector followed a positive trend meant to achieve its main goal – the convergence to international standards. By adopting IFRS beginning with the year 2012 for all banks, we can assert that the National Bank of Romania succeeded to take one more step ahead in this respect after the first one from 2005 when consolidated financial statements in accordance with IFRS were required and the second one from 2009 when informative individual financial statements in accordance with IFRS begun compulsory. Anyway, through the conclusions reached, our paper could be considered as valuable for a wide range of users: academics, researchers, practitioners for both public and banking sector.

COMPARATIVE STUDY OF OWN FUNDS IN THE BANKING SYSTEM

Tesu Ramona
Babes - Bolyai University of Cluj - Napoca, Romania
Faculty of Economics Science and Business Administration

The present article has as a reserch field theoretical, methodological and practical aspects of the own funds, taking into account the line-up attempts of the romanian banking system to the requirements of the European Union, materialised in the Basel Agreement. The objectives of the research theme, presented in this paper, are mainly oriented towards own funds. We also proposed the following secondary objectives: presenting the concept approaches concerning own funds, emphasysing the tipology of own funds and pointing out their purpose in the banking activity; presenting and analyse the evolution of the own funds in Romania, for a period of 8 years (2004-2011). Even though the actual stage of the research in this field is advanced, in the romanian and foreign literature which dedicate a lot of theoretical and empiric studies concerning own funds. In our study we will use a theoretical and a practical research. The theoretical research describes the laws, reglementations and rules of application in the banking field in our country. In the practical part we will use as a research method the quality-comparative analyse by presenting details regarding bank back-ups. Despite the global financial crisis, the Romanian banking system can be considered as stable as a whole, with levels of capitalization, solvency and liquidity in accordance with consistent with prudential requirements. Tier 1, defined as the core of their sources of credit institutions through the permanent criteria, payment flexibility and capacity to absorb losses continued to overwhelmingly support a total equity. Appropriate quality of own funds is on their structure. The most important component frame our capital plus capital frame attached. The second component in terms is still represented by legal reserves. An important challenge for banks was to maintain a level of own funds accordance, in the conditions witch they were eroded by the current period losses. Tier 2 support rate of about 20 percentages of total equity and subordinated debt were the main components and revaluation reserves. Re-evaluation reserves have preserved funding contributions to Tier 2. An for evaluation of the level of capitalization of credit institutions, the central bank uses solvable indicator, as the only indicator currently regulated for this purpose. It also provides banks in Romania at the conditions for additional capital requirements related to Basel III framework to be taken by the European regulatory Capital Requirement Directive IV. As a final conclusion of the research in the own funds field we want to mention and express our opinion that the methods and techniques of managing risk, calculation of capital need permanent revision and adaptation to the changes that take place on the financial market the appearance of Basel Agreement 3, which are absolutely necessary in the actual economic and financial context. The presentation of concrete cases concerning the bank back-ups represent the personal work which completes the study concerning the analysis of managing banking risks, the role of bank back-ups in the bank capital adequacy mechanism.
Key Words: capital adequacy, own funds, Tier 1, Tier 2, Basel 3
JEL Classifications: G2/G21

I. Introduction

The present article presents the common problems of the credit institutions, introducing theoretical aspects and also practical aspects of applying a model and of interpreting risk situations, considering the attempts of alignment of the Romanian banking system to the requests of the European Union, materialized in the stipulations of Basel Accord. Considering the scientific research methodology, the following issues were set: introduction, motivation, importance and scientific research methodology, objectives, development of the article, estimated scientific results. In the introduction is being argued the research theme, the necessity and the importance of it. In the present economic-financial context, the fluid character which often brings major differences of opinion. The motivation of choosing the research theme is formulated and further the used research methodology is being presented. In the scientific research methodology, there are presented the scientific research areas, the field and the objectives of the scientific

research, and also its structure. The present research is based on a deductive approach - strictly qualitative. For analyzing all the data I used the following research methods: comparative method, document analysis, external observation. I choose this subject for scientific reasons and realistic reasons. I consider that Romania' chances, on the road to the European integration in globalization, firstly depend on its own performance, the quality of management at all levels. Romania's efficient integration within the above mentioned context cannot be achieved otherwise than through a performance superior to that already existing. The necessary performance can be achieved only with a advanced, new, modern management, with good results of own funds in the banking system.

The objectives of this study are characterization of the own funds of the Romanian banking sector, evolution of the own funds in the Romanian banking sector between the years 2004-2011 and interpretation of this evolution of the own funds in the banking system.

II. Literature review

Even though the stage of research in this field is advanced, in both romanian and foreign literature, which dedicate a lot of theoretical and empiric studies to bank own funds and their implication in the bank capital adequacy mechanism, in this moment the international crises pointed out the purpose and implications of credit institutions in the financial field.We had and we have ways to approach these problems. We want, in the allocated space, based on those already presented, to refer to the „own funds in the banking system". Referring to the literature in the field , a very useful starting for our research is the series of works developed under BIS (Bank for International Settlements engl. "central bankers' central bank, which controls the vast global banking system, with precision a Swiss watch"), economic and monetary department making a series of tests in the banking system in emerging economies in order surveillance developments The conceptual, bibliographical main support is represented by the books like „Performance and risk management in commercial banks in Romania" by Eugenia Ana Matis, Home Book of Science Publisher, Cluj-Napoca, 2009 and „Financial-accounting management of the risks in the banking activity" by Cristina Palfi, Risoprint Publisher, Cluj-Napoca, 2009 and of course, the legislation. I have been used due to their importance, new character and desire to be largely and deeper known and especially used in the scientific research and in the practical activity.

III. Research design and methodology

Considering the scientific research methodology, the following issues were set: introduction, motivation, importance and scientific research methodology, objectives, development of the article, estimated scientific results. In the introduction is being argued the research theme, the necessity and the importance of it. In the present economic-financial context, the fluid character which often brings major differences of opinion. The motivation of choosing the research theme is formulated and further the used research methodology is being presented. In the scientific research methodology, there are presented the scientific research areas, the field and the objectives of the scientific research, and also its structure. The present research is based on a deductive approach - strictly qualitative. For analyzing all the data I used the following research methods: comparative method, document analysis, external observation. I choose this subject for scientific reasons and realistic reasons. I consider that Romania' chances, on the road to the European integration in globalization, firstly depend on its own performance, the quality of management at all levels. Romania's efficient integration within the above mentioned context cannot be achieved otherwise than through a performance superior to that already existing. The necessary performance can be achieved only with a advanced, new, modern management, with good results of own funds in the banking system.

The objectives of this study are characterization of the own funds of the Romanian banking sector, evolution of the own funds in the Romanian banking sector between the years 2004-2011 and interpretation of this evolution of the own funds in the banking system. For analysis of national or international data, we used comparative longitidunal research method (showing the evolution of bank own funds in our country).

IV. Results and discussions
1. Own funds in the banking system
In Romania there is now a modern and competitive banking system, which provides circulation of the economy and domestic supplies banking products and services in accordance with trends in the European banking sector. The conceptual framework, the notion of equity is the residual interest in assets of an entity that remains after deducting liabilities. The term is also known as the wealth of shareholders or owners of the property. Bank capital can be defined as money terms of obligations to individuals and businesses who participated in the constitution. This includes all funds at its disposal a permanent (sustainable) and consists of written contributions as shareholders, related raw capital, reserves, grants, subordinated debt, provisions, benefits carried over from previous years. In the banking sector, the concept of equity capital accounting differs in that it includes some sources provided by the international banking regulations, taken over current profit for the year, and other elements assimilate. Federal Reserve Board of Governors, highlighted four important functions of bank capital: to protect uninsured depositors in insolvency and liquidation; absorption of unanticipated losses, at a rate sufficient to maintain confidence in the bank; purchase of basic equipment for banking services; restriction in regulatory terms, the undue expansion of assets.

We describe the level 1 an 2 own funds of credit institutions. A special attention is being given to the evolution of own funds on a period of 8 years: 2004-2011. According to the actual reglementations (Regulation BNR and regulation CNVM no. 18/23/2006 on own funds of credit institutions and investment firm, approved by Order BNR and CNVM no. 15/2006, published in Official Gazette no 1034?27.12.2006), the own funds of credit institutions are made of: level 1 own funds; level 2 own funds. Level 1 own funds represent a part of own funds and contain: poured and subscribed social capital, with the exception of cumulative preferential actions or the endowement capital made available for the branch in Romania by the credit institution from the third country;Capital bonuses, cashed,afferent to social capital; legal back-ups and other back-ups and also the positive result of prior financial exercises, which remain after the distribution of the profit according to the Stockholder General Meeting. Level 2 own funds contain: base level 2 own funds; additional level 2 own funds.

2. The evolution of own funds in the banking system
Components of own funds must be used at any time and priority to absorb losses, do not involve fixed costs for the credit institution and be effective at its disposal, that are fully paid. An adequate level of capitalization indicators for credit is a guarantee for financial system stability, since they are most important component of the Romanian financial market. The capitalization terminated

Credit institutions directly capacity to absorb shocks or losses arising induced exogenous domestic and international macroeconomic framework or practices inadequate risk management related endogenous banking.

(Sursa: proiecția autorului pe baza Rapoartelor anuale ale Băncii Naționale a României, Secțiunea Statistică)

Capital remains the most dynamic element of equity, another important component of which is represented by current year net profit. In the composition of additional capital, there is trend in the growth of subordinated debt financing from banks contracted. Thus, the situation for the period 2003-2004, when the additional capital was supported largely by reserves from the revaluation of assets recorded in the balance sheets of banks, in 2005 the contributions of the two elements are balanced, and the year 2006 saw real annual growth of 69 percent subordinated debt, which drove the main driver of additional capital.

The year 2006 marked slowdown in the banks' own funds, respectively, of their component fundamental equity. Thus, to a real growth rate of about 37 percent recorded for both indicators in December 2005 compared with same period last year, in December 2006 equity rose 22.2 percent and equity 18,1 percent. Although growth in real terms, the result of a banking profit recorded a slight rebound in 2006 (5.5 percent in December 2006 from 6.3 percent in December 2005) the previous year, it continues to be an important element to support capitalization of credit institutions. Evolution of the main elements to support equity of banks, Romanian legal entities (paid-up capital of shareholders and current year profit) remains divergent in 2006. Thus, capital contribution increased to 65 percent of equity in December 2006 (from about 63 percent in December 2004 and 2005), while the profit share declined to 16 percent of equity at end 2006 (from 23 percent in December 2004 and 18 percent in December 2005). Other important elements are the first equity linked capital, legal reserves, statutory reserves, other reserves.

The year 2007 saw an increase in corporate equity owned banks Romanian and, respectively, of their main components, Tier 1, a lower rate than in the past three years. Components of Tier 1

capital remains the most important element, with net profit of current year. Real growth of aggregate capital amounted to 10 percent in 2007, lower than that recorded in December 2006 (21.8 percent), respectively, in December 2005 (38 percent). However, capital position as main driver of Tier 1 was strengthened in 2007, rising its share to 65 percent, compared with 63 percent level recorded in 2004 - 2006. In 2007, the downward trend recorded in recent years aggregate solvency report, calculated credit institutions widened indicator losing 5.4 points percentage compared with the level recorded in December 2006 to 12.7 percent. The main factor responsible for this trend is continuing non-government credit expansion,while the own funds of credit institutions recorded a growth rate lower. However, the solvency ratio is maintained at an appropriate level, the higher minimum threshold required by prudential regulations applicable in Romania since 2007 year and also the European and international level (8 percent).

According to data presented by the National Bank of Romania (Financial Stability Report, 2009), note that, by continuing the trend started in 2006, the own funds belonging to banks, Romanian legal person and their main component - Tier 1, recorded in December 2008 the lowest annual rate in real terms over the last six years. This was determined both by recording the negative financial results of banks holding 10% of aggregate banking assets (with direct impact on Tier 1) and the changes in August 2008 regulations prudential, aimed at eliminating from the calculation of Tier 1 (respectively, of total equity) of the most volatile element that represents the current year profit result. Until the entry into force of said amendment, only some of the banks recorded profit amount included in the eligible reserves, because the requirements of prudential regulations in force, consisting in auditing financial result represents profit. As a result, in 2008, share capital and eligible reserves were the main elements to support Tier 1. Based on the modifications made in the banking safe reglamentation, in December 2008, the level 1 own funds decresed with more than 2% their contribution to supporting the total own funds belonging to romanian banks bussiness costumer, by majorly raising the level 2 own funds contribution, mainly based on raised volume of loans contracted by credit institutions.The proportion of level 1 own funds maintained relatively constant and in march 2009, based on the consignment of a series of banks of negative financial results. Even though the weight of level 2 own funds in level 1 own funds advanced in 2008(34%) the growing potential of this element maintains high, the credit institutions being able to appeal to secondary sources of capitalization in order to develop the banking activity. When he began the first quarter of 2008, credit institutions report solvency indicator ratio Basel II principles.

Despite the global financial crisis, the Romanian banking system can be considered as stable as a whole, with levels of capitalization, solvency and liquidity in accordance with consistent with prudential requirements. Tier 1, defined as the core of their sources of credit institutions through the permanent criteria, payment flexibility and capacity to absorb losses continued to overwhelmingly support a total equity. Appropriate quality of own funds is on their structure. The most important component frame our capital plus capital frame attached. The second component in terms is still represented by legal reserves. An important challenge for banks was to maintain a level of own funds accordance, in the conditions witch they were eroded by the current period losses. Tier 2 support rate of about 20 percentages of total equity and subordinated debt were the main components and revaluation reserves. Revaluation reserves have preserved funding contributions to Tier 2. An for evaluation of the level of capitalization of credit institutions, the central bank uses solvable indicator, as the only indicator currently regulated for this purpose. It also provides banks in Romania at the conditions for additional capital requirements related to Basel III framework to be taken by the European regulatory Capital Requirement Directive IV.

V. Implications

Lines of action taken aimed at avoiding deteriorating credit institutions in the general context of limiting investment options and restricted possibilities to attract resources. Accepting a higher

risk level by credit institutions means strengthening the level of own funds, even over the level stipulated by the bank. Capital adequacy is prominent feature in the management of any risks encountered by the credit institution. The credit institutions should manage the inherent risks. The very efficient management of risk it is essential for the success on long term of any bank. Methods and techniques of risk management, capital calculation must be continually reviewed and adapted to changes occurring in financial markets, a review of Basel Accord is absolutely necessary in the current economic and financial context. As a final conclusion of the research in the own funds field we want to mention and express our opinion that the methods and techniques of managing risk, calculation of capital need permanent revision and adaptation to the changes that take place on the financial market the appearance of Basel Agreement 3, which are absolutely necessary in the actual economic and financial context.

VI. Own contribution
The presentation of concrete cases concerning the bank back-ups represent the personal work which completes the study concerning the analysis of managing banking risks, the role of bank back-ups in the bank capital adequacy mechanism.

To conclude, be as kind as to receive my thanks and gratitude for your kindness and availability! I wish we continue a prolific collaboration with you in the forthcoming future!

THE ADJUSTEMENT OF THE BANKING MECHANISM FOR FINANCING ECONOMY UNDER CRISIS CONDITIONS

Istrate Luminita Gabriela
The Bucharest Academy of Economic Studies

Development of complex financial products and necessity of reducing the costs encourages the creation of groups with multiple activities in the financial sector. Structures of financial group are also present in Romanian, and most of them are part of the international groups, provided that the financial capital is mainly foreign.

Both the benefits as well as the risks associated to the financial groups present in Romania are limited due to their orientation mainly mono-sectorial (very high weight kept by the credit institutions).

The National Bank of Romania has an intrinsic role for maintaining the financial stability, taking into consideration the responsibilities that result from its double aspect of monetary and prudential authority. The attributions afferent to the objectives of financial stability are exercised by prudential supervision and regulation of the institutions under its authority, as well as by formulation and efficient transmission of the measures of monetary politics and supervision of functioning under optimum conditions of the payment and reimbursement systems systemically important.

At the same time, it is necessary the identification of risks and vulnerabilities of the entire financial system, on the whole and separately, because the financial stability monitoring is preventive. The occurrence and development of some malfunctions, like the incorrect evaluation of risks and inefficiency of capital allocation can affect the stability of the financial and economic system.

1. Introduction

The main modifications registered in the structure of the Romanian banking system during 2009 were the following: the change of the status of Citibank Romania from Romanian legal entity into a foreign bank branch, Citibank Europe (starting from January 2009), closing of the branch from Bucharest of Depfa Bank in August 2009, starting of the activity of Banca Comerciala Feroviara (Railway Trade Bank) – institution with majority of autochthonous private capital – in November 2009 and the fusion between Raiffeissen Bank for Real Estates and HVB Bank for Real Estates by absorption of the latter in December 2009.

As a result, the number of credit institutions diminished to 42 units from which: 2 credit institutions with majority or integral capital of state, 4 institutions with majority autochthonous private capital, 25 banks with majority foreign private capital, 10 branches of the foreign banks and Creditcoop.

The share capital of credit institutions collected 14,4 billions Lei in December 2009, increasing by 3,2 % in real terms in comparison with year 2008. The majority private capital stays mainly at 87,8%, but slightly falling down due to the modifications occurred at the capital of the foreign banks branches, but also due to the capital increase performed at CEC Bank.

Stagnation of the aggregate net asset was attributed mainly to the divergent evolutions registered by the main components. On one side, the lending activity of the non-banking clients got reduced by 4,4% in real terms during 2009 in comparison with the end of 2008, the weight of this segment getting reduced by 3%.

Thus, the request of loans continued to be affected by: the downturn in economic activity and pessimism regarding its perspectives, as well as the persistence of the negative expectations regarding the upturn of the financial situation of the population.

On the side of the credit bidding, it has been noticed an intensification of the prudence of the credit institutions, developed by: tightening the standards and the crediting terms and increase of owning government bonds.

According to the destination of the private credit on institutional sectors, the dynamics of loans to population as well as the one of credits for companies became negative, the real annual rates of increase reaching -3,6% and respectively -3,7 %. There have not been recorded changes of structure, the credits to population maintaining their weight slightly superior (50,1%).

2. The access to financing of enterprises and population

The access to the bank financing has improved since 2008, both in the segment of companies and in the one of population.

Year 2009 marked a reversal in trend because there was an accentuated tightening of the terms and conditions of access to lending.

The number of companies which received credits from financial institutions (autochthonous or foreign) reached 16% (from the total of the active companies from Romania in March 2009, in comparison with 8% in 2005). The number, still small, of the companies which make a loan, as well as their significant role in economy prove that the decrease of financing could have important negative consequences.
Graphic 1 Evolution of debts of the non-financial companies and population.
Source : B.N.R.(The National Bank of Romania)

Trade companies and real estate companies could experience the highest impact of the decrease of access to financing, as they use much more intensely the resources of the banks comparing with the created added value. The difficulty of maintaining the external financing would affect the most the real estate companies and the manufacturing industry.

3. Modification of the lending standards in crisis conditions

At the aggregate level, the lending standards were slightly tightened in T4/2009. The net percentage of the banks which adopted such measures was 13%. The rest of the banks did not consider a new revision to be opportune, even though their expectancies were aiming this direction.

The cumulative level of restrictiveness of lending standards, corroborated with the request of lending in decrease, favored, under a certain extent, the neutral attitude of the banks.

This series of tightening of the lending standards that lasts for almost two years could end, although some banks do not exclude its continuation.

In structure, the slight tightening of lending standards was undifferentiated according to the size of the company (Small and Medium Enterprises (SME) versus corporations). Previous evolutions disfavored the access to financing of the Small and Medium Enterprises in comparison with the one of the corporations, after a lower perception at risk of the latter ones.

The perspectives of the credit bidding towards companies is differentiated by the criterion of maturity. The net percentage of the banks which notify a tightening of the lending standards for long-term is 30%, while it has been considered that there won't be any modifications for the short-term loans.

The main factors which made the banks change the lending standards are the expectations regarding the general economic situation, the risk associated to the industry in which the company activates and the risk associated to the requested guarantee/collateral.

The crediting standards of population registered an evolution differentiated on types of credits.

The net percentage of the banks which considered necessary the tightening of the crediting norms of the consumption loan, remained raised (45% in February 2012), although the anticipations showed the attenuation of the tendency.

For the credits allocated to the purchase of real-estates and lands, the restrictiveness input was lowered to the level of the banking sector (under 10%). Expectancies for T1/2010 show a slight relaxation of the standards for the real-estate credits, for the first time in almost two years.

Regarding the population sector, at the beginning of 2010, the previous relaxation tendency of some terms of mortgage loan (the spread of the medium rate of interest of the credit towards ROBOR 1M and of the maximum weight of the credit in the value of the real estate guarantee) was not confirmed in T4/2009. The only concern for some banks (33%) was manifested in the area of reducing the maximum weight of the debts service in the monthly income, on the basis of deterioration of the expectations regarding the incomes and the unemployment.

Prudence of the banks vis-à-vis the loan for consumption is equally fed by the following factors: the risk associated to the clients' creditworthiness, the risk associated to the collateral/guarantees, the expectations regarding the financial situation of population and the decisions of monetary or prudential policy of NBR (*The National Bank of Romania).*

Tightening of the maximum weight of the monthly debt service in the monthly income is the main change brought to the terms of the consumption loan, similar to the mortgage loan.

There were also tightened: the spread of the medium rate of interest of the credit towards ROBOR 1M and of the maximum limit for the loan value. The other contracting clauses were not modified.

4. The role of the Central Bank in maintaining the financial stability under crisis conditions

The National Bank of Romania has an intrinsic role in maintaining the financial stability, taking into consideration the responsibilities that result from its double aspect of monetary and prudential authority. The attributions afferent to the objectives of financial stability are exercised by regulation and prudential supervision of the institutions under its authority, as well as by formulation and efficient transmission of the monetary policy measures and supervision of functioning under optimum conditions of the payment systems and settlements systemically important.

At the same time, it is necessary identification of the risks and vulnerabilities of the entire financial system, on the whole and separately, as monitoring of the financial stability is preventive. Occurrence and development of some malfunctions, like the incorrect evaluation of

the risks and inefficiency of capital allocation can affect the stability of economy and the financial system.

a) Open Market Operations (monetary market)

Open market operations represent the most important instrument of monetary policy of N.B.R. (The National Bank of Romania). These are performed on the initiative of the Central Bank, having the following functions: guidance of the interest rates, management of the liquidities conditions from the open market and notification of monetary policy orientation.

The main operations of open market being at the disposal of N.B.R. (The National Bank of Romania) are the following:

- *repo* **operations – of eligible assets** – liquidity-providing reverse transactions whereby the National Bank of Romania buys transactional eligible assets from credit institutions upon their commitment to repurchase the assets at the date and the price agreed on the date the transaction was concluded;
- **deposit-taking operations** – liquidity-absorbing transactions with pre-specified maturity whereby the National Bank of Romania takes deposits from credit institutions;
- **issuance of certificates of deposit** – liquidity-absorbing transaction whereby the National Bank of Romania sells certificates of deposits to credit institutions;
- *reverse repo* **operations** - liquidity-providing reverse transactions whereby the National Bank of Romania sells transactional eligible assets from credit institutions upon their commitment to repurchase the assets at the date and the price agreed on the date the transaction was concluded;
- *credit operations against eligible assets as collateral* – liquidity-providing reverse transactions whereby the National Bank of Romania grants loans to credit institutions that remain the owners of the underlying eligible assets;
- **outright sales/purchases of eligible assets** – liquidity-absorbing/providing transactions whereby the National Bank of Romania sells/buys eligible assets whose ownership is transferred from Seller to Buyer on a "delivery versus payment" basis;
- **foreign exchange swaps** – consist of two simultaneous transactions concluded with the same counterparty, whereby the National Bank of Romania:
    - - buys foreign currency spot against lei, for liquidity-providing purposes, and sells the same amount of foreign currency forward against lei; or
    - - sells foreign currency spot against lei, for liquidity-absorbing purposes, and buys the same amount of foreign currency forward against lei;

During 1997 – 2008, the open market operations performed by NBR were almost exclusively used with the purpose of **making use of the liquidity surplus from the banking system.**

Starting with the last part of the year 2008, at the same time with the change of the liquidity net position of the banks from surplus to deficit, the liquidity-providing open market operations became predominant, thus, the NBR becoming in the position of Creditor of the banking system.

b) Standing facilities granted to credit institutions.

Standing facilities granted to credit institutions by NBR have the purpose of: absorption, respectively liquidity supplying on a very short term (one day); notification of general monetary policy orientation and stability of the interest rates on short term on the inter-bank monetary market, by means of the interest rates afferent to the two instruments.

Credit institutions may access on their own initiative the two permanent facilities offered by NBR:

- **lending facility** which allows obtaining of a credit with overnight maturity at the central bank, counter collateral, to a pre-determined interest rate; this interest rate normally being a limit of an overnight interest rate on the monetary market;
- **deposit facility**, which allows placing of a deposit with overnight maturity at the central bank, to a pre-determined interest rate; the interest rate of the deposit facility representing, normally, the limit of an overnight interest rate on the monetary market;

c) Mandatory Minimum Reserves (MMR)

Mandatory minimum reserves (MMR) are represented by the cash assets of the credit institutions, in lei and foreign currency, kept in accounts open at the National Bank of Romania.

The main functions of the MMR mechanism in lei are: the monetary control function (being in tight correlation with the one of liquidity management by NBR) and the one of interest rate stabilization on the inter-bank monetary market. The main role of MMR in foreign currency is that to temper expansion of the foreign currency credit.

In case of postponing of the programmed entries of external funds, the covering of the financing necessary of the governmental sector from resources of the internal market in the last part of 2009, concomitantly with the maintenance of the macro-economical stability, necessitates adequacy of the financing conditions of the autochthonous banking system.

Thus, NBR decided a tough management of the liquidity from the banking system to consolidate the transmission of the signals of monetary policy, as well as maintenance of the levels of the mandatory minimum reserves rates applicable to the liabilities in lei and foreign currency of the credit institutions.

The NBR rate for foreign currency liabilities with the residual maturity date under two years of the banks was reduced by 5% (from 30% to 25%) within a special meeting of the Managing Board of the National Bank of Romania organized on 16 November 2009, the decision being adopted in the context of confirmation of postponing of the external loans calendar provided for trimester IV 2009 within the multilateral arrangement concluded by Romania with EU, IMF and other international financial institutions.

5. Conclusions

Amid the political-economical instability from the last period, but also as a result of the banks' decision to "cover" from own sources the tax on the interests received by natural persons for the deposits made in the banks, it is possible for the rate of interest for credits to register an ascendant trend in the following period.

During December 2009-February 2010, as a result of reducing the monetary policy interest rate and of inter-bank efficiency, as well as amid a significant improvement of liquidity from the banking system, the interest average rates to the new term deposits and to the new credits intensified their decrease (-1,46%, to 8,13% and respectively -2,22%, to 13,75 %). Evolutions were homogenous for both client categories, but different in magnitude.

I consider that the evolutions shall not be homogenous anymore between both client categories as a result of the banks' decision to "cover" from own sources the "tax" owned by natural persons for the received interests at the deposits made in the commercial banks.

Thus, a few questions are raised. From where shall the banks take the necessary amounts for covering the "fresh" tax on the deposit interests? Shall they have a loss? In no case! And then, the explanation is simple: they shall try to recover these amounts on the basis of increasing the level of the interest rate to the granted credits (both to the new ones and to the ones in tendering).

For the economical development, this is not quite a favorable situation, thus I consider to be opportune an intervention of the central bank to adopt some decisions by which the commercial banks to be "determined" not to increase the credit interests.

The interest rate risk is the most important risk that derives from the OTC transactions, taking into consideration both the notional amounts and the market value of the financial derivatives that relies on interest rate contracts. Open positions on interest rate derivatives represents more than 75% of the OTC market. In the European banking market interest rate swaps prices are strongly dependent on the interbank interest rates. In this paper we want to analyze the behavior of the Eoniaswap indices and their impact on the interest rate swaps between banks.
Key words: interest rate risk, Eoniaswap, volatility, impulse response functions
JEL code: E43, E50, G10, G21

1. Introduction

Financial derivatives became in the last decade the most dynamic segment of the financial industry, offering multiple benefits to investors. Simultaneously, the rapid growth of the financial derivatives market has generated seriously controversies regarding the risks associated with these instruments. Interest rate risk remains the most important risk that derives from the OTC transactions, taking into consideration both the notional amounts and the market value of the financial derivatives that relies on interest rate contracts. Also, the largest share in this category is hold by swap contracts, which represent more than 75% of the OTC market.

The underlying asset of the interest swap contracts is directly linked with the interest rates evolution on the interbank market. In the European banking system, the interest rates swaps that have the Eonia interbank rate as underlying asset constitutes the most liquid market from the Eurozone interbank markets. Eoniaswap rates are the most used instruments in speculation and hedging the interest rate risk that derives from the banks' assets and liabilities indexed to Euribor. Also, is a very good indicator of the market anticipations regarding the short and long term evolution of the swap rates during the transactions.

Liquidity problems registered on the international financial markets have caused an increase in the volatility of the swap rates, especially after September 2008 and also in the spread between these and the monetary policy rate of the European Central Bank (ECB). By reflecting the market anticipations of the future monetary policy rate during the maturity of the swap contract, all the Euribor deviations form the monetary policy rate established by ECB is reflected in the interest swaps rates evolution.

Open positions on interest rate financial derivatives totally amount 478 milliard thousand USD in June 2010. OTC derivatives on interest rates constitutes 82% of the total notional values of the financial derivatives traded in 2010 and 75% of their gross market value (Table 1).

Table 1. The structure of financial derivatives traded on OTC markets (mil. USD)

Type of contract	Notional values		Gross market values	
	June2007	June 2010	June2007	June 2010
Foreign exchange derivatives	57.604	62.933	1.613	3.158
Interest rate derivatives	381.537	478.093	6.730	18.508
Equity derivatives	9.518	6.868	1.212	7.968
All commodities derivatives	8.255	3.273	656	492
Credit derivatives	51.095	31.416	906	1.708
Other derivatives	78	72	1	12
Total value	507.907	582.655	11.118	24.673

Source: Bank for International Settlements, 2011

Focusing on the European interbank market, we have analyzed the behavior of Eoniswap rates in comparison with the overnight borrowing interest rate. Section 2 provides the literature review. Section 3 presents the evolution of the Eoniaswap market. Section 4 analyze the transmission of volatility through the interbank markets and section 5 concludes.

2. Literature review

A vast range of studies have concentrated on the factors that determines banks to use financial derivetives and also on the relationship between financial derivatives and banking risks. One of the most representative studies are those of Brewer, Minton and Moser (2000), Gunther and Siems (2002), Kim and Koppenhaver (1992) and Sinkey and Carter (1994), which demonstrate that the probability of banks to enter into financial derivatives transactions depends on their dimension, their traditional commercial activity, their equity rate, but also the interest rate gap and net interest rate spread. Regarding the impact of the financial derivatives trading on the exposure of banks to market risk Chaudhry and Reichert (2002), Shanker (1996) and Venkatachalam (1996) highlight that some financial instruments are efficient in reducing the interest rate risk, while Choi and Elyasiani (1997) highlight the role of the financial derivatives in reducing the foreign exchange risk.

From a financial supervision perspective, financial derivatives present important challenges both for banks and for supervisors, due to the difficulty of managing and regulating the trading activities in comparison with the traditional banking activities. Culp and Mackay (1994) state that given the exposure of OTC derivatives to credit risk an adequate level of capital adequacy is an essential condition for trading on OTC markets. On the other side, Peek and Rosengren (1997) suggest that undercapitalized banks are more likely to be active in derivatives markets. Similarly, Gunther, Hooks and Robinson (1997) state that undercapitalized banks are more predisposed that others to open positions on OTC markets.

Regarding the management of the positions held on financial derivatives, Stulz (2006) highlights that both commercial and investment banks have developed methods that permit an efficient risk management taking into account the capital needed to ne held in order to absorb unexpected shocks. Stress testing and Value at Risk models are the most used by financial institutions to estimate the market risk associated with the financial derivatives portfolio, but don't work properly all the time because they are strongly dependent on the degree of liquidity registered on the markets.

Kotomin et al. (2008) using the Libor rates for 11 currencies, suggested that the liquidity preference at the end of year or trimester is the main factor that influences the behavior of interest rates on short term. Prati et al. (2003) have analyzed the daily evolution of the overnight borrowing interest rates for a series of highly industrialized countries like Canada, Great Britain and others from Eurozone over a period of 16 years, demonstrating that the intervention style of

the central banks plays an essential role in modelling the empirical characteristics of interest rates on short term.

3. The evolution of the Eoniswap market

Since the introduction of the euro, the transformation of numerous national markets into a unique one has offered a great opportunity for developing new reference indices for the monetary market, like Euribor for unsecured lending or Eurepo for secured lending. This approach has lead to a more homogeneous and integrated swap market in the Eurozone. Eoniaswap, the representative index for this market has been launched with the aim of developing new products in order to manage the interest rate risk that affects the banks' portfolios of assets and liabilities. A study of ECB (2007) states that swaps that have as an underlying asset the overnight interbank offered rate Eonia form the most liquid interbank market from the Eurozone, because of their very frequent usage in speculating and hedging the interest rate risk that affects the assets and liabilities indexed by Euribor. Also, it permits to analyze the spread between the swap rates and the monetary policy rate. In an interest rate swap contract one part pays a fixed rate (the swap rate) and the other one pays a variable rate (the average of Eonia rate registered during the maturity of the swap contract).

Figure 1: Euribor and the monetary policy rate of the European Central Bank
Source: authors' prelucrations

Nautz and Offermanns (2008) have analyzed the transmission of volatility through the European monetary markets from Eonia rate to the long term interest rates in the 2004-2006 period, finding that the Basel II regulatory framework have reduced the volatility of all monetary market interest rates. Also, the Eonia fluctuations are caused by the long term gap between 3 month Euribor and ECB's monetary policy rate. Linzert and Schmidt (2008) highlight that the positive difference between Eonia and the ECB's monetary policy rate is due to a long term high level of the former. Hassler and Nautz (2008) found that the persistency of the swap rates volatilities increases with maturity.

The Euribor rates for different maturities show an increasing trend until the collapse of Lehman Brothers in September 2008, from 2% (2005) to 4% (2008) and a decreasing trend after due to the monetary policy of ECB that aimed to reduce the reference rate for the Eurozone (Figure 1). It should be remarked both an increase in the spread between Eonia and the ECB's monetary

policy rate and the intensification of this spread volatility after September 2008. The explication for this derives from the liquidity surplus in the Eurozone due to BCE's monetary policy conducted in order to reduce the effects of the financial crisis.

Eoniaswap rates with 1 month, 3 months, 6 months, 9 mounts and respective 12 months maturities have registered an evolution similar with Eonia (Figure 2). When an increase in the monetary policy interest rate of ECB is expected Eoniaswap rates with 12 months maturities are larger in comparison with the short term interest rates (1-6 months) because of higher percents expectations of Eonia rate in the future,

Figure 2: Eoniaswap rates and the monetary policy rate of European Central Bank
Source: authors' prelucrations

4. The transmission of volatility through the interbank market
Analyzing the impulse-response functions between Eonia and Eoniaswaps at different maturities it can be observed that the imapct of Eonia on the swap rates decrease with the maturity (Figure 3). The graph below illustrates the effect that the modification of Eonia rate variance with one unit has on the swap rates variance.

Eoniaswap rates quickly absorb the shocks from Eonia. None of the interest rates at different maturities give a response greater than 4% to unexpected shocks, neither in the nest 10 days, nor in the next 60 days. Over a longer time horizon these impulses became insignificant. So, the probability of the banks which trade these financial derivatives to obtain profit based on the past information that characterize the overnight interbank market is reduced on long term. They could make profit just on a short term basis.

5. Concluding remarks

Analyzing the Eoniaswap rates behavior in the 20.06.2005-20.06.2011 period and their relationship with the interbank borrowing interest ratewe have seen that the variance of Eoniaswap at different maturitis is influenced by the shocksregistered by the Eonia rate, but these extreme volatilities are quicklu absorbed by the swap prices. These results reflect the difficulties of banks in making profits by trading finacial derivatives with Eoniaswap rates as undelying assets, but on the other side the situation is advantageous for the interest rate risk management, because the future volatility evolution of the swap rates could be estimated based on the past informations.

It is well known that empirical data coming from financial markets, like stock market indices, commodities, interest rates, traded volumes and foreign exchange rates have a multifractal structure. Multifractals were introduced in the field of economics to surpass the shortcomings of classical models like the fractional Brownian motion or GARCH processes.
In this paper we investigate the multifractal behavior of Central and Eastern European foreign exchange rates, namely the Czech koruna, Croatian kuna, Hungarian forint, Polish zlot, Romanian leu and Russian rouble with respect to euro from January 13, 2000 to February 29, 2012. The dynamics of exchange rates is of interest for investors and traders, monetary and fiscal authorities, economic agents or policy makers. The exchange rate movements affect the international balance of payments, trade flows, and allocation of the resources in national and international economy. The empirical results from the multifractal detrending fluctuation analysis algorithm show that the six exchange rate series analysed display significant multifractality. Moreover, generating shuffled and surrogate time series, we analyze the sources of multifractality, long-range correlations and heavy-tailed distributions, and we find that this multifractal behavior can be mainly attributed to the latter. Finally, we propose a foreign exchange market inefficiency ranking by considering the multifractality degree as a measure of inefficiency. The regulators, through policy instruments, aim to improve the informational inefficiency of the markets, to reduce the associated risks and to ensure economic stabilization. Evaluation of the degree of information efficiency of foreign exchange markets, for Central and Eastern Europe countries, is important to assess to what extent these countries are prepared for the transition towards fully monetary integration. The weak form efficiency implies that the past exchange rates cannot help to improve forecasts about future spot exchange rates, therefore there are no opportunities for profit based upon past data. Our results show that the Russian foreign exchange market has the highest degree of efficiency while the Hungarian foreign exchange market is at the opposite side.
Keywords: multifractality, MFDFA, long-range correlations, heavy-tailed distributions, foreign exchange markets.
JEL Codes: C10, F31, G15.

I. Introduction

The financial markets are open and complex dynamical systems with a large number of interacting elements. For institutional investors, a correct assessment of these systems is very important to determine the optimal investment strategy. Recently, the analysis of financial markets has been found to exhibit some universal characteristics similar to those observed in physical systems with a large number of interacting units. Since the classical financial theory cannot explain effectively this characteristics, (multi)fractal theoretical models were introduced in the field of economics by Mandelbrot (1997) to study the economical and financial data from a new perspective.

A fractal is an object that displays self-similarity on all scales. Self-similarity means that each piece can be considered a reduced-scale image of the whole. Mandelbrot (1977) uses the characteristic of self-similarity to develop the concept of fractional dimension, not integer. "When the dimension of a time series is non-integer, this is associated with two specific features: inhomogeneity - extreme fluctuations at irregular intervals, and scaling symmetries - definite

relationships between fluctuations over different separation distances" (Scarlat, Stan and Cristescu 2007:188-189).

In existing literatures, the presence of fractal characteristics in financial markets implied the market complexity (Jiang and Zhou 2009), crash predictions (Grech and Pamula 2008), volatility predictability (Wei and Wang 2008) and inefficiency (Cajueiro and Tabak 2004, 2007). Among the techniques of fractal analysis on financial time series are those based on Hurst exponent (H). In the case of unifractal processes, the scaling behavior is determined from a unique constant H, while in the case of multifractal processes a continuous spectrum of exponents is needed.

The originality of this research is given by several aspects. First, is the first study that compares the multifractal behavior of six Central and Eastern European foreign exchange rates, namely the Czech koruna (CZH), Croatian kuna (HRK), Hungarian forint (HUF), Polish zlot (PLN), Romanian leu (RON) and Russian rouble (RUB) with respect to euro (EUR) from January 13, 2000 to February 29, 2012 via a robust and powerful technique – the Multifractal Detrended Fluctuation Analysis (MFDFA). The exchange rates between currencies are a particularly interesting category of economic data to study as they dictate the economy of most countries. Second, we quantify the contributions of two different factors that are thought to be the causes of multifractality – long-range correlations of the time series and heavy-tailed distributions – by generating shuffled and surrogated time series form the original ones. Third, we follow Zunino et al. (2009) and we build an inefficiency ranking by considering the multifractality degrees as a measure of inefficiency.

II. Literature review

Multifractal analysis which was initially employed to investigate the intermittent nature of turbulence has been widely applied to financial time series including stock prices, interest rates, commodity prices and exchange rates. For example, Ausloos (2000), using the DFA technique, empirically shows that several foreign exchange rate series display significantly long-range persistently or anti-persistently autocorrelated behavior. Using R/S analysis, Kim and Yoon (2004) find the multifractal behaviors in the Korea Won–USD and Japan Yen–USD exchange rates. Norouzzadeh and Rahmani (2006) study the dynamics of Iranian Rial–US dollar exchange rates and find the evidence of multifractality based on MFDFA. Moreover, they show that the main source of multifractality are long-range correlations of small and large fluctuations. The same source of multifractality is found by Wang et al. (2011) in case of twelve exchange rates series. For USD/AUD, USD/EUR and CNY/USD, both fat-tail distribution and long-range correlations have important contributions to the multifractality. In addition, the authors find that extreme events play an important role in the contributions to multifractality of the USD/EUR exchange rate series. Tabak and Cajueiro (2006) estimate Hurst exponents using the local Whittle estimator and find that the Euro bilateral exchange rates of the US, Canadian and Singapore Dollar are amongst the most efficient currencies, while Japanese Yen and Swedish Krona are amongst the most inefficient. Jiang, Ma and Cai (2007) show that distribution of relative return of 74 global currencies is a power-law and the distribution of correlation coefficients in terms of relative return in currency price changes is time dependent, based on the method of scaled factorial moment. The correlation of foreign exchange rates and their degree of asynchrony is investigated by Liu, Qian and Heng (2010) for a period from 1995 to 2002. The results show that the cross-sample entropy of every two exchange rates returns of DKK/USD, NOK/USD, CAD/USD, JPY/USD, KRW/USD, SGD/USD, THB/USD and TWD/USD become higher after the Asian currency crisis, indicating a higher asynchrony between the exchange rates. Wang, Yu and Suo (2012) provide evidence that the change in the yuan exchange rate regime in July 2008 caused different multifractal properties of CIB/CNY Composite Index in 2008-2010 compared to 2005-2008. The Romanian currency market drew the attention of Scarlat, Stan and Cristescu (2007). The authors observed that due to the "in-phase" evolution of the economic agents, the

statistical self-similarity of the time series of the daily exchange rate RON/USD resembles a theoretical self-similarity. The self-similar cells of dimensions obeying a definite power law scaling rule are related to five categories of economic agents detected via a crossing-type analysis based on the Hurst exponent and the frequency spectrum and are employed in the study of the fragmentation-defragmentation process.

III. Methodology

The MFDFA is a generalization of the detrended fluctuation analysis (DFA) and it was developed by Kantelhardt et al. (2002) for non-stationary multifractal data. The procedure can be described as follow:

- determine the "profile" $Y_j = \sum_{i=1}^{j}(x_i - \langle x \rangle)$, where x_i is a series of lenght N and $\langle x \rangle$ denotes the averaging over the whole time series, and divide it into $N_s = \text{int}(N/s)$ nonoverlapping segments of size s;

- calculate the local trend for each segment v by the least square fit of the series and then determine the variance $F_v^2(s) = 1/s \sum_{j=1}^{s}\{Y[(v-1)s + j] - y_v(j)\}^2$ between the local trend and the profile in each segment v. Here, $y_v(j)$ is the fitting polynomial in the $v-th$ segment;

- average over all segments to obtain the q-th order fluctuation function, defined as $F_q(s) = \left\{ 1/2N_s \sum_{v=1}^{2N_s}\left[F_v^2(s)\right]^{q/2} \right\}^{1/q}$. In general, $F_q(s)$ scales with s as $F_q(s) \approx s^{H(q)}$ with the generalized Hurst exponent $H(q)$. For a monofractal time series, $H(q)$ is independent of q and the scaling behavior of $F_v^2(s)$ is identical for all values of q. For multifractal data, $H(q)$ depends on the chosen moment q since the small and large fluctuations scale in a different way. When q has a large positive value, $H(q)$ implies large scale fluctuations. By contrast, if q is negative or has a very small positive value, $H(q)$ describes small scale fluctuations. Therefore, richer multifractality corresponds to higher variability of $H(q)$. We follow Zunino et al. (2009) and we quantified the multifractality degree and hence we define our measure of inefficiency by

$$Inefficien\,cy = \Delta H = H(q_{\min}) - H(q_{\max}) \qquad (1)$$

In order to determine the contributions of long-range temporal correlations and heavy-tailed probability distributions of variations in the multifractality we follow the procedures introduced by Norouzzadeh and Rahmani (2006): shuffling (1) and Fourier phase randomization (2). First, we destroyed any temporal correlations by randomly shuffling the return time series and we quantified the influence of correlation by

$$H_{cor}(q) = H(q) - H_{shuf}(q) \qquad (2)$$

Second, since the shuffling procedure doesn't affect the probability density function (PDF), we create phase-randomized surrogate time series to study the contribution of the heavy-tailed distribution. Thus, the contribution of the non-Gaussian PDF will be

$$H_{PDF}(q) = H(q) - H_{sur}(q) \qquad (3)$$

IV. Empirical results

Fig. 1 illustrates the generalized Hurst exponents $H(q)$ via the MFDFA procedure for the original, shuffled and surrogate daily exchange rate returns of the six markets investigated. In our study we follow Zunino et al. (2009) and use a polynomial fit of order 3 (hence, the algorithm is denoted as MFDFA-3) and window lengths (s) between 20 and $N/4$ with a step of 4 according to the suggestions of Kantelhardt et al. (2002). The variation of q is from [-10, 10] with a step of 1. Overall, it can be observed, especially in case of original returns, that the change of $H(q)$ depends on the values of q indicating that the EUR exchange rate series are multifractal. The

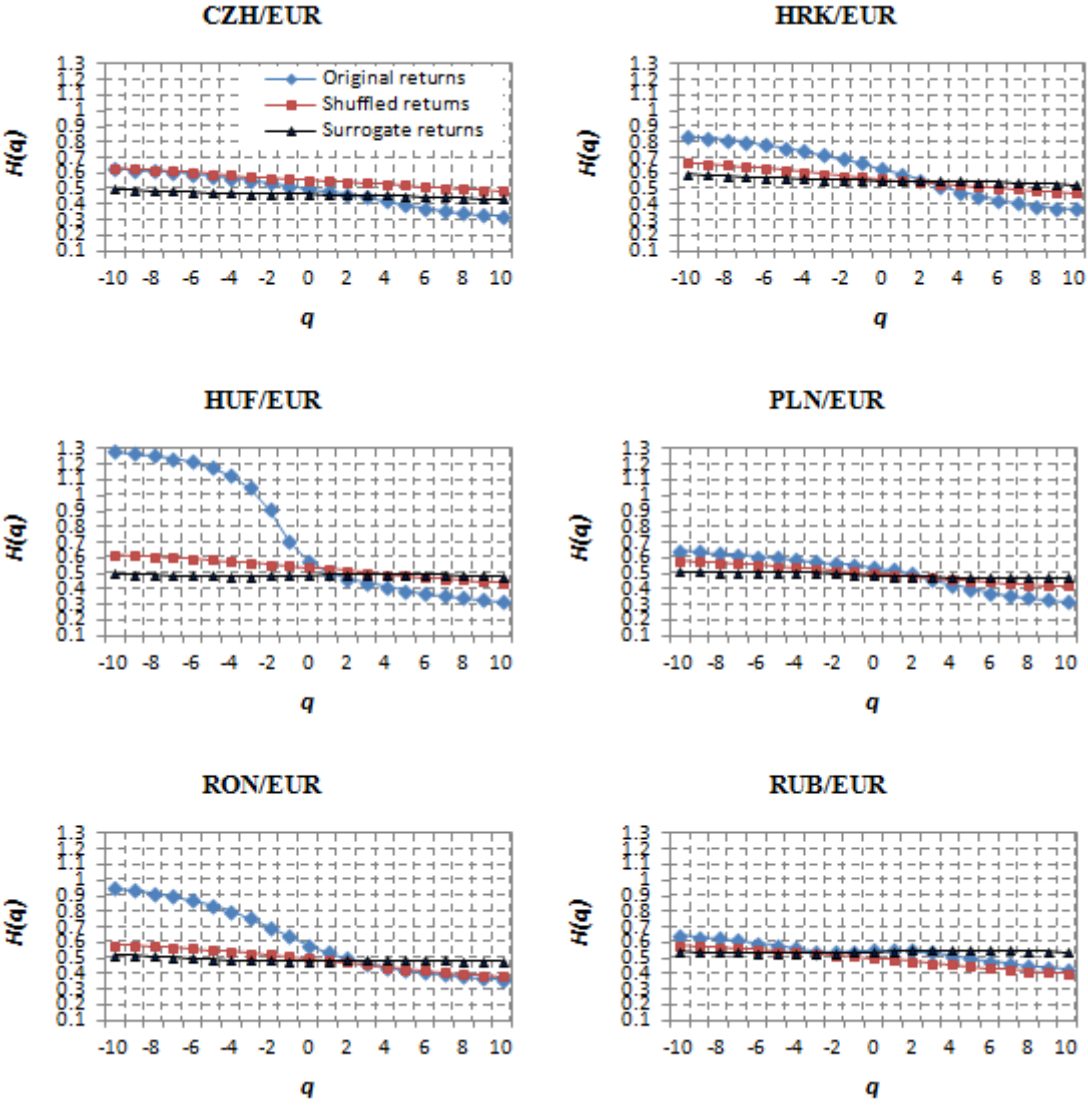
highest variability of $H(q)$ is displayed by HUF/EUR exchange rate, followed by RON/EUR and HRK/EUR exchange rates. It should be mention that for most series, $H(q)$ monotonically decreases with the value of q increases, except the surrogate return series.


Fig. 1. *Generalized Hurst exponent, H(q), as a function of q for the original, shuffled and surrogate daily exchange rate returns*

Source: authors' calculations.

Multifractality degrees of the original, shuffled and surrogate return series are reported in Table 1. As expected, the associated shuffled and surrogate time series have a lower degree of multifractality than the original time series ($\Delta H_{shuf} < \Delta H$, $\Delta H_{sur} < \Delta H$) indicating that both long memory and heavy-tailedness have major contributions to the multifractality. However, in all cases, the multifractality degrees of surrogate series weakened more remarkably that those of the shuffled series ($\Delta H_{sur} < \Delta H_{shuf}$) pointing out that heavy-tailed distributions play a more significant role in the sources of the observed multifractality ($\Delta H_{PDF} > \Delta H_{cor}$).

Table 1. *Degrees of multifractality for the daily exchange rate returns*

Exchange rate	ΔH	ΔH_{shuf}	ΔH_{sur}	ΔH_{cor}	ΔH_{PDF}
CZH/EUR	0.305	0.146	0.065	0.159	0.240
HRK/EUR	0.466	0.191	0.069	0.274	0.396
HUF/EUR	0.963	0.179	0.015	0.784	0.948
PLN/EUR	0.323	0.162	0.039	0.161	0.284
RON/EUR	0.585	0.204	0.042	0.381	0.542
RUB/EUR	0.217	0.181	0.005	0.036	0.212

Source: authors' calculations.

In Table 2 we rank the exchange rate returns by considering their multifractality degree as a measure of inefficiency. Ranking market inefficiency is important information for investors and for regulatory authorities and has implications for financial theories and investment strategies. The multifractality degree is estimated as in Eq. 1 and also by the mean absolute deviation of the generalized Hurst exponents. The second measure is chosen because it is independent of the Gaussian assumption like the standard deviation. As one can observe comparing the first and the third column of Table 2, the ranking order of the foreign exchange markets is unchanged. In the first position in the ranking is the RUB/EUR exchange rate, while the last position is occupied by the HUF/EUR exchange rate. Thus, the Russian foreign exchange market has the highest degree of efficiency, the returns of the RUB/EUR exchange rate being less predictable than those of HUF/EUR.

Table 2. *Inefficiency ranking of daily exchange rate returns*

Measure: multifractality degree [Eq (1)]		Measure: mean absolute deviation of the *H(q)*	
RUB/EUR	0.217	RUB/EUR	0.051
CZH/EUR	0.305	CZH/EUR	0.093
PLN/EUR	0.323	PLN/EUR	0.101
HRK/EUR	0.465	HRK/EUR	0.153
RON/EUR	0.585	RON/EUR	0.201
HUF/EUR	0.963	HUF/EUR	0.371

Source: authors' calculations.

V. Conclusions

In this paper, we firstly studied the multifractal properties of six Central and Eastern European foreign exchange markets through the MFDFA technique. The main advantage of this technique is that it can be used for nonstationary multifractal data. Basic notion is the examination of deviations from polynomial fit of different moments *q*. We show that the time series for exchange rate variations exhibit the characteristics that can be interpreted in terms of multifractality. The highest variability of *H(q)* is displayed by HUF/EUR exchange rate, followed by RON/EUR and HRK/EUR exchange rates. Second, we employ the shuffling and Fourier phase randomization procedures to obtain the origins of the multifractality. It has been shown that there are two main factors leading to multifractal behavior of financial time series, nonlinear time correlations between present and past events and the heavy-tailed probability distributions of function. Our results provide the evidence that the multifractality can be mainly attributed to the fat-tail distributions and secondarily to the long-range correlations, since the degree of multifractality of the surrogate return series became significantly weaker than that of the shuffled series. Moreover, we follow Zunino et al. (2009) and we introduce the multifractality degree as a measure of

inefficiency and rank the six foreign exchange rates. Two different estimators for the multifractality degree were introduced: the range and the mean absolute deviation of the generalized Hurst exponents and the same results were obtained in both approaches: the RUB/EUR exchange rate is the less predictable, while the HUF/EUR exchange rate is the most predictable.

VI. Notes

(1). Shuffling procedure preserves the distribution of the variations but destroys any temporal correlations. What then remains are data with exactly the same fluctuation distributions but without memory. For more details see Norouzzadeh and Jafari (2005).

(2). Phase randomization preserves the amplitudes of the Fourier transform but randomizing the Fourier phases. This procedure eliminates nonlinearities, preserving only the linear properties of the original time series. For more details see Norouzzadeh and Jafari (2005).

THE CARD - CURRENCY WITH AND WITHOUT CASH

Ţîrlea Mariana Rodica
"Dimitrie Cantemir" Christian University Bucharest
Faculty Of Economic Sciences Of Cluj-Napoca

Nicoară Mihaela
"Dimitrie Cantemir" Christian University Bucharest
Faculty Of Economic Sciences Of Cluj-Napoca

Use by individuals and businesses resulting in reduced cash cards in circulation, the corresponding increase in transfer payments and payments accounts also limit exchange risks and make effective use of currency. As a result, we have the effect of reducing cash in circulation.
These advantages are also available for businesses and for banks and leads to favorable effects on import-export business.
Following this, banks can diversify our products, so to meet customers' new products.
Key words: card, bank card, debit card, credit card,
JEL Classification: G32

1. INTRODUCTION:

The large cash flow and the cost of cash in circulation amounted to 2-3 percent of the banks was very high costs for banks. This was the reason that led to the need to find solutions that reduce cash operations.

Solving this problem has direct effects on economic activity, resulting in a series of medium and long term benefits provided: reduce cash in circulation, the corresponding increase in transfer payments and payments accounts, which are equally benefits for individuals, businesses and banks. Banks have the opportunity to diversify their services so as to come as much to meet customers' wishes.

In Romania, the first payment system was introduced by VISA global network, which is the largest international network which performs 80 percent of all commercial transactions in countries where it is used.

Stages, the transition from cash payments from card operations is as follows:

1. to create logical, necessary support for foreign card holders, issued by foreign banks, can be used anywhere in Romania;

2. stage show, the Romanian banks have begun issuing credit cards, conditioned that the cardholder must meet the requirement of having bank accounts

3. ATM network establishment.

In 2005, the Bank has issued regulations on the principles and organizing card payments by the banks, which led to the creation of legal framework in Romania and therefore creating the conditions for companies, banks and households to benefit fully from new payment instruments.

2. THE LITERATURE AND THE PRACTICE

The first reference to card, as new means of payment, was made in the paper published in 1880, "Looking Backward" of the American writer Edward Bellany, who already imagined that in 2000 the money will be replaced with a value card payment predetermined, which would enable their holders to receive credit.

1914 is the first birthday of the card, symbol of a relationship between a business entity and a customer. This year, "General Petroleum Corporation of California" (later the Mobil Oil) issued a credit card to its officials and a few carefully selected clients. The issued card, which takes the form of metal plates, had a recorded information on each client who had a credit line. At that time, The Western Union handed over a metal plate such its most loyal customers and the

telegraph company in 1915 to issue plates for its main customers and identify and authenticate their telegrams.[1]

The advance took credit cards occurred in a relatively short period and went hand in hand with technological advances. Its size is directly related to technological innovations, particularly Internet and the rest of the media.

The first modern form of card appears only in 1949 when Frank McNamara along with his partner, Ralph Schneider, created the first credit card payment in restaurants, with Diners Club Card brand. In a few years, the card would be accepted by thousands of traders. In 1951 there were 20,000 such cards. Diners Club Card will be recognized as a new payment instrument.

Banks soon found McNamara's success and began to develop payment systems on the same principle but with some improvements. Profits were realized from fees charged owners. Their number was higher, the banks had higher incomes. Institutions such as American Express and Franklin National Bank began an offensive to popularize the real card.

In 1958 there is a leap forward in the history of payment cards, due to U.S. Bank of America Bank of San Francisco, which introduced the universal precursor of the modern card, called BankAmericard. The Bank of America bank card quickly proved that there is an extended market for bank credit cards and universal (general purpose), in that it is accepted by any merchant participating in the payment system for buying any kind of product and that any of its holder to buy on credit.

Gradually banks have found another opportunity and profit: the interest. From business based charging, the cards have become a huge business based on charging interest. The concept "buy now pay later" has become extremely popular in a very short time. The banks have realized that profits from consumer loans can be higher than in commercial loans.

In 1976, the BankAmericard cards have become the well known Visa and Bank of America, together with other associated banks and going through several transformations, is Visa International. Visa International is a huge cooperative association of banks that serve the same regulation and jointly contribute to the development and operation of the association. Other international electronic payment systems will be developed later, being more or less inspired or shaped by Visa. Thus, in 1966 and still having originated in Bank of America, has 17 U.S. banks formed association Interbank Card Association (ICA), which eventually became no less famous then International MasterCard with its own private telecommunications network (BankNet), the main competitor and rival Visa. The two systems of electronic payments by cards currently hold about 90% of the market.

The fictitious money on the card can give the false impression that they are inexhaustible.

3 THE BANKING CARDS IN ROMANIA

The principles of organization card payments by the banks in Romania are set out in Regulation no. 6 / 14.11.1995, which is to lay down the rules applied in the service activity funds transfer and settlement of payment card.

The year onset bank cards in Romania is 1992 when a group of banks: BankAgricultural, Romanian Commercial Bank, Romanian Bank for Development, Bancorex Commercial Bank "Ion Tiriac" and in 1995 and BancPost, set up card programs in Romania, banks engaged in card issuing and in creating conditions for acceptance these payment instruments as a means of settlement in the Romanian economic environment. A first step was the accession of the program banks of Visa International and Europay systems worldwide, and creating specialized departments dedicated bank card operations.

Since 1993, banks have initiated programs for processing transactions on cards issued by international banking system. To this end, was formed the ROMCARD company specializing in automatic processing operations performed by cards. Romcard also acts as a related entity (interface) between the Romanian banks and international use of the card system. Romcard offers

the advantage of obtaining the Romanian traders, the authorizations in a time of 30 sec., and provide foreign settlement facility within two business days.

Another important step was the issuance of cards in local currency. Starting in 1996, the Romanian commercial banks have started issuing the cards to cover the value in local currency denominated deposits.

Use by Romanian companies issued cards VISA or Eurocard / Mastercard, involves favorable effects on import-export activities such as foreign exchange risk limits and actual use of foreign exchange payments.

The romanian market the cards, although it was in the beginning, is characterized by a diversification of products. Thus, BRD launched its first national card, called the first card issued under a deposit agreement in lei. Overcoming their availability is allowed for the payment instrument, within the coverage within 30 days.

Among the products launched by other banks we noted: "Agricultural Bank Visa Classic"; "Europay BCR Maestro"; "BCR VISA Classic"; "BCR Eurocard - Mastercard"; "Banc Post - VISA Classic Thrive"; "Ion Tiriac Bank - Eurocard Mastercard" which highlights traders prefer to use these payment instruments, compared with cash payments.

In this paper payment cards in Romania, the authors Red-Hamzescu, and others, MONDO Publishing-EC, Craiova, 1997, payment cards fulfill different functions such as identification, debit and credit. Starting from these relations that arise are very different. Such identification card when we deal with relations between the holder and issuer and subject of these relations and the account balance is included in it, if we deal with a credit or debit card, present client, beneficiary and payer's account manager. This book uses paying customers to adjust its debt to the trader substituting payment by check or cash. If the check is a payment, the order book is nothing but generating matrix of the wire.

When a bank issues a payment card, it opens holders who are natural persons or legal accounts. The bank is required to ensure their full monthly account statements containing the following specifications: amounts relating to transactions, bank fees, interest on deposits side, bank interest charged for loans, date of transactions, merchant name and location where operations concerned, etc. [3]

4. THE CARD. CONCEPT, CLASSIFICATION AND FEATURES

The credit card is a means of cashless payment and settlement, enabling cash withdrawals from ATMs counters, which provides the owner authorized the purchase of goods or services, financial linkages between traders and consumers

The literature in banking practice meets these criteria for classification of cards:

1) By the way of information storage and security features of the card;
2) After the functions performed;
3) After the quality of the issuer;
4) After the transaction.

1) By the way of information storage and security features of the card
- Magnetic stripe cards;
- Microprocessor cards.
2. After the functions performed
- Debit cards;
- Credit cards.
3. After the quality of the issuer
- Cards issued by banks;
- Cards issued by non-banking companies.
4 After the moment when is using the transaction

- Payment cards before (frontloaded);
- Pay now (debit cards);
- Pay later (credit cards);
- Card dealer (retailer card);
- Card charges (charge card).

The cards have some common features:
- Presents card in plastic, standard size and thickness;
- On the card is printed by printing (embossing) or laser engraving: the issuer's name, the card number, the duration, the name of owner;
- On the reverse of the card issuer is printed a logo, a hologram security standard;
- On the reverse of the card is always applied magnetic tape registration elements and signature space designated owner;
- These common features provide uniformity card technology and universal recognition. [1].

5. THE ELEMENTS OF SECURITY OF THE CARD AND THEIR PRESENTATION

The card features special material must be of PVC or other material PVCA or fulfill the same features such as polyester or polyethylene, resistant to deformation: the book must allow deformations (bending, not folding) occurring during normal use in a device read or print without prejudice the operation of the book; rigidity: if the book is too flexible it could not be used under normal conditions.

The physical characteristics of the cards are: flammability, chemical resistance, toxicity, humidity, light, heat stability.

The card thickness was determined taking into account the human factor: young, orientation, insertion and retrieval easy, convenient pocket.

The plastic card printing is mainly used to soften at 50 degrees Celsius. Allowing this card, there where created the characters in relief on their stamping. The payment card sizes are subject to international standardization in this area (ISO 2894), and the format is retained to 86x54x0.76 (in millimeters) with low tolerances.

5.1. THE MAGNETIC STRIPE CARDS

The magnetic strip card is located on the backs, which can be protected by a thin plastic film (overlay). The tracks of tape magnetization corresponds to the various networks of transmitters, the style of card reader devices (ATMs, payment terminals) must be adapted to the characteristics of all network cards used and must take account of factors likely that can affect the magnetization tracks. In order to allow an international payment, the card standard was needed to support both itself and the information contained therein. After these requirements, it was prepared using two formats for magnetic tracks.

5.2. THE TRANSAC FORMAT

It is called as the French manufacturer who has developed the first magnetic cards for cash withdrawal through vending machines bank notes. These magnetic tracks were known as T2 and T3, they are used to automatic first French are used today along with tracks ISO1, ISO2, ISO3, corresponding to ISO format.

The information can be recorded on the tracks that follow the format Transac and they are: T2: copy of identity banking service code and PIN (Personal Identification Number), T3: time of validity, date of withdrawal operations, limit withdrawals and number of weekly PIN attempts.

5.3. THE ISO FORMAT

These were finalized after developing Transac format, the ISO track covers the following information: ISO1: 68 characters, fixed length (ISO 3554). This track is divided into three areas,

and it contains the following data: the first card number, name bearer in the second-by date, service code, the PIN verification, an area of 68 characters for the whole competition track for the third area. ISO2: 40 characters, fixed length (ISO 3554). This track consists of two parts: the card number in the first area and the second area includes: the validity date, service code, area confidential check code, a free competition in the 40 characters for all track.

ISO3: 107 characters, fixed length (ISO 4909), is a complement to track ISO2 and its encoding is optional. This track is divided into two areas: country code, currency, currency type, the total amount authorized per period, the balance available for the current period, the period start date, duration, number of tests of the code of confidentiality, the nature of accounts, date of validity, are among other elements the first area and the second area includes: a code structure, operating a number, date operations, the total amount authorized period, the balance remains available in the current period, on commencement of the period and duration.

Following these rules can make the following observation: only tracks ISO3 and T3 can be deleted to reset totals or authorized regular operations. T2 lanes, ISO1, ISO2, can only be read.

The magnetic cards have limits, they are related to technological and capacity of the runways and the degree of security they provide. These limitations include: limited capacity, security questioned where we need to discuss the risks of using the card, damage due to prolonged use, vulnerability to fraud, protect information, and a future compromise.

5.4. THE BOOKS WITH ELECTRONIC MICROCIRCUITS

These books include a microcomputer, on the one hand, only with the memory cards, without any "intelligence" and any protection and on the other hand, smart protected cards to access the memory area. In this section we understand payment card memory card with electronic microcircuit (CME) protected by security means.

The microcontroller book was invented in 1974 by Roland Moreno and the book has several advantages over tape. This book was the first means of disseminating information with logical access security architecture features a multi-dimensional, with a certain autonomy characterized by responsiveness to external events (blocking circuits after introducing a number of times the PIN wrong site) with a capacity calculation etc. The choice of components on the market to be a microcircuit card depends on your application needs to be done with it. These components are: electronic memories, processing units, micro-modules.

5.5. MICROPROCESSOR CARDS

A microcomputer can contain the same component of a microprocessor, different memory, registry status, data and address buses. Some companies have developed microcontroller cards with "two-way" and even "multi-chip". Microcircuit contains, besides the microprocessor itself, a music program, working memory and data memory. The information stored in the microcircuit is organized in words of 32 and they serve as indicators of system status, which is programmed to act differently depending on the value of those bits.

These bits are:
- A bit of validation, it indicates if the word is written or not;
- A bit that specifies the type of transaction: money or service;
- A bit of memory protection: secret word or unclassified;
- A bit starting block.

The operation of a microcomputer depends on keys introduced at different stages of life card:
- The key manufacturer: it protects the card to personalize it. Consists of the card serial number, indication of the manufacturer, card type and other information;
- The key Bank is the need to record a level of expenditure and its frequency to change the PIN. This key is specific to each card;
- The transaction key used for the calculation certification transactions;

- <u>The opening key words or Service</u> authorizes access to memory for one or more previously established providers.

If a card is inserted automatically, the microcircuit identifies it. If its components are operational, he expects orders to the PLC where it is connected. If the state control and the automatically procedure are correct, the card will respond to its various applications, such as identification card application, confidential code verification, application for registration of a transaction, record the information in the memory etc. [2]

6. THE CARD PAYMENT INSTRUMENT WITH AND WITHOUT CASH
6.1 THE CARD PAYMENT INSTRUMENT WITHOUT CASH

The credit cards are a simplified form of payment.

The card is a cashless payment instrument by which an owner may be authorized to pay for the goods or services purchased from authorized dealers or get cash from the issuing bank. Thus, the card offers to its holder the following facilities:

- On the one hand, a card holder can withdraw cash from their account (for this it uses special devices such as cash vending machines);
- On the other hand, using a card can pay the equivalent of a good or service, so based on an agreement between the payment card holder, issuer and trader of goods or service.

Thus, can be a group of these two big cards criteria:

A. After the facilities it provides:
- The credit card (credit card);
- The store card (card shop);
- The debit card;
- The cheque guaranteed card;
- The multifunction cards;
- The smart card (smart card).

B. After the issuer:
- The banking cards;
- The private cards (issued by retailers);
- The cards issued by other institutions and organizations.

As it follows, there are some card types listed above, along with highlighting the main benefits arising from their use for each participant in the transaction: cardholder, its issuer and merchant (store that accepts payment cards). [3]

6.2 THE CARD. THE CASH PAYMENT INSTRUMENT

To release cash in banknotes and transfer funds for payment of services, providing account information using ATMs that are safes with notes, a counting mechanism, and another taking notes and transport are operated electronically, and a locking device connected to the alarm user to display a screen instructions so there is a payment card entry slot to convey information to the bank's computer center and receiving the answer, a keyboard to key money or payment for services requested and a slot with a cash drawer release.

The cashing procedure is as follows:
- Introduction of the payment card bay (card reader);
- Typing PIN (allowed only two typographical errors, in the third mistake is retained ATM card);
- Typing the desired amount not to exceed the limit specified in the Convention;
- Release cash and debit card personal account;
- Restitution payment card;
- Release receipt.

Payment transactions appear in the menu that is displayed, of which the most common concerns:
- For services such as telephone bills, electricity, gas etc.
- Loan repayments, interest payments, commissions etc.;
- Obtain account balances and other account information;
- Obtain the financial information market (interest on deposits, loans, securities or other securities);
- Cash management operations.

By typing the chosen menu, the requested data is processed, then waited and the solicitation transaction confirmation is optional.

7. THE MANAGEMENT OF THE CARDS

The credit risk management portfolio focuses primarily on cards issued by banks.

The conditions of developing banking risks are determined by the expression of several factors that depend on general evolution of the economy, changes in organization bank, financial decisions, political and economic conditions.

The operations management with cards is in connection with the risk management.

Relative to risk, they refer to: operational risk, reputational and legal risk as the major categories of risk, especially for international banks.

The operational risk can arise from a failure to correct the system of electronic money or electronic banking and the development or inadequate implementation of these systems. In this category fall the following risks:

The security risk**:** this risk may be increased if the banks fail to incorporate adequate measures to detect and prevent counterfeiting.

The risks associated with the design, implementation and maintenance of a bank is the risk of an interruption or slowdown systems, whether electronic bank or electronic money bank elected not compatible with user requirements.

The risks that arise due to misuse by customers of banking products and services, are increased when a bank fails to properly educate customers on security precautions, the existence of appropriate

measures to verify the transactions, customers may reject transactions that they have approved in the past, thereby creating numerous bank financial losses, the bank may suffer financial losses due to unauthorized transactions. Money laundering can be another source of concern.

The reputational risk is the risk due to significant negative public opinion, it is important not only for a single bank, but it is important for the entire banking system.

The legal risk is the violation or noncompliance with laws, rules, regulations or practices prescribed.

Other risks, such as credit risk, liquidity risk, interest rate risk and market risk are risks that can occur in electronic bank activity.

Inadequate procedures which determine the credibility of borrowers seeking loans through electronic channels can lead to credit risks bank

We decided to do an analysis of performance related bank card risk management, analysis during the crisis and measures to reduce or remove it, based on risk management, which means their identification, assessment, quantification and strategy counter their respectively solutions of some levers to alleviate or even eliminate the possibility of occurrence or the consequences that would occur if they appear.

8. METHODOLOGY

We took into account the existing research, the evolution of the economy reflected in GDP growth, the evolution of inflation, monetary stability. The banks depend on a country's economic condition at some point upstream because monetary policy decisions that the central bank are

applied through banks and banks downstream draw their resources and made investments in and nonbank environment, generating results macroeconomic level and at the same time affected the overall evolution of the economy. The card is an issue often addressed in recent years, as is the current theme is in line with recent research and trends which are in the banking system on the new requirements for risk management and reporting as Basell 2.

It is interesting that the crisis increased the number of cards though as value, witnessing a decline in value thereof.

9. CONCLUSIONS

The advantages for the owner of credit card are:
- The holder of a credit card, the buyer, can choose when he is making certain purchases, because the credit is available, you can buy a product when you need it, even when there is available in its account;
- Cardholder may, as we have seen, pay the debt in full receipt of balance situation, or to pay the balance in monthly installments, if the debt is paid in full, the credit card holder can get a loan without interest for a period of up to 56 days;
- The transactions are carried out more quickly than the check, if the store (retailer) is equipped with appropriate equipment (terminals for electronic transfer of funds), the procedure will be the only card insertion device, but it will take to process and transmitting the data recorded in magnetic tape, automatically will generate the bill and will issue to the client.
- Advantages for the retailer:
- The merchant account is immediately credited with the value of goods or services sold based on credit card when confirming sales documents (invoices, receipts, invoices) are presented to the bank for payment;
- Offering goods on credit, credit card accepting merchants attract more customers, compared with those who have introduced this method of payment;
- Operating with credit cards, the merchant is burdened with much of the costs and risks involved in using cash;
- To improve customer service, as a part of the big chain stores enable customers to obtain cash by presenting the card, the customer, this is an added bonus, and the trader is a way to "convey" cash without expenditure for such an operation.
- Advantages for the banks:
- Allow increasing automation of operations, thereby reducing the volume of operations manual;
- Reduces the cash operations;
- Interests in transactions with credit cards are higher than for most other forms of borrowing;
- Fees charged to merchants who accept payment by credit cards for goods and services they are a source of income taken into account for the bank, I called this bank revenue from the fees they pay merchants and companies that are connected to the network can carry out transactions using cards.

At the same time with the development of market and consumer behavior of Romanians, the growth rate of cards market accelerated. Of course, infrastructure and acceptance network were very important, they are the factors that allowed the widespread use of cards.
Currently, any natural person or legal entity is engaged in commercial relationships involving financial transactions, the electronic payments having an important role, representing virtually future transactions, both nationally and across borders.
The financial institutions have made a more rapid segmentation of the portfolio of cards and began to focus increasingly on services and benefits situated behind the payment instruments. Meanwhile, cardholders were becoming more educated and sophisticated, knowing what to ask of cards. More, many financial institutions have adapted so that network to accept chip cards.
On the Romanian market, the chip cards will increase which are much more effective in terms of security transactions, as well as for co-branded cards, that offers the possibility of the loyalty of the customers. They will try to get as many benefits from different types of cards, but at the same time, they will focus on niche products, business cards, cards for shopping or for payment of public services.
The scientific paper aims to capture aspects that emphasize the fact that the permanent market monitoring and the continuous adaptation of it will become necessary for the next period. The current client is more demanding, more educated and less tolerant in the relation to the suppliers of any kind and especially with those of financial services.
The tendency to use co-branded cards for everyday payments will increase as merchants and issuing banks will attach more and more benefits on these cards, which will ultimately increase trading volumes on the card to merchants. The bank clients benefited of the cutting - edge technologies, of dual cards functionality - debit and credit.
Keywords: cards market, crisis, markets segmentation, personalized card, co-branded card
JEL Classification: E42, E50

In a computerized society, on a global and strong competitive market, the spreading of the electronic transactions is very dynamic both in the economic and banking fields. The banking sector is characterized by a high dynamic of services and products offer (e-banking, e-payment, m-banking etc.). The development of some commercial activities between the participants placed at large geographic distances can not exist without using electronic payment systems. The introduction and use of the electronic payment tools ensure a better administration of the companies business and cash in a shorter period of time and with reduced costs. The cards represent electronic (modern) payment instruments.

To ensure the success of the banking activity to impose the cards as payment instrument in the Romanian economy, it might be necessary the achievement of the following objectives: (Vechiu et al. 2009: 106-107)

- the design and putting into place in a short period of time an « aggressive » promotion program of the card as a payment instrument. The concise and convincing articles launched in the writing press, the suggestive publicity clips presented many times on a day in the visual environment and other actions can generate the attraction of the individuals and legal persons in using the cards. It is unanimously recognized the fact that the success of one product launch is related, in proportion of 70% of the quality and efficiency of the implemented publicity campaigns. Taking into account the increased costs of the publicity activities, it is necessary an efficient message leading in mass-media. Throwing on the market, publicity slogans as "X card is the future but also the present" is on the detriment of that bank because no matter of the veracity of the message sent, the patterns create only the idea of some dangerous receiver leveling. In order to avoid such inconveniences, the bank must clearly define the product that will launch and also the market segment addressed to. In this manner, the product will be received especially by the target subjects and the product success will be immediately.

The Romanian banks will succeed also using publicity campaigns, in a short time, the development of a new payment behavior in the economic environment;

- setting-up of some specialized departments within the banks to ensure the design, implementation and administration of an integrated cards program. The activity involving cards needs specialized and sustained efforts, but also the twinning of work results of a strictly specialized personnel exclusively for this field (marketing, publicity, behavior sociology on the market, banking methodology). In order to obtained the estimated results, it is absolutely necessary a strictly specialization of the banking personnel working in this field. Solutions like borrowing staff from credits, payment or banking treasury departments mean only a superficial approach of this new field and the solutions can occur late due to the behavior lack of involvement. Without making the apology of the market behavior studies or of a «banking philosophy», it can be considered that a positive financial result will occur late if the banking personnel will not be responsible of the product optimal functioning as a result of the day by day activity.

2009 was the first year of the Romanian cards market history when the number of valid cards in circulation was less than 2008. Nevertheless, in only 10 years, the number of cards in circulation increased more than ten times. In 2009, was the same situation also in other 13 European States. Romania was rated on the third place with a diminution of 5% of the number of cards in circulation (also in Bulgaria), after Greece (13%) and Irish (8%).

In 2008, the cards market was characterized by important launches being also continued the trend started in 2005-2006 which marked the diversification of the financial institutions products portfolio and the issue of different types of credit cards: standard, co-branded or premium. The financial institutions introduced a more accelerate segmentation of the cards portfolio and started to emphasize the services and the benefits of the payment instruments. In the same time, the cards holders were more and more trained and sophisticated knowing what to ask about cards. Moreover, in 2008, most of the financial institutions adapted their network in order to accept cards with chip.

Otherwise, out of the 25 new programs launched by the MasterCard in 2008, only 2 programs were debit cards (the debit card „Marea Unire" launched in partnership with Leumi Bank – special edition and a debit card in euro launched in partnership with the „Carpatica" Commercial Bank), the rest were credit cards, special editions, with chip or co-branded.

In comparison with 2008, 2009 was the year of reduction the operating costs, materialized through the diminution of the cards portfolio – through closing the inactive accounts – till the renouncing of some acceptance contracts with traders which didn't generate transactions. So, in the end of 2009, although the issuing activity was not stopped, the valid cards portfolio in circulation was about 12.8 mil. of cards, with approx..3.5% less than the level registered in the end of 2008.

The most sever contraction was registered at the credit cards, which beginning with March 2009 until June 2009, were reduced with almost half of a million. Practically, in only 3 months, it was negated the increase registered in an entire year (March 2008 – March 2009). This portfolio „cleaning" had instead a benefic effect because led to the increase level of activation, regarding the cards weight that generate transactions in the total number of valid cards, from 81.6% in September 2008 at 89.1% in September 2009. Also, another crisis reaction was the adjustment of the portfolio for the traders by keeping only the ones with activity.

Despite the heavy economic context, the market of the bank cards had actually a positive evolution. In the end of 2009, the Romanian National Bank statistics showed that the number of the payment transactions by the debit cards reached 16.3 mil. Euro, from 14.33mil. Euro in the first quarter of 2009 and the number of the payment transactions by the credit cards reached 4.22 mil. Euro, from 4.03 mil. Euro in the first trimester.

Due to the crisis, the total card portfolio (banks and non-banking financial institutions) decreased during December 2008 – December 2010, with one million cards until approx. 12.6 mil.

In 2010, the Romanian cards market continued to be active in all aspects – issuing, acceptance, transactions – that led to a significant increase of the main indicators in the field. The innovation and the thematic segmentation represented important landmarks for the non-cash payment activity. The bank clients benefited of the cutting- edge technologies, of dual cards functionality – debit and credit. The operators from these fields attached to the cards additional loyalty benefits, such as: discounts to the traders, opportunity of cash back, favored access in the waiting rooms from the airports, insurance offers, assistance services.

According to the RomCard, the electronic commerce with on-line payment increased in 2010 with 38% in comparison with 2009 and the volumes of the transactions were twice compared with 2008 reaching 127.8 millions euro.

In 2010, the contraction trend of the cards issuing was maintained, thus in the end of 2010, from the total number of the cards issued, the number of the valid cards was about 12.58 mil, of which 2.1 mil. were credit cards. The cards total number decreased with 2.2% in 2010, but the number of the credit cards decreased with 5.6% in comparison with 2009 and with 22% in comparison with 2008.

Taking into account the heavy economic environment, most of the credit cards holders focused on buying essential products. The average amount of the transactions using the credit cards decreased with 11.6% underlining that the Romanian citizens reduced the large amounts of expenses, in other words, they are not buying any more expensive products like they did in other years. The segment of business cards registered a positive trend on all the indicators, there were issued more Visa business cards (+12.5%), the transactions on those cards were increased (+25.7%) and the number of transactions to the traders was also increased (+26%) which indicate the increased interest of the companies to use cards.

In 2011, Visa encouraged even more the card use for traders through awareness raising campaigns, promotions, products and new services and will continue to enlarge the acceptance network also for the local and central public authorities in order to be possible to pay the taxes and other contributions using the card.

During the financial crisis, the banks are looking for solutions, in this matter, in 2010, MasterCard Europe developed a study in Romania focused on the market cards that analysed the habits related to the cards use by the persons aged over 15 years. The study indicated that during the crisis, people are paying more attention to their expenses and the cards holders try to benefit of those products advantages. For example, 27% of those people, started to search more information about the financial products, 13% of the persons told that they are paying their buying in the grace period, 11% searched information about the loyalty programs, 10% are paying frequently with the card to the traders in order to avoid the cash withdrawal fee and 9% started to find a credit card with the possibility to pay in several installments without interest.

At national level, 41% of the Romanian citizens hold a credit card and at urban level, the percentage is about 54%. The percentages are very much influenced by the education level, from 20% of the persons with primary education until 86% of the high-educated persons.

Most of the Romanian citizens buy a credit card as a result of the bank offer – 39%, in order to have any time at their disposal an amount of money – 34%, but also in order to facilitate the transactions – 27%. Regarding choosing one credit card or another, the most important are the small commissions and interests – for the 63% of the people and the issuing bank – for 53%; the grace period is important for 38% and the maximum credit allowed for the 36%. The high-educated persons are even more interest on those aspects: for 78% of the persons asked, there are important the interests and the commissions, for 50%, the grace period and for 46%, the maximum credit allowed.

The Romanian marked registered important steps, 17% of the holders said that they are paying by card even for the amounts less than 100 RON. 21% of the credit cards holders agree on this kind of payment. For the amounts more than 1000 RON, the percentages increase at 27% and 32% for the credit cards holders.

In the same context, the study "saving and investment" developed by the Romanian GFK Market Research Institute, on a panel of 1,200 persons from urban area which use at least one financial-banking instrument, shows that in our country, the most used banking product is the debit card. This, with the exception of the current account is hold by three quarters of the banking clients. Lately, the banks target was not only the increased number of the debit cards but the customers training for using them and also the credit cards.

Table no. 1. The main operators of card market at 31.12.2011

Despite the crisis which affects the banks cards portfolio, on 7th of June 2011, at NOCASH Gala for the banks activity in 2010, the cards industry awarded BRD-InstantPay "The pioneering in the payment industry without cash" and "The year opening" was considered the money transfer service at ATM launched by Western Union in partnership with "Transilvania" Bank.

The Commercial Banks competed on a restrained market due to the financial crisis, but even so, they obtained important results, for example:

- the best promotion. The competition was between the Romanian Commercial Bank-Bucharest Autonomous Transport Administration (RATB) with the campaign « We keep your place for an year » for the promotion of the operations regarding the charge/recharge of the RATB transport card in the Romanian Commercial Bank network; the BRD with the campaigns « A la carte » - « Create a card as original as you », « Point Card » and « Instant Pay » - « Live in speed, pay in super speed » ; The Romanian Bank with the campaign « A smart card for intelligent buying » ; the "Transilvania" Bank with the campaign « Pay by card the local taxes and contributions » ; Garanti Bank – Bonus Card campaigns for the product increased use and to build the brand on the market ; Raiffeisen Bank with the campaigns – Multishop – bonus and installments without interest program and «Studentocard – it fits perfectly to your lifestyle ». The winner was GarantiBank – "Bonus card Campaign", because after the promotion campaigns, GarantiBank obtained the following increase in 2010 in comparison with 2009 : cards portfolio with 52% increase ; active cards with 62% increase ; the number of transactions with 230% increase ; transactions value with 270% increase.

- pioneering in cards industry registered BRD – Instant Pay – for the first development of an application that allows the travel payment in the public transportation using the « contactless » technology ; The Romanian Commercial Bank – for the opportunity to recharge the Active Transport Card directly to the ATM placed at the Subway.

- the Year Bank on cards market is « Transilvania » Bank. In 2010, the bank registered the most important increase of the valid cards portfolio in circulation and of the POS terminals network. Also, the « Transilvania » Bank was the most active bank as regards the products and services launch in the market without cash payment

Table no. 2. The results of the « Transilvania » Bank between 2009-2010

Indicators	2009	2010	Increase
Cards	1,706,874	1,804,294	97,420
Cards accounts	1,570,432	1,667,307	96,875
No of ATM	766	805	39
No of POS	11,717	14,770	3,053
Contracts	9,619	9,223	-
Products launched	The card for doctors	Visa Gold Rotary; MC Gold Debit; Money transfer ATM "BT" application for iPhone and Android ; ADS implementation	
No. of transactions with own cards	40,836,093	44,806,455	3,970,362

Source: www.nocash.info.ro

- co-branded Card is still a solution for the financial crisis, this fact was also proved by the competition of the most important banking players for this product. Thus, the most successful card and co-brand program was Raiffeisen – Vodafone with the following results: number of transactions in 2010 – 1,760,000; the transactions value in 2010 - 220 mil. Lei; new card accounts in 2010 – 1,100. A similar success had: « Transilvania » Bank – Rotary ; BRD – ISIC ; GARANTI-AVON.

In this way, the banks are permanently looking for solutions and products to stimulate the customers interest for using the card for acquisitions, as a response to the traditional credit that was discouraged due to the financial crisis.

On the Romanian market, the banks offer cards with chip, more efficient as regards the transactions security, also in the case of co-branded cards which offer the possibility to reward the loyal customers. They will try to obtain as much as possible advantages from the diverse range of cards, but, in the same time, they will concentrate on the niche products, business cards for purchases or payment of public services.

The Romanian citizens started to use co-branded cards which are actually credits. Their number increased rapidly to 300,000. Apparently, the banks which work with the co-branded cards are not obtaining major profits because if the loan is paid in less than a month, the interest is zero. But sooner or later, everybody is late and the bank has also other advantages: it is promoted outside the branch and has cards sold through shops. In the business world it is a word „to sell on co-branded card means to sell more and better". The trend to use the co-branded cards for usual payments will be accelerated when the traders and the issuing bank will give more benefits on those cards and in the end it will lead to the increase of the transactions volumes on card to the traders. Moreover, in the last period of time, the banks are negotiated with many retailers, reductions for their clients.

In a crisis period, the creativity was also tested in terms of cards. The careful products segmentation – personalized cards, photo cards, offers for young people or women was one of the cards market characteristics.

The card from the wallet can be more than a payment instrument. Custom with the client picture, perfumed or decorated with a small mirror, the plastic card becomes a real accessory. The everyday polyvinyl chloride (PVC) is more attractive if it has something different, a reason for the holder to take off more often from the wallet. Actually, they are payment instruments that can be used for shopping, to on-line payment or to POS of taxes and contributions but also to the simple withdraw of cash from ATM. Moreover, in the case of the cards with photo, the holders identity can be easily checked by the traders.

Also, with the support of the member banks, the Local Office of Visa Europe will introduce innovative products to meet the clients needs, as follows: contactless cards, cash back service, on-line payment of the taxes and contributions.

For the development of cards use at traders and of the co-branded card, the banks must better explain the card advantages starting from the way of working and to the convincing of the obtained advantages accepting as payment the banking card. Also, the bank must play the client « role » and to think viable reasons to determine the trader to accept the card, to convince that in this way, the selling will be increased. The mentality of each trader is the same no matter of its typology or size: it presents a well-known product and he knows that it will be sold;

- paying more attention on the products/services quality and also on the quality of the client-bank interface (the easy access of the bank)

- in this period of time when the clients are paying more attention at what they pay and what they get, the remote electronic channels have great chances of promotion due to the efficiency, accuracy and the decreased operational cost;

- it is necessary the compensation of incomes from interests with those from commissions. It will be necessary to increase the level of cards use and to develop the offer of higher added value for client;

- the cards industry will oscillate between two approaches – to continue independently, at the level of each issuing/acceptant body, on the basis of some bilateral arrangements with partners from different fields or to make the step to a systemic collaboration, in national projects to solve major clients expectations (the unitary payment of taxes and contributions, invoices, penalties, health services etc.). On this trend of collaboration, there must be speculated the serious opportunities for the enlargement of the actual EMV technology (global standard for the debit and credit cards based on chip technology) with connection to the contactless, which may cover,

for example, the public transport and also all the payment applications of small value that need a big execution speed. (Moga et al. 2011: 38-44)

The banking business with cards, in general and with the co-branded cards, in particular, represent an important potential to obtain profit in the case of the banks which are engaged in the design and administration of some cards integrated programs. Taking into account the permanent interest of the Romanian banking companies to modernize their activities and to adopt the world techniques to operate at the medium level of payments from our country, it is for granted that the payments by cards will become a daily reality in a short period of time.

The Romanian cards market was characterized in the past years by an increase of two digits, being one of the most active from the region, on all its components: cards issuing, dynamic of setting-up of new POS and ATM terminals, payment transactions volume or cash withdraw. Although the first cards were issued in Romania about fourteen years ago, the behavior of the cards holders is specific to the incipient market, respectively, only 12.5% of the transactions volume are performed to the traders (the rest being cash withdraw from ATM).

As a conclusion, the period in which any actor in the market had rapid and consistent results on the base of classic patterns is coming to an end. There will survive only the ones that will combine the quality with the price, the technology with the efficiency and the imagination with the implementation speed.

REAL AND NOMINAL CONVERGENCE, THE SYNCRONIZATION OF BUSINESS CYCLES BETWEEN THE NEW EUROZONE MEMBERS (NEM) SLOVENIA, SLOVAKIA, CYPRUS , ESTONIA AND THE CORE EUROZONE

Zapodeanu Daniela
University of Oradea, Faculty of Economics

After the accession of newly members in the European Union in 2004 and 2007 these countries are expected to adopt the common currency: Euro. The nominal convergence must be achieved until then as the Maastricht treaty implies but in order to be an Optimum-Currency-Area (OCA) these countries economies are expect to behave similarly to those of the Eurozone. We test the synchronization of the business cycle between the EU12 and Slovenia, Slovakia, Cyprus and Estonia using as a measure their GDP evolution . The GDP for all the states are seasonally adjusted using the X12-ARIMA methodology, we apply the Hodrick-Prescott filter in order to capture the trend and cycle of GDP, using the correlation coefficient we test their level of synchronisation. The main findings are that their level of synchronisation has rise over the 1995-2011 period, also adopting the common currency Euro doesn't seem to have an impact on the level of busyness cycle synchronisation.
Keywords:Eurozone, business cycle synchronisation, Hodrick-Prescott filter, Optimum-Currency-Area

1. Introduction

The monetary union means adopting the same currency by at least two countries, Euro area, or that of the most important commercial partner, the dollarization in Latin America (Ecuador, Peru). For Romania an important significance has been given by the "Euro zone"; now that our country is a EU member, it should focus on continuing the process of integration into European economic and monetary union and the next step is to adopt the Euro. The benefits of achieving a monetary union are related to the existence of an optimal currency areas where an optimum currency area is defined as a geographical region in which the member states must use fixed exchange rates or a single currency. (Mundell, 1961) presents the criteria that a country must satisfy to be part of an optimal currency area: business cycle synchronization, high degree of labour mobility, diversified production, a high degree of openness of the economy and symmetry to the external shocks.

Table 1. Nominal convergence in 2010

Country	HICP Inflation	Gerneral government deficit	General government gross debt	ERM II membership	Exchange rate vis-à-vis euro	Long term interest rates
Reference value	**max. 1%**	**max. 3%**	**max. 60%**	**min. 2 years**	**+/- 15%**	**6%**
Bulgaria	1.70%	2.80%	17.40%		-	6.9
Czech Republic	0.30%	5.70%	39.80%		2.6	4.7
Hungary	4.80%	4.10%	78.90%		4.5	8.4
Latvia	0.10%	8.60%	48.50%	since 2 May 2005	-0.4	12.7
Lithuania	2.00%	8.40%	38.60%	since 28 June 2004	-	12.1
Poland	3.90%	7.30%	53.90%		8.4	6.1
Romania	3.40%	2.40%	30.50%		2.9	9.4

Source: ECB Convergence Report, 2010

A preliminary stage of adopting the Euro is compliance with the fulfilment of the convergence (Tabel 1) criteria of the Maastricht Treaty (1992): the average inflation rate should not exceed with more than 1.5 percentage points the average of the most performing three members, the long-term interest rates should not exceed with more than two percentage points the average of the top performing members, consolidated budget deficit should be less than 3% of GDP, public debt should be below 60% of GDP, exchange rate fluctuations against the Euro should fall within a corridor of + / - 15% of the average level.

In this paper we investigate the correlation of business cycle between the Eurozone and the NMS who adopted Euro: Cyprus, Slovakia, Slovenia, Estonia.

2. Literature review

In his seminal paper of (Mundell, 1961)☐ which analysis the Optimal Currency Area (OCA) he finds that the economic benefit depends on the mobility of production factors, the level economic openness, economic diversification, wage and price flexibility, the synchronization of business economic cycles and the shock symmetry. (Frankel & Rose, 1997) finds that an optimum area is endogenous if countries have a strong trade and synchronization of business cycles, (Ricci, 1997) propose a two country monetary model of trade and observes that the benefit from adopting a single currency is correlated with shock symmetry, labour mobility, inflation differential. (Mongelli, 2002) in an analysis of the OCA discuss the specialisation versus endogeneity of the countries in an currency union, (Alesina & Barro, 2003) finds that there are well established Euro and dollar area but not yen area, (Blaszkiewicz, 2003) observe that Central and Eastern countries are having a high open trade with the European Union but only Hungary and Slovenia have shock correlation, (Darvas & Szapáry, 2004) analyse not only the GDP co-movement but also the industry, trade, consumption, services and investment, finding that for the core countries of European Union (Austria, Belgium, France, Germany, Italy and Netherlands) show a high degree of synchronisation, while for the periphery (Finland, Ireland, Portugal, Spain) countries the level of synchronization is lower, also the Central and Eastern European Countries (CEEC) Hungary, Poland and Slovenia are the most synchronized while Czech Republic and Slovakia are less synchronized and in the case of Baltic states they aren't synchronized at all nerveless the degree of synchronisation has significantly increased in the 1993-1997 and 1998-2002 period for all the countries. (Sander & Kleimeier, 2004) analyses the monetary policy in the Eurozone between 1993 and 2002 concluding that when using the monetary policy rate proxy the pass-through increased in the analysed period and that real and nominal convergence lead to a homogeneous transmission in the Eurozone. The European Union is not entirely an optimum currency area, there are differences in labour mobility, however, joining an economic union and then a monetary union showed that the euro zone economies become integrated as a result of monetary union (Baldwin, 2006). In their meta-analysis (Fidrmuc & Korhonen, 2006) review the existing studies on OCA and observe that Central and Eastern European countries, also the methodology used by research range from using HP and Kalman filters, supply and demand shock, VAR models to dynamic correlation, the date used are usually quarterly and sometimes monthly. The most of studies (Fidrmuc & Korhonen, 2006) are on new EU members while in the case of Romania and Bulgaria the number of studies are small, the highest correlations of the business cycle is for Hungary followed by Slovenia and Poland and only in the case of Lithuania are negative. (Afonso & Furceri, 2007) analyses the sectoral business synchronisation finding that industry, building and agriculture are the highest correlated sectors while the services sector has a low business cycle and volatility. (Bîtcă, Preotu, Radu, & Toniţa, 2007) analyze the synchronisation of CEEC's (including Romania) and finds that the level of synchronization is higher for the 2002-2006 period then in the 1997-2001, Romania and Bulgary have the lowest level of correlation. (Ionut Dumitru & Dumitru, 2010) test the degree of readiness of New Member States (NMS) using for extracting the trends and cycles from GDP the following

methods: quadratic trends, Hodrick-Prescott filter, Band-Pass filter, Beveridge-Nelson decomposition, Wavelet transformation and principal component analysis (PCA) the main findings regarding Romania are that the level of synchronisation is the lowest, but the level of correlation has increase the most for Romania and Slovakia, continuing their the research for Romania (I. Dumitru & Dumitru, 2011) finds that the demand shock are negative for Romania while in the case of supply shock the level of correlation has raise over the 1997-2009 period.

3. Data and methodology

The countries analysed are Cyprus, Estonia, Slovakia, Slovenia which adopted the Euro between 2002 and 2011, Malta was excluded because the data were available only from 2000. The GDP data series obtained from Eurostat are quarterly and span over the 1995-2011period. The GDP for the EU12 and the NEM (New Eurozone member) are de-trended using the X-12 Arima methodology, in order to extract the trend and cycle we use the Hodrick-Prescott filter (Hodrick & Prescott, 1997) and the Band-Pass filter (Baxter & King, 1995), in order to capture the level of synchronisation we will calculate the level of correlation in 5 years groups.

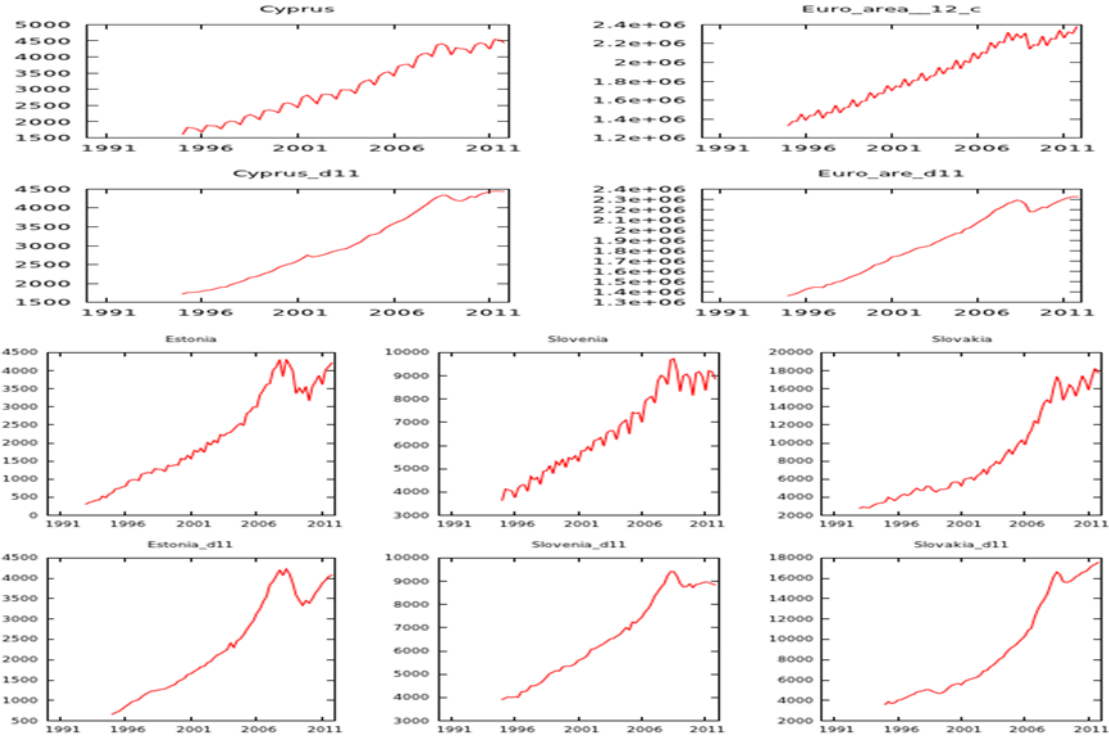
The Hodrick-Prescott filter has the following form:

$$\sum_{t=1}^{T} (y_t - \tau_t)^2 + \lambda \sum_{t=2}^{T-1} [(\tau_{t+1} - \tau_t) - (\tau_t - \tau_{t-1})]^2 \quad (1)$$

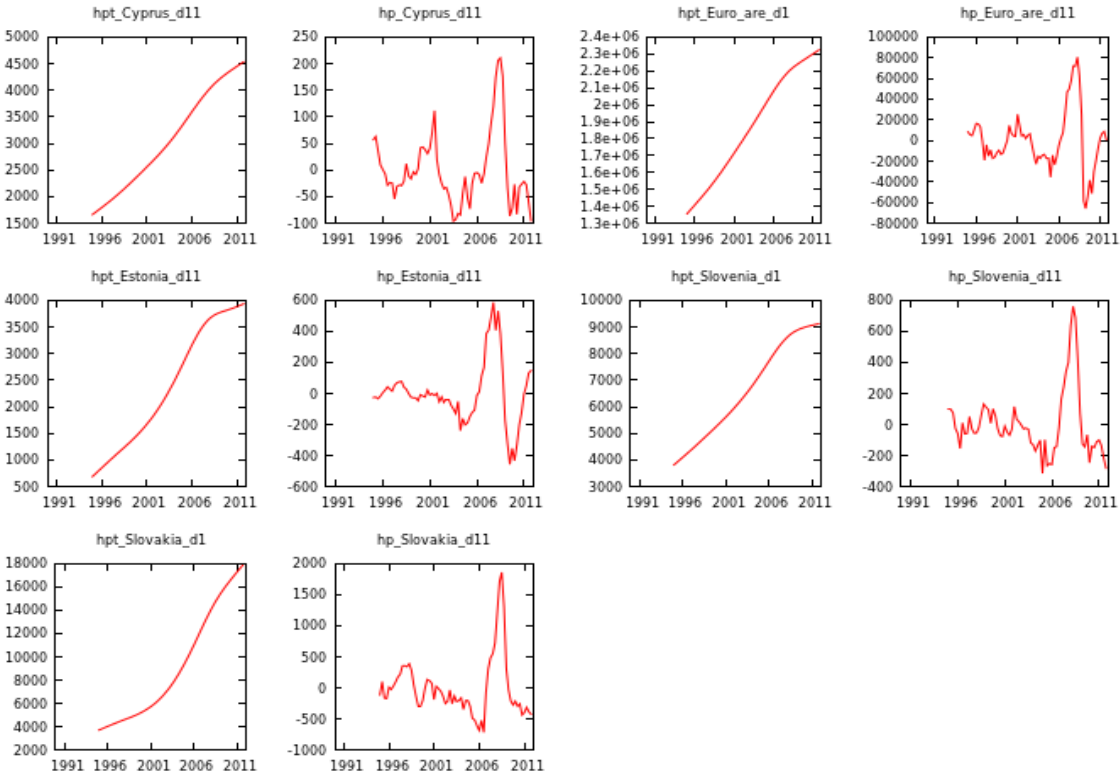
where λ is a penalisation parameter, which in the case of quarterly data will have the value $\lambda = 1600$.

4. Results

The evolution of GDP (Figure 1) for the period 1995-2011 has an upward trend, with the exception of 2008-2009 when the European Union was in recession, we will eliminate seasonal component using X12-Arima methodology.

Figure 1. GDP and GDP de-seasonal evolution 1995-2011


Where the variable: Cyprus, Euro_area, Estonia, Slovenia, Slovakia represents the GDP and Cyprus_d11, Euro_area_d11, Estonia_d11, Slovenia_d11, Slovakia_d11 represents the smoothed series without the seasonal influence. Applying the Hodrick-Prescott filter we extract the cyclical and trend component.

Figure 2. Trend and cyclical component


Source: authors calculation

Where hp represents the cycle and hpt the trend, we observe that the trend is upward for all the analysed countries, in order to capture the synchronisation of business cycle we will compare the correlation coefficient (Table 2) over the following periods 1995-2011, 1995-2000, 1997-2002, 1999-2004, 2000-2005, 2002-2007, 2004-2009, 2006-2011.

1.0000	0.7350	0.9608	0.7690	0.6519	hp_Euro_ared11

For the 1995-2002 period we find that Estonia, Slovenia and Slovakia are negatively correlated with the EU12 while Cyprus is linear correlated for all the sample period, the highest correlation is observed in the case of Cyprus 0.61 and the lowest negative correlation is observed for Slovakia. From 2000 on all the countries became positively correlated with EU12, so we can observe that for the last period the highest correlation is for Estonia and Slovenia, while Cyprus has a lower correlation, while Slovakia is the least correlated from the analysed countries. Nevertheless it can be observe that the degree of synchronization of the business cycles has an upward trend and we can expect that Slovenia, Slovakia and Cyprus to became more correlated in time. These countries adopted the Euro as follows: Cyprus - 1 January 2008, Estonia – 1 January 2011, Slovakia – 1 January 2009, Slovenia – 1 January 2007, so as the level of correlation for the last period (2006-2011) is lower then the previous periods we cannot draw the conclusion that adopting the Euro increases the level of business cycle synchronisation.

Analysing the degree of synchronisation between the NEM's we can postulate that the other countries which are suppose to adopt the common currency: Bulgaria, Czech Republic, Hungary, Latvia, Lithuania, Poland, Romania should have also a high degree of business cycle syncronization.

5.Conclusion

This paper analysis the degree of business cycle synchronisation in order to asses if the NEM's states will form am Optimum-Currency-Area, the research is build upon the seminal papers of (Mundell, 1961) using a methodology similar to those proposed by (Darvas & Szapáry, 2004). Using the GDP series evolution for EU12 and Cyprus, Estonia, Slovakia, and Slovenia for the 1995-2011 period, we apply the X12-Arima methodology in order to seasonally adjust the series and decompose the GDP evolution in trend and cycle using Hodrick-Prescott filter. In order to test the level of synchronisation we use the correlation coefficient, the main finds refer to the rise in the synchronisation cycle and the fact that adopting Euro didn't rise the level of synchronisation between these economies.

ALM is the management of risk at enterprise level, the models used in ALM can be static or dynamic: single period-static models, multiple period static model, single period stochastic model, multi period stochastic model. While single period-static don't incorporate the dynamic of the economical changes the multiple period-static models are an extension of the single period-static model, the most common used are multi-period stochastic which model the evolution of financial series in time and the assets and liabilities using different types of probability distributions (Student, GED). Highly correlated with ALM is the Value at Risk which can be used as and function to be minimized in ALM models. In the Value at Risk methodology the estimation models are classified as: parametric, nonparametric, semi-parametric; we present the parametric models (GARCH models) used in Value at Risk and the connections that can be established between ALM models and Value at Risk. We present the Conditional Value-at-risk and offer and example on how to calculate CVaR .
Keywords: asset-liability models, Value-at-risk, Conditional Value-at-risk, GARCH,
Jel codes: G21, G17

1.Introduction

Asset liabilities management (ALM) is defined by (Rosen & Zenios, 2006) as the strategic management of the balance sheet, (Uyemura, Van Deventer, & Foundation, 1993) define ALM as the management of income and expenses with respect to maximizing earnings, adjusted to risk factors, given the long term interest of the shareholders, also ALM manages the risk due to mismatches between assets and liabilities. The main purpose of ALM is the management of risk, in the context of enterprise risk management, having different objectives : profitability, liquidity, solvency, Conditional Value-at-risk (Ferstl & Weissensteiner, 2011)□. The first steps in ALM where made by (Markowitz, 1952) who treats the management of assets in an efficient portfolio, while (Sharpe & Tint, 1990) discuss the correlation and the associated risk between assets and liabilities. The first ALM models where developed from the early '80s (Uyemura et al., 1993). For (Kusy & Ziemba, 1986) ALM represents a cost/profit analysis between the risk level , earnings and liquidity; using a stochastic linear programming model they concluded these models are more robust and efficient then the previous linear programming models. (Giokas & others, 1991) test a linear programming model on the Commercial Bank of Greece which takes into consideration the institutional and legal framework, the financial position, showing that using ALM the risk level can be reduce in banks.

The ALM models can be classified (Zenios & Ziemba, 2007), in terms of the period and the random variables, as : single period-static models, multiple period static model, single period stochastic model, multi period stochastic model.

Single period-static models, which started with balance sheet immunization (Redington, 1952), and are better know as GAP analysis have some drawbacks because these models don't incorporate the dynamic of the economical changes. Multiple period-static models are an extension of the single period-static model, in which the period analyzed in more than one year.

Single period stochastic models include the analysis of risk-return (Markowitz, 1952) which treats the assets allocation. While (Sharpe & Tint, 1990) also analyze the liabilities fluctuations

and their relation with asset allocation. Both (Markowitz, 1952; Sharpe & Tint, 1990) use normal law in order to represents the assets and liabilities, the non-normality of financial series is presented by (Zenios, 1995) ,using asymmetric and non-normal distribution for the financial series he finds that this models outperform.

Multiperiod stochastic models are the most common in ALM, for e.g. the stochastic programming (Carino et al., 1994) the Russel Yasuda Carino (Dempster & Consigli, 1996)☐ and Promoeteia model (Consiglio, Flavio, Cocco, Zenios, & others, 2007), they model the evolution of financial series in time and the assets and liabilities are considered as having different types of probability distributions (Student, GED).

(Ferstl & Weissensteiner, 2011) apply a multi-period stochastic linear programming model with re-allocation, the function to be minimized is the CVaR of shareholder value, which is the difference between mark to market value of assets and the present value of liabilities.

2. Value at Risk

The Value-at-risk is defined by (McNeil et all, 2005) as at "... some confidence level $\alpha \in (0,1)$ the VaR of the portfolio at the confidence level α is given by the smallest number l such that the probability that the loss L exceeds l is not larger than $(1-\alpha)$." Or mathematically we can write VaR as probability:

$$P_{VaR} = P\left(l < -VaR\right) = \int_{-\infty}^{-VaR} P_T \cdot l \cdot dl \quad (1)$$

In Figure 1 we have a hypothetical distribution functions of Profit and Loss (P/L) where P/L has a leptokurtic distribution with mean 1 and standard deviation 1, then the Value-at-risk represent the percentile (in red) of losses.

Fig.1. Value-at-risk graphic representation
(Manganelli & Engle, 2001) classify the Value-at-risk models in three categories:

a) parametric (RiskMetrics, Garch)
b) nonparametric (historical simulation, hybrid model)
c) semiparametric (Extreme Value Theory, CAViaR, quasi-maximum likelihood Garch).

2.1. The Parametric models

The RiskMetrics models were the first application of Value-at-risk, developed by J.P. Morgan in 1989, in order to offer a clear position of financial institution regarding their potential losses. Where volatility can be expressed as a function of return and expected value :

$$\sigma_t^2 = (1 - \lambda) \sum_{t=1}^{n} \lambda^2 (R_t - \mu)^2 \quad (2)$$

-where R represent return, μ is the expected value and λ is the exponential factor used in order to quantify the volatility persistent. The λ parameter usually has an 0.94 or 0.97 value (Manganelli & Engle, 2001), also the RiskMetrics model assume that the residual are normally distributed.

We will present the parametric models (Garch models) which are the most used because of their capacity to quantify non-linear dependencies. The ARCH models where developed by [Robert F. Engle, 1982] and have the following equations:

$$y_t = B_0 + e_t \quad (3)$$
$$e_t \mid I_t\text{-}1 \sim N(0, ht) \quad (4)$$
$$h_t = \acute{\alpha}_0 + \acute{\alpha}_1 * e^2_{t\text{-}1}, \ \acute{\alpha}_0 > 0, \quad 0 \le \acute{\alpha}1 < 1 \quad (5)$$

The equation (1) expresses the series evolution, where errors are following a normal distribution law (3) of conditional variance define by equations (4). Equations 3 and 4 express the ARCH type models, autoregressive models with different time variance, residuals follow a normal law of 0 mean and ht variance. The value of $\acute{\alpha}_0$ and $\acute{\alpha}_1$ must be positive, and $\acute{\alpha}_1$ has a value between [0,1] in order to avoid an explosive processes, also errors(residuals) follow a normal distribution law.

The GARCH (Generalized autoregressive conditional heteroskedasticity) developed by (Bollerslev, 1986), bring the use of lags as an innovation in equation variance, the equations in the GARCH (1,1) case are:

$$y_t = \beta_0 + e_t \quad (6)$$
$$et \mid It\text{-}1 \sim N(0, ht) \quad (7)$$
$$h_t = \acute{\alpha}_0 + \acute{\alpha}_1 * e^2_{t\text{-}1} + \beta_1 * h_{t\text{-}1}, \ \acute{\alpha}_0 > 0, \quad 0 \le \acute{\alpha}_1 < 1 \quad (8)$$

It have been observed that on the financial markets the assets prices are influenced by the news (also called innovation), so that a bad news generates more volatility than a good news. A GARCH model which treats differently the bad-good news was proposed by (Zakoian, 1994) – Threshold GARCH. It is an asymmetric model in which the conditional volatility is:

$$h_t = \acute{\alpha}_0 + \acute{\alpha}_1 e^2_{t\text{-}1} + \gamma * d_{t\text{-}1} * e^2_{t\text{-}1} + \beta_1 * h_{t\text{-}1} \quad (9)$$
$$\text{where: } d_t = 1 \text{ if } e_t < 0 \text{ or } d_t = 0 \text{ if } e_t > 0 .$$

Also in order to reflect the relation between risk and return another models where proposed in order to incorporate this characteristics (R.F. Engle, Lilien, & Robins, 1987), GARCH in mean model have the following characteristic:

$$y_t = \beta_0 + e_t + \theta * h_t \quad (10)$$
$$et \mid It\text{-}1 \sim N(0, ht) \quad (11)$$
$$h_t = \acute{\alpha}_0 + \acute{\alpha}_1 * e^2_{t\text{-}1} + \beta_1 * h_{t\text{-}1}, \ \acute{\alpha}_0 > 0, \quad 0 \le \acute{\alpha}_1 < 1 \quad (12)$$

In this model as the volatility rises the return are rising too, this models are useful in order to capture the risk of the assets.

There is a large variety of GARCH models (Bollerslev, 2008) identifies over 100 types of models, but must of them are variations of some nested models and in the practice the asymmetric , GARCH in mean and the simple GARCH(1,1) models are the most used.

4. Conditional Value at Risk (CvaR)

Expected shortfall (ES) or Conditional Value-at-risk (Acerbi & Tasche, 2002) is used as an alternative to Value-at-risk, it can be defined as (Rau-Bredow, 2004): "... the average of all losses which are greater or equal than VaR, the average loss in the worst (1-p)% " and mathematically:

$$ES_\alpha = \frac{1}{\alpha} \int VaR_\gamma (X) d_\gamma \quad (13)$$

where VaR_γ is the Value-at-risk and α is the lower quantile.

For example if we invest 1000 in a portfolio and the expected value is presented in column 2 (Portofolio expected value) of Table 1, then the Profit/Loss (column 3) will be the difference between the invested value and the expected value.

Table 1. Example of expected shortfall calculation

Event probability	Portfolio expected value	Profit/loss
5%	100	-900
10%	500	-500
20%	1500	500
50%	1600	600
15%	2000	1000
Worst case probability $\alpha =$	Expected shortfall	
5%	$ES_{0.05}$ = -900	
10%	$ES_{0.10} = \dfrac{0.05*(-900)+0.05*(-500)}{0.1} = -700$	
20%	$ES_{0.20} = \dfrac{0.05*(-900)+0.10*(-500)+0.05*(500)}{0.2} = -350$	
50%	$ES_{0.20} = \dfrac{0.05*(-900)+0.10*(-500)+0.20*(500)+0.15*(600)}{0.5} = 280$	

ES0.05 represent the worst 5 out of 100 cases, these cases are a subset of the 5% quantile (actually they identify with it) so the expected shortfall is -900, in the case of ES0.20 which represents the worst 20 out of 100 worst cases we calculate the Expected Shortfall as being compose of a 5% quantile with an expected loss of -900 and an 10% quantile with an expected loss of -500 and an 5% quantile with an expected profit of 500.

CvaR or Expected Shortfall are used by (Ferstl & Weissensteiner, 2011)☐ in a multi period stochastic linear programming model with re-allocation, CVaR of shareholder value is minimized in order to , which is the difference between mark to market value of assets and the present value of liabilities.

5. Conclusion

In order to apply the management of assets and liabilities in financial institutions it is imperative that the objective function, which usually are the risk level, earnings, liquidity, profit, solvency, the loans and deposits levels, value added
 to also take in consideration the worst cases scenario. Value-at-risk and Conditional Value-at-risk can be used as the principal objective function or as a secondary one in ALM. We present the Value-at-risk with the most used models (GARCH) and the Conditional Value-at-risk; the GARCH models can capture the specific of financial series, their asymmetric and leptokurtic characteristics so applying GARCH models in VaR specification will enhance the reliability of forecasts.

Corporate governance became in the last decade an important domain of reforms in emerging economies. The reforms in the corporate governance models and in accounting should assign a more important role for accountants. The objective of this paper is to analyze the changes in the accountants' roles and competencies as a result of the reforms in corporate governance model of an emerging economy. We focus on a single-country case study, i.e. Romania, because it is acknowledged that each country is characterized by a unique set of institutional factors. We correlate information from the job offers (as indicators of the role and competencies expected from accountants) and from the corporate governance disclosures (as indicators of the application of roles and competencies) in order to discuss the recent changes in the Romanian accounting profession roles and competencies. Our results contribute to the understanding of the factors related to the modernization of the accounting profession in emerging economies, illustrating the challenges associated with the "import" of Western models.
Keywords: accountants, accountants' roles and competencies, corporate governance, Romania
JEL classification: M 41, M 14

1. INTRODUCTION

Corporate governance, as a mechanism of increasing the accountability and responsibility of organizations (Christopher, 2010: 683-695), became in the last decade an important domain of reforms in emerging economies. The economic importance of these countries for the global economy raised the importance of improving the organizations' management and responsibility. Corporate governance codes were implemented, especially as a result of strategies, recommendations and support of international organizations, such as OECD, World Bank or International Monetary Fund (Vurro and Perrini, 2011: 459-474). These programs conducted to the modernization of corporate governance and accounting in emerging economies by the adoption or adaption of Western models. In this context, Ezzamel and Xiao (2011: 625-637) raised a number of fundamental research questions, one of which being how managers and accountants in emerging economies embrace Western ideas.

It is acknowledged that in emerging economies the role of accounting and accountants is undervalued. For example, during the communism the role of accountants was limited to bookkeeping, and this role assigned to accounting was difficult to be changed after the fall of communism. Accounting should evolve in these countries from bookkeeping to fulfilling the users' needs, both internal and external (Anderson and Lanen, 1999: 379-412). The reforms in the corporate governance models and in accounting assign a more important role for accountants. The objective of this paper is to analyze the changes in the accountants' roles and competencies as a result of the reforms in corporate governance model of an emerging economy. We focus on a

---

single-country case study, because it is acknowledged that each country is characterized by a unique set of institutional factors, such as the complexity and structure of the business environment, the efficiency of the capital market, the competencies of the accounting profession, the culture, law system and management practices (Peters et al., 2011: 429-445). We correlate information from the job offers (as indicators of the role and competencies expected from accountants) and from the corporate governance disclosures (as indicators of the application of roles and competencies) in order to discuss the recent changes in the Romanian accounting profession roles and competencies.

Our results contribute to the understanding of the factors related to the modernization of the accounting profession in emerging economies, illustrating the challenges associated with the "import" of Western models. After a literature review on corporate governance and accountant's roles and competencies, we present the methodology, results and implications of our research.

2. LITERATURE REVIEW

2.1 CORPORATE GOVERNANCE

The interest in corporate governance increased in recent years, and it is advanced that the economic crisis will further raise the interest in governance (Christopher, 2010: 683-695). CG is understood as the general set of principles underlying the manner in which an organization is managed and is accountable to the stakeholders. Corporate governance has been explained initially by the agency theory, but recently the legitimacy theory, the institutional theory, or the stakeholder theory (Perrault Crawford and Clark Williams, 2010: 512 – 526; Vurro and Perrini, 2011: 459-474) are also advanced as justifying and influencing CG practices. Previous literature in emerging economies documents the variety of practices (Boytsun et al., 2011: 41-60). Because observing CG practices is difficult, many studies use the CG disclosures as an indicator of these practices. Generally it is noticed that emerging economies have a reduced level of disclosures (see for example ISAR, 2008), this being an indication of the underdevelopment of the CG practices. However, improvements were been made in recent years in emerging economies.

After the fall of communism in 1989, Romania engaged in drastic reforms, which also affected accounting. The corporate governance became relatively late a part of this reform. But on the other hand, Romania is presented in literature as developing one of the first corporate governance codes in the CEE region (Przybyłowski et al., 2011: 77-98). A program of developing CG practice was established in 2001, when OECD elaborated a strategy including recommendations and guidelines. BSE has accordingly adopted a Corporate Governance Code in the same year (2001). A new and improved Code was issued in 2008 and is applied starting 2010 by listed companies. Răileanu et al. (2011: 11-15) analyze the information included in the Annual reports of the entities listed on the BSE in order to discuss the corporate governance practices. They consider that Romanian managers have less incentive to fulfill the provisions related to transparency. Gîrbină et al. (2012) also find a reduced level of disclosure and advance several reasons for this, of which one being the attitude and competencies of managers and accountants. In the next section we discuss the roles and competencies of accountants.

2.2 ACCOUNTANTS' ROLES AND COMPETENCIES

A competency is defined as a specific behavior whereby a professional applies knowledge, skills, and professional values in a work environment, and this behavior can be defined, demonstrated and assessed. A competency group represents the major responsibility areas in the professional practice (CGA, 2009). Literature reports that the accountant's role in organizations changed over the last decades because of the changes in the global business environment, such as the globalization, the IT developments, or the stakeholders' expectations. The accountant

transformed from a 'bookkeeper' and a 'number cruncher' into a business analyst, a partner in decision making, a consultant, a 'knowledge worker' (Gammie et al., 2002: 63-78).

In a literature review on the changes in the accountants' roles, Albu et al. (2011a: 153-182.) synthesize the position of different associations of accounting professionals. The authors use IFAC (2002) which identifies some directions of evolution through interviews conducted with professionals: managing the information flow, supporting strategic changes, and developing and sustaining the organization's vision. Also, they use ICAA (2004) which identifies three types of contributions that future accounting may have: compliance (through audit, communication, forecasting, IFRS), strategic and commercial (business plans, managing costs) and people-related (manage relationships, lead, provide support). Albu et al. (2011a: 153-182.) concludes that in literature these transformations are closely related to the orientation towards CG and corporate social responsibility practices. This is seen as an enrichment of the previous responsibilities of accountants, because besides the core areas of action, they have to expand such issues as corporate governance, risk management, and strategic management.

IFAC underlines the importance of accountants in improving governance in organizations, stating that the accepted responsibility to act in the public interest is an important element of good governance (IFAC, 2009). Ramaswamy (2005) identifies the following areas in which the accountants have to play a role in the context of strengthening CG practices: formulating and applying a comprehensive governance policy, establishing an efficient control system and preventing fraud, creating a positive work environment, establishing effective lines of communication, monitoring activity and reformulating governance policies.

Based on this literature review, we conclude that with the increasing importance attached to CG, the accounting profession has to change. Accountants have to play a crucial role in organizations in areas such as reporting, transparency, ethics, legal compliance, communication with stakeholders, and resource consumption. This implies that the reforms in CG in Romania have to lead to improvements in the roles and competencies of accountants.

Previous studies on Romania indicate a reduced level of adoption of management accounting practices and an increased role of taxation (Albu et al., 2011a: 153-182; Glăvan et al., 2007: 103-115), thus suggesting a reduced level of accountability. On the other hand, these studies indicate that it seems to be a difference in the role and competencies of accountants between large entities and the smaller ones, between the entities with Romanian and foreign capital. Our aim is to analyze the accountants' roles and competencies in association with the improvements in CG. The next section presents the research methodology employed in this respect.

3. METHODOLOGY

Data collection is one of the major issues in doing research in emerging economies (Hopper et al., 2009: 469-514). Accordingly, researchers search for alternative methods to collect data. In this research, we used two types of publicly-available data, with relevance for accountants' competencies and roles. We use the CG disclosures of first iter listed entities on the Bucharest Stock Exchange. We also use job offer announcements as indicators of accounting practices, because they describe the roles and competencies of accountants. 200 job offer announcements classified in the "finance and accounting domain" were collected in 2010 and 2011 (100 in each year) by monitoring the most representative job advertising national websites. A content analysis was performed in order to identify the roles and competencies and to relate them to corporate governance.

4. RESULTS

As previously mentioned, Romania undergone a number of reforms in accounting and more recently in corporate governance, with impact on accountants' work. The Directive 2003/51 (the 'Modernisation Directive') amended the Accounting Directives and added that European

companies are required to include non-financial information in their annual and consolidated reports if it is necessary for an understanding of the company's development, performance or position. Another amendment of the Accounting Directives (Directive 2006/46) introduced an obligation for listed companies to include a corporate governance statement in their annual report. Both directives were implemented in Romania. Listed companies begin to publish "comply or explain" statements related to the application of best practices in CG. ISAR (Intergovernmental Working Group of Experts on International Standards of Accounting developed a list of 53 items related to CG grouped into 5 categories (ISAR, 2008): (1) financial transparency, (2) board and management structure and process, (3) ownership structure and exercise of control rights, (4) corporate responsibility and compliance (CSR), and (5) auditing. Of the 53 items included in the ISAR benchmark, Romanian entities listed on the first tier of the BSE disclose between 8 and 34, with a median of 24, which we interpret to be a rather low level of disclosure. The results also indicate variations between entities in terms of the level of disclosures and in terms of the information's category. Managers are inclined to disclose less information on auditing and CSR than on other CG items. In relation with the 5 categories described by ISAR, the role of accountants in business is important especially in two areas: financial transparency and corporate responsibility and compliance. We will correlate for each of these domains the data obtained by analyzing the disclosures and the job offer announcements in order to identify the implications on the Romanian accountants' roles and competencies.

4.1 FINANCIAL TRANSPARENCY AND IFRS
Financial transparency concerns the disclosure of financial and operating results, critical accounting estimates, and related-party transactions. In our sample of companies listed in the first tier, 53.84% published financial statements in compliance with IFRS. Noncompliance cases were identified, meaning cases in which consolidated financial statements are published under the national regulations and not under IFRS. One company claimed compliance with both national regulations and IFRS for the same set of financial statements. This situation raises questions about the competencies of accountants in IFRS. EUO no 90/2008 implementing Statutory Audit Directive introduced the requirement for public interest entities to establish an audit committee with at least one independent member with competencies in accounting and/or auditing. We found that 36% from the first tier listed companies did not set an audit committee.

Our job offer analysis for 2010 and 2011 also indicated a moderate level of requested IFRS competencies. 24% of job offers in 2010 and 28% in 2011 require competencies in IFRS. While IFRS is seen as a framework providing better information for users, these results may surprise. On the other hand, there is a reduced level of the application of IFRS by Romanian entities. Besides the listed entities (which do not comply all of them with the request to apply IFRS), some other entities use IFRS in a second set of financial statements, as a results of the users' pressures. Therefore, we might imply that the level of the IFRS competencies required depends on the entity's characteristics: larger entities, with foreign capital and/or foreign managers, and entities having demanding users are more inclined to apply IFRS, and therefore to request IFRS competencies to their accountants.

4.2 CORPORATE SOCIAL RESPONSIBILITY
The CG disclosures on CSR indicate that the majority (73%) of our entities disclosed that they have a policy and specific activities in connection with environmental and social responsibility. But the number of pages allocated to CSR activities in their annual reports was very small (0 to 3). One company from the sample presented a CSR report, another company has a web page dedicated to CSR policy, CSR actions and a prize obtained for its eco-friendly practices. The reduced level of disclosures might indicate a reduced level of CSR practices by Romanian

entities. It is consistent with previous studies realized by KPMG (2008, 2011) indicating an increasing, but still low level of disclosure and assurance on CSR issues.

The content analysis of the job offer announcement indicate some references to area generally related to CSR such as risk management, performance management and use of non-financial information. However, as regards the specific areas of CSR, such as environmental and social reporting, evaluation of CSR impact and compliance with environmental and social regulations, our textual analysis of the advertisements shows a lower occurrence in the competencies and task required from Romanian accountants. These results are in line with Albu et al. (2011b) which for the years 2007, 2008 and 2009 indicate an implication of accountants in transposing the general framework of CSR, which is legal compliance, communication with stakeholders and performance measurement, thus leading to an increase in the importance of the accounting function in organization. Our results for 2010 and 2011 indicate the same trend, accountants being required to analyze social information, to elaborate strategies for the environmental and social implications of the business, and to deal with tax issues related to environment laws.

5. CONCLUSION

The purpose of our study was to analyze the changes in the accountants' roles and competencies as a result of the reforms in corporate governance model of an emerging economy, i.e. Romania. If during the communism, accounting was reduced to bookkeeping, it is expected that the reforms in accounting and corporate governance changed the accountant's role. Our study continues and complements the results of other studies on the case of Romania (Albu et al., 2011a: 153-182., b: 221 – 234; Gîrbină et al., 2012). We correlated information from the job offers (as indicators of the role and competencies expected from accountants) and from the corporate governance disclosures (as indicators of the application of roles and competencies) in order to discuss the recent changes in the Romanian accounting profession roles and competencies.

We focused our analysis on two areas of CG elements close related to accountants work: financial transparency and corporate responsibility and compliance. Our results indicate a better disclosure of the financial results than in the case of CSR. We pursued the investigation by analyzing the competencies required in job offers announcements. Besides the core technical competencies related to these areas, literature documents that other related competencies (such as personal, ethics, leadership, communication) are related to good CG practices. The content analysis of job offer announcements indicate a reduced but increasing demand of competencies related to IFRS and even lower demand for CSR. However, we confirm that job offer announcements requiring technical competencies in these areas also requested the complementary competencies associated in literature to good CG practices. These results indicate a slow improvement in the role of accountants in Romania. The reforms in CG (at a legislative level) are important, but in order to have good CG practices, improvements in the business environment and in the accountants' and managers' education are necessary.

FREQUENCY USE OF FAIR VALUE WITHIN INTERNATIONAL ACCOUNTING STANDARDS – A STATISTICAL APPROACH

Andreicovici Ionela-Irina
Babes-Bolyai University Cluj-Napoca
Faculty of Economics and Business Administration

Abstract:
The debates over the paradigm of fair value are not recent; they have gradually evolved and intensified with awareness of the current financial crisis. However we accept the idea that expanding the use of fair value is correlated with widespread application of IFRS, either by convergence of the national accounting systems, or by express requirements for listed entities. Starting right from the definition of fair value and going further to the attempt to put it into practice, this desideratum has in scientific literature various opinions.
Starting from these differences of judgment we took on our shoulders the task of convincing readers about the importance of using fair value; and how to accomplish this better than by international accounting standards. Into international accounting standards the references to the notion of "fair value" are numerous. The objective of this study is highlighting the need to use fair value as a measurement base, underlining the importance and its role. We try by the frequencies of use the concept under the international accounting standards. We prove this by frequency of use of this concept in the international accounting standards. Using as a research method content analysis we examined International Accounting Standards, edition 2011 and we calculated the frequency of use of the words in these regulations. To get an overview of the use of this concept we calculated the most common uses of words. As a result of the research we mention that the fair value has been used 933 times, being the concept with one of the highest frequency of use.
Keywords: fair value, IASB, frequencies, valuation
Cod JEL: M41

Introduction:

International Accounting Standards Bord (IASB) was established in 2011 as a successor of International Accounting Standard Committee (IASC). Since the adoption of International Accounting Standards (IAS) by the European Comision and the convergence agreement with Finacial Accounting Standards Board (FASB), IASB has grown in importance and is recognized as the global leader in accounting standards regulation. Financial Reporting Standards (IFRS) are recognized or mandated in more than 100 countries, including all European Union (Deloitte, 2010).

The widespread adoption of the standards for financial reporting demonstrates a demand for a single set of international standards of high quality. Standards are developed by long term public consultation through procedures which may include field tests, invitations to comment on exposure drafts, public workshops, meetings and public hearings.

The development of accounting standards is a regulatory act which invariably involves value judgments on financial reporting objectives.

Initially IASB was equidistant to the bases of evaluation. In the past years the international governing body called for stronger use of fair value and therefore its implementation extensively.

With the implementation of International Accounting Standards in the European Union voices have emerged claiming that IFRS are "Fair Value Standards" and the IASB is moving inevitably towards fair value accounting.

This IASB show at a time that the fair presentation of results and the financial position of an entity is more important than applying a set of rules (Tournier, 2000:14).

2.Literature review

However we accept the idea that expanding the use of fair value is correlated with widespread application of IFRS, either by convergence of the national accounting systems, or by express requirements for listed entities.

A rich academic accounting literature has treated the subject of fair value from different perspectives, conceptual or empirical approaches, especially in the fair value of international accounting standards.

For example, Cairns (2006) examines the IASB fair value related guidance, identifying inconsistent definitions and evaluation rules. Hitz (2007) discuss the decision usefulness of fair value measurement. Aboody et. al. find evidence consistent with earnings management in model-based fair value measurements for stock options. Danbolt and Rees' (2008) results suggest that fair values are biased where valuation is ambiguous (tangible assets), whereas they are more reliable where the values are derived from market prices (financial assets).

The current study has as starting point the study of Wallton (2008) "Les délibérations de l'IASB en 2002 et 2003 : une analyse statistique IASB 2002 and 2003 deliberations : a statistical analysis". Wallton uses detailed reports of the proceedings of the IASB in 2002 and 2003 to carry out a statistical analysis of their debate for the first two full years of their work which formed the platform for adoption in 2005. It finds that four Board members dominate the debate. The conceptual framework is often referred too, but fair value occurs most frequently.

3. Research Methodology

To conduct this synthesis and to achieve the objectives that we propose, we use as a research method, content analysis. Holsti proposes a definition of this approach: Content analysis is a research method which can satisfy multiple needs and was introduced in order to solve communication problems when serving as the basis of deduction. Holsti notes that the approach can be both qualitative and quantitative. Quantitative analysis measures the frequency of references to symbols or other units linguistic in the text.

For the text analysis and the words frequency calculation we used a specialized software.

4.Research results

The current trend to an assessment based on fair value is considered to be a paradigm shift (Barlev şi Hadad, 2003:385). A paradigm is a set of values and beliefs that are shared by a community.

A paradigm for valuation in accounting requires a consensus on evaluation attributes necessary to achieve financial reporting. Changes in valuation paradigms proceed upon the assumption of superiority based on market value assessment.

The term "valoare justă" is the anglo-saxon translation of the phrase "fair value", which from literary point of view corresponds to "honest value." Concept of fair value, translated differently in different languages: juste in French, real in German, rezonabil in Spanish, and also not having an equivalent in Italian, is taken in Romania by the French approach, namely "valoare justă".

A linguistic analysis of this phrase leads us to say that the word "fair" is based on the judgment in making a decision. Walking further on the term "value", this is an economic concept that can be employed to express a basic accounting.

The concept of fair value is used for the first time in 1953 in Accounting Research magazine, in an article on revaluation in accounting (Simon 2009:1423).

Today the two accounting regulatory bodies propose us the same definition of fair value:

"Fair Value is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date" (IASB 2011; FASB 2007).

In our approach to emphasize the importance of evaluation in delivering accounting information in terms of presenting accurate, we must recognize the merit of professional bodies related professional evaluators. Therefore we mention here the most important, in our opinion, in this area, namely the International Valuation Standards Committee (International Standards Committee - IVSC).

Going back to the definition of fair value, the definition proposed by the IVSC is:

"The estimated price for the transfer of an asset or liability between identified knowledgeable and willing parties that reflects the respective interests of those parties" (IVSC 2011).

The debates over the paradigm of fair value are not recent; they have gradually evolved and intensified with awareness of the current financial crisis.

Starting right from the definition of fair value and going further to the attempt to put into practice, this desideratum has in scientific literature various opinions.

Starting from these differences of judgment we took on our shoulders the task of convincing readers about the importance of using fair value; and how to accomplish this better than by international accounting standards. Into international accounting standards the references to the notion of "fair value" are numerous. The objective of this study is highlighting the need to use fair value as a measurement base, underlining the importance and its role. We try by the frequencies of use the concept under the international accounting standards. Note that in this sample are not included last publication of IFRS legislators namely 10, 11 IFRS, IFRS 12 and IFRS 13. The research results and the table containing the frequencies use of the concepts within international accounting standards can be illustrated as follows:

Table nr. 1 – Frequencies use of the concept within international accounting standards

WORD	LENGHT	COUNT	WEIGHETED PERCENTAGE (%)
An	2	2553	1,52
Financial	9	2477	1,48
Entity	6	2312	1,38
Assets	6	1880	1,12
Value	5	**1701**	1,01
Amount	6	1511	0,90
From	4	1256	0,75
Which	5	1250	0,75
Asset	5	1212	0,72
Other	5	1118	0,67
Cash	4	1030	0,61
Ias	3	1026	0,61
Paragraph	9	1022	0,61
Its	3	972	0,58
Fair	4	**933**	0,56
B	1	886	0,53
Statements	10	874	0,52
Information	11	852	0,51
Liabilities	11	824	0,49
Date	4	803	0,48
Fair value		**933**	

We can see from the above table that the two words that form the concept of „fair value" are used to a great extent. If we customize our search and we focus only on the frequency of use of the concept of fair value, we can say that it is used in accounting standards by 933 times, the word "fair" being used in the standards only accompanied by the word "value".

Among the most common words used in international accounting standards are the connection words (an, wich, from, its) and specific terms of acconting (financial, asset, entity), „fair value" being the only concept used in such a large degree. In this respect we can consider „fair value" generally accepted accounting principle. With every step and decision IASB increase the use of fair value as a single basis of valuation.

Generalli accpeted accounting principle are assumptions and accounting conventions that have emerged as a result of observations and practical experience, starting from repetead practical cases and leading to generalization. These principles evolves over time, some are perfected, others appear or dissapear.

5. Conclusion

Fair value accounting has become a crucial principle of international accounting measurement, being considered by International Accounting Standard Board and Financial Accounting Standard Board as the main basis for assessment (IASB: 2006, FASB: 2008).

This paper analyzed the frequency of using the concept of fair value in the international accounting standards.

To have an overview of the importance of using this concept we calculated the frequency of all the words in these standards.

With a use a frequency of 933 times we can say that fair value is among the concepts commonly found in the accounting standards.

The results help to emphasize the importance of fair value in the evaluation process.

MORALITIES AND ETHICS. THE PARADOX OF THE PARABLE OF THE UNJUST STEWARD AND THE PARADOX OF CREATIVE ACCOUNTING

Balaciu Diana
University of Oradea
Faculty of Economics

Bogdan Victoria
University of Oradea
Faculty of Economics

The paper targets the approach of the implications regarding the compliance or non-compliance with ethical principles in the accounting profession, the interest for this debate being the profound crisis we are experiencing which makes us come back to fundamentals, the current world trying to discover them morally and ethically.
In order to reach the purpose of our research, we have carried out an exploratory research, as a specific research method, using the analysis of secondary data. In this view, starting from the behaviour of the characters of the controversial biblical parable of the unjust steward bringing it into the context of our days, we can notice that the wit of the above mentioned steward mentioned above, it cannot be underestimated and we cannot, even now, underestimate the creativity of a "good" accountant when he has "to solve" a problem or to reach a certain purpose. Also, we have used a descriptive research, too, the research method used being the survey. In making up the surveys, we used the 5 level Likert scale, this type of scale targeting aspects related to the relation ethics-morality-religious values with which, the respondents, in our case represented by a sample made up of the managers of large enterprises and those of the SMEs in the Bihor County, agreed or disagreed.
This paper shows that, from a philosophical and spiritual point of view, the contemporary crisis is a conscience crisis and a crisis of the humanity's moral values, emphasising the idea that humankind must enter a phase of new humanism, meant to cultivate the features of a morally developed man, endowed with responsibility regarding the choices that he makes as well as the capacity to suffer the consequences of his choices.
In our opinion, the parable mentioned has in view the accentuation of the moral aspects of the steward's behaviour and, extrapolating, of the accounting professional in creating a solid basis for an ethical behaviour. Thus, the solution for the economic, political, or environmental problems we identify in the world we live in, depend, to a high extent, to the way in which the moral problem is solved, a problem depending, in our opinion, on the spiritual problem.
Keywords : ethics, morality, creative accounting, economic crisis
JEL Classification : M 41

1.Introduction

The relation between ethics and moral philosophy, as it is defined by Paul Ricoeur (quoted by Crăciun D.,2005), is a relation "perfectly applicable to enterprise", the economic and business environment. According to the latter, intention and purpose bring together and connect ethics and moral philosophy; they precede, in his opinion, the notions of law, of moral exigency. The author presents in his work Soi meme comme un autre (1990) the basic triangle of ethics as being composed of Me, You, Him.
In his first study, Ricoeur notes, I believe in my freedom: "I do what I can and I can what I am": an act of evulsion, of power stating, the esteem form your own person. Yet, actually, we really enter ethics when we state both our own will and the other's freedom: an act of absolution.

Therefore, the ethics is born out of this transgression: to act in such a way that "the other man's freedom is like my freedom". In other words, "the other is my fellow creature". According to Ricoeur, the *Him* pole "qualifies the meditation of the rule".

In business relations, this idea might be translated as such: "To agree my own project with the institutional project" Meditation permits coexistence" "your freedom is as worth as my freedom". In this way, we can move on from ethics to philosophical moral with the notion of exigency and law. Thus, formalism in ethics defines morality.

The profound crisis that the world is experiencing represents one of the first factors raising the interest for ethical debates. In this context, we notice a statement from The Declaration of Global Ethic, adopted in 1993 in Chicago by the Parliament of the World's Religions according to which: "The world is agonising. The agony is so overwhelming and penetrating that we are forced to unveil all the manifestations, thus underlying the depth of crisis of the world" (Kung, quoted by Singer,2006:14).

A second factor is the religion's resurgence at the planetary level. Gilles Keppel (quoted by Singer, 2006:14) stated: "God takes His revenge". After, at the end of the 19th century and the beginning of the following century, Nietzsche enacted "God's death" (by the famously known statement "God is dead"), we are witnessing an opposite movement.

The third factor is related to real life itself, with its more and more varied aspects. The numerous problems starting with those referring to global governance or the environment preservation and ending to those referring to the behaviour towards fellow creatures, require that ethics should be acknowledged and, also, taken into consideration. Thus, the solution to economic, political, environmental a.s.o problems that we identify in the world we live in, highly depend to the way in which the moral problem is perceived and solved, a problem depending, in our opinion, on the spiritual problem. This thing was perceived even at the level of common sense, in this view being eloquent the statement of a rescue teams member, who, after the tragic events of September 11th 2001 in the United States of America, said: "we either accept the Ten international Commands as compulsory or we will perish together."

2. Research methodology

To reach the purpose of our research, we performed an exploratory research, and we used as specific research method the analysis of secondary data. In this view, we started from the biblical parable of the unjust steward trying to transpose it in our days and to identify the aspects related to the creativity of professional accountant. Also, we used a descriptive research, too, the research method used being Likert's scale with 5 levels of appreciation, this type of scale targeting aspects connected to the ethics-morality-religious values relation to which the respondents, in our case represented by a sample made up of the managers of large enterprises and SMEs in Bihor county, expressed their agreement or disagreement.

3. The paradox of the Parable of the unjust steward and that of creative accounting

For the times we live force us to go back to bases, the current world trying to rediscover them morally and spiritually. Therefore, we found both interesting and opportunistic the idea of debating in this paper the parable of unjust steward for, from our point of view, the religious aspects concur to a great extent to shaping an ethical profile of any individual, being able tom easily to extrapolate to the one at the basis of his professional rationale formulation. Let's see first the content of the parable:

"1. And he said also unto his disciples, There was a certain rich man, which had a steward; and the same was accused unto him that he had wasted his goods.2. And he called him, and said unto him, How is it that I hear this of thee? give an account of thy stewardship; for thou mayest be no longer steward.3. Then the steward said within himself, What shall I do? for my lord taketh away from me the stewardship: I cannot dig; to beg I am ashamed.4. I am resolved what to do, that,

when I am put out of the stewardship, they may receive me into their houses.5. So he called every one of his lord's debtors unto him, and said unto the first, How much owest thou unto my lord?6. And he said, An hundred measures of oil. And he said unto him, Take thy bill, and sit down quickly, and write fifty.7. Then said he to another, And how much owest thou? And he said, An hundred measures of wheat. And he said unto him, Take thy bill, and write fourscore. 8. And the lord commended the unjust steward, because he had done wisely: for the children of this world are in their generation wiser than the children of light. 9. And I say unto you, Make to yourselves friends of the mammon of unrighteousness; that, when ye fail, they may receive you into everlasting habitations. 10. He that is faithful in that which is least is faithful also in much: and he that is unjust in the least is unjust also in much. 11. If therefore ye have not been faithful in the unrighteous mammon, who will commit to your trust the true riches? 12. And if ye have not been faithful in that which is another man's, who shall give you that which is your own? 13. No servant can serve two masters: for either he will hate the one, and love the other; or else he will hold to the one, and despise the other. Ye cannot serve God and mammon. (Luke 16)

Let's try to further analyse the **characters of the parable.**

The first character is "a certain *rich man* who had a steward" (v. 1-2)

This second character, the *steward*, handles the master's businesses. He can sell and lend, forgive and pay debts in the name of his master, earning his existence from the commissions and taxes resulting from the transactions he makes. From the parable, it follows that the steward must carefully record all his transactions (according to the rabbinic tradition, the copies of the transactions were usually made in two copies – one for each party). In this way, the steward dealt with his master's debtors, those identified by us as the third character of this arable. They could be those who took goods from the estate – for which they have not yet paid – or the lessees who agreed to pay in a fixed quantity of products for the annual rent. Thus, the steward could directly deal with the people indebted to his master.

It seems hard to believe how the main character of this parable, from an unjust person can become a model followed by others. He would have used the reduction of debts either by eliminating any hidden extortion-like debts or by eliminating the commission requested for himself previous to the writing of the documents.

Bringing this parable to our times we can, without great difficulty, identify common elements, "the wisdom" of the steward being assimilated to the accountant's "creativity".

This orientation towards creativity is told also by Feleagă (2002: 447) in transposing the story of the creative accountant that we are going to present further:

The manager: "Mister Accountant, could you explain these figures in the financial statements? Do you think I hired you to destroy my business? You have two weeks to fix this. Otherwise, you will be fired."

The accountant: " I cannot believe this. I will lose my job. What will I do? I am too old to change my profession and too proud to ask for my family's help. Yet, I might use these two weeks to my interest..."

" Hello! Client X? The accountant speaking. We have not heard from each other since the last receipt. Tell me, how much do you owe to our enterprise? 80,000,000 m.u.? If I grant you a 50% discount, do you think it will be easier for you to pay us right now? I think this is to your advantage. By the way, I am thinking of changing my work place. If your business goes well, I might come and work for you. Keep in touch."

The manager: "Mister Accountant, I can see you can do a good job when you want. Yet, your actions cost me too much and you are fired. I will give you, though, good references because I liked your creativity".

Even though, they were fired, the steward from our parable and the accountant from the story are given an unlimited period of time to prepare their reports about their economy, yet they still

having the power to act (in a certain way) for a short period. The story maintains the tension by creating this scheme of "already/not yet" for report or judgement.

Verse 3 brings us closer to the steward character, discovering his thoughts through a monologue. The monologue in itself has the role to put us in his place. This internal reflection suggests the **huge importance of the crisis and decision moment.**

The steward is thinking to what kind of job could find if he were rejected from his position or if he could live from the others' goodwill. The steward knows his limits, setting up a plan based on his power of execution. In the first place, the steward rejects a plan of action in which he can count on himself. Also, he cannot conceive a plan based on his generosity, without any implication on his part.

In the second place, the terms "when the lord taketh away from me my stewardship" and "they may receive me" refer explicitly to the character's unjustness and to the debtors' houses, expressing a financial and a judgement relation. These two concepts – the threat to be fired and the hope to be well received – become the two coordinates of the steward's rationale.

The steward's plan to impoverish the rich man from the capital which was lent, using the practice of writing a debt document for the amount lent plus interest, not noticing any difference to what is officially written on the official receipt. The wit people demonstrated the permissiveness of rabbinic writings to support this practice as a way to make businesses profitably, **without breaking the law (creative accounting).** Hence, the well organised usury practices in Palestine against the Israelite law. We learn from his deed that, being afraid not to be thrown away from the people's houses, the steward is reducing their financial obligations for his master.

The steward's ingenuity consisted in the fact that he knew how to use the means he had, thus ensuring his future. By reducing so generously the loan agreements, the steward significantly favoured the debtors; for he is further the rich man's steward, his agreements with these debtors being compulsory. Money lending and interest charge (which is forbidden, for example in Exit 22,25), presents a juridical fiction conceived through the payment of projected interests, modified from that written in the initial credit. In v. 5-7 the steward is simply detached from this interest his commission and his engagement in unfair activities. Similarly, it is postulated that the steward is the one having the power to release the debtors from the interest charged against the loans, in contradiction to the Jewish law against the usury.

The steward has become the benefactor of those who borrowed and, in exchange, he can expect reciprocity through the hospitality granted by these, thus allowing him in their houses. Thus, the steward enjoys the advantage of his current status, using the time interval in which he was a steward and makes a wealth management accounting (v 2), ensuring his future. The parable ends surprisingly. The master praised the steward for unjustness, yet he was unfair. The master suffered substantial losses, but the new debt can be considered, according to the Mosaic Law requirements, "little or a trifle". The steward moved from the position of being fired and thrown in the street to a favourable position due to the quickness he solved the urge of the moment. The master does not praise the steward for his lack of honesty, but his prudence in making business. "The children of this world", says Messiah, must understand how the world works and how everything is used to have benefits.

There are many questions without answer in the parable, for example: the steward was unjust his entire career? Does he continue as a steward because he gave up to the interest for himself and for his master, concentrating on debt collection? The limited space that we have does not allow us to give an answer here to all these questions, leaving yet the possibility to meditate on the message that this parable wishes to send us. A possible interpretation could be mirrored in Father Arsenie Boca's learning (2006) : "By forgiving, you erase what you forgive. What you forgive in another, it will be erased to you. This judgement takes you from the Judgment."

4. The economic crisis viewed through the relation among ethics, morality, and religious values

The circuit of businesses and its information networks operate as efficiently as any others. The persons with arguable intentions are discreetly identified and avoided. In the world of businesses, somebody bragging how they have cheated or stolen from other people will be tacitly avoided. People can continue to be polite, yet nobody wants to make business with them, being afraid not to be the next victim.

Ethics in itself represents a system of moral principles and methods to apply them, providing the instruments needed to draw up the moral judgement. In this view we have to take into consideration a series of ethical principles characterising current behaviour: what we must do, how we must do; people's customs and attitudes regarding the good and bad, truth and lie, equity and discrimination, freedom and constraints general concepts etc.

The application of ethics to business is made on at least 3 levels, that is:

The micro level – being the one established among individuals based on the principle of trade, containing promises, intentions, consequences, individual rights. All these are governed (as Cohuţ I stated, 2008), by the principles of fair trade, fair treatment.

Individual or personal ethical orientations refer to each individual's ethics in an organization. They are the result of a more varied set of ethical pressures or influences. As an individual, each of us "enjoys" a series of ethical pressures influences containing the following: parents, social groups, religion, culture, profession etc.

The macro level – refers to institutional or social rules of the business world. The main concepts afferent to operating within this level are usually the result of political, cultural, legal and religious pressures.

The corporation level – implies aspects related to social responsibility.

The three application levels show the society's interest, as a whole, for the use of ethics both at the individual level through work relations, the preoccupation with the application and compliance with the professional ethical codes, the preoccupation with the creation of the feeling of belonging to a professional group (the micro level), at the national level – in institutions, governmental organizations, state bodies, the emphasis being on the preoccupation with transparency of national decisions to the detriment of personal or group interests, the preoccupation to ensure the fair legislative framework, the preoccupation with economic, social policies etc. of national interest (the macro level) and at world level through multinational corporations (the corporation level). Taking into consideration the last aspect, the current trend is to implement social responsibility programmes, strengthening this preoccupation both at the company level and at the consumers and business' third party level.

Social responsibility, as a component part of corporate responsibility, implies, in the European Commission's vision the corporations' preoccupation to voluntarily contribute to the society's welfare and to the environment's protection.   The difference between ethics in business and corporate social responsibility consists in the fact that the first means to do things ethically ("doing ethical things"). This differentiation is made taking into consideration the importance that the corporation gives to the community where it works. The European Commission's official document directly hints to the advantages coming from the manifestation of social corporate responsibility: the reputation of a company in the place it works, its image as employer and producer, and also as an actor on the local stage surely influences its competitivity. (Pantelică, 2008)

Currently, humankind lives within an interactive social system based on « being the first », »being more successful » encouraging the old-fashioned corruption and unfair behaviours when, actually, in a truly enlightened society, the purpose would be everybody's survival, a better life for everybody, the secret being transparency, as it has already said: »Know the truth and the truth will set you free.» (Walsch, 2003), because in such a society nobody would want to get anything

on someone else's expense. Instead, the governments, the politicians, the world corporations do not want to allow the promotion of such an economic-social system, taking into account that the law of gain and the law for power are promoted. We are invited to remain open in order to live the experience of a new system of thinking within a society based on the principle of transparency, without being afraid that someone might have something to lose. Our contemporary thinkers agree that the new model of economic-social development will depend on a renewal of minds, mentalities, and of human beliefs, by directing human will towards the reception of the source of superior Consciousness, generator of unconditioned love, freedom of expression, creativity, inspiration and intuition that human mind can transform into material, concrete experiences and manifestations, for everybody's welfare.

The capitalism, which replaced the ideological dictatorship of communism, through that of money and private ownership, creating the image of an individual sure of his destiny, torn from his metaphysical roots, capable of finding happiness in the prosperity of his life and material success, has proved its inefficiency to ensure the balance of life both affectively and morally.

The actual crisis emphasises these contradictions and the vulnerability of the two systems, opening up a new perspective of reconciliation of private property with collective property, of re-opening the human spirit towards humanistic values and the source of divine wisdom to rebuild a world as it was imagined by the greatest visionaries of all times.

To support the creation of an economic model of quality and transparency, of generosity and simple life yet complex through the Chapter 7-8), this being the authentic paradigm of human relations in the business world and everyday life.

The contemporary world can have this interior force to enrich from the experiences of the past, opening up to new potentialities to explore life at the level of its political, economic, and social institutions.

We consider as purposeful the presentation of the results obtained after applying a survey to the managers of Bihor county, their answers to two questions being relevant for the specificity of this paper. At the first question – When making a managerial decision, is the use of ethics a priority? – the highest part of the managers in the sample chosen (110 of 125, which represents a percentage of 88%) consider that the use of ethics represents a priority in making a decision.

For ethics can be defines from the large perspective as being a set of moral principles or values, that each of us has them defined in a more or less explicit way and because when applying them religious doctrines are also used, we designed the second question: Are ethics and moralities influenced by religious values? The answers to this question show the fact that almost half of the respondents agree or strongly agree, while only 28% do not agree with this statement.

According to the participative theory of the firm, the company does not have obligations only to one group but to the whole variety of social groups affected by the firm's activity. Starting from this enlarged perspective of corporations towards multiple groups of participants, we can conclude that because the managers get a new role, that of finding a balance between the shareholders' interests and the concurrent interests of the other groups of participants to ensure the company's long term survival, rather than the maximization of the profit and the promotion of a single group's interests. Therefore, the purpose of a business is to ensure efficient operations, in the same time answering to a variety of ethical requests of all the parties interested.

5. Conclusions

Starting from the assumption that the profit is the target had in view in any business, are created the premises determining the management of an entity in using the choice between two or more accounting options in order to reach the desired result, therefore they could motivate the management to use creative accounting techniques in order to reach this wish. We insist on this "could" for, in our opinion, the existence of several alternatives and, implicitly, of the possibility to choose among them do not automatically overlap with the idea of accounting manipulation

permission. This "permission" exists only in the mind of those for whom, in our opinion, the spirit of the law has become an old-fashioned concept.

In our opinion, the parable mentioned has the purpose to emphasise the moral aspects of the steward's behaviour and, extrapolating, of the accounting professional's in creating a solid base for an ethical behaviour.

From a philosophical and spiritual point of view, the contemporary crisis is humankind's crisis of conscience and moral values culture. We agree with contemporary great philosophers and visionaries thus supporting the idea that humanity should enter the phase of new type humanism, meant to cultivate the features of a morally evolved individual, endowed with the spirit of responsibility regarding the choices he makes as well as the capacity to assume the consequences of these choices. In the specialists' writings more and more often it is used the term of "business transparency", which requires a new typology of business people, a new vision of the essential sense of making material goods and a new conscience of the relation between man and nature and the environment.

EUROPEAN HARMONIZATION OF CONSOLIDATED FINANCIAL STATEMENTS REGULATIONS?

Baltariu Carmen-Alexandra
Babeş-Bolyai University, Faculty of Economic Science and Business Administration, Cluj-Napoca

Cîrstea Andreea
Babeş-Bolyai University, Faculty of Economic Science and Business Administration, Cluj-Napoca

The purpose of this paper is to analyze the degree of formal accounting harmonization within the European Union with respect to the EC Regulation No. 1606/2002 adopted by the European Parliament and European Council on the 19th of July 2002, which regulates the application of IAS/IFRS regarding the financial reporting of listed European companies. The conclusions of the paper were drawn after the completion of a thorough analysis performed by using correlation and/ or association coefficients, namely: the Jaccard's Correlation Coefficients, Rogers and Tanimoto Coefficient, Lance and Williams Coefficient and Binary Euclidian Distance Coefficient. The results lead us to conclude that although our first hypothesis is verified, the degree of harmonization between the accounting systems of EU Member States could be truly quantified only through an analysis of the material accounting harmonization, more precisely by analyzing the way the companies put into practice the requirements imposed through the EC Regulation No. 1606/2002.
KEYWORDS: formal accounting harmonization, consolidated financial statements, regulatory framework
JEL: M40, M41, M48

I. Introduction

Nowadays, more than ever, the effort to improve the international accounting system through a set of globally accepted and implemented financial reporting standards is considered a topic issue. The main reason for this is the extensively discussed possibility by the international forums according to which the international accounting system and the extant accounting regulations represent one of the factors, if not the most important factor that instigated, or at least led to the exacerbation of the economic and financial crisis in 2007. (Ojo 2010: 606-607)

This paper approaches the international accounting system domain by proposing a special focus on the formal accounting harmonization process regarding the consolidated financial reporting standards. The central theme of the paper is developed in a structure consisting of three parts. The first part includes a brief overview of the extensive literature on formal accounting harmonization process in order to develop a perspective on the current state of knowledge of the topic addressed, but also for a better understanding of key concepts that are operating in this field of study. The key concepts are also summarized in the first part of this work. Our study is completed with an empirical analysis over the degree of comparability between the accounting system of Romania with respect to consolidated financial reporting standards, on the one hand, and the accounting system of each member state of the European Union, all in the light of the EC Regulation No. 1606/2002 adopted by the European Parliament and the EU Council on July 19, 2002. The comparability analysis was performed by measuring the degree of formal accounting harmonization with respect to consolidated financial reporting standards, from two major points of view. First, the similitude, or the degree of similarity extant between the accounting systems was analyzed. Afterwards, the focus was shifted on the analysis of the dissimilitude, or the degree

of dissimilarity between the accounting systems, taking into account the EC Regulation No. 1606/2002. Following the empirical analysis we were able to draw certain conclusions presented in the last section of this paper.

II. Literature review
The existing body of research papers on formal (de jure) accounting harmonization process includes studies that address this issue through a theoretical viewpoint, by analyzing the accounting systems and/ or the accounting regulations, or the extant studies published on the subject (Standish 2003: 1-25; Larson and Street 2004: 89-119; Yüksel et al. 2008: 279-294; Wüstemann and Wüstemann 2010: 1-27; Feleagă et al. 2009: 1-12). Other studies approach the subject of formal accounting harmonization by analyzing the factors that have contributed the most to this process by influencing it' s development (Judge et al. 2011: 161-174). The subject of formal accounting harmonization process has also been developed through research papers in which the analysis is based on the actual measurement of formal accounting harmonization. This body of research literature can be distinguished taking into account the research methods used in the analysis. Thus, based on these criteria the studies extant on this subject can be organized into two categories, the first of which includes papers presenting research methods grounded on descriptive statistics, in which the analysis involves determining the number, or percentage of the sample analyzed according to certain selection criteria considered. The second category includes studies containing analysis that was developed on the basis of correlation and/or association coefficients, or analysis developed by using other mathematical methods. In this category we find research studies using methods based on the concept of distance, namely: Mahalanobis Distance Method (used for the first time in the study of Rahman et al. 1996: 316-333); Euclidean Distances (Garrido et al. 2002: 1-26; Fontes et al. 2005: 415-436); or fuzzy clustering analysis (Qu and Zhang 2010: 334-355); studies using correlation coefficients, respectively: Spearman Rank Correlation Coefficient (Fontes et al., 2005: 415-436) and Pearson Correlation Coefficient (Ding et al. 2007: 1-38), but also studies in which we can find the association coefficients: Jaccard's Coefficients (Fontes et al. 2005: 415-436).

Conceptual framework
After consulting the research literature, we appreciate that the concept of *accounting harmonization* designates the decrease in the degree of international accounting diversity and the growth of accounting uniformity (Tay and Parker 1990: 73; Mustaţă 2008: 60-93). The concept of accounting harmonization also refers to the degree of compatibility and/ or comparability between a national and an international accounting referential, in the same time implying the orientation of the national accounting referential towards the international financial reporting framework by assuming greater efforts to reduce disparities (Mustaţă 2008: 60-93).

The concept of accounting harmonization was developed in the research literature by Tay and Parker 1990: 73. Thus, two other new concepts were created, respectively: *formal (de jure) accounting harmonization* and *material (de facto) accounting harmonization*. The clear distinction made by the two authors mentioned above between formal (de jure) accounting harmonization and material (de facto) accounting harmonization can be found in other research papers too (Van der Tas 1992: 470; Parker 1996: 317; Canibano and Mora 2000: 351-353). According to the literature references mentioned above, the concept of *formal accounting harmonization* refers to the degree of comparability between regulations and accounting standards, whereas *material accounting harmonization* takes the meaning of the degree to which accounting rules and methods provided in the regulations and/ or standards are observed and enforced by companies in their financial reporting practices. In general, in the research literature the material accounting harmonization is seen as a process that occurs as a consequence of formal

accounting harmonization. This fact can be considered a proof that in an accounting system the rules and standards are the first to be harmonized, followed by the accounting practice.

III. Research methodology

The central theme of this article is restricted in our study to the existing de jure accounting harmonization within the European Union regarding the EC Regulation No. 1606/2002 adopted by the European Parliament and the European Council on the 19th of July 2002. This regulation deals with the application of IAS/IFRS in the consolidated financial statements of European companies that are listed on the stock market.

This paper is an empirical research that addresses from a comparative perspective the degree of de jure accounting harmonization between Romania and other EU Member Countries, taking into account how the EC Regulation No. 1606/2002 was adopted in their legislation. The research methodology of this paper includes both qualitative and quantitative research methods, which are based on computing the degree of similarity and dissimilarity between Romania and other EU Member Countries using correlation and/or association coefficients. Among the research methods used both at theoretical and empirical perspective level we can distinguish the analysis of documents, the comparative method, the interpretative method and last but not least the mathematical and statistical research methods, whose instruments, the correlation and/or association coefficients, will be described in detail in the case study.

IV. Case study: Quantifying the degree of formal accounting harmonization at a European level

The case study is based on an empirical analysis of the degree of comparability, or more precisely of the degree of formal (de jure) accounting harmonization, that exists between the accounting system of Romania and the accounting system of each EU Member Country. In other words, the empirical analysis regards the way in which the above mentioned accounting systems adopted the EC Regulation No. 1606/2002. This regulation deals with the compulsory application of IAS/IFRS in consolidated financial statements of European companies listed on the stock market, starting no later than 2005. The analysis of the level of comparability was made from two main viewpoints, the first referring to the similarity that exists between the analyzed accounting systems and the second referring to the dissimilarity between the analyzed accounting systems related to the adoption of EC Regulation No. 1606/2002. (Deloitte 2010; IAS Plus 2010)

The starting point of the empirical analysis consisted in establishing two hypotheses which were tested by applying correlation and/or association coefficients.

Hypothesis 1: The first hypothesis refers to the degree of similarity supposed to be higher among the Romanian accounting system and the accounting systems of the countries which are traditionally representatives of the continental accounting system: France, Germany, Austria, Belgium, Italy, Spain, Portugal and Sweden. Also, the degree of similarity is assumed to be lower between the Romanian accounting system and the Anglo-Saxon accounting systems belonging to Great Britain, Ireland and Holland. This hypothesis was established taking into consideration the fact that during 1994-1999, Romania adopted a dualist accounting model inspired by the French continental accounting system. (Matiş and Pop 2007: 20-40).

Hypothesis 2: The second hypothesis makes reference to the degree of similarity supposed to be very high among the Romanian accounting system and the accounting systems of the Central and Eastern European countries that adhered to EU in 2004: Czech Republic, Estonia, Latvia, Lithuania, Poland, Slovakia, Slovenia, Hungary and in 2007, respectively: Bulgaria. This hypothesis is based on the economical characteristics of these countries, considered to be very similar, (all the countries are rated as being developing economies, all these countries adopted a series of reforms aimed at improving the economic growth and development), characteristics that are also reflected in their accounting systems. (EU 2012)

In order to quantify the level of similarity and dissimilarity between the Romanian accounting system and the accounting systems of the other EU Member States regarding the adoption of EC Regulation No. 1606/2002, a series of items was identified: 1. The adoption of IAS/IFRS; 2. The permission/compulsoriness of using IAS/IFRS for individual financial statements of companies listed in 2010; 3. The permission/compulsoriness of using IAS/IFRS for consolidated financial statements of companies not listed in 2010; 4. The permission/compulsoriness of using IAS/IFRS for individual financial statements of companies not listed in 2010. For each element identified in these items, by using the comparative method, an analysis of the fulfillment of the condition of existence of each element in the accounting systems taken into consideration was done in order to allocate the value 1 or 0.

The empirical analysis was developed and finalized by using a series of correlation and/ or association coefficients. Among these coefficients the most known and used (Fontes et al. 2005: 415-436; Strouhal et al. 2008: 101-122) are Jaccard's Association Coefficients. This type of correlation/ association coefficients have the advantage of making possible the quantification of both the degree of similarity and dissimilarity between two accounting systems that are analyzed from a formal (de jure) harmonization point of view. The results obtained through the analysis based on the Jaccard's Association Coefficients were corroborated with the results obtained by applying over the same data other correlation and/ or association coefficients, respectively: Rogers and Tanimoto Coefficient (in the case of the results regarding the degree of similarity); Lance and Williams Coefficient and Binary Euclidian Distance Coefficient (in the case of the results obtained regarding the degree of dissimilarity).

V. Conclusions

As mentioned previously, this study establishes two hypotheses, which will be discussed through empirical results, while addressing the two quantified issues: the degree of similarity and the degree of dissimilarity.

Regarding the first hypothesis, it is noted that Jaccard's Similarity Coefficient values calculated between the Romanian accounting system and the accounting systems of the countries that are classified as having a continental (European) accounting system, namely: Austria, Germany, France, Belgium Spain, Portugal, Italy, Sweden is high, recording the following values: 0.824, 0.824, 0.822, 0.833, 0.822, 0.882, 0.700, 0.619 and 0.882 respectively. We can notice that the highest values are found in the case of Spain and Sweden, and the lowest values are found in the case of Portugal and Italy. The values computed with the use of Rogers and Tanimoto Coefficient verify the results obtained through Jaccard's Similarity Coefficient. Unlike these values, the results obtained by comparing the Romanian accounting system and the accounting systems of the states classified as Anglo-Saxon (Holland, Ireland and UK) are generally lower for both coefficients used to check the similarity. Therefore, for Jaccard's Similarity Coefficient these values are: 0,684; 0,667; 0,632. However, we can see that the values exceed the results obtained through Jaccard's and Lance-Williams Dissimilarity Coefficients. As the results obtained so far cannot be considered conclusive enough, we will analyze and interpret the values of Binary Euclidian Distance Coefficient, which in the case of the comparison between the Romanian accounting system and the accounting systems classified as Anglo-Saxon are higher (2.449; 2.449; 2.646) than the values obtained in the majority of the cases of countries with continental accounting system. The exceptions are represented by Italy and Portugal, in which case the registered values are 2.828 and 2.449.

With the exception of these two cases, we can conclude that hypothesis 1 is verified, the degree of similarity is higher between the Romanian accounting system and the accounting systems of the countries that are by tradition representatives of the continental accounting system: France, Germany, Austria, Belgium, Italy, Spain, Portugal and Sweden. In the same time, the degree of

similarity extant between the Romanian accounting system and the Anglo-Saxon accounting systems belonging to Great Britain, Ireland and Holland is lower.

In the case of hypothesis 2, we notice the fact that the Jaccard's Similarity Coefficient values computed between the Romanian accounting system and the accounting systems of Czech Republic, Estonia, Latvia, Lithuania, Poland, Slovakia, Slovenia, Hungary and Bulgaria are the following: 0.722; 0.550; 0.579; 0.550; 0.579; 0.478; 0.550; 0.882; 0.550. We can notice that generally the values are quite low, being almost equal to those obtained through Jaccard's Dissimilarity Coefficient. The highest values are registered in the case of Czech Republic and Hungary, and the lowest values are registered in the case of Slovakia and Estonia, Lithuania, Slovenia and Bulgaria (representing the same value). The values computed through Rogers and Tanimoto Coefficient verify the results obtained through Jaccard's Similarity Coefficient. Unlike these values, the results obtained after comparing the Romanian accounting system and the above mentioned accounting systems through Lance-Williams Dissimilarity Coefficient are quite low. So, we consider that a valid conclusion can be drawn only after analyzing and interpreting the Binary Euclidian Distance Coefficient. The conclusion drawn after checking the values obtained through the Binary Euclidian Distance Coefficient (2.236; 3; 2.828; 3; 2.828; 3.464; 3; 1.414; 3) is obviously that the hypothesis 2 is not verified, the degree of similarity is not very high between the Romanian accounting system and the accounting systems of the Central and Eastern European countries that adhered to EU in 2004: Czech Republic, Estonia, Latvia, Lithuania, Poland, Slovakia, Slovenia, Hungary and in 2007 respectively: Bulgaria.

The general conclusion drawn following our empirical study is that despite the results obtained after analyzing the degree of formal accounting harmonization existing between Romania and the other countries, some relevant results regarding the degree of harmonization between these accounting systems could be obtained only through an analysis of the material accounting harmonization, more precisely by analyzing the way the companies are applying into their financial disclosures the requirements imposed through EC Regulation No. 1606/2002.

Faculty of Economics and Business Administration

The aim of this article is to compare standards from private sector with standards from public sector with respect to consolidated financial statements. It is known that standard setters are trying to introduce a whole accounting of government in order to respond to the qualitative characteristics of the accounting and for doing this a lot of rules are copied from private sector. There are many researchers that studied this aspect, from different countries and a common idea of their research is that accrual based accounting is the main cause of this process of consolidation. Through this article we appealed a theoretic analysis and an empirical one based on Jaccard`s Coefficient to measure the degree of the comparability between the two sets of standards and as a result we found that they are similar. When developing the standards, regulators from IPSASB should have in mind the objective of their standards, the particularities from public sector and the alignment with user's purpose. Organizations from public sector are not-for-profit, while the scope of a private entity is to obtain profit. So, through the standards this objective of the users should be reached but at the same time the information presented should be complete, faithful and relevant. Implementing standards in order to elaborate consolidated financial statements could be expensive at the beginning but also the transparency and the comparability between the countries is ensured. So, measuring the impacts of this new rule in public sector we sustain the idea that we have more advantages than disadvantages for entities that apply these standards. The standards are revised periodically and in this article we analyze the comparability between IPSAS 6, 7, 8 and IAS 27, 28, 31 based on existing version before the year 2011, and for further researches we propose ourselves to follow the revision of these three standards for public sector as is state in IFAC projects, accordingly to IFRSs.
Keywords: consolidated financial statements, public sector, private sector, Jaccard`s Coefficients, accrual based accounting
JEL codes: M4

INTRODUCTION

We all live in a complex society and we take decisions based on different types of information. Financial information is very important for the welfare and development of the society. In private sector stakeholders like shareholders, investors, creditors, clients, suppliers and others analyze financial statements of the entity before any decisions. At the same time, in public sector we can talk about users which are interested in the transparency and relevancy of the information and in the quality of the services that they need. So, we can state from this point that users from private and public sectors have different objectives.

Complexity led to the formation of a new type of entity – *the group of entity*. The group has to present consolidated financial statements to ensure a true, accurate and complete image about their actions.

In private sector IASB, through IASs and then IFRSs, regulates the way in which an entity should prepare consolidated financial statements and defines the terms of a group (control, parent entity,

controlled entity, methods of accounting). Based on IASs were issued by IPSASB IPSASs for public sector organizations, which are predominantly not-for-profit. This is an important difference between the two sets of standards: IASs have been developed for entities that are for profit, while IPSASs have been developed for not-for-profit organizations. All the countries that switched from cash based accounting to accrual based accounting should implement IPSASs. Currently, IPSASs do not provide guidance on how to account for a public sector combination which means that users may not be able to obtain the information needed to evaluate the nature and financial effect of a public sector combination.

In this article we will analyze the main differences and similarities between IPSASs and IASs for consolidated financial statements, and to measure these we will use Jaccard`s coefficients. As we have said already the users from these two sectors have different objectives. So, it is a good idea to implement standards for public sector based on standards from private sector? Can we talk about the same type of entities, both in private and public sector, and can we apply the same methods of accounting and the same measurement bases? On the other hand implementing standards in accountability ensure us that we can compare entities from different countries, or from one year to another, so we will have one qualitative characteristic that will be reached: comparability.

LITERATURE REVIEW

Consolidated financial statements for public sector organizations are an interesting subject for debate, both for academics and for practitioners. This is the reason why we have turned our attention on this subject.

Given the changes and improvements in public sector accounting system, we believe that the idea of implementing the consolidated financial statements in the public sector is directly related to the adoption and implementation of an accrual-based accounting. This idea is sustained by Guthrie and it`s very widespread in the literature. Others researchers, like Jaruga and Nowak, believe that the accounting systems of each country are based on their economic and political environment. Tiron and Blidisel argue the fact that culture, history, value systems or structural elements of the country are some of the reasons that led to the emergence of different national system and at the same time specific objectives and main users of financial reporting statements, financial resource providers and regulators influence the national accounting systems.

In many countries, international auditing and consulting firms have played a crucial role in the implementation of accrual accounting in public sector (Luder and Jones, 2003; Christensen, 2005). Thus, methods and practices in the private sector have been taken as a model and applied in the public sector without any further analysis in detail of the objectives and characteristics of public sector (Christensen, 2002).

In the private sector, the consolidated financial statements are considered useful tools in accounting that are designed to improve accountability and provide a true and fair overview of the assets/liabilities and financial results of the group (Walker, 1978), while in public sector, the consolidated financial statements is a useful tool for governments that have a lot of pubicly owned entities because they present a clear picture of current economic status and functioning of government as a whole (Srocke, 2004, Wise, 2006, Grossi and Srocke, 2005).

Benito et al. (2007:298-299) says that we should have in mind the different particularities of the public sector, in general, and how the public accounting system must adapt to the needs of specific areas of this information. Also, Johnsen and Lapsley (2005) have demonstrated the need to introduce something new in public sector accounting (*Reinventing public sector accounting*) by introducing innovative approaches that allow going beyond the imitation of private sector, and Chan (2003) asked if it is "*necessary for the government to uncritically imitate practices from the private sector*".

We could say that these researchers are reticent regarding the imitation of the private practices into the public sector, and we introduce here the practices for consolidated statements, because we can talk about different objectives and users of the financial statements.

METHODOLOGY

As mentioned before, having in mind that in a complex society we could speak about a group of entities which should present consolidated financial statements, all our methodology was based on this subject, trying to reach our objectives.

In the first place we have to position the general area of this research, which is divided into specific areas. So, the general area of research of this paper is the issue of the *consolidated financial statements, a comparative analysis between public and private sector*. We began our research by first analyzing the impact of consolidation on the society, both in public and private sectors, and the standards that regulates consolidated financial statements through a comparative analysis.

Once we defined the area of the research, we should speak about the predominantly current of this research. We include our paper in a positive current because we analyze what it is in these standards and not what should be.

Having in mind the type of research, we use both a theoretic and an empiric research. Theoretic because we analyze different articles from the researchers that activate in this domain, consolidated financial statements, and empiric because we have test the similarities and dissimilarities between the two sets of standards, IASs and IPSASs for consolidations, in order to draw a well established conclusion regarding the comparability degree existent between them. A more detailed presentation of the empirical analysis process, and the methods which were used, is done within the chapter-Results. Theoretic research was combined with a qualitative one at the point of literature review. The source of information for the empirical analysis was also the information gathered by closely analyzing the regulations mentioned above, IAS (27, 28, 31) and IPSAS (6, 7, 8) which were accordingly codified and assayed by using some statistical methods.

In terms of temporal criterion, we used predominantly the transversal analysis for the comparative analyze of different theoretic aspects on consolidated financial statements, both in public and private sector.

Based on this methodology we were able to draw our conclusions and also to design a short outlook of future research in the field.

RESULTS

International standards are desirable because some practices are better than others and necessary because of need for information and comparability. These international benchmarks in accounting domain are divided in two categories: for public and for private sector. At European level, accounting benchmarks are: (1) for private sector IAS/IFRS (issued by IASB, obligatory for some types of entities and the compliance is mandatory) (2) for public sector IPSAS (issued by IFAC, with an advisory role and the compliance is voluntary) (Tiron, 2007).

As we already said, the objective of this article is to measure the similarities and dissimilarities between the two sets of standards, in order to identify the specific elements of each other and the degree to which elements have been implemented under IAS and IPSAS. To do this we turned to *Jaccard's Coefficients* which are mostly known in the form being used as follows (Strouhal, 2011:317):

$$S_{ij} = \frac{a}{a+b+c} \text{ (1)} \qquad \text{and} \qquad D_{ij} = \frac{b+c}{a+b+c} \text{ (2)}$$

where:

S_{ij} represents the similarity degree between the two sets of analyzed accounting regulations or practices; D_{ij} represents the degree of dissimilitude or diversity between the two sets of analyzed

accounting regulations or practices; a – the number of elements which take the 1 value for both sets of regulations or practices; b – the number of elements which take the 1 value within the j (IAS) set of regulations or practices and the 0 value for the i (IPSAS) set of regulations or practices; c – the number of elements which take the 1 value within the i (IPSAS) set of regulations or practices and the 0 value for the j (IAS) set of regulations or practices.

The values that can be recorded by these coefficients go from 0 to 1, where 1 represents a maximum level of harmonization when considering the similarity coefficient. Also, the sum of the two Jaccard's Coefficients, Jaccard Sij and Dij, is obviously always equal to 1.

Jaccard's Coefficients will further be used within the next section, in our empirical analysis, in order to measure the comparability between IAS and IPSAS. So, for our analysis we have compared IPSAS 6 *Consolidated and separate financial statements* with IAS 27 *Consolidated and Separate Financial Statements*, IPSAS 7 *Investments in associates* with IAS 28 *Investments in associates* and IPSAS 8 *Interest in joint ventures* with IAS 31 *Interest in joint ventures*, issued until the year 2011. Starting from this approach we have identified a series of elements that we should have in mind when we talk about consolidated financial statements and then we organized them within five big topics, as follows: 1.Definitions, 2.Scope, 3.Presentation, 4.Consolidation procedures, 5.Disclosure.

In order to illustrate our methodological approach, we would benefit from the following situation:

Table no.1 Exemplification of the analysis method used for the considered topics

Analyzed elements	Standards	
	IPSAS 6	*IAS 27*
Definitios		
-consolidated financial statements	1	1
-controlled entity	1	1
-controlling entity	1	0
-cost method	1	1
-minority interest	1	0
-separate financial statements	1	1
-subsidiary	0	1
-parent	0	1
-control	1	1

(Source: author's analysis)

As a result of the effective measurement of the comparability degree between IPSAS 6 and IAS 27, based on Jaccard`s Coefficients we can present the following situation:

Table no.2 Comparison analysis based on Jaccard`s Coefficients for IPSAS 6 vs. IAS 27

Analyzed elements	Jaccard`s Coefficients	
	Sij	*Dij*
Definitios	*0,667*	*0,333*
Presentation	*1*	*0*
Scope	*1*	*0*
Consolidation procedures	*0.8*	*0.2*
Disclosure	*0.769*	*0.231*

(Source: author`s analysis)

Table no.3 Comparison analysis based on Jaccards' Coefficients for IPSAS 6, 7, 8 and IAS 27, 28, 31

	Sij	*Dij*
IPSAS 6 vs. IAS 27	*0,847*	*0,153*
IPSAS 7 vs. IAS 28	*0,752*	*0,248*

| IPSAS 8 vs. IAS 31 | 0,812 | 0,188 |

As we could see in the tables the degree of comparability between standards is very high and we consider that the main reason for this fact is that IPSAS were copied from IAS, even if IASs were developed for entities from private sector.

Analyzing these three situations we observed that the main differences between standards are: (1) (*IPSAS 6 vs. IAS 27*) IPSAS 6 contains specific guidance on whether control exists in a public sector context, uses different terminology, permits entities to use the equity method to account for controlled entities in the separate financial statements of controlling entities and requires controlling entities to disclose a list of significant controlled entities in consolidated financial statements while IAS 27 does not require this disclosure (IFACa); (2) (*IPSAS 7 vs. IAS 28*) IPSAS 7 applies to all investments in associates where the investor holds an ownership interest in the associate in the form of a shareholding or other formal equity structure while IAS 28 does not contain similar ownership interest requirements and uses different terminology (IFACb); (3) (*IPSAS 8 vs. IAS 31*) IPSAS 8 uses different terms and definition and includes a transitional provision that permits entities that adopt proportionate consolidation treatment to not eliminate all balances and transactions between ventures, their controlled entities, and entities that they jointly control for reporting periods beginning on a date within three years following the date of adopting accrual accounting for the first time in accordance with IPSASs while IAS 31 does not contain transitional provision (IFACc).

CONCLUSIONS

This article has analyzed the degree in which it is appropriate for IPSASB to introduced rules from IAS/IFRS for public sector, and, in special, for consolidated financial statements. We could say that the cause was the introduction of accrual based accounting for public sector organizations which were transposed from private sector. We have turned our attention at the same time on the degree of comparability between IASs and IPSASs for consolidated financial statements and to measure this we used Jaccard`s Coefficients.

The consolidated financial statements for not-for-profit organizations, which are the most common in public sector, is a very discussed subject because some countries already prepare consolidated statements and others are difficult to be convinced. We think that introducing this new rules have both advantages and disadvantages. The most important advantage is that transparency grows, users can take decision based on trust because they can known which were the governmental actions and how much resources were used for them. Also, presenting the financial statements as a whole represents the real position and performance of the country, the comparability between states can be made and the image is more reliable and faithful represented. Limits identified by us are the following: can be expensive to implement a new system in public sector, it needs well prepared human resources, the practitioners should be prepaid by academics which have studied the phenomenon and knows the impact of the change.

As a result of our empirical analysis we found that the standards considered are similar, the degree of similarities calculated through Jaccard`s Coefficients being higher than the degree of dissimilarities. But is this a good thing or regulators should take more into consideration the particularities from public sector? We think that even users from the two sectors are different and the problem of consolidated financial statements for public sector organizations should be more closely analyzed because, at the same time, in private sector we can speak about entities whose aim is to obtain profit, while in public sector organizations are not-for-profit and their most important objective is the transparency of the governmental activities.

For further researches we intend to follow the revision of IPSAS 6-8, and more closely the alignment with IFRS 10 *Consolidated financial statements*, IFRS 11 *Joint Arrangements* and IFRS 12 *Disclosure of interests in other entities*. As is state on IFAC projects doing this we hope

to answer some question like: (1) Should the temporary control exemption from consolidation in IPSAS 6 be retained? (2) The term control should continue to be used and whether the revised definition of control is appropriate? (3) Should the scope of the project include consideration of whether all controlled entities should be consolidated? (IFACd).

QUALITATIVE STUDY REGARDIND THE RELATIONSHP BETWEEN CORPORATE GOVERNANCE AND CREATIVE ACCOUNTING

Berinde Sorin Romulus
„Babeş-Bolyai" University, Faculty of Business

Răchişan Paula Ramona
„Babeş-Bolyai" University, Faculty of Business

Groşanu Adrian
„Babeş-Bolyai" University, Faculty of Economics and Business Administration

The concept of corporate governance has come into the spotlight after the big accounting scandals. Corporate governance represents the manner in which a company is managed and controlled, and this aspect is closely related to the creative accounting practice; ownership structure, the board of directors' structure, the frequency of these bodies' meetings, they all can encourage but also discourage accounting manipulation.

We tend to agree with the authors who claim that certain changes within the company – including the structure of certain departments – and a rigorous control can significantly reduce the use of creative accounting techniques.

Concerning the main objective, respectively outlining a clear image of corporate governance starting from creative accounting, in order to achieve it we conducted a qualitative study, we decided to analyze one of the main research directions, namely corporate governance, as we considered it a current issue with great impact on creative accounting. Our study is based on corporate governance seen as a possible solution to reduce creative accounting practices

We used as research method the content analysis which developed in three stages, namely: pre-analysis, content exploitation, respectively processing and interpretation of results. Moreover, when conducting this qualitative study, we use both quantitative and qualitative analysis, using external observation (non-participant) method in collecting the necessary data. We also used the comparative method by studying the main lines of research in different periods (1990-2010).

These studies refer to creative accounting techniques, to conflicts of interest between managers, directors and shareholders, to joint ownership and control rights, to the lack of transparency regarding financial reporting and auditors' independence – as evaluators of the financial and accounting information. Not all research directions have been sufficiently explored; therefore, in the future the researches must be continued and deepened.

We consider that a number of independent outside directors within the board could contribute to a better monitoring of the management team, leading to a lower possibility for the company to use creative accounting practices compared to the situation in which the board would be formed mainly from inside director.

I. Introduction
1.1. Corporate governance – a bureaucratic layer or a method against creative accounting?
Currently, there is a strong trend of cross-disciplinary research and the concept of corporate governance is related to microeconomics, macroeconomics and also to law, sociology and psychology. The particular connection between corporate governance and creative accounting practices is the reason this concept caught our attention, namely how the structure of the Board of Directors of a company can encourage or discourage accounting manipulation. The topic came under the spotlight as a result of a chain of events, more specific a series of highly publicized scandals which have created anxiety and a lack of confidence on the international capital market. Everything started when Enron collapsed – the company which became 'a symbol of contemporary corporate fraud' – and it continued with a significant number of companies that went bankrupt in an equally dramatic manner (WorldCom, Parmalat, Xerox). As a consequence

of the fact that companies used creative accounting practices, but also because the big audit firms overlooked or even collaborated to conceal tax frauds, doubts have emerged concerning the investors' ability to take sound decisions based on information provided by companies and capital market.

1.2. Corporate governance and creative accounting

In recent decades, the concepts of corporate governance and creative accounting have often been associated with each other within economic debates. Along with business development, many companies have come to be managed and controlled by founding families, but the problem is not confined to the conflicts of interest arising among their members, but it extrapolates to other categories of stakeholders. Capital markets use financial information to establish the price for securities, and the investors rely on them in order to substantiate their decisions to buy, sell or keep securities. Market efficiency depends on the information flow provided to capital markets, and if the information is biased, the markets cannot determine the exact price of securities. Moreover, it appeared that sometimes managers manipulate financial statements to influence certain competitors on the capital market. On the other hand, the fact that managers use creative accounting techniques can affect the investors' ability to properly assess the true value of the company which on long term may affect the company's performance on securities market.

Moving from the management team and the Board of Directors' structure to audit, we believe that the audit committee has an important role in discouraging creative accounting. As we know, the great financial scandals which burst worldwide were based on accounting manipulation practices, but also on collaborations with audit firms which, instead of acting as the 'guardians' of the financial markets, have come to overlook, to hide, and even to participate to some of the greatest frauds in history. Thus, reform measures for the companies' governance systems were imposed. The most striking example is provided by the United States of America. As a result of the bankruptcies related to accounting scandals, the American parliament adopted a law in 2002 meant to strengthen the audit independence. The above mentioned law, known as the **Sarbanes-Oxley Act** (SOX) is a component of the legislative reform considered necessary after the US financial scandals. It represents 'the foundation of the vision on management and control of a company and it imposes standards and regulations on the control framework of the financial system.' (Cuc 2008: 84). This law tries to regain the confidence of the American investors (and not only) through measures that were included in five chapters, namely: Restriction – through strict regulation – of the activities of board members, Strengthening the internal control function, Strengthening the external control function, Transparency, Accountability and Penalties.

II. Research metodology

Regarding the *research methodology*, it is closely related to the established objectives. Thus, we started with a theoretical research (conceptual-descriptive), a *qualitative research,* in order to analyze different concepts, and we also used the *comparative method* to study the various approaches of these concepts, specific to our area of research. In addition, the analyzed information has also been obtained by means of *document analysis* (covering the specialty literature selected) or *non-participant observation.*

Concerning the qualitative study, we used as research method the content analysis which developed in three stages, namely: pre-analysis, content exploitation, respectively processing and interpretation of results. Moreover, when conducting this qualitative study, we use both quantitative and qualitative analysis, using external observation (non-participant) method in collecting the necessary data. We also used the comparative method by studying the main lines of research in different periods (1990-2010). At international level, the current state of knowledge concerning creative accounting area was delimited by means of a sample of 57 articles published in international journals. In order to conduct this study we selected 14 international accounting

journals, 9 of which are ISI indexed journals. We considered appropriate one research direction we identified within the articles in the sample, namely **corporate governance**. Thus, we identified seven articles related to corporate governance, four of which were empirical studies and three were based on theoretical research.

III. Results and discussions
3.1. Analysis of the articles that include empirical research
Although every science begins by being descriptive and only later it tries to explain the facts it observed, in our study we considered important to firstly analyze the articles based on empirical studies, as they allow us to outline a more real and accurate view on corporate governance.

A. Corporate Governance and Performance of Malaysian Listed Companies
This study was conducted in 2006 by **Cyril H. Ponnu** from the Faculty of Business and Accountancy, University of Malaya. This empirical study was carried out on a sample of 100 listed Malaysian companies, of which 30 were large companies and 70 were medium-sized. Data was collected from the annual reports published by the Bursa Malaysia Securities Bhd for the financial year 1999 (prior to the implementation of the Malaysian Code on Corporate Governance issued in 2000) and the financial year 2005 (after the code was released). Thus, the sample was selected such as to allow the comparison of results before and after the implementation of the Code on Corporate Governance. The analysis was based on identifying the connection between the structure of corporate governance and the performance of the companies from the sample. Therefore, the author used an econometric model which had ROA and ROE indicators as dependent variables and duality (a binary variable which has a value of one when an individual has the joint title of chairman and CEO and 0 when these functions are separate) and the proportion of independent directors as independent variables.

The main results revealed that in 2005 there were more independent directors than in 1999. In addition, companies with duality had higher ROA than those with separate functions, the results showing that the separation of CEO and chairman improves firm performance in terms of ROE but not in terms of ROA. The results revealed that the companies that retained duality have better ROA than those who did not. ROE analysis shows the opposite result. In terms of board independence, the analysis showed that an increased proportion of independent directors leads to a better performance. The connection with the creative accounting sphere is more than obvious, since its techniques are based on these conflicts of interests, which only lead to a reduced long-term performance of the company. We support the idea that implementing a Code of Corporate Governance that would be respected within all departments of a company could significantly reduce creative accounting practices and increase company performance.

B. Separation of Ownership from Control and Acquiring Firm Performance: The Case of Family Ownership in Canada
This study was conducted in 2005 by the American researcher **Walid Ben-Amar** in collaboration with the Canadian researcher **Paul André**. This study investigates the relationship between ownership structure and acquiring company performance in the context of ownership concentration and separation between ownership and control rights. The study is based on a sample consisting of 238 events (mergers and acquisitions) performed within 138 Canadian companies. Data was obtained from the Securities Data Corporation Worldwide Mergers and Acquisitions database, but also from other studies previously conducted. The observations are for 1998-2000, and the companies selected were those who performed mergers or acquisitions greater than 10 million US dollars. The main information provided by this study refers to the fact that the abnormal results of the Canadian companies that performed acquisitions are positive in

the analyzed period. These results are even greater for the companies in which ownership is held by families. Moreover, it was shown that the separation of ownership and control rights does not affect the company and that corporate governance mechanisms influence in a positive manner the performance of the companies that perform acquisitions. The study reached the conclusion that there is a connection between ownership and the abnormal results of the companies that perform acquisitions.

C. Investigating the effect of board independence on performance across different strategies
This study, undertaken in 2006 by the Indonesian researcher **Lindawati Gani** in collaboration with the Canadian researcher **Johnny Jermias**, analyzes, as the title suggests, the influence the Board has on company performance. The sample on which the study relied consisted of 109 companies from the manufacturing industry listed in the Compustat S&P database for the period 1997-2001. In this study, the authors used an econometric model, having as variables: *Competitive strategy*, *Board Independence*, and *Performance* (represented by ROE and ROI). After analyzing this model, the results were consistent with the hypothesis that companies which follow a strategy of cost efficiency benefit more from an increased level of board independence than firms that pursue a strategy of innovation. Although it has been concluded that the relationship between Board independence and company performance differs across business strategies, other variables might also affect this relationship. Moreover, the results are valid only for the manufacturing industry and they cannot be extended to other industries without further research in those directions.

D. Corporate Governance and Profit Manipulation: A French Field Study
The study published in 2005 in the international journal 'Critical Perspectives on Accounting' by the French researchers **Caroline Lambert** and **Samuel Sponem** analyzes the practices of profit manipulation and it examines the manner in which the Anglo-Saxon Corporate Governance model can lead to discourage these practices. The authors have used the results from 32 interviews applied in 13 companies. The study concluded that two of the factors underlying the accounting manipulation practices are the changes occurred in the corporate governance system and the shareholder pressure that accompanies them. Therefore, changing the rules of the game because of the increased shareholder pressure encourages management controllers to use their experience and knowledge to help managers manipulate profits. Management controllers are aware that they cannot focus only on financial aspects. The authors also raise the issue of implementing the Anglo-Saxon corporate governance model in countries that do not follow the same cultural patterns, indicating that this measure may entail unexpected consequences such as the multiplication of the accounting manipulation practices or the reduction of financial statements' relevance.

3.2. Analysis of the articles that include theoretical research
Since we have already discussed the results of the four empirical studies, next we only have to extract the most relevant ideas from the theoretical studies.

A. The role of Information and Financial Reporting in Corporate Governance and Contracting
The article was published in 2009 by the researchers **Christopher Armstrong**, **Wayne Guay** and **Joseph Webber**, and its aim was to explore the importance of transparency regarding financial reporting in order to reduce the conflicts between managers, directors and shareholders, and also to diminish the differences between shareholders and other contractual parties (creditors). Moreover, a key topic approached in this study is the reduction of the *creative accounting* phenomenon by making certain modifications in the corporate governance system – such as: the presence of several independent directors within the Board of Directors, the separation of

ownership and control rights, by regulating the principle of transparency regarding financial reporting and by taking measures concerning audit independence.

B. Management accounting and corporate governance: An institutional interpretation of the agency problem

The study conducted by the British researcher **Will Seal**, published in 2006 within the international journal 'Management accounting Research' deals with the manner in which management accounting relates to corporate governance, especially after the collapse of Enron when certain 'weaknesses' have been found in accountants' work. However, the authors believe that management accounting techniques can improve corporate governance practices. The article emphasizes the collapse of the US and the UK stock markets which brought into light many irregularities concerning corporate norms and the implementation of several unwise strategies. Because of these practices, most of them belonging to the creative accounting sphere, management accounting and corporate governance have begun to converge.

C. Corporate Governance and Accounting Systems

The French researcher **Yvon Pesqueux** published the article in 2005 within the international journal 'Critical Perspectives on Accounting' where corporate governance is seen as an ideological perspective of granting a special attention to the interests of leaders, since the accounting system is the field where these interests are validated. Corporate governance provides the illusion that the rules of a representative democracy are indeed implemented within companies on the market, which is only a mechanism for masking the power accumulated by the leaders of multinational companies. Therefore, the French researcher considering it the best mask for the interests of those in the top of the corporate pyramid and not a mechanism able to discourage creative accounting practices, to mitigate information asymmetry between various categories of stakeholders or to support the transparency of financial statements.

IV. Conclusions

As we can observe from the analysis of the previous articles, most of them focused on the connection between corporate governance and company performance, all of them making references to creative accounting techniques, to conflicts of interest between managers, directors and shareholders, to joint ownership and control rights, to the lack of transparency regarding financial reporting and auditors' independence – as evaluators of the financial and accounting information. The fact that we chose to analyze the articles that focus on corporate governance is not random taking into account that we strongly support the idea that the best way to reduce the creative accounting practices involves certain modifications in the corporate governance system of each company. Nevertheless, in order not to be misunderstood, we must mention that changing the members or their number within the Board or eliminating the duality from companies is not enough. It is also important to carry out legislative changes, to harmonize accounting practices with the policies of the international specialized committees, and to cultivate a fair and transparent spirit in order to mitigate the discrepancies within companies and, of course, to eliminate the pressures which, most of the times, lead to a reckless behavior of the managers with long-term drastic consequences both for themselves and the performance of the entire company.

We can also conclude that not all research directions have been sufficiently explored; therefore, in the future the researches must be continued and deepened. Among them we can mention the information asymmetry between various categories of stakeholders, the reform of accounting, or the ethical aspects within companies. In addition, we observed that, although our study relied on articles published within international accounting journals, the scientists' concerns converge with

those in other fields, stressing, thus, the multidisciplinary and interdisciplinary nature of the research concerning creative accounting and corporate governance.

Although our intention was to develop a complex study, we must say that this paper is not without limits, most of them being established mainly in order for us to be able to centralize a series of data meant to give us meaningful results, hoping that such research will be further conducted in the future. Among the limitations of this study we can mention the period of time (20 years) because we considered that the current studies, especially those conducted after the year 2000, reflect clearly enough the interest of the scientists for the concerned field and also the current state of knowledge. Another limit is represented by the international journals from which we selected the sample of articles necessary for our study. Although they are among the highest rated international accounting journals, they limit our research because most of the articles are written in English by researchers from USA or UK, many of them focusing their studies on these two particular geographical areas, almost ignoring other areas.

ACCOUNTING STANDARD SETTING IN THE INTERNATIONAL ARENA: UPDATE ON THE CONVERGENCE PROJECT

Bonaci Carmen Giorgiana
Babeş-Bolyai University, Faculty of Economics and Business Administration

Mustata Razvan V.
Babeş-Bolyai University, Faculty of Economics and Business Administration

Matiş Dumitru
Babeş-Bolyai University, Faculty of Economics and Business Administration

Our paper contributes to the literature on international accounting by focusing on the standard setting process. As documented by research literature, accounting regulation can enhance corporate governance (Melis and Carta, 2010), corporate reporting being expected to reduce information asymmetry. Based on accounting research and trade literature we first synthesize recent evolutions in the international accounting arena. We therefore position our study within current realities significantly marked by uncertainty in relation to the world wide globalization process. The objective of our paper is to perform an analysis that would help assess further developments of the convergence project. This is done by looking at the current status of the projects being developed under the IASB –FASB collaboration, as well as by developing a comparison between IFRS and US GAAP. The employed research methodology relies on analyzing data provided through the IASB and the FASB's websites, as well as other official documents being issued by the two Boards. The assessment of the projects was done by reviewing exposure documents and monitoring the Boards' deliberations, while the developed comparison requires accounting regulations content analysis. Concluding upon the Boards' ongoing projects, we might identify areas in which convergence seems to be quite close (such as revenue recognition and leasing), but also areas in which convergence becomes even more challenging (such as financial instruments or the particular case of offsetting). Similar to other studies being developed within accounting research and trade literature (SEC 2011: 8) we may conclude that, generally, US GAAP present more detailed, specific requirements than IFRS.

1. Historical evolutions and landmarks in the international accounting arena

It is a well known fact that national differences impact upon national accounting systems, accounting research literature identifying a series of reasons for differences in the financial reporting process, including the character of the national legal system, the way in which industry is financed, the relationship of the tax and reporting systems, the influence and status of the accounting profession, the extent to which accounting theory is developed, language, etc. On the other hand, economic realities closely linked to the globalization process encourage us to aim the diminishing of such differences. In this regard literature offers the option of the standardization approach (referring to rules to account for similar items in all countries) and the harmonization approach (aiming to provide a common framework while allowing for some different national approaches). The therefore generated benefits would mainly relate to permitting greater comparability and reducing training costs for the accounting profession on the long run.

A significant role under the given circumstances belongs to accounting standard setting bodies based on their accountability for the accounting standards' (financial reporting standards') due process. When positioning our analysis in the international arena we implicitly relate to the

International Accounting Standards Board (IASB), former International Accounting Standards Council (IASC). Furthermore, we must also relate to the Financial Accounting Standards Board (FASB) as being the regulatory body for the world's largest economy, the United States (US) representing an attractive source of capital for foreign companies. This also takes us to the Securities and Exchange Commission closly monitoring the accounting standard setting process in the US. Looking back on the relation between the IASB and the FASB, we consider it safe to assess that there was always an apparent competition for international supremacy between the two accounting standard setters and the corresponding regulations which they issue (namely the International Financial Reporting Standards – IFRS (including the International Accounting Standards -IAS) and US Generally Accepted Accounting Principles – US GAAP). Despite such potential competition, the above mentioned process of globalization also impacted their relation due to the manifestation of a need for accounting harmonization. Perhaps a more suitable term when discussing the IASB and FASB would be accounting convergence. Following such a purpose, the IASB and FASB signed in 2002 what we all know as the Memorandum of Understanding (MoU - The Norwalk Agreement, September 2002), both Boards acknowledging their commitment to the development of high-quality, compatible accounting standards that could be used for both domestic and cross-border financial reporting.

While US GAAP were perceived as high quality accounting standards until the 21st century, it was the large US bankruptcies that became known world wide (Enron, Parmalat, WorldCom) that also brought doubts with regard to the accounting regulations that would allow for such manifestation without signaling stakeholders. It was also at the beginning of the 21st century that the European Union (EU) started negotiations in order to adopt a set of accounting regulations. Considering the negative impact of the previously mentioned bankruptcies taking place under the watch of the FASB, but without forgetting the IASB's flexibility in the negotiation process, it therefore becomes easy to follow the EU's decision. It was Regulation (EC) No 1606/2002 of the European Parliament and of the Council of 19 July 2002 on the application of international accounting standards and Regulation (EC) No 1725/2003 of the European Parliament and of the Council of 29 September 2003 on adoption of certain international accounting standards in accordance to Regulation (EC) No 1606/2002 that became landmarks in the evolution of the accounting standard setting process in the international arena. In accordance to these regulations, consolidated financial statements of companies listed on EU capital markets had to be filed in based on IFRS starting with year 2005.

This can of course also be easily seen as one of IASB's victories over the FASB. The following was to come in 2007 when the SEC and the FASB were recognizing IFRS for the purposes of foreign companies listed in the US (mentioning that this applied only to IFRS as issued by the IASB since the SEC was not at all pleased with the IAS 39 carve out that the IASB accepted under European lobby). Things were looking quite promising for the IASB, considering the fact that by the end of 2007 IFRS were used in more than 100 countries round the world. It was through a subsequent MoU (September 2008) that the FASB and the IASB agreed that a common set of high-quality, global standards remained their long-term strategic priority and established a plan to align the financial reporting of US issuers under US GAAP with that of companies using IFRS (AICPA, 2011). Very soon (November 2008) the SEC issued a proposed roadmap that included seven milestones for continuing US progress toward acceptance of IFRS.

Evolutions in the international arena started storming and it was only turbulent times that were able to slow things down. The 2007-2009 financial crisis determined shareholders to also question the high quality of IFRS considering that this time it happened under the watch of both the IASB and the FASB. Furthermore, SEC's new chair, Mary Schapiro, stated she did not feel bound by the existing roadmap, arguing that another assessment should be made regarding the decision (Millman, 2009 quoted by Erickson et al., 2009), and early in 2009 expressing reservations about the progress and proposing a timetable of IFRS convergence, criticizing the

IASB and indicating reluctance to adopt IFRS (WebCPA, 2009 quoted by Rezaee, 2010). It was in 2011 that the SEC should have decided whether to incorporate IFRS into the US financial reporting system for US issuers, and in case of deciding so, when and how. In early January 2012 Schapiro was promising a decision in the next few months, adding that there are some challenges that have to be addressed before the SEC will be comfortable making the ultimate decision (IFRS USA, 2012).

Positioning our study under the above discussed setting, the purpose of our paper is to develop an analysis that would help assess further developments of the convergence project. This is done by looking at the current status of the projects being developed under the IASB –FASB collaboration as well as by developing a comparison between IFRS and US GAAP.

2. Research methodology

The employed research methodology relies on analyzing data provided through the IASB and the FASB's websites, as well as other official documents being issued by the two Boards. The developed analysis comprises two parts. The first focuses on the actual stage of the IASB-FASB collaboration in terms of undertaken projects. The assessment of the projects was done by reviewing exposure documents and monitoring the Boards' deliberations. The second part of the analysis develops content analysis of IFRS and US GAAP in order to establish differences without considering their impact in practice, which would be more difficult to assess. Developing the comparison between IFRS and US GAAP is done based on accounting regulations content analysis.

3. IASB - FASB collaboration: actual stage of projects

When looking at projects which the IASB and the FASB undertook in their collaboration when considering the accounting standard setting process we have to consider both the MoU and their other joint projects. The two accounting standard setting bodies issued the MoU in 2006 and further updated it in 2008 with the purpose of identifying the accounting standard setting projects that they considered to mostly require improvement in the near-term. The MoU included both short-term projects and longer-term projects. Establishing the two Boards' priorities was mainly done by considering the purpose of increased convergence between IFRS and US GAAP as well as higher quality for the two sets of accounting standards. The manner in which the Boards considered it suitable to do so primarily related to the development of new standards. We will further synthesize the longer-term projects based on their status:

Table 1: MoU longer term projects

Completed
Business combinations
Fair value measurement
Post-employment benefits
Project scope reassessed
Derecognition
Re-exposure of proposals
Insurance
Leases
Revenue recognition
Redeliberation of exposure draft
Insurance
Leases
Reassessed as a lower priority project
Financial statement presentation
Financial instruments with characteristics of equity
Intangible assets

Differentiated on project elements	
Financial instruments: classification and measurement, impairment, hedge accounting, and balance sheet offsetting.	
Ongoing	
Consolidations	

Source: (authors' projection based on information available on IASB's and FASB's website)

If we are to select the projects that are considered to have greater priority, we have to make reference to financial instruments, revenue recognition and leasing, all requiring the Boards final decision regarding technical aspects. We will further synthesize the two Boards' collaboration on these topics, all representing active on-going MoU projects.

With regard to the financial instruments project (which includes the elements mentioned within the above presented table), the two Boards aim the issuance of converged standards, but actual timing and phasing in their development was differentiated. The IASB chose to consider each of the above mentioned elements of the project as a separate phase which is approached under the development of IFRS 9 Financial Instruments. Meanwhile, the FASB initially approached the project by considering the following two phases: classification and measurement, impairment, and hedging; and balance sheet offsetting. Offsetting represents a significant aspect due to the fact that the different requirements result in a significant difference between amounts presented in statements of financial position prepared in accordance with IFRS and amounts presented in statements of financial position prepared in accordance with US GAAP, particularly for entities that have large amounts of derivative activities. Despite the fact that the Boards jointly issued the exposure draft on offsetting in January 2011 (proposing changes to address the differences between IFRS and US GAAP), it seems like the received feedback encouraged them to continue further with different offsetting models. Still, considering the fact that users consistently asked that information be provided to help reconcile differences in the offsetting requirements between IFRS and US GAAP, the Boards decided to work on converging disclosure requirements to assist users in this regard (SEC 2011: 4).

As seen from the above presented table, in June 2011 the revenue recognition project was considered to require re-exposure (despite their due process requirements stating that re-exposure was not required) of the proposals due to the special nature of revenue. The two Boards had previously published a joint discussion paper (in December 2008) and a joint exposure draft (in June 2010) related to revenue from contracts with customers. The leasing related project was also included in the re-exposure of proposal category. After jointly publishing a discussion paper (in March 2009) and a joint exposure draft (in August 2010) related to leases, it was in July 2011 that the two Boards decided to re-expose the revised proposals due to the fact that up to date decisions were significantly different when compared to the exposure draft, and therefore required re-exposure. A more detailed content analysis of IFRS and US GAAP will further be developed within the following section with the purpose of providing the synthesis of such a comparison.

4. Where are we today? Synthesis of IFRS and US GAAP comparison

We will further synthesize the results of the developed comparison between IFRS and US GAAP by considering specific areas and factors that are relevant (SEC 2011) for the convergence process nowadays still under debate.

Intangibles (IAS 38 and ASC (Accounting Standards Codification) Topic 350): require initial capitalization of acquired intangibles and preclude the recognition of most internally-generated intangibles. While IFRS allow entities to elect between the cost model and the revaluation model, US GAAP requires the cost model for all intangible assets within the scope of ASC Topic 350, the revaluation model therefore not being permitted. Still, practical implementation of the revaluation model is perceived to be limited even under IFRS due to the existence of several

restrictions (fair value needs to be determined by reference to an active market, and the revaluation must be kept sufficiently up-to-date so that the carrying amount of the asset does not differ materially from its fair value). *Research and development* (IAS 38 and ASC Topic 730): IFRS require capitalization of development costs under given criteria, with costs incurred before the criteria being met having to be expensed as incurred; meanwhile US GAAP require research and development costs to be expensed as incurred, with the exemption of computer software development that requires capitalization under criteria that is similar to those in IFRS. *Property, Plant, and Equipment* (IAS 16 and ASC Topic 360): require initial capitalization at an amount based on cost and subsequent depreciation of the capitalized asset, with impairment tests being required in case there is an indicator of impairment. While we notice general consistency between the principles of IFRS and US GAAP, there are some differences with regard to definitions and mostly in detailed guidance. SEC (2011: 26) exemplifies what it considers some of the potentially more significant differences including: asset depreciation, remeasurement of residual value, option for revaluation, impairment and impairment reversals. *Investment Property* represents another area that might generate differences due to the fact that IAS 40 Investment Property allows the use of the fair value model and the cost model (based on the entity's election) while US GAAP only allows for the cost model (unless the entity meets the criteria of an investment company measuring its assets at fair value).

Inventory (IAS 2 and ASC Topic 330): require initial recording at cost and subsequent testing for impairment by reference to a market-based value. Among the significant differences we would mention: IFRS require inventory to be carried at the lower of cost or net realizable value while US GAAP requiring the lower of cost or market; IFRS require reversal of inventory impairments in the period in which an impairment condition reverses while US GAAP precludes a reversal of previous inventory write-downs; US GAAP permit the use of LIFO (last-in, first-out) method which is not permitted under IFRS. *Cash and Cash Equivalents* (IAS 7and ASC Topic 305): similar principles (such as cash equivalent instruments requirements: short-duration, highly liquid, and readily convertible to cash), IFRS articulating certain requirements in a less prescriptive manner than US GAAP. *Liabilities* (IAS 39 and ASC Topic 405): mainly consistent accounting guidance for the extinguishment of liabilities. US GAAP offer application guidance for circumstances which are less (or not at all) covered under IFRS (such as transactions, transfers of noncash financial assets in settlement of a creditor's receivable). *Contingencies* (IAS 37 and ASC Topic 450): require that loss contingencies are recorded when a future economic outflow is probable, with the term probable itself being defined differently (IFRS: more likely than not to occur, US GAAP: the future event or events are likely to occur), but allowing similar interpretations (more than 50%).

Share-based Payment (IFRS 2 and ASC Topic 718): include similar share-based payment models requiring fair value measurement. Significant differences can be noted in relation to the classification of share-based payment awards. *Foreign Currency Related Aspects and Inflation* (IAS 21 and ASC Topic 830): require translation of financial statements of foreign operations into the reporting currency, with recognition of the effects of changes in exchange rates in other comprehensive income and remeasurement of foreign currency transactions into the entity's functional currency with impact upon income; operating in hyperinflationary economies imposes special accounting. SEC (2011) emphasizes some significant differences including exchange rates for translation, cumulative translation adjustment and impairment, translation of entities with multi-level organizational structures, monetary items forming part of net investment in foreign operation, application of highly inflationary accounting, and cessation of highly inflationary accounting. *Risks and Uncertainties* (IAS 1 and ASC Topic 275): include similar principles, but US GAAP present more particular disclosure requirements that are not required under IFRS. Main differences that might generate differential disclosure are linked to vulnerabilities due to certain concentrations and estimates and uncertainties.

5. Concluding remarks, research limitations and research perspectives

The above presented synthesis represents a selection of topics that were approached and could further be developed by enlarging the list of analyzed topics. We consider this to represent both a limitation of our paper and an opportunity for its future development. Another limitation of aiming to develop a similar comprehensive comparison between IFRS and US GAAP comes from the fact that differences affect stakeholders in different manners and to different extant, therefore making their assessment difficult. Concluding upon the Boards' ongoing projects, we might identify areas in which convergence seems to be quite close (such as revenue recognition and leasing), but also areas in which convergence becomes even more challenging (such as financial instruments or the particular case of offsetting). Furthermore, it is also difficult to position the Boards' decisions related to the priority of the approached projects in relation to the so-called roadmap for convergence previously being undertaken and which again is currently under significant uncertainty. More precisely we must not forget that the US representatives keep delaying the decision related to the incorporation of IFRS into the financial reporting system for US issuers.

Similar to other studies being developed within accounting research and trade literature (SEC 2011: 8) we may conclude that, generally, US GAAP present more detailed, specific requirements than IFRS. Nevertheless, there are cases in which IFRS offer higher-level or general guidance, as there are also cases in which they do not contain any corresponding guidance when compared to US GAAP. We therefore relate to SEC (2011: 11) emphasizing the fact that any developed comparison between IFRS and US GAAP should consider the existent fundamental differences linked to:

- IFRS containing broad principles to account for transactions across industries, with limited specific guidance and stated exceptions to the general guidance; and

- fundamental differences existing between the FASB and IASB conceptual frameworks. Ohlson et al. (2010) discuss how standard setters and most academics maintain that accounting standards should be guided by a set of precepts and principles spelled out in a conceptual framework document. As Whittington (2008) and Ronen (2008) note, both the FASB and the IASB already had conceptual frameworks in place, the FASB's, dating mainly from the 1970s, comprising seven substantial concepts statements, each published separately, and the IASB's 1989 briefer framework in one document containing 110 paragraphs. The IASB and FASB are currently jointly facing the challenge of developing a comprehensive project (added on their agendas in 2004) having the purpose to replace existing documents with an improved, common conceptual framework that builds on their existing frameworks.

The developed historical retrospective documents how things started to move quickly in relation to the IASB – FASB collaboration after the 2002 Norwalk Agreement, providing a roadmap for convergence that was recently stormed by turbulent times such as the financial crisis. Discussing the IASB - FASB collaboration on recent projects as well as developing a comparison content analysis of IFRS and US GAAP might prove helpful in assessing the developments as well as perspectives of the convergence process.

DEVELOPING A METHODOLOGY FOR DETERMINING THE SCORING OF GOOD AUDIT COMMITTEE PRACTICES USED BY EUROPEAN COUNTRIES

Boţa-Avram Cristina
Universitatea Babeş-Bolyai, Facultatea de Ştiinţe Economice şi Gestiunea Afacerilor

The ensuring of a good corporate governance is a relatively new target on the list of objectives for international economic convergence, and the way that audit committee could contribute for the achievement of this objective is becoming a subject of greatest interest and debate among members of both academics and practitioners or specialists. The attention given to the audit function, especially in the context of corporate governance becomes a priority for European Commission (EC), one significant proof in this way being represented by the latest green-papers issued by EC that outlines the social role and responsibilities of audit function in terms of corporate governance, in order to rebuild and to establish the investor confidence in the effectiveness of financial markets. The major purpose of this paper is to develop and to propose a methodology for measuring the score of good audit committee practices in the context of corporate governance used by European countries. During its evolution, the audit committee also had known significant mutations from its objectives' point of view, and so if at the beginning audit committee was mostly focused over the financial reporting process, actually the objectives of the audit committee started to be more extended, being strongly focused over the ensuring the soundness of corporate governance of the entity (Porter, 2009). Based on a well-documented literature review, with a focus on significantly research developments and studies with respect to the audit committee's role and responsibilities it was developed a synthesis of main audit committee practices that should be taken into account into an integrated framework of good audit practices in the context of corporate governance. The results consist of a set of certain criteria that should be taken in consideration when considering the methodology for measuring the score of audit committee practices in the European context. These results represent only a preliminary step in a major research project dedicated to the analysis of good audit practices in European context. The following step in developing this major research will be to determine based on the methodology proposed a score for more than 550 European economic entities, listed at European markets capital in the most significant indexes, finally trying to determine a synthesis of the most significant practices of audit committee when speaking about the good audit practices in the context of corporate governance. By presenting the main criteria included in the proposed methodology, the author hopes to stimulate further constructive debates on this field of research which might contribute at the value-added improvement of the developed methodology, assigning to the further results a better relevance.
Keywords: audit committee, corporate governance, good practices, scoring of good practices, methodology.
JEL Code: M40, M42, M21, M14

I. Introduction

Subsequent to the many financial scandals that shuddered the economic world starting with the end of 20th century and the beginning of 21st (like Enron, Parmalat, Questia, etc.), there has been felt an increasing necessity for implementing measures designed to improve corporate governance framework which should rebuild the investor confidence in the credibility of financial reporting and the soundness of capital markets at international level. In this context, a huge attention was given to the audit committee as a *central governance body* within the company which should provide a carefully monitoring of financial reporting process and ensuring the reliability of the audited financial statements.

In that direction, McMullen(1996) shows through his study the direct connections that could be identified between the presence of an audit committee and the reliability of financial reporting, but also with a reduced incidence of errors or irregularities. The audit committee is commonly view as a body or an instrument which should supervise the soundness of financial reporting process, but also as a main provider of reasonable assurance for the relevance and reliability of annual reports and financial statements issued by management (DeZoort, 1997; Wolnizer, 1995; Bradbury, 1990), being in the same time the main responsible for improving the quality of flow information between the company owners (shareholders and potential shareholders) and the managers (Barako, 2007). The study of Bradbury (1990) identified at least three reasons for establishing audit committees:

- to contribute at the increasing the reliability of audited financial statements;
- to give a help to the board of directors in achieving their responsibilities;
- to ensure the auditor independence.

II. Literature review

Most of the researches and studies centred on the audit committee concept were focused mainly of the effectiveness of the audit committee (McMullen, 1996; Porter & Gendall, 1998; Beasley et al., 2000), but starting with the beginning of 21st century the audit committee and its responsibilities have began to be in the centre of various researchers interests, mostly under the perspective of the relationships between audit committee and the other pillars of audit function (internal audit and external audit), the role and responsibilities of audit committee corroborated with the ones of internal audit being quite relevant for the improving the quality of corporate governance system (Bishop et al., 2000; McElveen, 2002).

The necessity to investigate the way that audit committee interact with internal and external audit is increasingly more growing, especially in the context of the increasing importance given to the ensuring the soundness of corporate governance (DeZoort, 2002), all these being resulted in developing different studies focused on the way that audit committee interacts with internal audit, and sometimes with external audit (Mat Zain & Subramaniam, 2007; Sarens & DeBeelde, 2006; Goodwin and Kent, 2006; Krishnan, 2005; Gramlin *et al,* 2004; Gendron *et al.,* 2004; Willekens *et al.,* 2004; Turley and Zaman, 2004; Goodwin, 2003; Goodwin and Yeo, 2001).

Synthesizing the findings of these studies into a general idea, there could be noticed the intensification of the relationships between audit committee and internal and external audit, but mostly with internal audit, being promoted the idea that as long *this audit committee will be seen by internal auditors as an independent forum where various company' business affairs are discussed and solved, as long the premises for a good corporate governance will be ensured*.

The connections that should exist between audit committee with internal audit and external audit are also highlighted by the latest findings of some researchers (Porter, 2009; Sikka, 2009) that emphasize the idea of audit trinity (internal audit, external audit, audit committee – the interface between internal and external audit) as a key element in the process of ensuring the corporate responsibility and governance.

Braiotta et al (2010) had dedicated a very extensive and valuable work to the audit committee, its role and its practices in the context of corporate accountability and corporate governance. Accordingly to Sections 205 and 301 of the Sarbanes-Oxley Act of 2002, Braiotta et al (2010) emphasize the fundamental roles for the audit committees:

1. *The audit committee has oversight responsibility for the accounting and financial reporting processes of the company and for its financial statements audited.*
2. *The audit committee is responsible for appointing, compensating and supervising the external auditor.*

3. *The audit committee must establish the procedures for solving different complaints about accounting, internal control or auditing matters, ensuring in the same time the confidentiality for different questionable accounting or auditing issues submitted by employees.*
4. *The audit committee also should ensure that the company has the appropriate systems implemented for the effective monitoring and management of risk.*

III. Research design

This study propose to develop a relevant starting point for the emphasising of the good audit committee practices in the context of more and more stringent latest requirements over the soundness of corporate governance, trying to develop the most relevant methodology for determining the score of the audit committee practices used by listed economic entities listed at European market capitals. More exactly the main objective of this preliminary study was to get a synthetic view of the most relevant criteria that should be taken in consideration when discussing about a methodology for measuring the score of audit committee practices.

IV. Proposing a methodology for measuring the score of good audit committee practices

Based on relevant literature review, it was made a selection of the most significant and relevant audit committee practices, all these being included into a set of criteria followed for the proposed methodology. Our proposed methodology propose the determination of the audit committee practices scoring (max=39), which should reflects the quality of audit committee practices used within the companies from a specific country, this scoring being constructed by combining the following x sub-scorings presented next in Table no.1.

Table no.1 Developing a methodology for measuring the scoring of good audit committee practices

Criteria	Variables and values assigned
The existence of audit committee	**0** – If the audit committee does not exist **1** – If the audit committee exists.
The independence of chairman	**0** – If the chairman of the audit committee is executive director. **1** – If the chairman of the audit committee is non executive director. **2** – If the chairman of the audit committee is independent non executive director
The professional expertise of chairman	**0** – If the chairman's professional expertise is not disclosed or if the chairman does not have an accounting, auditing or financial expertise. **1** – If the chairman has an accounting, auditing or financial expertise.
The audit committee structure	**0** – If the audit committee's structure is not disclosed. **1** – If the audit committee comprises 2 members and the chairman. **2** – If the audit committee comprises between 3-5 members and the chairman. **3** – If the audit committee comprises more than 5 members and the chairman.
The audit committee's position	**0** – If the audit committee's position is not disclosed. **1** – If the audit committee regularly reports to the Executive Management on the work of the committee. **2** – If the audit committee regularly reports to the Board of Directors (one-tier) or Supervisory Board (two-tier) on the work of the committee.
The independence of the audit committee	**0** – If the criteria of independence for audit committee are not disclosed. **1** – If audit committee comprises at least 1-2 independent non-executive director. **2** – If the majority of audit committee is represented by non executive directors. **3 –** If the majority of audit committee is represented by independent non executive directors. **4 –** If all members of the audit committee are independent non-executive directors.
The professional	**0** – If no member of the audit committee has accounting, auditing or financial expertise.

expertise of audit committee members	**1** – If at least one or two member accounting, auditing or financial expertise. **2 –** If the majority of audit committee members has accounting, auditing or financial expertise **3 –** If all members of the audit committee have accounting, auditing or financial expertise.
Responsibilities of the audit committee	-Monitoring of the financial reporting process: **0** – if it's not required; **1** – if it's required; -Audit committee ensure appropriateness and consistency of accounting policies: **0** – if it's not required; **1** – if it's required; -Audit committee monitors accuracy of internal procedures: **0** – if it's not required; **1** – if it's required; -Monitoring of the external audit (including statutory audit): **0** – if it's not required; **1** – if it's required; -Makes proposals/recommendations for the external auditor's selection, appointment and dismissing: **0** – if it's not required; **1** – if it's required; -Makes recommendations for the internal auditor's selection, appointment and dismissing: **0** – if it's not required; **1** – if it's required; -Audit committee does the preparatory work for the Board of directors (one-tier)/ Supervisory board (two-tier) on all issues with regard to the audit of the consolidated financial statements and consolidated management reports: **0** – if it's not required; **1** – if it's required; -Reviews the annual plan of internal audit: **0** – if it's not required; **1** – if it's required; -Monitors the achievement of independence criteria for external auditors and confirms through a review that external audit firm complies with the legally required quality assurance measures for achieving audit quality and independence : **0** – if it's not required; **1** – if it's required; -Oversees the effectiveness of internal audit function: **0** – if it's not required; **1** – if it's required; -Monitors the effectiveness of internal control systems: **0** – if it's not required; **1** – if it's required; -Monitors the risk management process: **0** – if it's not required; **1** – if it's required; -Oversees the follow-up issued by the management as a response at external audit recommendations: **0** – if it's not required; **1**– if it's required; -Oversees the follow-up issued by the management as a response at internal audit recommendations: **0** – if it's not required; **1**– if it's required; -Review the statement issued by the management about corporate governance effectiveness: **0** – if it's not required; **1**– if it's required; -Monitors the fees paid for audit services and non-audit services, in order to avoid the influencing of the external auditors' independence: **0** – if it's not required; **1**– if it's required; -Monitoring the management efforts for ensuring the compliance with the appropriate legislative framework: **0** – if it's not required; **1**– if it's required; -Establishing a system or policy in order to ensure the possibility for any person employed to report in confidence if it has knowledge about illegal acts/irregularities in the company, which could have serious consequences over the ability of company to achieve its objectives (whistle-blowing policy): **0** – if it's not required; **1**– if it's required; -In case of non existence of internal audit function, periodically audit committee will analyse the necessity of establishing internal audit department: **0** – if it's not required; **1**– if it's required; -Analysing the proposals for the distribution of profit made by management: **0** – if it's not required; **1**– if it's required;
Number of audit committee meetings	**0** – If the number of the audit committee meetings is not disclosed. **1** – If the number of the audit committee is less than twice per year. **2** – If the number of the audit committee is between 2-4 meetings per year.

holding annually	3 - If the number of the audit committee is more than four times per year.
The higher each scoring, the better is the quality of the external audit practices in the context of corporate governance.	

Source: projection made by author

V. Conclusions

Considering the preliminary status of the research results presented within this paper, the author propose a methodology for measuring the score of good audit committee practices, but looking in the same time for a relevant feed-back that might have a significant contribution for the proposed methodology, considering the next step of this major research project – testing the proposed methodology for a sample of more than 550 economic listed entities at European level, trying to develop studies in this research direction with more complex statistical analysis applied at international level, but also connected to the real economic life, which might provide significant value that would help to obtain the real effectiveness for the audit committee in the context of corporate governance.

Agriculture[73]*represents the branch of the material production which deals with growing crops and raising animals in order to obtain farm produce and some raw materials, as well asthe totality of works and methods used for this purpose. Agriculture has specific traits mainly induced by the traits of its results. Thereupon, what sets apart agriculture from other sectors of the economy is the volume, structure and concretization of the resources in the process of their consumption. The essential cause of these differences is the fact that land is the main production factor and that, compared to the development level of the production forces and the natural and biological factors, it behaves in a specific manner.   Definitions and characteristics of agricultural activities are given also in The International Financial Reporting Standards (IFRS)[74], respectively IAS 41, "Agriculture". Hence, according to IAS 41 "Agriculture", agricultural activity is defined as the management of the biological transformation of biological assets (living plants and animals) into agricultural produce (harvested product of the entity's biological assets). The received concessions represent an important characteristic of these units and, as a particular case concerning such concessions, we will tackle the issue of terrains pertaining to the assets sold by the Romsilva National Forests Administration.*
KEYWORDS: agricultural activity, concession,, forest land, agricultural exploatation
COD JEL: M – Business Administration and Business Economics;Marketing;Accounting
M4 / Accounting, M41-Accounting

1.Introduction

The particularities which differentiate agriculture from the other branches of material production are: Agriculture is the only branch in which inorganic matter is transformed into organic matter, assimilable by man, capable to sustain his/her physiological functions and, moreover, all other economic and social functions. From this point of view, agriculture is and will always be a the primary pre-requisite of life and of any activity; Land(soil and the immediate subsoil layers) has an active role, owed to fertility (a characteristic of the land/soil used for agricultural production and without which the whole agricultural activity could not be made possible); In agriculture the production process unfolds with the help of life organisms, the help of plants and animals; Agricultural production is under the incidence of natural conditions; Raw

materials and materials used by man in the technologic process specific to agriculture, can be smaller, in number, volume and weight, than the produce obtained, these being composed of the biologically created, new, organic matter; when growing plants, during the biologic transformation, the plants are bound to the land; in agriculture differences occur in the shorter work time and the longer production time; this production time include the longer or shorter periods in which living organisms suffer physical, chemical, physiological transformations, without the direct intervention of man[75]; for accomplishing the biological transformation, the expenses are gradually borne, in accordance with the biological rhythm.

Agriculture is compound out of a wide variety of activities: bee-keeping, growing perennial and annual crops, fruit growing and other plantations, flower growing, foresting, pisciculture (including growing fish), etc.

2. Accounting regulations regarding concession

Concession represents the convention by which a party named „concedent" (lessor) yields to another party named„concesionat" (lessee), over a predetermined period of time, the right to use some assets/goods or to perform certain operating activities. (Mateş D., David D., 2010,p:137).

*According to Order 3055/2009,*concessions received are reflected as intangible assets when the concession contract includes an established duration and value. Amortization of the concession will be recorded for the entirety of the duration, established in the contract.

In case the contract assumes payment of royalty and not an amortization value, in the accounting of the entity receiving the concession, the expense representing royalty is reflected, without the acknowledgement of an intangible asset. (point 81(2)).

Example 1:

An entity working in the piscicultural field, and which has the purpose to capitalize upon growing carp, receives in concession a lake that belongs to the State public domain. The duration of the concession is 20 years starting with 01.01.N.In the contract the total concession value 1.000.000 lei is stipulated, with a monthly royalty of 4.167 lei, payable on the 15th of the following month. The concession's amortization is calculated with the linear method, on the overall duration of the concession. On the contract's expiry date, the lake is returned to the State's public domain.

The received concession is reflected as **intangible assets** because **the concession contract entails a period of (20 years) and an established concession value of (1.000.000 lei).**

On 01.01.N, on signing the contract the intangible assetis acknowledged for the total value of the received concession:

| 1.000.000 lei | **205**
Concessions, patents,
licenses, brands, rights and
similar assets | = | **167**
Other loans and
similar debts | 1.000.000 lei |

And simultaneously:
Debit 8038Public goods received for managing, in concession and rent 1.000.000 lei

Monthly amortization of the concession:
Duration of the contract in months = 20 years x 12 months = 240 months
Monthly amortization = 1.000.000 lei/240 months = 4.167 lei

| 4.167 lei | **6811**
Operating Expenses
regarding assets' | = | **2805**
Amortization of
concessions, patents, | 4.167 lei |

| | amortization | | licenses, brands, rights and similar assets | |

On 15 February N the monthly rent is recorded:

| 4.167 lei | **167** | = | **404** | 4.167 lei |
| | Other loans and similar debts | | Suppliers of fixed assets | |

Payment of rent:

| 4.167 lei | **404** | = | **5121** | 4.167 lei |
| | Suppliers of fixed assets | | Bank accounts in lei | |

The last three records are repeated monthly for a period of 20 years, the duration of the concession contract.

On the expiration of the contract, simultaneously with returning the lake, the removal of the received concession from the assets of the entity is recorded:

| 1.000.000 lei | **2805** | = | **205** | 1.000.000 lei |
| | Amortization of concessions, patents, licenses, brands, rights and similar assets | | Concessions, patents, licenses, brands, rights and similar assets | |

And simultaneously:

Credit 8038Public goods received for managing, in concession and rent 1.000.000 lei

Example 2:

An entity working in the piscicultural field, and which has the purpose to capitalize upon growing carp, receives in concession a lake that belongs to the State public domain. The duration of the concession is 20 years starting with 01.01.N. In the contract a monthly royalty of 4.167 lei, payable on the 15th of the following month, is stipulated. The concession's amortization is calculated with the linear method, on the overall duration of the concession. On the contract's expiry date, the lake is returned to the State's public domain.

The received concession is reflected as an **expense** because **the concession contract** stipulates the payment **of rent (4.167 lei) and not an amortization value.**

On 01.01.N, on signing the contract the total value of the royalties is recorded outside the accounting books: = 4.167 lei x 20 years x 12 months = 1.000.000 lei:

Debit 8038Public goods received for managing, in concession and rent 1.000.000 lei

On 15 February N the monthly rent is recorded:

| 4.167 lei | **612** | = | **401** | 4.167 lei |
| | Expenses with royalties, administrative locations and rents | | Suppliers | |

And simultaneously:

Credit 8038Public goods received for managing, in concession and rent 1.000.000 lei

Payment of rent:

| 4.167 lei | **401** | = | **5121** | 4.167 lei |
| | Suppliers | | Bank accounts in lei | |

The last two recordings are repeated monthly for 20 years, the duration of the contract

Particular cases regarding concession: The terrains afferent to assets sold by the Romsilva National Forests Administration

A particular case of concession occurs in the **forest domain**, where the State owned public forest fund **cannot be leased,** with the exception of the **terrains afferent to assets sold by the Romsilva National Forests Administration**(The Forest Code**in art. 11, paragraph 3**).

These terrains are referred to in **Order nr. 367/2010 of the Environment and Forests Minister for the approval of the concession value, the method of computing and payment of royalties obtained from the concession of the terrains afferent to assets sold by the Romsilva - National Forests Administration, as well as the model concession contract.**

Example 3:

We assume that a private forest ward acquires from the Romsilva - National Forests Administration several building, respectively: a former forest range premises, a ward headquarter, two shelter sheds for workers, two reciprocating saws and 3 forest berries picking up points. The acquisition cost of the buildings was 300.000.000 lei.

Together with the buildings' sale contract, **the concession contract for the forest terrain** is signed, the duration of the concession, according to Order 367 from 2010, is of **49 years**. The contract was signed on 01.01.N.

Moreover, we assume that the forest plot of land on which the buildings are placed presents the following characteristics:

-The surface of the leased plot of land is: 4.520,4573 ha

-The plantation on the plots of land is made up of the Birch trees which allow for intensive treatments, for instance forest gardening, as well as plots of land intended for afforestation, pertaining to functional type TIII.

-The terrain is situated at a distance of over 10 km from the limit of the buildable perimeter of a mountain village.

-The situation of the terrain compared to transportation links is presented below:

◆Transportation by roads: the terrain is situated at a distance of maximum 2 km from a county road; a village road and a forest road.

◆Train Transport: the terrain is situated at a distance of maximum 5 km from a train station.

-Other utilities: there are electric energy distribution networks situated up to 500 m from the leased terrain.

The surface of the national forest fond in the county is somewhere between 16,1-20%.

The medium price of a cubic meter of wood for birch tree is 150 lei/m$^{3.}$

We shall take into account an established BNR interest rate of 5,5 % per year.

Solving the case:

Annual royalty = VAC x Established BNR interest rate

$$VAC = S \times Cr \times PML \times (1 + N),$$

1. Computing VAC

VAC = 4.520,4573 ha x 3,4 m^3/ha x 165 lei/m^3 x (1+76) = 195.270.193 lei

2. Computing the annual royalty:

Annual royalty = VAC x Established BNR interest rate

Annual royalty = 195.270.193 lei x 5,5 % peryear = 10.739. 860 lei

Monthly royalty = 10.739. 860 lei/12 months = 894.988 lei

3. Computing guarantee:

Guarantee = 5 % x Annual royalty

Guarantee = 5 % x 10.739. 860 lei = 536.993 lei

Order Nr. 367/2010 also presents in the annex a contract model in which only the value of the royalty is specified, thus excluding the capitalization option.

Given that the value of royalties is computed annually, based on the addendum to the contract, the problem of recording the resulting difference arises **from an accounting point of view.**

The accounting postings that we propose are shown below:

On 01.01.N, based on the sale / purchase contract, the acquisition of the buildings is registered:

300.000.000 lei	**212**	=	**404**	300.000.000 lei
	Buildings		Supplier of fixed assets	

On 01.01.N, the concession contract for the total value of royalties is registered outside the accounting books: 894.988 lei x 49 years x 12 months = 526.252.944 lei.

Debit 8038 Public goods received into administration, concession and rent 526.252.944 lei.

On 30.06.N (in 180 days) the deposit is registered:

536.993 lei	**2678**	=	**5121**	536.993 lei
	Other receivables		Bank accounts in lei	

On 30.06.N the biannual royalty is registered: 894.988 x 6 months = 5.369.928 lei

5.369.928 lei	**612**	=	**401**	5.369.928 lei
	xpenses with royalties, administrative locations and rents		Suppliers	

And simultaneously:

Credit 8038 Public goods received into administration, concession and rent 5.369.928 lei

Royalty payment:

5.369.928 lei	**401**	=	**5121**	5.369.928 lei
	Suppliers		Bank accounts in lei	

The last two entries are also made on 31.12.N.

For year N + 1, we suppose that the VAC value is the same, but the reference interest rate set by the National Bank of Romania (BNR) is 5,6%

Annual royalty = 195.270.193 x 5,6% per year = 10.935.131 lei

Monthly royalty = 10.935.131 / 12 months = 911.260 lei

The increase in the monthly royalty will have to be registered for the remaining 48 years:

Deposit = 5% x Annual royalty

Deposit = 5% x 10.935.131 lei = 546.756,5 lei

Difference = 546.756,5 lei – 536.993 lei = 9.763,5 lei

9.763,4 lei	**2678**	=	**5121**	9763,5 lei
	Other receivables		Bank accounts in lei	

On 30.06.N+1 the biannual royalty is registered: 911.260 lei x 6 months = 5.467.560 lei.

5.467.560 lei	**612**	=	**401**	5.467.560 lei
	xpenses with royalties, administrative locations and rents		Bank accounts in lei	

And simultaneously:
Credit 8083 Public goods received into administration, concession and rent: 5.467.560 lei.

Payment of the royalty:

5.467.560 lei	**401**	=	**5121**	5.467.560 lei
	Suppliers		Bank accounts in lei	

The last two entries are also made on 31.12.N.

For the year N+2, we suppose that the VAC value is the same, but the BNR reference interest rate is 5,4%.
Annual royalty = 195.270.193 lei x 5.4% per year = 10.544.590 lei
Monthly royalty = 10.544.590 lei / 12 months = 878.715,8 lei.
The decrease of the monthly royalty will have to be registered for the remaining 47 years:
(878.715,8 lei – 911.260 lei) x 12 months x 47 years = 18.354.928.8 lei
Consequently, on 01.01.N+2:
Credit 8083 Public goods received into administration, concession and rent 18.354.928,8 lei
The last two entries are also made on 31.12.N.

3. Conclusions and Propositions

Traditional forms of agricultural units are still maintained, even though agriculture is less homogenous that industry when it comes to the socio-economic organization, and in spite of the considerable diversity of models all around the world. These traditional agricultural units harmonize with the modern ones, thus creating complex, coherent and economically viable national systems.

The entities which perform agricultural and food production activities are currently called: **unit**; **exploitation** or an **agricultural enterprise**.

The concept of **agricultural unit** has a wide significance, defining any entity in which agricultural products are obtained.

The agricultural unit represents the "place" where the agriculturalist combines factors of production in order to obtain agricultural products. The agriculturalist can exploit the land as an owner, a renter, an administrator or an entrepreneur.

The variety of agricultural units commences with the infield exploitation and they spread all the way to extremely complex, holding-type (and often fully integrated) units.

A typical feature of agriculture is the fact that a considerable part of the production means are obtained directly from the production process, such as: planting material, seeds, breeding animals. This is where some particularities in the recognition and evaluation of accounting structures which are typical of agricultural activities.

The legislative framework with a direct incidence on the agricultural entities can be structured as follows: Regulatory documents which govern the organizing and functioning mechanisms of the agricultural entity, regulatory documents which govern the way of organizing and keeping of accounting, regulatory documents which govern fiscal aspects, regulatory documents particular to the diverse agricultural activities.

FINANCIAL BALANCE AND LOANS OF THE SHAREHOLDERS TO THE COMPANY

Burja Vasile
University "1 Decembrie 1918" Alba Iulia

Rus Luminiţa
University "1 Decembrie 1918" Alba Iulia

Financial balance in the activity of companies is a necessary condition for improving performance and competitiveness. Interpreting indicators expressing financial stability must be nuanced depending on concrete conditions. This paper presents a case study of influence of companies' loans from shareholders on company's financial balance. The results of analysis show that the mode of treatment in the accounts of these borrowings affects the financial balance of indicators. The conclusions of the analysis have theoretical and practical value, being useful to the managers, members, business partners and all shareholders, in taking the economic decisions.
Keywords: financial balance, loans from shareholders, working capital, necessary of working capital, net treasury
JEL Codes: M41, L29

1. Introduction

The ultimate objective of companies is to maximize the profit and the patrimonial value, which ensure appropriate remuneration of shareholders and strengthen their competitiveness on the market. This objective can be achieved only under conditions of financial balance which ensure appropriate funding sources, a sufficient level of liquidity to meet payment obligations and a continue solvency, which maintain the trust of business partners. Financial balance is appropriate if the providers of capital, the shareholders and the financial creditors are remunerated proportional with the degree of risk taken (Charreaux).

Financial balance is a component of the economic balance in general and it is manifested by providing the necessary resources for financing the activity. The analysis of financial balance is founded on the principle that the long-term investment of companies should be financed from the resources that have a permanent character (Corhay and Mbangala, 2007). From this perspective the financial balance must be seen in dynamic under three aspects (Burja, 2009): long-term balance, which is the correlation between the permanent capital and fixed assets (working capital), current balance, by comparing current assets with short-term obligations (necessary of working capital), the short term balance, based on the correlation between the working capital and the necessary of working capital (treasury).

In the activity of companies often occur situations where they need immediate liquidity and economic practice shows that they are covered in most cases by the bank loans. In the case of limited liability companies (LLC), often the companies borrow from the own funds of shareholders. The advantage of this type of loan is linked to the reduction of time of getting the loan, to simplify operations and sometimes lower costs for company.

Methods of making loans from shareholders by the company it is governed by regulation in terms of legal interest (OG 13/2011), but some aspects on the terms of these loans remain the decision of members which are in most cases the administrators of the companies. Because there is no firm deadlines for repaying the loans this affect the indicators of financial balance by the possibility of processing short-term loans into long-term loans.

The present analyses, based on a case study show the influence on the financial balance of the loans from shareholders , taking into account the accounting treatment of loans. We do not know that the Romanian economic literature to be treated that aspect. That is why we consider the study as being useful to managers, members, shareholders, and all business partners to form the economic decisions.

2. Methodology

The purpose of this financial analysis is to examine critically the accounting and financial information ofered by the companies to assess their performance and their financial position (Laurence Le Gallo). The financial position of firms is assessed based on the financial structure and financial balance. In a same time the financial balance is approached from a static perspective based on the: net situation, working capital, necessary of working capital, net treasury. The information obtained in this way is complemented by the analysis of rates expressing financial balance. In a dynamic perspective, financial balance is analyzed on the basis of financial flows (Cohen, 1994). The present analyses deals with financial balance in a static manner based on these four indicators listed.

Net Situation reflect the wealth of the shareholders and must be sufficient to ensure the operation and financial independence of the company. This is important for the owners, shareholders and the creditors of the company (Petrescu 2008), showing net assets remaining after deducting all debt (Trebuchet, 1995). Shall be calculated starting from the fundamental equation of the financial statement sheet:

The Net Situation = Total assets-Debts (1)

The positive value of the indicator shown an efficient economic management in order to allow a proper financing of net assets. If a company has a negative value of this indicator there is a risk of bankruptcy because the real assets are exceeded by the debts contracted by, which generates the impossibility of paying debts.

Working Capital represents an excess of permanent capital over the value of assets, which may be used to finance the current activity (Peyrard, 1986). Viewed through the prism of the financial management, the working capital is a safety margin or security margin for the financing of current assets, the portion of the financial autonomy of the companies (Popa and Mester, 2006). This indicator shows the strengths and weaknesses of the investment policy of the companies because it can identify the risk of unredeemable short term liabilities and, indirectly, the risk of bankruptcy (Berheci 2010). Shall be calculated in two ways:

Working Capital = Permanent capital – Fixed assets (2)

Working capital = Current assets - Short term liabilities (3)

Existence of a positive working capital fund is an expression of the long-term financial balance, but the assessment of the situation must be done carefully because a huge working capital generates immediate possibilities for increasing production, but are neglected the investments which in the future may affect the competitiveness of the company. A negative working capital expresses a state of financial imbalance, which obliges the company to turn to short-term loans which can be expensive in the ratio of interest and can put the enterprise in difficulty due to the requirements for reimbursement in a very short time.

Having regard to the balance that must exist between the temporary needs and the sources for financing those needs there can be determined an indicator called the necessary of working capital. It shows money which must be run in the company in order to operate (Petrescu, 2008) and is calculated as follows:

The necessary of working capital = (Current assets – Disposable Funds) -
(Short term Liabilities – Short Term Loans) = (4)
= (Stocks + Receivables + Prepaid Expenses) –
(Short term Liabilities – Short Term Loans + Income in Advance)

If the necessary of working capital has positive value there is a surplus of temporary needs (current assets) to the temporary sources that can be deployed. This situation can be considered normal if it is the result of investments in stocks due to enhance of production, the increase in duration of manufacturing cycle or sales growth and also of commercial debt. When there is a gap between current assets liquidity and the liabilities' due date, then the situation is unfavorable. The existence of a negative necessary of working capital reflects temporary needs, with lesser value then temporary funding sources. The situation may be bad, if it is a result of accidental interruptions in supply and renewal of stocks or in production or the receipts have been speeded up and the payment of debts have been relaxed.

The net treasury reflects faithfully the financial balance of companies by comparing the working capital with the necessary of working capital. This indicator shows the current evolution of receipts and payments and can be calculated as follows:

Net Treasury = Working Capital – The Necessary of Working Capital (5)

Net Treasury = Disposable Funds – Treasury Credits (6)

If the treasury is positive the situation is favorable to business, with some short-term financial autonomy. A negative treasury (cash-flow) appears if there is a need for excessive working capital or there is a structural crisis if the working capital is insufficient.

Fluctuations recorded by the net treasury at the end of two financial years may be determined by the net flow of money based on the indicator "cash-flow" (CF) of the interval of time mentioned (Burja, 2009).

The money that the companies borrowed from the business associates (shareholders) affects the value of the indicators that characterize the financial balance. They can be short-term or long-term liabilities, and even if the loan agreement specifies a term of repayment of the loan, if the company still has a financial difficulties then the loan is not repaid, or the shareholders granted a new loan immediately. As such short-term loans became long-term loans.

This document analyzed the indicators of financial balance in two hypotheses: the first treats the loans granted by the associates to the firms as short-term debt; the second hypothesis sees these loans as long-term debt.

3. Results and discussion

The sources of data for the analysis of financial balance are offered mainly in the financial statement. This document has been used data from a company that is engaged in the carriage of goods. Analysis was made over a period of five years on the basis of the data in the table 1.

Table No. 1 . Extract from the financial statement, lei

Nr. crt.	Indicators	2006	2007	2008	2009	2010
1	Fixed Assets	52.696	80.762	83.584	111.041	63.960

Source: company's financial statements

Using the formulas for the calculation of the indicators characterizing the financial balance of the company it had been obtained the results presented in table no. 2.

Table No. 2. Indicators of financial balance, lei

No.	Indicators	2006	2007	2008	2009	2010
1	Net situation	13.487	38.719	70.509	70.766	67.990
2	Working capital	- 39.209	- 42.043	-13.075	-40.275	4.030
3	Necessary of working capital	-59.068	-64.931	-90.601	-48.177	-50.855
4	Net treasury	19.859	22.888	77.526	7.902	54.885

Source: Calculated data

The analysis of financial balance based on the indicators in table 2 and the data of the financial statement reflects the following aspects.

At the company analyzed there is a trend of growth of the net situation during the first four years, very strong in 2007 and 2008 and a slight decrease in 2010. Flaunting the fact that the company has not registered in those five years nor any provisions nor revenue in advance, the net situation was equal to net equity throughout the whole analysis period. The evolution of net situation was due mainly to the profit realized because since 2007 the company has not distributed its profits and the social capital and the reserves are maintained at the minimum limit prescribed by law. The net situation of company reflects the overview of the evolution of the Romanian economy during that period.

The financial working capital of company analyzed during the first four years has negative value, and in fifth year recorded a positive value. These results reflect a state of financial imbalance, because current assets that can be converted to cash , are not sufficient to cover the obligations of the company in the short term.It is necessary in this case a detailed analysis of the current assets and the short-term liabilities which could bring a further understanding of the situation of society. Necessary additional data analysis can be found in table 3.

Table No. 3. Receivables and Payables, lei

Nr.Crt.	Indicators	2006	2007	2008	2009	2010
1	Receivables, showing separately:	265.307	234.228	217.743	260.599	259.787
2	Clients	213.088	186.126	160.945	192.454	205.887
3	The percentage of total clients in receivables,%	80,32	79,46	73,92	73,85	79,25
4	Short-term liabilities, showing separately:	325.672	300.151	309.454	309.768	312.768
5	Vendors	54.142	55.393	37.636	70.785	60.032

6	Associates - current accounts	221.490	229.894	229.709	204.030	218.109
7	Percentage of vendors in short term liabilities,%	16,62	18,46	12,16	22,85	19,19
8	The percentage of loans from shareholders in the short term liabilities%	68,01	76,59	74,23	65,87	69,74

Source: calculated data

If you analyze the working capital of permanent needs which must be covered from the permanent resources, the fact that working capital is negative, reflects the coverage of these needs from temporary resources, what obliges the company to turn to loans.

The necessary of working capital has recorded negative values throughout the five years analyzed what signifies a temporary surplus of sources. This situation may be favorable if there were a speed up of revenue and a relaxation of payment of debts, with an employment of debt with longer maturities. The situation is unfavorable if there are interruptions in the supply of inventory or reduction of receivables as a result of the reduction of activity and not as a result of the recovery of receivables.

During the period analyzed, the net treasury has been positive in all the years, a situation favorable to the company ensuring that short-term financial autonomy. What remains to be managed is the use of surplus of cash as efficiently as possible, because there is the possibility of making placements on the financial and monetary markets. However, on the long-term the maintenance of a positive treasury may be a sign of ineffective use of stable resources with any negative effects on the repayment of loans and the remuneration of the capital. The company has strong treasury variations, which can be determined by the net monetary flow of each fiscal year.

We observe in table 3 data, that the firm analyzed turned to loans from associates throughout the whole period analyzed. Their value is approximately constant, what show in fact that short-term loans were converted into long-term loans. Consideration of loans from associates as long-term loans alters the indicators of financial balance, which as a result of the new calculations are presented in table 4.

Table 4. The indicators of financial balance recalculated

Nr. Crt.	Indicators	2006	2007	2008	2009	2010
1	Net situation	13.487	38.719	70.509	70.766	67.990
2	Working capital	182.281	187.851	216.634	163.755	222.139
3	Necessary of working capital	162.422	164.963	139.108	155.853	167.254
4	Net treasury	19.859	22.888	77.526	7.902	54.885

Source: calculated data

We observe in table 4 that the working capital and the necessary of working capital were positive throughout the whole period of analysis. It is necessary reinterpretation of financial balance in this situation.

The existence of a supplementary working capital at the firm analyzed is an expression of the long-term financial balance that generates immediate possibilities for increasing production, but must be taken into consideration any future investments that can lead to increased competitiveness of the company.

The necessary of working capital being positive, the situation may be interpreted as normal, if it is the result of the growth of stocks in order to align with the needs of production; otherwise it is a situation unfavorable in terms of financial balance and is caused by the gap between the

liquidity of assets and the retention of debts. Be reviewed contracts with customers and vendors for the renegotiation of the terms of payment.

The net situation and net treasury situation had not been influenced by the treatment of shareholders loans to the company.

4. Conclusions

The present analysis showed that financial balance is influenced by the way that the shareholders loans to the company are treated by including them in long-term debt or short-term. At the company analyzed the situation of the financial balance in the assumption of considering the loans from associates as long-term loans showed the existence of financial imbalance, illustrated by a negative working capital during the first four years of the analysis. Reprocessing of loans and their inclusion in long-term debt, changes the perspective on financial balance showing that on the long-term company has a stable balance.

These aspects require preparation of loan agreements with associates as loans work in reality. The contracts must to highlight the progress of the loan on the long term and not to be extended or remodeled the short-term contracts.

Of course, there are always solutions to improve the financial balance and in this way the financial position and the performance of the company. However, the proposed solutions must be based on a proper perspective on the financial balance offered by the suitable treatment of the raw data.

THE RELEVANCE OF MANAGEMENT ACCOUNTING
FOR THE HOSPITALITY INDUSTRY

Briciu Sorin
University December 1, 1918 of Alba Iulia, Faculty of Science

Scorte Carmen
University of Oradea, Faculty of Economics
University December 1, 1918;PhD

In the contemporary period the tourism and hospitality industry has experienced dynamic growth despite the challenges facing not only the global crisis, but also market changes, consumer behavior and technological trends. Accounting, the language of business is required to keep up with changes made to each particular area of activity so that they can provide timely relevant information to be managed by an efficient information system.
Our article focuses on presenting the importance of management accounting and cost information system in the hospitality industry, then consider identifying features of this sector and their impact on accounting. The methodology of our research falls within the economic research, being theoretical, aiming primarily to knowledge objectives and the relevance of management accounting for economic entities, and then we have the characteristics of hospitality industry and possible organizational management accounting in this sector. In our perspective cost calculation for services, packages or travel benefits must take into account the development of the accounts from Class 9, so we propose a possible method to customize them according to the Direct Costing and CVP analysis. Our research will also be explanatory descriptive, trying to answer the questions How? and Why?
Keywords: Hospitality industry, management accounting, cost information system
JEL Code M 41

Introduction

Tourism is an economic and social phenomenon of modern civilization, very anchored in society and therefore strongly influenced by its development, it is also a factor in individual and social equilibrium, a source of fulfillment of own pleasures, which must develop in harmony with the human, natural and cultural environment and to enroll in a context of sustainable development[76].

From the importance of tourism, from the perspectives of evolution of this sector but taking into account the current situation for national economies hit by the global economic crisis, the maintenance and development of an entity from the hospitality industry involves the harmonization of the market opportunities with their own resources and skills, funding strategies based on cost information complementary tourism products and services based on financial and accounting information, but considering and balancing the company's capacity to environmental conditions.

Costing and management accounting in the hospitality industry is a challenge for managers in this sector entities, but it also is, in our opinion, a promoter of success and a market strength. Romanian literature is rather poor in the treatment of these issues, but more generous is the international literature on studies of this topic. Thus, in a context of economic difficulties and the loss in results it is very important for accounting researchers to address the issue of cost

---

[76]Processing of The synthesis of congress works, Naples, 14-18 June 2000, taken from Theoretical and Applied Economics. Supplement. 29 to 31 May 2009, Bucharest, page 136

calculation and more responsibility in the hospitality industry, making a motivational approach in understanding the benefits that the implementation of an cost information system produces.

Therefore the question arises, wich costing methods are best suited for the hospitality industry? If there are more options which is the best solution? Who provides the most important information? Then the great task of the specialists to aware the management team of the hospitality industry of the importance of implementation an information system cost calculation. Our opinion is that only with businesses enviroment from the hospitality industry we can answer many questions that arise when exploring this arid area.

The current state of knowledge on management accounting and costing

It should start by answering the question what exactly is management accounting? Why should it be given much importance?

In the special literature this component of the accounting information system (management accounting) is also known as cost accounting, analytic or managerial accounting, definitions being different for each one.

Business Dictionary defines management accounting as "making information on the accounts and management reports to provide information, financial and statistical accurate and timely information required by managers to base decisions daily and on short term. Unlike financial accounting, which produces annual reports, mainly for outsiders, management accounting generates monthly or weekly reports to internal stakeholders. "77

According to research cost accounting is largely nineteenth century production, this is actually the predecessor of management or managerial accounting. "The first book of cost accounting is considered to be Garcke and Fell's Factory Accounts, published in 1897"78..

Cost accounting history has been approached by Solomons in 1968, Johnson and Kaplan in 1987, and Cooper and Kaplan in 1991 which gives us a modern perspective. "The link between economics and cost accounting was emphasized by Clark in 1923 when his famous expression appeared " different costs for different purposes ". Demski and Feltman in 1976 continues this theme with emphasis on the idea of the cost allocation approach that was later exploited in a variety of contexts. Marginal cost and other aspects of accounting costs were examined by Demski and Feltham in 1976 by Zimmerman in 1979, by Kaplan in 1973, Baker and Taylor in 1979. Demski (1981) and Verrecchia (1982) analyze the cost allocation criteria, trying to develop new cost allocation procedures79

French authors A.Burlaud and C. Simon in " Comptabilité de gestion " define management accounting as a process of identifying the economic - financial operations for accounting for accurate registration, measurement and quantification of economic acts made or likely to be made, analysis and communication of significant and relevant information to managers or other persons to use internal or external.

Management accounting defined like that has following purposes: planning (improving the understanding of economic - financial operations and other economic acts that impact the entity), evaluation (analyzing and judging the consequences of various events past, present and future of the entity), control (ensuring departures from the activities and of expected resource consumption), accountability (holding an efficient information system to help measure performance effectively). Based on the above we conclude that these French authors give a definition of American inspiration overlapping management accounting to managerial accounting.

78 Paul M Collier, Accounting for Managers: Interpreting accounting information for decision-making, John Wiley & Sons Ltd, 2003, p 7

79 Joel S Demski, Managerial Uses Of Accounting Information, Springer Science & Business Media LLC, 2008, p 104

According to the author Henri Bouquin[80] management accounting corresponds to a part of the management process that provides information essential in ensuring optimal use of resources in the organization, current activities of an entity controlling, planning strategies, tactics and future activities, measuring and evaluating performance, reduce part of subjectivity in decision making and improve internal and external communication, acquisition and maintenance of organizational capabilities needed for the strategy, negotiation strategy and transformation capabilities necessary for success and survival of the entity.

Other french authors define distinct the general accounting from the analytical accounting and from the management control. From their perspective the general accounting and analytical accounting are tools of the management control, along with budgets, budgetary control, dashboard, balance score card. So management control can be partly assimilated to managerial accounting, given th fact that it is under the service of hierarchical leaders and is defined as a set of measures taken to deliver the digital data which characterize the business. By comparison with previous data set, the management team can be induced to formulate and impose corrective measures.

Charles T. Horngren and his colleagues have actually three sides of the accounting distinction between management accounting and cost accounting. "Management Accounting (or managerial) quantifies and reports financial and non-financial information that helps managers take decisions that will allow an organization's goals. Managers use management accounting information to select, communicate and implement strategy.

They use this information also to coordinate decisions on product design, production and marketing. Cost accounting quantifies and reports financial and nonfinancial accounting information about the cost of purchasing or using resources in an organization. Cost accounting includes those components of the management accounting and financial accounting which are collected and analyzed information on costs ".[81]

Leslie Chadwick[82] mentions that it is difficult to separate the cost accounting from the management accounting. Cost accounting aims to effectively measure the results of the different compartments of an economic entity, the measurement of results on products, works and services. Management accounting subject is much more extensive and involves: providing information needed to conduct business, advising managers, forecasting, planning and control of activities, communication and flexibility, the existence of cost control and reporting of results, training staff, taking porter and servant role to the economic entity. In fact L. Chadwick overlapps management accounting with managerial accounting, in which a major role has the cost accounting.

The authors that that have a different opinion are Leah R. Dobson, David K. Hayes, that the overall objectives of accounting are made by the five branches of its own objectives and goals, even if they overlap. The five branches (sub-branches) of accounting are: [83]

Accounting branch	Goals and Objectives
Financial accounting	Registration of financial and economic operations
Cost accounting	Calculation and control costs
Tax accounting	Calculate taxes due

Audit	Checks the accounting datas and procedures for their registration
Managerial accounting	Managerial decision taking based on accounting information

Table 1 Accounting sub-branches

Chartered Institute of Management Accounting specifies activities that involve management accounting as:

> • "Participation in planning at a strategic and operational level, involving the establishment of policies and formulation of budgets;
> • Analysis, presentation and interpretation of relevant information to guide management decisions;
> • Contributes to control and performance analysis by providing reports and comparisons with the budget, analysis and interpretation of deviations. "84.

Other researchers (Boland and Schultze in 1996, Hoskin 1996) call into question the triad *accounting-responsibility - account*, which suggests that any definition of accounting components involves responsibility. They define accounting as a collection of systems and processes used to record, report and analyze business transactions and these objectives are implemented through an account, an explanation or a financial report.

The organization of management accounting can be based on a variety of existing paradigms that have been approached by various researchers. Concepts such as scientific management (Taylor), Maslow theory of human resources, Rickert and Argyris, school for taking decisions (Simon) school of political science (Sleznick) provide alternative paradigms for the management or financial management as it relates to the behavioral and as well to organizational problems. 85

A definition of management accounting (taken over as well by the Romanian accounting system) has as main purpose the entity's knowledge of costs of various functions, knowledge of product costs, works and services, explain the results by comparing the activity of selling costs, finding achievements and explain deviations.

But management accounting is more than "a simple statement of costs or a data handling", but must allow the management team the "keep under control" costs, the action on them, based on analysis of couples' responsibility-cost-performance ". The analysis of this couple is not possible without an approach to the market, without knowledge of customer needs. This approach is imperative especially in hospitality and tourism industry where sometimes services or packages offered are customized according to customer requirements.

In our opinion, management accounting is mainly focused on collecting expenditure cost on carriers, on destinations, places of cost, and finally, connecting them with income to assess the effectiveness of cost carriers, the overall activity, providing data to develop and substantiate strategic decisions, tactical decisions and operational decisions and the company's investment programs.

We favor the transformation accounting for Romania in a classical oriented management accounting, a managerial accounting in which each component has a considerable importance (financial accounting, management accounting, controlling or management control, management and economic analysis and financial, audit, human resources, marketing and strategy).

A possible organization of management accounting in the hospitality industry No matter the definition of management accounting, a detailed view of the work done in any field of activity is impossible without the existence of an economic information system. "Good economic management information requires the development of an information system with multiple interfaces, oriented towards both inside and outside entity to management information that will help create information flows that have a high level of quality and whose purpose is to attract competitive advantages in the fight with ascendancy of needed informations manifested in contemporary society "86and to be able to achieve the objectives it is vital and indispensable the existancy of a cost information system. The information system is a cost accounting information system through which are determined the costs of manufactured products, works and services provided and contribute as well to record these costs in the accounts.

The evolution to a new economy - the knowledge based economy - gives new dimensions and roles of information and information system. The information revolution taking place with a special intensity makes impact on the functionality and performance information system entity to increase.

In our vision the building of an cost information system in the hospitality industry starts with data collection of economic, social and cost accounting information which will then be subject of a manual processing or through a computer system, an important factor in this phase being the human one, then there will be taken into account also the external sources. This is how the database of cost information system in the hospitality industry will be made.

Given the objectives and purposes of cost information system we can say that the economic entity that is based on the following three subsystems: the informational subsystem of cost organisation , the informational subsystem of cost calculation, the informational subsystem of control information and cost analysis (controlling). The entire cost information system will provide information to the management team, which will implement one of these methods of management: management through costs and management through objectives, or a combination of the two.

Schematic cost information system of an entity in the hospitality industry can be prese

Fig. 1.Cost information system in the hospitality industry

nted as follows:

The second subsystem of cost information can use the accounts from class 9 to provide information about the cost of services, packages and tourist services, but they must be tailored to the specific activity and the method adopted by the economic entity, or they may develop analytic accounts of expenditure and income. We believe that one of the methods appropriate for cost calculation in the hospitality industry is Direct Costing and Cost Volume Profit Analysis.
 We propose the following customization of the accounts name from Class 9:
-Account 901 Domestic settlement of expenditure, account that will ensure the taking over of the incorporable costs expenditures from the financial acctounting ;
-Acount 902 Internal settlements regarding the effected tourism We consider beneficial the open of analytic accounts of this synthetic account for tourism packages on domestic and international tourism, treatment tickets, outpatient treatment, etc., action wich will facilitate the determination of any "differences" that can occur between the default cost and the actual cost of travel benefit;
-Account 903 Internal settlement regarding the price differences, the same detailed analytical accounts as the account 902. We consider appropriate to mention, that due to the features of the hospitality industry, existing amounts in account 903 shall have the meaning of income and not as differences;
-Account 921 Basic business travel expenses, with development of similar analytical accounts like 902 and 903. Given the fact that the proposed new method in order to determine costs in the hospitality industry is Direct Costing, we need to make some comments. Direct Costing method is based on the principle of separation costs incurred in an economic entity, depending on their behavior in relation to the physical volume of production, variable costs and fixed costs constant or conventional. We do support this separation, although we recognize that certain expenses are not completely variable or fixed altogether.
We might call them trimmers and semifixe expenses, but I opted for the name of mixed costs. Examples are many on these expenses, but we'll develop one that summarize the costs of postal

services and telecommunications. Any economic entity in the hospitality industry records these type of expense as fixed costs, but given the potential tourists to call various national or international phone numbers from the phone in the room, these calls will generate additional costs. The same behavior "semi" have expenses of maintenance and cleaning materials, energy costs and examples could continue.

Mixed costs are determined by adding fixed costs to variable costs based on the formula:

$$C_M = C_V + CF$$

$$C_M = C_V / \text{Number of tourists (tourist packages)} + CF$$

We do not consider it appropriate to introduce an account to reflect mixed costs, since some of them are variable and will be recorded through account 921, and some are fixed and will be reflected through the account 924.

If we know that certain expenses have mixed character, but at the moment of their record we do not know wich part is variable and which part is fixed, we have a possibility, to use the account name 923 with mixed costs related to tourist activity for their full record followed by determining the variable and the fixe value and their settlement on the accounts 921 and 924.

For delimitation of expenditure incurred in the performance of service or benefit package tourist procedure uses maximum and minimum points using the following formula or method of least squares.

$$c_v = \frac{C_{max} - C_{min}}{Q_{max} - Q_{min}}$$

-Account 924 General administration expenses has the part where it takes from the financially accounting those expenses that do not change by changing the physical volume of production and are indirect from the types of benefits for tourism.

-Account 931 Cost of provided services is considering that it enters into correspondence with accounts 902 and 903 will be detailed on the same principle as those analytical accounts.

Conclusions

To cope with fierce competition existing on the market of this sector plus the strong influence of the global crisis is mainly important to be given a greater importance to internal and external information activities aimed at economic entity, and these data to be summarized and presented using one management team performance measurement tools namely dashboard. The dashboard is essential to the running of the economic entity, providing synthesis absolutely necessary to know and analyze activities more complete and also identifying activities such deviations' loss-achievements ".[87]

We believe that hospitality dashboard will not achieve its objectives if it's gonna present only this financial information, but be prepared as a dashboard that provides extra financial information to the management team in terms of customers, employees, suppliers and not least all of the before mentioned from the perspective of shareholders. An important role in performance measurement process in the hospitality industry have employees, therefore it id needed to forme primarily an organizational culture, which is considered "primary vehicle" for the successful implementation of performance measurement tools, whether it's dashboard or Balanced Scorecard.

BUSINESS MODELS FOR TAX AND TRANSFER PRICING PURPOSES

Corlaciu Alexandra
Babes-Bolyai University,
Faculty of Economics and Business Administration

The purpose of the present investigation is to provide, from a tax and transfer pricing point of view, a systematic and structured analyze of the generally characteristics of business models (manufacturer and sales business models) used by multinational enterprises in the process of business reorganization, with the scope to increase their performance and the sustainable competitive advantages. According to the functions performed and risks assumed, the entities are labeled into limited risk units (such as toll manufacturer or commission agent), medium risk (contract manufacturer, commissionaire, stripped distributor) or high risk units (fully fledged manufacturer, fully fledged distributor) and, further, the most important characteristics of each type are presented by comparison with the other types.
Key words: business restructuring, business model, manufacturer models, sales models, transfer pricing
JEL codes: H20, H25, M16

Introduction

In the present globalised economy, the international companies (regardless of products or sectors) face the pressure of increasing competition. Thus, they are bound to examine on a continuous basis the effectiveness of their business structures and to adjust their activity to these changing circumstances. As a consequence, the business restructurings undertaken by multinational enterprises have been a widespread phenomenon in recent decades because the globally competition forces them to maximize synergies and increase related efficiencies.

The need for an international company to change / to restructure its activity is generally underlay by both internal and external factors, such us: increasing demand in certain territory, changing customer demand, proximity to the sale market, various cost related factors (transportation cost, labor cost, energy cost, raw materials cost), savings from economies of scale, the need to increase the productivity by decreasing the costs, the need for specialization, centralization of functions etc.

Due to the development of global business models, the reorganization operations affecting an entity's industrial, commercial and supply chain processes has become increasingly common in the last years while taking various forms. These kind of industrial and commercial restructurings have complex and (often) significant consequences for international tax purposes, although tax considerations by themselves are generally not the principal driver for the reorganization.

From a transfer pricing point of view, the business reorganizations are defined as "cross-border redeployment by a multinational enterprise of its functions, assets and/or risks" (OECD Report – Transfer Pricing aspects on Business Restructurings).

This paper is aiming to describe, from a tax and transfer pricing point of view, the general characteristics of the business models used in present times by multinational enterprises. We choose to analyze this subject as we consider this is a hot topic in the present globalised economy, due to the fact that business reorganizations might have a dramatic impact on the allocation of the taxable profits of a multinational enterprise among the countries in which it activates.

Research methodology

The purpose of the present investigation is to describe, from a tax and transfer pricing point of view, the general characteristics of the business models used by multinational enterprises. In this paper, the fundamental research type was applied and the deductive research method was used (meaning that general conclusions were extracted based on available data).

One of the investigation techniques used was the literature research. We analyzed the international scientific literature on accounting and taxation topics, starting from older papers (Hirshleifer, 1956 & 1957; Dean; 1955 and Cook; 1955) to newest ones (Johnson, Christensen & Kagermann, 2008; Bakker, 2009). The papers observed were found in the following databases: SpringerLink, Jstor, Emerald and ScienceDirect. As a research key, we tried to found papers discussing about "business restructuring", "business reorganization", "transfer pricing impact in case of business restructuring" etc.

Another investigation technique used was the analysis of international regulations in taxation filed (OECD reports or discussion papers on Transfer Pricing topic: Transfer Pricing Guidelines for multinational enterprises and tax administration; Transfer Pricing aspects of business restructurings chapter IX of the Transfer Pricing Guidelines), with the scope to find out how the specialized international institution estimates the impact of business restructuring for tax and transfer pricing purposes.

Moreover, we applied the comparison investigation technique, by using as comparison criteria: the assets used, the risks assumed, the function performed, the profitability. According to the functions performed and risks assumed, the entities were labeled into limited risk units (such as toll manufacturer or commission agent), medium risk (contract manufacturer, commissionaire, stripped distributor) or high risk units (fully fledged manufacturer, fully fledged distributor) and, further, the most important characteristics of each type are presented by comparison with the other types. Evidently, the profitability is growing up simultaneously with the risks assumed and functions performed.

Literature review

The resource allocation and transfer pricing problem are topics with a long debate in the accounting, management science and economics literature.

The earliest studies on the transfer pricing issue were realized by Hirshleifer (1956 & 1957), Dean (1955) and Cook (1955) who provided the first reasons and were between the first sustainers of the later developed *decentralization theory*. For example, Dean wrote: "…the modern integrated multiple product firm functions best if it is made into a miniature of the competitive free enterprise system". Chang & Hong (2000), adepts of the decentralization theory as well, defines the business groups as "a gathering of formally independent firms under the single common administrative and financial control".

There are a lot of studies suggesting that business groups provide efficient forms of governance in certain circumstances by showing that companies affiliated to groups tend to exhibit higher profitability than independent companies in the same countries (Ghemawat & Khanna, 1998; Khanna & Palepu, 1998; Chan & Choi, 1998). This approach relied on the *resource-based theory*, who emphasizes the role of both intangible and tangible resources as the ultimate source of competitive advantage and performance (Barney, 1986; Wernerfelt, 1984). Certain researchers (Prahalad & Hamel, 1990; Kogut & Zander, 1992; Teece, Pisano & Shuen, 1997) consider that intangible resources like brand or technology shared among group entities are particularly important sources of sustainable competitive advantage. This approach leads to the conclusion that a group possessing more intangible resources would exhibit higher performance.

In our times, in order to increase their performance, companies are faced to reorganize their activity by operating various restructurings which may involve cross-border transfers of valuable intangibles. Business model innovation (restructuring) is seen as material to obtaining profit and

"focuses on aspects such as creating new markets, developing go-to-market initiative and innovation thereof, competitive disruption or competitive positioning and developing new value propositions" (Debruyne & Schoovaerts, 2006). According to Johnson, Christensen & Kagermann (2008), the elements of a succesul business model are: customer value proposition, key resources (resource based theory), key processes (diversification theory) and profit formula. They also consider that restructuring generally requires more effort than anticipated.

From a tax perspective, a business model's cost base and revenue potential are the most relevant aspects. In the value chain of getting the products to market, all business models have a certain organization of assets used, risks assumed and functions performed, that trigger the company's overall success (Bakker, 2009).

For tax and transfer pricing purposes, the fact that a multinational group entity is labeled as manufacturer, distributor or services provider has immediate effect of attaching consequences to the taxation of that company (Bakker, 2009).

Business models for tax and transfer pricing purposes
Generally, a business model reorganization consist of "stripping out intangible assets, functions and risks which were normally integrated in local operations and transferring them to more specialized and centralized regional or global entities within the group" (OECD, 2010). Typically, the profitability of an entity depends on the functions performed and risk assumed (meaning that the higher are functions performed and risk assumed, the higher is the profitability).
Fig.1. Relation profitability – risks & functions (realized by authors)

A. Manufacturer models

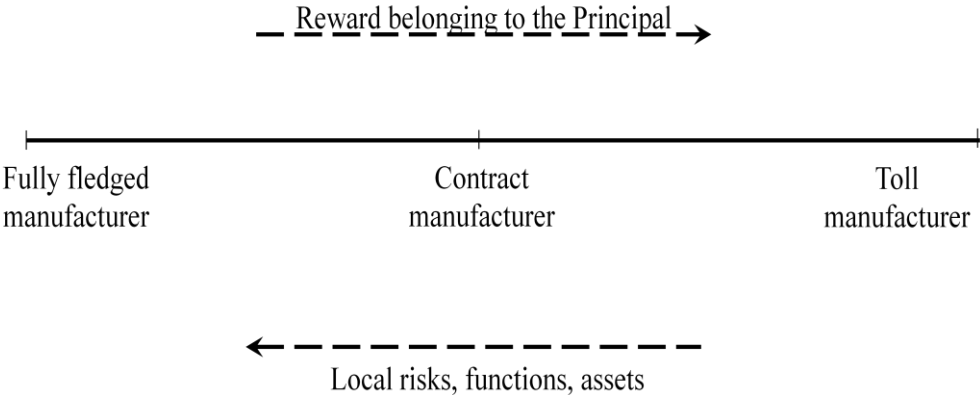
Manufacturing is the process of transformation from raw materials into finished goods. As presented in the chart below, manufacturing is generally performed in one of three risk/function models recognized for transfer pricing purposes: toll manufacturing, contract manufacturing and fully fledged manufacturing.


Fig.2 Manufacturer models (realized by authors)

A toll manufacturer is actually a service provider which activity generally consists of processing raw materials following the specification and clearly instruction of the principal. The toll manufacturer does not become the owner of the raw-materials, work-in-progress or goods manufactured; it has no responsibility for production scheduling, procurement of raw material, quality control, distribution, logistic or revenues collections (Adams & Graham, 1999). Thus, such an entity assumes neither inventory risk and usually owns no valuable intangible (just routine manufacturing/processing skills). The transfer prices used for remunerating the operations performed by a toll manufacturer can be determined by using the cost-plus method or the transactional net margin method (assuming that the comparable uncontrolled price method – CUP, cannot be used).

A contract manufacturer generally provide manufacturing functions based on a written agreement, becomes the owner of the raw materials and the finished products and is responsible for processing the raw materials (quality control). The contract manufacturer bears the inventory risk, and generally bears more risks and responsibilities than a toll manufacturer, however, the procurement decisions, production scheduling and logistics remain with the principal. Also, the contract manufacturer does not hold valuable intangibles. As in case of a toll manufacturer, the transfer prices used for remunerate a contract manufacturer might be determined by applying the cost-plus method or the transactional net margin method (assuming that the comparable uncontrolled price method – CUP, cannot be used).

A fully fledged manufacturer typically assumes all the relevant functions related to the production process (sourcing and purchasing raw materials, finding clients, R&D - use of intangibles, production schedule, quality control, logistics) and also the associated risks (inventory risk, market risk, warranty risk etc). If the fully fledge manufacturer and the distributor with which it transacts use valuable intangible, the most appropriate method to be used for determining the transfer prices is the profit split method.

B. Sales models

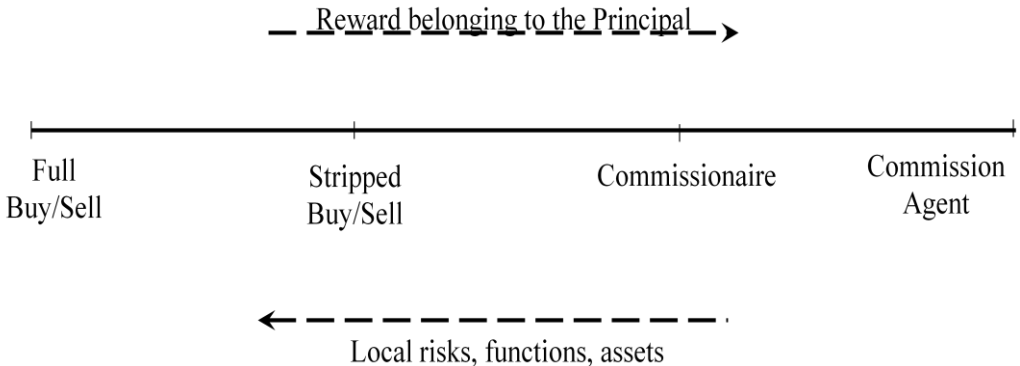
The sales or distribution represent the process by which a product/service is passed through the business system to the end-consumer. As in the manufacturer case, there are different types of distributors (depending on functions performed, risks assumed and assets used), as presented in the chart below:


Fig.3 Sales models (realized by authors)

A commission agent is an intermediary that arranges the sales of products to customer on behalf and on the name of the principal, while the later is the goods' owner and generally signs the sales

contracts (no inventory risk for the commission agent). The remuneration for activity performed by the commission agent is typically based on the cots-plus method (assuming that the CUP method cannot be used), or a commission (percentage) on the sales.

 A commissionaire is similar with the commission agent, with the difference that it sells the goods on behalf of the principal but in its name. The commissionaire does not become the owner of the goods and does not bear any inventory risk. The transfer prices used for remunerate a commissionaire might be determined by applying the resale-price method or the transactional net margin method (assuming that the comparable uncontrolled price method – CUP, cannot be used).

A stripped buy/sell distributor is similar to fully fledged distributor, with the difference that the former is stripped of certain functions and risks. The stripped buy/sell distributor become the owner of the goods sold (immediately prior to the sale to the client) and thus bears certain limited inventory risks. Also, the distributor acts in its account and in its name. As in case of a commissionaire, the transfer prices used for remunerate a stripped buy/sell distributor might be determined by applying the resale-price method or the transactional net margin method (assuming that the comparable uncontrolled price method – CUP, cannot be used).

A fully fledge distributor is acting more autonomously than a stripped distributor; the activity performed is decentralized, with little or no central control or consistency.

Conclusions

As a consequence of the globalized economy, the pressure of competition and the need for increasing the efficiency are important drivers for business restructurings. Generally, a business reorganization consist of "stripping out" intangible assets, functions and risks which were normally integrated in local operations and transferring them to more specialized and centralized regional or global entities within the group. The industrial and commercial restructurings have complex and (often) significant consequences for international tax purposes due to the major impact they have on the allocation of the taxable profits of a multinational enterprise among the countries in which it activates.

By using the fundamental research type, the literature review and comparison as investigation techniques, this paper was aiming to present, from a transfer pricing point of view, the general characteristics of the business models used in present times.

FROM ACCOUNTING REGULATIONS TO VALUATION PRACTICE - THE APPRAISER'S ROLE IN TANGIBLE ASSETS' REVALUATION

Crişan Sorana Adina
Babeş-Bolyai University, Faculty of Economics and Business Administration

Tangible assets revaluation has an impact over equity, profit and the financial indicators of the company, several being relevant for the decision making process of investor's and company management. The revaluation process is usually done by valuation experts who have to start their mission departing from the accounting information regarding the revalued assets. A sound understanding of accounting rules and of the necessities of the revaluation process is essential for a reliable revaluation. Lack of specific accounting knowledge on the valuer's side can lead to distorted representations of the valued assets which will affect faithful representation, have accounting and fiscal impacts and can also raise problems when auditing the company. The quality and valuation expertise of the called-in appraiser are also relevant for the outcome of the revaluation process, especially if market values evidence is scarce or the revaluated assets are highly specialised. We present the actions that the valuer and the entity have to pursue in order to ensure a reliable revaluation process, contributing thus to a better understanding of the practical approach to assets revaluation and its specific requirements.

1. Introduction

The tangible assets can be revalued periodically as IAS 16 provisions respectively OMFP 3055/2009 allow an alternative treatment: maintenance at cost or revaluation at fair value. In Romania, due to Fiscal Code stipulations, companies often revaluate fixed assets, especially buildings, every three years. The results of these revaluations have an impact over the financial statements of the revaluing companies which can be split into accounting impact and fiscal impact. These results are opposed to the management of the company, auditors and fiscal bodies of control, the public. The revaluation itself is made, as stipulated in both IAS 16 and OMFP, by valuation professionals. The company can choose to have it done by the management and in this case the reliability of the management's own assessment of values can be an issue. In either case, it is important that the results of the revaluation are accepted by all involved parties and that the financial situations resulted will reflect a faithful representation.

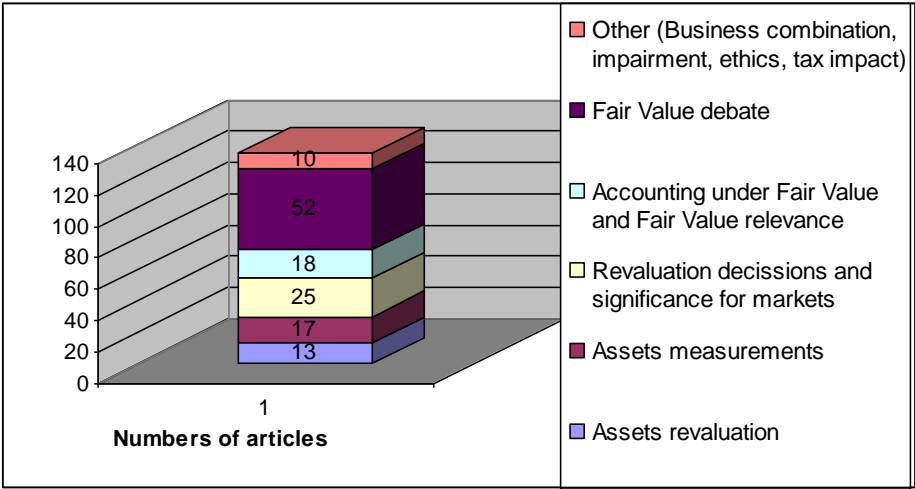
We aim to offer a relevant picture of all elements involved in the revaluation process: decision drivers and management incentives, legal stipulation, international financial reporting standards, international valuation standards, valuation practice and its practical requirements and limitations, mirroring their actions and interactions. The goal is to highlight the importance of the approach of the revaluation process in itself and to put an emphasis on the role of the independent expert – the appraiser – whose expertise and knowledge of the particularities of this kind of valuation mission are essential for the outcome of the revaluation process. The key to reliable revaluation of fixed assets is based as much on the company's policies and support offered to the appraiser as on the appraiser's own quality, experience and knowledge of the needed approach. Our analysis will show that without specific accounting related knowledge, the appraiser will have difficulties in providing a reliable result of his mission. This way, we contribute to a better understanding of this process, of the importance of the interaction between the appraiser and the entity and of the importance of employing a valuer with sound valuation expertise but also accounting knowledge related to this process.

The article unfolds as follows: first, we present the research methodology used. Second, we make a literature review, aiming to offer reflections of the literature's general position relative to fair

value and the fair value concept and, in particular, to the existing conclusions with regard to incentives behind assets revaluations. Our literature review will also show how often the revaluation of tangible assets and valuation practical problems are issues that were researched. Then, our findings are presented in mirroring tables forms in order to enhance the interactions between domains. We then draw conclusions and point to further research possibilities.

2. Research Methodology
Our research is situated at the frontier between accounting and valuation. Literature review has involved both a qualitative and quantitative analysis, allowing us to draw conclusions with regard to the frequency of the themes of interest pursuited and their content. We have relied during our research process on content analysis, comparative analysis and critical analysis. Our content analysis is orientated to the meaning of the studied documents. Regulations and standards were studied using description and explanations techniques. Comparative analysis was used in order to emphasis resemblances and differences between standards. In the end, critique analysis is used to highlight difficulties when comparing regulations with practical possibilities in valuation.

3. Literature Review
Discussions over fair value are numerous and embrace many of the domains where fair value has an impact: relevance of fair value for financial reporting, fair value versus cost, the role of fair value during the financial crisis, investors' perceptions with regard to fair value, reliability of fair value etc. As our research is focused on revaluation of tangible assets, we have proceeded first to position this subject in the larger context of the debate regarding the quality, importance and relevance of financial reporting under fair value. We have reviewed first articles published in established academic accounting publications but also several articles written by practitioners and opinion leaders from relevant fields, including speeches gave by financial world personalities. Our review has settled for 135 articles. We have then divided the subjects of interest in several categories obtaining the following spread:

Figure no. 1- Subjects of Interest in Fair Value Literature


Source: Author analysis

Most of the debate is concentrated on the fair values pros and cons and its role in the financial crisis. Another important topic is related to the decision of revaluation and the reactions of markets and investors to revaluation of assets. Asset measurement, as a separate topic, represents

about 13% of the reviewed articles, allowing us to believe that the subject is less under focus due to involvement of another profession – valuators.

Incentives behind the revaluation of assets are researched in the literature with the use of empirical research mostly. The prevailing motives scrutinised are: influence over leverage indicators of the companies (Cotter and Zimmer 1995: 150, Gaeremynck and Veugelers, 1999: 135, Missonier Pierra, 2007: 23) and earnings management (Bartow 1993: 854, Black, Sellers and Manly, 1998: 1314-1316). Other incentives as information asymmetry reduction, company size, assets nature are also analysed. Quagli and Avalone (2010: 461-493) in an empirical study over real estate companies in Europe which are first time adopters of IFRS demonstrate that the decision to choose the fair value model is motivated by information asymmetry, contractual efficiency and management opportunism.

Nevertheless, attention to the necessity of employing specialised experts is drawn by Mary Barth (IFRS standard setter), showing that "*accountants must become more comfortable with valuation theories, techniques, and practicalities*" (Barth, M., 2007:14). Cotter and Richardson, in an empirical study made on 225 firm-assets-class in Australia (1981 to 1999) find that independent revaluations of plant and equipment are more reliable than revaluations made by company management (Cotter and Richardson, 2002: 438).

4. Research Results

Regarding the revaluation of tangible assets, the regulations to be abided are those stipulated by OMFP 3055/2009 and the provisions of the applicable financial reporting standards (IAS 16, IAS 17, IAS 40, IAS 36) applicable. Starting with January 2013, a new standard will be in force: IFRS 13 – Fair Value Measurement which brings higher convergence with US GAAP stipulations regarding fair value and also orientates the fair value definition towards an exit value. The stipulations of todays in force regulations are outlined below. These specific requirements have an impact over the valuation approaches when the company decides to revaluate the assets at fair value due to the interaction between accounting and valuation practice.

IFRS and OMFP stipulation regarding tangible assets treatment:

- an item of property plant and equipment is recognized as an asset only if it is probable to bring future benefits to the company and its cost can be measured reliably;
- assets are initially measured at cost or at fair value. OMFP makes no distinction between assets held for sale or as investments while IFRS stipulates different measures for these categories;
- land is not depreciated;
- several initial expenses can be capitalised in the assets value (e.g. dismantling and removal costs, financing expenses, operational losses of the first period) but these provisions are not entirely consistent between the two mentioned reference systems (e.g. OMFP does not mention first period's operational losses as eligible for capitalisation);
- several subsequent expenses can be capitalised in the asset's value (modernisations, if meeting the capitalisation requirements, new spare parts of significant value, major overhauls and periodical inspections);
- IFRSs state that the depreciable amount of an asset is determined after deducting its residual value;
- after recognition, the entity can choose the cost model or the revaluation model. If choosing the revaluation model, the revaluation shall have to be applied to the entire class of assets. Revaluations shall be made with sufficient regularity.
- fair value is usually determined on market-based evidence through appraisals made by qualified valuers. Assets can also be evaluated using the cost approach when no active markets can be identified or using an income approach for those assets which are usually sold as part of an on-going business;

- when applying the revaluation model, the entity will re-calculate the book values and depreciation of the revalued assets. There are two models for depreciation re-calculation: (1) proportionally with the change within the asset value, the revalued value being the new net book value and (2) by eliminating the depreciation from the gross book value of the asset and restating the net book value at the revalued value of the asset;
- fixed assets have to be tested for impairment especially when there is an indication that it might be the case. The relevant standard is IAS 36 – Impairment of Assets;
- revaluation differences are impacting the company's equity and depending upon their bearing and the existence of previous reserves from revaluation they can lead to a reserves' increase or an expense.

Fiscal stipulations regarding revaluation of assets:
In our country there are also fiscal regulations to be taken into account, as in Romania taxation of buildings property of companies is made in direct connection to book values. Land is not taxed in connection with book values. Relevant provisions are:
- taxation is calculated in relation with gross book value of buildings;
- taxation quota is different depending upon the duration since the last revaluation date (higher as the last revaluation is older);
- for entirely depreciated buildings the taxable value is reduced with 15%;
- in case of a decrease following the revaluation of fixed assets (below cost), the difference in depreciation is not a deductible expense.
The direct connection between buildings taxation and registered book values makes Romanian companies to revalue their tangible assets registered in the first accounting group regularly. It is expected that the recent increase of this taxation quota and the inclusion of the second interval (buildings not revaluated for more than five years) at an even higher tax percent will result in an expansion of the mass of buildings being revaluated rhythmically.

Revaluation impact:
Considering both accounting and fiscal stipulations it is to be noted that the level at which tangible assets are being revaluated has more than one effect. This effect is different from accounting to fiscality and depends upon the differences from revaluation. Revaluation of assets impacts the company's financial position and can subsequently influence its financial performance. An upward revaluation will lead to an increase in assets and equity and modify relevant financial ratios, thus influencing the decisions taken by the users of financial reports. Accounting profit will be diminished. Local tax will increase while profit tax will not be affected (or will decrease due to a higher local tax expense).
In the opposite case, when revaluation results in a decrease of value, the impact is correlated with the existence of previous re-valuation reserves. If values do not decrease under cost, accounting impact will be a decrease in assets and equity and a raise in accounting profit. Fiscal impact will be a decrease of local tax and profit tax will not be affected (or will increase due to a lower local tax expense). If values decrease under cost the accounting profit will also be affected due to an increase of expenses.

The valuation approach:
Most often companies revert to valuation professionals in order to perform the required valuations. Valuators in Romania are members of the professional body known under the name of ANEVAR (National Association of Romanian Valuers) and the profession was recently regulated by the Government under a new professional body named Uniunea Nationala a Evaluatorilor Autorizati din Romania. In practice, Romanian valuators (or appraisers) abide by the provisions of the International Valuation Standards (IVS), the standards applicable starting with January 2012 being the 2011 edition. For valuation for financial reporting the relevant

standards applied are IVS 300 – Valuation for Financial Reporting and all other standards with incidence in valuation of assets. IVS 300 mentions that IFRS's definition of fair value is consistent with IVS's definition of market value.

Considering all requirements made by IFRSs, Romanian accounting regulations and fiscal code (reviewed above) and practical approaches and possibilities of the appraisers, we present below the action-reaction table [Table 1] between accounting and fiscal requirements and the appraiser's approach necessary in order to make the revaluation process reliable, recognised and approved by the auditor and with consideration to the accounting and fiscal impact.

Table 1 – The connection between accounting and fiscal demands and valuation process

IFRSs and OMFP 3055 provisions	Valuation process
Conditions to be recognised as an asset	- the appraiser requests the fixed asset register (FAR) from the company; - identification and description of the valued assets; - assessment of the possibility of obtaining a "reliable" valuation given the assets to be evaluated and market information available.
Revaluation of the entire class	- the appraiser should check the reconciliation between the FAR and trial balance. If this information is not provided to the valuer, appropriate disclaimers have to be included in the valuation report.
Capitalisation of initial expenses	- this can raise valuation issues as initial expenses might not be recognised when marking to market;
Subsequent expenses capitalisation	-the appraiser has to ask and the entity provide all correspondence cases between a principal asset and the items of modernisation or other subsequent expenditure capitalised for the respective asset; - the appraiser has to ask and the entity to provide the list of on-going investments (fixed assets in progress) in order not to double their value by including the investment into the valuation of the subject asset; - the asset is valuated „as it is" and subsequently the value can be allocated (unless the entity decides to unify all FAR positions).
Different approaches depending upon asset type and market information available	- the appraiser, based on entity information, has to classify the assets subject to revaluation into sub-categories (used in operation, non-core assets, held as investment etc.) before deciding on valuation approach.
Alternative treatments in re-computation of book values and depreciation	- the outcome of the valuation process is a value that corresponds to the net book value. Appraisers should not give another indication and the approach in re-computation of gross book value and depreciation is the entity's decision.
Impairment	- when revaluation of fixed assets is based on the cost approach the appraiser has to advise about the necessity of applying an impairment test or can perform if it was foreseen in the services contract
Totally depreciated assets	- these have to be revalued if they are still operated by the entity and bringing benefices to the entity. If agreed with the company, the valuator can make estimates of the future life duration of these assets for the purpose of depreciation computation.

Land is not depreciated. Property tax is calculated at gross book value for buildings but has no correlation with the registered value for land.	- allocation of value between land and buildings for real estate type properties (where the valuation approach is either income approach or market approach for the property treated as a whole – land + building). - buildings' gross book value recalculation treatment is the entity option.

Source: Author analysis

Besides the above noted, the appraiser has to abide by all valuation and valuation reporting requirements included in the International Valuation Standards. Before starting the valuation process it is important that the appraiser establishes the conditions within which the appraisal is being made, respectively the company is an on-going concern or is being liquidated.

5. Conclusions

Depending upon the direction of the revaluation results of tangible assets (upwards or downwards) revaluation may have an impact over the financial indicators of the company and influence decision makers which use the financial statements. Various requirements and possible accounting treatment regarding tangible assets recognition, initial and subsequent measurement, depreciation policy and impairment are reflected in the registered value levels and componence of the fixed assets register which is, for the appraiser, the basis from which revaluation process begins. Understanding of accounting rules and of the necessities of the revaluation process is essential for a reliable revaluation. The appraiser has to be familiar with specific requisites while the entity has to provide the valuer with all relevant information plus access to the appraised assets. Lack of specific accounting knowledge on the valuer's side can lead to distorted representations of the valued assets (e.g. not considering assets' classification in establishing the valuation approaches, not allocating separate values for land and building, doubling the effect of on-going investments etc.) which will affect faithful representation, have accounting and fiscal impacts and can also raise problems when auditing the company. In the meantime, the quality and valuation expertise of the called-in appraiser are also relevant for the outcome of the revaluation process, especially if market values evidence is scarce or for revaluation of specialised assets. Impairment analysis is another important aspect, when the appraiser is required to perform it.

The valuation issues to which we have pointed in this article can lead to further research. Many of these are related to the financial reporting standards requirement of measurement and subsequent expense capitalisation versus practical possibilities of the valuation process. The new fair value definition included in IFRS 13 also opens the road to analysis of the exit value versus market value, which should also be placed in the context of this standards' relevance for the Romanian market. Also, further research might involve a study in order to establish if for Romanian companies buildings taxation (as stipulated by the fiscal code) is the main driver of revaluation and not the requirements of faithful representation or other managerial incentives.

The paper analyses the relationship between accounting and taxation in the Romanian accounting environment. In this respect the paper illustrates the results of the main research conducted in the national and international literature in terms of the relationship between accounting and taxation in Romania and also the main research directions in terms of tax-accounting link. The paper concludes that the level of influence was decreased over time (de jure and de facto) as a result of changes made in the Romanian accounting and tax environment.
Keywords: accounting, taxation, tax-accounting link, accounting environment, Romania
JEL Classification: H29, M40, M41

1. Introduction

The relationship between accounting and taxation is a topic highly debated in the international accounting and tax literature. In the last two decades a lot of paper and analysis was conducted in order to capture the influence which exists between them.

In this respect, this paper overtakes, under the spectrum of a fundamental analysis, the main research which was conducted in the case of Romania regarding the relationship between accounting and taxation or vice-versa.

After a brief review of the literature (section 2) of the European countries in terms of tax-accounting link, section 3 illustrate the main aspects which was analyzed in the national and international literature in terms of the relationship between accounting and taxation in Romania. Section 4 concludes the study.

2. Literature review

The tax-accounting link is one of the most debated items to the European level, more analysis being conducted in this respect. Hoogendoorn (1996) analyses the tax-accounting link in 13 European countries, being identified 12 factors of influence. Lamb *et al.* (1998) conducted an empirical study regarding the tax-accounting link in four countries (Germany, France, UK and USA), in this respect 5 cases of the link between accounting and taxation being identified (disconnection, identity, accounting leads, tax leads and tax dominates). The conducted analysis was made based on 15 factors of influence of tax-accounting link. The study concludes that in terms of connection between accounting and taxation, in case of Germany and France (countries included in the EC accounting system) there is a strong link between them, in the opposite with the case of UK and USA, countries dominate by more flexible rules.

The last study mentioned above is one of the most representative studies in the area of tax-accounting link, several studies being conducted based on this study. In this respect, studies

conducted by Nobes *et al.* (2004), Nobes and Schwencke (2006) and Gee *et al.* (2010) can be mentioned.

Gallegro (2004) analyzed the relationship between accounting and taxation in terms of Spanish listed firms, the author identified several items such as: income tax expense, welfare schemes, provision for pensions, monetary correction, accelerated depreciation, or exemption for reinvestment, as point of differences between accounting and tax profit. The studies conducted by Oliveras and Puig (2005) and Blake *et al.* (1998) are representative for the research regarding the Spanish tax-accounting link.

Also, several studies analyzed the case of Sweden as one of the main representative Nordic country, the evolution of the tax-accounting link being almost similar with the case of Norway (Nobes and Schwencke, 2006) or other European countries (from a strong link between accounting and taxation to an decrease of the intensity). In this respect, the study conducted by Blake *et al.* (1997, 1998, 1999) are representative.

The literature from the Eastern Europe is also representative, several studies being conducted in terms of tax-accounting link. In this respect, studies conducted by Sucher and Jindrichovska (2004), Krzywda and Schroeder (2007) and Bosnyák (2003) can be mentioned. The relationship between accounting and taxation was seen as a main obstacle in the process of accounting harmonization in the case of Czech Republic (Sucher and Jindrichovska, 2004) and Poland (Krzywda and Schroeder, 2007). The case study of Hungary was analyzed by Bosnyák (2003), the author mentioned that, the tax-accounting link has an important role in the case of SMEs.

3. The main directions of tax-accounting link in the Romanian accounting environment

Romania is member of the European Union from 1st of January 2007, in this respect the accounting regulation being conforming to the European Directive in the current period. Over the last two decades (after the fall of the communist regime), the accounting regulation pass from several stages from a strong influence of French accounting system to the influence of the AS accounting system (the adoption of IAS/IFRS), in this moment (as member of European Union), the accounting regulation being conforming to the European Directive but with strong influences of IAS/IFRS.

Based on description mentioned above, the following classification of the Romanian accounting period can be realized:

- *The first period (1991-2000)* of the Romanian accounting regulation (influenced by the French system) is known as a period dominated by a strong influence of taxation over accounting in terms of tax-accounting link.

- *The second period (2001-2005)* is influenced by the adoption of IAS/IFRS (OMFP 94/2001) in the case of listed companies, this period being aware a decrease of the link between accounting and taxation in terms of accounting regulation, but the Romanian accounting practice remaining influenced to the tax practice, in the case of individual financial statements, the accounting regulation being harmonized with the European Directives (OMFP 306/2002).

- *The third period (2006 – present)* is governed by regulation conforming to the European Directives (OMFP 1752/2005 amended with the OMFP 3055/2009), the Romanian accounting regulation being strong influenced by the AS accounting system as the effect of the period of implementation of IAS/IFRS (2001-2005) and as result of the mandatory for listed companies from European Union to implement the IAS/IFRS in their consolidated financial statements.

In this respect, the study conducted by Deaconu and Buiga (2009) is representative, the authors demonstrated empirical that the first period governed by the French influence is governed by the EC accounting system from the perspective of tax influence, the second and the third period being governed by the AS accounting system based on the tax influence over accounting (*de jure* analysis).

Around these three stages, several studies were conducted in the international and national literature in terms of tax-accounting link in the Romanian environment.

One of the first *international studies* regarding the Romanian accounting environment was conducted by King *et al.* (2001). In this study it is realized an extensive analysis of the evolution of accounting reform in Romania, the authors mentioned that the tax law and the accounting law was developed separately in Romania, but the *de facto* differences between tax and accounting profits are less clear. The authors gave as similar example the case of Poland, Hungary and Czech Republic.

Another illustrative analysis of the accounting environment and also the influence of tax-accounting link it is realized in the study conducted by Ionascu *et al.* (2007). Referring to the cost of IAS/IFRS implementation in Romania, the authors affirmed that it was taken the decision of a gradual reform that led to an approximate application of IAS/IFRS ('a tax application' in certain audit reports) which conducted to no assistance for those companies that needed or would need financial statements conforming to IAS/IFRS (p. 195). The study conducted by the Larson and Street (2004) are also representative from the perspective of adoption of IAS/IFRS in Romania.

The national literature regarding the relationship between accounting and taxation can be separated in two categories: fundamental and empirical research, the most studies being included in the first category, these being characterized by a normative and interpretative methodology.

Sucala (2002) affirmed that the relationship between accounting and taxation is defined by dynamicity and the meanings which relate to the cultural, economic and judicial environment.

Berinde (2004) analyzed the implication of the introduction of deferred tax accounting in the Romanian legislation, seen as an effort undertaken in the way of tax accounting disconnection, given the close relationship between accounting and taxation.

Several studies (Petre and Lazar, 2006; Cotlet and Megan, 2007) analyzed the relationship between accounting and taxation from the perspective of the accounting and tax regulation. The authors conclude that accounting rules are not connected to the fiscal rules in terms of legislation *(de jure)*, but in practice *(de facto)* companies can use the tax rules in the favor of accounting rules (Bunget and Dumitrescu, 2008).

The analysis of the accounting versus tax principle is also discussed, the study conducted by Ciumag (2004) being representative in this respect. Also, Istrate (2011) mentioned that each of the nine principles explicitly listed in the Romanian Accounting Standards could be restricted by the tax rules. In this respect, the author identified several cases where the tax rules has priority, such as: tax implications of the lack of continuity, tax recognition of a change of the accounting method (inventories and revaluation), tax regime of the provisions, tax vs. accounting timing of revenues and charges (interests, subsequent costs), lease-back as a finance lease, recognition of some revenues from sales of goods. Also, the author mentioned that in the last period *de jure* influence of the tax-accounting link decreased.

In the last period a new field of interest was developed in the case of SMEs research, as the effect of a possible implementation of IFRS for SMEs which also has an impact over the relationship between accounting and taxation. In this respect, several studies were conducted in this field, based on the Romanian accounting environment.

Berinde and Răchişan (2005) in their fundamental analysis argued that in the case of SMEs, there is a strong link between accounting and taxation.

Deaconu *et al.* (2008) conducted an empirical analysis regarding the main elements in order to define the SMEs, the analysis being performed in the case of Romania. In this respect several items was identified in order to conduct the analysis, the authors mentioned that the inflexible legislation and the link between the accounting and taxation standards make the reporting mandatory at least for tax-related purposes. On the other hand, Deaconu *et al.* (2009) conducted an empirical analysis regarding the technical aspects in terms of the implementation of IFRS for SMEs in Europe, the analysis being conducted also in the case of Romania. The authors

concluded that Romanian market presents other technical options as well as the proposal of IFRS for SMEs standards, one of the main causes of these differences being represented by the tax-accounting link.

Albu *et al.* (2010) conducted an exploratory study regarding the possible implementation of IFRS for SMEs in Romania. The authors identified as one of the main obstacles in the way of implementation the extant emphasis on the conformity with tax regulations.

Cuzdriorean *et al.* (2011) conducted an empirical analysis regarding the evolution of profit tax in Romania. The authors concluded that the profit tax regulation are dominated by instability, a number of 217 amendments were made in 57 regulations over the period of 20 years of analysis.

The empirical analysis regarding the tax-accounting link in the Romanian accounting environment began to be conducted in the last few years.

Fekete *et al.* (2009) and Cuzdriorean *et al.* (2010) developed in their studies an attempt of measuring the fiscal influence over accounting. In this respect, the authors developed an empirical model in order to capture this influence. The analysis was conducted on a sample of 433 listed companies on Bucharest Stock Exchange and a period of 3 years. The results illustrated that the level of influence of taxation over accounting is about 4%, the model being statistical validated, and the value cannot be interpreted as high or low in the case of lack of other items of comparison.

Based on study conducted by Fekete *et al.* (2009) and Cuzdriorean *et al.* (2010), Fekete *et al.* (2012) conducted a similar analysis in the case of Romanian SMEs. The authors conducted a longitudinal analysis over a period of 11 years (1999-2010), The analysis included a total sample of 336 companies, the analysis being conducted over a sample between 117 and 176. The results illustrated that the SMEs accounting is strongly influenced by taxation, the level of fiscal influence seems to be connected with changes in accounting and/or fiscal regulations in the sense that changes in both accounting and fiscal regulations lead to smaller level of taxation impact on accounting (to disconnection), but the strength of this phenomenon is rather low (the level of influence varies over time form a level of 99.8% in 1999 to 2.6% in 2004 and again to 99.6% in 2009).

Deaconu and Cuzdriorean (2011) conducted an empirical study based on the factors of influence developed in the international research (e.g. Hoogendoorn, 1996; Lamb *et al.*, 1998) and adapted to the Romanian accounting environment. The interview was selected as statistical instrument, in this respect, the first 20 accounting firms from Cluj-Napoca being included in the sample. Based on 15 factors of influence of the relationship between accounting and taxation (closed questions), and also open questions in order to capture the tax-accounting link over the period, the study concludes that there is a link between accounting and taxation in the accounting practice *(de facto),* but the trend is to a decreasing of the influence.

In order to realize an extensive analysis of tax-accounting link from the perspective of factors of influence, Cuzdriorean (2012) conducted an analysis based on 11 factors of influence of tax-accounting link to the national level. In this respect, the survey was selected as statistic instrument; the sample included 1710 licensed accountants expert, the analysis being conducted to a sample of 179 questionnaires. The results illustrated that in the Romanian accounting environment, there is a strong link between accounting and taxation in terms of accounting practice based on the factors of influences identified in the literature in the case of small entities, this link decreasing along with the increasing of the size of entity. As an overall analysis, the study concludes what also concluded the study conducted by Deaconu and Cuzdriorean (2011), namely, a decrease of the influence of accounting over taxation or taxation over accounting.

4. Conclusion

In this study it is performed an exploratory analysis regarding the main research conducted in the international and national literature in terms of the relationship between accounting and taxation in Romania.

As a result of the analysis performed, few studies were identified in the international literature in terms of tax-accounting link. All studies conducted debated the Romanian accounting environment from the perspective of IAS/IFRS adoption, only exploratory studies being conducted.

The national literature includes also fundamental and empirical studies, the main studies being included in the first category. In this respect, the main research directions identified are: deferred tax, tax and accounting regulations, tax and accounting principles. The fundamental studies conducted concludes that in the Romanian accounting environment can be made a distinction between accounting and tax regulation, the main direction being conducted to a *de jure* disconnection.

The accounting of SMEs as particular research area was presented, the tax-accounting link having an important role in the way of a possible implementation of the IFRS for SMEs. Several exploratory and empirical studies were conducted, further research are welcome in order to fundament the decision of implementation.

From empirical perspective, several studies were conducted in order to measure the influence of taxation over accounting in the case of listed companies and SMEs. Also two studies were conducted in order to capture the accounting practice based on the factors of influences identified in the international literature. As main conclusion of the empirical investigation in terms of tax-accounting link, can be mentioned, a trend of *de facto* disconnection between accounting and taxation.

FINANCIAL PERFORMANCE VERSUS NON FINANCIAL PERFORMANCE CASE STUDY AT ANTIBIOTICE TRADING COMPANY IASI

Dănescu Tatiana
„Petru Maior" University from Tîrgu Mureş, Faculty of Economical, Juridical and Administrative Science

Beleneşi Mărioara
Oradea University, Faculty of Economic Science
University „1 Decembrie 1918"from Alba Iulia, post-graduate student

The actual economical conditions, the effect of global crisis and the efforts to pass this turning point, does force trading companies toward an extremely balanced management of performance. Now, when financial indicators are neither so spectacular nor so relevant, and when the principles of a durable development are mentioned over and over, the exigencies of companies' external environment are higher and higher. This reality does force the companies to pay more attention to social responsibilities' assuming and investment into green innovation, as well as to the field of information's communication in a relevant way, which should gather financial, social and environment information. The absence of a normalized balance of financial and non-financial indicators used in measuring companies' global performance, does allow them selecting of "agreed" indicators which should reflect the company under the light of high performance. But, the same reason urges the searcher for some research studies of the most adequate diagnostic model of global performance, which should faithfully reflect company's current status. The purpose of this study is to measure the global performance of ANTIBIOTICE Trading Company, taking into account, both financial and non-financial indicators for a period of 5 years. For the financial years 2006 and 2008 company's global performance is an acceptable one, while for the financial years 2007, 2009 and 2010 the global performance is a medium one. It should be highlighted the lack of involvement or transparency regarding social and environment responsibility in 2006 and weak financial performance in 2008, indicators which positioned the company to an acceptable level.
Key words: performance, financial indicators, non-financial indicators, global diagnostic, ANTIBIOTICE Trading Company.
JEL Codes: M14

1. Introduction

A performing company is the one which creates values for its shareholders, satisfies the clients, takes in consideration its employees opinions and respects the environment. Thus, the shareholder is satisfied as the company remunerates his invested capital, the clients do trust into company's future and into the quality of its products and services, the employees are proud of the company they are work in, and the society does benefit by the company's policy regarding environment protection (Jianu 2007: 24). Accepting this statement, we notice the importance of measuring companies' performance, in order to classify them from economic point of view and of all implied actors. Even the international legislator, by the spirit of International Standards of Accountancy (IAS 1), does encourage the companies to publish, beside financial situations, also analyzes regarding their financial performance.

Moreover, within current developing level of global economy, the stress is moving from financial performance to the global performance. Nowadays, economic environment is severely punishing the companies which do not pay the same importance to social and environment aspects as to the economic-financial one. For the sake of steadfast development, we consider necessary that

company's performance should be given not only by financial indicator's results, but also by those which are measuring social and environment performance.

Hence these reasons, the purpose of this study is to treat and to analyze the performance of economic entities, both conceptual and practical point of view.

The main objective is measuring of global performance of ANTIBIOTICE Trading Company, taking into account both financial and non-financial indicators. The analyzed periods are last 5 years, respectively from 2006 until 2010. Financial results published for this period are available on company's official website.

The secondary objectives of this research are deriving from the main one and are focusing on the reevaluation of performance concept. The steadfast development is based on the concept of global performance, which we intend to treat it together with its all three valances: financial performance, social performance and environment performance. At the final of this study we are analyzing the procedure of performance measuring, presenting two empirical cases realized with the purpose to identify the most relevant financial and non-financial indicators in order to diagnose companies' health. The applicative part of the study, does present the global performance of analyzed company, putting into application the diagnostic model of global performance exposed within one of above mentioned cases.

2. Research methodology

Mainly, the research is treating the two sides of same issue: both establishing a connection at conceptual level between performance, global performance, financial, social and environment performance, and their reflection through a case study.

International literature is materializing through a theoretical contribution of some researchers like Bourguignon, Debiens, Lebas, Burlaud, Anthony etc. On national level, researchers like Niculescu, Mărgulescu, Jianu, Pintea, Mironiuc, Robu and others, do bring an important theoretical and empirical contribution into this field.

This study's purpose is to sustain the hypothesis that within an economy where steadfast development is the keyword, the performance of a company cannot be analyzed at economic-financial level only. When we are measuring a company's performance, we should take into account also the social responsibility it is developing and its quality.

The study is presenting a trading company quoted on Bucharest Stock Exchange, being chosen upon following criteria: to be a quoted trading company, to be a representative trading company from pharmaceutical field and to publish detailed annual reports. The analyzed period is last five consecutive years. Primary data are taken over from published financial reports and from Monthly Bulletins issued by Bucharest Stock Exchange during those five years, without sampling. The data are taken over electronically from the website of studied trading company, from official website of Bucharest Stock Exchange and of National Bank of Romania. As of the law, these data are mandatory to be published on these websites.

In this case data collection is a simple procedure, consisting in accessing these websites through an informatics program installed an o personal computer which allows files' downloading into an intelligible format. Data presented in these downloaded files are retained and are processed through simple arithmetical calculations.

Data's processing is made upon tabular calculation. For each five analyzed years, we'll take into account the size of those 10 financial indicators measured within the model of global diagnostic; then, we'll quantify the size of non-financial indicators based upon available data, using presented conceptual domain and financial information from annual reports.

After collecting and processing primary data, the obtained results are analyzed quantitatively both as absolute and relative sizes and as evolution in time, through their graphical presentation. Then, comparing the sizes and evolutions we'll conclude the results through a qualitative analyze.

3. The performance and its valences

We start this scientific intercession by investigating "performance" term from conceptual point of view and of evolution in time. According to Explanatory Dictionary of Romanian Language, the term of performance is originate from French word "performance" which means "The result (an extraordinary good one) obtained into a competition by somebody; extremely good achievement into a field of activity. The best result obtained by a technical system, by a machine, by a tool, etc." As we can notice, "performance" concept could have almost an infinite number of definitions, many of them referring to specific contexts or functional perspectives.

For instance, from'50 to '80, when there weren't known homogeneity in defining this concept, there were used several appreciation criteria of the performance, out of them we are mentioning: *productivity, flexibility, adaptability, capability, environment control, turnover, production costs, etc.*

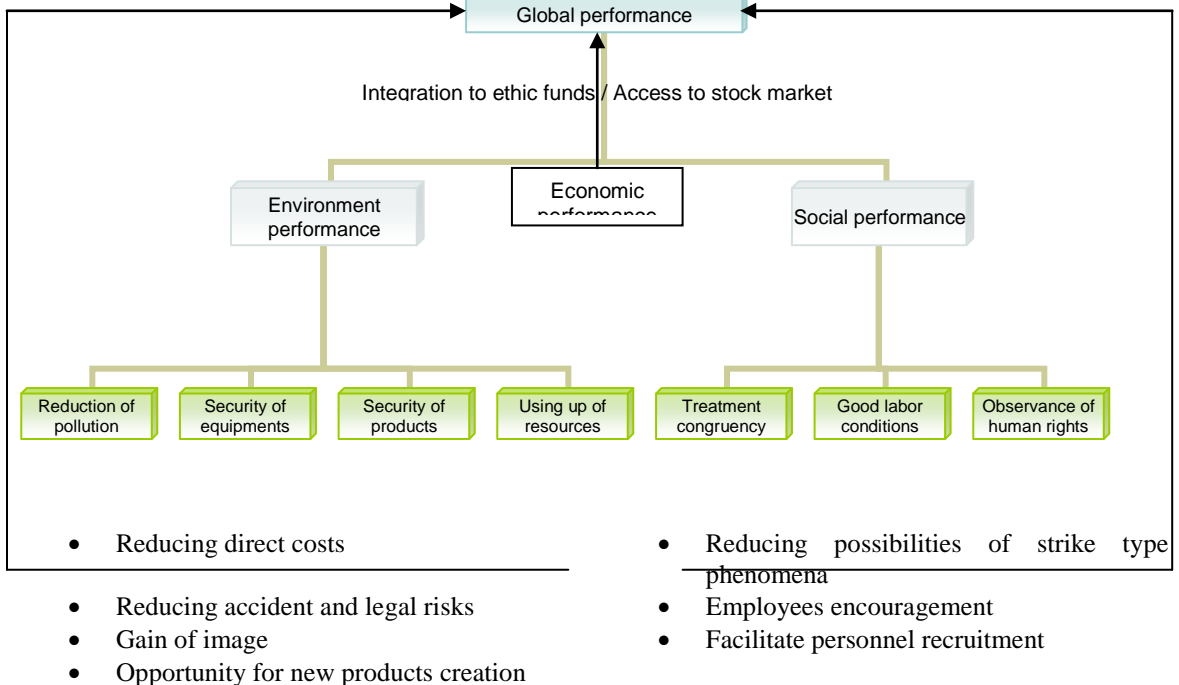
Defining performance in terms of achieved level of objectives do characterize the period of years '90. On inventory field, A. Bourguignon (1995) is defining the performance as being: *achievement of organizational objectives.* Same opinion is shared also by authors like Debiens, 1988; Lebas, 1995; Burlaud, 1999. This definition could be translated also into another way: the performance into a company represents everything which contributes to reach strategic objectives.

Defining performance in terms of company's productivity and efficiency is supported by M. Niculescu (2003), who states that *"theoretically, a company is performing if in the meantime it is both productive and efficient";* the idea is shared also by authors like Niculescu & Lavalette, 1999; Mărgulescu, 1994; Burlaund & Simion, 1999; Anthony et al., 2003.

As productivity represents the ratio between obtained results and the means engaged for their achieving and, as the efficiency represents the ration between the obtained results and expected results, into the view of these authors: performance = productivity + efficiency.

Defining performance in terms of value creation is supported by P. Lorino (1995) who states that "performance for company represents everything which contributes to ameliorate value-cost couple, and not only which contributes to cost decrease or value increase.

Nowadays, **performance is seen holistic,** getting a global vision. Authors like Alazard and Separi (quoted by Pintea, 2011), Reynaud (2003), Robu and Vasilescu (2004), Mironiuc (2009) think that ***global performance represents aggregation of economic, social and environment performance*** (fig. 1).

Fig. 1. **Global performance of an entity**


(Source: Pintea after Reynauld, 2011)

As it was showed, performance concept has known a remarkable evolution. If within last century financial performance was on first place, nowadays, economic entities have realized that under the frame of a steadfast developing company, the global performance of an entity (economic, social and environment performance) gains more ground.

4. Measuring financial and non-financial performance

Measuring global performance of a trading company means elaboration of a set of relevant financial and non-financial indicators fated to offer a pertinent image over its performance. Non-financial indicators should contain social performance indicators, as well as environment performance indicators (see performance indicators issued by Global Reporting Initiative – GRI).

A survey achieved in Romania between July 2010 and February 2011 which seemed very inventive, has taken into account realizing and testing the structure of an evaluation system of global performance of economic entities. By the distributed questionnaires, it were tested *opinions of analysts from academic centers* (Cluj-Napoca, Bucharest, Timişoara, Iaşi, Craiova, Sibiu, Piteşti, Galaţi), and the opinions of financial analysts from analyze department of Companies of Financial Investment Services (Broker S.A, BT Securities, Target Capital, Tradeville, Estinvest, Intercapital, KBC Securities, etc.) regarding the structure of a system for global performance appreciation. Analyzing received answers, there were selected 20 indicators (10 financial, 10 non-financial ones), the two categories holding equal share in structure of the system for global performance appreciation, namely 50% each. Within non-financial indicators' structure, the ratio of social indicators is equal with the one of environment indicators, namely 25% each.

Regarding financial indicators, these have weights of different importance; three indicators considered as relevant ones by the information they are bearing (added economic value, net profit and indebtness grade) have a share of 7%. Remaining indicators (left 7) has a total share of 29%, and individually the weight of each indicator is about 4.14%.

Non-financial indicators have received weights of equal importance within model structure and, namely each non-financial indicator has received a share of 5%. Financial and non-financial indicators taken into account when constructing the system of appreciation indicators of global performance, as well as the weight of performance indicators within diagnostic model, are presented in table 1.

Table 1. Financial and non-financial indicators taken into account when constructing the system of appreciation indicators of global performance, as well as the share of performance indicators within diagnostic model

Financial indicators	Share	Non-financial indicators	Share
Added economic value	7.00%	Grade of clients' satisfaction	5.00%
Grade of indebtness	7.00%	Labor satisfaction	5.00%
Net profit	7.00%	Labor encouragement	5.00%
Total profitability obtained by shareholders	4.14%	Number of claims	5.00%
Net ptofit per share	4.14%	Organizational climate	5.00%
Immediate liquidity	4.14%	Grade of pollution	5.00%
Operational cash-flow	4.14%	Observance of environment standards	5.00%
Investment profitability	4.14%	Emissions	5.00%
Financial profitability	4.14%	Recyclable materials	5.00%
Turnover	4.14%	Initiatives for emissions' reduction	5.00%
TOTAL	**50.00%**	**TOTAL**	**50%**

(Source: Pintea, 2011)

Evaluation of global performance of an economic entity through the help of diagnostic model does have on its basis a score granted to each analyzed aspect and which finally leads to obtain the total score upon following formula (Pintea, 2011:33):

Total score = 0.50* Quantitative aspects + 0.50* Qualitative aspects

Each indicator (criterion, aspect) gets a final score from 1 to 5, 1 being the lower grade and, 5 being the highest grade. The total score is calculating as above mentioned formula, by combining qualitative and quantitative criteria, and for determining final score it is used the balanced average in a way that economic entities under evaluation could get under the frame of following performance categories (Pintea, 2011:34).

Depending on the points obtained after application of this model, economic entities could be framed under the following performance categories:

G1 – weak global performance, not observing either financial criteria, nor non-financial ones (final balanced score between **1.00-2.00**);

G2 – acceptable global performance, with worsening tendency either of financial criteria, or of non-financial ones (final balanced score between **2.00-3**.**00**);

G3 – medium global performance, with stagnation tendency of both categories of criteria (final balanced score between **3.00-4.00**);

G4 – good global performance with improving tendency of most of financial and non-financial criteria (final balanced score between **4.01-4.50**);

G5 – high global performance, by observing both financial and non-financial criteria (final balanced score between **4.51-5.00**);

5. Case study at ANTIBIOTICE Trading Company

The study is viewing performance estimation by putting into application the above presented diagnostic model of global performance. The analyzed company is ANTIBIOTICE Joint Venture Company, with a social capital of 56.800.710 lei, quoted on Bucharest Stock Exchange (BSE) in first category under ATB symbol. The company is quoted on Bucharest Stock Exchange since 16.04.1997 and in the present there are trading 568.007.100 shares. Stock exchange data are taken over from monthly Bulletins issued by BSE, and financial and non-financial data from annual financial reports available on company's official website, together with annual reports. After calculations, we got following financial indicators taken into diagnostic model:

Table 2. **Financial indicators' size**

INDICATORS	FINANCIAL YEAR				
	2006	2007	2008	2009	2010
Added economic value	6.383.576	6.982.890	-11.841.171	-16.123.590	-6.538.707
Grade of indebtness	40%	36%	46%	47%	42%
Net profit	23.839.146	32.456.007	10.572.756	11.916.807	12.539.100
Total profitability obtained by shareholders	17.996	11.809	0.1793	17.397	10.206
Net ptofit per share	0.0524	0.0713	0.0232	0.0262	0.0263
Immediate liquidity	0.4176	0.4353	0.3782	0.0313	0.0336
Operational cash-flow	-1.693.784	12.642.099	13.719.189	5.260.657	25.024.115
Investment profitability	11,55%	10,70%	3,64%	4,16%	4,71%
Financial profitability	13,46%	13,18%	4,28%	4,92%	4,77%
Turnover	195.677.945	229.415.602	215.805.947	219.754.104	243.626.062

According to used diagnostic model of global performance, we granted scores from 1 to 5 (1 being the lower grade and 5 being the highest grade) for each calculated financial indicator depending on its maximum or minimum value presented during those five analyzed years.

The same procedure was used also with non-financial indicators, highlighting the regret that the company does not make a presentation in time of the evolution of non-financial indicators fated to quantify its social and environment responsibility. Thus, we had to qualify them depending on

the available information in this meaning. From this point of view, we qualified on the lower level the year when, the company hasn't published into the annual report its social and environment activity, considering either the company hasn't performing such activities, or these kind of activities haven't been publicly presented. The years when the company has intensely manifested his interest regarding social and environment responsibility and made them public, these years have been qualified with highest grade.

Accordingly, for 2006, the company received the worse qualification concerning non-financial indicators (see chart 1) due to lack of transparency or to slight implication into social and environment issues.

Chart 1. **The evolution of scores granted to non-financial indicators**
(Source: authors calculations & estimations)

Regarding criteria of financial estimation, the company obtained a minimum score in 2008, when global economic crisis has started and which has left his print on it, the recovering procedure being rather slow.

Applying formula presented within previous chapter, the total score was obtained and company has been framed to one of those 5 existing categories in each year (see table 3).

Table 3. **Final score and afferent performance category**

	2006	**2007**	**2008**	**2009**	**2010**
Total obtained score	2.60	3.00	2.55	3.05	3.80
Performance category	G2	G3	G2	G3	G3

(Source: authors calculations)

For financial years 2006 and 2008, company's global performance is an acceptable one, with worsening tendency either of most financial criteria, or of most non-financial criteria (final score 2.6, respectively 2.55). For financial years 2007, 2009 and 2010, the global performance is a medium one, with stagnation tendency of both criteria categories (final score 3, 3.05, respectively 3.8).

6. Conclusion and suggestions

An steadfast development does assess new performance standards to economic entities which are exceeding economic area; these entities should integrate into entities' developing strategy in order to assure sustainability to performing activities through harmonization of economic, social and ecological objectives, and thus, to achieve "sustainable" performances. The steadfast development concept presumes needs' balancing regarding economic development, social equity and efficiently use and conservation of environment.

In this meaning, the systems which are evaluating financial performance, are proved to have a reduced efficiency regarding performance management, as they are based on financial indicators calculated upon historical data, does not intercept the connection between respective entity' strategy and its performing activities and, does not offer information regarding quality, innovation, services offered to clients, pollution, labor satisfaction, etc. For a relevant estimation of global performance there is necessary using a system of indicators which should catch both financial and non-financial aspects of the activity.

The above mentioned aspects have been concluded following our scientific study, both theoretically and practically. A considerable part of the study has focused on presenting the concept of performance and those three dimensions of global performance, namely: economic (financial), social and ecological dimension; also, it has focused on the knowledge level regarding measuring instruments of performance, namely, performance indicators. In the final part has been achieved an applicative study for measuring the performance at ANTIBIOTICE trading company. We applied a diagnostic model of global performance, which result does frame the company among those with acceptable global performance level (2006 and 2008), and for 2007, 2009 and 20120 among those with medium performance level.

Regretfully found out that at the beginning of analyzed period, gathering information regarding non-financial indicators has been hard to achieve, because the company either wasn't involved in social and environment activities, or these activities haven't been presented into the annual reports. At the end of the period, namely in 2010, the company makes clear statements concerning social and environment responsibility it assumed, but without presenting an evolution in time of his preoccupation regarding these aspects, as it was presenting the evolution in time of economic and financial profitability.

In our view, the used diagnostic model does closely reflect the global performance of the company, with the notice that application of this model is based on information which depends on company's transparency, thus, could be influenced the global performance by the publishing or non-publishing some information regarding involvement into social and environment issues, unlike financial information which are mandatory to be published, as of the law.

In the future, we desire to develop our study by spreading analyze over more companies from different fields (energetic, chemical, financial), quoted also to other stock exchange, like the ones of Polish, Czech or Hungarian State.

Conclusively, the performance is a permanent preoccupation of all economic actors, its perception being different depending on each specific interest. Performance measuring is a necessary condition for assuring one's entity's progress, but not enough. It is saying that a progress that is not measured does not exist. But measuring cannot be a goal, but the impulse to react and to act for a steadfast developing.

MANAGEMENT ACCOUNTING IN EUROPEAN SOCIAL FUND FINANCED PROJECTS IN ROMANIA

Dogar Cristia
"1 Decembrie 1918" University Alba Iulia

Associating spent amounts in European Social Fund (ESF) financed interventions to eligible activities could be important premises for safeguarding the sound financial management principle. Incorporating management accounting in the beneficiaries accounting systems may provide primary warranties about compliance to the above mentioned principle as described in the EC Regulation 1605-2002

This study aims to explore some facts in actual accounting management implementation, as a base for future improvements of Romanian ESF beneficiary's accounting systems

ESF financed interventions covers a large range of labor market related services, delivered to the people to increase adaptability and occupational mobility with the aim of allowing or improving labor market access. Even if these services are diverse and delivered by various entities such as government agencies, enterprises or NGO's, they do have something in common; they cannot generate incomes, but costs for implementing entities. But costs according to the sound financial management principle calls for tracing money with eligible activities using at least some if not all of management accounting concepts. Without some specifics from the donor or a mutual accepted best practice model, most of the ESF beneficiaries are reporting their efforts to actual researches and specialized literature regarding management accounting implementation in services delivering activities.

This study was realized in March 2012 by applying an investigation instrument, an on-line questionnaire collecting both opinions and factual data as well to a number of 962 members of a practice community for ESF interventions implementation. This technique was used to test hypotheses regarding the premises for a future improvement of the existing accounting system model by incorporating management accounting.

130 members of this community answered anonymously, revealing an important concern for management accounting usage, even if only less than 15% declared that they organize it continuously. The rest of more than 85% perceive an important concern about tracing money with budget breakdowns and activities within their projects, just about 65% of them considering also that their work is different now in an ESF project than in past situations. More than 83% of the ones organizing management accounting stated that their actual work is different than in past situations.

Analyzing all the answers, we may consider that our hypothesis is correct and there is a real opportunity for accounting system improvements, by incorporating management accounting.

Some other conclusions about interactions between the accounting and internal control systems may be drawn from the way that community members perceive communication from and to the accountant. Possible weaknesses of the internal control system may lead to unpleasant effects for sound financial management.

This study is a part of a larger research "New models of the accounting and internal control systems of ESF financed interventions in Romania", addressing a qualitative approach of ESF absorption through improved practices. The research is coordinated by Prof. Dr. Tatiana Dănescu and elaborated by PhD student Cristian Dogar.

JEL Code: M41 - Accounting

Keywords: Management accounting, Accounting system, European Social Fund, communication, sound financial management.

1. Introduction

Addressing ESF projects is claimed as difficult by most of Romanian beneficiaries. Even if they already implemented PHARE – Human Resources Development financed projects in the past, they are now facing something new, something bigger: larger project teams, target groups, implementation periods and budgets as well. New risks may occur and project management has to deal with these according to ever adjusting rules, enforced by the Managing Authority and lasting principles such as: transparency and sound financial management.

With this respect, beneficiaries control and accounting systems as parts of the larger national management and control system of ESF have their own importance in ESF implementation for managers and ESF officials as well.

If we consider that ESF financed interventions are implemented by beneficiaries organizations only if these are compliant with their own strategies, we may also consider that managers should use management accounting to choose, communicate and implement strategies (Horngren, Datar and Foster: 3).

Management accounting should than support managers in sound financial and transparency compliance assisting them through a continuous decision making process of resource allocation, considering costs and advantages, behaviors and technical conditions, different costs for different purposes (Horngren, Datar and Foster: 23).

Apart from financial accounting, the management accounting is an internal reporting one; organizing such a system stays at manager's decision. The National regulatory framework imposed the management accounting as mandatory in Romania (art. 1 of Law no. 82-1991 Accounting Law, republished), but conditioned by some subsequent implementation rules, never issued. Hereinafter some questions arise. Is it now clear enough for managers of ESF implemented projects that they need accurate and timely financial and non-financial information? So are they asking for? Are they organizing the accounting system in the way this information may become accessible? Is accounting management a reality of actual stage of ESF implementation in Romania? Do they explain to the accountant what the project is about and the manner that costs are covering activities progress? Is the actual implementation faraway from a sound management accounting? Is it possible to implement it now? The subject of this study are answers at these questions, as a part of a more comprehensive research dealing with new models for accounting and internal control systems for ESF projects.

2. Literature review

Our study aim is to collect opinions from accountants of the ESF financed projects and to provide a conclusion about the actual facts of ESF implementation. We are not comparing now different models of management accounting, so we do not rely on any of management accounting dedicated studies. Anyhow, the general context is described in the regulatory framework and in the selected references as referred to in the study.

3. Methodology

For relevant conclusions, collecting opinions and factual data from ESF implementation teams has to cover a large area and an important number of opinions. In 2010 – 2011, an ESF financed project created a virtual community of financial responsible, accountants and auditors of ESF projects. That community, comprising more than 950 people from all over the country, working in some of the about 2000 projects in implementation at that time was relatively active at the end of 2011. The list of communities' members is available at: www.practicifse.ro

An opinion and factual data on-line questionnaire was applied to all members of the community, asking the accountants for an anonymous reply by choosing the most suitable version of the answer at every of the ten questions. We assume that no one answered twice or more times at this

questionnaire. Answers were collected in a table, using Google docs during March and April 2012.

4. Study results

There are 130 answers, so the response rate is more than 13%. Organizing accounting in work centers could be a plus for accounting management; all projects costs can be physically separated from the current costs of the entity in synthetic accounts. The other option, registering costs in analytical separate accounts needs financial documents accurate management of verification prior of the accountant.

Nearly 17% claimed that they organize accounting in work centers, meaning an increased interest to separate the accounts of the project. The second question was about management accounting in the ESF projects. Apparently no more than 18 answers were compliant with the definition of management accounting, representing less than 14% of the total answers.

As we find out that now, accountant of ESF projects prefer organizing accounting in work centers more than management accounting.

ESF interventions have their own rules and particularities, and costs incurred must follow these properly. Certainly, acknowledging these particularities may involve efforts from all interested parties, and accountants are not an exception. Having a long tradition in being involved only in financial accounting, the accountant may face difficulties in fully understanding of what's to be done in such a project. Regarding the understanding of ESF intervention respondents stated as follows:

Table no. 1. Understanding of ESF intervention

Opinions	With management accounting	Without management accounting
Are you aware about the content of ESF intervention you are keeping records for and what's to do on it?		
Fully understood, I understand exactly what's to be done	66,67%	59,82%
Fully understood, I read the project	27,78%	30,36%
Partially, not enough information	5,56%	9,82%

We may than consider that those who organize accounting management are aware in a more direct way about the facts of the ESF financed intervention than the others. Even so, with an aggregate figure of more than 90% we can assume that accountants fully understood the projects content.

ESF project is implemented within the limits of the approved budget breakdown. Budget lines include sums to be spent for eligible expenditures, in a particular way, choosing among existing procedures. Balances of analytical accounts should be put in correspondence with existing budget lines. Commitments should be recorded separately, allowing the accountant to estimate the remained availabilities for every item. About the awareness of the budget breakdown, respondents stated as follows:

Table no. 2. Awareness of budget breakdown

Opinions	With management accounting	Without management accounting
Are you aware about the content of ESF intervention budget breakdown?		
Yes, I have a copy	100,00%	89,29%
Yes, broadly	0,00%	9,82%
I have not enough information	0,00%	0,89%

There is no doubt that the accountants organizing management accounting have more information about budget breakdown and than the others, having in so a proper possibility to put in correspondence financial documents (costs) with the budget lines.

Table no. 3. Corresponding costs with budget breakdown

Opinions	With management accounting	Without management accounting

Do you realize correspondence between financial documents presented for registering and budget breakdowns?		
Always	100,00%	79,46%
Almost always	0,00%	9,82%
Sometimes, almost never, never, not relevant	0,00%	10,71%

The accountant of an ESF project, as stakeholder, has to be aware not only on budgets, but also in activities, in implementation realities. It's largely accepted in Romania that accountants are more interested in figures than in facts. The answers received confirms that accountants have more interest in budgets, 79,46% of them always connecting financial documents with budgets, as long as only 65,75% are always connecting those documents with projects activities. We also found out that a small part of the accountants are not connecting costs to activities or budget breakdowns.

Table no. 4. Corresponding costs with project activities

Opinions	With management accounting	Without management accounting
Do you realize correspondence between financial documents presented for registration and project activities?		
Always	100,00%	68,75%
Almost always	0,00%	16,07%
Sometimes, almost never, never, not relevant	0,00%	15,18%

Communication to and from the accountant could be a very important issue in assessing reliability of financial data. The accounting system has to receive not only invoices, but also certifications from the management about reality of costs represented by the transferred invoices or other financial documents. According to the answers, even in case of management accounting, accountants do not receive always information about meaning of financial documents received to register. For projects that are not keeping management accounting, less than 60% of the respondents receive always explanations.

Table no. 5. Communication about invoices from management or responsible person

Opinions	With management accounting	Without management accounting
Do you receive explanations from management or responsible person for financial documents for registration?		
Always	94,44%	59,82%
Almost always	5,68%	26,79%
Sometimes, almost never, never, not relevant	0,00%	13,39%

Certification of financial documents by the authorizing officer is very important for ensuring reliability of financial information. Authorizing officer may be the project manager or other responsible as well. Semantically assuming that certification could mean only verification, we found out that even if management accounting is organized, more than a quarter of respondents perceive lack of verification. If no management accounting, only 63,39% of the accountants perceive document verification prior receiving them.

Table no. 6 Perception about prior authorization of financial documents

Opinions	With management accounting	Without management accounting
Are the financial documents received by you for registration prior verified by another person?		
Always	77,78%	63,39%
Almost always	22,22%	25,89%
Sometimes, almost never, never	0,00%	10,71%

Certification means more than a simply verification of documents, than we may assume that financial documents are certified prior the accountant less than indicated in the answers received. This indicates possible malfunctions of internal control systems with influence on potential for fraud and on compliance with sound financial management principle.

Communication is sideways, and accountant should act accordingly. Accountant can deliver a lot of information but is this requested by the manager? Is the management asking for more

information that the one accountant are usually including in financial reports of the organization? As a part of communication process we wanted to explore the accountant's perception about manager's expectation for more information. Those who organize management accounting are delivering always such information to managers. We conclude that managers are always asking for more information when they organize management accounting, and are frequently asking for such information in no management accounting situation. The large number of responses "sometimes, almost never" may drive to a limited compliance of the intervention at the sound financial management principle.

Table no. 7 Perception about management's interest on non financial information

Opinions	With management accounting	Without management accounting
Is management asking you for more information but the one you usually include in yours entity financial reports?		
Always	100,00%	16,96%
Frequently	0,00%	48,21%
Sometimes, almost never	0,00%	34,82%

Accountant perception about difficulties in implementation, relatively to prior work experience was another issue of the study. The received answers confirmed the theory of "European bureaucracy" and how is this viewed by accountants, practitioners in ESF projects. Working in these projects is considered "extremely different", "very different" and "different" by more than 80% of those who organize management accounting and "very different", "different" and "small differences" by more than 80% of those who are not organizing management accounting. We may consider that different opinions between those organizing and not organizing management accounting is due to the management accounting implementation in entities accounting system. The opinions of those who are not organizing management accounting can be taken into consideration in quantifying the "European bureaucracy".

Table no. 8 Perceived work differences relatively to prior work experience

Opinions	With management accounting	Without management accounting
Do you think that your work now, implementing ESF project is different (more complex) reported to prior situations, without ESF project?		
Extremely different	33,33%	8,93%
Very different	16,67%	16,07%
Different	33,33%	40,18%
Small differences	16,67%	31,25%
Unchanged	0,00%	3,57%

5. Conclusions

ESF funding is based on rules to be applied by the Member State beneficiaries. The rigor of these rules is differently perceived depending on compliance reaction. Even without organizing management accounting, working in ESF projects is broadly considered different and those accountants who organize accounting management consider their work as extremely and very different.

Managers and accountants are aware, in different measure that sound financial management principle is to be applied in the projects. Organizing work center based accountancy is one first step in adequate records keeping. Relatively to management accounting, this is simply and costless, especially when accountants perceive communication with authorizing officer as insufficient. Management accounting to be developed means the two parts working together: management (internal control system) and accountant (accounting system). Manager has to be interested in management accounting reports and accountant has to be convinced (prior authorization) that documents he registers are reflecting real and legal operations. Even if management accounting is broadly not organized, accountants are associating costs to budgets and activities in a substantial manner, so we may consider that accountants acting on ESF rules

are carrying the premises for new accounting systems based on management accounting implementation.

Concluding, we may consider that managers are not entirely aware of the need for accurate and timely financial and non-financial information, except the ones working in projects those accountants are organizing management accounting. Only a small minority have organized management accounting, so information is not always timely accessible in ESF projects. Communication is perceived as limited by the accountant as long as documents are not entirely explained or checked before presentation for registration. Apparently managers have a limited interest on supplementary data available at the accountant; there may be a lack of feedback with possible impact on sound financial management principle compliance.

Based on the different perceptions of those who are organizing or not management accounting we may consider that results of this study are confirming there is a real opportunity for accounting system improvements, by incorporating management accounting for a better compliance of ESF projects with the sound financial management principle. Organizing also a proper internal control system is a must; using COSO's referential as the most suitable solution, as long as even INTOSAI oriented its guidelines on internal control on COSO.

Management accounting may also offer a proficient feedback instrument to be used against implementation risks, over budgeting being one of the most important.

ROMANIA'S FACTS ABOUT INTERNAL CONTROL ENVIRONMENT OF EUROPEAN SOCIAL FUND FINANCED PROJECTS

Dănescu Tatiana
"Petru Maior" University Târgu Mureș

Dogar Cristian
"1 Decembrie 1918" University Alba Iulia

The malfunctioning of internal control system of European Social Fund (ESF) financed interventions may prejudice the sound financial management principle. Incorporating COSO principles in the beneficiary's internal control systems may provide some warranties about compliance to the above mentioned principle as described in the EC Regulation 1605-2002. This study aims to explore some facts in actual internal control environment, as a base for future improvements of Romanian ESF beneficiary's internal control systems

ESF financed interventions covers a large range of costs for implementing labor market related services. But supporting costs according to the sound financial management principle calls for best value for money in real and legal operations. Without some specifics from the donor or a mutual accepted best practice model, most of the ESF beneficiaries are reporting their efforts to actual researches and specialized literature regarding internal control system implementation in services.

This study was realized in April 2012 by applying an investigation instrument, an on-line questionnaire collecting both opinions and factual data as well to a number of 962 members of a practice community for ESF interventions implementation. This technique was used to test hypotheses regarding the premises existence for a future improvement of the existing internal control system model. 100 members of this community: managers, accountants, auditors financial responsible and other team members answered anonymously, revealing a real concern for internal control, providing as well a different side image for this. Analyzing all stakeholder answers, we may consider that our hypothesis is correct and there is a real need for internal control environment improvements.

This study is a part of a larger research "New models of the accounting and internal control systems of ESF financed interventions in Romania", addressing a qualitative approach of ESF absorption through improved practices. The research is coordinated by Prof. Dr. Tatiana Dănescu and elaborated by PhD student Cristian Dogar.

JEL Code: M42 - Auditing

Keywords: COSO, internal control, sound financial management, European Social Fund, projects.

1. Introduction

Addressing ESF projects is claimed as difficult by most of Romanian beneficiaries. Even if they already implemented PHARE – Human Resources Development financed projects in the past, they are now facing something new, something bigger: larger project teams, target groups, implementation periods and budgets as well. Reported to last programming period problems, new risks may occur and project management has to deal with these according to ever adjusting rules, enforced by the Managing Authority and lasting principles such as: transparency and sound financial management.

With this respect, we consider that an adequate internal control environment may be extremely useful in meeting sound financial management principle.

Even if National legal framework exists and imposes for public institution a yearly evaluation of internal control, there is no such obligation for private companies. Considering the INTOSAI

GOV 9100 creation process and the latest developments of COSO and ESF origin we may appreciate COSO's framework as appropriate for internal control investigation and diagnose.

Hereinafter some questions arise. Are COSO's principles recognized in practice by the stakeholders and in what extent? Do they have convergent opinions and if no, why? We processed here answers at these questions, as a part of a more comprehensive research dealing with new models for accounting and internal control systems for ESF projects.

2. Literature review

Our study aim is to collect opinions from stakeholders of the ESF financed projects and to provide a conclusion about the actual facts about internal control environment of ESF project implementation. We are not comparing now different models of internal control environment, so we do not rely on any internal control dedicated studies. Anyhow, the general context is described in the regulatory framework and in selected references as referred to in the study.

3. Methodology

For relevant conclusions, collecting opinions and factual data from ESF implementation teams has to cover a large area and an important number of opinions. In 2010 – 2011, an ESF financed project created a virtual community of financial responsible, accountants and auditors of ESF projects. That community, comprising more than 950 people from all over the country, working in some of the about 2000 projects in implementation at that time was relatively active at the end of 2011. The list of communities' members is available at: www.practicifse.ro An opinion and factual data on-line questionnaire was applied to all members of this community, asking for an anonymous reply by choosing the most suitable version of the answer at every questions. Questions followed the COSO's principles as they can be applied in ESF project beneficiary's organizations. We assume that no one answered the questionnaire more than once. Answers provided by managers, accountants, auditors, financial responsible and other members of the teams were collected in a table, using Google docs during April 2012.

4. Study results

There are 100 respondents: 18 managers, 15 accountants, 15 auditors, 33 financial responsible and 19 other members of implementation teams, so the response rate is more than 10%. Interaction between internal control and accounting systems is essential for sound financial management, so we asked information about respondent's knowledge on organized management accounting in their entities implementing ESF projects.

Table no. 1. Organizing management accounting

Opinions	Managers/ Assistant	Auditors	Accountants	Financial responsible	Other team's members
Yes	33,33%	20,00%	18,75%	21,21%	47,37%
No	66,67%	80,00%	81,25%	78,79%	52,63%

Accountants and auditors are single functions/positions in project teams, so we could receive more information from one single project from other members or managers and their assistants. We may consider so that projects organizing management accounting are less than 20%, even less than 15% according to one of our previous studies, applied only to accountants.

COSO's principles are to be investigated in our target entities through perceptions of respondents. Separate questions were prepared, at least one for a COSO principle, adapting the COSO's integrated framework to our target and to the sound financial management principle. Answers received for each category of respondents have their importance in creating a broader image of the internal control, as is it seen in implementation by various participants. The first principle: "The organization demonstrates a commitment to integrity and ethical values" relay basically on ethics and integrity of the managers, from the tone of the top perspective. This can be rephrased from sound financial management perspective in the above two questions:

Table no. 2. Perception of COSO's principle 1

Opinions	Managers/ Assistant	Auditors	Accountants	Financial responsible	Other team's members
How much you consider project manager as involved in implementing activities at lowest costs?					
Extremely involved	61.11%	33.33%	26.67%	24.24%	52.63%
Very involved	16.67%	46.67%	46.67%	39.39%	21.05%
Involved	11.11%	13.33%	26.67%	24.24%	21.05%
Sometimes or never	11.11%	6.67%	0.00%	12,12%	5.26%
How do you appreciate management supervision follow costs with activities?					
Always for all activities	77.78%	73.33%	60.00%	54.55%	73.68%
Always for important activities	0.00%	26.67%	20.00%	21.21%	21.05%
Frequently	16.67%	0.00%	13.33%	15.15%	5.26%
Sometimes or never	5.56%	0.00%	6.67%	9.09%	0.00%

As long as a good and very good opinion is expected from the managers, we may observe and not only at this question, the trustee relationship between the manager and the other team members, except financial responsible. The last category has an important opinion for our study, because of its position, dealing both with activities and money. Auditors and accountants are external independent experts, so they rely more on paper work than in day-by-day implementation realities. The second COSO's principle "Exercises oversight responsibility" relay on hieratically supervision of the management and on internal control related tasks assumed by the ones are supervising the management. This may be broadly investigated through the above question:

Table no. 3. Perception of COSO's principle 2

Opinions	Managers/ Assistant	Auditors	Accountants	Financial responsible	Other team's members
Has your organization a hieratically structure managers to report to?					
Existing structure, periodically reports	50.00%	46.67%	26.67%	57.58%	47.37%
Existing structure, often reports	11.11%	13.33%	6.67%	9.09%	10.53%
Existing structure, occasionally reports	5.56%	0.00%	6.67%	3.03%	5.26%
There is no structure or no report or NA	33.33%	40,00%	60.00%	30,30%	36,84%

We may observe that both managers and financial responsible claim that there is a supervision structure (in average 67-70%), but there are differences of perception referring to the frequency of reporting. We may assume that managers ask for reports to the financial responsible and they know exactly how much and when do they report. The fact that the accountants have a separate position, dealing mainly with financial accountancy is confirmed by the answer given here. 60% of them don't know if reports are made by the management to their superior structures.

The third COSO's principle "Establishes structure, authority and responsibility" was investigated through questions collecting respondent's perception on internal structure – segregation of duties, subordination lines and number of position. At first question, accountants assumed that everything goes right in 55,33% of the cases, far more than other respondent categories, as long as, managers and financial responsible have almost the same opinion about the accuracy of subordination lines; about 27% assumed that there is unclear subordination, independent of the positions in the organizational structure. The second question received relevant answer from the auditors, accountants and financial responsible. The auditor, as a contracted expert receives the product of the manager's concern and involvement, as long as the financial responsible, entities employee collaborates with the manager in practicing segregation of duties.

Table no. 4. Perception of COSO's principle 3

Opinions	Managers/ Assistant	Auditors	Accountants	Financial responsible	Other members
How do you consider internal structure, number of positions and subordinating relationships?					
Enough positions, clear subordination	38.89%	33.33%	53.33%	33.33%	57.89%
Enough positions, unclear subordination	22.22%	20.00%	26.67%	18.18%	10.53%
Enough positions, more people needed	5.56%	33.33%	13.33%	15.15%	15.79%
Too many positions, clear subordination	0.00%	0.00%	0.00%	0.00%	5.26%
Too many positions, unclear subordination	5.56%	0.00%	0.00%	9.09%	5.26%
Not enough positions, more people needed	22.22%	13.33%	0.00%	24.24%	0.00%

Others	5.56%	0.00%	6.67%	0.00%	5.26%
How do you perceive the project manager in the segregation of duties context?					
Extremely involved	38.89%	13.33%	20.00%	21.21%	31.58%
Very involved	27.78%	20.00%	26.67%	21.21%	21.05%
Involved	16.67%	33.33%	46.67%	33.33%	47.37%
Sometimes or never	16.67%	33.34%	6.67%	18.18%	0.00%

The fourth COSO's principle "Demonstrates commitment to competence" is investigated through the question: "How do you consider competence is taken into consideration by the management when members of the team are employed?" Manager's registered opinions are confirmed by the financial responsible and by the others members of the teams. All the answers are convergent for "Always" and "Often" in about 70 – 80% of the answers.

Table no. 5. Perception of COSO's principle 4

Opinions	Managers/ Assistant	Auditors	Accountants	Financial responsible	Other team's members
How do you consider competence is taken into consideration by the management when team members are employed?					
Always	50.00%	20.00%	46.67%	51.52%	47.37%
Often	27.78%	53.33%	20.00%	36.36%	36.84%
Sometimes	11.11%	20.00%	20.00%	3.03%	10.53%
Not a factor, I don't know	11.11%	6.67%	13,33%	9.09%	5.26%

The fifth COSO's principle: "Enforces accountability" was a subject of investigation through the following question: "How do you consider the accuracy of team's member responsibilities and the control done by the management?" Financial responsible has a slightly different opinion from the ones of managers and auditors, considering responsibilities and control.

Table no. 6. Perception of COSO's principle 5

Opinions	Managers/ Assistant	Auditors	Accountants	Financial responsible	Other team's members
How do you consider the accuracy of team's member responsibilities and the control done by the management?					
Clear responsibilities / appropriate control	38.89%	40.00%	33.33%	39.39%	63.16%
Clear responsibilities / some kind of control	50.00%	53.33%	26.67%	36.36%	0.00%
Responsibilities and control	11.11%	6.67%	40.00%	24.24%	36.84%

Stakeholder's perception on risk assessment was also investigated. In ESF implementation internal and external risk may occur and managers have to deal with these. The way organizations identifies risks and analyzes them is a very important issue in sound financial management. Even if risk management involves a dynamic process of identifying and assessing risks, the process must be a formal and iterative one. Using specific procedures and risk registers could bring a plus of rigor, and help also to keep track of past experiences. Nevertheless formal or informal meetings when risks may occur have their advantages, but formalizing the process by using a risk register and adequate procedure is undoubtedly the best way of managing risks.

Answers received indicate auditors are not aware in a significant measure about risk management in ESF beneficiary's organizations. Financial responsible consider that there is a procedure in a more substantial way than management declares it, accountants being just skeptical. They all seem to agree that risks are discussed in periodically meetings, probably during progress meetings, and also in instant meetings, when risks may occur. Management doesn't recognize but in small extent the importance of instant meetings, all the rest of the stakeholders seem to agree about it.

Table no. 6. Perception of project's risk management approach

Opinions	Managers/ Assistant	Auditors	Accountants	Financial responsible	Other team's members
How do you consider the risks are identified, analyzed, and managed risks?					
Specific procedure and/or risk register	16.67%	33.33%	6.67%	21.21%	5.26%
Periodically meetings when we discuss about risks	66.67%	13.33%	53.33%	48.48%	52.63%
Discussions about risks when they may	11.11%	33.33%	40.00%	27.27%	36.84%

occur					
Don't know	5.56%	20.00%	0.00%	3.03%	5.26%

Potential for fraud in assessing risk is another important issue from sound financial management perspective. Are the assets protected, are there potential conflicts of interest?

Table no. 7. Perception of project's potential for fraud

Opinions	Managers/ Assistant	Auditors	Accountants	Financial responsible	Other team's members
Do you consider fraud may occur in the project?					
Very possible with all taken measures	5.56%	0.00%	6.67%	6.06%	0.00%
Possible but there are control activities and procedures in force	11.11%	26.67%	6.67%	15.15%	5.26%
Slightly possibility, but there are control activities and procedures in force	33.33%	60.00%	60.00%	60.61%	47.37%
Impossible, management took all necessary measures to avoid fraud	44.44%	6.67%	20.00%	18.18%	47.37%
I do not know	5.56%	6.67%	6.67%	0.00%	0.00%

Received answers confirm over rating of management from other team members, but also the criticism of management done by financial responsible. They agree in less than half extent with managers declaring that fraud cannot occur because they done everything to avoid. We may conclude that financial responsible believe more in control activities and procedures in avoiding fraud than in management statements.

5. Conclusions

Considering ESF financed projects internal control environment from COSO's approach we may observe that relevant stakeholders: managers, accountants, auditors, financial responsible and other members of the teams have different opinions about the subject. As long as the other members of the team are relying on managers and trust them, as an average, their answers are the same or even better than the consideration of management. Auditors and accountants, as contractors may deliver an external opinion, more accurate for auditors. Financial responsible may deliver an internal, relatively objective opinion, as long as the questions are not directly subject of their work.

We may conclude than that ethics and integrity are declared by managers as implemented in a favorable and very favorable way in a total extent of 77% , opinion endorsed by the financial responsible in a substantial manner (64 to 76%) and perceived as declared by 81 to 100% of the auditors. Limitations of audit mission may be an explanation for the auditors super rating of managers ethics and integrity.

On over sighting responsibilities, managers and auditors have the same opinion, as long as, financial responsible is over rating this. We may assume that, as team members they don't know exactly when and what is reported by the management. As an average, more than 60% of ESF projects are seen to have a hieratic authority they are supervised from and sent reports to.

The entities structures meet some inconsistencies; with a general stakeholder's opinion of about 27 – 30 % of employed personnel unclear responsibilities, management declare itself as "involved" and "very involved" in enforcing segregation of duties in a substantial manner (76%), partially endorsed by financial responsible (42%) and recognized much less by the auditors (only 33%). We may observe that auditor's perception's level is half of the management's statement but consistent with financial responsible opinion.

We may also consider management's statement on commitment to competence, as long as both financial responsible and the auditors have a better opinion on this. We may assume that in no less than 70% of the projects competence has been taken into consideration always and often by management in employing team members.

Accountability is enforced in a substantial manner, even if managers are declaring 89%, this is more than 75% according to financial responsible perception.

Risk management is perceived by all stakeholders as dealt in meetings; periodically or instant. Managers declare this for 77% of the cases, financial responsible endorse it for 75%, team members agree in 89% and accountants in 93%.

Potential for fraud is considered as very possible or possible by less than a quarter, and auditors are the most prepared to face it. Financial responsible (19%) and managers (18%) are also considering the potential for fraud.

Based on this study, we may consider that COSO's principles are recognized by ESF projects practicing stakeholders in an appropriate extent and their perceptions are convergent in most of the cases. Stakeholder's perception is confirming the initial hypotheses and there is room for internal control environment improvements for ESF projects to comply with the sound financial management principle.

Are COSO's principles recognized in practice by the stakeholders and in what extent? Do they have convergent opinions and if no, why?

THE IMPACT OF THE BUSINESS AND ORGANIZATIONAL SIZE OF A COMPANY ALONG WITH GRI AND CSR ADOPTION ON INTEGRATING SUSTAINABILITY REPORTING PRACTICES

Dragu Ioana-Maria
Babes- Bolyai University, Faculty of Economic Sciences and Business Administration

Tiron-Tudor Adriana
Babes- Bolyai University, Faculty of Economic Sciences and Business Administration

This paper intends to investigate the correlation between the business and organizational size of companies as well as GRI and CSR practices adoption, and the level of sustainability disclosure. The correlation is highlighted through SPSS statistic analysis and determination of an econometric model between a dependent variable - sustainability information disclosure - and five independent ones- sales, number of employees, GRI and CSR policies and ultimately reporting period/year -. We use the Deloitte Sustainability Scorecard for measuring the sustainability reporting practices. Our sample comprises companies that adopted integrated reporting for the period 2009-2010. Sample selection was made on the basis that sustainability reports are incorporated within the integrated reports. We assume to obtain a high correlation between the business and organizational size of companies, GRI and/or CSR polities and the level of sustainability information disclosed in our integrated reports.
Key-words: integrated report, reporting scorecard, sustainability, disclosure, correlation.
M41, C58

I. Introduction

In a world dominated by global challenges, in the form of globalization, population growth, climate change, resource scarcity, recognition and response to sustainability issues is trivial for the corporate environment. Stakeholders influence on sustainability reporting is understated by organizations, which focus their disclosure on customers, employees, suppliers, activists, governments, community. The engagement with stakeholders is indeed increasing in importance as companies choose to disclose information on the matter. The level of sustainability information presented within the integrated reports issued by the firms that have adopted this system can be measured using the Sustainability Reporting Scorecard developed by Deloitte, and further on communicated to the users of the annual reports. The efforts made by companies to incorporate sustainability reporting practices would lead to enhancement of corporate performance, by increasing the business and organizational size of the firm. Ultimately, companies are expected to improve their relationship with stakeholders- investors, regulators, customers, business partners and employees- by adopting sustainability disclosure.

II. Review of Literature

Katelijne Van Wensen et al. (Katelijne Van Wensen et al. 2011:115) argue that integrated reporting means nothing but a sustainability report adapted to the various needs of the stakeholders. They add that innovation in sustainable reporting leads in fact to integrating the sustainability information into one single integrated report. The Global Reporting Initiative has established guidelines for sustainability reporting frameworks. However, the corporate environment is merging towards integrated reporting, a new trend that in fact promotes the presentation of information related to finance and sustainability issues (Benoit and Niederman 2010:9).

Research on corporate responsibility and sustainability reporting (Michael 2009:3-8) in the area of real estate reveal that corporate reports have changed over time, making improvements on sustainability and CSR disclosure. Michael (Michael 2009:11) studies eight corporations from UK and Australian, by creating a matrix with the purpose of evaluation and comparison of the corporate responsibility and sustainability reports. The methodology involved characterizing each criterion from the matrix as being or not being disclosed within the analyzed reports. These criteria were chosen by the author in accordance with the GRI Sustainability Reporting Guidelines and GRI Standard Disclosure and generally refer to: headquarter location, strategy and analysis, organizational profile, report parameters, governance, economic, environmental social and governance performance metrics. The findings of the study demonstrate the initial objective, that CSR and sustainability reporting has improved over time, the researcher underlining in the end of its paper certain limitations in the form of input data, subjectivity, human error or misinterpretation.

Empirical studies were elaborated concerning the benefits of implementing corporate social responsibility (Selvi, Wagner, and Türel 2010:281-290). Starting from a sample of the most profitable companies from a certain country and the ones that are socially responsible, the author uses Spearmen coefficient to determine the relationship between company reputation and corporate social responsibility. The conclusions were that the relationship between the variables is a positive one.

Discussions on trends towards non-financial information show that sustainability reporting registers positive evolutions, more and more companies applying for it. According to data from Fortune Global 250 during the period 1998-2001, there is a considerable increase regarding sustainability reporting (Kolk 2003:279–291).

III. Research methodology

The methodology of research involves SPSS data processing, by establishment of the correlation level between the dependent variable- sustainability information measured by the DSRS (Deloitte Sustainability Reporting Scorecard) - and the independent ones- sales, number of employees, GRI and CSR policies and reporting year-. The econometric function can be described as follows:

$DSRS_{SI} = \lambda_1$ x Sales + λ_2 x No. of employees + λ_3 x GRI adoption + λ_4 x CSR adoption + λ_5 x Year

The coefficients $\lambda_1, \lambda_2, \lambda_3, \lambda_4$ and λ_5 will be generated through SPSS regression analysis.

We intend to measure sustainability using the *Deloitte Sustainability Reporting Scorecard* which involves 30 criteria each scored between 0 and 4 points. These points are distributed according to the degree of fulfillment with the conditions of presenting the elements contained in a sustainability report. The four possible levels of sustainability correspond to four cases that can be met for a certain company, namely:
- it does not mention the requested information or the disclosed information is insufficient (0);
- some relevant aspects are presented (1);
- coverage of most important information (2);
- better sustainability practices (3);
- outstanding reporting (4).

According to this method, the maximum score that can be allocated to a certain company is 120 points. Therefore, the total score of 120 is considered to represent 100%. The final percentage level generated by each company can be analyzed by allocating the respective firm to one of the following groups or categories:
- no information or insufficient- 0%
- few information- 25%

- average information coverage- 50%
- better than average- 75%
- outstanding- 100%

Data description

This section provides empirical evidence on integrating sustainability reporting practices. The case study involves a sample of 35 integrated reports, from 24 companies that operate in 10 different countries. Therefore, our initial database comprises large corporations, namely: AEP, Altron, Amplin plc., Anglo Platinum, BASF, Capita Group, Eskom, Gold Fields, Great Portland Estate, Implats, Logica plc., Massmart, Metso Corporation, National Grid, Natura, Novo Nordisk, Philips, Potash Group, RB Platinum, Standard Bank, UTC, Vodacom, Wolesely, Xstrata plc.. The firms from ours sample have also been classified by industry type: aerospace and industrial, agriculture, banking and insurance, chemicals, communication, construction, cosmetics, electricity, electronics, information technology, medicine, mining, real estate, retail. Our database contains reports for financial years 2009 and 2010.

IV. Results

This section presents the output results obtained through SPSS regression analysis. Table 3 presents the descriptive statistics of our data, and therefore contains the minimum, maximum, mean and standard deviation indicators of our sample of 35 integrated reports. These indicators are determined for each of the variable included in the model. The mean level of GRI adoption registers 0.45429, while for CSR policies we obtain a value of 0.4571. Both variables are equal in standard deviation (0.5054). The maximum value for the business size represents in total sales 273,683.03 mil. Euro, and the minimum number of employees (organization size) represents 17. The scores generated by the Deloitte Sustainability Scorecard fluctuate between the interval of 77.92 and 109.97 (out of a total of 120 points), with mean value of 101.1754 and standard deviation of 7.0439.

Table 3. Descriptive statistics

	N	Minimum	Maximum	Mean	Std. Deviation
Year	35	2009	2010	-	-
GRI	35	.00	1.00	.5429	.5054
CSR	35	.00	1.00	.4571	.5054
Sales	35	0.01	273683.03	31010.58	64306.8312

DI	35	77.92	109.97	101.1754	7.0439
Valid N	35				

(Source: SPSS data processing)

Table 4 shows the Pearson Correlation Coefficients determined for our sample of 35 integrated reports. We notice that the dependent variable of reporting period (year) has a negative influence upon the disclosed information on sustainability issues. In addition, the coefficient of -0.186 demonstrates that our analyzed period (2009-2010) is characterized by a decrease in the supply of sustainability information- this fact is also highlighted in the section dedicated to the Deloitte Sustainability Scorecard, where the analysis from time period perspective indicates the same results. The Pearson Coefficient for GRI adoption indicates a medium level, positive correlation with sustainability information disclosed within integrated reports (0.447). The significance test shows a value close to 0.01, that is the statistical threshold for significant values. The results for GRI factor are not surprising, as GRI guidelines cover most of sustainability reporting issues, and it would have been expected to be correlated to the high levels of disclosure on sustainability. CSR policies tend to have a negative influence on the score generated by Deloitte Sustainability Scorecard, which could be obvious as generally companies adopting GRI practices, do not follow CSR policies, and the other way around. However, CSR has a significance level of 0.001, which

means that these findings are very conclusive. The business and organization seem to have a small influence on sustainability reporting, with coefficients of 0.125 and 0.1.

Table 4. Pearson Correlation Coefficients

		Year	GRI	CSR	Sales	Employee	DI
Year	Pearson Correlation	1.000	.125	-.125	.074	.055	-.186

(Source: SPSS data processing)

The estimated econometric model can be described as follows (Table 5):

$DSRS_{SI} = 2.081^{-5}$ x Sales $- 1.92^{-5}$ x No. of Employees $- 1.058$ x GRI adoption $- 8.874$ x CSR adoption $- 3.786$ x Year $+ 7,713.937$

Table 5. Beta Un-standardized Coefficients

Model	*Un-standardized Beta coefficient*
Constant	7,713.937
Year	3.786
GRI	1.058
CSR	8.874
Sales	2.081E-05
Employee	1.058E-05

V. Final Remarks

The main purpose of this paper has been to investigate the correlation between the business and organizational size of companies as well as GRI and CSR practices adoption, and the level of sustainability disclosure. The methodology involves SPSS statistic analysis and model determination between a dependent variable - sustainability information disclosure - and five independent ones- sales, number of employees, GRI and CSR policies and ultimately reporting period/year -. The sustainability reporting practices are measured using Deloitte Sustainability Scorecard. Our sample comprises companies that adopted integrated reporting for the period 2009-2010. Sample selection was made on the basis that sustainability reports are incorporated within the integrated reports. We assume to obtain a high correlation between the business and organizational size of companies, GRI and/or CSR polities, reporting year and the level of sustainability information disclosed in our integrated reports.

The Deloitte Sustainability Scorecard is meant to provide guidelines on the content of reports regarding the sustainability information disclosure. Thus, in the absence of a general current framework, the scorecard can be used for developing best sustainability practices and to create sustainability reports that should integrate within annual reports.

THE SOUND OF CORPORATE GOVERNANCE

Dumitrascu[1]Mihaela
[1]Academy of Economic Studies Bucharest,
Faculty of Accounting and Management Informatic System
Department of International Accounting

The paper explores the corporate governance and corporate social responsibility in music industry, by reviewing the literature and investigating the aspects in the context of a sample made by top companies in this domain. The paper spotlighting the mutual connections between corporate governance and corporate social responsibility. The research methodology used consists in investigate the corporate governance codes. It's about a qualitative interpretive research methodology that was adopted. The findings suggest the intercorelation of corporate governance with corporate social responsibility. The main contribution of the author consists in the fact that the added value of this paper and the original contribution leads in the intercorelation of these two aspects of corporate governance and corporate social responsibility, the findings beeing interesting, implying that recent preoccupation with corporate governance in music industry is starting to be equable by some attention to social responsibility aspects, with growing appreciation of their interdependencies. Previous literature has researched corporate governance and corporate social responsibility independently. Due to this fact, this paper is considering them jointly. The paper is important for both practical and theoretical aspects: for managers and also can serve as the basis for future research on this topic.
The current paper is realized in the doctoral program entitled "PhD in Economics at the Standards of European Knowledge- DoEsEc", scientific coordinator Prof. PhD Niculae Feleaga, Institution: The Academy of Economic Studies Bucharest, Faculty of Accounting and Management Informatic System, Department of International Accounting, period of research 2009-2012.
Keywords: corporate governance, corporate social responsibility,music industry, stakeholders
JEL Classifications: G39, M14

1. INTRODUCTION

Music is something that everybody feel and understand in a big or small measure, depends on tastes, cultures, trends or other factors. Due to the international character of the music and the extensive investment required in technology, logistics, marketing, more and more stakeholders are participating in the music global production chain. According to this, the music companies are becoming more sensitive to consumers' opinions and concerns and more responsive to shareholders' demands. The companies must respond to calls for greater transparency, social responsibility corporate governance, fair trade initiatives, the protection of human rights and sustainable environmental practices.

Corporate governance is a set of rulls under which companies are directed and controlled, that branch of economics that studies how companies can become more efficient, promote fairness, transparency and responsibility in an organization.

The **music industry's stakeholders are:**
- the musicians, those who create and interpret the music;
- the companies who sell recorded music (music publishers, producers, studios, engineers, record labels, retail and online music stores, performance rights organizations);
- professionals who present live music performances (booking agents, promoters, music venues, road crew);

- professionals who assist musicians with their music careers (talent managers, business managers, entertainment lawyers);
- those who broadcast music (satellite and broadcast radio);
- those who listen and buy music;
- journalists;
- academies;
- professors;
- musical instrument manufacturers; and many others.

Corporate governance is based on a set of attributes, including ensuring accountability to shareholders or stakeholders (Keasy and Wright, 1997), ensuring that companies are run according to the laws and answerable to all stakeholders (Dunlop, 1998), ensuring that reporting systems are structured in such a way that good governance is facilitated (Kendall, 1999).

These aspects we also find in the OECD Principles (1999), first adopted by the 30 member countries of the OECD in 1999, which have become a reference tool for countries all over the world. Based on the investigation carried out on the selected companies from the music industry, this article ambitiously attempts to sketch out the corporate governance issues.

2. RESEARCH METHODOLOGY

Regarding the research methodology, was conducted a qualitative research based on observation of some aspects. Information was extracted on the basis of reports like: corporate governance codes, corporate social responsibility reports. To achieve homogeneity of the selected sample, we choosed top 6 companies from music industry.

3. A BRIEF REVIEW OF THE MUSIC INDUSTRY

The definition of music varies from culture to culture and from a social context to another. Music can be divided into genres and subgenres, although the dividing lines and relationships between them are subtle or controversial.

Since 2000, there were four major corporate labels which dominate recorded music — Universal Music Group, Sony Music Entertainment, Warner Music Group and EMI Group — each of which consists of many smaller companies and labels serving different regions and markets.

Many record labels died. Here we can mention the Columbia Records, Crystalate, Decca Records, Edison Bell, The Gramophone Company, Invicta, Kalliope, Pathé, Victor Talking Machine Company and many others. The "Big 6" consists of EMI, CBS, BMG, PolyGram, WEA and MCA — which dominated the industry.

Sony bought CBS Records in 1987 and changed its name to Sony Music in 1991. In mid-1998, PolyGram merged into Universal Music Group (formerly MCA), dropping the leaders down to a "Big 5". EMI, CBS, BMG, PolyGramMCAUniversal, WEA

The "Big 5" major record companies became the "Big 4" in 2004 when Sony acquired BMG, CBS: EMI, PolyGramMCAUniversal , WEA , and the "Big 3" when EMI was acquired by Universal in 2011: Sony, Universal, WEA.

4. CORPORATE GOVERNANCE IN MUSIC INDUSTRY SECTOR

By studing the corporate governance codes of the most important companies from the music industry sector was observed some differcences which was presented below. We can not say there is a best model of corporate governance, all systems presenting pluses and minuses, perfect model of corporate governance being only an illusion.

4.1. Board mission and Director Responsibilities

The board is elected by sharehoders to represent their interest and the overall success of the organization. The board will meet monthly or 6 times a year or monthly (the case of EMI).

Directors attend all meetings and are elected for one year by shareholders or board, without the number of terms. The management team consists of 10 (WEA), 7 (EMI) or 16 (SONY) members. Director Access to Officers, Employees and Information is full and free. There is an annual Chief Executive Officer Performance Evaluation. The Board and the committees will regularly review management succession planning. The Board of Directors will conduct an annual self-evaluation to determine whether it and its committees are functioning effectively. improve.

4.2. Committees of the Board
The Committees of the Board are: Finance Audit Remuneration Nominations Committes, Risk Management And Internal Controls (EMI), Nominating audit committee (Sony), Audit, Compensation, and Executive, Governance and Nominating (WEA).
The Board may establish additional committees as necessary or appropriate. The Chairman of each committee will determine the frequency of committee meetings,

4.3. Corporate Social Responsibility Aspects
As music companies, all of these, have a positive effect on people and make a significant contribution to communities all around the world.
Decisions about community investment and charitable giving are made locally by business units around the world.
Other responsible decisions that we can mention are: reducing paper use and promote recycling, the company successfully attains a goal toward which it has been steadily building.
Also were announced the development of a new company-wide program to reduce or offset greenhouse gas emissions associated with:
-convert CD/DVD products to environmentally-friendly packaging;
-practice ecologically superior paper procurement;
-reduce waste;
-enhance recycling.

5. CONSLUSION
Music represents the trendsetter in terms of products and services like mobile phones companies, cars, in a snobbish economy. There are plenty music campaigns involving corporate social responsibility. Anyway, we can't affirm there is "a bed of roses" seeing the cases of drugs, alcohol or indecent dressing, abuse, which are a common phenomenon nowadays. Even if is a giving back to society or just a way of having fun, brands will always sell and ride high on the wheels of music.
Our research could represent a support for organizations, suggesting that must be a convergence in the context of both corporate governance and social responsibility. The research conducted concludes that some corporate governance codes do not mention all the necessary information.
The main conclusion that can be drawn is that corporate governance and social corporate responsibility should not be considered and sustained independently. Only with an efficient long-term view of leadership, an organization can be sustainable.

CONTRIBUTIONS OF DUMITRU VOINA TO THE DEVELOPMENT OF ACCOUNTING AND ACCOUNTING EDUCATION IN ROMANIA

Fărcaş Teodora Viorica
Babeş-Bolyai University
Faculty of Economics and Business Administration
Nantes University
LEMNA

The paper presents the biography and the work of an important accounting professor from the Academy of High Commercial and Industrial Studies from Cluj, trying to surprise his contribution to the accounting development in Romania.
Professor Dumitru Voina had an important activity as a professor of accounting in Transylvania and at the Academy of High Commercial and Industrial Studies from Cluj. He had lots of papers and studies in the accounting field. From his papers we presented in our article the most complex one General Accounting Course, in which he presented important elements of accounting, issues that were preoccupying the accounting world of those times.
Keywords: biography, professor, accounting, history, education
JEL code: B31

I. Introduction

Our paper is among the studies made in the accounting history field about the individuals. The biographical works are very important in telling the history because, how R.H. Parker cites Carlyle in his article, "history is the essence of innumerable biographies", so is for the accounting history (Parker, 2002, p.127). The paper is part of a bigger work which will be my PhD thesis, and which deals with the beginning of the higher education in the accounting field in Transylvania, at Cluj-Napoca.

Dumitru Voina was among the first accounting professors from the Academy of High Commercial and Industrial Studies from Cluj-Napoca. If our hypothesis will turn out right the Academy from Cluj-Napoca can be considered the first form of higher education in Romanian language, in the accounting field from Transylvania.

Voina "was a man of works and deeds" who deserves to be the subject of an accounting history biography, exactly like others great accounting personalities from the international level, (Parker, 2002, p. 127). He had a great teaching and scientific activity and wrote numerous papers, books and courses, not only in Romanian language, but also in Hungarian and French.

He was also a pioneer in the accounting history from Romania because with his PhD thesis he structured the evolution of the accounting during the time. He contributed to the development of the accounting in Romania and possibly at an international level, because "accounting developments within academic or influenced by academics within a certain country or region are not confined to that particular geographical location but may spread to other countries or regions." (Carnegie & Williams, 2001, p.111)

The work of this professor and the work of all the professors from the Academy of High Commercial and Industrial Studies from Cluj, is more than appreciated as the political, economical and social context in which they needed to operate was very complicated. So, throughout his career, Dumitru Voina, has faced major historical moments that shook the Romanian history. In 1940, after Vienna Dictate an important part of Romania, including big part of Transylvania, with Cluj-Napoca, was given to the Hungary, so in only five days, all Romanian educational and cultural institutions needed to be moved to other Romanian towns.

The Academy of High Commercial and Industrial Studies from Cluj was moved to Brasov and functioned there between 1940 and 1948. This was a period when the professors and the students struggled a lot for reorganizing the Academy and its institutes. Not in the end, the professor witnessed the communist regime in Romania and continued to work also at the Institute of Economics and Planning from Brasov (the new name given to the Academy by the communist) till 1950 when the Institute was dissolved and the professor has retired.

The contribution of the professor in the accounting development of Romania cannot be underestimated because even his contemporaries were aware of the importance of his work. We could find in a report from the archives the remarks of the chief inspector in the area of Cluj from the Minister of Education, that "this professor has a high education level and he is very dedicated in his work, giving a great contribution to the development of the accounting education trough his papers" (National archives of the state, the fund of the Academy of High Commercial and Industrial Studies from Cluj, personal file 112, paper 4).

The paper is composed of four parts. The first part presents the methodology and the literature on which the article was based. The second part is devoted to professor's Voina background information; the next two parts are synthesizing his work. We finalize with some brief conclusions.

II. Research methodology and literature review

The biographical studies in international accounting history literature are not something new, but in the same time we couldn't find as many as we thought there will be. G.D. Carnegie and B. G.Williams (2001) in their study appreciated also that there is an interest for the first things in accounting but a less interest for the first important actors in accounting.

There is an American author Stephen A. Zeff, which was interested in the biographies of Americans and Australians accountants and accounting academics (Parker, 2002, p.127). He wrote multiple studies on accounting personalities including Hatfield, Solomons, Littleton.

The biographical studies made in the accounting history about the academic accountants are about the first professors (Carnegie & Williams, 2001; Clark, 2005) and the contribution of their work (Parker, 2005; Romeo & McKinney, 2008). Our study combines the two of them trying to bring important elements about professor Voina's biography and a brief analyses of his work.

We are interested in professors "who influenced their profession by both deeds and words" (Parker, 2002, p.127), this is why this is our second article after Farcas and Tiron-Tudor in 2011 about I.N. Evian, also from the Academy of High Commercial and Industrial Studies from Cluj-Napoca.

As we could have seen in the studies at the international level it is very important the relationship between the quality of the personality as an accountant and his academic work and that the professors were activating in an international community of scholars (Carnegie & Williams, 2001).

Our hypothesis is that Professor Dumitru Voina had an important contribution to the development of the accounting and accounting education in Romania, and that he contributed to the spread of international theories and practices in the accounting field in Romania.

The study of the archives was essential for proving our hypothesis. We have seen his personal file at the Romanian National Archives and extract his personal dates. The improvements and the new ideas that he brought into accounting field in Romania could be seen only by studying his works and comparing with his contemporaries. For this reason we have read his *General accounting* and we tried to extract his most important contributions.

III. Background information

Dumitru Voina was a Transylvanian; he was born in Braşov on 2nd October 1893. After he finished the primary and secondary education in Braşov, in 1908, he attended the classes of the

Superior Commercial School also from Braşov obtaining the certificate of maturity no. 392-1910-1911 from 15 June 1911 (National archives of the state, the fund of the Academy of High Commercial and Industrial Studies from Cluj, personal file 112, paper 4).

Voina studied at the Normal Superior Institute of Commerce attached to the University from Budapest, at the University from Zürich and at the University from Paris, during 4 years, between 1911-1914 and 1916-1917, 1917-1918. These interruptions of the studies were because of the First World War when everybody was enrolled into the army. So, for the first two years of study he attended the Normal Superior Institute of Commerce attached to the University from Budapest. For the third year of study, for the first semester, he attended the Faculty of Political Science and Economics in Zürich, and for the second semester he attended the University from Paris. The fourth year of study was divided into first semester during 1916-1917 and second semester during 1917-1918, both at the Normal Superior Institute of Commerce attached to the University from Budapest.

Given the new conditions in Romania after 1918 he finishes the studies abroad and returns in Transylvania, more exactly in Cluj-Napoca, which was now part of Romania. Here he will do his PhD at the Academy of High Commercial and Industrial Studies and obtains his PhD with a very good thesis: *Phases in the evolution of the accounting*, in 19th November 1932.

His teaching career started as a provisional teacher at the Commercial School for boys from Lipova on 1st October 1919, continuing in 1920 at the Commercial School from Târgu-Mureş. Afterwards, also in 1920 he becomes professor at the accounting department, the study of commerce and commercial correspondence from the Commercial School for boys from Cluj-Napoca, till 31st August 1936.

In September 1936 he becomes permanent professor at the Commercial High School *Marele Voievod Mihai* for boys from Cluj-Napoca and also adjunct assistant at the Department of General Accounting and Banking from the Academy of High Commercial and Industrial Studies from Cluj.

Dumitru Voina started his activity at the Academy of High Commercial and Industrial Studies from Cluj-Napoca in 1934 in the pedagogical practice seminar where he was teaching commercial sciences, till 1939. After being assistant for almost six year at the Academy, in 1942 he was named associate professor of the Academy for the general accounting department and banking accounting department.

Apart of being accounting professor at the Academy, he was also the head of the accounting department (1948-1949) at the Institute of Economics and Planning from Brasov (the new name of the Academy), the Adjunct rector of the Academy of High Commercial and Industrial Studies from Cluj – Brasov (1945-1947), the director of the student cafeteria (1942-1945), president of the censor committee of the Academy (1943-1945).

Dumitru Voina's teaching activity was completed by the administrative function that he had at the General Secretariat of Education and the Directorate General of Education from Cluj between 1920 and 1922. For ten years (1923-1933) he was also inspector for the commercial schools from the country at the Ministry of Education, what helped him to see the lacks from the commercial education from Romania and also give him the legitimacy of proposing reforms in this area of education.

His recognition as an important personality and professor can be also seen in the fact that he was part of important commissions that decided about the reorganization of the commercial teaching in Romania, in the commissions which examined the applicants to the degree of Chartered Accountant.

IV. Dumitru Voina's work in the accounting field

The contribution of this professor in the development of the accounting in Romania cannot be underestimated. He wrote over 40 papers, having also studies in foreign languages (French and

Hungarian) including articles, courses, books, manuals concerning the accounting and the commercial teaching in Romania. He was also preoccupied by economical and cultural issues and by the organization of the commercial education in Romania (see annex 1).

Dumitru Voina was influenced by the German school of Nicklisch and Schär. The two authors who developed the materialist theories with two series of accounts, and who tried to demonstrated the scientific character of accounting and the primacy of human resource related with computing (Horomnea, 2006).

His first important work in the accounting field was his PhD thesis, *Phases in the evolution of accounting*, 1932. This book made him a pioneer of accounting in Romania, because it is the first work of accounting history written in Romania in which he structured the periods in the accounting evolution during the time in an international context. In this book Voina also noted that the subject of accounting included elements provided by different types of organizations that are not included in economic functions. The result was that the object of accounting was not just for the private sector but also for public budgetary institutions as we mentioned in our paper Fărcaş and Tiron-Tudor, 2011.

All his works brought significant elements in the accounting education, but his *General accounting course*, wrote in three volumes (1937, 1938, 1944) was his masterpiece. The first two volumes were used as manuals in the commercial schools. The last volume is the most complex and it is extended to all accounting sectors. In this book he develops the legal-economic theory. According with Dumitru Voina's conception, the account is defined as "a means of calculation to determine the status of the initial and successive movements of an asset or liability" (D. Voina, 1947).

V. General Accounting

In his *General Accounting*, Voina reached all the areas of accounting and explains from the most basic things like the differences between the meaning of the term *exploitation*, the types of exploitations and also the differences between *exploitation* and *enterprises*, what assets and liabilities are, and going to complex accounting operations, the theories of the balance sheet and the theories of accounts.

Dumitru Voina was part of the first professors in Romania who founded and helped develop accounting in our country. At that time, even at an international level, accounting was not considered still an independent science and important researchers and writers were trying to demonstrate the scientific character of accounting, between them was also Voina.

In the first part of his work professor Voina stated for the explanations and definitions that in the end will proof that accounting is not only "an arithmetic" part of the science economy of the enterprise. Trying to evidence the difference between economy and accounting Voina gives the definition of social economy as being the study of the big "economic body" and the study of commercial enterprises being the study of the economic phenomena in an enterprise.

He is not approving that accounting was included in the study of economy enterprises and was considered only an "arithmetic addition of the science economy enterprises" (Voina, 1947, p. 16). He argues that the accounting is an independent science and discipline: "Existing stock movements impose throughout the intervention of accounting and constitute the very fabric that is subject to accounting processing…" (Voina, 1947, p. 14)

This professor it has underlined very well and with strong and logical arguments the fact that the accounting is not part of the science of economy enterprises and that is an independent science (Voina, 1947, p. 23). In the same time D. Voina criticizes the affirmation of his contemporary, professor Evian, that "the accounting is an art, a technique", and also the patrimonial theory, that the accounting is part of the juridical disciplines, or that the accounting is being part of the mathematics only because it has equality for the balance sheet formula.

Voina sustains the scientific character of the accounting and says that no theory remains forever, any theory at some point will not be relevant and will let the place for another. Accounting is a science because it "works for the knowledge and representation of value movements, with objective methods" (Voina, 1947, p. 21), it has theories and principles, not only evidences.

Going further Voina explains the differences between *accounting and accounting techniques,* so that *accounting* means principles, theories, rules and *accounting techniques* are "procedures for practical application of useful principles which governs the numerical expression of values" (Voina, 1947, p.18). In his vision accounting is searching to find the correct calculation of costs, for producing more with lower costs, trying to find the economic efficiency. This is why he speaks about accounts sector, costs calculation, compared calculation (statistics), preliminary calculation (budgetary).

Voina is trying to explain the important terms that were used in accounting so he said that the term **resources** means the capital (equity + foreign), the **assets** are not only the fortune of a company and not all that has its fortune and the **liabilities** are not composed only from capital, how some of his contemporaries were sustaining. He explains that for starting the accounting of an economic entity we begin with doing the inventory and after that forming the initial balance sheet. The modifications of the assets and liabilities were shown in a snapshot (*tablou sinoptic*), presented by the German R. Breuer.

In his approach to show that accounting is a science he presents the balance sheet theories and the theories of accounts. For the balance sheet there were Walter le Coutre's theories, which professor Voina exposed and explained that the role of these theories is to explain the scope of the balance sheet.

Like his colleague and contemporary, professor I.N. Evian, Voina considers to develop the subject of the theories of accounts in his book, because he says that these theories helps to the understanding of the accounting (Voina, 1947, p. 401). He exposes and comments the theories of accounts, the personalist theories and the materialist theories. He considers for the materialist theories with one series of accounts that the most evident is Berliner's theory and he says that the difficulty of this theory is the way of how the losses and the expenses are treated as parts of the fortune. He says that the fact that an expense is considered part of the fortune is fine but not when it comes to losses.

He goes one and presents the materialistic theory with two series of accounts, mentioning Hügli, Kurzbauer, Augspurg, Nicklisch and Schär. The theory of Hügli and Schär was developed in our country by Professor I.C. Panţu.

For the Romanian authors Voina, mentions Evian, Spiridon Iacobescu and Alexandru Sorescu. Evian was the one that tried to build a theory of accounts in Romania based on Nicklisch's theory. Evian's theory was more contested in those times and Voina was also one of the contestants, together with Iacobescu and Sorescu. He considers that Evian's accounts theory is making confusion between the active with the fortune and the liabilities with the capital. He accuses Evian that his explanations are not having a scientific fundament and that are base on fiction.

Conclusions

The brief presentation of professor's Voina scientific and academic activity can show that he really was an important actor in the development of accounting and accounting education in Romania. He wrote books and courses that were used in commercial schools.

In the end we can say that he actually was a man of "deeds and words" because he actively contributed to the reforms in the commercial education in his period. He had functions that can show that he was a capable and appreciated professional and professor. Also the remarks that were found in the archives are showing the fact that his work was appreciated.

The analyze needs to be extended also to his PhD thesis. For sustaining our hypothesis we will need to analyze others professor's works from those times for having a clear imagine of his contribution. With this article we are making an introduction in professor's Voina work.

COURT OF AUDITORS – THE ASSESSMENT OF INTERNAL CONTROL SYSTEM IN THE PUBLIC SECTOR IN ROMANIA. CASE STUDY BIHOR COUNTY

Gherai Dana Simona
University of Oradea, Faculty of Economics

Țara Ioan Gheorge
University of Oradea, Faculty of Economics

Since resources in the public sector generally represent public money and their use in the public interest generally requires special care, the significance of safeguarding resources in the public sector needs to be underlined. The public romanian sector is characterized by an descendant trend of public resources, limitation of expenses and new risks horizons, this is way the ability to anticipate threats or opportunities is the most important objective of internal control sistem. The internal control is a dynamic process which continuously adjusts to the changes faced by an entity, with the direct involvement of the management and staff at all levels of the organization, to identify and address risks and to resonably ensure that the entities' mission and the general objectives have been fulfilled. Regardless of the nature or the size of entities, the efforts given by the application of internal control are much related to the implementation of good practices, monitoring, evaluation, adaptation and updating of their implementation.
Which is the level and the current state of the system of internal control in the Romanian system? Do we understand and respect the notion of Public Internal Financial Control? To all these questions we try to answer in this paper, primarily through the presentation of general principles and objectives of the internal control and analysis of the report to the Bihor Board of Auditors for the year 2010. As a result of the study, a number of flaws and errors revealed, both of organization and coordination, in order to be able tooffer some measures of solving the developed.
Keywords: external public audit, internal control, public sector, risk.
JEL: M42, M48.

Internal control sistem

Making a brief introduction into the financial scandals we observe, during '90s, a series of financial scandals which have revealed a behavior without ethics and transparency of those who led large companies. Unfortunately, the history is repeated from certain points of view and even though, during the 2000s, enters into discussion the concept of corporate governance, which are the mechanisms by which a company must be led and controlled, we are dealing with one of the biggest financial and economic crisescaused by the global impact that some organizations' business had had.

These series of events have not bypassed the public sector which owns a significant portion of the economy and drew the attention upon managers and professionals and upon the professionalism with which it is run and regulated the economic activity.

The definition for internal control given by the INTOSAI GOV 9100: is an integral process that is effected by an entity's management and personnel and is designed to address risks and to provide reasonable assurance that in pursuit of the entity's mission, the following general objectives are being achieved:
- executing orderly, ethical, economical, efficient and effective operations;
- fulfilling accountability obligations;
- complying with applicable laws and regulations;

- safeguarding resources against loss, misuse and damage.

Internal controls in the public sector have a strong impact on the credibility of the Government and of the operations carried out. Internal control standards provides a mechanism by which you can obtain reasonable assurance that assets are safeguarded,financial reporting is reliable and financial transactions comply with the ethical aspect.

In the legislation of Romania, internal control is defined as all forms of control exercised at the level of the public entity, including internal audit, established by the managers in accordance with its objectives and legal regulations, to ensure the management of public funds economically, efficient and effective; it also includes the organizational structures, methods and procedures.

The internal control in public sector organizations must be understood in the light of their specific features, such as:

- achievement of social or political objectives;
- how to use the public funds;
- the importance of the budgetary process;
- public sector managers responsible for the implementation of the internal control system.

Internal control is a dynamic process that is continuously adapting to the changes an organisation is facing, is not one event or circumstance, but a series of actions that permeate an entity's activities. Management and personnel at all levels have to be involved in this process to address risks and to provide reasonable assurance of the achievement of the entity's mission and general objectives.

The internal control system is intertwined with an entity's activities and is most effective when it is built into the entity's infrastructure and is an integral part of the essence of the organisation.

According to the *Guidelines for Internal Control Standards for the Public Sector* (INTOSAI GOV 9100), internal control consists of five interrelated components, namely:

Control enviroment,

Risk assessment,

Control activities,

Information and Communication,

Monitoring.

The *control environment* is the foundation for the entire internal control system. It provides the discipline and structure as well as the climate which influences the overall quality of internal control. It has overall influences on how strategy and objectives are established, and control activities are structured.

Having set clear objectives and established an effective control environment, an *assessment of the risks* facing the entity as it seeks to achieve its mission and objectives provides the basis for developing an appropriate response to risk.

 The major strategy for mitigating risk is through *internal control activities*. Control activities can be preventive and/or detective. Corrective actions are a necessary complement to internal control activities in order to achieve the objectives. Control activities and corrective actions should provide value for money. Their cost should not exceed the benefit resulting from them (cost effectiveness).

Effective *information and communication* is vital for an entity to run and control its operations. Entity management needs access to relevant, complete, reliable, correct and timely communication related to internal as achieve its objectives.

Finally, since internal control is a dynamic process that has to be adapted continuously to the risks and changes an organisation faces, *monitoring* of the internal control system is necessary to help ensure that internal control remains tuned to the changed objectives, environment, resources and risks.

These components define a recommended approach for internal control in government and provide a basis against which internal control can be evaluated. These components apply to all aspects of an organisation's operation

Internal control is designed to provide reasonable assurance regarding the achievement of the General objectives of the institution. That is why goals clearly set out by the heads of the appropriate entity of the budget and planning, is a *sine qua non* condition for an effective internal control.

Achievement requires the identification, knowledge and taking risks. As with INTOSAI GOV 9130, the risk management purpose entity is to allow the management of an entity to identify the element of uncertainty on achieving the established targets and the risk associated with it, i.e. in terms used in the public sector, to provide more efficient, economic and effective services, and to take account of the values, such as equity and justice. The risk may be regarded negatively, uncertainty, obstacle or threat, or in the positive sense of opportunity.

Research methodology
Our research has as objective to understand the internal control sistem in the public sector entities in Romania, in respect of the current economic situation and international directions on the field.

The basis of the study consists in a synthesis of the ideas published on the topic, the regulations issued by the national and international accounting regulators. We have try to analyse the proces of internal control and we have used a fundamental research method identifying in the public sector from Bihor county the entities that have non-implemented internal control system or have not organised internal audit.

Chamber of Accounts in the Bihor County
In 2009, at a conference organized and hosted by the European Commission in Brussels, the main debated problem was about the Public Internal Financial Control (PIFC), stressing that after accession many of the 12 new EU member countries, namely the harmonization of their central units, did not continue to develop their PIFC, although they were compelled. Therefore, the European Commission has recommended that the supreme audit institutions should intervene promptly by assessing the progress of implementation in their own countries of PIFC and to leverage the ongoing development and with greater efficiency.

So in accordance with the schedule approved by the Plenum of the Court of Auditors of Romania for 2011, TheBihor Board of Auditors was carrying out the statutory audit competency to a total of 366 local subordination of entities managed to plan and to realize territorial administrative units at the local level, a number of 41 actions: 36 actions on financial audit of accounts run concluded in 2010 and 5 control shares, which represents a degree of coverage of 11,20% of total subordination to local entities.

Organizational, economic and administrative structures, subject to check are:

Source: Local pubic finance report for the year 2010, the Bihor county.

In the purpose of objective financial audit resulted in the general expression of opinion of the audit was to obtain assurance on the management of the assets of the entity and on the drawing up in accordance with the financial reporting framework practicable in Romania of the financial statements.

In the context of the verification activity, in order to achieve the general objective of the statutory audit, the external public auditors had in view the manner of organization, implementation and maintenance of management systems and internal control (including internal audit) to entities audited.

Within the framework of the activities of the Board of Auditors have rated Bihor control systems and internal audit, and the result of analysis performed, the irregularities noted deficiencies have been found to all the entities audited with a crash that caused, particularly, the existing of disfunctionalities in the organization and internal control.

So with regard to these deviations from the normative acts in force we noted:

-**non-implementation and failure in full forms of internal control system** in a number of 20 entities through the fact that policies and procedures for protecting against fraud losses of entities, irregularities and errors for administering public funds economic, efficient and effective. Also, lack of their own internal control rules caused the assessment by the auditors of a high risk control and granting of 14 qualifying satisfactory and unsatisfactory.

- **failure of preventive financial control** to a number of audited entities 15 on all operations that affect public funds and assets of public entities. what lead to the impossibility of identifying the

projects of operations which do not meet the conditions for legality and regularity and its performance on the basis of administrative documents are incomplete without the speedy \"general framework of operations subject to proper preventive financial control\" and \"documentary Circuit controlled preventive financial\". There have been a number of cases in which even though it was organized preventive financial control, it has not achieved the goal that has not been ensured a systematic check of operations subject to preventive financial control from the point of view of compliance with all legal provisions that were applicable, in effect on the date of the operations.

There have been recorded situations in which preventive financial control has not identified the projects operations which do not meet the conditions for legality and regularity and/or, where appropriate, employment in the destination budget appropriations and commitment and whose conduct has harmed the public heritage and/or public funds.

- **non-organization of the internal audit** by most of the territorial administrative units checked (in particular the commune) in accordance with the provisions of art. 9 of 672/2002, although they ran an annual budget of over 100,000 euros, so not eligible to be classified in the category of small public institutions as defined in the Law 672/2002 and, therefore, internal audit cannot be ensured by the engine's internal public audit of the Ministry of Public Finances.

Following the checks carried out at four officers tertiary credits it was found that they do not have organized the work of internal audit, being carried out by the internal audit compatimentele organized at the level of senior officers to whom loans are subordinate to the U.A.T. and U.A.T. County Bihor Oradea. Due to the low number of these compartments are Auditors, but unable to carry out regular tasks, in order to identify significant risks and deficiencies may affect the objectives, the activities and resources of the establishment, to provide the security of a real images and legal heritage.

Conclusions

Not being organized internal audit, management institutions are not offered on the proper management of public revenue and expenditure, there is no possibility to improve their activities and are not supported in fulfilling their objectives through a systematic and methodical approach to evaluate and improve the efficiency and effectiveness of the management system based on risk management, control and governance processes.

Framework of analysis and the Reports on the internal audit programmes for 2010, drawn up by the authorising officers who had organized the internal audit, it was found that in general this activity was carried out in outsourced system, which proved to be largely ineffective.

Reports produced in these cases are of a purely formal audits being more oriented towards a fund manager controls than towards a genuine internal audit to serve both entities in order to achieve an efficient management and the Board of Auditors as a source of information on the audits carried out.

In conclusion, in order to reduce the risk of new errors in the work of the units it is necessary to implement the system of internal control, management and development of clear procedures for all activities carried out within the framework of the entities and the identification and management of risks.

In view of the small number of staff, entities could opt for similar cooperation with other entities, to organize and exercise-control activities, audit, inspection, on the principles of efficiency, effectiveness and lower in furtherance of the duties established by law and local public administration authorities.

One of the main causes of the Organization and the exercise of preventive financial control, lacking is the lack of specialized personnel and poor skill of the latter, in particular in the case of the municipal territorial administrative units, which resulted in non-compliance with the provisions of law No. 119/1999 concerning internal control and preventive financial control, in

terms of separation of preventive control of those driving the bookkeeping or participate in the performance of economic and financial operations.

INTERNATIONAL RESEARCH REGARDING CREATIVE ACCOUNTING

Groşanu Adrian
„Babeş-Bolyai" University, Faculty of Economics and Business Administration

Răchişan Paula Ramona
„Babeş-Bolyai" University, Faculty of Business

Berinde Sorin Romulus
„Babeş-Bolyai" University, Faculty of Business

Although creative accounting practices are not at all recent, only since 2000 this phenomenon has been widely publicized because of the financial scandals that had erupted worldwide. Obviously, creative accounting practices came to be used with nonchalance at enterprise level, irrespective of their size or the industry within which they operate, fact that appears from different studies undertaken globally in recent years.Even though there are many studies based on the creative accounting phenomenon and on other subjects deriving from it, we considered both interesting and necessary an analysis of the articles that tackle different aspects concerning creative accounting, published after 1990 until now within the highest rated journals in the field of accounting.
The main objective of this study is to identify the main research areas in order to emphasize the main existent shortcomings and to outline possible solutions concerning future research directions in this field. Of course, from this main objective derive a few sub-objectives which we will try to achieve by means of the quantitative study.
The quantitative study is based on the analysis of researches performed in the filed of creative accounting and its aim is to observe their evolution within the concerned period of time, to analyze the main research directions approached, but also to study the predominant research current and the main type of research applied. Moreover, within this stage we have also analyzed the geographical areas on which the studies performed within the selected articles were based. The present study is far from being exhaustive, but it surely represents a starting point and an informative source for future research in the field of creative accounting.
We may conclude that most of the researches conducted within the creative accounting field fall within the main research current, which in our case is positivism. Concerning the type of research, we can observe that the vast majority of articles are of empirical nature, but many theoretical studies have also been published.

Keywords: creative accounting, corporate governance, true and fair view, creative accounting techniques, research current

JEL Classification: M40, G34

I. Introduction

Taking into account that we live in a world where almost everything can be sold and bought, where the resources decrease with every passing day while population needs are continuously increasing, we cannot live without accounting. 'The main objective of accounting regulations is to obtain a true and fair view upon the enterprise's financial position and its performances, so that the information to be sufficient, accurate and reliable for all users.' (Puşcaşu 2010: 327). Nonetheless, accounting, whose purpose is believed to be the representation of organizational reality, suffers from the ambiguity of its condition, and therefore the users of accounting information are often deceived by the performance of managers or directors. Everything is based on the 'skill and imagination of the operator' that uses the knowledge and experience in the field combined with an optimal dose of ingenuity, but also the gaps within legislation in order to make certain arrangements resulting in profit maximization or earnings per share maximization, in

order to improve the company's image and liquidity, or simply to reduce costs or debt ratio. All these accounting tricks are just some of the techniques used by accounting professionals and even managers, often in collaboration with auditors, to create the desired image of the company. In this case we speak of *creative accounting* practices, a phenomenon that has developed with predilection after the 80s, leading to real conflicts between the legal and economic substance of accounting. Considering that since the late nineteenth century we have been both witnesses and actors in a process of business globalization, we have witnessed various changes and rapid developments in most activity branches, which had significant implications and influences on economic and financial spheres, this context leading to the urgent need of continuous information. Despite the fact that companies have multiple sources of information at hand, accounting information is, however, the most important source of information concerning accounting activity, which is used by both managers and directors, and other categories of stakeholders such as investors and creditors.

We consider that certain aspects of the creative accounting sphere are current issues for the Romanian economy, especially when the creative accounting practices can have a negative effect on companies' long-term performance and may mislead some categories of stakeholders such as investors, creditors or shareholders, whose decisions rely on an accurate information concerning the financial and accounting statements.

II. Research methodology

In order to carry out the proposed literature review and also to achieve the objectives set out above, we went over a number of five stages which will be briefly described below.

The first stage consisted of selecting the journals which represented the searching base of the most relevant articles concerning the topic covered by the study performed. As a result of this analysis we selected 14 international accounting journals, 9 of which are ISI indexed journals. *The second stage* consisted of selecting the articles published during 1990-2010 within the journals chosen for the study. The search was performed according to the following keyword 'creative accounting'. *The third stage* consisted of the actual selection of the articles relevant for the study, eliminating from our database the articles that refer to other aspects concerning accounting and those that fell outside the previously established period of time (1990-2010). The next step in this stage was represented by a brief analysis of the sample of selected articles, which after this stage was reduced to 57, from which 35 (61.4%) were published in ISI indexed journals.

Table 1. Journals selected and the articles corresponding to each publication

No. Crt.	The name of the international journal included in the study	No. of articles
1.	Critical Perspectives on Accounting (CPA)	14
2.	Abacus – A Journal of Accounting Finance and Business Studies (ABA)[ISI]	12
3.	Journal of Business Finance & Accounting (JBFA) [ISI]	10

14.	Accounting Forum (AFo)	0
	TOTAL	**57**
	From which ISI indexed journals	**35**

Source: Made by the author

Stage four consists of a detailed analysis of the 57 articles selected from the above mentioned publications, the aim being to identify the main lines of research they cover. Therefore, we made a classification of 10 research topics which will be presented below. Thus, we followed the main issue covered within each article, some of which can be included in several of the 10 research topics. Moreover, an important step in this stage was to determine the research current of each article, the type of research used, but also the geographical area on which the study focuses. Regarding the *main topic covered*, we identified the following research directions: true and fair view, financial reporting, corporate governance, creative accounting techniques, consistency or inconsistency of accounting standards, ethical behavior within companies, financial scandals: prevention measures and control solutions, information asymmetry: managers versus stakeholders, audit independence, reform of accounting. Concerning the *research current* we identified: the main research current (positivist) and the alternative research current (critic or interpretative). Finally, the *geographical area* is an aspect we have pursued within our analysis, which helped us identify the following main areas the studies focused on Australia and New Zeeland, Great Britain, United States of America, Canada, Asia and Europe (except Great Britain). *The fifth stage* is closely related to the previous stages, also within this stage we interpreted results obtained, drawing, thus, some conclusions concerning the aspects observed during the study, but also the objectives we proposed to achieve.

III. Results and discussions

3.1. The development of international research concerning creative accounting

Within this quantitative analysis, the first feature that we focused on was the article's *year of publication*, a relevant issue in determining the development of international research concerning creative accounting during the analyzed period (1990-2010). After analyzing the articles from the 14 international journals, we have noticed that the number of articles did not vary significantly from one year to another, but there is the situation in which in some years one has not published any relevant articles on the theme concerned (1990 and 1997). We noticed that the largest number of articles is published in 2006 (6 items), and at the opposite pole is, of course, the year 1997, when no articles have been published. It is worth mentioning that the researchers' interest for this subject related to creative accounting increased after 2000, when the largest financial scandals burst, scandals which were based including on creative accounting practices. Thus, before 2000, 18 articles have been published (31.5%), and from 2000, including, 39 articles have been published (68.5%).
Figure 1. The development of international research concerning creative accounting

3.2. The main research directions in the field of creative accounting

The second feature that we considered important in conducting this study is the **main topic** covered by the articles from the selected sample. There were 10 main themes which will be briefly described, mentioning the number of articles that belong to each theme, emphasizing, at the same time, the degree of importance that researchers have granted to these issues. After analyzing the 57 articles from the sample selected, we identified 10 research areas: **t**rue and fair view, financial reporting, corporate governance, creative accounting techniques, consistency or inconsistency of accounting standards, ethical behavior within companies, financial scandals: prevention measures and control solutions, information asymmetry: managers versus stakeholders, audit independence, reform of accounting. In what follows, we will reflect the distribution system of the articles from the analyzed sample according to the research themes they approached concerning the creative accounting phenomenon.
Figure 2.: Article distribution according to the research themes concerning creative accounting

Source: Made by the author

By making an analysis based on the above figure we can notice a high interest of the researchers for the *creative accounting techniques*, this theme being covered by 10 (17.55%) of the articles in the sample. Aspects related to the *consistency and inconsistency of the accounting standards* and to *corporate governance* were also dealt in a large number of articles, on each of these two themes identifying 8 (14.03%) relevant articles for the concerned period. Topics related to *financial reporting* and *financial scandals* were analyzed within 7 (12.28%) articles each. Further, *true and fair view* and *audit independence* were covered by a number of 6 (10.52%) articles each. The chart also reveals a lower interest manifested by the researchers for the topics related to *ethical behavior within companies*, *information asymmetry between managers and stakeholders* and also for *accounting reform*, each one of these themes being found in 2 articles (3.5%) of the analyzed sample. Overall, one can notice a relatively balanced concern for all research themes since there is no great difference between the number of items corresponding to each line of research.

3.3. The dominant research current

Before discussing the research currents within which the analyzed articles fall into, we must point out that, over time, researches conducted in the field of accounting were recorded in different research currents, starting with the *normative* current, and subsequently focusing on the *positivist* current. If we refer to the main research current, it is noticeable the shift from the normative current – which does not involve hypothesis testing and it relies primarily on reasoning and promotes subjective thinking – to the positivist current which appeared, in fact, as a response to the criticism brought to the normative current, and it focuses on the experimental testing of theories and the exposure of accounting practices through empirical approaches. As a result of the dissatisfaction with the limits of the positivist current, one registered an increased focus on alternative currents, such as *interpretative* and *critical*. More than 90% of the analyzed articles

fall within the positivist current, while the articles that fall within the alternative currents are clearly less with a share of only 7.6%.
Figure 3.: Article structure according to the dominant research current
Source: Made by the author

3.4. Type of research

In order to obtain a more complete quantitative study, we considered necessary to analyze the type of research concerning creative accounting used at international level. Firstly, it is important to delimit the two great directions within which the researches in the accounting field fall into, namely: researches of *theoretical* and *empirical* nature. According to this classification we divided the articles into two categories: 68.42% of the articles are of empirical nature, while 31.58% are of theoretical nature. We can notice here the same shift of supremacy, from a theoretical approach to an empirical approach, respectively from a qualitative to a quantitative research. These results are justified considering that before 2000 (when the burst of the financial scandals brought the creative accounting practices to the researchers' attention) the researches were predominantly theoretical. Thus, after the year 2002 (the collapse of Enron), researchers have focused on testing previously formulated hypotheses, relying more on implementing specific methods and techniques for data collecting and processing.
Figure 4.: Article structure according to the type of research used
Source: Made by the author

3.5. The analyzed geographical area

Taking into account that more than 60% of the analyzed articles rely on empirical research, we considered relevant to examine the geographical areas on which they focus; therefore, we chose Australia and New Zeeland, the United States of America, Great Britain, Europe (except Great Britain), Canada and Asia as the representative geographical areas of the current study.
Figure 5.: Article structure according to the geographical area
Source: Made by the author

As reflected in the figure above, most empirical studies analyze the creative accounting practices from Great Britain (12 articles – 30.77%), followed closely by those from the Australian territory (11 articles – 28.2%), Europe (8 articles – 20.51%), United States (5 articles – 12.82%), Asia (2 articles – 5.14%) and Canada (1 article – 2.56%).

IV. Conclusions

We may conclude that most of the researches conducted within the creative accounting field fall within the main research current, which in our case is positivism. Concerning the type of research, we can observe that the vast majority of articles are of empirical nature, but many theoretical studies have also been published. After analyzing the articles according to the geographical area, we found that most empirical studies focused on Great Britain (or a parallel between Great Britain and the United States), Australia or Europe (except Great Britain). Our analysis revealed that the United States are occupying only the fourth rank, but, in our opinion, this did not happen because there were not enough studies focusing on this geographical area, but because the selection of the articles was made according to the keyword *creative accounting*, which is a term used mainly in Europe and Australia, while the term mostly used in the US is *earnings management*.

SOME APECTS REGARDING THE CONSOLIDATED FINANCIAL STATEMENTS

Hada Teodor
"1 Decembrie 1918" University, Alba Iulia

Szora Atila Tamas
"1 Decembrie 1918" University, Alba Iulia

The study is divided into four parts: in the introduction are presented the theoretical aspects of the consolidated financial statements and the consolidation methods. During the second part are shown the structure rates calculated prior and after the consolidation, and in the third are calculated the financial rates of return and the effective tax rates of fixed assets. The conclusion of this study presents that although the consolidated entity is not a tax, it presents the group effort without the internal flows between entities within the group.
In terms of the world scientific research typology used by the authors, it refers to descriptive research, explanatory research and applied research.
In terms of the novelties, brought by this study, it is specifically determined, based on the actual database, the evolution of structure indicators, indicators of balance, the financial profitability indicators of corporate companies prior to and after consolidation.
Key words: Consolidation, financial statements, rates structure, working capital, Return on equity.

1. Introduction

International Accounting Standard Board in paragraph 6 of the Framework for the preparation and presentation of financial statements reads: "The framework refers to general purpose financial statements, including consolidated financial statements."

Standards governing the consolidated financial statements are: IAS 27 "Consolidated and Separate Financial Statements", IAS 28 "Investments in Associates", IAS 31 "Interests in Joint Ventures" and IFRS 3 "Business Combinations".

In terms of performance the need to prepare the financial statements is given by "the opportunity to evaluate better the management performance of parent company because in the case of the consolidated accounts, the group's total earnings could be compared with its total assets, thus being estimated the return on capital employed by the group over the period". Also the consolidated financial statements avoid the increase of turnover by intra-group sales and thus determine actual profit at the level of parent company.

The basis for preparing consolidated financial statements is the individual financial statements of Group companies where will take place reclassifications, homogenization and restatements of financial statements subjected to the group.

The Consolidation itself is made by one of the three well established methods: global integration, proportional integration and equivalent commissioning.

As follows:

"-Global integration, where the control of the group on the consolidation company is exclusive;

- Proportional Integration, when control of a company included in scope of consolidation is shared with other shareholders / associates outside the group;

- The equivalence, if and only if there is a significant influence from the part of the group over the company to be consolidated".

Because in the case study which we present, the consolidation has been made through the global integration method, we herein point out the stages to be followed:

"-The accrual of the balance sheet and the receivable and payable accounts of the subsidiary with those of the parent company;

- Elimination of mutual transactions and internal results;
-Elimination of the shares held by the parent company in the subsidiary's equity, operation which determines the separation of its equity into the share for shareholders / minority shareholders and the share for the group, found in the form of consolidated reserves and consolidated result;
- Preparing and presenting consolidated financial statements".

2. Calculation of structure indicators
In the study presented below we used real data from a company, the consolidation being performed by a specialized company.

Table 1: Balance sheet structure after consolidation

Indicator	N	N+1
Fixed assets	81,113,507	75,843,914
Current assets	96,985,468	111,889,181
Advance payments	0	0
Total assets	178,098,975	187,733,095
Home Equity	46,703,390	82,457,692
Current liabilities	68,990,595	55,638,727
Long-term liabilities	57,247,355	45,459,658
Revenue	5,157,635	4,177,018
Total liabilities	178,098,975	187,733,095

2.1. Rates of the asset balance sheet structure
Table 2: Calculation of the structure of balance sheet assets prior to consolidation

Indicator	Parent company		Beta company		Gamma company	
	Year N	Year N+1	Year N	Year N+1	Year N	Year N+1
1. The rate of fixed assets $\left(\dfrac{Active\ imobilizate}{Total\ activ} \times 100\right)$	42.17	34.77	25.70	35.21	71.85	60.54
2. Rate of current assets $\left(\dfrac{Active\ circulante}{Total\ activ} \times 100\right)$	57.83	65.23	74.30	64.79	28.15	39.46
TOTAL	100.0	100.0	100.0	100.0	100.0	100.0

Source: processing by author

Table 3: Calculation of structure rates of balance sheet assets following consolidation

Indicator	N	N+1
1. The rate of fixed assets	45.54	40.40
2. Rate of current assets	54.46	59.60
TOTAL	100.0	100.0

Source: processing by author
Following the consolidation during the period N+1, the rate of fixed assets decreased compared to N period to the detriment of current assets.

2.2. Rates of liabilities prior to consolidation
Table 4: Calculation of structure rates of liabilities prior to consolidation

Indicator	Parent company		Beta company		Gamma company	
	Year N	Year N+1	Year N	Year N+1	Year N	Year N+1
1. Overall borrowing rate $\left(\dfrac{Datorii\ totale}{Total\ Pasiv}\times 100\right)$	68.38	51.11	74.34	76.67	129.16	125.19
2. Current debt rate $\left(\dfrac{Datorii\ curente}{Total\ pasiv}\times 100\right)$	3262	23.19	74.34	76.67	93.42	119.43
Term debt rate $\left(\dfrac{Datorii\ pe\ termen\ lung}{Capital\ permanent}\times 100\right)$	53.07	36.34	0	0	542.95	-29.68
Rate of global financial autonomy $\left(\dfrac{Capital\ propriu}{Total\ pasiv}\times 100\right)$	31.62	48.89	25.66	23.33	-29.16	-25.19
Rate of term financial autonomy $\left(\dfrac{Capital\ propriu}{Capital\ permanent}\times 100\right)$	46.93	63.66	100.0	100.0	-442.95	129.68
Rate of financial stability $\left(\dfrac{Capitaluri\ permanente}{Total\ pasiv}\times 100\right)$	67.38	76.81	25.66	23.33	6.58	-19.43

Source: processing by author

Table 5: Calculation of structure rates of liabilities following consolidation

Indicators	N	N+1
1 Overall borrowing rate	73.78	56.08
1.1. Current debt rate	38.74	29.64
1.2. Term debt rate	57.20	37.58
2.1. Rate of financial autonomy	26.22	43.92
2.2. Rate of term financial autonomy	42.80	62.42
3 Rate of financial stability	61.26	70.36

Source: processing by author

In terms of liabilities the rates following the consolidation dropped during N+1 to: global borrowing rate, the rate of current debt, term debt rate at the expense of the financial autonomy, financial autonomy term rate and the rate of financial return which saw increases.

2.3. Balance indicators: Working capital and net assets
Table 6: Balance indicators: Working capital and net assets prior to consolidation

Other taxes not included above	766,346	910,205
Tax profit	24,979,246	2,655,356
Profit/ Net loss	27,041,572	32,579,737
Profit or Loss for the fiscal year related to entities	477,767	-2,022859
Profit or Loss for the fiscal year related to parent company	27,593,378	35,582,812
Profit or Loss for the fiscal year related to interest	-1,031,573	-980,216

Source: processing by author

Net profit increased following consolidation during the period N +1 compared to N with 20.48%. From the above data results that the consolidated profit is determined by the relationship: profit or loss for the financial year related to the parent company plus the profit or loss for the financial year related to integrated entity plus the profit or loss for the financial year related to minority interests. Thus, we have for year N: 27,593.378 + 479,767 – 1,031,573 = 27,041,572 and for N+1: 35,582,812 – 980,216 – 2,022,859 = 32,579,737 that is, in both cases the consolidated net profit is smaller than that of the parent company for both the previous and current year.
We will determine, in this situation, the indicators of financial performance as follows:

3. Financial Rates of Return

Table 11: Financial Rates of Return

Indicators	N	N+1
	Parent Company	Parent Company
Financial return after consolidation $Rf = \dfrac{\text{Profit net}}{\text{Capitaluri proprii}} \times 100$	$\dfrac{27.041.572}{46.703.390} \times 100$ $= 57{,}90\%$	$\dfrac{32.579.737}{82.457.692} \times 100$ $= 39{,}51\%$
Return on fixed assets after consolidation $Rai =$ $\dfrac{\text{Profit net}}{\text{Active imobilizate totale}} \times 100$	$\dfrac{27.041.572}{81.113.501} \times 100$ $= 33{,}34\%$	$\dfrac{35.582.812}{75.843.914} \times 100$ $= 46{,}92\%$

Source: processing by author

Financial return after consolidation during the period N+1 was lower against the same period N due to the increase of equity compared to the base period. Return on fixed assets after consolidation increased during the period N+1 compared to period N due to a decrease of fixed assets value during the period N+1 compared to period N.

4. Conclusions
From the above we conclude that although the consolidated financial statements are not an entity tax they are mandatory and useful for certain category of companies by eliminating internal flows at the group level.

ENVIRONMENTAL REPORTING AND SHAREHOLDER STRUCTURE IN THE CASE OF ROMANIAN COMPANIES

Ienciu Ionel-Alin
Babeş-Bolyai University, Faculty of Economics and Business Administration

Because environmental reporting remains voluntary on an international scale, there are major difference in terms of quality and quantity of environmental information, reported by entities from varied sectors and countries. The literature identifies factors like public exposure, entities legitimacy, laws and regulation, characteristics of the company (management, size, profitability etc), culture as the main factors that could determine environmental reporting (Lee and Hutchinso, 2005). Within this study, I have focused on environmental reporting and I have analyses factors related to corporate governance characteristics, such as shareholder structure, in order to identify the existence of certain associations between the shareholder structure and the level of environmental reporting. The paper represent an empirical analyzes on how shareholder structure might explain the level of environmental reporting in the case of Romanian companies listed at Bucharest Stock Exchange. The sample consist in 64 entities listed at Bucharest Stock Exchange in the first, second and third tier from 10 areas of activity that may impact the environment: agriculture, forestry and fishing; the extractive industry; the manufacture industry; production and supply of electricity, thermal energy, gas, water; water distribution, sanitation, managing waste, recyclable materials recovery activities; construction; transport and storage; food industry, hotels, restaurants; the repair, retail, maintenance and installation of machinery and equipment; printing and reproduction of recorded media. I suggest a model comprising shareholder structure: percentage owned by families, percentage owned by institutional investors, percentage owned by private investors, percentage owned by foreign investors, percentage owned by board members, percentage owned by management members as factors that could explain environmental reporting. As future research we will test this model on companies listed with the London Stock Exchange. I conclude that the presence of foreign shareholders help increasing transparency maybe because they are more expose to the public and maybe because foreign investors need more relevant information's regarding environmental performance. Companies where the percentage of the shares owned by the state is higher report more on environmental aspects maybe because the state wants to give examples of good transparency. The paper contributes to the development of the research in the field of environmental reporting and corporate governance in the case of Romanian companies and shows that foreign ownership and state ownership influence the level of environmental disclosure.

1. Introduction

Environmental reporting represents a tool for providing environmental information to the stakeholders and to reflect environmental performance and companies concerns on environmental issues (Shearer, 2002). Because environmental reporting remains voluntary on an international scale, there are major difference in terms of quality and quantity of environmental information, reported by entities from varied sectors and countries. The literature identifies factors like public exposure, entities legitimacy, laws and regulation, characteristics of the company (management, size, profitability etc), culture as the main factors that could determine environmental reporting (Lee and Hutchinso, 2005).

Regarding Romania, there is, so far, no legislation in this area, requiring companies, listed or not at the capital market to provide stakeholders separate reports or specific information relating to the environmental impact.

Ienciu et al. (2011) reflecting the quality of environmental information voluntarily reported by Romanian listed companies compared with Hungarian companies for the period 2006-2008, conclude that the majority of environmental information provided by the Romanian companies is incomplete and irrelevant, the level of environmental reporting in this case being very low. Also

a study made by Ienciu (2011) sustain that environmental information provided by the Romanian organizations is incomplete and irrelevant for stakeholders. The study demonstrated that environmental reporting in the case of Romanian companies is influenced by the size of the entity, by public exposure by the structure of the shareholders.

Starting from the agency theory, the company is accountable for the decision to report environmental information, decision which is made by the management to serve for the best interest of the shareholders (Buniamin et al., 2010: 56).

Within this study, we have focused on factors related to the shareholder structure and we analyzed the way in which shareholder structure could influence environmental reporting in the case of Romanian companies listed at Bucharest Stock Exchange.

The Analysis of the Literature

Within this section we will approach a retrospective analyze regarding the correlations between the shareholder structure and the level of voluntary reporting, where to environmental reporting also belong. This retrospective is created from the perspective of the specialized literature, more precisely the studies approaching this matter, published between 2000-2011 in journals listed with the following databases: EBSCO, Emerald, Scopus, SpringerLink, Science Direct.

Rao et al. (2012) investigate using a quantitative analysis the annual reports of 100 Australian firms listed on the Australian Stock Exchange. The study showed a positive relationship between Environmental Reporting, institutional investors and board size.

The study conducted by Ho and Wong in 2001 (Ho and Wong, 2001) analyzes the connection between the ratio of family members and the level of voluntary reporting within the Hong Kong stock listed entities. The study concludes that the number of family members influences in a negative manner the level of environmental reporting for the scrutinized entities.

In 2002, Haniffa and Cooke (2002) analyze the importance of various cultural characteristics or corporate governance specificities for voluntary reporting within Malaysian stock listed companies. Results have shown that the number of family members influence the level of voluntary reporting, including the environmental reporting.

The study conducted by Huafang and Jianguo (2007) intends to examine, by means of regression analysis, the impact of shareholder structure and board structure onto the voluntary reporting for a sample of 559 listed companies from China. The existence of foreign shareholders as well as the percentage of independent managers is associated with an increased level of voluntary reporting.

In a study conducted on the Malaysian stock market, Akhtaruddin et al. (2009) suggests that the level of voluntary reporting is negatively influenced by the control inside a family.

Klai and Omri (2011) analyze the effect of corporate governance mechanisms (characteristics of board and shareholder structure) over the financial reporting on a sample of companies listed with the Tunisian Stock Exchange for a period between 1997 and 2007. The percentages owned by foreigners and families, in particular, decrease the quality of information which are reported.

Research methodology

Assessing how environmental performance or environmental information is reported in 2010 by Romanian companies listed at Bucharest Stock Exchange in the first, second and third tier (EnvRep) is based on a Disclosure Index (DI) on the following groups of information:

−   d1. Non-financial information regarding environmental objectives, management, policy and other aspects which can reflect environmental performance in non-financial information. This indicator can bring value "1" if company report this kind of information, or "0" if company doesn't report the information.

−   d2. Key Performance Indicators regarding environmental impact (water, air, soil). The indicator is "0" if company does not report such indicators or can be "1" if company reports

such indicators although this indicators are not correlated with indicators stipulated in international guidelines.

- d3. Financial indicators (environmental investment, costs, provisions). Suck indicators reflects in monetary terms companies attitude regarding the environmental. The values can be "0" if company does not report this information or "1" if company report this kind of information.

This method for quantifying environmental information allows integration of different types of information into one single figure comparable between companies and is not very subjective because this is not a qualitative examination which depends on the researcher point of view which is not always the same with the investor's point of view regarding the relevance of environmental reporting. So, our EnvRep Disclosure Index (DI) is calculated as:

$$EnvRep\_DI = \frac{\sum_{i=1}^{n} di}{m},$$ n – numer of element disclosed , m - numer of

posible elements to disclose, di – group of elements disclosed.

The sample consist in 64 entities listed at Bucharest Stock Exchange in the first, second and third tier from 10 areas of activity that may impact the environment: agriculture, forestry and fishing; the extractive industry; the manufacture industry; production and supply of electricity, thermal energy, gas, water; water distribution, sanitation, managing waste, recyclable materials recovery activities; construction; transport and storage; food industry, hotels, restaurants; the repair, retail, maintenance and *installation* of machinery and equipment; printing and reproduction of recorded media.

Every market and every governance system has its own characteristics which depend especially on the ownership and investors structure. In our study we look upon the structure of the shareholders for the Romanian listed companies in 2010. For this we analyze different types of shareholders:

v1. Institutional shareholders (Instit_INV) – the percentage held by institutional investors

v2. Family members in the structure of the ownership (Family_INV) - the percentage held by family members;

v3. Foreign shareholders (Foreign_INV) - the percentage held by foreign shareholders;

v4. Private shareholders (Privat_INV) - the percentage held by foreign shareholders;

v5. Executives (CEO and other executives managers) (Manag_INV) – the percentage held by executives management;

v6. Directors (chairman and other directors) (Board_INV) - the percentage held by directors.

Analyses and results

The analysis of previously introduced studies has helped us in fundamenting the following theoretical framework: *The level of environmental reporting is influenced by the shareholder structure.*

As far as the shareholder structure is concerned, a first element being analyzed is the percentage owned by the *members of the same family*, or type of shareholders. We believe that the level of environmental reporting is negatively influenced by the weight of family members in the leadership structures. By family members' weight, we mean that the company is owned, in a certain percentage, by the members of the same family. The specialized literature believes that, in the case of companies owned by the members of a family, there is no significant separation between the shareholders and the management, because the shareholders become involved in the company's management, with direct access to information, thus stopping voluntary information reporting to other shareholders.

Another element would be the type of investors: *Institutional investors* or individual investors and how they affect the level of voluntary reported information. Hidalgo et al (2011) seem to confirm there is an increase in institutional investors having a negative impact on voluntary reported information. Yuen et al. (2009) shows that individual shareholders is significantly correlated to the level of voluntary reporting.

Cormier and Gordon (2001) showed that the status of the capital (public or private) influences environmental reporting. Cormier and Magnan (2003) showed that the dispersion of the capital (national/foreign) positively affects environmental reporting in the annual report. So we analyse also the status of the capital (public or private) and its dispersion (Romanian or foreign).

We propose a regression model of environmental reporting depending on shareholder structure:

$F(EnvRep) = a0 + a1* Family\_INV + a2* Instit\_INV + a3* Privat\_INV + a4* Foreign\_INV + a5* Manag\_INV + a6 * Board\_INV$, where: a0 – constant, EnvRep – environmental reporting, a1, a2, a3, a4, a5, a6 – equation coefficients, FamilyInv, Instit_INV, PrivateInv, Foreign_INV, Manag_INV, Board_INV represent the independent variables.

The regression model was analyzed using SPSS, version 17.00 and we apply the Stepwise method for determining the variable that could explain the variation of the environmental reporting in the case of Romanian companies. The results are presented in tables above.

Table 1. Environmental Reporting Model Summary

M	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics					Durbin-Watson
					R Square Change	F Change	df1	df2	Sig. F Change	
2	.553[b]	.306	.283	.22009	.046	4.047	1	61	.049	1.848

b. Predictors: The procentage of privat investors, The procentage of foreign investor;

Table 2. ANOVA test

Model		Sum of Squares	df	Mean Square	F	Sig.
2	Regression	1.302	2	.651	13.435	.000[b]
	Residual	2.955	61	.048		
	Total	4.256	63			

b. Predictors: The procentage of privat investors, The procentage of foreign investor

Table 3. Model coefficients

Model		Unstandardized Coefficients		Standardized Coefficients			
		B	Std. Error	Beta	t	Sig.	VIF
2	(Constant)	1.384	.199		6.941	.000	
	Privat_INV	-.531	.105	-.552	-5.077	.000	1.039
	Foreign_INV	.062	.031	.219	2.012	.049	1.039

Analysing the rezults we can notice that the procentage of privat investors and the procentage of foreign investor are the only two independent variables that explains environmental reporting

variation. The model explains 30,6% from the environmental reporting variation (Sig. Coefficient is lower than 0.01, Anova test reflects F Coefficient of 13.435 and Durbin-Watson Coefficient is 1.848).

We can also notice that there is a negative corelation between the procentage of private investors and environmental reporting (the model coefficient is negative) so companies in which the procentage of shares held by state is higher report more environmental informations that companies with are controled by private shareholders.

Foreign investors are positivily corelated with environmental reporting (the model coefficient is positiv) and so companies in which the shares are held by foreign shareholders are more transparent and disclose more environmental informations. The collinearity diagnostics and the residuals statistics reflect the fact that there is no collinearity between independent variables so the model can be validated.

Conclusions
Although the specialized literature believes that, in the case of companies owned by the members of a family, there is no significant separation between the shareholders and the management, thus stopping voluntary information reporting to other shareholders we cannot find any correlation maybe because Bucharest Stock Exchange. Institutional investors do not affect the level of voluntary reported information in a relatively new market like Bucharest Stock Exchange. Also the percentage held by the executives or the percentage held by the board of director's does not have any effect on environmental disclosure.

From the point of view of the Romanian companies the presence of foreign shareholders help increasing transparency maybe because they are more expose to the public and maybe because foreign investors need more relevant information's regarding environmental performance. Foreign shareholders face more uncertainty because of "geographical separation of owners and management" and so managers are inclined to increase the environmental reporting for reducing information asymmetry among these shareholders. (Barako et al., 2006).

We also demonstrate that companies where the percentage of the shares owned by the state is higher report more on environmental aspects maybe because the state wants to give examples of good transparency. Because there is no legislation requiring companies in Romania, listed at the capital market to provide stakeholders separate reports or specific information relating to the environmental impact the state offer good examples of good ethics to private investors.

ENVIRONMENTAL REPORTING AND CORPORATE GOVERANANCE FOR FTSE 100 LISTED COMPANIES

Ienciu Ionel-Alin
Babeş-Bolyai University, Faculty of Economics and Business Administration

Because environmental information reporting remains voluntary on an international scale, there are major difference in terms of quality and quantity of environmental information, reported by entities from varied sectors and countries. Within this study, I have focused on internal characteristics, consisting mainly in how the entity is managed, in order to identify the existence of certain associations between the characteristics of corporate governance and the existence of environmental reporting. The literature in the field suggests various results related to the correspondence between corporate governance characteristics and environmental reporting. Within the factors suggested by the literature are the board structure, presence of the board committee, the separation between the Chairman of the Board and the Chief Executive Officer, shareholder structure. The paper represent an empirical analyze on how corporate governance characteristics might explain the level of environmental reporting. I suggest a model comprising corporate governance characteristics like: board independence, board size, existence of a Social Responsibility Committee that could explain environmental reporting. The sample comprises 48 companies listed at London Stock Exchange FTSE 100. From FTSE 100 I select only the companies that activates in sectors of activity that may have an impact on the environment such as Aerospace & Defence, Automobiles & Parts, Beverages, Chemicals, Electricity, Food & Drug Retailers, Food Producers, Gas, Water & Multiutilities, General Industrials, Health Care Equipment & Services, Household Goods, Industrial Engineering, Mining, Oil & Gas Producers, Oil Equipment, Services & Distribution, Personal Goods, Pharmaceuticals & Biotechnology, Tobacco. My results show that, from the point of view of the London Stock Exchange FTSE 100 listed companies, the presence of an environmental committee in the board help reduce the conflict of interests between the stakeholders and the company's management regarding the disclosure of environmental information. The environmental committee monitors the company's activity regarding the impact on the environmental, bringing about increasing transparency, and independence inside the board regarding environmental aspects. For assuring a high transparency level of environmental performance within a company, the board should ensure a sufficiently large number of members able to exercise an independent reasoning in order to solve potential conflict of interest. The directors represent the interests of the stakeholders and have more influence on reporting information regarding environmental aspects.

Jell Classification: M49

Introduction

During the last decade, the demand for environmental information reporting has increased dramatically within the stock listed companies (Beretta and Bozzolan, 2004). External users require relevant and credible information regarding the environmental performance of the entities (Di Piazza and Eccles, 2002). Because environmental information reporting remains voluntary on an international scale, there are major difference in terms of quality and quantity of environmental information, reported by entities from varied sectors and countries. A large number of studies can be observed in time focused on analyzing the time and space variation of the environmental reporting, emphasizing the factors which are determinant for environmental reporting (Cormier et al, 2005; Frost, 2007; Taylor and Shan, 2007; Sumiani et al, 2007). In the study conducted by Lee and Hutchinson in 2005 (Lee and Hutchinso, 2005: 86) the authors offer a current status of factors that can influence the decision to report environmental information: external factors (laws and regulations, entity's legitimacy, public pressure, public exposure), internal factors (charecteristics, cost/benefit ratio), individual factors (culture, attitude)

Within this study, I have focused on certain factors related to the entity, such as internal characteristics, consisting mainly in how the entity is managed, in order to identify the existence of certain associations between the characteristics of corporate governance and the existence of environmental reporting. Among the characteristics of corporate governance we could mention the board structure and composition, the existence of environmental committees.

Working hypothesis and Analysis of the Literature
I develop the following theoretical frameworks:

H1: The level of environmental reporting is positively influenced by the percentage of independent non-executive managers within the board of directors. The OECD principles and the majority of corporate governance codes respectively suggest the existence of both executive and non-executive managers within the board, the role thereof being the monitoring or management decisions.

The executive managers are employees of the company with a direct role in its management, while the non-executive managers do not participate directly in managing the company, having an objective and independent monitoring role on how the company is managed.

From the perspective of agency theory (Solomon, 2007: 82) the presence of independent non-executive managers in the board (board of directors) should help reduce the conflict of interests existing between the shareholders and the company's management, because their role is to independently monitor the company's activity, bringing about increasing objectivity, independence inside the board, thus leading to the minimization of agency costs. According to the OECD principles (OECD Principles, part VI) the board should be capable to objectively and independently analyze the economic operations exercised by the company. For this purpose, the board should ensure a sufficiently large number of independent members able to exercise an independent reasoning in order to solve potential conflict of interest. As independent managers should represent the interests of interested parties it is to be expected that they have more influence on reporting the environmental performance related information (Haniffa and Cooke, 2002).

Nevertheless, the specialized literature also introduces a negative perspective related to the existence of independent non-executive managers: in the event of a large board, the non-executive managers represent a powerless unjustifiable element within the structure. The supporters of this theory believe that the market wherein the company operates, has the capacity to determine a company's management to function properly, thus supporting the shareholders' interests (Solomon, 2007).

Studies suggest various results related to the correspondence between the number or percentage of independent non-executive managers and the level of voluntary reporting. Therefore, Akhtaruddin et al. (2009), Donnelly and Mulcahy (2008), Huafang and Jianguo (2007), Kelton and Yang (2008), Chen and Jaggi (2000), Bujaki and McConomy (2002) are all studies reflecting the existence of a positive correlation between the number of independent non-executive managers and the level of reporting, on the basis of empirical approaches, while Barako et al. (2006) reflects a negative association between the level of voluntary reporting and the ratio of non-executive managers.

I thus expect that a larger number or ratio of independent non-executive managers within the board would determine an increasing level of environmental reporting.

H2: The level of environmental reporting is influenced by the board size. Specialized literature believes that board size determines the efficiency and efficacy thereof (Xie et. al., 2001) because a larger board attracts more experienced individuals. A more efficient board incurs a more

efficient reporting system, and a more increased level of voluntary reporting at the same time, environmental reporting included.

Nevertheless, there are studies having proven statistically that there is no relation between the board size and the level of voluntary reporting: Halme and Huse (1997), Cheng and Courtenay (2004). I believe the level of environmental reporting might be correlated with the board size.

H3: The level of environmental reporting is influenced by the existence of a safety and social responsibility committee. The existence of such a committee would lead to an increasing importance given to these particular aspects of governing system, and as a result, an increase in the information related social and environmental performance within the company.

Research Methodology

Hence, the present paper is a fundamental, applicative research leading to the proposal of a model to be tested within 48 companies listed at London Stock Exchange FTSE 100. From FTSE 100 I select only the companies that activates in sectors of activity that may have an impact on the environment such as Aerospace & Defence, Automobiles & Parts, Beverages, Chemicals, Electricity, Food & Drug Retailers, Food Producers, Gas, Water & Multiutilities, General Industrials, Health Care Equipment & Services, Household Goods, Industrial Engineering, Mining, Oil & Gas Producers, Oil Equipment, Services & Distribution, Personal Goods, Pharmaceuticals & Biotechnology, Tobacco.

The dependent variable of the study is the Environmental Reporting Index 2010 (EnvRep) which was calculated using a Disclosure Index (DI) on the following groups of information:

− d1. Non-financial information regarding environmental objectives, management, policy and other aspects which can reflect environmental performance in non-financial information. This indicator can bring value "1" if company report this kind of information, or "0" if company doen't report the information.
− d2. Key Performance Indicators regarding environmental impact (water, air, soil). The indicator is "0" if company does not report such indicators or can be "1" if company reports such indicators although this indicators are not correlated with indicators stipulated in international guidelines.
− d3. Financial indicators (environmental investment, costs, provisions). Suck indicators reflects in monetary terms companies attitude regarding the environmental. The values can be "0" if company does not report this information or "1" if company report this kind of information

This method for quantifying environmental information allows integration of different types of information into one single figure comparable between companies and is not very subjective because this is not a qualitative examination which depends on the researcher point of view which is not always the same with the investor's point of view regarding the relevance of environmental reporting.

So, our EnvRep Disclosure Index (DI) is calculated as: $EnvRep\_DI = \dfrac{\sum_{i=1}^{n} di}{m}$,

n – number of element disclosed, n=3
m - number of possible elements to disclose, m=3
di – group of elements disclosed

I analyzed the following independent variables that reflect the corporate governance characteristics:

- **board_no** - The size of the Board of Directors (Total number of board members);
- **env_committee** - The existence of a Environmental/Safety/Responsibility Committee (We have marked with 1 the existence of such a committee and with 0 in case it doesn't exist);
- **indep_no** - The Percentage of the Independent Nonexecutive Directors on the Board (Number of independent non-executive managers within the board divided by the total number of the board members).

Analyses and results

For determining if three can be possible correlations between the dependent variable (Environmental Reporting) and dependent variables (board_indep, board_no, env_committee) we apply the following regression model: $F(EnvRep) = a0 + a1*board\_no + a2*env\_committee + a3*board\_indep$, where: a0 – constant, EnvRep – level of environmental reporting, a1, a2, a3 – equation coefficients, board_no - Board size, env_committee – existence of a Social Responsibility Committee, board_indep – percentage of the independent nonexecutive directors in the board of directors.

The regression model was analyzed using SPSS, version 17.00 and we apply the Stepwise method for determining the variable that could explain the variation of the environmental reporting in the case of FTSE 100 listed companies. The results are presented in tables above.

Table 1. Environmental reporting model summary

Model	R	R Square	Adjuste d R Square	Std. Error of the Estimate	R Square Change	F Change	df1	df2	Sig. F Change	Durbin-Watson
2	.712[b]	.507	.485	.10364	.046	4.173	1	45	.047	2.765

b. Predictors: env_committee, board_no

Table 2. ANOVA test

Model		Sum of Squares	df	Mean Square	F	Sig.
2	Regression	.497	2	.248	23.123	.000[b]
	Residual	.483	45	.011		
	Total	.980	47			

b. Predictors: env_committee, board_no

Table 3. Coefficients of the model

Model		Unstandardized Coefficients B	Std. Error	Standardized Coefficients Beta	t	Sig.	Collinearity Statistics Toleranc e	VIF
2	(Constant)	.652	.070		9.270	.000		

Env_committe e	.187	.032		.627	5.820	.000	.944	1.059
Board_no	.013	.006		.220	2.043	.047	.944	1.059

Analysing the rezults we can notice that the existence of environmental committee and the number of the board members are the only two independent variables that explains environmental reporting variation. The model explains 54,6% from the environmental reporting variation (Sig. Coefficient is lower than 0.01, Anova test reflects F Coefficient of 27.037 and Durbin-Watson Coefficient is 2.731).

We can see that the existence of an environmental, safety of responsibility committee on the board determine companies from FTSE 100 to disclose more environmental information. Also the size of the board is another corporate governance variable that could explain environmental reporting.

Conclusions and future research

From the point of view of the London Stock Exchange FTSE 100 listed companies the presence of an environmental committee in the board help reduce the conflict of interests between the stakeholders and the company's management regarding the disclosure of environmental information. The environmental committee monitors the company's activity regarding the impact on the environmental, bringing about increasing transparency, and independence inside the board regarding environmental aspects. For assuring a high transparency level of environmental performance within a company, the board should ensure a sufficiently large number of members able to exercise an independent reasoning in order to solve potential conflict of interest. The directors represent the interests of the stakeholders and have more influence on reporting information regarding environmental aspects.

So we can consider that implementing good corporate governance practices by establishment of environmental, safety or responsibility committee that monitor the environmental impact within the company and introducing a sufficient numbers of directors can assure transparency and objectivity can solve the agency's theory conflict and determine companies to report more voluntary information regarding environmental performance and other aspect. Our theory regarding good corporate governance assure environmental performance and good environmental reporting is can be partially validated for this sample and will be tested for other samples, like S&P 500 companies and others.

A LONGITUDINAL ANALYSIS OF INTELLECTUAL CAPITAL

Ienciu Nicoleta Maria
Babeș-Bolyai University,
Faculty of Economics and Business Administration
Cluj-Napoca, România

The term intellectual capital has been appeared recently in economy being debated in literature since 90s playing an important role in the economic activity of an entity of nowadays. The emerging of the "new economy", mainly driven by information and knowledge, has been identified by the Organisation for Economic Cooperation and Development as the explanation lying at the base of the development of intellectual capital, a fundamental topic in business (Hornery, 1999). One way or another, intellectual capital plays a significant role in the economic, administrative, technological and social development of contemporary times, being difficult to quantify. Many researchers avoid defining intellectual capital, but consider it the basic value of an entity, as it contains non-financial and related information (Amir and Lev, 1996; Edvinsson and Malone, 1997; Stewart, 1997; Bontis, 2001). The purpose of our paper is to highlights the contributions of researchers in the field of intellectual capital as far as the published articles in the high quality journals are concerned. Our paper presents a quantitative research by performing, on one side, a content analysis of the prestigious international journals which include papers related to intellectual capital and, on the other side, a content analysis of those articles. The originality of the present article is represented by the personal contribution to the stage of knowledge in the field of intellectual capital by means of analyzing already existent researches in the field. The results of our analysis, demonstrate that the studies conducted until now are very few by comparison to the number it should have existed until now in the literature, which demonstrates that this field of research is still at its early stage.
Keywords: Literature Review, Intellectual Capital, Analysis, Journals, Articles
JEL Classification: M49

I. Introduction

In this sense, in the nineteenth and twentieth century's, were particularly noted the writings of the philosopher Karl Marx, the writings that have scored more than any other intellectual works of the modern age. Although these writings were criticized throughout history, Marxist theory is found in nowadays globalization which means that we are witnessing at the concentration of capital, at the creation of wealth only by industry, even at the upheaval of traditional societies.

In the context of society's development, human factor is very important although there are situations when it seems that the necessary prerequisites are missing in order to develop this factor in society. In the development of the communities and the society, these situations must be approached intelligently, investment in human factor (intellectual capital) being essential to ensure the sustainability of society.

In the classical theory of economics, capital is one of the three factors of production, in addition to land and labor, and refers in particular to buildings, equipment, machinery etc., used for the production of other goods (the term physical capital is also used by the specialized literature). The use of the term „capital" alongside with „intellectual" evidences the presence of such a capital, different from the financial and physical capital (Jianu and Brătianu 2007: 16). This concept („intellectual capital") has been initially and soundly defined and argued by Thomas A. Stewart, one of the editors from the famous American *Fortune magazine*. According to him, intellectual capital is that intangible capital representing the sum of everything each employee knows to do in a company and which can be used for developing its competitiveness (Stewart 1997).

Therefore, in order to define intellectual capital we should start first with the definition for intangible assets. Intangible assets are considered a company's most criticized resources however

most entities cannot define them in a clear and accurate manner (Andreou et al. 2007: 52). The literature indicates that there is a large range of definitions and terms which can be attributed either to intangible assets or intellectual assets. For instance, a series of researchers define intellectual capital as the difference between the company's market value and its book value (Stewart 1997; Mouritsen et al. 2001), while others feel that the difference between the company's market value and its identifiable book value is represented by the "goodwill" which, in essence, is an intangible asset (Beaver 1998:78; Holthausen and Watts 2001:50). Therefore, we hereby evidence that there is presently no generally accepted definition associated with the concept of intellectual capital, due to the large number of existing definitions, presented from various perspectives and depending upon the areas of activity this capital operates within.

The main objective of this paper is to evidence the current status of researches in the field of intellectual capital, and, as far as the research problematic is concerned, we will consider studying the literature presented within prestigious journals, acknowledged internationally.

II. Research design

We have performed a quantitative study as part of this paper, thus analyzing the contents of the papers related to intellectual capital published in international journals included in Social Science Citation Index (ISI-rated journals): *Accounting and Business Research (ABR), Accounting Horizons (AH), Accounting, Organization & Society (AOS), Accounting Review (AR), Australian Accounting Review (AAR), European Accounting Review (EAR), Management Accounting Research (MAR) and Asia-Pacific Journal of Accounting and Economics (APJAE)*. Regarding this sample of ISI-rated journals, we have studied each journal separated and included in this study only those journals which include articles related to intellectual capital from 2000 to 2010. Thus, from a total of 18 ISI-rated accounting journals, only 8 (figure 2) of them have been containing articles on intellectual capital over the past 10 years.

The reason for choosing ISI-rated journals relates to the significance they have been given by the international academic community. Important research articles have been across time (especially during the past 10 years) in such journals by renowned researchers with a vast experience in the field of intellectual capital. These journals are considered important for the area of accounting research and for that matter we have as well deemed them to be relevant for our study.

III. Intellectual capital within literature

As far as our analysis in concerned, we state that the number of published articles in ISI-rated journals between the analyzed period is relatively low. The concerns of researchers in this field are not very many, maybe due to the fact that this subject is difficult to be developed and widely accepted in terms of definitions, structure, evaluation, recognition and reporting information related to it. Therefore, analyzing the published articles within high quality journals, we have obtained the following results:

Figure 1. *The number of published articles in ISI-rated journals between* 2000-2010
Source: accomplished by author

From the 8 ISI-rated journals taken into consideration, most articles have been published in the EAR (4 in 2003, 2 in 2005 and 1 in 2007) and the ABR (5 in 2008). There have been 3 articles published in the MAR during 2004 and 1 in 2005, and the remaining journals account for a single article throughout the entire analyzed period (2000 - 2010).

Furthermore, after we have established the articles related to our field of research, we have selected for analysis the following significant variables: the development of the conceptual framework (which is referring to definitions, classifications), theories, literature, type of research performed during the study and research trend.

Analyzing each article depending upon the chosen variables, we have reached the results as exposed in the below figure.

Table 1. The analysis of the articles existing in ISI-rated journals

Source: accomplished by author

From the performed analysis, we can see that the majority of articles develop the conceptual framework of intellectual capital providing definitions and classifications thereof. Thus, from the 26 analyzed articles, only 7 of them fail to mention definitions of intellectual capital, while 13 of them fail to make any classifications of the intellectual capital. This fact explains the increased interest of researchers towards theoretical approach to the detriment of the empirical approach. Also, theories connected to intellectual capital have been subject of debate only in 7 articles, accounting for 27% of the total analyzed studies. Quantitative approaches are predominant in the studies, but the qualitative ones also weigh consistently in the majority of studies and as far as the research trends are concerned, most articles are predominant of positivistic trend.

IV. Conclusions

The present analysis performed within the study provides us the opportunity to understand the existing international research level in relation with the intellectual capital, the significance given by researchers in this field and the degree of difficulty in developing this concept in the sphere of accounting. Simultaneously, this analysis help us in creating a landmark for these aspects which have not been discussed in depth across time, in determining the status of research on intellectual capital as of present times and in identifying possible aspects for future debate and thorough study.

As far as the intellectual capital research is concerned, we would like to state that it is poorly developed. Studies conducted until now are very few by comparison to the number it should have existed until now in the specialized literature, which demonstrates that this field of research is still at its early stage, as most studies approach general descriptive aspects.

Drăguşin Cristina-Petrina
University of Craiova
Faculty of Economics and Business Administration

This study fall within the scope of the management accounting and is based on the establishment and control of costs and performance within the entities from the urban public passenger transport. Our scientific approach was initiated as a result of some personal research studies in the domain of accounting and management control. We started from the need to know and quantify the costs and the performance in a domain which, despite its important position within human activities, is nowadays a hard-to-solve problem in most of the modern cities. The main aim of the research is to present an organization method of the management accounting, so that it enables the calculation of a pertinent cost on every profit center, and finally, the establishment of the result obtained by comparing the cost with the incomes. We critically realized the current organization conception of the management accounting at an entity from the analyzed domain, aiming to underline the need to organize and implement a modern management accounting, which would enable to control costs and to increase the performance of the entities in this domain, starting from the premise that there are enough similarities between the entities in the domain. The main research methods we have used in order to carry out this scientific approach were the analysis, synthesis and qualitative research. We have studied the specialized writings in the field published in the country and abroad and the legislation in force in the concerned domain. The research emphasized the fact that, in present, there is organized no proper management accounting and, that it is compulsory to organize and implement a management accounting based on the use of a modern method, namely the method of costs on activities, as well as to integrate it with the direct – costing reasoning. The major implications of the proposed system for the research domain consisted in establishing a pertinent cost, oriented towards the entity's management, as well as optimizing the result, by permanently correlating the (direct and indirect) expenses with the activity's volume, namely the degree of using the capacity of transport with the tickets price. The added value consists in carrying out a rigorous study of the current organization conception of the management accounting in an important domain of the urban activity and in the projection of a modern leading system through costs.
Keywords: management accounting, direct costing reasoning, ABC method, activity, transport route
JEL classification: M41, *M49*

1. Introduction

The aim of this paper is to organize and implement a management accounting which would correspond to the specific nature of the entities from the urban public passenger transport and to be adapted to the conditions of the current economic crisis.

Since there are enough similarities between the entities of the analyzed domain, we consider that the researches and experiments carried out with the aim of using some methods through which

the objectives continuingly harmonize with the resources, although they initially had in view only a certain entity, they can be adapted and generalized at the level of all entities from the urban public passenger transport. In this context, our research has as a reference model the Public Transport Operator (RAT) Craiova.

Management accounting is the analytical representation of the entities interior processes which lead to qualitative and quantitative transformations in the patrimony mass. The acquired information is designed for administrators as interior beneficiaries who must answer the question of how to allocate and manage the resources used by investors in order to achieve performance.

Taking into account these requirements, we will further analyze the notion of management accounting organization at RAT Craiova in order to establish if it can meet the need of informing all its users, they can provide a pertinent cost, as well as operative information on the profitability on every type of service and on the whole entity.

2. The critical analysis of the current organization conception of managerial accounting

In present, RAT Craiova has its own conception of organizing the management accounts, being on one side facilitated by the autonomous data processing, and not having on the other side a clear purpose. The objective of this organization method is to compare the collected expenses with the incomes distributed at the level of the profit centers. On these grounds, in the case of incomes, a calculating distribution is being applied.

The expenses are collected within RAT Craiova on three profit centers (sections) in which were established, for each profit center, three cost centers, plus three more independent cost centers.

In what the expenses are concerned, it results from the carried out analysis that the primary documents provide information not only for the financial accounting but also for the managements accounting, through their integrating codes which enable the identification of the following elements: management account, expense account from the financial accounting; the activity; the account pertaining to the operation that affected the expense in the financial accounting.

On the basis of the software available to RAT Craiova, the data can be processed (sorted and centralized) in five collecting situations and distribution.

Series of expenses neither can be identified on profit centers (sections) and nor they have a character of indirect administration expenses. For these particular expenses, the entity carried out a fundamental study on the basis of some elements specific to the activity, from which resulted the following coefficients (percentages): section 1 (activity 11) = 0,56 or 56%; section 2 (activity 9) = 0,27 or 27%; section 3 (activity 13) = 0,17 or 17%.

In what the incomes are concerned, the primary documents provide through the integrating codes information on: the incomes account of the financial accounting; the activity that generated the income; the account corresponding the action that affected the income in the financial accounting.

By processing this information, on the basis of the software, RAT Craiova obtains the following information regarding the income: the number of the sold tickets; the incomes generated by the sale of tickets and subscriptions; the handout of the account of incomes on activities; the incomes centralizing situation.

We notice that, concerning the incomes recording, RAT Craiova adopted a monist accounting system. The incomes are identified due to the accounts of the 7 class of the General accounts plan in which they are analytically open on types of activities.

Another remark is referring to the fact that the management accounting does not use accounts of financial results that will compare the incomes with the expenses, on activities, and will determine the efficiency or inefficiency of every activity.

On the other side, the incomes have a direct character towards the profit centers only partially. Most of the incomes are distributed on activities on the basis of some conventional coefficients.

We also consider questionable the direct character towards the profit centers of incomes from the selling of tickets in stalls, on the basis of their distribution to routes, taking into account that a stall covers two or more routes that pertain to different profit centers.

Following this analysis, we can state that RAT Craiova meet most of the requirements on the management accounting organization with the aim of achieving a modern management.

3. Research methodology

The main research methods we have used in order to carry out this scientific approach were the analysis, synthesis and qualitative research of the current organization conception of the management accounting at RAT Craiova, including the costs calculation methods. In order to carry out this study we have taken and processed data from the analyzed entity (RAT Craiova). We have studied the specialized writings in the field published in the country and abroad and the legislation in force in the concerned domain.

4.The results of the research

Although the conception of managerial accounting organization meets almost completely the control necessities of the interior activity of the entity, from the analysis we have carried out, we observe that it can be improved so that the data on the costs of activities facilitate the decision making process aiming to increase the efficiency of the performed activities.

In this context, we consider that the optimum organization of the management accounting, which would fully capitalize on the information necessary to the management board and to orient the entity's activity, can be made only if concomitant methods and techniques are used in a system, which would take only the essential things from it and present advantages for the entity that applies it.

Starting from these grounds, the system we propose combines the costs on activities method (ABC), used to calculate costs, with the direct - costing reasoning, used to establish and analyze the profitability on types of activities and on the whole entity.

We have oriented on the possibility of achieving this integration starting from the particularity of the object of activity of the entities from the urban public passenger transport and the influence factors which imply a certain structure of the production cost.

Cost on activities method (ABC) represents one of the most recent methods used by the management accounting. It hasn't yet registered an evolution in the costs calculation, but it brought series of innovations in the treatment manner of the indirect expenses, in comparison with the classical, traditional methods of calculating costs. Starting from the transversal splitting of the entity on activities and from the principle that the activities consumes resources, and the products (the services provided, in the analysis of this study) consumes activities, the ABC method proceeds to a multiple accounts distribution, based on the causality relations of the indirect expenses, that enables at the managers' "command" to calculate a cost, which is not necessarily more exactly, but is always pertinent. In the same time, it is a method of management since it provides information regarding the activities management in order to form the basis of the operational and strategic decisions and to evaluate the results of these decisions.

The implementation of the cost on activities method (ABC) will enable to improve the current management accounting in two directions.

The first direction of improvement refers to the reconsideration of using the management accounts. On one side, it is compulsory to renounce to the static role of the management accounts, in present only the debit part of them being used, and on the other side, we consider mandatory to include the incomes accounts at the levels of profit centers and data comparability on accounting manner, which would lead to their increasing informational role. We can achieve it by using different variants. One variant, more difficult, would be to introduce some management accounts, which are not in present included in class 9 from the General Accounts Plan, such as:

„Internal deductions regarding sales"; „Internal deductions regarding the analytical results"; „Results from sales".

A simpler variant of our choice in this study, supposes the use of the existing management accounts, but one of them have new accounting roles and functions (accounts 902, 903 and 931), taking into account that RAT Craiova is not an entity which produces material assets.

The second direction of improvement concerns the finality of the management accounting, which is lacking in the current organizing manner, namely the cost calculation on every type of car/route transport constituted, as a cost center, as well as comparing the cost with the incomes generated at the level of the concerned center.

This means that for every transport route or type of car there will be established a distinct analytic at accounts: 921 „Expenses of the basic activity"; 902 „Internal deduction regarding the production"; 903 „Internal deductions regarding the results obtained"; 931 „Incomes generated by the basic activity".

When calculating the costs we can use as a cost carrier the travelled kilometer or route, namely the complete route travelled by the bus/tram between the departure and arrival station. Thus, all the direct costs can be calculated on every route, and monthly direct cost on the cost center is calculated in relation to the number of routes. The indirect expenses (consumption of activities) are added subsequently to this cost, and are distributed through the methodology specific to ABC method, due to the cost inductors and the total cost of every route transport is thus obtained. By comparing this cost with the income distributed to every transport route, the result on the route can be established at the end of the month, and the cost center becomes a profit center.

Apart from the pertinent cost, it is also very important for the entity's management, especially in the conditions of the current economic crisis, to operatively determine the profitability of every route and on the whole entity.

In this regard, within the implemented management accounting we proceeded to the use of the direct – costing rationing, which is based on the permanent correlation between the (direct and indirect) exploitation expenses with the degree of using the transport capacity and with the tickets price.

The quantification of this correlation can be achieved by calculating the indicators: the profitability threshold, coverage factor, the dynamic safety coefficient and the safety interval (Călin, Man and Nedelcu 2008: 285).

These indicators were calculated in table 1, the analysis comprising the data for the two transport routes, 2R and 9, within profit center. It is very important for the entity management to know the four indicators because:

- The break-even shows the point from which any increasing of the passengers number on the route bring profit to RAT Craiova, and its activity becomes profitable, as well as any decrease of the passengers number brings losses on the concerned route, thus the activity of RAT being unprofitable, if the connection between the optimization factors of the activity is respected (costs, tickets price and the structure of transport routes). The profitability threshold can be established at the level of the center profit, the transport route or on the whole entity. Knowing the profitability threshold the tickets price can conversely established.

- The coverage factor expresses the potential profitability and represents the percentage of the necessary turnover for covering the indirect expenses and obtaining profit. This indicator can contribute to the decisions-making process of creating new passengers public transport routes or of renouncing at some existing routes.

- The dynamic coefficient of safety indicates the relative decrease of incomes so that RAT Craiova reach the break even and avoid losses.

- The safety interval has the same meaning as the dynamic coefficient of safety, but, in this case, the information are presented in absolute sizes and not in relative sizes.

Except the calculation of the four indicators for optimizing the result (Călin, Man and Nedelcu 2008: 304-307) of the carried out activity, it is also important for RAT Craiova management to determine the influences of the factors modification on the profit that contributed to its calculation: the selling price of tickets, number of passengers, direct and indirect expenses.

Thus, we start from the existing situation presented in table nr. 1 (to simply the calculations we supposed that RAT Craiova has only routes 2R and 9 – the calculations are being made following the same methodology no matter the number of transport routes – and that it obtains incomes only from the selling of tickets on the two routes), according to which the entity registers the following indicators: profit 98.125 lei, coverage factor 45,30%, break-even 86.282 lei, the dynamic coefficient of safety 71,51%. The RAT Craiova management aims to increase the profit. For this purpose, it can act on the optimization factors and can decide:

- either a tickets price increase, and in this case, in comparison with the initial situation, the value of all calculated indicators will increase, excepting the profitability threshold whose value will decrease (positive situation);
- either a degree of occupation increase, so an increase on the number of passengers, a situation in which will lead to an increase of the profit and of the dynamic safety coefficient, while the coverage factor and the profitability threshold will remain unchanged (positive situation);
- either a direct expenses reduction, which will lead to the same evolution of the calculated indicators as the first situation, namely the tickets price increases;
- either an indirect expenses reduction, a situation which will lead to an increase of the profit and the dynamic safety coefficient, while the profitability threshold decreases, and the coverage factor will remain unchanged (positive situation).

Cumulating the four decisions previously taken, the management board will achieve the expected result, that is an increased profit, as well as a positive evolution of the other indicators specific to the relation cost – volume - profit, representing a favorable situation for the entity.

Yet, in the practical activity of RAT, some of the optimization factors can have an unfavorable influence on the profit, and, thus, it is important to determine it so that RAT management actions through a favorable decision of other optimization factors.

For example, if the price of tickets is reduced, the profit will decrease. This can be compensated either by reducing the direct expenses, or by reducing the indirect expenses.

In conclusion, the management of the modern entity is in the position to take rational decisions that will lead to the achievement of some optimum results only if we know the manner of action of each of the optimization factors and, especially, the reciprocal influences of the concerned factors.

5. Conclusion

For the cost optimization of the public passenger transport, the management of RAT Craiova must have managerial accounting which will provide it the relevant information.

The analysis of the current situation has emphasized the fact that RAT Craiova has its own conception of organizing the accounting management, in which the accounting accounts has only a statistic role, being used only their debit part. Furthermore, it is not calculated a real cost, but there is an extra-accounting comparison of the collected expenses with the incomes distributed on the basis of some conventional coefficient, at the level of the profit centers.

In this context, we consider that it is necessary to propose the implementation of a management accounting which would combine the cost on activities method (ABC), used for the costs calculation, with the direct – costing reasoning, used to establish and analyze the profitability on types of activities and on the whole entity.

The cost on activities method (ABC) will enable, on one side, to reconsider the use of management accounts by renouncing to their present static role and by assigning new accounting roles and functions to some of them (accounts 902, 903 and 931), taking into account that RAT

Craiova is not an entity which produces material assets, and on the other side, will enable to establish more exactly the route transport and the degree of participation of every route to the profit mass.

The use of the direct – costing reasoning will enable to optimize the result obtained due to the correlation of the indirect and direct expenses with the activity's volume, the degree of using the transport capacity and with the tickets price.

In conclusion, the implementation of the management accounting in the presented version will enable RAT Craiova management to take some rational decision in order to optimize the result obtained and, what it is extremely important, to anticipate the consequences of this type of decisions.

Table 1 - Optimization calculations of result RAT Craiova

Explications	Initial situation	Optimization factors				
		Ticket price increase	Number of passengers increase	Direct costs reduction	Indirect costs reduction	The final situation
1. Income from ticket sales:						
- route 2R: 208.845 x 1,2 lei	250.614	313.268	263.144	250.614	250.614	328.931
- route 9: 34.830 x 1,5 lei	52.245	62.694	54.857	52.245	52.245	65.830
Total	**302.859**	**375.962**	**318.001**	**302.859**	**302.859**	**394.761**
2. Direct costs						
- route 2R: 208.845 x 0,65 lei	135.609	135.609	142.537	114.865	135.609	120.608
- route 9: 34.830 x 0,86 lei	30.033	30.033	31.452	26.471	30.033	27.795

THE IMPACT OF ECONOMIC CRISIS ON ACCOUNTING PROFESSION

Ionescu Ion
University of Craiova
Faculty of Economics and Business Administration

Drăguşin Cristina-Petrina
University of Craiova
Faculty of Economics and Business Administration

This article appears as an extensive study of the impact of global economic crisis on the accounting profession and accountants, our research highlights the development and fortuitous changes in accounting under the restrictions and auspices of the global recession. The article begins with the study and comparison of international responses on the subject treated. Thus, we studied foreign literature, as well as articles in numerous newspapers, journals of international stature. Then our research is oriented mainly towards identifying responses to the following questions: How did the accounting profession develop under the auspices of the global recession? What does itimply the new culture in the accounting profession and innovative practice in the field? What is the role of the accountant in crisis management? What problems does the accounting face up as a significant pawn in crisis? Using deductive reasoning we have established conclusions referring to the global recession mark upon the profession and have determined the general trend at present time in accounting. In times of economic recession, the role of accountant has changed, getting augmentative and multifaceted dimensions. It is required, more strongly, the need of guidance for accountants on providing integrated services to the entities they serve. Thus, we noticed the position of the accountant-consultant, as an important pillar for the entity, perspective which gives us an image of the specialist accountant, who always ensures the security of the business. Also, in the context of recession, professional accountants should be concerned with the identification of financial engineering which could lead to an exit from the crisis and to reduce and mitigate its negative effects, but also to prevent and reduce the potential intensity of future crises. Accounting, as a mirror of events in the economy in order to fulfill its mission and to ensure success in times of crisis, it must be concerned with improving financial reporting in order to rebuild confidence and information on users and to remove their skepticism towards financial reporting. Accounting is required to commit to a system of high quality financial reporting, commitment which could provide users with confidence and security. Also, in times of crisis, to achieve accounting objectives, there should be abandoned the erroneous conception that the responsibility for various problems and failures occurred at the level of individual entities and the level of the global economy, it could belong to accounting.
Keywords: global economic crisis, the accounting profession, professional accountant consultant, financial reporting, reliability of the information
JEL classification: M41, *M49*

I. Introduction

The global economic crisis is, in addition to a threat, an opportunity to review the accounting profession, which requires a change in the obsolete trends, and a modernization and alignment for the purposes of the latest practices and trends in the field.

The National Courier in its article of September 6, 2010 entitled "Accountants can play an important role in combating the crisis" wrote that "Despite the fact that professional accountants often complained that they were guilty of financial crisis, they can play an important role to

overcome this crisis." The CECCAR doctrine makes out that the accounting profession has an important role upon community, that the public relies on credible information provided by the accountants and they base on this information for effective financial management and decision .

The current international economic environment remains a turbulent one, characterized by high economic uncertainty. While some countries continue to face economic downturn, with dire predictions and also announcing the recession and economic decline for years to come (eg. Spain), in other states there are experiencing slight growth, but its rate is significantly slowed (eg. Romania). However, the context remains a pessimistic one and also the next periods. 2012 seems to stand under the sign of global austerity as experts forecast the global economy in 2012 which shows that the euro area will undergo a strong recession and the World`s biggest economies would record sluggish growth.

In this conjuncture dominated by controversial developments is rendered more striking a new culture in the accounting profession.

As it is a topical issue and a focus in this paper we will study how the accounting profession was influenced by the recession, answering questions like:
- How did the accounting profession develop under the auspices of the global recession?
- What does imply the new culture in the accounting profession and innovative practice in the field?
- What is the role of the accountant in crisis management?
- What problems does the accounting face up as a significant pawn in crisis?

II. Analysis of Previous Research

Nouriel Roubini, the economist who predicted the crisis in 2008, believes that in 2012 the recession will affect all Europe, the Chinese economy will face a period of slowdown, and the United States will register a small growth.

In this pesimistic context, a new culture in the accounting profession appears to be imperative. In the conditions that those to whom it refers are in a constant change, professional accountants should consider the need for innovation within their profession. Taking into account the words of Burke Hedges, well known author, speaker and trainer, who predicted "Change or you will be changed! Since the change is not an option, it is preferable to take advantage of it and to accept it fully, instead of waiting for it to take advantage of us." (Hedges and Price 2000:105), we emphasize the need for evolution and adaptability of the new accounting requirements imposed by the current economic environment.

Moreover, the President of the International Federation of Accountants (IFAC) Robert Bunting highlights at the most recent Congress CECCAR, the need for a new culture in the accounting profession, anticipating that the role of accountants in the world will change in the current economic context. In his view, the accounting profession bears an important role in that it basically creates the business cycle and ensure the market stability, offering to the companies reliable information upon to base when investing.

Lazaro Arias, president of the Institute of Certified Public Accountants of the Dominican Republic supports the position of the accountant-advisor, as a prominent contributor to optimize resources of small and medium sized business and reducing operational costs. According to his conception, accounting assurance provided by the contractor identifies where to reduce the costs. To this end, in 2009, the Institute confessed the intention to train and educate its members in basic counseling issues, to raise and maintain professional standards attached to the best practices.

In turn, Marin Toma, the President of CECCAR Romania, said in an interview published in March 5, 2012 The Economist that "the accountant not only provides bookkeeping and accounting system, but integrated services that every enterprise needs without to employ these services separately."

Certified accountants and chartered accountants, reunited under the generic name, accountants, are called to be "health advocates" for financial economic entities (Domnişoru and Vînătoru, 2009:76), and under the global financial crisis, their role became augmentative.

It has been noted that the global recession has become a consistent incentive to improve assurance provided by professional accountants in financial reporting. The assurance of financial reporting is essential to reduce the skepticism of the users of financial information (especially managers and investors), users who, in order to take timely decisions and now, given the conditions of crisis, need the best insurance ever.

III. Research Methodology

This article examines, discusses and compares the responses on the accounting profession and accounting professionals under the overall global economic crisis and financial setting using deductive reasoning, conclusions about their imprint on the global recession and leading the overall trend in accounting.

IV. The Results of the Research

First, we consider that to adapt to the new conditions imposed by the economic crisis and financial accounting professionals should exceed reflection works in accounting and focus on providing integrated business services. Especially nowadays, they are considered specialists which public community can not miss and they have confident status for economic entities. For these reasons, we support the opinion of Lazaro Arias, president of the Institute of Certified Public Accountants of the Dominican Republic that accounting professionals need to focus increasingly on the position of accountant-advisor and seek to reinforce this position.

Professional accountant, as an adviser for the economic entity it serves, has to ensure the security of the business in all its evolutionary stages.

The purpose of this approach emphasizes that we must not neglect the distinction between the two professions: the accountant and the chartered accountant.

The chartered accountant is the person who acquired that status under the law and has the power to keep accounts and to prepare the work on the financial statements. More specifically, the chartered accountant is a person who is trained to implement in the life of the financial entity statements using a specific language accounts.

However, chartered accountant specializes in the highest degree of training in accounting, which allows access to all specific profession work: financial, accounting and tax consulting, research, analysis, financial engineering, business evaluation, etc.

We believe that in order to access the position of accountant-consultant, there are two courses of action, taking into account the distinction between the two professions (certified accountant and chartered accountant):

- Certified accountant must go beyond the "holding" of accounts, to study the past and prepare balance sheets, to dedicate and to provide economic and financial analysis to support the effectiveness of running a business and become permanent promoter for improvement in the economic entities.

- Chartered accountants, in turn, must be included among those who take decisions and use their resources to bring value to the entity that offers its services. They must be able to anticipate and actively participate in change, avoiding the mentality of "statistician". Also, the chartered accountant should focus on use of information to improve performance, increase profits and increase competitive advantage.

In the present context, we consider that professional accountants should try to stop exercising their work traditionally and anticipate that their role will gain scale, while they have become specialists in measurement and business information.

Thus, since the global economic crisis, the role of the accountant has changed and its industrial advisory services are becoming increasingly vital, we think that he must stand apart from the position of "statistician" and to be rational as an innovator within the law focusing more on forecasting, in order to ensure economic and financial health of the entity in the service where they operate.

Second, since accounting is a mirror of all phenomena in the economy, we believe that its role and that of the chartered accountant in the management of global financial and economic crisis is undoubtedly primary.

Accountancy and the accounting profession is an essential lever to overcome the crisis but also to prevent and attenuate its effects. Do not forget the role of accountancy, of financial reporting in general, as factor of economic growth and welfare. In absence of financial reporting and trust provided to decedents and interested public,would not exist: bank loans, investments, economic growth.

In the context of recession, we consider that the accountants should be concerned and interested in indentifying those financial engineering leading to overcome the crisis as soon as possible and to reduce and attenuate its negative effects, but also to prevent and reduce the intensity of new potential crises.

Thirdly, we note that there is an erroneous tendency, which must be avoided, according to which the responsibility for different problems and malfunctions, both at the level of individual entities and at the level of global economy, was unjustifiably attributed to accountancy.

But it is very important to emphasize the fact that the accountants should bases on the information delivered to them by other people, who are supposed to do their job properly. Accounting does not produce the phenomenon of crisis; it only reflects faithfully the situation of an entity at a given time, reflecting what happens in that environment. Is regrettable that, although the phenomenon of crisis is occurred and developed in business environment, sometimes the responsibilities tend to be looked elsewhere, and usually in such circumstances, the accountant is firstly concerned.

It is known that there are two schools of accounting: an Anglo-Saxon school and a Latin-continental school, each with its values.

Latin conception is very keen to rules. According to this conception, the accountancy is controlled by state and orientated towards all the partners of the economic entity: fiscal administration, owners, creditors, employees, etc. Assets are valued at the historical cost.

Anglo-Saxon conception, in turn, promotes the principles. But, as the principles leave room for interpretation, embellishment elements of accountancy rapidly arise, which unfortunately distort the reality. Anglo-Saxon accountancy serves, above all, the interests of investors. It is focused on the evaluation of assets to the market value (mark to market), which means to adopt the doctrine of the just value.

The Anglo-Saxon doctrine favors, in terms of governance, the shareholder model at the expense of stakeholder model, which takes into account interests of all participants to the life of the entity and which belongs to the continental doctrine.

For example, the European Union decided to leave the initial politic of European accounting normalization and joined, for rated groups and societies, and optionally, for other categories of entities, to the international referential IAS/IFRS, of Anglo-Saxon inspiration and elaborated by a private organism, International Accounting Standards Board.

In this situation, the natural question which can be asked is: which economic model is more resistant to the crisis?

For many years, Americans and British have accused the leaders of continental Europe that the economies of their countries are sclerotic, dominated by state, and that for thriving we need a free market. However, the American president Barack Obama admitted that, from many points of view, continental Europe handled better in crisis because it seems to still agrees the formula of

higher taxes and social security of citizens, rather than a more free market. Despite these strength points, forecasts show that U.S. and UK will recover more quickly from the crisis than most of continental Europe.

Giving its opinion about the best model to follow, the newspaper The Economist through its article „Europe's economies - A new pecking order. There has been a change in Europe's balance of economic power; but don't expect it to last for long", published on may 7, 2009, militated for the Anglo-Saxon model, one of the reasons being that it gives more power to the individuals and not to the state.

In this respect, remarkable is the opinion of Marin Toma, President CECCAR Romania, a view that we share, taking it into account as the best choice and that ultimately, internationally thinks of interweaving the values of the two models: to have a standardization based on the principles, combined with rules.

Fourthly, we can note another aspect, also very important: accountancy during the crisis facing a loss of confidence among users of accounting information.

For this reason, we believe that scientific research as a way to overcome the crisis should be aimed at seeking scientific solutions to reduce the degree of uncertainty. Thus, the idea to "restore confidence" in financial information gets interest.

Financial reporting plays a critic role in establishing and maintaining the confidence of the investor public. The aim of the financial reporting is to offer credible and useful information for various users of information provided by accountancy, to assist them in decision-making processes.

The information provided by the accountancy must be neutral, reliable and able to portray the economic results in an accurate and faithful manner. The accountancy should undertake the commitment of a correct and high quality financial reporting system, commitment which offers confidence and safety to the potential investors.

James L. Kroeker, chef-accountant at U.S. Securities and Exchange Commission confessed in an interview the fact that the actual financial crisis revealed the type of information that the investors, regulatory authorities and also others users of financial reports need and should see reported in the financial situations of a company.

He asked in January 2008, the FASB (Financial Accounting Standards Boards) to improve the financial reporting for many funding, securitization and other transactions that were not previously consolidated in the balance sheet, arguing that the existing standards needed improvements to what companies should report as assets and liabilities. In response, FASB has completed and finalized an important standard of initiative for the accountancy of financial assets transfers. These requirements entered in force for the reporting of results from 2010. The new standards also imposed a series of new information, which are designed to provide better information on a company's exposure to risks. (1)

In times of financial crisis, the confidence of the investors has the biggest potential to be tormented by uncertainty and therefore to be taken as essential components for assuring the success on short and long term: transparent reporting and objective audition of financial situation, and also a system of independent and objective reporting standards.

Also, CECCAR considers that the most important measures that should be considered to improve users' confidence in financial reporting information in the next period are:

- strengthening the role of the international regulatory and supervisory organism;
- improving the practices of financial presentation;
- strengthening the standards for a better presentation of methodologies related to the evaluation.

V. Conclusions

We can conclude that, in times of economic recession, although there is an erroneous tendency according to which the accountancy is responsible for the different problems and malfunctions faced by the economic entities and the economy as a whole, it represents an essential lever to overcome the crisis, but also to prevent and attenuate its effects.

Clearly, under the financial and economic crisis manifested at the international level, accounting profession has evolved to a new culture in the field. The role of the accountant was changed, receiving augmentative dimensions and multiple facets. Thus, it is necessary the guidance of professional accountants to provide integrated services to the entities they serve. In this respect, we notice the position of professional accountant – consultant, as an important pylon for the entity. From this perspective, the professional accountant is seen as an adviser of the management a specialist who always watches to ensure the business security. But the accountant should not act as a dilettante in consulting; on the contrary, he must act to raise and maintain professional standards attached to the best practices in consulting field. Also, the professional accountant should become a defendant of the financial health of the entity he serves, by orientating towards the realization of economic-financial analyses and previsions and militating for the growth of efficiency, the improvement of performances, the growth of the profit and the increase of the competitive advantages.

Furthermore, the accountancy, as mirror of the phenomena from the economy, to fulfill its mission and goals, especially in times of crisis, must be concerned with improving financial reporting system in order to regain the confidence of the users of information.

Thus, we conclude, emphasizing the idea that in the context of the current scientific research we should focus increasingly on finding solutions to reduce the uncertainty in financial reporting to ensure the public of the credibility of the information necessary for the substantiating of various decisions to be made, accountancy being forced to undertake the commitment of a financial reporting system of high quality, commitment that gives to the users confidence and security.

SOME CONSIDERATIONS OVER THE INTERNAL CONTROL IN THE CONTEXT OF CURRENT ACCOUNTANCY REGULATIONS

Lenghel Dorin Radu
"Dimitrie Cantemir" Christian University Bucharest
Faculty of Economic Sciences of Cluj-Napoca

Through the hereby study we set ourselves on an analysis over the internal control and the ways of implementation of it. The final purpose of our research is represented by the characteristics of the internal control system in the context of current accountancy regulations. The accomplishment of such goal has forced us to research the current literature in the area and also the legal regulations over internal control.
Of course, the accomplishment of such a research was possible only after a pertinent analysis over the opinions expressed in specialty literature regarding this area.
Our research wants to be with a theoretical and applicative character. It is based on analysing the internal control system, the methodology of internal control and the steps of internal control. We express our belief that the implementation of the internal control in a very exact manner comes as an aid to the company management and lead to the accomplishment of managerial objectives and policies.
In what it regards the result of our research there can be drawn the following conclusions: from the legal regulations (OMFP nr. 3055/2009), there is no clear conclusion over the procedures and policies of implementation of internal control applicable to an economical entity; also there are not presented in a detailed way the types (forms) of internal control, being presented in the legal regulations only a classification of them after the time in which they are exercised (before, during or after the finishing of the operations); also in the legal regulations there is developed a certain way of internal control, represented by the financial and accounting internal control, as if the other forms of internal control do not exist; in what regards the components of internal control, these are presented in another way, but similar to already known models of internal control (Coso and Coco); also in the legal regulations there are presented the general objectives of internal control, without developing the differentiate objectives on each for of internal control.
Keywords: internal control, financial and accounting internal control, methodology of internal control, techniques and procedures in internal control, types of internal control.
JEL Code: M40, M41

1. Introduction

The objective of the current article if to present the author's opinion regarding the modifications imposed to the introduction in the accounting legislation of several theoretical aspects regarding the way of implementation of internal control at the economical entities.

The internal control methodology is defined as being an assembly of inter-dependant activities which, through the usage of some specific procedures and techniques, has as a goal the accomplishment of the knowledge process of a phenomenon or an economic activity through reporting, the definite way of manifesting those to the legal regulations, the norms and instructions through which they were defined.

Through the undergone research, we tried to answer the question, what is the methodology of implementation of internal control and which are the steps of accomplishing the internal control.

The results of the research and the conclusions which we have reached confirms the fact that in the legal regulations (OMFP nr. 3055/2009), there is no clear statement which the procedures and the implementation policies of the internal control applicable to an economic entity are.

2.The Concept of Internal Control

In general, control consists of surveying, analyzing and verifying permanently or periodically a certain activity or situation, in order to follow its course and take measures to master the potential risks, and measures for improvement. Internal control consists of any measure taken by the management with a view towards improving the management of the risks to which the entity is exposed, and towards increasing the probability that the aims and objectives established be fulfilled.

The system of internal control represents the sum total of policies adopted by the management, which contribute to fulfilling managerial objectives, preventing and detecting frauds or errors, to the accuracy and completeness of accounting records, as well as to the preparation in due time of financial-accounting information.

The role of internal control may be summed up in the following:
- limiting non-economical and inefficient operations;
- ensuring the integrity of the patrimony;
- ensuring a rigorous and effective management of activities;
- respecting the directives of the management;
- respecting legal provisions;
- ensuring the reality and accuracy of accounting information.

Internal control presupposes:
- an appropriate information system;
- a hierarchical and defined organizational structure, which would ensure the separation of tasks and the supervision of activities;
- a manual of internal control procedures or internal work norms.

The existence of a rational and correctly applied system of internal control constitutes a serious assumption regarding the reliability and credibility of annual financial records and the concordance between accounting and factual reality.

According to the international audit standards (ISA), internal control is the process conceived and undertaken by those appointed to governance, management and other employees, with the aim of providing reasonable assurance on the accomplishment of objectives regarding the credibility of financial records, the efficiency of the activity and its conformity with the applicable legislation. It follows that this control is conceived and implemented in order to approach identified business risks that could hamper the achievement of any such objective.

National audit norms stipulate that the internal control system consists of an ensemble of policies and procedures, undertaken by the management of a given entity in order to ensure a rigorous and efficient management of activities in said entity.

According to current legislation, internal control represents the ensemble of forms of control undertaken at the level of public entities, including internal audit, established by the budget administrators according to their objectives and legal provisions, in order to ensure the economical, efficient and effective administration of funds, which also include organizational structures, methods and procedures.

3.Regulations regarding internal control

a. *The aim of introducing internal control*

According to current regulations (OMFP 3055/2009), the internal control of an entity aims at ensuring:
- the conformity with current legislation;
- the implementation of management decisions in an entity;
- the efficiency of the entity's internal activity;
- the reliability of financial information;
- the efficacy of the entity's operations;

- the efficient use of resources;

- the prevention and control of risks regarding the achievement of objectives etc.

Consequently, internal control procedures aim to:

- on the one hand, ensuring the activity of the entity and the personnel behavior complies with the framework of current legislation, with the values, norms and internal rules of the entity;

- on the other hand, to verify if the accounting, financial and transaction information correctly reflects the activity and the situation of the entity.

In the context of consolidated annual financial statements, the area of accounting and financial internal control refers to the organizations belonging within the consolidation.

Internal control is applied throughout the operations undertaken by the entity, as follows:

a) prior to undertaking operations, on the occasion of budget drafting, which will allow budgetary control after the operations;

b) during operations, for instance, regarding the percentage of actual production being executed or the percentage of penalties registered;

c) after finalizing operations, in which case verifying is done, for instance, in order to analyze the profitability of operations and to ascertain conformity or possible anomalies that need to be corrected.

Accounting and financial internal control of the entity is undertaken in order to ensure a management of records and financial supervision of its activities, in order to comply with defined objectives.

Accounting and financial internal control is a major element of internal control. It regards the whole of the processes of obtaining and communicating accounting and financial information, and contributes to its reliability and conformity to legal provisions.

Similar to internal control in general, it relies on a system comprising especially the elaboration and application of policies and procedures in the field, including the system of supervision and control.

Accounting and financial internal control aims at ensuring:

- the conformity of accounting and financial information published with the regulations applicable to it;

- the application of the management's instructions regarding this information;

- the protection of assets;

- the prevention and detection of fraud and accounting or financial irregularities;

- the reliability of information disseminated and used internally with the aim of control, to the extent to which it contributes to elaborating published accounting and financial information;

- the reliability of annual financial statements published and of other information released on the market.

b. *The components of internal control*

Internal control comprises tightly related components, such as:

- a clear definition of responsibilities, adequate resources and procedures, ways and systems of information, corresponding instruments and practices;

- the internal dissemination of pertinent, reliable information, whose knowledge allows everyone to exercise their responsibilities;

- a system that seeks, on the one hand, to analyze the main risks identifiable with respect to the entity's objectives, and, on the other hand, to ensure the existence of procedures that manage these risks;

- corresponding control activities for each process, conceived so as to reduce possible risks that would affect the accomplishment of goals of the entity;

- a constant surveillance of the internal control apparatus, as well as an examination of its functioning.

The purpose of internal control is to ensure the coherence of objectives, to identify the key factors for success and to communicate to the leadership of the entity, in real time, information on performance and perspective. Regardless of the nature or size of the entity, efforts undertaken for a satisfactory internal control are tied to the application of good practices.

The human resources policy must consider aspects such as the recruiting of qualified personnel, career management, lifelong formation, individual evaluations, employee counseling, promotions and corrective actions.

Control activities are an integral part of the management process, by which the entity seeks to accomplish its objectives. Control regards the application of norms and procedures of internal control, at all hierarchical and functional levels: approval, authorization, verification, the evaluation of operational performance, the securing of assets, the separation of functions.

c. *Requirements for implementation*

According to accounting rules, one must consider:

- the existence of a manual of accounting policies;
- the existence of application procedures for the manual;
- the existence of controls, which would ensure compliance with the manual;
- knowledge of the accounting and fiscal legislation;
- the undertaking of specific controls regarding weak spots;
- the identification and adequate management of anomalies;
- the adaptation of software to the needs of the entity;
- conformity with accounting regulations;
- ensuring the accuracy and comprehensiveness of accounting records;
- respecting the qualitative features of information in the financial statements, so that it satisfies the needs of users;
- the preparation of information necessary to the group's consolidation;
- defining and distributing elaboration procedures for the consolidated financial statements, to all entities to be consolidated.

d. *The evaluation of internal control*

The evaluation of internal control starts from elements such as:

- the existence of procedure guides and manuals;
- guaranteeing the evolution of the internal control system;
- ensuring the possibility of access to the system for external control;
- ensuring the possibility of confronting theoretical description with reality.

In the framework of an IT environment, internal control starts from elements such as:

- the existence of a formalized IT strategy, elaborated with the input of operational management;
- the involvement of management and its sensitizing to risks caused or increased by computerization;
- the allocation of resources, which demonstrate the capacity of the system to accomplish its goals;
- the recruiting of personnel qualified to work with the technologies used, and the existence of a continuous learning plan, to allow the upgrading of knowledge.

The specific risk elements brought about by the use of software refer to the evaluation of aspects such as:

- the level of the entity's dependence on its computer system, with an influence of the continuity of usage, when dependence is too elevated;
- the level of confidentiality of information circulated in the system;
- the obligation to respect current fiscal provisions, the protection of persons, intellectual property, or specific regulation of certain areas of activity.

4. The methodology of internal control

The methodology of internal control is defined as an ensemble of interdependent activities that, by the use of specific procedures and techniques, has as a purpose the knowledge of an economic phenomenon or activity by reporting on their concrete manifestation in relation to legal provisions, norms and instructions which define that activity.

The methodology of internal control presupposes the following stages:

a) The stage of programming the internal control:
- defining the control program;
- establishing the objectives and tasks;

b) the stage of preparing internal control:
- gathering data;
- establishing control procedures and techniques to be applied.

c) the stage of effecting internal control:
- verifying the accuracy of accounting records in relation to justifying and accounting documents, and to reality;
- following the authenticity and conformity of the document specific to each operation, in conformity with internal and legal provisions;
- verifying the conformity of operations with the provisions of internal norms and of current legislation;
- applying the techniques of internal control: inspection, observation, investigation (the interview, questioning), confirmation, calculation, analytical procedures etc.

d) the stage of compiling control documents:
- finding notes;
- control record or report.

e) the stage of using the findings in the control documents: any infringement of the legal and internal norms that regulate the management of material assets or money, the contracting and discharge of payments and expenses, the fulfilling of professional duties must engage the full responsibility of the persons involved (manages, accountants, internal control bodies, administrators), which responsibility is formulated legally as disciplinary responsibility, contraventional responsibility, patrimonial responsibility and penal responsibility.

5. Conclusions

Regarding the organization of internal control in the context of current accounting regulations, the following conclusions can be drawn:

– the legal regulations (OMFP no. 3055/2009) do not clearly state what the procedures and implementation policies are for internal control, applicable to an economic entity;

– also, they do not present the types (forms) of internal control in detail, providing only a classification of these according to their time frame (prior, during, and after finalizing operations);

– also, in the legal regulations, only one form of internal control is discussed, that accounting and financial internal control, as if the other forms did not exist.

– regarding the components of internal control, these are presented in a different, but similar, form to the already established models of internal control (COSO and CoCo);

– regarding the modalities of implementing internal control, only some general aspects are presented.

– also, in the legal regulations, the general objectives of internal control are presented, without developing differentiated objectives for each form of internal control;

– regarding the methodology of internal control, we propose that it comprises the stages: programming, preparation, execution, the compiling of control documents, and the use of information gathered in the process of internal control;

– also, in the local regulation, specific procedures and techniques for verifying internal control are not presented. We propose that these be listed as follows: inspection, observation, investigation (interview, questioning), confirmation, calculation, analytical procedures etc.;

– the legal provisions only attribute real importance to one of the components of internal control, that is accounting and financial internal control, hence the detailed delineation of the general objectives of internal control according to the financial and accounting function;

– still, the management of entities should not limit the sphere of applicability of internal control merely to accounting and financial internal control, since the applicability of internal control is much wider than that of accounting and financial internal control;

– regardless of the mode of organizing internal control, the manager, in order to achieve managerial objectives, must choose the most appropriate forms, techniques or procedures of internal control.

The article emphasizes aspects regarding the perceptions of master accountancy graduates concerning the chances to find an adequate job at graduation. These preoccupations are relatively recent in the academic studies. The student's expectations are often unrealistic, which causes problems to them and also to the private firms and organizations. From the empirical section results that the students' evaluations regarding their own opportunities to get a job modify as they advance in the programme. Even more, this evolution is influenced by employment during the studies and by the professional experience.
Keywords: higher education, master accountancy graduates, early career experiences
JEL classification: M40, M41

I. Introduction

The present study is an empirical research intended to analyze the evolution of the perceptions students have regarding the educational programmes they are enrolled in. It is part of a much broader project whose main goal is to assess the quality of the educational process unfolded in the master programme of Audit and Management of Structural Funding at the Babes-Bolyai University. Previous results related to the subject have already been presented (Mare et al, 2011a; Mare et al, 2011b; Popa et al, 2011). These studies concerned a statically situation regarding the first year students. The partial unrolling of the second year of studies allows now for a comparison in the dynamic of some characteristics regarding the perception over the possibilities to find an employment after graduating the academic programme.

In order to achieve the goal of the present paper, the group of master students involved was monitored on their way through the educational programme. To do this, we have applied the same questionnaire in time, at the end of the first year of study and at the end of the first semester of the second year. We have based our research on the idea that if the master programme is efficient and the performance of the professors is good, the opinion of the students should

improve in time. This, because a high quality of an educational process should lead to high value added in the professional life of the students.

As the analysis has a high level of complexity, the paper presents partial results of the study.

II. Literature review

The academic preoccupations regarding the perception over the opportunities to find employment after graduating an academic programme are relatively recent. The application of some quantitative methods concerning the evaluation of this perception starts in the 1990s in the developed countries (Dykxhoom and Sinning, 1996; Mangematin, 2000) and in the years 2000s in the emerging countries (Gao and Smyth, 2010, Pema and Mehay, 2010).

It is generally accepted that a student decides to follow a programme for superior qualification (master) in order to get a better job. But there is a gap between the students' expectations and the reality from the labor market. The expectations can often be unrealistic having as a consequence important problems at organizations' level (Phillips and Crain, 1996). The problems can be partially resolved by early employment, during the period of studies (Sellers and Fogarty, 2010).

In particular, in the accounting field, the professional environment imposes relatively strict forming requirements: "education for the accounting profession must produce graduates who have a broad array of skills and knowledge" (Big Eight Firms, 1989 p. 5). For the master graduates, the American Institute of Certified Public Accountants (AICPA) stipulates the main goal of the professional formation, respectively: "technically competent and who possesses the analytical abilities, communication and interpersonal skills, and cultural awareness that will enable them to serve the public in a complex and changing environment" (AICPA, 1992 p. 2).

By taking into account the binding aptitudes and the students' expectations, the organizations and private firms formulates particular aptitudes expected from the students (Mazni and Zamzulaila, 2006).

In this article, we demonstrate that the students' evaluations regarding the possibilities of employment are modified as they advance in the study programme. Furthermore, this evolution is influenced by employment during the period of the studies and by the professional practice.

III. Methodology

The questionnaire was applied on the 60 students enrolled now in the second year of the master programme, twice – once at the end of the first year of study and afterwards at the end of the first semester of the second year of study. Through the questions used, where assessed aspects that could draw a picture regarding the general opinion of the students in respect to the programme.

The present paper presents aspects related to:
- the most important consequence of the programme,
- the proportion in which the programme is considered to influence the finding of a job in the field,
- the status on the labour market.

Beside them, the original questionnaire contained questions regarding:
- the reason for enrolling in this master courses,
- the time considered as necessary to find a job in the field after graduating,
- the field of the bachelor degree,
- different average grades obtained at the end of the bachelor period, at the entrance exam, etc,
- demographic variables.

The data obtained was processed with the help of descriptive statistics, multidimensional data analysis and qualitative econometrics methods. Hereinafter are presented the descriptive results of the three aspects mentioned above.

IV. Results

Bearing in mind the purpose of the present paper, results will be presented further on comparatively, for each of the aspects assessed in the questionnaire.

The most important consequence of the programme was the first aspect evaluated in the questionnaire. As table 1 emphasizes, for the majority of the students, the most important consequence of being enrolled in this educational programme is improving the personal knowledge. However, one can see that opinions have slightly changed in time, the share of this group in the sample diminishing by more than 10%. Has increased the number of students considering that they will be able to obtain a job in accordance with their new qualification. Moreover, almost 4% of the student now estimate they will be able to get higher remuneration, while at the beginning of the analysis process, none of them had chosen this variant.

*Table 1.***Distribution of the students based on the most important consequence of master programme**

	Percentages 1st year	Percentages 2nd year
Improving the personal knowledge	67.9	57.7
Getting a job in accordance with my new qualification	32.1	38.5
Obtaining higher remuneration	0.0	3.8
Total	100.0	100.0

Source: authors' calculus

Once with advancing in the study programme, the opinions also improved in what regards the degree in which the students will be able to find a job in the field. On a scale form 0% to 100%, we chose to group the answers into ten equal groups. After the first year (two semeters), the majority of the answers were situated in the range 50% - 60%. This group represented 25% of the answers. Moreover, 46.4% of the students gave values of maximum 50%. And only about 20% of the students considered the enrollment in this programme will help them find a job in the field in a higher degree. In comparison, after three semesters, at the middle of the second year of study, the mode group went up one range, being situated between 60% and 70%. The share of the modal group in the volume of the sample is 22.2%. The level of 50% is now the maximum value for less than 35% of the students. In the same time, this master programme will contribute to a higher extent to getting employed in the field for more than 25% of the students. Figures 1 and 2 present comparatively the results.
*Figure 1.***The degree in which the master programme will contribute to finding a job in the field – results after two semesters (1st year)**.

Source: authors' calculus.
*Figure 2.***The degree in which the master programme will contribute to finding a job in the field – results after three semesters (2nd year)**.

Source: authors' calculus.

*Table 2.***Distribution of the students in accordance with their status on the labour market.**

	% 1st year	% 2nd year
Not employed	**33.33**	25.93
Employed, but in other fields than accounting, audit, structural funds	22.81	11.11
Employed in accounting or audit, but not in the field of the master programme	28.07	29.63
Employed in the field of the master programme	15.79	**33.33**
Total	100.00	100.00

Source: authors' calculus

As the opinion about the contribution of the educational programme to finding a job in the field improved in time, we were also curious to see how the actual status of the students on the labour market evolved. The results show important changes that have occurred. For example, if at the beginning of the analysis one third of the students were not working anywhere, at the end of the studied period, the same share were now being employed in the specific field of the master programme. The percentage of the last group more than doubled, emphasizing a positive effect of the educational programme on the active life of the students on the labour market.

V. Conclusions

As the Results part shows, changes could be seen in the evolution of the perceptions students have related to the educational programme they are involved in. They are more aware about the importance of the new knowledge gained on the labour market. Moreover, the quality of the programme could be seen in the improvements in the students' employment status in relation with the field of interest.

Miculescu Marius Nicolae
"Dimitrie Cantemir" Christian University, Faculty Of Management Tourism And Commerce Timisoara

Abstract: This article provides information on business and therefore need managers to obtain information relevant accounting, reliable, clear, accurate and lowest costs to optimize decision making. This need derives from the current economic environment. The survival of organizations in a competitive environment, to which they must adapt, is conditioned by obtaining accounting information which should be qualitative, opportune, vital, and in a short time. This information is related to patrimony, analytical results, the market (dynamics, dimensions, and structure), and relationships with business partners, competitors, suppliers. Therefore focus more intensely on the quality of accounting information. Definition of quality of accounting information but leave the boundaries and features of accounting communication process and aims to determine "quality criteria" or "qualitative characteristics" to develop a measurement tool. Note that the reviewliterature was found that the normalization and accounting dotrine, criteria for definition of quality of accounting information are not identical, their selection and ranking is different. Theory and practice also identifies the fact that information itself is worthless. Instead it is valuable once it is used in a decisional process. Thus, the economic value of the accounting information depends on the earnings obtained after making a decision, diminished by information cost. To be more specific, it depends on the table or on the implemented decision tree, on the informational cost and on the optimal condition established by the decision maker (due to the fact that producing accounting information implies costs which are often considerable and profits arise only form shares). The problem of convergence between content and interpretation of information sent by users also take, and the quality of information to be intelligible. In this case, those who use, say users should have sufficient knowledge about business and accounting. Also were studied data on how the easiest to increase intelligibility provided by management accounting information. It was found that there are different possible behaviors of managers in the dissemination of accounting information in relation to how the organization deals with information about the external environment and as a result of research efectaute have identified some solutions that managers can limit the effects of uncertainty in information dissemination accounting. Therefore the present study, the detailed approach and identify the quality requirements of modern economic information system, comes to effectively support managers in making decisions.
Key words: accounting information, relevance, incertitude, decision, costs
JEL classification: M40, M41, M49

1. Introduction

Nowadays, economic organizations can no longer be led through traditional methods based on intuition, experience and talent, manifested by a manager. This phenomenon has been generated by the increasing complexity of elements which are led, by the dynamics of economic process both in production and in other fields of activity. It is necessary to have a specific activity of informing which should connect the leading process to the execution process. *Information* has become not only "raw material", needed by leaders but also the linking part between the two

processes. Only with the help of information can the deciding party observe permanently the economic processes for the entity as a whole, for each part of the activity and it can also act upon them. That is why treating the *accounting information system* as a component of management is necessary and opportune at present, as managers are aware of their roles.

In the economic context, managers have to answer many important questions, such as: Is there enough cash to pay taxes? What is the production cost of each product category? Can the enterprise afford raising salaries? Which production line is more profitable? etc.

Thus, to find solutions to these problems, the manager must be capable of defining the type of information needed and required, and the informational system should be capable of offering the information.

Practically, things are not exactly as stated, as the manager is forced by circumstances to use available information from all available sources. Peter Drucker underlined that *„the manager will never be able to take over all actions needed. Most decisions are based on incomplete knowledge – due to the fact that information is not available and it would cost too much time and money. Nothing is more painful, more common than the presupposition that we should wait for decisions based on incomplete information”.*

Thus, despite objective difficulties in obtaining, producing information, managers need qualitative accounting information to help them plan, adopt, implement and control decision.

2. Evolution of economic thought on criteria and qualitative characteristics of accounting information

Defining the quality process of accounting information starts from delimiting particularities of the process of communicating in accounting and it aims at „quality criteria” or „quality characteristics” in order to elaborate a measurement instrument.

It is a fact that, *in accounting norms and doctrine, criteria which allow defining the quality concept of accounting information are not identical, as their selection and hierarchy are different* (Minu, M., 2002:111-138).

American norms stated in[88] Statement of Financial Accounting Concepts no.2 identify the following characteristics: intelligibility, pertinence *(relevance), feasibility and comparison. This concept reveals that „utility of information in making decision”* is the first quality. It is ensured by *relevance, feasibility of provided information considered primary qualities.*

On a global level, accounting norms[89] have been strongly influenced by the American concept and it has the same characteristics: intelligibility, pertinence *(relevance), feasibility and comparison*. The general restriction is identical with the one specified by FASB (Financial Accounting Standards Board): production cost or analysis of information should be less expensive than the cost brought by using information.

In Great Britain, specialized organisms[90] have different points of view from the American ones: *relative importance* is the prime quality for information to be useful; *relevance and feasibility* are main qualities and comparison and intelligibility are secondary qualities.

According to French norms[91], „ *accounting information should give users an adequate, loyal, clear, precise and complete description of events and situations”*. French norms used to think that accounting information has as an objective a clear image of represented reality and it followed the principles: regularity, honesty, prudence. It did not suppose any hierarchy or articulation of quality criteria. At present, there is a structure of qualitative characteristics and ideas referring to the quality of accounting information, different from Anglo-Saxon ones. Thus, the *object of*

[89] IASB- International Accounting Standards Board; IASC-International Accounting Standards Committee

[90] ASB - Accounting Standards Board

[91] CNC - Conseil national de la comptabilité; OECCA - Ordre des Experts - Comptables et Comptables Agréés

accounting information in annual financial statements is „to offer a useful representation of reality in an enterprise", and the characteristics of accounting information are: *pertinence, intelligibility* and other characteristics which comprise a series of accounting principles (such as method permanence), as well as relative *importance, cost, opportunity and comparison.*

In Romania, after the changes occurred in three essential stages (1990-1994, 1994-2005, 2006-present) Romanian norms[92] have adopted and introduced quality criteria in elaborating and spreading information as IASC did. Thus, in „The general framework to set up and present financial statements", elaborated by the Committee for International Standards in Accounting, in the chapter „Qualitative characteristics for financial statements", point 24 it is stated "*Qualitative characteristics are the attributes that determine utility of information offered in financial statements. The four qualitative characteristics are: intelligibility, relevance, credibility and comparison."* Also, *„applying main qualitative characteristics and adequate standards has as a result financial statements which reflect a real image of the enterprise."*

A conclusion on the above points of view may give a definition of qualitative characteristics of accounting information:

-*pertinence (relevance)* → capacity of the information to influence decisions and to allow assessment of past, present and future events, either by confirming them or by correcting past evaluations.

-*feasibility* → presupposes a lack of errors or elements which lead to misinterpretations and is appreciated according to neutrality, prudence, credibility, integrity, allowing a real representation of a situation.

-*intelligibility* → represents the quality to be easily understood by users, if they have enough knowledge on business, economic activity and accounting.

-*comparison* → is the quality to capitalize on information, both in time and space.

At the same time, we can observe a controversy about hierarchy of qualitative characteristics by norm organizations, some of them considering (ASB, FSAB) pertinence and feasibility as main characteristics, others (IASC/IASB, OECCA, CECCAR) intelligibility and pertinence.

The main common point is given by the fixed objective which can be thus summarized *"accounting information must serve to make an economic decision".*

In practice, establishing equilibrium between qualitative characteristics is necessary because no information may have all qualities, more often than not, the focus is on a single characteristic. In general, the aim is to realize a balance between characteristics. The relative importance in different cases is a problem of professional rationale.

3. The quality of accounting information in the decision making process

Accounting information does not have intrinsic value, it acquires value when it is used in the decision making process. Thus, the economic value depends on the earnings obtained from making an optimal decision. To be more specific, it depends on the table or on the implemented decision tree, on the informational cost and on the optimal condition established by the decision maker (due to the fact that producing accounting information implies costs which are often considerable and profits arise only form shares).

Thus, quality is appreciated according to two parameters:

      -information utility;
      -information cost.

These parameters sustain the idea that *production cost or analysis cost of information should be lower than the profit made after using the information.* Thus, according to general economic principles, additional information should be produced only if the value is higher than costs. (Diaconu, P., 2002:78).

---

[92] CECCAR – Romanian Certified Accountant Expert Board

There are *differences in the hierarchy of main qualitative characteristics* (Diaconu, P., 2002:10): if information provided by financial accounting is feasible (*credible*) and pertinent (*relevant*), in managerial accounting pertinence (*relevance*) is more important than feasibility (*credibility*).

This controversy is determined and maintained by the modality to carry on a task:

-financial accounting has to provide exact information, and, at the same time, neutral, prudent and exhaustive to all users, not to allow making a decision in an uncertain environment, even if it is affected by the operability to provide information;

-managerial accounting operates with relevant data, based on statistics, which are sometimes incomplete, but can be the base of managerial decision.

Thus, imposing qualitative characteristics, even in a hierarchy is a necessary condition but not sufficient to have the guarantee of quality.

Some authors (Cristea, H., 2003:14-15) think that managerial accounting information is complex and refers to relevance for leaders' responsibilities, relevance in decision making process, in obtaining real-time valuable information.

For information to be produced by managerial accounting and useful in the decision making process, it should have a series of traits (Diaconu, P., 2002:79). It should

    -reflect economic reality correctly;
    -be relevant for the person who uses it;
    -be produced in real time;
    -be correct;
    -be intelligible.

The problem of convergence between content of sent information and its interpretation by users is also related to the quality of being intelligible. In this case, users should possess enough knowledge about business and accounting. In order to increase *intelligibility of provided information by managerial accounting* we should:

    -avoid terminology difficult to understand
    -use diagrams and tables;
    -use reports and comparative figures;
    -use flexible models to present reports;
    -present reports and negative factors together with solutions to eliminate them
    detail the level of reporting.

It is concluded that there are possible behaviours of managers to spread information in accounting based on how they approach the data on the exterior environment, that is:

-if the environment is stable, uncertainty is strong and past actions become irrelevant, managers will try to demonstrate obtaining future performance by presenting actions which allow adapting and controlling the environment;

-if the environment is stable managers sustain the capacity to obtain future performances by appealing to past performances.

Due to these situations, managers' behaviours in spreading information will be different:

managers who manifest reduced tolerance to uncertainty propose a less formal spreading and try to present the real situation of the enterprise;

managers who manifest increasing tolerance to uncertainty will only offer compulsory information without explaining and controlling uncertainty;

Beyond these considerations, there are some solutions which can limit the effects of uncertainty*:*

presenting outcomes or outgoings as variation intervals;

using three points of estimation (maximum level, minimum and medium level);

associating probability to a production value to be achieved;

using sensitivity analysis – this process represents the variation of factors that determine a situation (sales volume, unitary cost, inflation rate, sales price per unit, etc.) and registering their

effect on outgoings. Thus, sensitive factors are identified and analysed before making a final decision;

using trustful intervals when elements can vary from a statistical point of view.

If accounting information, as a result of a modern informational and economic system, may efficiently support the manager in making decisions, it has to satisfy the following *requirements*:

-to provide concrete data so that the manager may anticipate the effect of a decision;

-to present the information uniformly, constantly and operatively;

-to identify, structure and quantify significant relationships from the past, anticipating future reports using modern mathematical methods;

-to combine financial data with data on basic activities in order to appreciate achievements, to control expenses and ease the making of decisions;

-to overcome difficulties and threats in an enterprise as a whole;

-to cover information until a certain level, and the degree of details should correspond to the hierarchical level, thus reducing the necessary time to read information reports;

-to use personnel and technical equipment efficiently and effectively to realize speed and precision with minimum costs;

-to present data and information so that it minimizes future interpretations and analysis;

-to ensure elasticity and adaptability to change for the unit;

-to be realized as a whole with minimum costs.

4. Conclusions

In the present economic context, enterprises are forced to continually adapt to a turbulent economic environment induced by global economic crisis which become increasingly difficult to predict, being, at the same time under the pressure of ensuring the maximum security to all interest factors: investors, banks, clients, suppliers, unions, governmental institutions, etc. This situation, although it complies with the logics of the process, presents difficulties for managers. Accounting information comes as an intrinsic component of the informational system and it is a useful instrument to run a modern enterprise, due to the following factors:

-the majority of decisions in an entity are provided by accounting;

-it has the role of supporting the management by offering information related to planning and control;

-it allows managers to have an image over the whole organization;

-it has the role of helping mangers reduce waste and create value;

-it links other components of the information system of the entity (marketing, production, personnel, etc.);

-it is a measurement instrument for the economic performances.

The role of accounting information, its qualities and characteristics have significantly increased in the past decades due to the fact that it influences users' behavior in the process of decision making. It is obvious that each user wants to have relevant qualitative information with low costs, in order to diminish uncertainty and to offer the possibility to make the best decisions, these requirements designating, in fact, the necessity to produce qualitative accounting information.

VALUE RELEVANCE OF GROUP FINANCIAL STATEMENTS BASED ON ENTITY VERSUS PARENT COMPANY THEORY: EVIDENCE FROM THE LARGEST THREE EUROPEAN CAPITAL MARKETS

Müller Victor-Octavian
Babeş-Bolyai University,
Faculty of Economics and Business Administration, Cluj-Napoca, Romania

Financial statements' main objective is to give information on the financial position, performance and changes in financial position of the reporting entity, which is useful to investors and other users in making economic decisions. In order to be useful, financial information needs to be relevant to the decision-making process of users in general, and investors in particular. Regarding consolidated financial statements, the accounting theory knows four perspectives (theories) on which the preparation of those statements is based, namely, the proprietary theory, the parent company theory, the parent company extension theory and the entity theory (Baxter and Spinney, 1975). Of practical importance are especially the parent company extension perspective and the entity perspective. The IASB and FASB decided (within an ED regarding the Improvement of the Conceptual Framework) that consolidated financial statements should be presented from the perspective of the group entity, and not from the perspective of the parent-company. However, this support for the entity theory is to our knowledge not backed by empirical findings in the academic literature. Therefore, in our paper we set to contribute with empirical arguments to finding an actual answer to the question about the superior market value relevance of one of the two concurrent perspectives (theories). We set to carry out an empirical association study on the problem of market value relevance of consolidated financial statements based on the entity theory respectively on the parent company (extension) theory, searching for an answer to the above question. In this sense, we pursued an analysis of market value relevance of consolidated accounting information (based on the two perspectives) of listed entities between 2003-2008 on the largest three European Stock Exchanges (London, Paris and Frankfurt). The obtained results showed that a „restrained" entity perspective, which would combine elements of entity theory (by focusing on the whole group equity) and elements of parent company extension theory (by focusing on income corresponding to majority interest), would have a superior relevance compared to the classical versions of the two mentioned perspectives.
Keywords: Consolidated Financial Statements, Entity Theory, Parent Company Theory, European Capital Market, Market Value Relevance

I. Introduction and Literature Review

Financial statements' main objective is to give information on the financial position, performance and changes in financial position of the reporting entity, which is useful to a wide range of users in making economic decisions. In order to be useful, financial information must be relevant to the decision-making process of users in general, and investors in particular, meaning that it must have the capacity to influence their economic decisions. In fact, relevance constitutes one of the main characteristics of financial information quality (Francis et al. 2004: 968). Moreover, in the revised Conceptual framework (2010), IASB named relevance and faithful representation as the two fundamental qualitative characteristics of financial information (QC5). Therefore, in order to make assessments on the quality of information of financial statements, it is absolutely necessary to quantify this relevance (capacity to influence) of financial information.

An appropriate environment to perform such a measurement is the capital market, where investors' decisions (as users of financial information) are reflected directly in the share price of the reporting entity. In this context, market value relevance is measured by the ability of financial information to capture or summarize information that influences share prices (Francis and Schipper 1999: 325). According to the same authors market value relevance means the existence of a statistical correlation/association between financial information and prices or returns, and also the fact that this information explains market prices to an extensive measure, starting from the presumption of the efficient market in which prices reflect the available information (Francis & Schipper 1999: 326).

Regarding consolidated financial statements, the accounting theory knows four perspectives (theories) which the preparation of those statements is based upon, namely, the proprietary theory, the parent company theory, the parent company extension theory (which is an improved parent company theory) and the entity theory (Baxter and Spinney, 1975). Of practical importance are especially the parent company extension perspective and the entity perspective (theory). While the entity theory presents assets, liabilities and transactions from the perspective of the whole group as an economic entity, the parent company (extension) theory focuses on assets, liabilities and transactions (only) from the perspective of the parent company and its shareholders (Küting and Weber, 2006).

Within the exposure draft (for phase A) regarding the improvement of the Conceptual Framework – entitled „Objective of Financial Reporting and Qualitative Characteristics and Constraints of Decision-useful Financial Reporting Information", the IASB and FASB decided that consolidated financial statements should be presented from the perspective of the group entity, and not from the perspective of the (owners) parent-company. However, this support for the entity theory is to our knowledge not backed by empirical findings in the academic literature.

Topics regarding group financial statements have been approached by several authors within the last two decades (e.g. Harris et al., 1994, Niskanen et al. 1998, Abad et al. 2000, Goncharov et al., 2009, Müller, 2011 – which investigate the relevance of consolidated financial statements as compared to individual financial statements; Bartov et. al, 2005, Jermakowicz et al., 2007, Barth et al., 2007, Lin and Paananen, 2007 – which investigate the impact of IFRS adoption on consolidated financial statements). However, from what we know, the topic regarding the influence of accounting theories on the value relevance of consolidated financial statements was tackled empirically only by Abad et al. (2000). In that reference paper, however, statistical evidence based on a sample of Spanish firms listed on the Madrid Stock Exchange shows that (from the point of view of market value relevance) closeness to the entity theory is not justifiable. Therefore, in our study we set to contribute with empirical arguments to finding an actual answer to the question about the superior market value relevance of one of the two concurrent perspectives (theories).

Considering all these aspects, we set to carry out an empirical association study on the problem of market value relevance of consolidated financial statements based on the entity theory respectively on the parent company (extension) theory, searching for an answer to the above question. In this sense, we pursued an analysis of market value relevance of consolidated accounting information (based on the two perspectives) of listed entities between 2003-2008 on the largest three European Stock Exchanges (London, Paris and Frankfurt).

II. Research Methodology

In this empirical research we pursued the analysis of market value relevance of consolidated accounting information on companies listed on the largest three European stock markets (London Stock Exchange, Paris Stock Exchange and Frankfurt Stock Exchange) in 2003-2008. The main criteria for the selection of companies is the belonging to the main index which includes the first 100 of the largest and most traded companies on that particular stock exchange (FTSE 100,

EURONEXT100, HDAX 110). We excluded financial and insurance companies from the sample because their structure and accounting practices differ significantly from those of non-financial companies (Hellström, 2006: 335). As well, to eliminate composition differences of the sample from one year to the other (which would affect comparability of results in time), we excluded companies that have not been listed on the stock exchange for the whole analyzed period. At the same time, to increase the homogeneity of the sample and to use the same time span (31.03 – 30.04) to determine average share price, companies with closing dates different from 31.12 were excluded.   Therefore, after going through these steps, the final sample is made up of 98 companies, respectively 588 firm-year observations. We computed average closing share prices for 31.03 – 30.04 of each year, thus neutralizing possible daily fluctuations of the prices, caused by factors that are not linked to the financial information published in the annual reports.

For the purpose of this study, we formulated the following hypothesis concerning the comparison of the value relevance between entity theory based and parent company extension theory based consolidated financial statements:

Information supplied by consolidated financial statements in the view of entity theory are more relevant (market value relevance) than information supplied by consolidated financial statements in the view of parent company extension theory.

In order to compare the value relevance of information supplied by consolidated financial statements based on the entity theory respectively on the parent company theory, the following empirical models were elaborated:

Model 1: $Pit = \alpha0 + \alpha1 * BVit + \alpha2 * Eit + \varepsilon it$ (1)
Model 1: $Pit = \alpha0 + \alpha1 * CiBVit + \alpha2 * CiEit + \varepsilon it$ (2)

Where

Pit	=	share price of company i in year t
BVit	=	book value of group equity/share of company i in year t
Eit	=	group earnings (net income)/share of company i in year t
CiBVit	=	book value of group equity related to the controlling interest/share of company i in year t
CiEit	=	group earnings related to the controlling interest /share of company i in year t

This models measure the degree of association between share price and accounting information supplied by financial statements (equity and net income). The basis for this models is the Ohlson (1995) valuation model, which expresses share price as a function of current accounting value of equity plus discounted value of future (abnormal) results.

We statistically measured the explanation power of these models quantified by adjusted R^2. Confirming the first hypothesis assumes that explanatory power of model 1 (based on the entity theory) is superior to the explanatory power of model 1 (based on the parent company theory).

III. Results

To test the hypothesis we compared the explanatory power of model 1, as exponent of entity theory and model 2, as exponent of parent company theory (Table no. 1). While the explanatory variables of model 1 refer to group financial information (based on the entity theory), the variables in model 2 present financial information referring only to the controlling interest in the group (i.e. nased on the parent company theory).

The comparative analysis of the empirical results obtained for the two regression models (Table no. 1) reveals, for the whole sample, a minor difference (of 0,6%) in favour of model 2. By doing this comparison for each year, one can notice a fluctuation in the difference between the explanatory power of the two models, between 4,1% (in favour of model 1) and 3,3% (in favour of model 2). Obviously, these preliminary results (for the analysed complete sample and sub-samples) refute the hypothesis of superior relevance of information provided by consolidated financial statements from the point of view of entity theory.

Table no. 2: Empirical results regarding the difference of relevance between models 1 and 2

		2003	2004	2005	2006	2007	2008	2003-2008

Made by the author

Trying to obtain more conclusive results, we applied the two regressions to a smaller sample (n=85), composed only from those observations for which the weight of non-controlling interest in group equity is at least 10% (or in other words, the difference between group equity and the equity corresponding to controlling interest is more than 10%). The results of this analysis (Table no. 3) reveal a slight superiority of the power of explanation of model 2 as opposed to model 1. All these empirical evidence finally lead to refuting the fifth hypothesis regarding the superiority of consolidated information from the point of view of entity theory.

Table no. 3: Empirical results for models 1 şi 2 applied on the reduced sample

The very tight results obtained for the two empirical models, as well as the slightly higher correlation of share price to group equity and controlling interest earnings, determined us to investigate the market value relevance of a restricted entity theory, based on group equity – as synthetic measure of the economic power of the group (conferred by total assets and liabilities controlled directly or indirectly by the parent company) and respectively on earnings corresponding to the controlling interest – as measure of group performance corresponding to parent company shareholders. This restricted entity theory would combine, therefore, entity perspective (by focusing on the whole group equity) and parent company perspective (by focusing on earnings corresponding to majority interest). Therefore, this econometric model developed to measure market value relevance of restricted entity theory (equation 3) includes as independent variables group equity/share and group earnings corresponding to controlling interest/share, this last variable actually being the well-known earnings per share (EPS).

  Model 3: $P_{it} = \alpha_0 + \alpha_1 * BV_{it} + \alpha_2 * CiE_{it} + \varepsilon_{it}$ (3)

By comparing the obtained empirical results for this model (Table no. 4), applied for the whole sample, as well as for the restricted sample, with the results of models 1 and 2, one can notice the superiority of explanatory power of model 3. This is more marked when applying the model on the restricted sample, in which case the explanatory power of model 7 is with 2,4% higher than model 2, respectively with 3% more than model 1. Considering these results, we conclude that for the (analysed) capital market, consolidated financial statements perceived through the restricted entity theory (as it was defined above) present a superior relevance as opposed to the same statements perceived through entity theory, respectively through parent company theory.

IV. Conclusions

In this study we statistically compared the entity theory and parent company (extension) theory through the point of view of the value relevance of consolidated financial statements. The developed hypothesis regarding the superiority of entity theory (inspired by the joint decision of IASB and FASB to prescribe presenting consolidated statements from the perspective of the group entity) was statistically refuted. This conclusion is, as a matter of fact, in accordance with the empirical results obtained by Abad et al. (2000), according to which there is no justification

(from the point of view of market value relevance) for a conceptual closeness to entity theory. In our study we showed, however, that a „restrained" entity perspective, which would combine elements of entity theory (by focusing on the whole group equity) and elements of parent company extension theory (by focusing on income corresponding to majority interest), would have a superior relevance compared to the classical versions of the two mentioned perspectives.

In the end, some aspects regarding the limitations of this study should be mentioned, as well as the perspectives of future empirical research. First, it is possible to raise the problem of sample representativeness (and implicitly of the results obtained) for the German capital markets. In this respect, future research could extend the analysis (and the sample) to other capital markets in Europe, as well as to companies that are not included in the main index of the stock market they are listed on. Second, the obtained results are based only on testing linear price level regression models. Future research could employ nonlinear models, for example logarithmic models (see Hellström, 2006) respectively return regression models (see Bartov et al. 2005). And third, the present study investigates relevance and therefore usefulness for decision making of consolidated financial statements only from the point of view of the investors on capital market. So, a future research theme less approached until now (see Goncharov et al. 2009) would be to investigate the relevance of financial statements from the perspective of other categories of users (for example financial institutions in their role as creditors).

COMPANY PERFORMANCE MEASUREMENT AND REPORTING METHODS

Nicu Ioana Elena
West University of Timişoara
Faculty of Economics and Business Administration

One of the priorities of economic research has been and remains the re-evaluation of the notion of performance and especially exploring and finding some indicators that would reflect as accurately as possible the subtleties of the economic entity.

The main purpose of this paper is to highlight the main company performance measurement and reporting methods. Performance is a concept that raises many question marks concerning the most accurate or the best method of reporting the performance at the company level. The research methodology has aimed at studying the Romanian and foreign specialized literature dealing with the analyzed field, studying magazines specialized on company performance measurement. If the financial performance measurement indicators are considered to offer an accurate image of the situation of the company, the modern approach through non-financial indicators offers a new perspective upon performance measurement, which is based on simplicity. In conclusion, after the theoretical study, I have noticed that the methods of performance measurement, reporting and interpretation are various, the opinions regarding the best performance measurement methods are contradictive and the companies prefer resorting to financial indicators that still play a more important role in the consolidation of the company performance measurement than the non-financial indicators do.

1. Company performance – conceptual approaches

Performance will always remain a contested, continuously-evolving concept. The performance concept can be narrowed down through an almost infinite number of definitions, many of which refer to specific contexts or functional perspectives. Reaching a consensus regarding the definition of performance is difficult at the level of an entity, since we must take into account the type of activities a certain entity is specialized in and the different interests of the one involved. Most times the objectives of the entities tend to be vague, constantly shifting, controversial and, sometimes, contradictive. Under these circumstances, the performance is a subjective and multi-faceted phenomenon. As to what an economic entity is concerned, many shares may influence or are influenced by the activities provided by the respective entity and this is exactly why divergent perspectives regarding the performance exist on a large scale. The specialized literature offers no unitary outlook upon the concept of performance, it either gives particularized definitions, which encompass certain facets, or general definitions that are difficult to quantify (Siminică 2008: 107):

- M. Porter considers that the company performance depends upon its capacity of creating value for its clients;
- A. Buirguignon defines performance as reflecting the accomplishment of organizational objectives;
- Eli Cohen associates performance with efficiency, analyzing the results obtained by the company in comparison with the used resources;

- Philippe Lorino states that, for a company, performance represents what contributes to optimizing the value-cost couple and not only what contributes to diminishing the cost or raising the value;
- C. Marmuse considers performance to be the element that, on the long run, keeps the competition at a distance through a strong motivation (based on rewarding systems) of all the members of the organization.

Bourguignon's definition of performance, based on the *action-result-success* trinomial is very widely used in the specialized literature. The essence of this approach consists in defining the three dimensions as follows (Bourguignon 1997: 89-101):
- **action performance:** performance is a process and not a result that occurs at a certain point;
- **result performance** (result of the action)**:** performance measurement is understood as an evaluation of the results obtained as the consequence of an activity (process). This meaning relates only to value: performance measurement is regarded as an ex-post evaluation of the obtained results.
- **success performance:** performance does not exist independently, but it depends on the company representation of success made by various categories of users of the accounting information.

Performance can be defined as a state of competitiveness of the economic entity, reached through an efficiency and productivity level, which ensures its durability on the market (Niculescu 2005: 43).

Professors C. Bărbulescu şi C. Bâgu have stated that performance represents the level of best obtained results. They consider that, correlative performance measurement implies concepts of competitiveness and competition advantage (Bărbulescu şi Bâgu 2001: 55). However, it is inevitable that the performance notion foregrounds efficiency and effectiveness and that expression indicators acquire a special diversity. Reaching a company-level performance implies direct or indirect re-evaluation of the competitiveness, competition advantage, efficiency and effectiveness concepts.

2. Financial performance measurement indicators

In the course of time, performance has been either measured through the size of the company or through its productivity and profit. Managerial accounting researchers have become aware of the fact that performance at an organizational level cannot be quantified only through accounting or financial indicators. Especially that in the new age organizations cannot raise their competitiveness only for the rapid development of new technologies represented by physical shares or by an excellent management of shares and financial debts.

In the specialized literature, financial indicators related to the company performance are presented in three large categories:

- *Accounting result and derivative indicators.* The accounting result is actually the result from the financial statement. It is a fundamental indicator that can be explained through a structural analysis of the profit and loss account, namely an analysis of the intermediary balances of administration. The accounting indicators present the company performance in absolute values. Using rate indicators is recommended for various comparisons: the personnel expenses balance in the turnover, the productivity rate, the commercial margin balance in the turnover, etc. These indicators offer an image concerning productivity;

- *Traditional productivity indicators.* These indicators offer information regarding productivity, namely, reporting is made at the value of the invested assets. The most well-known indicator is ROI (return on investment), determined as a ratio between result and invested values. A traditional productivity indicator is the *Financial productivity ratio* determined as a ratio between net result and company equity (known as ROE – return on equity in the specialized literature). The financial productivity ratio offers information that allow companies to make comparisons

regarding the productivity expected by shareholders and, therefore, to assess the financial attractiveness of the company. Another indicator used to evaluate the economic productivity is the Return on capital employed (all the used financing methods are being taken into consideration) determined as a ration between the operating result and the capital employed;

- The new category of financial indicators. A representative indicator is EVA (Economic Value Added), whose positive value suggests that the company has managed to create value from a strictly financial point of view after payment of all capital contributions and especially after payment of capital shareholders. The economic value added is determined based on the relation:

Operating result = operating result – (average weighted cost of the capital x adjusted capital employed)   (1)

EVA is an indicator that is better related to the stock market flow than other financial measures. From the perspective of the local performance, this indicator is used for evaluating the performance of divisions at a group level.

Financial indicators offer a short-term perspective upon performance, which represents one of the limits most frequently formulated. The information offered by them do not allow for a good reactivity on behalf of the managers. Another limit is represented by the fact that financial indicators are indicators of result and not of process, they are the effect of decisions of various origins and, through time reporting, of various durations. The information offered by these indicators is often difficult to comprehend by the managers. Financial indicators are often the result of complex and even debatable calculations, requiring complex economic and financial knowledge. Generally, the information provided to the deciding factors must be obtained rapidly and it must be intelligible in order to facilitate quick decision-making.

The fields of interest concerning management, investors and creditors are presented in the following table, together with the most frequently used methods of performance measurement.

Table no. 1. Performance indicators according to segments and perspectives

Management	Investors/Shareholders	Creditors
Operational analysis	**Investment productivity**	**Liquidity**
Gross margin	Net assets productivity	General liquidity
Profit margin	Social capital productivity	Acid test
Added value	Earnings per share	Liquidity value
Gross revenue surplus	Cash flow per share	
Net revenue result	Share quotation increase	
Analysis of operational expenses		
Structural analysis	Total productivity for shareholders	
Revenue leverage

Resource management	**Profit usage**	
Asset turnover	Dividend per share	Leverage degree
Working capital management	Dividend ratio	Financial stability (Debts/Capitalization)
	Distribution/un-allocation ratio	Financial autonomy (Debts/Equities)
Stock turnover	Dividend-coverage degree	
Receivables turnover	Dividends/Total assets	
Suppliers turnover		
Productivity	**Market performance**	**Debt service**

Economic productivity (net)	PER	Interest-coverage degree
Gross productivity	Cash-flow multiplication degree	Debt-coverage degree
Net assets productivity	Value on market/Accounting value	
Economic value added		Fixed-expenses coverage degree
Economic profit	Relative movements of quotations	
Cash-flow productivity		Cash-flow analysis
Free cash-flow	Value vectors	
	Company value	

Sourse: Helfert 2006: 113

All the three basic groups are interested in the success of the business, each from a different point of view. From the variety of the presented indicators, the crucial business test is the productivity of the invested capital and its effect upon the assets owned by the shareholders. These indicators are the best interpreters when they are approached as a system of correlations, sensitive to managerial decisions, which may be influenced by the evolution of the specific value-creating vectors.

Many individual indicators are, by nature, merely static elements and cannot be interpreted accurately in the context of activity dynamics. The drawbacks are connected to the limits of the traditional accounting principles. This way, the necessity that managers should adopt an economic perspective, based on cash flows, in order to consolidate the decision-making activity, which, on the long term, will also determine a performance based on accounting information, has been highlighted.

3. The profit and loss account – image of performance

The complex informational background of the financial statements has led to their being acknowledged, nationally, as well as internationally, as the manager's fundamental instruments on all organizational levels. Referring to their importance, P.A. Samuelson, Nobel prize winner for Economics, states: *it is compulsory for the modern man to gain at least some knowledge in the accounting elements. Everyone that works in economics must be able to understand the two essential mapping features, balance and the profit and loss account.* (Samuelson 1964: 107)

Alongside the other components of the financial statements, the profit and loss account provides information regarding the company performance, each company's objective and each investor's mission.

In time, the profit and loss account has been the subject of concern for specialists and normalizers.

As a first performance-reflection model, the profit and loss account has been outlined in 1494 by Luca Pacioli, who considered that "the purpose of each merchandiser is to make profit that is legal and competent for his sustenance" (Paciolo trans. by Rusu and Cuciureanu 1991).

The profit and loss account represents the effect of the operational decisions of the management upon the company performance, upon profit, and upon loss for shareholders for a certain period, respectively. The profit and loss calculated within this document increases or reduces shareholders' level of equities from the balance sheet. Therefore, the situation concerning the obtained results is a necessary extension of the balance, in order to gain accuracy regarding some important components of the modifications in shareholders' capital, and in order to offer detailed information necessary for the measurement of a company's performance.

The information regarding the company's performance, and especially regarding its productivity, reflected in the profit and loss account, is used for:

- evaluating potential modifications of the company's economic resources so that they can be controlled in the future. The information regarding performance changeability is therefore extremely important.

- anticipating the company's capacity of generating treasury flows with the existing resources.
- formulating statements regarding the company's efficiency in using new resources.

The presentation method of the profit and loss account varies from one country to another, according to the informational contents and the form of presentation. The impact of the implementation of the 4th Guideline by the European Union member states has generated a host of profit and loss account models. In countries like Belgium, France, Italy, Portugal and Spain it is illegal that commercial societies publish their profit and loss accounts with the classification according to functions. Even among the countries that allow the four models to be used there are various varieties of their usage, as can be seen in the following table:

Table nr. 2 Methods of the profit and loss accounts in the countries of the European Union

Source: Ştefănescu 2005: 126

The development of the financial markets and of the financial communication requirements regarding future performance anticipation, imposed by the investors, requires a dynamic measurement of the performance. In order to accomplish this, two currents are fighting for supremacy in the accounting world: "current operating concept" and "all inclusive concept", referring to operations included in the determination of the result.

According to the "correct operating concept", in the profit and loss account only the consequences of normal operational transactions of the current fiscal year are to be included, while the ones that do not concern operations need to be reported upon the reserves. In this version, only the operational transactions allow for a pre-visualization of the companies' future performance.

The users of this concept remove all elements that are not significant to highlighting the performance in the balance from the profit and loss account.

The "all inclusive concept" implies including in the profit and loss account elements that involve the growth or decrease of equities in the fiscal year, except for dividends distribution or capital decrease due to distribution by shareholders, and shareholders' contributions, respectively.

This dual approach upon the result sets forth to offer the users an answer for two categories of needs: that of measuring the performance of the activities (current operating concept) and that of measuring enrichment (all inclusive concept).

In the last years the tendency to presents the company's performance in a single financial statement, rather than in two or more, has been noticed (Săcărin 2002: 128). This situation corresponds to the global result, an indicator that projects new dimensions upon the economic-financial performance analysis.

The measurement of the global result determines the dimension of the company's performance. It refers to the fluctuation in the company's equities, as a consequence of different sources, except for the ones generated the operations with the owners.

It is an indicator more encompassing than the result highlighted by the profit and loss account, since it also includes elements determined in the equities, but which do not transit the income and expenses accounts. Its analysis highlights the contribution of all production factors to the forming of the result, it its economic form.

The most complex understanding of the *global result* concept is offered by IFRS 1. From this point of view, the boundaries of the accounting result are overcome, and "differences of conversion, income or latent loss in the financial instrument, actuarial income and loss associated to provisions, the effect of modifications in accounting methods, and the correction of fundamental errors" are also included (Ristea and Jianu 2004: 226).

4. Non-financial indicators – a modern method of measuring performance

The new financial performance measurement trend that uses non-financial indicators has brought about severe criticism towards the financial indicators, including criticism towards their aggregated form, too slow in offering useful information that would aid the managers in understanding the deep causes of the issues or that would help them initiate quick corrective measures. In the last years, a growing number of companies have started to lay stress on the measurement of certain non-financial aspects that have a financial impact, which had not yet stirred the interest of the managers, such as the clients' loyalty, the satisfaction degree of the employees or other aspects concerning performance improvement, but which are not financial and have a later impact upon productivity.

Poincelot & Wegmann (2004) present them in opposition with the financial indicators: they are considered to be non-financial because they do not convey the financial objective of a company directly like the productivity indicators based on the result or on the turnover do and they can be qualitative or quantitative indicators, sometimes expressed in monetary value (for example the expenses for client-forming programs, client marketing expenses), as the authors emphasize. Considering the nature of the non-financial indicators, these cannot lead to a global evaluation of the company's value creation in arithmetic terms. For the evaluation and guidance of the performance, Poincelot & Wegmann generically term the non-financial indicators *non-financial criteria.*

As to what the *contractual approach* is concerned, the two authors present the advantages of introducing non-financial criteria in the systems of performance measurements:

- *the non-financial evaluation criteria facilitate the coherence between strategy and the assignment of decisional rights* either by playing the role of an incentive mechanism, or as an essential component of the control system, or the two roles mentioned above simultaneously, or as a proper modality of evaluation of the realized performance (therefore they represent a mechanism that stirs, controls and evaluates performance, since they are much more adapted than the financial criteria). Poincelot & Wegmann have noticed that these non-financial criteria predominate when the decisional function is decentralized.

- *using non-financial criteria may favor the internal coherence of the organizational architecture.* After studying various representative research papers (Jensen and Meckling 1992, 1998; Horngren et all. 2003), the author have reached the conclusion that in the contractual literature the relations between the organizational architecture and the non-financial criteria have not been clearly established.

- presenting the non-financial indicators to the directors in the incentive agreements (agreements with bonus) as a means of reducing conflict (conflicts between directors and shareholders, conflicts between directors and employees). To Ittner, Larcker & Rajan, the managerial incentive agreements based exclusively on financial dimensions are not the most efficient means of motivating the directors to act according the interests of the shareholders (Ittner, Larcker & Rajan 1997: 231-255). This way, the three authors suggest using non-financial indicators, which quickly provide the shareholders with information regarding the effort put by the directors into creating value at the level of the organization (therefore, the presence of the non-financial indicators represents a means of reducing the conflict between the directors and the shareholders at the level of the organization).

The non-financial indicators for a company's performance measurement may unify the information offered by the financial indicators, but the fact that the process of creating a set of indicators that are relevant to the activity performed by each company is difficult, leads to their being less used. The application and analysis difficulty of these indicators is determined not only by the complexity of the process of selecting the information that is most relevant to the respective company, but also by the high costs required by the stages necessary in creating a set of activity-specific indicators.

The necessity of introducing the non-financial indicators in order to guide and evaluate a company's performance has been advocated by Kaplan and Norton, for instance: "the financial indicators cannot reflect the global performance of a company".

Any performance measurement system includes a subjective side as well. Therefore, using various indicators evaluated by various interested parts (partners) is recommended, the company thus benefiting from various points of view at the performance level.

5. Conclusions

The performance of a company implies entwining various types of abilities that characterize the activity of the company, such as: productivity, profitability or competitiveness. From a chronological point of view one may notice that the specialized literature as well as the exercise has emphasized the company's performance measurement through traditional financial indicators. In the past decade a new methodology of assessing performance at a microeconomic level has emerged and has developed, based on the company's capacity of creating value in the performed production and sales activity. These indicators that measure the internal and external value of the company (EVA, MVA) have developed as a consequence of the higher demands of the shareholders and of the market as well. As companies perform their activity in a more and more dynamic environment, analysts are more open to non-financial aspects when it comes to reaching certain conclusions concerning the company's performance.

Therefore, in order to measure a company's performance, it is necessary to resort not only to the financial results, but to a global vision upon inter-dependences between internal and external, quantitative and qualitative, technical and human, physical and financial parameters of the company management. Even though more and more analysts confirm the importance of analyzing non-financial indicators, the financial indicators will hold the supremacy in consolidating the measurement of the company's performance due to ease with which the results can be analyzed and interpreted.

In this context, one may state that an easy solution that can be adopted by each company when performance measurement is aimed at does not exist. Each organization that best characterizes the activity and its specific situation.

Molnar Andra
„Babeş-Bolyai" University, Faculty of Economics and Business Administration, Cluj-Napoca, Romania

Gaban Lucian
„Babeş-Bolyai" University, Faculty of Economics and Business Administration, Cluj-Napoca, Romania

In this paper the authors present ways to measure the effectiveness of financial control in Romanian companies. Thus, based on the concept of economic efficiency the authors show ways to increase efficiency and results achieved by ANAF control lately.
Key words: control, efficiency, economy, effort, effect
Jel classification: M41

1. Introduction

Although the concept of efficiency is met praxology, most forms it takes are expressed by the concept of economic efficiency as a way of expressing actions capacity to produce positive economic effects.

Terms of efficiency come from the French word which signifies efficacy, the quality of the effect (positive) expected.

The explanatory dictionary of the Romanian language shows that the efficiency understands "the quality of the effect (positive) expected".

The concept of economic efficiency is addressed in various works only after 1909, although some indirect analyzes are common since the nineteenth century. It appears that economic class was taken in technical economics, as suggested by Michael Draganescu, or natural sciences.

In a practical sense, energy efficiency has always concrete dimensions. The principle of economic efficiency is discussed in theory in the eighteenth century by Maupertuis, which makes it the principle of least action thus: "It is a natural maximum action to achieve the aim pursued with minimum expenditure of resources. When this maximum is happily applied, the consequences can be expressed in two forms logically equivalent to a single product, while decreasing labour, for both the work produced in increasing numbers."

2. Method and results

Generally, one can say that efficiency is a measure of achieving a goal, objective, proposed. Such a conception has the advantage that correlation implies at the same time, comparison between the proposed goal and the degree of fulfilment of its coordinates.

Given that any phenomenon and economic process is viewed as dual aspect, quantitatively and qualitatively, which found that economic efficiency is simply a ratio between the sides of the economic phenomenon under review and may be viewed as a result of activity, knowledge human.

This is actually an expression of economic efficiency through quantitative measurement of its forms:
- Direct form, i.e., effect / effort;
- Indirect form, i.e. effort / effect.

A. Iancu believes that the economic efficiency means "increase maximum results with minimum effort, expense and time". The same author points out that "economic efficiency can be understood only in the whole process of reproduction and only within social life".

Economic efficiency can be assessed by volume indicators (annual income, annual income, total income, expenses, and etc. currency.) As may be options for effects, for example, to be higher but resource consumption leading to inflated the lower efficiency at a lower volume per unit of effort effects. Hence, the efficiency of financial control can be determined by comparing the effects of efforts, as follows:

$$e = \frac{E}{\varepsilon} \quad \text{or} \quad e' = \frac{\varepsilon}{E}$$

Where:

is - is effective financial control;

E - effects achieved (income identified);

 - Efforts (expenses specialized control staff).

The effects can be quantified by volume indicators (physical output achieved) or value (revenue, profit, etc. currency receipts.). Efforts can also be expressed in physical units of volume (number of employees) or value units (volume of investment, production costs, material costs etc.

Given the above, we define the efficiency of financial control part of the economic efficiency of the entity, category targeting systemic financial stability of the entity, and make the balance on the one hand the results of the control (identified additional revenue) with costs personnel supported, on the other.

The control action is expressed in the results following its implementation measures. Control results, that its effects can be grouped into two categories:

a) Direct and immediate effects of control, quantifiable elements that can be known, tracked and summarized, from one period to another;

b) Indirect effects that shape over time, such as: extension of control measures, the branches, industries or the economy.

In the effort to achieve control, are taken into consideration, first, all expenses of maintenance and operation control device (salaries, allowances, subsistence allowances, school fees and improvement of control bodies, etc.). Also, bear in mind the effort of the national economy by depriving it of intake specialists working in the control device.

Ways to increase the efficiency of control can be grouped as: modernization of the control, increased training, rational organization of work control, moral and material incentives and tax control independence.

We believe that in the control must consider the factors that influence efficiency and financial control that can be grouped into two categories: factors direct and indirect factors.

The category of direct factors we considered body control, awareness of his training and methods used during control to increase efficiency.

The category of indirect factors is taken into consideration in our view the material conditions in which the control, audit-specific legislation, relations between inspectors and economic entity and factual situation, that the control objectives, control period checked and results.

Finally note that financial control of the results by attracting additional amounts to the state identified the corollary of control.

Effectiveness of control has resulted in 2011 in an effort NAFA collection of revenues by collecting the amount of 133,914.5 million. As a share of the budget submitted by the MPF program, revenues were approximately 99.97% and represented 26.5% of GDP. The good results obtained A.N.A.F. In 2011 were caused by the adoption of efficient management, which aimed to increase the performance of all Agency activities, leading to largely counteract the negative impact of macroeconomic presented.
Figure 1: Income structure of NAFA on budgets in 2011

Greatest contribution to total revenues of the National Tax Administration Agency have incomes of state budget (64%) and state social security budget (25%).

Budget revenues (consisting mainly of income tax, income tax, and VAT and excise duties) were 85637.3 million lei, by 1.4% over the programmed (84460.2 million lei). Largest contribution to the formation of a state budget without VAT, accounting for 40.1%, followed by income tax (21.7%) and tax (12.4%), as shown and in the following figure.
Figure 2: Weight of the main taxes in the state budget in 2011

Previous year, income tax recorded in 2011 increased by 137.5 million lei (0.8%), exceeding the budgetary provisions (18,274.3 million) by 1.5%.

In 2011, revenue from excise duties, accounting for 2.8% of GDP, were 14272.1 million lei, surpassing the level recorded in 2010 (15.3%) and was programmed (+ 7.2%).

Budgetary provisions to the value added tax were made at a rate of 96.9% (34322.4 million, compared to 35,405.0 million lei). Revenue share in GDP was 6.8%, 1.3 percentage points lower than that recorded in the previous year.

The tax budget provisions were made at a rate of 93.8%.

The receipts in customs duties were 679.4 million lei, exceeding the budgetary provisions of 145.3 million lei, by 27.2 percentage points respectively.

Provisions of the revenue budget for 2011 social security budget have been made at a rate of 101.3%. The share of gross domestic product revenues was 6.8%, 0.6 percentage points higher compared with 2010.

Fund revenues single national health insurance in 2011 recorded a decrease of 737.0 million (-5.1%) than in 2010. Share in GDP income in 2011 was 2.7%, 0.2 percentage points lower than the same period last year. Budgetary provisions in this budget were made at a rate of 95.6%. Compared to 2010, the unemployment insurance budget has decreased revenues to 483.1 million (-24.6%), due to the reduction of 0.5 percentage point contribution from 01.12.2010. Budgetary provisions have been exceeded by 13.4%.

mil lei	inciome tax	personal incomne tax	VTA	excise	customs duties
2010	13.040	18.414	40.874	12.383	971
2011	10.617	18.551	34.322	14.272	679
Sursa: http://www.anaf.ro/public/wps/portal/ANAF
Figure 3: Evolution of the main revenue taxes of the state budget

Large and medium taxpayers are an important issue for revenues because their contribution to revenues is significant: taxpayers generate 46.6% of total revenues and medium taxpayers - 23.6%. Meanwhile, specialized monitoring of these categories of taxpayers is necessary because of high levels of related late payments.
Sursa: http://www.anaf.ro/public/wps/portal/ANAF
Figure 4: The evolution of large and medium taxpayers

Unfavourable economic conditions have created difficulties in fulfilling financial obligations even some fiscal discipline economic agents. In addition, there were situations where insufficient or delayed allocation of budgetary resources by some public institutions determined the accumulation of unpaid tax obligations.

3. Conclusions

Although control knows widening its sphere of action and a diversification of forms of expression, in conclusion I would like to say that certain restrictions must be subject to control. Knowing these limits and restrictions are both important and necessary for the control authorities (who need to know precisely how far they stretch their duties) and for administration and management bodies (who are not entitled to restrict or expand at will action control, to prevent checking targets or require performance of unnecessary interventions or illegal).

A. A first limit of financial control that is given to objectively ascertainable facts and compliance with regulations in force is necessary for control bodies have not contributed in any way to create such situations or to prepare documents and records which mirror.

Two. Second, to verify an activity must be necessarily a genuine and accessible source of information control body. This means that when the technical and operational records and accounting records are kept in order and completed to date, economic control, and financial manager could be held in good conditions and its results are not conclusive enough. Accessibility of information sources takes into account not only formal or legal aspect (right to consult), but body control and opportunities to understand and interpret that information, regardless of their form of presentation or delivery. We refer especially to cases where information processing and financial accounting are provided by modern information systems.

Three. Thirdly, content and complexity of each control actions require a certain profile, level of qualification and competence of the responsible body to perform. This means that any check cannot be entrusted to anybody of economic control, and financial manager.

Four. On the other hand, is an attribute of management, financial control is, in principle, irrelevant to line managers. But, in a real democracy and strengthen the rule of law that limit is increasingly attenuated. Extending the organizational control intervention independent professionals, creating bodies with full autonomy in control, and the increasing role played by mass media make it possible to check all hierarchical levels.

Five. In many cases, financial control bodies may not take direct decisions about the direction of future work units or departments checked, according to the regulations in force such decisions are the competence of management, the higher authorities or other bodies, which generates a specific branch to propose measures and decision making in the context of clearly defined responsibilities.

Six. Finally, other limitations and restrictions may be imposed by the very objectives of control (how to select them in all possible aspects of control), subjective or personal factors (such as preparation of the audit, their intelligence and insight, ability to work and their ability synthetic) or even social factors (possible kinship, friendship or collegial with people to be controlled). Obviously, can be discussed and other influences, generated by the organization and assessing the work of control, such as material incentives to control bodies, moral incentives, management's position of these organs or to the findings and their proposals, the degree of personal responsibility and the like. All this creates limitations and restrictions inherent in daily exercise financial control.

CONTEMPORARY APPROACHES OF COMPANY PERFORMANCE ANALYSIS BASED ON RELEVANT FINANCIAL INFORMATION

Popa Dorina
University of Oradea, Faculty of Economics

Kiss Melinda
University of Oradea, Faculty of Economics

Sziki Klara
University of Oradea, Faculty of Economics

In this paper we chose to present two components of the financial statements: the profit and loss account and the cash flow statement. These summary documents and different indicators calculated based on them allow us to formulate assessments on the performance and profitability on various functions and levels of the company's activity.

This paper aims to support the hypothesis that the accounting information presented in the profit and loss account and in the cash flow statement is an appropriate source for assessing company performance. The purpose of this research is to answer the question linked to the main hypothesis: Is it the profit and loss statement or the cash flow account that reflects better the performance of a business?

Based on the literature of specialty studied we tried a conceptual, analytical and practical approach of the term performance, overviewing some terminological acceptations of the term performance as well as the main indicators of performance analysis on the basis of the profit and loss account and of the cash flow statement: aggregated indicators, also known as intermediary balances of administration, economic rate of return, rate of financial profitability, rate of return through cash flows, operating cash flow rate, rate of generating operating cash out of gross operating result.

At the same time we had a comparative approach of the profit and loss account and cash flow statement, outlining the main advantages and disadvantages of these documents.

In order to demonstrate the above theoretical assessments, we chose to analyze these indicators based on information from the financial statements of SC Sinteza SA, a company in Bihor county, listed on the Bucharest Stock Exchange.

Keywords: accounting information, performance, result, profitability, cash flow.
JEL codes: M41, M21

Introduction

In the socio-economic space in which it operates, an economic entity must constantly prove its economic and financial performance. For business performance analysis we chose to present two components of the financial statements: the profit and loss account and the cash flow statement.

Company performance - concept, content, approaches

Reviewing the literature we can say that currently the term 'performance' has a high degree of complexity and can have different meanings: a positive result of an activity, competitiveness, profitability, productivity, adaptability, growth, efficiency, satisfaction, success, achievement (Jianu 2007: 12-23).

Some authors define the notion of performance as "the degree to which a company meets the requirements of the economic environment both internal and external through an optimal combination of effectiveness and efficiency" (Buşe 2005: 136).

In the American literature no clear distinction is made between performance analysis by the rates of return and those of profitability, the two concepts are often used interchangeably (Pinches 1990). The continental literature, who is of French inspiration, expresses a negative attitude towards the confusion of the concepts of profitability / return and their use as synonyms (Vernimmen 1988: 313).

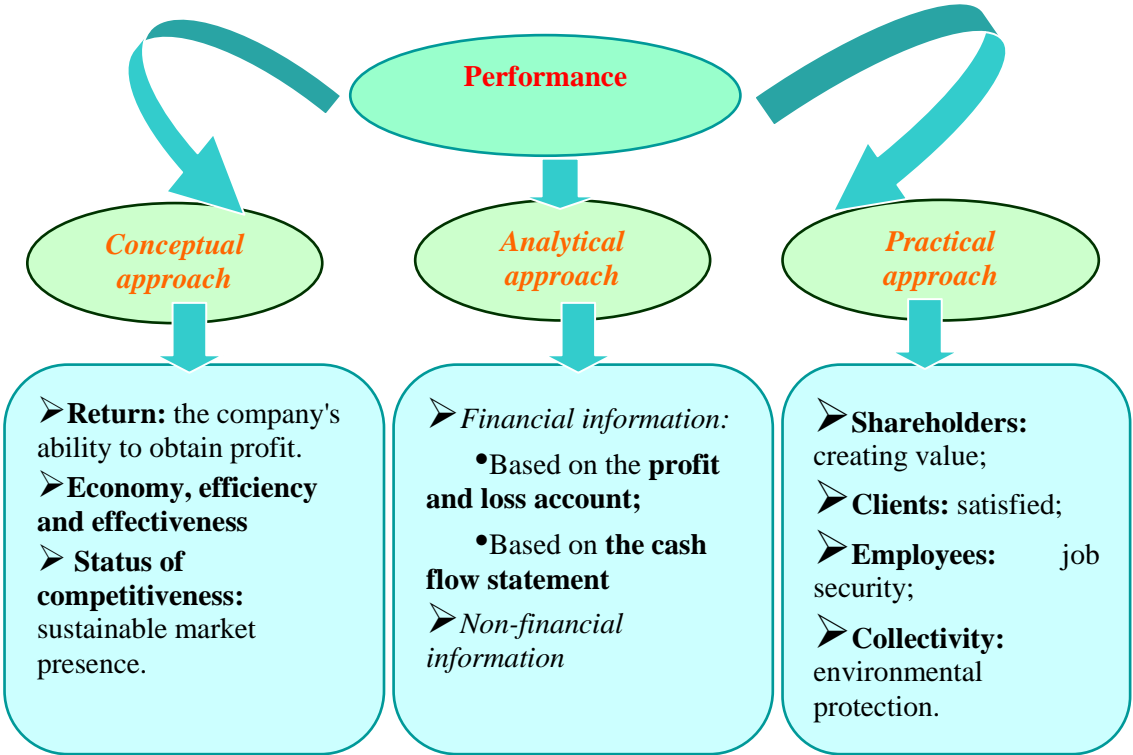
The literature in Romania claims that profitability is an economic category which reflects the company's performance (Petrescu 2008: 31) and represents the ability of an enterprise to make profits by using factors of production and capital, regardless of their origin (Robu and Georgescu 2000: 190). A complex research of the concept of performance is achieved by Julia Jianu, who concludes that "performance is a state of competitiveness of the enterprise which ensures sustainable presence on the market" (Jianu 2007: 24).


Figure 1 Approaching the term performance
(Own projection)

We believe that the components of financial statements reflect the different aspects of the same events and transactions. Thus for evaluating the performance of an economic entity it is not sufficient to analyze only the *profit and loss account*, but we must take into consideration *the cash flow statement* and other non-financial information.

Profit and loss account - the traditional tool for assessing the company's performance
Most companies have as main objective to maximize the profit, so traditionally the company performance is evaluated based on profit, reflected in the profit and loss account. The profit and loss account gives a retrospective view of the operations that influenced the financial result of the exercise (Moscviciov 2011: 75) and explains the way the result of the exercise is formed as an expression of partial or global adjustments between different types of income and expenses (Mironiuc, 2006: 342). This analysis expresses the firm's profitability on various levels.

For measuring the profitability we can use two categories of indicators: the profit and the rates of return.

I. *The profit* expresses in *absolute values* the business' profitability and it is "the main component of wealth of a society and reflects both the company's performance and the capacity of the company to reinvest and pay dividends" (Mironiuc 2006: 237).

In the analysis of the profit as it is presented in the profit and loss account we must consider its components, whose aggregation leads to the building of a series of aggregated indicators, also known as intermediary balances of administration.

Operating income = Turnover + Other operating income	Material expenses				
	Staff expenses				
	EBITDA = (RBE, EBE) (Earnings Before Interest, Taxes, Depreciation Amortization); **Gross operating result**	Amortization Depreciation Other operating expenses			
		EBIT= (RE) (earnings before interests and taxes) **Operating result**	Financial income – Financial expenses		
			Current result	Extraordinary income– Extraordinary expenses	
				Gross result	Income tax
					Net result

Figure 2: The formation of the net result and its aggregate indicators
(*Model adapted from Moscviciov 2011: 184*)

II. *The rates of return* express in relative indicators the profitability of a company and represent the enterprise's efficiency in using its capital and resources at different levels. Profitability reflects the level of remuneration of capital, and we could speak about return only when the surplus obtained by the investor is compared with the invested capital (Ştefea 2002: 271).

1. The economic rate of return reflects the relationship between economic results and economic means employed to achieve it. In the literature we can distinguish several formulas for calculating this indicator, depending on which we have different names for the indicator (Pierre 2004: 25-32; Niculescu 2003: 215-222):

a) The economic rate of return on total capital or assets (Ret), known in Anglo-Saxon literature by the name *"Return On Assets" (ROA),* is a global measure of profitability that highlights the capacity of the total capital of the enterprise, materialised in its patrimony, to generate profit, and is calculated as the ratio between gross profit and total assets.

b) The economic rate of return on invested capital (Rei) - is established as the economic rate of return - in French literature, or Return On Investment (ROI) - Anglo-Saxon literature. The rate expresses the level of remuneration on the capital gains, determined as the ratio of the result before interest payments and income tax (EBIT) or the operating result and the capital invested.

c) The economic rate of return on employed or permanent capital (ROCE - Return On Capital Employed) – means the profit that the company gets from the money invested in the business and is determined as the ratio of the result before interest payments and income taxes (EBIT) and the capital employed.

2. The rate of financial profitability or the rate of equity's profitability, known in the Anglo-Saxon literature as the *"Return On Equity" (ROE)*, and in the French as *"financial rate of return" (Rf),* allows *assessment of the efficiency of shareholders' equity investments and of the appropriateness of keeping* them and is calculated as the ratio between the net income for the year and the equity.

Cash flow statement - modern tool for performance measurement
The analysis method based on cash flow is a more modern financial analysis compared with the classical one, based on the financial statement relying on tables of financial flows. Producing the cash flow table is mandatory for listed companies and large companies according to IAS 7, and optional for small and medium size enterprises that apply simplified accounting rules.
The ensemble of the financial flows complete the analysis of the entity's performance by a more dynamic and more global approach that enables reconstruction of the financial flows of the period according to the nature of operations, thereby identifying the existence of any cash difficulty of the entity (Petrescu 2008: 306-310).
Structure of the cash flow statement
The cash flow statement should highlight the existence, movement and transformation of cash along the financial year, related to the entity's activities, classified into: operating activities, investing activities and financing activities.
An entity shall report the cash flow statement using the direct method, which requires the use of the information in the balance sheet, to determine the flow of receipts and payments and the indirect method, which is based on information from the balance sheet, income statement and explanatory notes having as starting point the profit or loss of the year adjusted with the items not affecting the treasury of the entity.
Main indicators calculated in the cash flow statement
The information provided by the cash flow statement allows calculations of several financial ratios, of which we mention here:
- *Rate of return through cash flows*, determined as the ratio of cash flow from operations and the capital invested - provides managers with information on the profitability of investment in terms of operating results;
- *Operating cash flow rate* - a measure of the entity's ability to discharge current liabilities by use of the operating cash flows (Buşe 2005: 335-336).
- *Rate of generating operating cash out of gross operating result* – shows the ratio to which the gross operating surplus generates effective cash corresponding to the operation.

Profit and loss account versus cash flow statement - comparative approach

Table 1 Comparative approach of the profit and loss account and cash flow statement

Profit and loss account	Cash flow statement
General aspects	
Main purpose : Presenting *a genuine image* of the entity.	
Traditional, static presentation	More *modern, dynamic* presentation
Reflects the *expenses and incomes* by their nature.	Reconstructs *financial flows* of the period according to the functions of the operations.
Allows calculation of the *global result*.	Calculates the *treasury variation*.
The assessment of the enterprise's ability to *generate profit*.	The assessment of the company's capacity to *generate cash* or cash equivalents.
Information about *profitability and return*.	Information about *liquidity and payment capacity*.
Advantages	**Disadvantages**

It is mandatory for all companies.	It is a mandatory document only for *big companies.*
Highlights all revenues and expenditures of a financial exercise, explaining the formation of the *result*.	Explains only the *variation of liquidities* on different levels of the activity.
Permits the assessment of enterprise profitability, the cash flows not being significant in this respect.	Is *influenced* by the policy of liquidation of claims and of debt servicing.
Disadvantages	**Advantages**
Potential cash flows. A high profit does not mean that there is more cash.	*Actual cash flows.* You cannot spend profit, you spend money!
Can be manipulated by the company's management, by the adoption of decisions with negative effects on long-term	It cannot be easily manipulated in favour of management, because it is not influenced by the accounting policies adopted.
Does not consider the risk of failures to receive payments (even in the case of provisions).	Takes into account only *the amounts actually received.* Highlights the differences between spending, usages and payments and also between incomes, resources and collections.

(Own projection)

In order to demonstrate the above theoretical assessments, we chose to analyze these indicators based on information from the financial statements of SC Sinteza SA, a company in Bihor county with tradition in Romanian chemical industry, listed on the Bucharest Stock Exchange.

Assessment of performance on the basis of the profit and loss account

Table 2 Structure indicators of the result for the period 2009-2011

Indicator	2009	2010	2011
Gross operating result (EBE=EBITDA)	1 059 958	405 068	-786 249
Operating result (RE = EBIT)	418 281	145 387	- 1 479 491
Gross result (RB)	619 925	33 637	-1 330 486
Net result (RN)	479 528	15 329	-1 330 486

Source: www.sinteza.ro

Analyzing the indicators we can see that the entity is becoming less efficient, recording declining profits in the 2009-2010 period, while in 2011 the result of the activity is loss. While in 2009 the gross and the net results are higher than the operating result, in 2010 the situation is changed, and in 2011 the company registers losses on all levels of the indicators of result.

Table 3 Rates of return for the period 2009-2010

Name of indicator	Calculating formula	2009	2010
1. Economic rate of return			
a. Economic rate of return on total capital (ROA)	$= \dfrac{\text{Gross profit}}{\text{Total assets}} \times 100$	0.36 %	0.019 %
b. Economic rate of return on invested capital (ROI)	$= \dfrac{\text{RBE (EBITDA)}}{\text{Invested capital}} \times 100$	1.65 %	1.20 %
c. Economic rate of return on capital employed (permanent) (ROCE)	$\dfrac{\text{RE (EBIT)}}{\text{Total assets- Current debt}} \times 100$	0.25 %	0.083 %
2. Return on equity (ROE)	$= \dfrac{\text{Net result}}{\text{Equity}} \times 100$	2.28 %	0.009%

During 2009-2010 we can notice that the main economic rates of return and the return on equity record an unfavourable downward evolution. In 2011 the results take the form of losses, so we cannot talk about profitability.

One cannot say that the company is efficient, unless the economic rate of return is at least at the level of the minimum rate of return in the economy (the average interest rate: 6-8%, source www.bnr.ro) taking into account the economic and financial risk assumed by the shareholders and the creditors of the company. From the analysis of various forms of economic profitability rate in 2009-2010 we can see that they recorded values below the average interest rate.

The return on equity shows a significant downward trend, reflecting the decreased ability of the company to release net profit through the equity employed in the activity.

Performance assessment based on cash flow statement

Table 4 Indicators determined on the basis of the cash flow statement

Indicator	Calculating formula	2010	2011
Operating cash flow *(FTE)*	FTE = EBE - Δ NFRE	1 041 416	1 832 030
Total cash flow (net cash variation) *(FNT)*	FNT = FTE + FTI + FTF (operating, investment, financial cash flows)	1 995 684	- 3 270 847
Rate of return through cash flows	$\dfrac{\text{Operating cash flow}}{\text{Invested capital}}$	1.15 %	1.05 %
Operating cash flow rate	$\dfrac{\text{Operating cash flow}}{\text{Current debt}} \cdot 100$	24.30%	29.25 %
Rate of generating operating cash out of gross operating result	$\dfrac{\text{Operating cash flow}}{\text{Gross operating result}}$	2.57	-

Source: www.sinteza.ro

The evolution of *operating cash flow* in the period under review is favourable, recording a growth. The cash flow surplus resulting from the operation is a source of supporting the needs of the investment and financing activities during the period. The drop in gross operating surplus usually drives the reduction of the operating cash flow, but the decrease of the working capital

needs generated an increasing operating cash flow. This is a favourable aspect on the company's operating activities.

Overall, the *total cash flow* decreased in 2011 compared to the previous financial exercise, passing from surplus to shortage of cash, leading to assessing of the alteration of the enterprise's financial position as a bad one at the end of 2011, mainly as an effect of funding policy, with the entity not calling on new sources of funding. The cash flow from investing activities was negative in the period analyzed due to significant payments for purchased assets.

The rate of return through cash flows shows a slight decrease and records low values, a negative aspect upon the return on investment.

The operating cash flow rate shows a rising trend, the debts arising from the activities of the entity being covered at a rate of almost one third by the operating cash flow.

The rate of generating operating cash out of gross operating result registered a value higher than 1 in 2010, reflecting a positive operating cash flow, higher as compared to the gross operating result, due to lower operating working capital needs. In 2011 based on an operating deficit, a positive operating cash flow is generated, reflecting the gap between the time of recording the money income / spending and the time of their collection / payment, as well as the existence of elements of revenue and expenditure that do not generate cash flows.

Conclusions

Following the theoretical and empirical research we can support the validity of the main hypothesis, that the relevant accounting information presented in the profit and loss account and in the cash flow statement is an adequate source for assessing the company's performance and may be influenced by non-financial information.

The conclusions of the analysis of performance of the company Sinteza SA are as follows:

- *on the basis of the profit and loss account* we can notice that the company's performance fell in the period 2009-2011, reflected by the decrease of the overall results and of the values of the rates of return, passing from profit to loss, which is an unfavourable evolution.

- *from the analysis of performance based on cash flows*, we found that during 2010-2011 the company's performance is limited to *operating activities*, reflected in a *growing surplus of liquidity,* meaning a positive aspect and the *total cash flows* shifted from a cash surplus in 2010 to a cash deficit in 2011, as a result of the investing and financing policy.

In our opinion the assessment of the performance of an enterprise is the result of a process of complex analysis, whereby we must take into account the most relevant information sources.

ASPECTS OF COMPANY PERFORMANCE ANALYSIS
BASED ON RELEVANT FINANCIAL INFORMATION AND NONFINANCIAL INFORMATION

Popa Dorina
University of Oradea, Faculty of Economics

Bogdan Victoria
University of Oradea, Faculty of Economics

Balaciu Diana
University of Oradea, Faculty of Economics

The main objective of our work is the conceptual description of the performance of an economic entity in financial and non-financial terms. During our approach we have shown that it is not sufficient to analyze the performance of a company only in financial terms as the performance reflected in financial reports sometimes do not coincide with the real situation of the company. In this case the cause of the differences has to be found among the influences of other nonfinancial information. Mainly following the great financial scandals the distrust in the reliability of financial-accounting information has eroded strongly and thus the business performance measurement cannot be the exclusive domain of the criteria of financial analysis, but must be done in a comprehensive way, based both on financial criteria and on non-financial ones (intangible assets, social responsibility of the company). Using non-financial criteria have led to the occurrence of new types of analysis, namely extra-financial analysis. Thus, enterprise performance is not subject to material and financial resources managed and controlled by the entities, but to the complex of intangible resources that companies created by thier previous work. The extra-financial analysis has to face difficulties arising mainly from the existence of non-financial indicators very little normalized, and from the lack of uniformity of the practice in the field. In determining the extra-financial performance indicators one has to observe the manifestation and the evolution of the company's relationships with its partners / environment. In order to analyze the performance measurement by financial and nonfinancial indicators we chose as a case study a company in Bihor county, listed on Bucharest Stock Exchange. The results of our study show that the Romanian entities are increasingly interested in measuring performance and after the extra-financial analysis we concluded that the company had set targets appropriate for adopting a responsible behavior, aimed at a sustainable development of the entity.
Keywords: accounting information, relevance, performance, financial information, non-financial information.

Introduction

In the socio-economic space in which it operates, an economic entity must constantly prove its economic and financial performance. The results of the enterprise's performance analysis process depend on quality, quantity, timeliness and accuracy of information used in the analytical work. Thus, in order to be useful the accounting information must comply with all requirements relating to content and type of presentation in the annual financial statements. Sometimes the performance reflected in financial statements does not coincide with the real situation of the company. In this case the cause of the differences must be found in the influences of other "nonfinancial" information.

Research methodology

This paper aims to support *the hypothesis* that accounting information that is relevant, reliable, and available in real time, completed with non-financial information, is an appropriate source for assessing the company's performance.

In the process of drafting this paper, we have followed the next steps:

- *-Choosing the subject of the research and establishing the significance of the problem;*
- *-Documentation, by resorting to the international and domestic accounting literature regarding our research topic;*
- *-Defining the research questions: t*he purpose of this research is to answer a series of timely *questions* of great economic interest and related to the main hypothesis:

Q1: Is the accounting information an appropriate source in assessing performance of an enterprise?

Q2: What are the quality features that accounting information must meet in order to be a relevant source for the performance analysis?

Q3: How does the nonfinancial information influence the assessment of the enterprise's performance?

- *Chosing the data collecting methods and techniques;*
- *Data analysis and data interpretation.*

Relevance of accounting information in assessing company performance

According to the local accounting regulations (OMFP 3055/2009), *qualitative characteristics* are "attributes that determine the usefulness of information provided by financial statements". The four principal qualitative characteristics are *understandability, relevance, reliability and comparability* (OMFP 3055/2009: Section 2.2.).

In the IASB's view the fundamental qualitative characteristics of accounting information are: *relevance, materiality and credibility,* and the characteristics relating to the presentation manner of accounting information are: *comparability, verifiability, timeliness, understandability* (IASB 2010).

According to the definition in the national legislation, the information is ***relevant*** when it influences the economic decisions of users, helping them to evaluate the past, present or future events, to confirm or correct their previous evaluations (OMFP 3055/2009: section 2.2.). The relevance of information is influenced by its nature and its significance level. According to the 2010 conceptual framework developed by the IASB to meet the requirement of relevancy, the information should have predictive value and confirmatory value, i.e. to provide an adequate basis of forecasts and to confirm previous forecasts, which of course are interrelated aspects (IASB 2010, QC6-QC10).

Another essential characteristic of the accounting information is ***reliability***. In the view of OMFP no. 3055/2009, but also in the IASB's view, the information is reliable when it does not contain significant errors, it is not biased and users can be confident that it accurately represents what it is bound to represent or what they expect, reasonably, to represent. Credibility supposes: accurate representation, consistency with economic reality, neutrality, i.e. independence from influences and completeness. Comparability, verifiability, timeliness and understandability are quality features of form that improve the utility of the information which is represented in a relevant and credible way (IASB 2010, QC19).

The influence of the accounting information disclosure on the stock market price

The conceptual framework for financial reporting developed by the IASB in 2010 states that the ***overall objective*** of financial reporting is to provide useful financial information about the entity to current and potential investors and also to creditors in making decisions on the distribution of the financial resources (IASB 2010, QB2). The current and the potential investors are those users

of accounting information contained in financial reports that are interested in the entity's future ability to make profit. These investors want to foresee the future dividends and the further changes in the market price of the company's stock (Moscviciov, 2011: 48). Dividends and prices are largely influenced by the profit, therefore the investors may seek to anticipate these results.

Negative news on the performance has a negative impact on share price quoted at the stock exchange and on human resources, thus the managers try to avoid publishing negative results on performance. Therefore a regular publication of financial results and especially of financial performance has a positive impact on the public and especially on the investors (Brown, Pinello, 2007: 23).

In this sense accounting communication is defined as a means of expression, which is characterized by a message and a code, in which the recipient must have the ability to decode the message (Durand, 1981:58-59). The information provided by financial statements must be adapted and processed in the financial and economic analysis in accordance with the objectives targeted, so that it can be easily understood by the users of information.

For the companies quoted at the stock exchange it is recommended to calculate and analyse specific indicators, such as: (Niculescu, 2003: 226-227).

- **EPS (Earnings Per Share) –** represents the earnings per each share owned, the part of the result that comes from each share owned, calculated as a ratio between net income and the average number of shares. This indicator is particularly useful for the individual shareholder interested in the part of the result that is due to him.
- **SMV (Stock market value) –** indicator that reveals latent capital gains or losses compared to the book value, determining it as the product between the number of shares and the price of a share.
- **MVA (Market Value Added)** – is the added value that the entity created as function of the amount of the initial capital invested, quantifying the impact of a managerial decision on both current and future performance. It is determined as the difference between the market value of equity and the book value of the equity or as the difference between the stock market value and the shareholders' contribution to the capital.
- **PER (Price Earning Ratio) –** the market capitalization ratio, shows the number of years needed to recover the invested capital in the case of full distribution of net profit as dividends, determining it as the ratio of the stock price and the earnings per share of the action or the ratio between stock market value and the result of the exercise (Vâlceanu, Robu, Georgescu, 2005: 58-59).
- **P/BV (price to book value)** – is the ratio of the market price of shares and their book value. We can say that if P/BV is higher than 1, the entity created value for shareholder, while if P/BV is less than 1 the entity destroyed a part of the value that shareholders have brought.
- **DPS (Dividend per Share)** – expresses the short term profitability of the shares, determining it as the ratio of the distributed dividend and the number of shares (Buşe, 2005: 300).

The non-financial information and the performance analysis
The suite of financial scandals (bankruptcy of Enron, WorldCom, Parmalat) led to the distrust in the reliability of financial - accounting information, which doesn't cover all the aspects of performance. Therefore the measurement of the enterprise's performance cannot be the exclusive domain of financial analysis criteria, but must be done in a comprehensive way, based both on **financial criteria** and **nonfinancial** ones (**intangible assets, social responsibility of the company**).

The use of non-financial criteria has led to the appearance of new types of analysis, known as **extra-financial analysis**. Thus, enterprise performance is no longer conditioned by material and financial resources managed and controlled by the entities, but by a complex of *intangible resources* created by the previous activity of the companies (Mironiuc, 2009: 154-155). The

setting up of the extra-financial analysis confronts with difficulties arising mainly from the existence of **non-financial indicators very little normalized**, and from the lack of uniformity of practice in the field.

The phrase **responsible behaviour of multinational companies** lies in their involvement in the development of policies of environmental protection and employees' rights within the developing countries. The most advanced initiative towards a credible reporting system of sustainable development - based on non-financial criteria - is the *Global Reporting Initiative (GRI)* launched in 1997 by an American NGO. This has the merit of developing the following performance indicators: *Indicators of economic, environmental, social performance*. In determining the extra-financial performance indicators it is observed the expression, the evolution of the enterprise's relations with its business partners / "surrounding" environment (internal and external) (Mironiuc, 2009: 153-160).

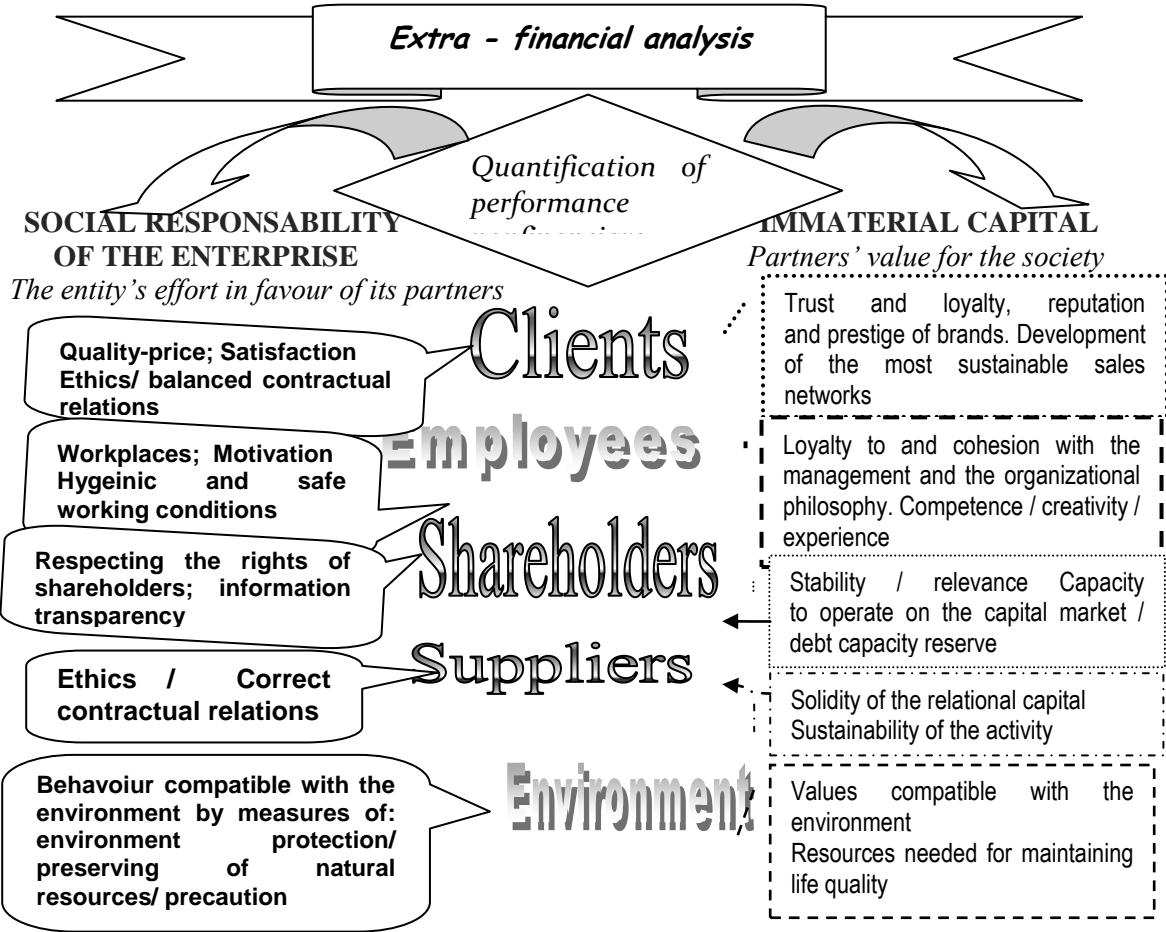
Through these types of analysis (financial and non-financial) numerous aspects and causes can be found that generate deviations between market value and economic value of a company (Mironiuc, 2009: 151.)


Figure 1 Performance from the point of view of the relation with stakeholders
(Authors' adaptation after Mironiuc M., 2009, p. 157)

To demonstrate those presented theoretically above, we chose to analyze these indicators based on information from the financial situations of SC Sinteza SA, a company in Bihor county, listed on Bucharest Stock Exchange.

Assessment of the performance of the company Sinteza SA reflected by stock market indicators

Table 1. Main stock market indicators of Sinteza SA.

Indicator	Calculating formula	Value in 2011-2012
Dividend paid		0
Number of shares (N)		66 112 590
Social capital		9 916 888.50
Nominal value (VN)	Social capital /N	0.15 Ron
Book value (BV)	Equity/N	2.54 Ron
Current share price (P)	Demand-Supply	0.487 Ron
SMV - Stock market value (Capitalization)	P x N	32 196 831.33
MVA - market value added	Stock market value - Initial invested capital	15 470 346.5
P/BV Price to book value	P/BV	0.19
DPS Dividend per share	Dividend paid /N	0
EPS – Earnings per share	Result/N	-0.02

(source of values: http://www.bvb.ro/ListedCompanies/SecurityDetail.aspx?s=STZ)

In 2011 the company Sinteza SA did not distribute dividends, because the 2011 result is loss. This negative aspect is reflected also by the *market price of shares* (0.384 Ron), that exceeds their nominal value (0.15 Ron), but is well below their *book value* (2.54 Ron).
The *market value added (MVA)* indicator characterizes the wealth the company released to its shareholders, totaling over 15 million RON.
Price to book value ratio P/BV is less than 1, so we can say that the company destroyed a part of the value that shareholders had brought, so the amount that investors would be willing to pay in the market for shares is less than the amount that shareholders would receive from the liquidation of assets. The indicator records the value of 0.15, i.e. the market price of the shares represented only 15% of the book value, a low percentage in comparison to the average indicator in the manufacturing sector, which is 0.99, i.e. 99% (source www . bvb.ro).
The negative value of the *earnings per share (EPS)* is due to the loss recorded in 2011, which is also a signal of a poor performance.
Therefore we can say that the stock market indicators reflect a low performance of the company.

Performance analysis using non-financial information
In the extrafinancial analysis of the performance of the company Sinteza SA we have established as a basis for assessment its responsible behaviour. The information posted on the www.sinteza.ro website shows the importance of performance considering economic, environmental and social aspects.
In terms of **economic and environmental policy's performance** the company Sinteza SA seeks the following objectives:
- obtaining profit as long as it does not produce a major impact on the environment;
- minimization of losses of raw materials and resources;
- pollution prevention in the company;
- compliance with environmental laws and regulations;

- the company has obtained all permits and authorizations required by legislation.

As for the **social aspect** the performance of the activity appears in:

- assurance of products' quality in accordance with customers' requirements;
- emphasis on health and safety of staff based on training and learning.

In order to achieve a high level of performance of the activity the company has in view the implemention and preservation of a Quality Management System according to SR EN ISO 9001:2001 which is an appropriate organizational framework to achieve the quality policy and objectives.

Conclusions

Following the theoretical and empirical research we can support the validity of the main hypothesis, that the relevant accounting information presented in the profit and loss account and cash flow statement is an adequate source for assessing company performance and may be influenced by non-financial information.

The conclusions of the performance analysis for the company Sinteza SA are as follows:

- The values recorded for the *stock market indicators* confirm the situation presented in the financial statements and reflect a poor performance and the non-financial information has little and occasional influence on their evolution.
- From the *extra-financial analysis* we concluded that the company has set appropriate targets corresponding to a responsible behaviour, aimed at a sustainable development of the entity.

In our opinion the assessment of the performance of an enterprise is the result of a process of complex analysis, in which we must take into account the most relevant information sources.

THE DEFINITION OF GOODWILL- A CHRONOLOGICAL OVERVIEW

Rațiu Raluca Valeria
Babeș-Bolyai University, Faculty of Economics and Business Administration, Cluj-Napoca

The purpose of this paper is to offer a full perspective on the evolution in time of goodwill definitions. This paper is part of the research conducted in the doctoral dissertation and we consider it is very important to have a full understanding of the concept studied in order to develop on this subject. We use a chronological analysis and review definitions from the late 1800s until today. The definitions are given by prominent scholars of the time, published in highly ranked journals and books or offered by international accounting boards. We approach the definition from an accounting and a legal perspective. Our findings are that, in time, the definitions offered either improve on an old definition or are completely original. Some elements used to describe goodwill remain the same throughout the whole period we studied. The conclusion of our study is that this type of in-time analysis is beneficial to the researcher in the way that it offers a complete picture of the concept and its history.
Keywords: goodwill, definition, chronological
JEL Code M41

I. Introduction

Goodwill is one of the intangibles which have always been a constant problem of accountants and accountancy ever since its existence was first acknowledged in the 1880s. Many authors have since then defined the concept of goodwill (Dicksee&Tillyard, 1906, Seed, 1937, Gynther, 1969, Fess and Niswonger, 1981).It is interesting to observe that the divergent opinions with regard to the definition of goodwill over timeare also true about the accounting treatment of goodwill worldwide today.

Many questions which researchers raised about goodwill one hundred years ago are still being answered today, which represents a strong reason to study this topic, which is challenging, current, ambitious and also important both to stakeholders and to the field of research.This paper makes the first step in comprehending the meanings of goodwill as they were conveyed in the last hundred years by the most esteemed accounting professors or researchers of a certain time, and in the latest years by the international accounting boards which have a significant influence in accounting worldwide. Our study continues the study of Courtis(1983), but improves on that study by adding definitions from 1983 to the present time, by including international accounting boards'definitions alongside academic definitions alone, by linking the definitions to one another through the elements which we find similar.

We consider our study to be important and useful to the field of research because it gathers only the best, carefully selected definitions of goodwill, which have taken the test of time, offered only by outstanding academics, published in highly ranked journals or famous books which have become part of the accounting history, or by influential accounting boards, namely the International Accounting Standards Board and Financial Accounting Standards Board.

II. Literature review

By the end of the 19th and beginning of the 20th century, business combinations were not very common, sole owners and family businesses were still the most spread types of businesses on the market. Meanwhile, the only form of existing goodwill referred to the quality of the services or products offered and the reputation of the business or the correctness of the owner. Before accounting institutions were formed, individual writers and researchers of the time based their writing on personal experience and referred to legal cases in common law. One of the first

authors to give a definition for goodwill that is still popular today was Professor L.R. Dicksee in the first book dedicated entirely to goodwill, "Goodwill and Its Treatment in Accounts" (1906). Goodwill he says, "is the benefit arising from connection and reputation, the probability of old customers going to the new firm which has acquired the business" (cited by Courtis, 1973, p.3).

Although there is no internationally accepted definition of goodwill from a legal perspective, Courtis (1973) identifies numerous cases in common law where definitions were offered. One of the best legal perspectives was offered by Lord Macnaghten in 1901. He said goodwill "is the benefit and the advantage of the good name, reputation, and connection of a business. It is the attractive force which brings in the custom... Goodwill is composed of a variety of elements. It differs in its composition in different trades and in different businesses in the same trade". Macnaghten's view of goodwill is strongly related to the elements which comprise it.The comprising elements of goodwill have been subject to change over time, along with the creation of institutions or accounting bodies which regulated their valuation.

III. Research methodology

We approach a chronological, qualitative overview of the definitions and the conceptualization of goodwill starting from the late years of the nineteenth century to this day. By analyzing accounting writings and the legal encounters of the term goodwill we offer a clarification of this concept and its nature. The diversity of definitions explaining goodwill for more than a decade will inherently advance criticism about the substantiality, complexity or logic abiding when formulating these definitions. In order to prevent such criticism we only considered for this paper the definitions which were given by prominent scholars of the time, published in articles or books which proved their substantiality over time, appeared in legal cases which are considered precedents, especially in the common-law countries and in the international accounting standards worldwide.

In conducting this research, for the beginning of the period studied we used the first books which were published about goodwill. Dicksee published the first book on goodwill in 1897, but we used the later, third edition, which was published in coauthorship with Tillyardin 1906. P.D. Leake published his valuation theory of goodwill in 1914, but for our paper we used the later version republished in 1921. We also used journals which are ranked in the Thompson Reuters (ISI) Web of Knowledge, especially for the period after 1900,when accounting journals were first indexed in this database. The most cited papers were published in the following journals: *The Accountant*, which is the first journal of accountancy worldwide, *ABACUS*, *Accounting Review* and not least, *The Accounting Historians Journal*, which was the *sine qua non* journal for this type of research.

We consider the chronological content analysis conducted in the research of our topic to be important and adequate at the same time, because it is crucial to have a thorough understanding of the evolution of goodwill in order to properly work with the concept further along when demonstrating the importance of this intangible asset in investors' behavior on the market.

IV. Research findings

Defining goodwill is a process which has spread over a long period of time, from the late 1800's until today, and has not yet found closure. The stretch over time and the continuity of this process was best explained by Hughes (1982), as cited by Bloom (2008):

"...there was no one Truth and never will be. The origin of goodwill can be revealed through history, but its nature is a matter of personal interpretation."

The earliest reference to goodwill was cited by Leake (1921), "I gyue to John Stephen …. My whole interest and good will of my Quarelle" (i.e. quarry) and goes back to 1571. This citation does not give a definition of the term, but it proves it has been acknowledged more than four

centuries ago and it seems to be the oldest, most famous quote about goodwill researchers ever found.

The oldest definition authors refer to appeared in Bithell's "A Counting House Dictionary" in 1882 as cited by Courtis (1983):

"The advantage connected with an established business of good repute. A well-established business presents an expectation of profits to any one entering upon it, and is worth paying for. Anyone having such a business and who is willing to relinquish the expectation of the business by transferring it for consideration to someone else can do so by what is technically called "selling the Goodwill of that business"".

There are two important aspects in this definition which perpetuated over time: first, goodwill is viewed as an "advantage" and to this day the international accounting boards refer to goodwill as such and the second aspect is goodwill's attribute of "expectation of profits" which is also part of its description today.

In the first book ever written on goodwill, "Goodwill and Its Treatment in Accounts" Dicksee and Tillyard (1906) revise the most important legal cases of that time, which give definitions of goodwill, and summarize them into a very suggestive paragraph:

"...where the locality of the business makes the trade, Goodwill as a disposable asset represents the advantage derived from the chance that customers will continue to frequent the premises in which the business has been carried on; that where the business is one which depends upon the reputation of a firm, the Goodwill consists of the advantage which the owner (whether original or by assignment) derives from being allowed to represent himself as such; and that where the value of the business depends on its business connection, the Goodwill on sale consists of the right to be properly introduced to those connections."

Again we find an element in this definition which remained constant over time: the advantage associated to the concept of goodwill, derived from the location of the business, the reputation orbrand significance, or the prior to the sale business connections.

In 1921 the illustrious chartered accountant P.D. Leake publishes the second book dedicated entirely to goodwill called "Commercial Goodwill. Its History, Value and Treatment in Accounts", where he elaborates the "Super-profit Valuation Theory of Goodwill". He defines goodwill as:

"...the right which grows out of all kinds of past effort in seeking profit, increase of value or other advantage... The exchangeable value of the right depends upon the probability of earning future super-profit- the term "super-profit" meaning the amount by which revenue, increase of value, or other advantage received exceeds any and all economic expenditure incidental to its production".

The main idea of Leake's theory is that the value of commercial goodwill is the current value of a super-profit which diminishes annually on a straight line pattern. He also identifies the "advantage" associated to goodwill which results from the difference between revenue and expenditure incurred in obtaining that revenue.

For the first time, in 1937, H.D. Seed relates goodwill to law associated with its components- namely trade names, trademarks, patents or copyrights. He develops the thesis that goodwill should only be valued in association to the valuation of the whole business. The influence of his predecessors is evident in the qualities Seed attributes to goodwill when defining it:

"The advantage which arises from the good name, reputation and connections of a business; alternatively, the benefit which accrues to the owner of a business from the likelihood that such business will earn, in the future, profits in excess of those required to provide an economic rate of remuneration for the capital and labor employed therein."

In 1946, in an attempt to probably express the frustration of some writers to find the best definition for goodwill, Harry Norris, in his book "Accounting Theory. An Outline of Its Structure", as cited by Courtis (1983), brings a little true humor into the definition of goodwill:

"If X is a live pedigree dog, and Y a dead one, then perhaps X-Y=Z. But Z doesn't mean anything in itself. The label 'goodwill' in business accounts closely resembles Z; its use is as sensible as trying to find what makes a dog tick by dissecting it."

What Norris probably means is that what gives value to goodwill are precisely its components, which cannot be valued separately, therefore are all included under the name of goodwill. Even though a funny definition, the truth behind it still emerges to the surface today, when accountants admit that the notion of goodwill contains elements which cannot be separately valued as asstes.

In 1969, Gynther approaches the definition of goodwill in a way that is still valid today, and this validation in time of his definition makes it, in our opinion, one of the most convincing definitions we managed to find in our research. Gynther(1969) admits that goodwill has been a "thorny problem" of accountants over time and the motive for that may be the fact that the real definition has been replaced by just means of calculation for goodwill. He says:

"Goodwill exists because assets are presented, even tough they are not lined with the tangible assets. For example "special skill and knowledge", "high managerial ability", "monopolistic situation", "social and business connections", "good name and reputation", "favorable situation", "excellent staff", "trade names", "established clientele" are assets in this category. The sum of the value of these assets...is the value of Goodwill".

The list of the elements which form goodwill thatGynthermentions is definitely not an exhaustive one, but our attention will be directed to those elements in another research paper. He draws attention to an aspect that is still troubling accountants today, what is the value of goodwill and what does components does it encompass?

In 1975, Gibson and Francis are among the first researchers to define goodwill with connection to consolidation:

"Goodwill on consolidation is the term used to describe the excess of the cost of investment in subsidiaries over the book value of the equity acquired."

In 1981, Fess and Niswonger, define goodwill with relation to the higher rate of return it can bring in a business combination:

"Its (goodwill's) existence is evidenced by the ability of the business to earn a rate of return on the investment that is in excess of the normal rate for other firms in the same line of business."

In 1981, when the International Accounting Standard Committee exposed its first draft for ED22 *Accounting for Business Combinations*, they defined goodwill as "the excess of the purchase price over the assigned values of the net identifiable assets acquired."

In 1983, the International Standard Committee issues IAS 22 *Accounting for Business Combinations*, where goodwill is defined as "the future benefits from unidentifiable assets".

In 2010, the International Accounting Standards Board issued the International Financial Reporting Standard 3 *Business Combinations* and replaced IAS 22. IFRS 3 defines goodwill as: "future economic benefits arising from assets that are not capable of being individually identified and separately recognized". The definition confirms that the value of the business as a whole is bigger than the sum of the accountable and identifiable net assets.More important however than this descriptive definition, the IFRS 3 defines goodwill by means of how it should be measured:"Consideration transferred to obtain control *plus* Amount of non-controlling interest (using either option) *plus* Fair value of previously-held equity interest *less* Fair value of the identifiable net assets of the acquiree (100%)"(Paragraph 32, under IFRS 3 Revised 2008 (IFRS 3R)).

The Financial Accounting Standards Board issued the Status of Statement No. 142, SFAS 142,*Goodwill and Other Intangible Assets* in 2001 and in 2007 SFAS 142 Revised where they define goodwill through how it is measured: "the aggregate fair value of purchase consideration, any non-controlling interests in the target company, and any equity interests in the target company already held by the acquirer on the transaction date less the net fair value of identifiable assets acquired and liabilities assumed in the business combination". The very similar definition

of goodwill offered by the FASB to the one offered by the IASB is explained by the convergence process both institutions signed up for.

From a legal perspective, until today, no international legal or financial institution has published an act or another legal form of regulation with regard to goodwill. In many common-law countries, some trials have been considered important precedents to others and many accounting related trials mentioned goodwill. By large, over the last hundred years we studied, what most cases referred to in connection to goodwill, was in fact connected to its components.The location of the business, the social and business connections, trademarks, copyrights, patents, skilled workers, the quality of the services or products sold, the customer loyalty, the reputation of the business were all subject to trial. Legal opinions with regard to goodwill also highlight the importance of the element of advantage which we identified in almost every definition accountants give of this term.

Even if there is no *Goodwill Law,* to be sanctioned internationally, in 1967, the World Intellectual Property Organization is formed, who, in its own words "is dedicated to the use of intellectual property (patents, copyrights, trademarks, designs, etc.) as means of stimulating innovation and creativity", in a fair manner and with respect to the regulations of this worldwide organization. The importance of this institution to goodwill has proved to be crucial in time, because all the intellectual property elements mentioned above, which were prior to this included in goodwill, had now grounds to be valued on their own and not be considered goodwill components anymore.

Another milestone in close connection to the definition and components of goodwill happened in 1990, when the Swedish company Skandia, for the first time, gave meaning and draw a clear perspective of the concept of intellectual capital, which is a major component of goodwill. Until today, the intellectual capital is not accounted for separately, but there is an international interest, both in business and in academic research of how it could become an independent intangible asset. When this happens, goodwill will be short of one more important element, and its accounting value will drastically drop, meaning its value won't be as significant to the business as it is today.

V. Conclusions

The purpose of this paper is to offer an overview of goodwill definitions, going back for longer than a century and to understand how goodwill evolved, through the definitions given by academics, professional bodies of accountancy and courts of law. We have coveredmostly accounting definitions and legal opinions.

Our findings indicate that goodwill has been defined over time in two different ways: by academics who indicated mostly the elements comprising goodwill and its characteristics and by the international accounting boards which define goodwill through the way it is measured. The most common characteristic which we encountered was the *advantage* brought by goodwill in a business combination, which is the only constant characteristic mentioned both by academics and institutions over time.

This study is the result of a chronological qualitative analysis of the concept of goodwill and it brings novelty to the literature by improving on existing studies dating in 1980s, and completing them to the day.

This study is extremely useful to both academics and professionals who want to use a brief but comprehensive analysis of goodwill definitions. The authors wish to continue this study with a similar chronological analysis of goodwill components and the accounting treatment of goodwill.

INSOLVENCY CRISIS PERIOD. FEATURES ON THE SALE OF GOODS OF THE DEBTOR

Sarac Aldea Laura
Andrei Şaguna University Constanta

Development on tangible research is useful both for investors and owners of fixed assets and for the authorities and the public.

The paper aims to conduct a thorough research of legal, accounting and tax on assets and investments of the appropriateness and effectiveness as an indicator for assessing the companys development management decision. The paper starts from the concept of \"property in insolvency proceedings\".

During the current crisis has significantly increased the number of companies became insolvent. In the context of globalization as a result of economic and financial relations between companies in different countries of Europe, entry into insolvency of a company lead financial dificulties for business partners. No longer than a step up form entry into insolvency themselves.

Insolvency is the status of the assets of the debtor that is characterised by the insufficiency of the monies available to cover the debts, liabilities and certain liquids. The purpose of this law is to establish a procedure for covering the liabilities of the debtor\'s collective in insolvency proceedings. By insolvency proceedings \' shall mean collective insolvency proceedings and egalitarian concursuală applicable for the liquidation of the debtor\'s estate to cover liabilities, followed by deletion from the register in which the debtor is registeredThe company is the driving force of the economy and the company that moves after a strategy based on competitive know how is the future of the economy. The present work aims to offer this know how to the companies.

The liquidation of assets of the debtor will be performed by the liquidator under the supervision of a judge-trustee in bankruptcy. To maximize the value of the property of the debtor, the liquidator will make all arrangements for exposure in the market in a form appropriate to their advertising costs being borne from the debtor\'s estate.

The work treats in detail the aspect of the capital investment in long term assets, the effects of the insolvencz procedure on the development of the business.

Theoretical and scientific support of work is the ensemble of concepts, princes, researches, studies of cases, techniques of audit and the acknowledged methods of management from the special national or international literature.

Keywords: insolvency, assets
JEL Codes: M41, M21

The company is the economic engine of the company, and the knowledge-based economy is the future, so the research carried out is addressed to this entity, and the meniţi to assist it and to help in its work.

During the current crisis has increased the number of companies which have entered into insolvency.

Insovenţa is a general condition, present not only in Romania. In the context of globalization as a result of economic and financial relations between the undertakings in different States of Europe, the entry in the insolvency of a company lead to financial difficulties for inplicit business partners, is no longer just a step up from the entry in the insolvency proceedings. Insolvency and companies not evades. However as a result of the economic crisis, more and more companies

have opted for the insolvency of the company debitoarei, salvagardarea on the basis of a restructuring plan, well founded.

 a. if the proceeding was initiated as a result of the application of one or more creditors;

   b the judicial administrator), from the date of his appointment and until the fulfillment of a period of 30 days from the date of the definitive table display of receivables, provided they have demonstrated their intention to vote on the report referred to in art. 59. (2);

   c) one or more creditors who have announced their intention to vote on the report referred to in art. 59. (2), together with at least 20% of the total value of the claims contained in the definitive claims within 30 days from the date of the definitive table display of claims.

Plan of reorganization will include:

a) the categories of claims that are not disadvantaged within the meaning of the law;

   b) disadvantaged categories of receivables treatment;

   c) whether and to what extent the debtor, members of the Group of economic interest, associations of companies, partnerships and associations of undertakings in partnership with full partners will be download from liability;

   d) compensation to be offered to holders of all categories of receivables, compared to the estimated amount that could be received by distribution in the event of bankruptcy; the estimated value will be calculated from the date of the proposed plan. Insolvency proceedings under the law 85/2006 is a procedure in favour of debitoarei, giving it a last chance to safeguard the conditions of approval by creditors of the reorganisation plan, pursuant to article 94, paragraph 1 provides that the following categories of persons will be able to propose a plan of reorganization under the conditions below: a) the debtor, with the approval of the general meeting of shareholders/memberswithin 30 days of the final table display of receivables, provided that the wording, according to art. 28, intention, if the procedure of reorganization was triggered by him, and according to art. 33 para.

Lease payment of assets of the debtor to his creditors may be carried out only where prior written consent of them about this way of extinguishing their claim;

   G. modification or extinction of real guarantees, with granting compulsory, for the benefit of the creditor has a security guarantee, or equivalent protection, as provided in art. 39. (2) (a). (c));

   H. extended due date, and changing the interest rate, penalităţii or any other clauses in the contract, or other sources of obligations; The plan will specify appropriate measures for its implementation, such as: a. the keeping, in whole or in part, by the debtor, his business leadership, including the right of disposition over the property of his estate, with oversight by the judicial administrator appointed in accordance with the law;

   B. obtaining financial resources to support the completion of the plan and their sources of origin;

   C. transmission of all or some of the property of the debtor's goods by one or more natural or legal persons, whether before or after the confirmation of the plan;

   D. merger of the debtor under the law;

   E. liquidation of all or some of the assets of the debtor's property, either separately or as a unit, free of any charge, or lease payment of their creditors of the debtor in the account claims they have against the debtor's estate.

J, reorganisation plan may provide for the conversion of debts into equity value budget;

   L. inserting in articles of incorporation of the debtor-legal-person or persons referred to in (a). (C) and (D) of rule: a prohibire of the issue) of shares without voting rights;

   b) determination in the case of the various categories of ordinary shares, a proper vote between distributions of this class;

c) in the case of preferential categories of actions with their priority over other types of regulatory actions, the appointment of managers representing those categories of actions in response to the obligation to pay neonorării dividends. I. amendment of the Constitution of the debtor, in accordance with the law;

J. issuance of securities by the borrower or any of the persons referred to in (a). C and D, as required by law. 31/1990, republished, with subsequent amendments and additions, and law No. 297/2004, with subsequent amendments and additions. For inclusion in the plan of a broadcast of securities is required express consent, in writing, of the creditor who is to receive the securities issued, you will be given prior to the acceptance of the plan by the trustee in bankruptcy judge, in accordance with the provisions of art. 98 para. 3. By exception to the provisions of art. 205. (2) of law No. 297/2004, with subsequent amendments and additions, the operations referred to in this subparagraph shall be considered exempted from the operations within the meaning of art. 205. (1) of the law referred to above;

K. Notwithstanding the provisions of (a).

The liquidation will start immediately after completion by the liquidator of inventory and submission of the assessment report. The goods will be sold as a whole in the block-in running-or individually. Method of sale of the goods, namely the public auction, direct negotiation or a combination of the two, will be approved by the meeting of creditors, on a proposal from the liquidator. The liquidator shall submit to the General Assembly of creditors and the appropriate sales route for choosing.

In order to evaluate the debtor's assets in the estate, the liquidator may be to hire an appraiser on behalf of the debtor, either with the consent of the creditors ' Committee, to use a valuer. Evaluators must be members of the National Association of assessors in Romania, and the assessment should be carried out in accordance with international standards.

The assets of the debtor will be assessed both bulk and individually. Strategic guidelines that need to be taken into account by a firm in the struggle with competition, is contained in a large variety of financing programmes for the purposes of: making investments for the benefit of capital under the function of maximizing profits, tangible, intangible, refurbishment, environmental protection, information, or conduct of financial investment.

Analysis of restrained assets of special importance for any trader, while ensuring that through a thorough knowledge of accounting, tax and legal aims to reach, namely maximizing the profits proposed.

Carrying out the liquidation of the assets of the debtor will be performed by the liquidator under the supervision of a judge-trustee in bankruptcy. To maximize the value of the property of the debtor, the liquidator will make all arrangements for exposure in the market in a form appropriate to their advertising costs being borne from the debtor's estate. Evaluation in the block or the assessment takes into account all of the debtor's assets or functional units of assessment. The functional unit ' means those goods of a debtor which together ensures a finished product, standalone, or allow an independent business. A functional unit is considered only if the insured has access to the public highway and to the use of utilities.

The liquidator will conclude contracts of sale and purchase; the amounts derived from the sale shall be deposited in the account referred to in art. 4 para. (2) and acknowledgements will be handed over to the trustee in bankruptcy judge.

If the sale of assets will be made by public auction, the report of the award signed by the liquidator of property constitute judicial title. When required by law for the transfer of ownership form authentic, contracts will be issued by the notary public on the basis of the minutes of the auction.

Buildings will be sold directly to the liquidator, after the proposal, approved by the general meeting of creditors. Proposal of the liquidator will need to identify the building, by the situation on the ground and by data from the register of real estate advertising, showing the tasks to which

it is grevat and supraofertare to indicate the step and the date by which, in the event of sale, oversupply are supported.

The liquidator shall convene a general meeting of the creditors, not later than 20 days from the date of notification of the proposal, the proposal of the special administrator, creditors with real guarantees on goods, holders of rights of retention of any kind and of the Committee of creditors, by vote of the general meeting of the creditors of the proposed sale.

After approval by the general meeting of creditors, the sale will be made, under penalty of invalidity, but after 30 days from the date the last postings made by the liquidator in newspaper ad on supraofertare. The liquidator shall submit to the Committee a report that creditors will include assessment of the goods and their method of use and whether the sale will be made individually or as a unit or a combination thereof, by public auction or negotiated or by both methods. Where it is proposed to block the sale by direct negotiation, the liquidator may be proposed, on the basis of the tenders received, the commencement of negotiations with one or more buyers locate with payment terms and minimum price start negotiation, which may not be lower than the price. The liquidator shall convene a general meeting of the creditors no later than 20 days from the date of the meeting of the Committee of creditors, the creditors informing them of the possibility to study the report and of the minutes of the meeting of the creditors Committee on the report.

creditors, including guaranteed all, increases in capital, interest and penalties of any kind, as well as the expenses for claims arising prior to the initiation of the proceeding.

Where the amounts derived from the sale of these goods would be insufficient for the payment in full of such receivables secured, lenders will have, for difference, claims chirografare that will come in competition with those contained in the corresponding category, according to their nature, referred to in art. 123, and will be subject to the provisions of art. 41. If, after payment of the amounts referred to in paragraph 1. (1) would result in a difference in addition, it will be submitted to the liquidator, on behalf of the estate of the debtor.

Guaranteed debt with a creditor shall be entitled to participate in any distribution made before the sale amount of the asset subject to guarantee. The sums received in this way deals will be deducted from the creditor would be entitled to receive the following from the price obtained by the sale of the property subject to the security, if it is necessary to prevent such a creditor to receive more than you would have received if his property subject to the warranty would have been sold prior to distribution.

Every 3 months, calculated from the date of commencement of the liquidation and contained in a program to administer the liquidation to be done within 30 days after the appointment, the liquidator shall submit to the Committee a report to creditors in respect of funds obtained from the proceeds of the liquidation and claims and plan for distribution among creditors. The report will include the payment of remuneration and other expenses provided for in art. 123 section 1 of Law 85/2006. Distribution of amounts made in the realisation of the funds obtained from the sale of assets of the debtor, the creditor of the encumbered in favour of mortgages, gajuri, or other collateral pledging or retention rights of any kind, will be distributed in the following order: 1. taxes, postage and any other expenses relating to the sale of assets, including those necessary for the conservation and management of such goods, as well as the payment of the remuneration of persons engaged pursuant to articles. 10, art. 19 para. (2) article. 23 and 24 of the law 85/2006;

-claims of creditors warrant born during insolvency proceedings after confirmation of plan of reorganization, as part of this plan. These claims include the capital, interest, increases and penalties of any kind;

Use of the movable property seized

Recovery of seized movable if, within 15 days from the seizure were not paid the amount due, all accessories and costs of enforcement, the bailiff shall ascertain the recovery of seized assets by sale at public auction-,-direct sale or by other means permitted by law.

However, the sale will be made as soon as the goods have been seized, if they are subjected to involuntary, land degradation, interference or depreciation or whether their retention would disproportionately large expenses prilejui in relation to their value.

Bailiff, with the consent of the creditor, the debtor may încuviinţeze them to make himself the recovery of seized assets. In this case, the debtor is obliged to notify in writing to the executor of the tenders received, indicating, where appropriate, the name and address of the prospective purchaser, and the period within which the latter undertakes to keep the price proposed.

The bailiff may also undertake, with the agreement of both sides, the recovery of goods pursued by selling direct to the buyer that provides at least the price established according to art. 747. the term C.p.c for direct sale will be determined by agreement of the parties. The debtor and the creditor will be informed about the date, time and place of sale, as well as about the bid submitted by the potential buyer.

In the absence of the parties or if the direct sale or settlement is not achieved, the bailiff shall ascertain the sale by public auction of seized assets.

Sale at public auction in connection with the application of seizure, the bailiff shall be required to identify and evaluate assets seized, except in cases where this is not possible. The goods are to be valued at their market value, according to the market price of the locality in question. At the request of the parties concerned or where not possible to evaluate himself, the bailiff will appoint an expert to fix the price for the sale of seized assets.

Executor shall have the wizard set the price, through a written report which will be handed over at least 5 days before the day fixed for the sale.

The price will start at these auctions will be referred to in art. 758. (6) and (7);

 -place and date of the display, in the case of notices of sale;

- signature and stamp of the bailiff, in the case of notices of sale.

Publications and notices of sale will include: a) the name and location of the execution;

- the file number of enforcement;

- name of bailiff);

- name, surname and domicile or, where appropriate, the name and location of the debtor and the creditor;

- date, time and place of the auction;

- indication and summary description of goods to be sold at public auction, with the likeness of each price of the start of the auction, which is the price set out in the minutes of seizure or, where appropriate, as set out by the survey; in the case of securities nenegociabile, indicate the location and which can be purchased at the expense of the applicant, the specifications referred to in art. 746. (4);

- indication, if appropriate, that the goods are sold the rights of prior use, subsequent inclusion of any mortgages and that, if the creditors do not trackbacks would be covered in the first auction, it will be necessary, on the same day, a new auction for the sale of goods free of those rights. The bailiff shall draw up notices of sale, they will appear with at least 5 days before the holding of the auction at the auction, the bailiff of the Town Hall of the place of sale of the goods and of the Court of execution, as well as in other public places, where their heads are required to create the conditions needed to display publications sales, without imposing fees or contraprestaţii. Also, the bailiff will draw up and selling publications which they will bring to the attention of the public through one of the local newspapers or, failing that, of the national movement, through newspapers, magazines or other existing publications intended for sale of property of the kind offered for sale, as well as on open internet pages for the same purpose.

After the expiry of 15 days from notification of the financial condition of liquidation and distribution of the project or after the sentence on opposition remained irrevocable, accounts of liquidation and distribution shall be considered approved and liquidators are liberaţi.

joint stock companies winding-up, and limited stock liquidators in stock companies and joint-stock partnership shall be made by the General Assembly, which decides the validation, where the instrument of Constitution, unless otherwise stated. The General Assembly shall act by the majority laid down for amendment of the Constitution. Where the majority was not obtained, the appointment is made by the Court, at the request of any of the directors, members or associates of the Directorate, with the attendance of the society and those who have requested it. Against the sentence of the Court may declare the appeal only, within 15 days of its pronouncement. Liquidation of firms in partnerships, partnerships or limited liability companies, liquidators in partnerships, partnerships or limited liability will be carried by all associations, if in the contract of the company unless otherwise stated. If you will not be able to meet the unanimity of the votes cast, the liquidators will be made by the Court, at the request of any member or administrator, to listen to all the members and administrators. Against the sentence can be declared only by appeal or assign to administrators, within 15 days of its pronouncement.

After completing the liquidation company partnerships, partnerships or limited liability, the liquidators shall prepare the accounts and to propose the distribution of its assets between associates.

The accounts signed by the liquidators shall be submitted to be posted and published on the website of the Office of the trade register.

Administrators and members of the Directorate, the liquidators shall submit a report on the management for the past tense financial situation last approved up to the start of the liquidation. The liquidators have the right to approve the minutes and to make or support any dispute relating thereto.

PARTICULARITIES OF FIXED ASSETS. ACCOUNTING AND FISCAL TREATMENT

Sărac Aldea Laura
Doctorand, A.S.E. Bucureşti
UNIV ANDREI ŞAGUNA CONSTANTA

Introduction

The present work proposes to realize o complex research of the accounting and fiscal perspective of fixed assets. A special attention will be given to the opportunity and the efficiency of the investment as an instrument in the management decision for the development of a company.

The scientific novelty work is focused to the element of complexity and actuality of information, which, due to deep changes from the structure markets, of transformations alerts ale the process of productions based on the technical progress unknown in history, becomes vital as much in, practice the quotient and in theory. The novelty consist in comparative approach of the theoretical appearances concerning the immobilizations according to International Standards of Financial Report issued by IASB and OMFP nr. 1752/ 2005 for the approval of Accounting Rules according to Europe Directives.

The body of the work
The fundamental concepts concerning the material / immaterial assets. Viewpoints.

Different appearances of the assets immobilizations were treaties in the economic literature especially separate, on stage of active , or except alone viewpoints, as a rule either the bookkeeper, either juridical, either managerial, fact for which considered equip an which his work is one the all the appearances being in a the complete guides of the investor.

A correct characterization a phenomenon of investments upon on: The economic appearance, financier, bookkeeper and juridical.

From economic viewpoint, investment represents all the consumptions of which funds done currently in of a hopes economic future effects.

From financial viewpoint investment represents the creation of capital of production through the renunciation to the immediate consumption of money funds, capital achieved a flux of future receipts.

Below appearance bookkeeper, investments represents the transformation of money's availabilities in active physical submissive amortization, or in active financial. The expenditure in the case of investment, he represents the active transformation in active material an financial which increase the patrimony of business, be the word of an expenditure of which effect is stretched outside of the current exercise.

From juridical viewpoint, investment represents the creation of elements of which patrimony can constitute the objects of the ownership.

Considering investment as a phenomenon financial and monetary, it would be appreciated as these represents envolved on a long of a term capital of to his investor or given the accumulations of the populations in the aim obtaining of a the maximum gain with minimum in a riskness the after days.

As an agreement of a theories of the specialists, the elements components ale the concept of investments established by-path as the next:

-the concrete and material content of the effort of investments, I carry consider investments as a particularly structure of different funds as the nature and the volume, what I am brought in the realization of the project;

-the factor "The time", which show the fact as the any project of investments has a period of scroll, presented through stages and good moments described and on during which the indicators economically have the project have particular ways of evolutions;

-the concept of efficiencies, as per which, the investor accepts the utilization of present funds for an effective series(receipts) future, I carry in the total sum to is superior initial expenditures;

-the risk, carry results from the concrete way of achieve in the after days of the effects waited. Risk appears due to the fact as the these effects waited are maybe , but not certainties, the degree of risk be inverse proportionate the probability of achieve the waited effects.

In the literature the maul can be meet a series of approach of the concept of investments, such as in large sense and in limitary sense, or in economic sense, financier and the bookkeeper.

The concept of investments represented always a subject of chat, completions in on the average investigatory. The economist P. Caspar proposes a series of criteria appreciatory investments:

- for an expenditure an employee today, is expected to is obtained a result tomorrow.

-this expenditure conduces to a constituted the sinking-fund that is a capital of which effects are produced on an what period exceeds the of a landmarks exercise.

-the correspondence expenditures conduces to multiply the capacities of production or commercialization of the enterprise.

-Exist the evidence as the different expenditures employee increases the patrimonial undertook

And a supplementary condition applied to these expenditures were delimitate of the expenditures of operation:

-Place a break an in a report with the tendencies extrapolate from pasts.

All in sphere of the concepts concerning the answers of long-term capital existed the which specialists tried to accredited the term of" cvasi investments" as be certain which expenditures have the characters of investments but are taken all the some in the category current expenditures, because they have no frequent and the repeatability of investments the appearance.

Pierre Masse says as investments is" an expenditure dispute about future an uncertain" or, otherwise gave up to," the satisfaction quickly and sure, on the expense of the economies of which we dispose currently against of a future hopes of which support represents it just good invested"

The French economist F. Aftalion formulates the next definition:" The investments represent the renunciation to the monetary sources i current liquids against the of a hopes future funds, obviously else big.

P. Masse establishes the next four main elements for investment scilicet:

-Subject, represented of he who did investments - the person   physics or juridical;

-Object, represent the thing, undertake, the firm, the equipment etc., the way in which the investment is;

-Costs, carry is the supplementary effort, admonish, current spent for obtaining that concrete object;

-Effects in numbers, results through the realization of investments and which obtained in future and represents, in practice a hope more or less admonish.

Nicolae Feleaga in his book" The risks of bookkeeping to balance among milleniums" brings an important contribution and a binevenues to this research themes and does the specification as the nameable studies take the in the calculus the investments considerate measurable excluding investments material toes enterprises how are for instance: Investments in the strategic reflection, in formalization of his methods or the organizational investments.

The author says as analyses of immaterial don't is can confined to a distinction between immobilizations and expenditures. If undertake achieves the important expenditures this in area, means as they he expects to obtain a series of advantages in exchange. The author considers as the investment as the a papers of give in the immediate satisfaction of certain and against of a hopes of future benefits brought of good invested has a series of consequences how are:

-the investment is built from series of expenditures and future earnings of which ransom character is characterized of the notion of hope

-the investment is a defalcation from production in the sight of utilize them for building of a potential new susceptible to generate economic long-term advantages

- the investment is an arbitration , a problem of decident is not a realization of investment but choose from a portfolio of projects.

-the investment is a strategic decision , not being enforced of the current exploitation.

Taking in these sight these numerous characteristic immaterial expenditures can require the statute of investment. Most massive expenditures done of enterprises are in the areas: research development, the personal formation, reorganization of the production, information and commercial investments.

Yet, according as I show the author the inclusion of all immaterial expenditures in the category of the investments is, in the certain way, perniciously because the immaterial investments present a series of characteristics differed against one material: I am risky and their profitableness is uncertain, their effects don't the by-paths always perceptible, recognize their juridical and the patrimonial is limited many times of their virtual character.

In the researches done in this in area, the specialists adopts else many concepts: investments, funds, expenditures, or active.

The specialists considers as the mutations from the modern economy have a double consequence: On aside he causes a movement of the process of production from matter and energy towards information and knowledge and but then lead to an interconnection and a diversification without unprecedented these. Same in the same time the specialists considers as the blast of informal technologies, nationalization the economies, globalization markets led to an index of uncertainty of the phenomena much more than by now what does as the productive classic his models don't the maul gives results. New in stage these shall must set-up on the strength of the fashions of which his organization based on the development flexibility and the speed of reaction to changes in order to integrated in a economy based on cognition.

A report of OCDE specifies as" despite of conceptual difficulties the practical and in the definiteness immaterial and in the adoption as an account rule which permits their taking in a account manner the proper maul, the economic contribution of immaterial investments to the growth of the performance and competitiveness undertake does necessary the progressive these uses in accounting systems ".

Sequence in-sequence or OCDE considers as:" The notion of investments immaterial cover all long-term expenditures different than one proved by purchased corporal immobilizations, which the societies engages upon them to improve the results."

An study of OCDE divides the immaterial investments in three big components, investments in research, investments in produced the programs, and one of the third gift don't on last place, the publicity.

An another which tackled the in at large this category of were, Patrik Epingard in the work" L'investissement immateriel, coeur d'une economy fondee grey to savoir, Ed. CNRS, Paris", from which we quote:" To level economic, the notion of capacity becomes confusedly in numerous sectors of activity, so that nobody don't else knows which by-paths the frontiers of the investments: These limitation to the level corporal immobilizations don't focus the strategy of the enterprise, and the integration of all expenditures engaged in the sight obtain of economic future advantages in the sight obtain of future advantages is pre ambitious"

Epingard considered as in the place of the universal definitions or of a list which specify which the expenditure can be qualified as the investment is more important to be enumerated the specifications of immaterial investments as being in their views to:

-Massif in amonte of the process of respective production equal-phase in of research, develop into the case of his technologies of equal-phase in of the expansion of the market in the case of

commercial investments of irreversible active specific difficult rule of marketed, their value be as a rule connected with the organizations which in by-paths incorporate

The controversial problems of the appearances of evaluation and recognize of corporal and still more selected immobilizations immaterial.

Objective the financial compliant situations of general frame for the elaboration and the presentation of financial situations elaborated of IASB is delivered information about the financial sprocket, the performances and the modifications of financial sprocket ale of the entity, carry the useful of a by-paths large spheres of users in the taking of economic decisions.

The fate financial bookkeeping is connected with the elaboration, the presentation and the publication of balance-sheet in accordance to foresee of a frame conceptual bookkeeper.

The determination of the base of measure, used for the ascertainment different patrimonial elements in situations represented, one of the problems most difficult of bookkeeping. Recognize of a active or a debt were a long weather the preserve of expert bookkeeper. The examples most typical the one by-paths according to the expenditures investigatory, to brands, to the commercial background

In the practice and in the theory of accounting were accredited on many bases of measure. In as part as general for creating and the presentation of financial sheets issued of IASB these am: The historic cost, the current cost, the value net of realization, the value updated.

Historian: The assets are counted to the sum in coin or equivalent of specie paid in the moment their his purchase to the value justly the sum paid in the moment of purchasing.

Current: The assets are counted to the sum in coin or equivalent of which specie burn must paid if one same active his burn be buy in currently.

Realizable: The assets are counted to sum in coin or equivalences of which species can be obtained currently through the natural selling of his actives.

The updated value: the assets are counted to the updated value of the future incomes which were generate in the natural scroll activity.

Problem consist in the choice the fit maul among these in contextually satisfy the requirements of the users of accounting information on aside and an observance a principles and an accounting foundations but then.

Producers and the users of financiers sheets appreciated as , in the measure and the presentation of accounting information, most utilized is cost the historian, although presents and one thin points. This is of habits used another bases of evaluation. More, tendency is of is passed to the utilization of current cost as a response to the incapacity of the model of the bookkeeper based on the historic cost solved the incident to effective problems of modification prices the unmonetary assets.

He is obvious as the determination clear value of realization is released of an uncertainty an estimation nice and an erect incites the how much good time sold really on sale caning generate the different estimations from the assessors.

And another strong which they experimented the bookkeeping in actual value have given up gradually hereto base of evaluation, so with the decrease of inflation, he produced and " the end of the current cost".

If we accept as a cost is an effort agreed for obtaining income and if we placed in the optics of independent exercises, the acquire of a active fixed is an which transaction has consequences about the more exercises. Otherwise said, you be the word about an effort agreed about the more exercises. Following same the optics independence of exercises, each exercise shall it be it granted the afferent these incomes are due to absorbs the part from the efforts agreed achieved a results..

Only that but then the historic cost is again rough criticism when he is word of the depreciations of active incite for subjective estimated how much and for dependent estimations of the intentions of different size of interests ale the users of the information.

In current period the accounting practices appeal to a new guys of models of which evaluation win against historic costs the modern and just value to an another valuable respective concept: The updated his value the value of utility.

The actuarial brought we come in a row devotees modernization of the bases of evaluation. The context normalization the bookkeeper which in appeared these new expressions ale evaluation is one of the active depreciation.

At the present day an all elder brand name number deal in an globalization economy characterized through nationalization markets and the fluxes of capitals and seem as, for the present, don't he arrived at an agreement in the utilization of a bases of his evaluation, what drives, still once, to the conclusion as the for a distance these they shall coexist and are shall improved an in concordantly with changes from economy and requirement enforced the system informational the bookkeeper.

Another problem is a concept of capital and maintain the capital: The concept of financial his physical capital.

As per the concept of financial capital, this is synonymous with active clear his with the own capitals ale entity. The profit is obtained just if the financial monetary value of assets clear to exhausted the period is elder than the financial active clear value in the beginning the period, after the exclusion of any distributions to owners and any other contributions from the owners of the temporally period Maintain the financial capital can be evaluated incite the in monetary nominal units, quotients and in units of power of constant purchase.

As per the concept of physical capital, the capital represents the capacity of production entity counted, for instance, in units of production on day. The profit is obtained just when the physical productive capacity entity last the period exceeds the physical productive capacity from begin with the period, after he excluded any deliver to owners and any contributions from the owners of the temporally period .

The concept of maintain the physical capital require the adoption of current cost as the base of evaluation. The concept of maintain the financial capital don't enforces all the some the of a certain use bases of main evaluation difference between two concepts according to maintain the capital is reduced across the treatment of the effects of the modification prices of assets and the debts of the entity.

The International and continental normalization in according to the concept of immobilization assets.

The international harmonization represents a process institutional, which has as the aims, the assurance the convergence the accounting norms and the practices national assured of the pertinences in comparisons between financiers sheets of the enterprises from strong different, comparability of accounting information be a conditions necessary for a maul hello allocate a funds on world plan, definition taken over from Ion Ionascu, "Epistemology bookkeeping" , Ed. Economic, Bucuresti, 1997

The daily international harmonization would be considerate a simple consequence of globalization, she participate invisible, but persuasive, to sustain the report of power. The accounting norms the neutral totals, am incident to the big interests on international sale. Through they use concepts, ideation, ways of thoughts, of communication, of act from in last row, enforces behaviors. The accounting harmonization is requested in first site of the financial international community, represented of investors, but and of the organisms of regulate the financial market.

The accounting harmonization has three degrees of differentiations:

1) International Normalization - the use of the same norms in same geo politic space

(2) the harmonization the appearance - authorized the many maul practices and treatments, but compel to the settlement of equivalent in the documents of the synthesis of accounting;

3) Harmonization of Legislation – national court of settlement build, modify or adopt the settlements visas, the accommodation and approach the international accounting practices.

The accounting normalization is a social process wherewith is negotiated an equilibrium between very diverse interests and the necessity of uniformity presupposes formalization and the objective materialization, of the concepts, of the methods, of the rules and the procedures concerning the production and the utilization of the accounting information.

Departing from objective my work presented all the appearances note to the corporal assets try to delimit the efforts of nameable organisms of international normalization the active tangible category.

The tangible assets were definite in contextually standard IAS1" Presentation of financier sheets" as active non current(non assets) presented asunder in balance-sheet in the active category .

The normalization of the treatment of the bookkeeper referring to the immobilizations were written for first in detail of the international bookkeeper, through standard IAS 38 in 1998, which in established criteria of recognitions, the bases of evaluation and requests of report this ale categories of immobilizations.

The definition of the concept of assets according to International Standards of Financial Report

Definition of the concept of assets according to International Standards of Financial Report is an active, in the vision International Standards of accounting, represents" a resource controlled of enterprise as the result of a past events and from whereat is waited for generated the economic future benefits for enterprise."

His benefits the economic future advantages represent" potential contributed in direct his indirect way to the flux of specie and equivalent ale of the specie to enterprise.

This potentially can be, fitted the paragraph 53 of general Framework of elaboration and present financial sheets:

-a potential of production, carry does the part from the activities of exploitation ale the enterprise.

- a method of conversion in his equivalent treasury of treasury;

-a capacity of reduce the output of liquidity, for instance an alternative process of production a new - technology - what cause cost of productions.

-the possibility assured protection his average or the satisfaction of legal rules etc.

The economic future benefits incorporate active in can enter into the entity in the many maul ways, for instance:-Asunder or in company with another active for services or the production of good fated sale of to entity; -With another active; -For justify debts; -Shareholders of the entity;

Many active, for instance, the corporal immobilizations, have a physical form. With all these, form physics elemental for of a active existence of example, patents and copyrights.

Many active, for instance, the book debts and real property the associate by-path with legal laws, inclusively with ownerships. The ownership elemental for the determination be of a active of example, a realty in on the basis of an of a contract of leasing.

The previous version IAS38 don't specify " the features of identification", but sustained as the an intangible immobilization can be different clearly of the commercial background if active is separable, but the fact as the this is separable don't the east prerequisite for condition his identification. Standard 38 in the current version show as an immobilization carries out criteria of identification from the of a definition intangible immobilizations when:

-is shared, that is he can be separate his broken apart form the entity and sold, dumped, proprietary, rented or changed, is individual, he is in company with a contact, his active afferent debt;

 -From the contractual his laws from another secure laws of law, all the same if those laws are transferable his separable of his entity of another laws and obligations.

Definition of the concept of assets in according to OMF 1752/2005.
 The assets fixed are active generated of benefits and possessed on an elder period of a year. The corporal immobilizations represent which were:

 a) possessed of an entity were an used-up in production of good , making services, were rental the other parts or were used in administrative aims; And

 b) am used-up on of during a long periods the big maul of an active years

An fixed asset is active an identifiable, unmonetarry, without material supports and prisoner for utilization in the process of his production supply of good and services, were rental the other parts or for administrative . An intangible assets must recognized in balance-sheets if estimated as the you generate the economic benefits for entity and the active cost can be estimated in credible way.

 The financial immobilizations containing the shares in possession to the entities affiliated, the loans granted the entities affiliated, the interests of participation, the loans granted the entities of which the companionship is bind by virtue the interests of another participation , the investments as the another immobilizations loans.

In the accounts of receivable presenting loans granted with the sums granted other parts on the basis of contracts for which the entity perceives the interests, fitted the law.

 To another loans granted contained guarantees, the warehouses and the sum deposited of entity to others.

 The which entities have in the account of fixed receivable afferent receivable of the contracts of leasing financiers, as well as another fixed receivable with elder terms of a year, you present in balance-sheet, to financial immobilizations, merely the part with elder term of 12 months, differences were presented to receivable accounts.

Conclusions:
The theme is great due to the main aim touched all the appearances concerning the immobilizations and require a labor supported of documentary, of research recent researches and updated settlements, in the sight objective suggested realization.

 The development researches on the theme corporal immobilizations has the utility as much for investors and owners of fixed assets, quotients and for the fiscal and the juridical authorities and for the large audience.

ACCOUNTING INFORMATION – A BASIS FOR ACHIEVING THE DECISION FOR THE REALIZATION OF PUBLIC INVESTMENT PROJECT

Sărac Ionuţ Pavel
„1 decembrie 1918" University - Alba Iulia
PhDSchool

Accounting information plays a key role in the foundation process of public sector decisions. Financing budget deficits, treasury risk identification (availability risk), formation of tax claims, foundation of financial sustainability for public investment projects are just some examples of using accounting information in decision-making process of credit accountant.

How can we use and process accounting information in the foundation of public investment projects? We will try to answer this question in the content of this paper. The revenues and expenses, as accounting information, are necessary for determining the actual financial net value and/or the actual economic net value. These indicators have decisive information power in accepting and / or rejecting public investment projects. In the current economic context, the importance of investments is major for at least three reasons: the first one is a highly circulated reason in the last 20 years: the increase of technology, the alignment of the technology used in the alignment of competitors from the European market and even worldwide; the second reason is linked to the support of economic growth in crisis conditions through a policy of major investments especially in the infrastructure sector; the third reason, which derives from the second one, is that of post-accession grant funds available for investment both in private and public sectors. The importance given to public investments is also revealed by the authorities' approach to establishing key areas of interventions under grant programs (with programs designed to both public and private environment) designed exclusively to carry out public investment programs (for example the POS Transport).

In this context, the present research is intended to be a documentary of the role that accounting information plays in decision-making process that precedes the development of an investment, especially as most major investments are made in the public domain.

Keywords: public investments, accounting information, cost-benefit analysis.

H83 - Public Administration; Public Sector Accounting and Audits
H54 - Infrastructures; Other Public Investment and Capital Stock

Accounting can be viewed as a source of information for different users. Specialty literature identifies and groups these "consumers" of accounting information in two major categories: the internal users and the external users. In the internal users category, most authors include, together with managers and decision-maker managers, the employees. This category uses both information from the current financial accounting, from financial statements and also from the management accounting (internal management), the latter providing information exclusively for internal users. The external users category is larger: it includes investors, financiers, creditors, commercial partners (suppliers and customers), social partners (the unions), the public power and the financial analysts, the judiciary system and also the public.

Regarding the accounting information users involved in the decision-making process regardingthe realization of an investment, they can be found both in the category of internal users (namely managers, board members) and external users, on positions such as investors, donors and creditors.

In order to be used by these categories of users, accounting information must be understandable, relevant, reliable, comparable, consistent and objective, forming the internal sources of information. These are:

-Financial accounting planning documents (budgets);

-Financial accounting tracking documents (stock records, reports);

-Financial accounting reporting documents (the balance sheet and its annexes, activity reports, evaluation reports);

Based on the information gathered from the sources above it can be drawn a series of financial indicators. These, from their type of expression, can be natural indicators, conventional natural indicators, indicators of value, labor indicators, or, seen in terms of their economic content, they can be structure indicators or efficiency indicators. Whatever indicator system used in the decision-making process should have the following quality attributes:

-coverage (it sufficiently covers the program in it's main, general and specific aspects);

-balance (includes indicators from each area of interest);

-simplicity (lesson criteria take into account the capacity of responsibility, understanding and accumulation of information by the users);

-relevance (the indicator system develops in all directions of action);

Focusing particularly on public investments, it is not without importance to mention the reform process that public accounting undergone in the last decade. Today, public accounting is a commitment one, defined by IPSAS as being the method in which transactions and other events are recognized when they occur and not when cash or its equivalent is received or paid (as the case of flow accounting) and events are recorded in accounting records and recognized in the financial statements of the periods to which they relate. The elements recognized under accrual accounting are the assets, liabilities, equity, revenues and expenses.

Accounting Law no. 81/1991, Article 2, paragraph 2 names public accounting components as follows:

-accounting of revenues and expenditures, reflecting the collection of revenue and the payment expenditure related to budget;

-Treasury accounts;

-General ledger based on the principle of finding the rights and obligations, reflecting the financial and economic development, and the surplus or deficit heritage;

Public institutions accounting provides for information to credit accountants regarding budgets of income and expenses, the assets under management and for the preparing of annual general account of state budget implementation, the annual execution account of the social security budget, the special funds and the annual accounts of implementation of local budgets.

Even if the first component of public accounting refers to evidence of revenue flows and payments, interpreted by some authors as being a return flow accounting, it is complemented by the general accounting component, which is based on accrual accounting.

Accrual accounting presents several advantages, allowing users to assess responsibility for all the resources controlled and used by the entity, to evaluate performance, financial position and cash flows of the entity and making decisions about providing resources or starting a business that the entity may have.

Substantiate a decision on setting up a project investment is based on extensive and thorough analysis of profitability and financial sustainability of that investment. Through this analysis – the cost-benefit analysis - is aimed to answer the following questions:

Is that projectworth to be financed through investments?

Under what circumstances is that projectworth to be financed?

If, in the private sector, the problem of running an investment is not always put in such an analytical manner, in the public investments sector, or in a sector involving public funds, no investment can start without having as basics the cost-benefit analysis showing that the net benefits of the project for the society are positive and the project benefits exceed its costs, resulting in an advantage for the society, such as encouraging economic growth, boost employment, improving environmental conditions and so on.

The opportunity of making an investment is, therefore, analyzed in socio-economic terms through the Economic Analysis of the Cost - Benefit Analysis that is a positive value of the actual net economic value of the investment.

According to the National Guideline for the Cost - Benefit Analysis of projects financed from structural funds, the stages for the realization of the Cost – Benefit Analysis are:

-Investment identification and defining objectives;

-Analysis of options;

-Financial analysis;

-Economic analysis;

-Sensitivity analysis;

-Risk analysis;

-Result presentation;

The financial analysis is used to calculate the profitability indicators using projected cash flows of the investment project. There are two indicators used in the financial analysis, namely: the Financial Present Net Value (FPNV) and the Financial Internal Rate of Return (FIRR), used at the level of investments costs efficiency level (VNAF/C, RIRF/C) and at the level of return on national capital (VNAF/K, RIRF/K).

Financial analysis deals with the investment exclusively in terms of the economic operator that realizes it, aiming the verification and guarantee of cash flows generated by the project, namely the financial sustainability, and determining the financial return on investment with th help of the indicators listed above.

The economic analysis is carried out at a different level; it assesses the impact of the project on the region or country's economy. The information provided by the accounting system, respectively the recordings on inputs and outputs, reflects only the transaction price of certain goods and services, the price practiced on a certain market, and doesn't always reflect their social value, social opportunity cost. Such distortions may be found on monopoly or oligopoly markets, may be caused by trade barriers acting on prices, markets with regulated prices. There are also situations where no information is available on certain categories of costs and / or benefits related to the project, such as effects on the environment or general health conditions that cannot be easily monetized, but due to their significant impact, they need to be included in the evaluation. In order to calculate the indicator's value from the economic analysis (the Economic Net Present Value - ENPV and the Economic Internal Rate of Return - EIRR) it is necessary to transform the market prices (accounted) in shadow-prices, the non-tradable and monetization effects and the involvement of additional indirect effects, if they are significant.

The period for which a cost – benefit analysis forecast is spanning varies from project to project, or better said from one investment domain to another. For example, investments aimed at areas such as water and environment, railways have the highest recommended timeframe for undergoing the Cost - Benefit analysis, a timeframe of 30 years, while investments aimed at areas such as energy, telecommunications, industry, have the recommended time range of25 to 10 years.

When the benefits of an investment project cannot be quantified in monetary units, using a non-monetary quantification system of benefits in relation to the determined investment cost per product unit, it is used a different valuation technique: the Cost – Effectiveness Analysis.

The performance indicators of an investment project that are calculated within the financial analysis are based on net cash flows. These should not be mistaken with cash flows from accounting conventions, particularly those used in financial reports of economic entities.

The methodology used for achieving the Cost - Benefit Analysis in estimating cash flows, require a few assumptions, namely:

- are taken into account only incoming and outgoing cash, the depreciation, the reserves while other accounting elements, which do not correspond to real flows, are ignored;

- the project's cash flow statement is based on an incremental approach, respectively the difference between costs and benefits of the scenario with project (the alternative to do something) and of the scenario without project;

- annual cash flows for all the years under review will be aggregated, making it necessary to adopt an appropriate financial discount rate in order to determine the present value of future cash flows;

Financial analysiswill be carried out throughaseries ofinterconnected and subsequentcalculations, based ontotal investment costs, later estimating the operation and maintenancecostson one hand, and the incomefollowing the implementation ofinvestment project, on the other. Allthese estimateswillbe comparedwith another setofestimateswhich is based onthe assumption that theeconomicentity's operationswill continueunder the original conditions, withoutthe accomplishment of the investment.

The guidelinefor the cost - benefit analysisof investment projects, publishedin 2008by the General Directorateof European Commission's Regional Policy, showsthe categories ofinputs and outputsthat must bequantifiedand consideredseparately foreach categoryof indicatorswithina Cost–Benefit Analysis, within achart form,as follows:

	VNAF (C)	Sustainability	VNAF (K)

Source: Guidetocost - benefit analysisof investment projects, DGRegional Policy EC
Note: Signs"-" and"+" indicates the nature ofcash flow. For example, national public contributionsaretakeninto accountasinput when theproject's sustainability is checkedand is considered an outputwhen the profitabilityof national capital is estimated(K).

Most of the timesan investment exceeds a financial year, so there must be made an estimation of the investmentcosts, more specifically of thepaymentorsettlementof the charges.Total investment costscanbe grouped intothree main categories, namely:

-expenditure onfixed assets;

-start-up expenditure;

-changes inworking capital;

Most ofthepaymentsrelatedto an investmentare most oftenrepresented by cash outflowsarising fromthe acquisitionof **fixed assets**. The sourceof information regardingtheestimated valueofassets to be acquiredin aninvestment objectiveis represented by the feasibility study. The payments taken into consideredfor the acquisitionof fixed assetsare the incremental ones, establishedas the differencebetweenthe investment with scenario and the investment withoutscenario. This categoryincludesalso the residual value, which doesn't represent a cashoutflow, buta cash inflow supposed tobedoneat the end of the analysis. Thisis actuallythe net present valueofassetsat the end oflastyear of theanalysis period. Because of the factthat these flowsdo not occurduring the last stage ofinvestment, they are not includedinthe discounted investment cost(DIC), but in theupdated netincome(UNI). Residual value canbecalculatedin threeways:

- taking into account the residual market value of fixed assets, if sold at the end of the considered time horizon and with the liabilities standing net;

 - by calculating the residual value of all assets and liabilities, based on standard formulas for economic depreciation of capital (other than the depreciation for determining the profit tax);

 - by calculating the updated net value of cash flows for the remaining life of the project.

The size ofresidual valueisinfluenced bythe timeframe setfor theprojectionsofthecost - benefit analysis. Timeframeshall notexceed theusefuleconomiclifeof the investment, but also it shallnotbe significantlyreduced compared toit. The residual valueis minimizedwhenchoosingthe optimalanalysishorizon.

Start-up expenditure includeallcosts, at the level of payments, relatedto theinvestment objective, madeoutsidethe periodof realization of the investmentitself, and which cannotbeconsideredthemselves as investments.This includes the costs of variousstudies, including the feasibility study, costsofresearch - developmentexpenses,consulting expenses, training the staff that willserve theinvestment, thecost ofownsourcesoffinancing, etc.Evenif thebenchmarktreatmentdoesn't always allow the capitalization of thesecosts, they should be takeninto account within thecost - benefit analysison the groundsthat, withoutsuchinvestment, these costswould not have existed.

Changing inworkingcapitalissignificant generallyforproductiveinvestments. This changing in working capital isconsidered at thenet capital, determinedas the differencebetweencurrent assetsandcurrent liabilitiesrelativetothe investment'soperation. The size ofthis variationin workingcapitalisdetermined by thedemand fortrade creditfrom the customers,of the timing andsize of the creditprovider(short-term, suppliers ofcurrent activity)and of the correct estimation ofavailability needs, so that the financial sustainability of the investment projectis notjeopardized. Thus,inthiseconomic categoryare included thereceivables, the inventoryof each stage ofproduction,andcash andothershort-term liquidities. It is noted that, by its nature, working capitalisa fund thatshould be consideredinthecost - benefit analysisas a flowonly asitvaries fromone period to another.

Operating costsincludeallcurrentpaymentsresulting from operatingthe current investment. Thesearestaff costs, including the related social cost,expenditures forraw materials, utilitiesconsumption, generalexpensesarisingineachaccountingcycle. From the category of accountingexpensesrecordedcurrently, the depreciation expenditures, provisioning expendituresand other reserves expensesare not takeninto count, precisely becausethesedo not involvecash flowsand becausethe potential risks totheaccounting practicerequirethe provisioning to be taken into accountwhen achieving the cost - benefit analysis.

The revenues generated by the currentexploitation of the investmentaredetermined onthe basis of expectedpriceand quantityoftradedproduct orpossible service. Transfersandsubsidies are usuallynotconsideredincomesintheCost - Benefit Analysis, nor is the value added taxor otherindirecttaxesthat the operatorperceives from thefinal consumer, in order to

subsequentlypaytothe tax administration.There are, however, situations where it is recommendedtoconsider theflowofindirect taxesfor the financial sustainability analysisof the project.Regarding the consideration ofsubsidiesandtransfers as being part of the incomecategory, ifthesesubsidiesortransfersaredirectly linked to the exploiting activity of the investment, and they don't have a sporadic nature, they should be takeninto account.These situationsare the mostnumerouswhenit comes topublic investments, investmentsperformed in health infrastructure, social infrastructure, education infrastructure and so on, precisely becausetheactivity that uses theinfrastructureinvolvedisfinanced precisely through thesemechanisms.

Other specific situations related topublicinvestmentsare those wherethe ownership ofinfrastructureon whichinvestments are madebelongs to anotherentitythat the one who will operatetheinfrastructure. Such situationsare the ones related towater andsewersystems, centralizedheating and railway transport; in such caseswhere, the ownership of infrastructure belongs to the state or to the territorialadministrative units, while their exploitation iscarried out by different economic agents.

Due to the fact that thecost - benefit analysisis performedfor the owner of the investment, it wouldbe useful toperforma **strengthened cost - benefit analysis**forboth sides.

Financial sustainabilityof the investmentimplies the existence of apositive cumulativecashflowfor eachyear ofthe time horizon forwhichprojectionsare made. When we refer topublicinvestments, where,in the decision-making process, the politicalfactor is also involved, the financial sustainability ofan investment projectcan also besupportedbypublicfundsallocation policyin various formsbyoperatingactivitiesof the undergone infrastructure.

Asa conclusionregarding the use ofaccounting informationas a basis of the decision-making processfor the acceptance or rejectionofpublic investment projects, we must admit that thedecisionfactorhas also a politicalcomponent that mayuse some legalleverage in order to influence the outcomeanalyzes,andthus theinvestment decision.

The study shows the reasons taken into account by the students in choosing an academic preparation. Free courses and employment opportunities during or after graduation are the most important advantages students expect to receive from an educational program that aims to follow. The empirical section results emphasize the efficiency and performance of the master program financed by the European Social Fund.
Keywords: student employment, free courses, European Social Fund
JEL classification: I21, I23

I. Introduction

Preparing students requires a specific attention as they are closest to the time of their entry on the labour market. Practice has demonstrated there is a serious discrepancy between the students' preparation and the requirements in practice that students must meet (Nistor et al, 2011). The masters program we propose aims to achieve an effective collaboration between the academic and practical fields in order to increase graduates' chances of finding a job. The program study is organized and financed from the European Social Funds and the courses are free.

The empirical study conducted by us intended to analyze the evolution of the perceptions students have regarding the employment opportunities offered by this program and the benefits of its gratuitousness. Our research involved applying the same questionnaire in two consecutive years in order to observe how the students' opinion regarding the two advantages of the master program has changed. The results of the study are intended to emphasize the efficiency and performance of the master program.

As the analysis has a high level of complexity, the paper presents partial results of the study meant to put into light the above mentioned ideas.

II. Overview

The university education system is responsible with the preparation of the future practitioners who will occupy the vacancies on the labor market. Although requirements are constantly changing due to the increasing complexity of the economic, financial and social context, the academic preparation of the students do not fully meet the professional needs in practice. The master program "Audit and financial management of the European funds" financed by the European Social Funds, aims to form specialists in writing, implementing and monitoring the European projects. The benefits of the program include free courses and specialized theoretical and practical training in the European funds leading to increased employment opportunities.

The role of academic preparation in finding a job is a recent subject of the educational studies. Many researches demonstrated that there is a correlation between students' or graduates' employment and their academic preparation (Watts and Pickering, 2000; Riggert et al. 2006; etc). Moreover, there are studies that reveal the fact that during their education many students choose to work because following an academic preparation involves many expenses (Bozick, 2007; Roksa and Velez, 2012).

Our study shows the importance of free courses or employment opportunities in choosing a master program.

III. Methodology

The aspects presented in this paper deal with:
- the reason for enrolling in this master courses,
- the time considered as necessary to find a job in the field after graduating,
- the field of the bachelor degree,

In the original questionnaire where also assessed aspects related to:
- different average grades obtained at the end of the bachelor period, at the entrance exam, etc,
- demographic variables.
- the most important consequence of the programme,
- the proportion in which the programme is considered to influence the finding of a job in the field,
- the status on the labour market.

The questionnaire was applied on the group of 60 master students from the second year of the programme, in Cluj-Napoca. The sample is made up of approximately 20% men and 80% women, with ages ranging from 21 to 50. Their perceptions were analyzed in time by applying the same set of questions at different moments in the evolution of the study programme.

The methodology employed belongs to the group of statistical and data analysis methods.

IV. Results

Starting from the idea that the programme is sponsored through structural funds, we were first curious to see if this was the main reason for the students to choose the programme. Comparative results are presented in table 1.

Table 1. **Distribution of the students based on the main reason for enrolling in the master programme (%)**

Answers	1st year	2nd year
It is free	8.8	14.8
I was working in the field	10.5	11.1
To obtain a supplimentary qualification	**50.9**	**40.7**
I considered it offered me more employment posibilities than the field in which I have the bachelor degree	29.8	33.3
Total	100.00	100.00

Source: authors' calculus

Having in mind that it is the same group of students analyzed, we were not expecting any changes in the share of each group in volume of the sample. However, results show slight differences from the answers given at the end of the 1st year of study and the ones from the 2nd year. For example, while at the beginning of the period analyzed not even 10% of the master students declared they have enrolled because it was a free programme, their percentage slightly increased at the end, towards 15%. More complex questions and analyses will be needed in order to see why these changes appeared. However, the modal group remained the same – the ones that wanted a supplementary qualification. They are followed by the students that were looking for a field to offer them more employment possibilities than the one they were specialized in after graduating university. Only around 11% of the students were actually working in the field of structural financing.

Taking this information into account, the next step was to assess the distribution of the students based on the field of their bachelor degree. The results have shown in both cases that:
- approximately 35% of the students have graduated Accounting or Audit,
- around 53% have graduated an economic field, but other than Accounting or Audit,
- about 12% of the students have their bachelor degree in other fields than Economics or Business.

In both rounds of the survey, we have tested the relationship between the bachelor field and the reason for joining this educational programme. With critical values of Sig. = 0.015, < 0.05, we can conclude that there is a connection between the reason for joining the master courses and the specialization graduated by each individual at university level.

Also in relation with the first set of results presented above, we analyzed the period of time considered as necessary to get a job in the field of the master programme. We expect changes to occur once with advancing in the programme. If the quality of it is good and the professors are able to put into light the practical part of the courses, there should be an improvement. If the quality of the education process is poor, the students should become more pessimistic in what regards finding a job in the field and the expected output of the programme. Results are presented once again comparatively, in table 2.

Table 2. **How much time do you think you will need to get employed in the field after graduating the master courses? (%)**

Answers	1st year	2nd year
I do not intend to work in the field	3.8	4.5
0 – 3 months	17.3	**27.3**
3 – 6 months	32.7	**36.4**
6 – 12 months	28.8	9.1
1– 3 years	17.3	13.6
More than 3 years	-	9.1
Total	100.00	100.00

Source: authors' calculus

The share of the students not willing to work in the field has remained approximately the same. A new group has appeared, made up of students considering they will be needing more than 3 years in order to find a job in the field of the master programme. These are students that graduated Economics or Business (other than Accounting or Audit) that enrolled in the programme to obtain a supplementary qualification or gain more development possibilities. All of these students are employed, aspect that could have prevented them from a better understanding of the field or, simply, could have prevented them from being present at the courses scheduled for the programme. The multidimensional data analysis has emphasized that the ones that do not want to

work in this field are already working in Accounting or Audit. The most optimistic students belong to all of the groups studied at their employment status. What is interesting is that the majority of the students that consider they will find a job in the field of structural funds in maximum 6 months after graduating are students that are not employed anywhere.

All in all, improvements can be seen in the perception of the students regarding the efficiency of the master courses, as almost 65% of them consider in the second year of study they will need no more than 6 months to get employed in the field of the programme, in comparison with approximately 50% after the 1st year.

V. Conclusions

The results of our study show there are some changes in the evolution of the perceptions students have related to the educational program they are involved in. In nowadays crisis the gratuity of education is a reason to follow a master`s courses. The possibilities of employment increase the efficiency and performance of the program.

THE IMPACT OF GREAT DEPRESSION ON THE AMERICAN ACCOUNTING PRACTICE

Toman Cristina-Maria
Universitatea Babes Bolyai
Facultatea de Stiinte Economice si Gestiunea Afacerilor

This article aims to prove that the events surrounding the Great Depression of the late 1920s and early 1930s, marks a maturity point in American Accounting thought and practice. In order to achieve such objective we have undergone a qualitative research, using as method of research the content analysis of the books and articles regarding the American Accounting history and the Great Crash. We can conclude that there is evidence that the crisis had a profound effect on the subsequent evolution of the American Accounting practice.
Keywords: Great Depression, American Accounting, Federal Securities Acts, American Accounting Association
JEL Classification: M41 – Accounting

1. INTRODUCTION

Before World War I, the Federal Reserve Board had been influential in the original efforts to develop accounting and auditing standards. From the appearance of "Approved Methods for the Preparation of Balance Sheet Statements" in 1918 until the aftermath of the stock market crash more than a decade later, the board did little about financial reporting standards. And other regulatory agencies also cease to ask for independent audits as a form of corporate control.

The social demand generated in the progressive era for corporate accountability vis-à-vis greater publicity had sustained Certified Public Accountants (CPA) in their original claim to professional status. During the 1920s that claim was significantly weakened by public indifference and a reaffirmation of the traditional American Creed. Economic theories, which focused on competition as the most effective means of promoting social welfare, suited officials in Washington well, for then they had no responsibility.

Since the public sector generated few demands for audited financial reports, accountants promoted other services that they could provide the businessman. Budgeting, implementation of standard cost systems, and other management accounting techniques were extremely important in gaining acceptance for public accountants during the 1920s. (George N., 1975)

2. LITERATURE REVIEW

Stephen Gilman evaluated accounting theory in the post World War I period and found it inexplicable that income determination had not become the focal point of financial reporting. He concluded that the maturity of large corporations, the income tax laws, and rapid advances in cost accounting ought to have led to the primacy of the income statement. That this was not the case, Gilman believed to be one of the paradoxes of accounting. But, if one examines other environmental factors in the 1920s, the continued emphasis on the balance sheet is understandable.

There are references that to the post World War I period providing the "hard historical evidence" that deviations from historical cost-based, conservative accounting led to the crash of 1929. Many accountants empathized with George O. May's statement that: "in the 1920's accountants fell from grace and took to adjusting capital values on the books…to an extent never before attempted…In extenuation they might plead unsound laws, unpractical economies and a widespread if unfounded belief in the new order of things combined to recommend such a course, but…the wiser course is to admit the error and not to be misled again." (May, 1936)

Littleton analyzed the evolution of accounting theory, writing that "accounting is relative and progressive" and concluding that, "as older methods become less effective under altered conditions, earlier ideas become irrelevant in the face of new problems"(Littleton, 1933). He suggested change mandated acceptance of the "historical cost allocation model'" which became the dominant theory of accounting in the late 1930s.

But it is unfortunate that in justifying the new model, Littleton implied that previous accounting valuation theorists had not been aware of the ramifications of separation of ownership and management. Therefore, previous literature was no longer relevant. This implication seemed not only to justify disregarding questions raised in the 1920s but also to assert that once the corporate entity was accepted, theorists had no choice but to accept the historical cost allocation model.

Until the 1933 and 1934 federal securities acts, public demands for audit decreased, and the profession's obligation to third parties was obscured. The direction and growth of accounting practice was in the area of credit reports to bankers, as advisors to businessmen, and as tax experts. The New York Stock Exchange consistently refused to acknowledge the need for independent audits of listed companies before 1929. Only after the crash did accountants receive the full support of the exchange.

Perhaps a strong, united profession could have generated demands for protection of investors and developed standards to insure that all practitioners were aware of their responsibilities as professionals. But amid a wave of speculative fever unparalleled in American history which created a need for strong control and leadership in accountancy, the profession was bitterly divided. The lack of a unified, authoritative institution through which accountant could exercise strong leadership in the financial community persisted until 1936.

The academic organization was restructured in 1935, and the name was changed to the American Accounting Association (AAA). Academics issued a direct challenge to practitioners with the new stated objectives of the group. In March 1936, publication of a "Statement of Objective" served notice that academicians sought to take the lead in the development of accounting theory.

Practitioners did not empathize with the AAA's attempt "to develop accounting principles and standards, public and private accountants and governmental bodies." Practitioners had long assumed this to be their function and were reluctant to cede this privilege to group, whether within (academics) or outside of (the SEC) accounting.

With the publication "A Tentative Statement of Accounting Principles," also in 1936, the AAA left little doubt that they had adopted a new strategy. But the institute was not prepared to abandon the matter of developing of accounting principles to academicians, for clearly there was much at stake in the matter. Prior to 1936 there were no standardized accounting curricula and very little uniformity of course coverage among schools. Research, despite the excellent efforts of certain individual academicians, continued to lag behind other disciplines in terms of normative theory.

3. THE DEPRESSION YEARS

It is a formidable task to assess the impact of the stock market crash in 1929 – historical evidence suggests that contemporary observers did not foresee the lasting impact that the event would have. Yet it seems clear that the crash had a profound effect on the subsequent evolution of accounting practice. Politicians could no longer argue that Americans would prosper under a business system managed – or unmanaged – as it had been in the 1920s. But reaction was slow, and political leaders neither blamed accountants for the debacle of the 1920s nor looked to the profession for protection in the 1930s.

In the 1929 the American Institute of Accountants, with the support of the Federal Reserve Board, issued the Verification of Financial Statements. This pamphlet is fondly remembered as the "auditor's bible" by some older accountants. Although it was an attempt by the institute to

provide guidelines to the profession, practitioners made clear that they were not attempting to receive the concept of uniform accounting.

Many accountants seemed to believe that the issuance of the document "Uniform Accounting" had created an illusion that there were accepted accounting and auditing procedures in widespread use which led to complacency on the part of both the public and the profession. An editorial in the Journal of Accountancy condemned any suggestion "for uniform systems of accounting and auditing for all sorts of business conditions" as extremely dangerous because that implied to many investors a degree of assurance that could not be given by auditors faced with the uncertainty that existed in the business sector.

At the 1930 annual meeting of the American Institute of Accountants, J. M. B. Hoxsey opened the door for cooperation between the New York Stock Exchange and Certified Public Accountants. May, who had served as advisor to the exchange, became chairman of the Special Committee on Cooperation with the New York Stock Exchange. The committee presented its first draft of accepted accounting principles in 1933 and submitted six recommendations to the institute and exchange for approval the following year.

The exchange agreed to five of six recommendations. They rejected the requirement that "all listed companies…disclose the accounting methods employed" (AIA Minutes 1932: 62f). Cooperation resulted in the publication of Audits of Corporate Accounts, which listed five basic principles that dealt with the most overt abuses of the 1920s:

1. no unrealized profit;
2. no charges of expenses to surplus to relieve the income account;
3. earned surplus prior to an acquisition is not earned surplus of the parent;
4. dividends on treasury stock are not income;
5. notes and accounts receivable due from officers or employees must be shown separately. (AIA, 1934: 14).

A sixth principle – (6) donated capital does not result in earned surplus – was added at the annual meeting of the Institute in 1934 (AIA, 1934). These basic views indicate that accountants had recognized the validity of the argument that the inability, or perhaps unwillingness, of the profession to properly aggregate capital and income had been one of the major reasons for unsatisfactory reporting in the previous decade.

Despite the many theories about the nature of capital and income, there was general agreement among accounting practitioners that dividends should be paid from earned surplus. But there was no generally accepted procedural approach to this problem. Eric Kohler became a leading spokesman for the "revenue-expense," income orientation, which came to dominate accounting theory in the 1930s. One of the more interesting assertions made by historical cost-oriented accountants was that bankers had influenced accounting standards and had oriented accountants toward liquidation values.

Faced with a direct challenge from academics with the American Accounting Association's publication of "A Tentative Statement of Accounting Principles" (1936) and the specter of federal intervention with the establishment of the SEC, practitioners united.

In 1936 the American Institute of Accountants embarked on a new research program. Accountants were successful in their efforts to keep the standard-setting process in the private sector and in retaining their right to set those standards despite demands from some that the federal government assume absolute control over the financial reporting process. For example, William Schulter's proposal, contained in his Economic Cycles and Crises (1993), called the entire federal control of accounting.

Schluter advocated an institute of accountancy and pricing on valuation that would require al business enterprises to keep accounts according to standards set by the federal government. Although Schluter would permit some latitude, standardized systems would be adapted to the

needs of different industries. He believed that such rules would permit the "elimination of the present day system of certifying individual public accountants" and allow the government to do this important work. His proposed national institute of accountancy would be analogous with respect to accountancy to the Supreme Court of the United States.

He posited three divisions within the government to handle accounting data: first, there would be a division of accounting theory, methods, and procedure, empowered to develop accounting theory and principles: second, a division of reports for uniform classification and compilation of data; and, third, a division of examination and audit, whose duties would be similar to those now performed by public accounting firms. Given such proposals, the SEC, with its emphasis on disclosure, was not as onerous to the profession as has sometimes been suggested.

4. THE FEDERAL SECURITIES ACTS

The 1933 and 1934 federal securities acts marked the beginning of the development of a "social consciousness" with respect to business and financial reporting in the US (Greer 1964). Although that statement may eventually be proved to be historically true, since this legislation did acknowledge the importance of financial information for economic and social control, its immediate impact upon the accounting profession seemed to narrow somewhat the traditional concepts of the independent public accountant's responsibilities.

Despite the fact that the image of the profession was enhanced by the call for independent audits, these acts were not regarded as salutary for the profession. Many CPAs were frightened, not as some have suggested purely by the increased legal liability, but also by the extravagant claims being made by some reformers about the efficacy and reliability of accounting information.

Perhaps Clem Collins, AIA president, best summed up the prevailing sentiment within the profession when he wrote: "It is altogether possible that accountancy has been oversold. That is, a general belief has apparently developed that accounting procedures are infallible.

Medical science may have its defects, the principles of engineering may fail because of unforeseeable conditions, justice may miscarry because of malevolent human ingenuity, and even our spiritual destination might be uncertain as a result of the diversity of human understanding and belief, BUT, in the minds of many, accountancy seems to stand as the one science against which the machinations of the human mind shall not prevail." (Collins 1939)

By 1933, in fact, many felt that the terms "accountant" and "auditor" were synonymous. Walter Staub attempted to clarify the picture, explaining that auditing "has been sometimes described as the analytical phase of the accountant's work and accounting per se as a synthetic phase."

5. CONCLUSION

The purpose of this study was achieved so we can conclude that that the events surrounding the great depression of the late 1920s and early 1930s, marks a maturity point in American accounting thought and practice.

Most accountants believed that any theory must be pragmatic (useful, Practical, leading to desirable social consequences) and adaptive (to meet the changing demands made upon the profession). During the 1920s there is little evidence that any user group would have supported efforts to report only income from operations. To do so would have limited, or at least dampened, the wave of optimism which swept the country.

The desire for certainty seems to have been one of the characteristics of the "depression mentality." Accountants could not give legislators all the assurance they demanded. Over the years, it had become apparent to most practitioners that there were no simple rules in accounting.

What might conceivably be viewed by others as a simple question (Does an asset exist?) was not elementary for the CPA who believed that managerial intent was an important consideration in asset recognition. Assessment of managerial intent was not an objective matter, according to practitioners. And professional judgment continued to be a most important attribute of the CPA.

Social role of accountants came to be seen as minimization of taxes. Although some reformers questioned Mellon's synergistic approach, which assumed that the wealth of the rich would eventually filter down to the poor, social thought appeared to support Mellon. (Andrew M., 1924)

During the early 1930s there was an effort to divorce accounting from economic theory on "practical" grounds. Topics such as the accountant's function in a regulated society, the need for multiple valuations, and the problems of articulation introduced in the 1920s were subsequently ignored as the work of "valuation theorists."

GLOBAL FINANCIAL CRISIS – AN ACCOUNTING LITERATURE REVIEW AND OVERVIEW

Toman Cristina-Maria
Babes Bolyai University, Faculty of Economics and Business Administration

Reflecting the magnitude of "financial crisis" in 2008, some academics started examining causal relationships between accounting and the crisis. The purpose of this article is to review the current state of academic research articles related to the global financial crisis that are published in ScienceDirect, Springerlink, Emerald and SSRN databases, in order to identify the trends and researchers' contributions and to analyze the interplay between the global financial crisis and the accounting. Although there are lots of articles about the current financial crisis, the number of academic articles that examine the relationship between accounting and the crisis are still few, but the research questions are increasing, more and more researchers becoming interested in this topic.
Keywords: Accounting, Accounting regulations, global financial crisis, literature review, databases
JEL Classification: M41 – Accounting

1. INTRODUCTION

The magnitude of this financial and economic crisis calls for a fundamental reassessment of all areas of business and economic scholarship, including accounting research (Arnold P., 2009). The current economic and financial crisis has significant implications for accounting, both for practice and for the research community. In the academic and research community it certainly has illuminated issues that are in need of serious research attention. More than that, however, the crisis also points to the rather limited focus of much current accounting research. (Hopwood A., 2009).

Consequently, the fundamental objective of this paper is to analyze the relationship between accounting and the current financial crisis by analyzing and discussing changes encountered in research literature's way of dealing with this topic.

2. AIM OF THE STUDY AND RESEARCH METHODOLOGY

The objective of our paper is to provide a comprehensive literature review and overview of the relationship between the global financial crisis and accounting. It was proven that the literature review plays an important role in delimiting the existing research problem in the field of social sciences.

Also, the literature review is considered to be the primordial method in distinguishing what has been done from what needs to be done, identifying relationships between ideas and practices, establishing the context of the topic or problem, understanding the structure of the subject, relating ideas and theory to applications, identifying the main methodologies and research techniques that have been used, and placing the research in a historical context to show familiarity with state-of-the-art developments. (Ray B., 2002)

The discussion focuses on four scientific Journal databases: ScienceDirect, Springerlink, Emerald and SSRN, identifying the trends and researchers actively contributions to the development of our topic of research. For performing the analysis of literature we selected all the international journals on accounting and economics area, form the aforementioned databases, followed by the selection of papers dealing with the interplay between accounting and crisis. Also, we defined three sets of variables representing various features of journals, papers published and their authors. Finally, basing on empirical results revealing these features influences over international

literature, we concluded our study by discussing the changes in general trend of research caused by the financial crisis.

3. LITERATURE REVIEW

The crisis, thus, challenges us to re-evaluate our research agendas – and perhaps also the institutional incentives and unexamined assumptions that drive them – so that accounting research can contribute to a broader social and political analysis of the financial crisis (Arnold P., 2009). Although the implications for research in accounting may not be so great as that within the finance research community where the serious lack of critical research is much more visible, a more detailed consideration of the implications of the crisis for accounting research nevertheless points to the need for a more rigorous investment in diverse research perspectives rather than an unquestioned following of a singular mainstream view. (Hopwood A., 2009).

"A classical period of thought and practice, as delineated by the events surrounding the great depression of the late 1920s and early 1930s, marks a maturity point in American accounting thought and practice" (Previts & Merino, 1979: 215). Also, corporate governance became a subject of various debates and controversies since the '29 -'33 financial crises period (Berle and Means, 1932), being often considered as "the scapegoat" of the present financial crisis that spread all over the world in the latest years, too. Thus, the wide range of governance failures and corporate scandals encountered over time brought this concept to the attention of media and academic environment, transforming it into an increasingly challenging topic of worldwide research. (Stefanescu C., 2011: 749)

 "Developments in accounting came about in the first place in response to economic social and political pressures, but, thereafter, acted as an enabling device to assist further developments" (Tomkins, 1978:9). Transformations in accounting knowledge and practice have been influenced by many factors, such as economic, social and political pressures, (Tomkins, 1798) ad hoc influences like wars, periods of economic decline and labour disputes (Miller et al., 1991).

Also, Hans Hoogervorst, the Chairman of the International Accounting Standard Board, claims that "it is a sad truth that most initiatives to strengthen the international financial architecture to reap the fruits from the on-going liberalization of capital movements have been taken under the pressure of some kind of crisis" (Hoogervorst, 2002: 16). International accounting regulations (International Accounting Standards and International Financial Reporting Standards) can be regarded as part of this international financial architecture, defined as a "set of measures that can help prevent crises and manage them better in the more integrated international financial environment" (World Bank webpage).

Accounting rules have come under a lot of criticism during the credit crisis. Some people, especially bankers, even consider then to be an independent cause, or at least a strongly reinforcing factor in the credit crunch. Critics of fair value regularly point to the ridiculously low market prices, in their opinion, of financial products. These prices would allegedly not be in line with the fundamental value that still appears to be clear from the cash flows of these products.

The truth is that 'Fair market value' can indeed be very unfair. But indignation does not help you one bit in selling our assets at what you think is a fair price…fair value and International Financial Reporting Standards had very little to do with the causes of the crisis. The real cause of the crisis was the massive overleveraging of the economy as a whole and the undercapitalization of the banking sector in particular. And if there were problems with transparency, these were to be found principally in the capital requirements imposed by banking regulators (Laux C. and Leuz C., 2009)

4. RESEARCH QUESTIONS AND DESIGN

The review was conducted using a search command for the words "accounting" and "crisis" on a number of four databases available online: ScienceDirect, SpringerLink, Emerald and SSRN.

Also we limited our research, by including in this paper only the articles that were published after 2008 (the year when the global financial crisis has arisen). The search engine performed a quick overlook in the title, abstract or the whole paper, including references of all journals included in these databases.

After collecting the articles, the first step was to establish the information associated with the articles that were extracted from the databases: Title; Journal Name; Year of publication; Author(s) Name; Number of Authors; Author(s) provenience (EU, USA, Canada, Asia, Australia); Author(s) type; Research type (qualitative/quantitative); Research topic.

This information was stored in SPSS in order to facilitate a further detailed analysis. Also, we stored in Word a brief description of the most important points of the paper, in order to facilitate the comparisons between different articles. This type of information included: the subject, the procedure, the motivation, the target group, the results and our subjective point of view regarding the paper.

The third step was to analyze the articles keeping in mind some questions that we considered to be important for our research: What research topics emerge and what conclusions can be drawn? What are the major similarities and differences between the various writers? Are there any significant questions which emerge and which could form a basis for further investigation? The answer to all this questions and the link between the articles were included in the discussion and results section.

5. DISCUSSION AND RESULTS

During the past 5 years of crisis, there have been 63 articles, related to this subject, published in ScienceDirect, Springerlink, Emerald and SSRN databases. We would like to point out that we included in our research only the published articles, form the aforementioned journals, and we excluded all other types of research papers, such as working papers. As we can see in Figure 1 and Table 1 the majority of articles that analyzed the relationship between accounting and the current financial crisis, were published in 2011 (25 articles). Also the database with the highest number of articles related to this subject is SSRN (31 articles).

Figure 1. Publications with "accounting" and "crisis" included in the title, abstract or in the body of the paper by year
Table 1. Publications with "accounting" and "crisis" included in the title, abstract or in the body of the paper by database

Database	No. of articles
Emerald	9
ScienceDirect	18
Springerlink	5
SSRN	31

Total	63

As shown in Figure 2, we found 49 Journals that published articles related to the interplay between accounting and the global financial crisis. From these ones, 2 seemed to play a key role in the accounting academic research publications: Accounting, Organizations and Society (6 articles) and Journal of Accounting and Economics (5 articles). The diversity of academic journals that published articles related to our field of expertise suggest that academic community is engaged in the development of the accounting regulations during periods of financial crisis.

Figure 2. "Accounting" and "crisis" related articles appearing in academics journals
As emphasized in Figure 3 the majority of authors that published articles, regarding to the interplay between accounting and the financial crisis, are the Americans (34 articles), followed by the Europeans (17 articles). Also Figure 3 shows that qualitative research (39 articles) has prevailed over the quantitative one (24 articles).

Figure 3. Paper analysis according to author's provenience and research type

Bar Chart
As it can be seen in topic that was most financial crisis has academic community, is Value Accounting Accounting regulations.

according to the research

6. CONCLUSIONS

As this crisis has shown, accounting standards can have huge implications for the outside world, so the outside world should have the opportunity to have a say. This is especially the case now that public authorities have become so important in the worldwide acceptance of standards. We can conclude that the accounting community has spread in two: the ones that blame FVA and consider it for been a factor that causes the financial crisis and the ones that praise FVA.

This literature review was conducted by searching in four online databases, during 2008- 2012. The summary and information regarding the relationship between accounting and crisis, related articles were kept in both SPSS and Word, in order to facilitate detailed analysis. The aim was

identifying the trends and researchers actively contributions to the development of accounting and accounting regulations during the global financial crisis.

This review of the literature will be further developed, intending to include at least other four online databases: Wiley Interscience, JSTOR, Highwire and EBSCO and to perform a broader analyze on "accounting" and "crisis" related articles, including the authors' origin, research methodology and so on.

IMPORTANCE AND VULNERABILITY OF TRUE AND FAIR VIEW IN THE ROMANIAN ACCOUNTING ENVIRONMENT – CASE STUDY

Vladu Alina Beattrice
Babes-Bolyai University, Cluj-Napoca
Faculty of Economics and Business Administration

Matis Dumitru
Babes-Bolyai University, Cluj-Napoca
Faculty of Economics and Business Administration

This empirical study comprises items related to the operationalization of the concept True and Fair View in day to day accounting issues in Romanian accounting environment, demarche based on which we were interested in assessing the vulnerability of the concept and also the importance attributed by Romanian practitioners. If the vulnerability is high and the importance attributed low, the concept True and Fair View `s importance as an overall basis of accounting is limited, fact that will affect the quality of accounting information. The categories approached were chosen based on their implication related to the operationalization of the concept. The company's financial directors are responsible for ensuring that the financial statements give True and Fair View and in the same manner the expert accountants must consider it important in order to prepare the financial statements in accordance to its requirements and finally the financial auditors must assess its existence, otherwise if this principle is neglected the companies would consequently present spurious results of their activity. All the categories above asserted that the concept doesn't have only a symbolic role at the national level and their implication in achieving its requirements can be characterized by a proactive attitude. When it comes to assessing the potential vulnerability of TFV, our respondents agreed that items like legislative ambiguity and accounting estimates have the potential to affect TFV construct in the practical side of accounting.
Key words: True and Fair View, Legislative ambiguity, Accounting estimates, Operationalization, Quality of accounting information
JEL Classification: M41

1. Introduction

This part of the research is motivated by the fact that the literature has revealed little research regarding TFV operationalization. The results are important for both theoretical and empirical research as well as for regulators, lawmakers, firms and investors. TFV role in the current issues of accounting is considered to be very important taking into account the opinion of authors like Alexander (1993, 1996) or Amat et al., (1999). On the other hand authors like Forker and Greenwood (1995) consider the concept as having only a symbolic significance in current issues of accounting. When it comes to assess its meaning in a theoretical field this demarche is not considered to be a difficult one, but when its meaning must be assessed and interpreted in day to day accounting issues, the demarche can become a very complex one, having the fact that accounting legislation comprises estimations and sometimes ambiguity. The remainder is divided in 8 sections. The first section contains the motivation and scope of the empirical study conducted; the second section refers to the state of the art. The third section comprises the research design that explains the research hypothesis and the methodology employed, the research directions (research instrument and analysis and interpretation). The latter sections were designed as following: findings and discussions based on the results found, conclusions, where we discussed the implications of the findings, limitation of the study and scope for future research.

2. Motivation and scope of the study

A financial reporting system, independent from the economic context, encapsulates the concept of TFV, that without any discrepancies. The difference between one financial reporting system and other is given by the wording that is used for this principle of accounting that require that financial statements to be prepared and presented fairly and correctly, unbiased by particular interests. No matter if the terminology is "TFV" or "present fairly in conformity with GAAP" or "Faithful representation" the idea is the same, but the perception can be different since the relationship between accounting theory and accounting practice varies, since the history of concepts varies to time and place, since the importance of the concept can be higher or lower depending on the enforcement demarches conducted by the accounting regulators, since the alternative interpretation of the concept developed in its history are various[93]. All the above can act like conclusive items for the importance and the potential vulnerability of TFV, and further the latter can affect the quality of accounting information. Since the studies conducted so far regarding TFV were related mainly to perceptions gap (Parker and Nobes, 1991; Kirk, 2006; Albu et al., 2009; Bota-Avram, 2009) we are interested to assess the concept under a different spectrum, based on the fact that the practical side of accounting is primordially interested by its operationalization. Despite the fact that the concept is regarded as a changing one in time and space[94], we expect that the actors in the accounting field to regard it as having operational meaning not only a symbolic. Further we assumed that similar to Parker and Nobes (1994) opinion to be vulnerable to certain items found at national level. When it comes to the Romanian accounting environment the concept can be vulnerable to pressure as: accounting estimations and ambiguity of accounting regulations (Albu et al., 2009 and Bota-Avram, 2009).

3. State of the Art

Previous studies that have examined the concept TFV have assessed its meaning under different spectra approaching it in the context of: literal versus technical application (Kirk, 2006); through its constitutive components (Cowan, 1965); a concept that exist mainly for the benefit of auditors (Williams, 1985:30); as a legal residual clause (Walton, 1993); as an exercise of deharmonization (Parker, 1994); as an excuse for creative accounting (McGregor, 1992); as a root for debate on form versus substance (Flint, 1980) or as a nebulous concept that shouldn't be used to base trial on it (Cowan, 1965). Even if many empirical studies were conducted so far, little evidence exist regarding the importance attached to the concept by the actors from the different economic environments and even fewer were concerned to test the vulnerability of the concept under the influence of certain factors. At theoretical level we can found concerned regarding its importance and vulnerability in the work of: Rutherford, 1985; Houghton, 1987; Alexander, 1993; Karan, 2002; Ordelheide, 1993; Dunk and Kilgore, 2000; Aisbitt and Nobes, 2001, but when it comes to the empirical level the above authors haven't approached this path of research only tangential.

4. Research design

This empirical study conducted in the Romanian accounting environment in 2011 reports the main results of a survey that used as a tool a questionnaire that focused on the perceptions of financial directors, financial auditors and expert accountants regarding TFV importance and vulnerability. In this respect the questionnaire submitted comprised a number of 9 questions used in order to assess the importance given by the three categories to the concept of TFV in accounting practice. All 9 closed questions are compressed in the results presented in Table 2.

---

[93] For a detailed discussion regarding the history of the concept of TFV see Chastney (1975).

[94] For a complete taxonomy of TFV perceptions in different economic environments by various categories of respondents the studies conducted by: Cowan, 1965; Nobes and Parker, 1991 can be consulted.

5. Research hypothesis

Albu et al. (2009) documented that most of the respondents tip the balance to operational meaning not only symbolic one. Based on this, the importance attached to the concept it could be higher in the practical side of accounting, fact that can be proved by assessing the opinion of some actors from the national accounting environment. Accounting estimations and ambiguity of accounting regulations are known as possible factors that have the potential to affect the quality of accounting information and further to affect TFV. Based on the empirical study conducted by Cuzdiorean et al. (2011), Romanian accounting legislation is characterized by frequent changes conducting to ambiguity. Also the estimations have the potential to distort the accounting output. In this respect based on the above examined scientific background we develop the following research hypothesis:

H1: Romanian financial auditors, financial directors and expert accountants are characterized by an active implication in developing financial statements under the spectrum of TFV since they are seeing the concept as having operational meaning not only a symbolic significance;

H2: The TFV is vulnerable under the pressure of factors as accounting estimations and ambiguity of accounting regulations.

6. Methodology

The empirical findings have then been analyzed in relation to the literature review.

6.1 Questionnaire design

The design chosen for testing the above research hypothesis comprised the Web-Assisted Self Interviewing (WASI) that used a public platform that doesn't allow the interaction between the subject and interviewer, which is somewhat characterized by a limited view of the assertions tested. All our respondents used the Romanian version of the questionnaire that comprised a series of 9 closed questions. In this respect we were interested in its practical application mostly and in this regard we tested the importance attributed to the concept in the practical side of accounting. A question addressed the respondent's perception regarding the operational meaning of the concept, while others were concerned in assessing the regulation features that have the potential to distort TFV. Some of the questions assessed the importance attributed by the different categories of the respondents to the concept.

6.2 Sample

Our final sample included financial directors, financial auditors and expert accountants as following: the entire population of financial directors of all listed companies on the Bucharest Stock Exchange in 31.10.2010, in a number of 69 financial directors based on the addresses of the companies listed on Bucharest Stock Exchange (www.bvb.ro), tier I, II and III at 31.10.2010; the entire population of financial auditors that had available the email address on The Chamber of Financial Auditors of Romania in 31.10.2010, in a number of 1280 financial auditors (firms and individual) (www.cafr.ro); the entire population of expert accountants that had available the email address on The Body of Expert and Licensed Accountants of Romania in 31.10.2010, comprising a number of 4295 of expert accountants (www.ceccar.ro).

The questionnaire was submitted to those three categories of respondents using a database that comprised the contacts of 5644 specialists. From the whole sample, 3888 addresses contain errors. In this respect 1756 contacts remain valid. From those we received back 342 responses, obtaining a preliminary rate of response of 25, 61 % globally as a mean for the three categories surveyed. After revising the questionnaire received we eliminated 129 questionnaires as it is

presented below, for incomplete answering. The final global rate of response was 12, 99 %. In Table 1 we summarized the rate of response after assessing the content of the questionnaires.

Table 1. Questionnaire respondents assessed by the professional groups after examining the questionnaires

Professional groups	Valid contacts	Total Responses received	No. of incomplete questionnaires	Total questionnaires remained for final analysis	Final rate of response (%)
Financial directors	69	11	0	11	15,94
Financial auditors	295	139	107	32	10,84
Expert accountants	1392	192	22	170	12,21

Source: Authors projection

At the end of the session of data collection were included 213 completed questionnaires (completed by 170 expert accountants, 32 financial auditors and 11 by financial managers) which implies a response rate of 12, 99 %, higher than it is usually obtained in Romania (e.g. 5% -7% rate of response). The period for data collection was 6 of January to 18 of February 2011. The completing duration of one questionnaire was approximately 5-10 minutes.

7. Data analyses, Findings and Interpretation

In our empirical study we approached partially the concept of operationalization of the TFV when we were interested in assessing if the concept if perceived as being important in the Romanian accounting practice, verifying in the same time if the attitude of the practitioners is a proactive one when it comes to apply the requirements of the concept. Also, the potential vulnerability of the concept was assessed when the legislative ambiguity and accounting estimations were discussed to have the potential to affect TFV. In order to test the set of assertions below, the subjects were asked to express their agreement or disagreement. The results obtained are presented as following:

Table 2. Results assessing the importance and potential vulnerability of TFV in Romania

	Disagreement Row N %	Agreement Row N %
Based on your opinion, The LEGISLATIVE AMBIGUITY has the potential to affect the TFV?	3,3%	96,7%
Based on your opinion, ACCOUNTING ESTIMATIONS has the potential to affect the TFV?	37,6%	62,4%
TFV can be assessed only by its symbolic role, without a clear conceptual trust:	69,0%	31,0%
We cannot assert that the accounting information is characterized by TFV in Romanian accounting practice:	55.4%	44,6%
Accounting practitioners grant an increase importance to TFV, and based on that they are not concerned only with the mechanical application of the law but also in fair reflecting of economic reality:	28,2%	71,8%
The financial auditor play an important role in generating TFV in accounting:	23,5%	76,5%
The financial manager play an important role in generating TFV in accounting:	12,7%	87,3%
The expert accountant play an important role in generating TFV in accounting:	5,2%	94,8%
The accounting information cannot be characterized under the spectrum of TFV:	70,4%	29,6%

Source: *Author's projection*

The first question was design to test if an important factor correlated with the quality of accounting information (e.g. legislative ambiguity) can be considered an item that has the potential to affect TFV construction. In this respect 96, 70% of the respondents agreed that this factor has the potential to affect TFV and further the quality of accounting information. In a lesser extent, the accounting estimations also have the potential to affect TFV since the respondents agreed in a proportion of 62, 40%. When it comes to the role played by TFV in accounting profession, 69, 00% of the respondents answered that the role of the concept is not a symbolic one. The implication of accounting practitioners in reflecting the economic reality based on the principle of TFV is important since an increased importance is granted to the concept in the practice of accounting (71, 80% of the respondents agreed that they grant an increase importance to TFV in the practical side of accounting). The role played by the financial auditor, financial manager and expert accountant is an important role. Judging by the answers of the respondents (affirmatively: 76, 50 % for the first category; 87, 30% for the second category and 94, 80 % for the third category) the role of the practitioner is an important one and can be a factor that has the potential to influence TFV in a higher proportion. The last assertion "The accounting information cannot be characterized by TFV" comprised a rate of disagreement of 70, 40 %.

8. Conclusions

The results obtained documented that the financial directors, financial auditors and expert accountants regard the concept not from a symbolic spectrum but as having operational meaning. As we stated above, all the categories questioned asserted that the concept is important in the Romanian accounting practice and that the accounting professional's involvement when it comes to operationalize the concept is an active one. Not regarded as having only symbolic significance, the first research hypothesis was validated. Since the results obtained documented the categories questioned asserted that both accounting estimations and the ambiguity of accounting regulations have the potential to affect TFV in the practice of accounting, the second research hypothesis was also validated. Almost all respondents concluded that legislative ambiguity affect in a higher proportion TFV, while the accounting estimates in a small proportion, both items being responsible for its vulnerability at the national level. The great majority of the respondents concluded that role played by the accounting practitioners is important in assessing the magnitude of TFV.

9. Limitations of the study and scope for future research

The major problem identified was a matter of logistics having the fact no existing database that can entirely match our scope of the study existed and in this respect we had to develop such database for each category included in the sample. In this regard we manually selected all the available email addresses of the potential respondents from the internet web sites described above. Having the fact that we have chosen this particular approach a large eligible population remain outside the population of interest. Other limitations are those represented by the methodology adopted. The use of the questionnaire as a research tool may lead to non-response error and self-selection bias. A future study will enlarge the sample that will be surveyed and will change the research instrument, trying a more non-biased instrument like interview. Also other issues of transferability of TFV across languages and cultures that require their local realization in the locality of CEE region in the context of globalization process is considered to be appropriate since few studies were conducted in this respect. For a thorough understand of the New Europe the process of harmonization is important to be studied and assessed and from that process, TFV is an important part to assess. We are also interested in assessing in a future study the influence of overriding criterion on creative accounting practices in Romanian accounting environment.

CREATIVE DISCLOSURE: AN EXPERIMENTAL STUDY

Vladu Alina Beattrice
Babes-Bolyai University, Cluj-Napoca
Faculty of Economics and Business Administration

Cuzdriorean Dan Dacian
Babes-Bolyai University, Cluj-Napoca
Faculty of Economics and Business Administration

This empirical study extends the study conducted by Vladu, Grosanu and Cuzdriorean (2012) and reached similar conclusions. This particular research was conducted with the scope of assessing the impact of: positive bias, persuasive language, creative visual manipulation and performance comparisons over the unsophisticated users of accounting opinion. We have chosen this particular category since retail investors have been identified as relying on the information provided in corporate annual reports for decision making (Wills, 2008). Based on their relative inexperience and limited knowledge of these investors it is plausible that they can be mislead easily comparing to more sophisticated users of accounting information, as financial analysts.
The main argument for conducting such a research is the fact that little research was conducted so far and the effects of creative disclosure on investment decision cannot be assessed so far. Based on this, we conducted a laboratory experiment where participants where provided with an informational set of financial data and required to make an investment decision. Our results document that the users perceptions is strongly affected by creative disclosure, contradictory with previous results documented in the literature, that their opinion cannot be influenced since they relay mostly on numerical information and less on the narrative segments of the financial statements. Even if our sample compressed few participants, we consider the results conclusive. A further research can extend the sample and test if our research hypothesis can be validated. Another possible spring of research can deal with the assessing of the opinion of the users of accounting information that are not considered unsophisticated, as financial analysts.
Keywords: Creative disclosure, Positive bias, Persuasive language, Creative visual manipulation, Performance comparisons
JEL Classification: M41

1. Introduction

Creative disclosure can be regarded as a complex mechanism that comprises: motives for engaging in manipulation of accounts, types of information disclosed and types of manipulations strictly connected to presentation of information. Further, both verbal and numerical information can be comprised in the area of creative disclosure. Each of these strategies are not part of an objective disclosure choice moreover are based on subjectivity and bias. The scope of creative presentation is to present the financial information in the best light possible (or sometimes in a very negative light, depending on the management objectives) by comprising only certain items that flatter the final results. The items that don't portray the desired image are omitted from presentation and if there is mandatory to disclose them, will be presented in a very subtle way. In this respect the so-called in the literature "Pollyanna principle" (Hildebrandt and Snyder, 1988) can be the ultimate foundation for this demarche.

Courtis (2004) referring to a creative manner used to make the text of financial presentation difficult to read and interpret, asserted that this particular manner is designed to obscure the intended message, to distract or confuse the readers and further empirical studies proved that its arguments were correct (Wills, 2008). On the other hand, there were studies that rejected any connection between creative disclosure and user's perceptions. Since we found contradictory views in the literature, our study was design to bring new insights regarding this spring of

research. In this respect, our study documents the results of an laboratory experiment designed to isolate the effects of positive bias manipulation, persuasive language, creative visual manipulation and performance comparisons and assess their effect upon the user's perceptions that further are transformed in investment decisions. By determining the effects of creative disclosure features and its power regarding the users perceptions we can conclude regarding the decision making process and further about the risk of making unwise investment by unsophisticated users of accounting information (Smith, 2004).

2. State of the art

Courtis (1995) approaching the difficulty to read some corporate reports concluded that only two possibilities can be invoked in such cases by the following: "whether writing which is difficult to read is executed deliberately to mask some unfavorable aspect of corporate behavior, or is performed unwittingly out of ignorance". On the other hand Clatworthy and Jones (2001) attribute exclusively the reading difficulty to managerial manipulation since they consider that the lack of skill cannot be invoked in this context since corporate reports are written by professionals. Rutherford (2003) asserted that preparers that are willing to manipulate the user's opinion have the possibility to manage the transparency of financial information by minimizing the clarity of certain items that are disclosed. Another root for creative disclosure appearance is identified by Llewellyn and Milne (2007), as the codification of the accounting language, that "turns out to be a less than perfect solution". "Positive bias" (Lang and Lundholm, 2000) is not only related to the manner in which disclosures are presented but also in the frequency of the positive or optimistic segments comprised in the annual reports. The study conducted by Lang and Lundholm (2000) found that the frequency of positive disclosure increased substantially before equity public offerings in order to increase the firm's share prices. One study that was focused on the language used by firms to transmit positive and negative earnings was the study conducted by Yuthas et al. (2002). The authors suggested that firms with earnings surprises use preponderantly items like "sincerity" and "clarity" to emphasize their honesty and trustworthiness, their tone being persuasive in respect of the financial strong performance of the firms. Enron engaged in this kind of manipulation and used persuasive language based on our understanding. In the Enron's Letter to Shareholders, Annual Report 2000 the language can be easily categorized as persuasive language as we can notice from the following:

-"Enron's performance in 2000 was a success by any measure, as we continued to outdistance the competition and solidify our leadership in each of our major businesses. In our largest business, wholesale services, we experienced an enormous increase of 59 percent in physical energy deliveries. Our retail energy business achieved its highest level ever of total contract value" (2000:4);

-"During our 15-year history, we have stretched ourselves beyond our own expectations. We have metamorphosed from an asset-based pipeline and power generating company to a marketing and logistics company whose biggest assets are its well-established business approach and its innovative people" (2000: 6-7);

-"Our results put us in the top tier of the world's corporations" (2000:7);

-"We plan to leverage all of these competitive advantages to create significant value for our shareholders" (2000:7).

The way information is disclosed visually speaking has the potential to influence the decisions. Creative visual effects can be used to underlie a part of the corporate report or an item in order to make it more obvious to users (e.g. figures, font style, size of the letters or numbers, color, etc.) (Courtis, 2004). Where there is willingness to present an item as being very important the first parts of the corporate reports can be chosen for such a demarche. When the item is considered to minimize the favorable direction that must be created and interpreted under the best light possible, the last parts the corporate reports can be chosen or inserted in the most narrative part of

the reports. By choosing to explain or underlie the importance only for some earnings numbers and intentionally omitting the ones that are not flattering the final results involve subjectivity and further manipulation of corporate reports. This particular creative presentation is related to manipulation of numerical disclosures. The main idea is that firms can manipulate the information disclosed using performance comparisons that flatter their performance. This type of manipulation is developed using either inside numerical information or external numerical information. As regarding of inside numerical information the lowest prior-period comparative benchmark earnings number can be chosen to report in this respect the highest year-on-year increase in earnings (Schrand and Walther, 2000).

The main goal of this research is to refocus the previously research questions found in the literature, that comprises the identification of the mainly forms of creative disclosure assessing the effects not of a certain form of impression management, but almost all features of creative disclosure. Also, based on the fact that the positive bias is a persuasive construction, the figures conveyed in the annual reports might be overlooked or insufficient examined by the unsophisticated users of accounting information (Henderson et al., 2004). In order to overcome this shortcoming, we introduced in our laboratory experiment also numerical manipulations, in order to test all features of creative disclosure not only certain features previously tested like positive bias or persuasive language.

3. Hypothesis development

Since the goal of this particular study is to document the cumulative effect of creative disclosure, on corporate annual report users` perception regarding the company performance, below we have developed our research question to match such demarche. Based on the fact that creative disclosure is documented as occurring in the corporate annual reports (Jameson, 2000), the hypothesis tested is concerned with the effect that this particular manipulation over the unsophisticated users of accounting information. In this respect the research hypothesis developed is:

H: Investment decisions taken by unsophisticated users of accounting information can be influenced by creative disclosure features like: positive bias, persuasive language, creative visual manipulation and performance comparisons.

4. Research design

Based on the fact that our research is investigating a causal relationship, the laboratory experiment was chosen as proper research design to test our above hypothesis. In this respect our experiment was conducted using 26 last year university students, whom we provided a set of information commonly found in annual reports, comprising information of two fictional companies and the third one, developed partially on the financial statements provided by Enron, and request them to make an investment decision. All the participants received an information pack containing either no creative disclosure features (control group), and respectively no creative disclosure and creative disclosure features (treatment group). In this respect two groups were formed and further their investment choice analyzed in order to observe the effect of manipulation on the participants investment choice.

Like previously conducted studies in the literature (Schulz, 1999; Courtis, 2004) in order to increase the internal validity of the study and to assess the causal effect of the positive bias manipulation, we chosen a randomized two group design comprising one control group and one treatment group, with 13 students each, like in the following table:

Table 1.Experimental design – randomized two group design

(1) Control group – 13 last year students	(2) Treatment group – 13 last year students
2 set of financial information containing neutral language for company 1 and company 2. No positive bias language in order to manipulate their perception regarding the performance of the company. No performance comparisons, no creative visual manipulation and no persuasive language.	2 set of financial information as following: - first set contains neutral language, no positive bias or persuasive language comprised in company 1 from the control group, also no creative visual manipulation and no performance comparisons. - *second set of financial information contains positive bias and persuasive language (taken from Enron 2000 annual report, examples above) to whom we attached creative visual manipulation and performance comparisons. All those features of creative disclosure was selected in order to see if we can affect their investment choice.*
Students were asked to make an investment choice and to choose the company that they consider the most suitable one. *Observation: We included in this respect also numerical manipulation not only narrative one, in order to test for all features of creative disclosure not only some of them.*	

Source: Authors projection

We have chosen this particular research design in order to allow all participants to be tested in the same time and location, reducing potential threats to internal validity of the experiment. The students were asked to choose between the informational sets provided, where each of them where developed in the Romanian language with the exception of the 2000 Enron annual report that was translated in the Romanian language and used as an example of persuasive language. The participants were last year students from accounting and finance unit and their were told that they have a limited amount of money (unspecified) and that they have the possibility to invest in one of the companies presented or to split the money and invest in both, case in which they will have to specify the proportion of the investment (e.g. 30% investment in company 1 and 70% investment in company 2). We provided two sets of data for each group, comprising Chairman's statement, four year summary of corporate annual reports. Both companies 1 and 2 from the control group and respectively company 1 from the treatment group have strong performance indicators, but to make the scenario more realistic we designed those companies as being proportionally 1.5 larger than company 2 from the treatment group in order to examine if only the creative disclosure has the potential to influence mainly their investment decision. Company 1 is similar in both groups, company 2 from the second group (e.g. the treatment group) is developed based on Enron, but the participants haven't been informed about it.

5. Results and discussions
As we asserted above, the goal of the study was to assess if creative disclosure features has the power to influence investment choices. The results obtained are presented below in table 2 as following:

Table 2. Results of the investment choices taken by the participants

Companies / Results obtained per each group	Control group (%) – single investment choice	Control group (%) – split investment choice	Treatment group (%) – single investment choice	Treatment group (%) – split investment choice
Company 1 – No creative disclosure features	42	12 (50%/50%	7	22 (30% in company 1 and

		investment in each company		70% in company 3)
Company 2 – No creative disclosure features	46		Not tested in the treatment group	Not tested in the treatment group
Company 3 – Positive bias, persuasive language (Enron), creative visual manipulation and performance comparisons	Not tested in the control group	Not tested in the control group	71	22 (30% in company 1 and 70% in company 3)

Source: Authors projection

As can be observed based on the above results presented in Table 2, 42% of our participants from the control group decided to invest in company 1 while 46% of them decided to invest in company 2. The proportions are not significantly different. Only 12% of the participants from the control group decided to invest both companies, but equally as proportion. When it comes to the investment choices made by the participants from the treatment group, significant differences can be observed compared with the results obtained by the control group. Only 7% of our participants decided to invest in company 1 (where there is no influence of creative disclosure) based on the fact that company 1 is 1.5 largely compared with company 3 (e.g. based on Enron financial statements). A significant proportion (71%) decided to invest in company 3 (e.g. Enron), where creative disclosure features were comprised. More than that, a larger proportion compared with the participants from the control group decided to split their investment in both companies, but the proportions are significantly in favor of company 3. Based on the fact that company 1 and 2 present a neutral and non-persuasive utterance, and similar financial figures, the investment choices between them are equally split. In the treatment group, in order to make a distinction between the two companies and to offer a fair chance to each of them, we decided that since company 3 could have a competitive advantage based on the creative disclosure features, we designed company 1 to be larger as size (1.5 larger based on the financial information provided to participants). The significant proportion of the participants from the treatment group chosen company 3 as an investment choice. The only feature that could conduct to this choice in this respect is the presence of creative disclosure introduced under the manifestation of: positive bias, persuasive language, creative visual manipulation and performance comparisons that convinced them that the company is worth investing in.

6. Conclusions
The results of the experimental design conducted documented that significant difference between the investments choices of the participants occurred. Based on the results presented above, the participants exposed to creative disclosure features appear to be affected in their investment decisions in a significant manner, contradictory to Stanton et al. (2004) opinion. Personal traits of the participants did not differ across the groups and based on that should not be responsible for the results obtained. Since neutral and persuasive language, positive bias and creative visual manipulation was presented equally, and the participants chosen the informational set that comprised the latter, it can be concluded that they can be mislead by individual segments of the package, by the language used and by the creative visual manipulation. However since we haven't tested the same research path on other more sophisticated users of the accounting information the results must be treated with caution.

7. Limitations and scope for future research

One important limitation of the study can be related to the use of students as proxy for the unsophisticated or ordinary investors. Taking into accounting the opinion of Hoyle et al. (2002), this can threat our internal validity experimental design since our participants could have been more vulnerable to effects of creative disclosure. On the other hand, previous studies conducted in the literature documented that students can be used as proxy since ordinary investors are young to middle age adults with limited knowledge of investment and business practices (Wills, 2008). This research can open a new path by focusing on the cumulative effects of creative disclosure used in the annual reports and their power to distort the decision making process. A future spring of research can test our research hypothesis on sophisticated users of accounting information as financial analysts.

ROLE OF BEST PRACTICES IN ENTREPRENORIAL INITIATION OF STUDENTS ILUSTRATIVE CASE: WEST UNIVERSITY OF TIMISOARA

Abrudan Denisa Bogdana
West University of Timisoara
Faculty of Economics and Business Administration

Abstract:
In a competitive and dynamic international context, investment in education and training must take into account the new demands of knowledge based society. Education institution is the organization which, "teaches and produces knowledge" and the role and responsibilities of education are fundamental. Rethinking the way of doing business, reinventing our own business that allows the exploitation of opportunities and constraints of the economic environment can not be achieved without entrepreneurial education, without adaptive and responsive approach to changes in economic environment and beyond.
This paper aims to present the role and impact of good practice in creating a culture and entrepreneurial education in Romanian higher education system.
Research is a descriptive and analytical one, the conclusions drawn are important as they constitute a starting point in identifying and implementing solutions to reconfigure higher education system so as to meet the challenges of today's economic environment.
Personal contribution lies in identifying the multiple ways of expressing entrepreneurship and business culture embodied in innovative projects initiated and implemented in the Faculty of Economics and Business Administration from West University of Timisoara.
Keywords: Educational reform, entrepreneurial education, partnership between academic and business environments, policy of best practices.
JEL Codes: I23, A20, J23, J24.

1. Investment in education and training in a knowledge based society

In a competitive and dynamic international context, investment in education and training must take into consideration the new requirements of the knowledge based society.

In present, EU seems to present some disparities compared to USA, disparities like the inability to attract and retain talents in Europe.

The disparity in productiveness between EU and US continue to widen. To reverse this trend, there are additional investments needed, not only in research and development and IT, but also in the education and training European system.

Challenges of higher education in the economy based on knowledge

The unequal economic development with asymmetric consequences in world academic view had led to a social mobility, marked by variation and diversity, disparities between educational systems and for all these reasons the world *academic medium is challenged not only the answer the change but to initiate one of the changes*. Building an efficient system of higher education and universities of international level require a paradigm shift: *from uniformity and dispersion to differentiation and concentration.*

In the current era of globalization, redefining the university education is defined by new trends: internationalization, transnational education trough mobility, lifelong learning and distance e-learning system, qualifications and international ranking systems, research- innovation-development, association between university- industry and the private sector, new approaches in management and academic freedom, brain drain, global flows of talent and many others. These

requirements represent a continue adjustment to different contexts of society that haven`t been transformed without conflicts and oppositions. Each of these challenges lead to redefining how the University of the 21th century could serve the individual and the society. Regardless of the paradigms adopted (research, academic entrepreneurship, Open University, etc.) in present times universities have to redefine their mission so they will fulfill more roles with less resources. Moreover, specialists consider universities as real research and innovation incubators and training and development providers that offer skills and competences necessary for a bigger number of professions that require knowledge and complementary abilities.

The accreditation of the qualifications, quality assurance, public- private partnership, cross-border movement of students and curricula, multiculturalism and homogenization, recompose the university mission in the society based on knowledge.

The globalization process will focus on skills of graduates in the super-tech professions that require knowledge of foreign languages and also sensitivity to different cultures, which will enhance the internationalization.

In terms of diversity and flexibility of higher education level there are a number of priorities that assess with a direct impact on education quality such as: a larger number of public and private education providers, an increased international mobility (brain drain, brain gain, and brain train), an increased number of cross- border higher education, collaboration, communication between academic environment and business environment, an increased role of internships, etc.

2. Partnership between university environment and economic environment, a necessity

The collocation society based on knowledge, is bringing into discussion the objectives and the content of educational system, the mode in which the educated acquire knowledge, abilities and competences that help them face new challenges related to research, innovation, knowledge evaluation with success, especially in the new economical, social, political and cultural context.

Education institution becomes an organization that "teaches" and "produces knowledge" and the role and the responsibilities of education are fundamental. Nowadays, in Romania the educational programs have big quality issues and are not relevant for knowledge economy. The reinventing of the education system based on entrepreneurial fundaments it`s a must.

The biggest challenge is addressed to the reforms responsible in education and training, and to the experts and consists in exploring all the building and development possibilities of different types of public- private partnerships having the purpose to mobilize supplementary financial and human resources.

The triptych: academic institutions- business environment- governmental environment represents an exigency of the actual education reform that has as benefits economic growth on few bearings: at a corporation level, local, regional, national and international level.

In theory, the importance of the relationship between universities and entrepreneurial environment is emphasizes by a number of studies in this domain which sustain that "it is necessary for universities to collaborate with the regional or local business environment for developing new and innovative businesses.

Also, in a study conducted in 2005, by the National Alliance of Student Organizations in Romania, that had in view the role of universities to provide students a professional training appropriate for the demand on the labor market, is sustained that universities must become open systems, capable of achieving a high level of integration in academic, administrative, political and non-profit environments, and meet the challenges of a society based on knowledge.

It becomes a necessity in this situation that before creating and providing services by universities, to be completely and correctly known the requirements and needs of the economic environment, and to correlate these needs with the programs offered to students.

It is needed to build and implement flexible curricula centered on competences, skills and abilities that are necessary in an economy based on knowledge.

3. Example of best practices in entrepreneurial initiation of the students. Illustrative case study: Carma- FEAA, UVT Timisoara

Offering an important role to the entrepreneurship and business culture, promotion of innovative projects in educational field, the capacity of financing the acquisition of new technologies, higher level of professional training for an increased efficiency of emergent technologies, training and life learning programs are in the center of attention of the Faculty of Economics and Business Administration (FEAA) one of the faculties of West University from Timisoara.

Here, entrepreneurial education had found multiple expressing modalities, starting from adopting new attitudes beside knowledge, development, life until participating to different programs and initiative in solving real problems in a complex and dynamic economic context.

Problematical learning, learning by collaboration, simulation, role games, case studies, business plans and portfolio individual or team created, educational software usage by simulating a business can approach the process of teaching- learning- evaluation with the economic reality these are the ways trough which out students develop their capacity of rational approach of economic and social problems.

FEAA mission is to reach excellence in it`s activity, to obtain high performance, a strong motivation for success, responsibility and didactic creativity encouragement, commitment and implication in local, regional, national and international projects. FEAA is willing to take the role of entrepreneurial progressive institution for accomplishing it`s mission in an economy that has to create welfare and jobs.

As a natural consequence of this fact, is has been built in 2011 The Center for Entrepreneurship and Relations with Business Environment- CARMA- with it`s purpose to:

Develop and attract entrepreneurial talent which had become an important source of economic growth because this can simulate the innovative environment and can lead to development of innovative companies with a strong growth in the region;

Increase entrepreneurial competences among young generation by offering educational resources that have an inspirational impact over students and which allows these persons to cross the entire cycle of a successful business initiation;

Improve the profile of the graduates of West University of Timisoara, regarding applied skills, acquired during studies through practice stages and internships in partner companies;

Organize university courses for improvements of the employees of partner companies and attending management simulation;

Organize events for the development of opportunities of the companies in the local business environment (Business Arena, Business Wings, Best Business Plan, etc)

The attending of business personalities from the social- economic environment as practice experts in the educational programs;

Building an educational program common with business administration "Elite Business Administration" dedicated to employees from managerial medium from partner companies and the top students;

Internationalization of the educational programs of UVT in English or French trough diplomatic centers;

Creating subjects of research in entrepreneurship for PhD programs, and also implementing the result of the research in entrepreneurship and innovation in social- economic environment.

As an example we can mention a few activities developed between 2011 and 2012, activities of the Center but also of the faculty that represents best practice that contribute to building and developing competences and professional and personal skills of our students, for an increased percentage of graduates that find a job in a very short time from graduation.

The project: Young, successful Entrepreneurs, project co financed from European Social Fund trough Operational Program of Human Resources Development 2007- 2013, Invest in people!

This project is willing to: increase the entrepreneurial potential of student and graduates, entrepreneurial culture development, competitiveness improvements, potential entrepreneurs adaptability, increase the abilities of focus group to design and implement business ideas.

The persons that benefit of this project: 800 basic courses recipients, 320 advanced courses recipients, 40 business plans financed by the project. The project has as partners: MECTS, FEAA-UVT, JCI Romania- Young Entrepreneurs Federation, EXTREME TRAINING Company and UNSR- National Union of Romanian Students.

The conference: Discover the champion in you, an event that wanted to create a motivation for success, will to perform no matter in what field.

This project wanted to prove a simple fact: ideas gather people. Ideas are resources that can change everything, that make the difference. Enjoying a large number of attendants, over 180 students, at the event as speakers there were invited personalities from business and academic environment. From the themes we can mention: challenges in elite academy, the fulfillment of aspirations- personal development techniques, the manager- leader- entrepreneur, be pro- active!, how to discover the job that I like, from a survivor to a champion, , how do employers think.

Partners of this event: *FEAA, UVT, CARMA, Lideea company, John Maxwell team Romania, HR Dimension Bucharest.*

The international program in human resources- Bringing Cultures Together- an international program between Holland and Romania, in partnership with CHE from EDE Holland.

Starting with the idea of building an approach between these two different cultures: Holland culture (organizational culture) and Romanian culture (organizational culture), students involved in this project will be aware of the cultural differences and will have to accept, respect and approach them in an appropriate way. The project Bringing cultures together had developed in real time a transfer of know how regarding innovative practices in professional education.

This project has the following objectives: professional development of students regarding human resources management, to compare practices of human resources management from Romania and Holland, to offer Romanian students the opportunity to experience a multicultural environment.

As results of this project, we mention:

1. During these year of project 2004- 2011, over 140 Romanian and Dutch students had beneficiated of valuable opportunities of building career in a multicultural environment, both sites experienced the cultural differences in workshops, mix research teams, visits at companies, debates, through all these they had the possibility to acknowledge and compare practical aspects of human resources management applied in Dutch and Romanian companies.

2. Exchange of useful ideas, information and solutions in HRM;

3. Creating and developing professional relationships between teachers and project coordinators;

4. Building the cooperation platform between University of CHE from Ede, Holland and West University of Timisoara;

5. The attendants of every edition had received a diploma, since 2008 this diploma was officially certified by those two partner universities;

6. There is a website of the project: http://topshare.che.nl/timisoara2011 that offers an efficient dissemination of the results and information related to the project, starting with the 2008 edition;

7. Over these years, for an easier interaction between students and the reality of Romanian economic environment there are a few companies that got involved in the project: Alcatel, Azur, Profi Foods, Lideea, Coca- Cola, Flextronic, Bega Group, Eta2U, Lead Human Resources, Hella Electronics , Cores , ConDoor East , ADR- Regional Developement Agency, IT Incubator, Grafo Print, that offered studets the ocasion to debate, participate to lectures, debates and workshops as: Compensation& Benefits, Appraisal systems, Labour law for European migrants, Recruitment&Selection, Dismissal, Leadership & Coaching, Schooling &Training, Absenteism, sustained by HR specialists or HR departments representative, from the companies partners of the project.

From the basic arguments of the partner companies, we can mention: Positioning the company as a company interested in education and building future specialist in HR; Acces of inovative ideas, generated by multicultural environment, for solutioning real situations in HR; Acces to a database of young students with multicultural work experience.

The project LEARNING & ACTING TOGETHER, a videoconference that gathered 3 Universities, 2 from Romania and 1 from Moldovia Republic: West University of Timisoara, Faculty of Economic and Business Administration, ASE Bucharest, Faculty of Management and ASE Mondova- Faculty of Business and Administration, Training Centre and Business Advisory. This event gathered students that presented valuable projects of research and proved the attendants (professors from academic environment, business personalities and students) that there are values in young people that worth beeing involved in the research process because they bring inovative ideas and significantly contribute to professional and scientifical training and growing prosperity for knowledge creation.

These are just a few examples from the numerous programs developend at the faculty and university level.

4. Instead of conclusions

Rethinking the mode of doing business, reinventing our own business that allows opportunities fructification and operating constraints of the economic environment can not be achieved without entrepreneuship education, adaptive and reactive approach to the changes of the economic environment.

In a methaforic way, the purpose of education, of entrepreneurial education particulary is to build „an edifice" as solid and extended as possible, where initiatives can be identified and implemented, initiatives that sustain the obtaining and growth of organization performances.

In this context, a contemporan society challenge is the reinventing of school, formal education, with the nonformal and informal version.

The Faculty of Economics and Business Administration of the West University of Timisoara and the Entrepreneurship Center and business environment relationships had understood that investment in research and entrepreneurial education, the partnership between academic and economic environment represents the recepy for academic and professional performance at individual and organization level. In this matter, the raport ARACIS from 2011 assigns: „At the West University of Timisoara have been identified a series of best practices that can be extended to other universities or faculties in the country". Here we can meet: „Developement of structurate partnerships, compelling formalized with the economic and social environment, that contribute to the aplicativ level of teaching process growth, to a good organization of specialized practic stage, to update the curiculum content, based on the current and future requirements of economy, science and culture, to increase the percentage of graduates who find a job in a short time after graduation, in the professional profile that were prepaired in college".

Having an opening to implementation of educational programs adapted to the business environment, suntaining and developing colaborative projects between universities, public institutions, business organizations, promoting an entrepreneurial education and an colaborative business culture, FEAA of UVT manages to take with succes the role of evolving entrepreneurial institution for achiving it`s mission in an economy that needs to generate wealth and create jobs.

Romanian specialist`s studies show a harsh reality: Romanian universities programs have only theoretical value, creating specialists but not for real life, but for a more abstract environment. Our university graduates are doing very well in a stable economic and institutional environment that offers relatively easy material and financial resources, with a set of skills and professional skills which fail to meet harsh reality of the labor market.
An effective solution for professional skills development is the accumulation of work experience during college in the environment and on the job we have in view by following an internship program. As a form of practical education through work, internship meets young people, particularly students keen to gain experience through practical work in a job within a company or institution chosen, giving them the opportunity to translate theoretical knowledge into practice and to develop skills and experience of labor market activities that waits for them.
This paper is an original applied research conducted in the West University of Timisoara, Faculty of Economics and Business Administration.
It aims to identify whether there is a need for specialization Management students to acquire work experience before graduating, to what extent they are able to assess their skills and work in a company and especially the role of internship programs in professional and personal development of students.
The results show that participation in an internship program is beneficial not only for students but also for employers.
Leading to increased competences and to training and professional skills and personal development, internship becomes a more attractive alternative for young people because it gives them the opportunity to be "a ringer" of an employee on the position you have in view. Without being employed, students can gain practical experience in a certain position they sought in a company or institution on the labor market, practical experience they need so much and they can also learn what responsibilities and tasks the job entails and whether or not they are suitable for that position.
Keywords: internship, professional development, practical experience, gained confidence, applying faculty knowledge.

1. New demanding on labor market

The labor market suffered intense changes in the last decade. All the changes indicate that the culture of a job for a lifetime had ended. As a consequence, the security of the position held by employee is based on performance and skills set and not on the parental dependence.

Nowadays, employers from all the sectors require high standards; from their employees that are continue adapted to environmental changes, talent, competences, new and superior abilities and

skills that will offer them higher opportunities of performance and promotion within and outside the organization.

We are talking about a new attitude regarding work: an attitude of responsibility towards the actions taken, and to the obtained results. Practically, every employee will have to assume new responsibilities for personal and professional development.

In this new context, the partnership between the academic and the entrepreneurial environments acquires a fundamental role in providing quality human resources that are competitive on the labor market.

Unfortunately, studies reveal that the programs in Romanian universities have only a theoretical value, creating specialists that are not well prepared for the real life, but for an abstract environment. Our university graduates manage a stable economic and institutional environment very well, an environment that offers pretty easy material and financial resources, because they are having a set of skills and professional abilities which fail to meet harsh reality of the labor market.

For a long time, Romanian universities haven`t taught students to think critically, to understand, to act and react rationally and constructively in a changing society as the Romanian society is, and preferred to offer a theoretical specialized view, but almost always without pragmatic links, without applicability. (Korka M., 2003).

Values of education had changed in Romania, these having to adapt to a turbulent and dynamic environment.

In this way, freedom of thought and expression, professional responsibility, moral and social development, creativity and innovation, adaptability, critical and reflexive thinking represent only a few parameters that build the new educational paradigm.

2. Internship role in training and development of competences and personal and professional skills

The resume of a fresh graduate can be a real challenge for an employer. The lack of experience is one of the sensible points that every young person faces. This is the reason specialists advice fresh graduates to mention in their resume besides the school good results, relevant curses, awards and obtained distinction, scholarships, summer jobs or part-time jobs, voluntary activities, practical stage, training and professional development programs, trainings, internships.

Internship- definition

Internship is a form of practical education through work. This represents the possibility to acquire experience on a certain position in a company, without being their employee. Considered by the specialist as the first step in the professional career, internship does not necessary mean advancing in your career, but gaining new skills and necessary experience to complete your education, and helps you to access the domain you are interested in working.

Internship participants can learn from inside how a company works, what does the position they have in view imply, they can find out the latest news in the field and can acquire knowledge and practical experience useful in the future.

Internship program helps the youth, especially students eager to gain experience through practical work in a job within a company or institution chosen, giving the opportunity to translate theoretical knowledge into practice and to develop skills and experience activities on labor market that awaits.

In choosing an internship program, people may consider several criteria. They can start from a position that they would like to occupy in the future, in this case seeking internships on similar positions in companies or they can choose an internship that takes place in the country or abroad, or based on the offer of the companies or institutions that offer this kind of practical programs.

Reasons for which internship is the best choice in gaining work experience during college in the environment and on the job you desire are: to put into practice the knowledge acquired in theory,

to see what the job in the studied field involves, to gain experience, to know how to approach problems in that area, to learn from professionals, to assess the level of their professional training, to see if their choice is according to their career plan, to learn new things, for self-assessment, for new career opportunities, to have an inside perspective of the field, to be made aware of future trends field, to be familiar with company policies, for professional skills development.

Examples of internship programs:

- The "Work and Travel" - intercultural exchange program covered by the U.S. government, administered by the Department of Educational and Cultural Affairs U.S. State Department that allows students and graduate students to work on a specific period in the United States of America;

- European Organization for Nuclear Research offers students the opportunity to access further training and start a career in science. For the technical program can complete future engineers, IT specialists or applied physics specialists. The administrative program they are looking for human resources specialist, communications, administration and librarians. What is important to note is that they provide a monthly allowance, enough to cover expenses for one person in the Geneva area, health insurance and related expenses. The program can take between 8 weeks and 36 months, depending on specialization (www.startub.unibuc.ro).

- LLL- Lifelong learning program includes four sectors: for undergraduate education, Comenius, Erasmus for higher education-for-training Leonardo da Vinci, Grundtvig for adult education, a program focused on language and IT in education and last but not least, the Jean Monnet support program for European institutions and associations.

3. Case study on the role of internship in training and professional development of FEAA-UVT management students

Internship is that program that allows you be the "ringer" of an employee on the position you have in view. Without being employed, students can gain practical experience in a certain position they sought in a company or institution on the labor market, practical experience they need so much and they can also learn what responsibilities and tasks the job entails and whether or not they are suitable for that position.

Beginning with the idea that people are the greatest resource for any organization and that the values a company promotes are focusing on education and development and supporting the concept of internships, this study aims to identify to what extent students need to gain work experience before graduating, to what extent they are able to assess their skills by working in a company and, especially, the role of internship programs in professional and personal development of students.

To achieve this objective, research method used is questionnaire-based. Arguments that justify the choice of questionnaire-based survey as a research method are: the possibility of explaining the research objectives and how the questionnaire was completed, subject`s availability to answers the questionnaire when they find the time, we ensure anonymity, and low cost.

As for research instrument used to collect information the questionnaire was chosen. It contains 12 questions and the information obtained was processed using Excel program.

The questionnaire was distributed to a number of 255 students from specialization Management, of Faculty of Economics and Business Administration from the West University of Timisoara (200 bachelor degree and 55 master degrees). Of the 255 surveyed, 40 respondents were younger than 20 years, 200 respondents between 20-25 years, and 15 respondents have age over 30 years. Also 65.22% are students at bachelor studies, 21.74% master studies and 13.04% are employed.

Sampling was random and it was based on criteria related to: education level, specialization, age, interest for personal and professional development by participating in events such as conferences,

workshops, trainings and seminars. We mention that the results obtained from this sample should be understood as having a role that not generalized the internship role and importance to students of economics, but there are highlighting aspects that have to be known by students.

The two assumptions that start from this research are:

Hypothesis 1: internship programs generate a new attitude towards work: increase awareness and involvement;

Hypothesis 2: internship programs lead to increased competence and professional skills and personal development.

The study results show some interesting aspects as the following: first, we noticed two categories of respondents: those who have participated in training and professional development programs and those who did not participated to any program. So, among participants in professional development program (Lifelong learning program, with 4 branches: Comenius, Erasmus, Leonardo da Vinci and Grundtvig, practice programs offered for students or masters by the university, traineeship exchange program; summer school and internships) the most familiar program was practical program offered by the university (30.61%), opposite the exchange program of traineeship (4.08%), and among students who did not participate in any of these programs, results have shown the same information, differing only percentage (33.73%) for practical programs of university and (8.43%) for the exchange program professional internships.

-Being asked: " Which program from the mentioned would they choose to acquire new knowledge", both categories of respondents chose the internship as a program for professional development with a percentage of 38.24% and 27.66%.

- Being asked: "What business objectives can be achieved by following an internship", the answer of poll was: to gain practical experience (23.94%, 26.53%), learn new things from professionals (22.54%, 27.55%). There was also a percentage of 21.13% who considered an internship important for contacts in the field they want to work in the future.

- Being asked if they attended any professional development program offered by the university, 57.14% of them were involved in faculty practice programs, "the factory of entrepreneurs" being another practical experience for 23.81% of them.

Please note that the Faculty of Economics and Business Administration, University of West Timisoara, practical programs offered are: "Simulated enterprises" that aims to simulate the activity of a company and management decisions to be taken in various situations arising the scenarios presented, "Practeam" entails a period of one month of practice in companies in Timisoara in the economic department. "Entrepreneurs Factory" aims to help students who have a business idea and want to implement it by having a chance to present it to members of Timisoara business environment. This program included trainings programs as: personal development, career planning, leadership, time management, creating a business plan and opportunity to visit three successful companies in Timisoara.

- Regarding the time and place of an internship program: 57.14% of those surveyed have benefited from such programs for a period between 1-4 weeks, 38.10% for a period of 1-3 months and 4.76% for a period between 3 to 12 months while 95.24% of respondents chose subjects performed an internship in the country, not abroad.

-Because the students practice programs can be paid either symbolic or by the companies where they have participated at internships and also by the university through awards for those who were the best: 47.62% of respondents were not paid in any way for participation in such programs, while 14.29% of them received various awards for performance and outstanding achievements in the program and 38.10% were materially paid.

- Regarding the difficulty of tasks and responsibilities that participants faced during the programs, the answers reveal that 76.19% of those polled considered the tasks facile, and 23.81% have considered the tasks very easy.

For the question about which are the necessary ingredients for a successful career in Romania, respondents had a variety of answers. The most common were: confidence, courage, ambition, perseverance, experience, adaptability, responsibility, passion, luck, involvement, reliability, creativity, knowledge, intelligence, respect, learning all the time. Responding to these responses confirm a hypothesis:" internship programs increase the level of empowerment and involvement." - In our opinion the question:" How do you think this experience changed your way of being?" Is one of the most important aspects that are involved in an internship program and the answers received show that: most say they have more confidence in their self and more courage, more knowledge, accumulating some experience are more responsible and persevering to achieve their objectives, the are more professional than before this experience. Others have got a picture of what it means to have a job and what labor relations mean. So, confirming the hypothesis 2: "internship programs lead to increased competence and professional skills and personal development".

4. Conclusions regarding internship role in training and professional development of students

Internship has certain benefits not only for students, but also for the employers.

Internships provide work experience opportunities to university students, recent graduates and people considering career changes. Employers are willing to hire interns with little or no experience, especially if the intern is willing to accept little or no monetary compensation. However, the benefits of doing an internship go far beyond your pay-cheque.

Gain Valuable Work Experience

An internship provides the opportunity to gain hands on work experience that the students can't get in the faculty. First time job seekers and career changers aren't usually desirable candidates, but companies are willing to train them as interns and give them the experience they would need to get a job.

Have an Edge in the Job Market

Employers are usually more concerned with the students work experience than their qualifications and internships are often the only way to get the work experience they need to secure a job. Many employers prefer or require applicants who have done an internship or relevant work experience.

Transition into a Job

Employers see interns as prospective employees and many finish their internships and continue working with the company full time. Internships are the number one way for employers to find new staff in the USA.

Decide if this is the Right Career

If the student is not sure if this is the right career for him, doing an internship is a great way to try it out. Internships are generally short-term, so the young candidate can test his future career without committing and find out if it is a career that will satisfy him.

Networking Opportunities

Internships are a great way to meet people in different fields. An internship allows students to meet people who might help them land a job later on and give the contacts in the industry they're trying to break into.

Apply Faculty Knowledge

An internship can be seen as the pinnacle of the university education and give the chance to use the skills the students have learned in the faculty in a real-world setting. It's a chance to prove the worth of their qualifications and to show what they can perform.

Gain Confidence

After the students have done an internship, they has more confident in their self.

VIEW ON STRATEGIC MANAGEMENT LITERATURE FROM ROMANIA

Bacanu Bogdan
"Transilvania" University of Brasov
Faculty of Economic Sciences and Business Administration

This study focuses on analyzing the Romanian works on strategic management – a specific field of management theory. The literature to be analyzed is referred to the Romanian environment due to the national authors writing in Romanian on the one hand, and to the source of diffusion involving the products which were developed on the other.

This study evaluates the strategic management theory representation and reflection in the works issued in Romania by Romanian authors during the last two decades. Such an assessment is valuable for the evaluation of the development level related to a rather novel field of to the socio-economic area..The evaluation is also useful in order to devise curricula for the faculties providing training programs related to business and institution management.

The study schema taken into account is discussed by reviewing similar examples selected from the foreign literature. The works to be analyzed were selected taking into account the interest triggered by the prestige of the quoted authors and by the analysis schemes they used. The approaches related to a specific segment of management are compared to the ones dealing with the field as a whole. "The form oriented references" of the study are compared with the practice developed in the countries considered as sources for the management theory.

The research has mostly a descriptive character with a longitudinal approach focused on the last two decades. The qualitative aspects prevail, even if an amount of quantitative references are also taken into account. The quantitative approach attempts to provide a wider image where certain approximations are used in order to build a basis of reference. With no intention to develop case studies, the examples were preferred to doubtful quantitative determinations related to the relevance of representation, which could have concealed the essential state of facts. The secondary sources used were selected according to the level of visibility.

The results offer a general view, as a "snapshot," of the main set of characteristics related to the significant issues of strategic management published in Romanian by Romanian authors. Elements related to amount and contents are taken into account and deductive qualitative evaluations are developed on the quality of the issues. The limits of the study are predetermined by selecting an optimistic approach, a fact that implies the de facto formation of a favorable sample consisting of elements to be researched.

This study represents a point of entry for a "who's who" type discussion on the current strategic management theory in Romania. Its exploratory character allows the planning of a higher scale research in order to devise a more reliable inventory of the products related to the field and to measure the real impact of the knowledge diffused by these works, books and articles.

By choosing this topic, the author attempted to draw attention to the necessity of researching on the "production" of theory authors involved in a certain field – in this instance the strategic management – in order to decide if the research framework of the associated practice has a reliable basis. Even if structured in a rather elliptical style, the conclusions suggest that in the Romanian field of theory there is still a wide array of unbeaten paths.

Key words: strategic management textbook, strategic management theory, strategic management studies
JEL Codes: M19, Y90

I. Introduction

The year 1990 witnessed the downfall of the ideological and political barriers which had impeded on the diffusion of management works. This fact triggered the development of a national

specialized literature which attempted at drawing the attention of local practitioners, and also of those attending at the time various stages of training in the field of management. Instead of the "official" textbooks, issued by groups of "authorized" writers, several author works were issued, and then subjected to the market validation on the model provided by the practice developed in the Western countries. During the following years, series of books focusing on theoretic segments of interest related to the up-to-date management have been issued. The features of domains such as accounting, marketing, human resources management and other similar segments were defined due to works, books and articles, issued by Romanian authors and referring, in a way or another, to the Romanian context.

Strategic management can be considered as one of these segments of interest related to management, and more comprehensively, to economy as a whole. If the issue of the first textbooks can be traced between the years 1995 and 2000, both the label and the concept "strategic management" have diffused vertiginously both within the programs of study provided by higher education and within the day-to-day slang of the decision makers. Both "strategy" and "strategic management" have permeated the discourse referring to works considered as being of significant importance. Moreover, these terms have been associated as attributes with other concepts, as for instance "marketing" or "tourism", and in this manner the final result has become more difficult to interpret when taking into account the initial meaning of the term "strategy".

As the interest for this topic and for the labels associated with it has increased, a review of Romanian achievements in the field of strategic management theory will be indeed useful, and this approach will imply research on the works which have been issued on the one hand, and on institutional structures and authors diffusing knowledge related to the field on the other. Focusing on this specific field of management, this study will rely on textbooks used at higher education level and also on materials attempting to become training instruments designed for the university.

II. Some inspirational Western models

On one way or another, the reading public has shown a constant interest in the synthetic approaches of retrospective character related to various fields of science. As the evolution progress involved in the knowledge development has augmented during the last decades, the demand for such works has also seemed to increase.

The strategic management has not remained immune to these signals, and has adapted to a more mature trend involving general management and the organizational behavior. This orientation has developed more in countries with a sound tradition in the field, such as the United States, the Great Britain and France. However, the necessity to introduce order into the field, a field most frequently considered as an interest arouser at national level, is being also taken into account at the moment in the countries with emergent economies. In these cases, the domains of interest are represented by the national contributions and by the manner they influence the field at a national scale.

If one is searching for reference patterns for these retrospective approaches in the American literature, as the United States were the most creative area during the last decades, one can distinguish the existence of two great categories. As one of them focuses on the significant authors, the other's main domain of interest is represented by essential ideas and concepts. In other words, the first deals with a "history" of the authors organized in a chronological manner as the second can be seen as the history of "structures" which evolve according to specific concepts. Obviously, in both cases one cannot refrain from a complementary approach, the authors being reviewed by mentioning their contributions, as the "history" of concepts is described by referring them to their creators.

Some of these critical reviews are fathered by renowned names of the field, a fact that, even if in a succinct manner, imposes self quotation. The significant amount of works edited by names of reference for the field can also be included in this category of syntheses. The collections of

reference articles issued in special editions of best business reviews or journals are designed in a similar manner.

The list of this kind of syntheses issued in English is very comprehensive. One can identify in it interesting titles and lists of authors. In the same manner, certain "author syntheses" are of real interest due mainly to the prestige of the authors.

Moore (2001) builds a list including several authors specialized in strategic management, such as Andrews, Ansoff, Chandler, Porter, Mintzberg and containing also an amount of consultants of this field. Some of them, such as, for instance, Ohmae or Henderson, are renowned for their theoretical works in strategic management.

Mintzberg and Quinn (1992) structured a synthesis focusing on the strategic process, a synthesis involving more than two dozens of contributors. Moreover, Mintzberg, Ahlstrand and Lampel (1998) built an "inventory" of what had been issued related to the strategic management field by grouping the authors in a number of ten "schools" with the subtitle "A guided tour through the wilds of strategic management".

A modern synthetic approach focused on concepts and taking into account the significant up-to-date topics was used in Canada by a group of professors, the main authors involved in this project being Taïeb and Toulouse (1996). Their vision is rather detached from the clichés of the American space, a fact that supports an elegant integration of the various "directing lines" of the field.

As the strategic management, a concept which has been defined only for half a century, is being analyzed from the point of view of general management, the syntheses where this concept is to be found have increased in a significant manner. The "who's who" type lists have become more comprehensive in various shapes, their contents focusing on the authors' main characteristics, such as education, experience and their main works.

For instance, Matteson and Ivancevich (1999) devised a synthesis where two dozens of "classics" are exemplified with several excerpts from their works, while Pugh and Hickson (1989) (a work translated into Romanian too) built their synthesis on summaries of complete works belonging to significant authors. Cooper (2000) is a good example for the category of authors who devised an extensive list of authors, each of them being allowed a space similar to that provided in a specialized dictionary.

Among the journals, one can distinguish the case of Harvard Business Review who created special editions such as "business classics", dedicated to general interest topics. Usually, they are more restricted instead of taking into account a wider field such as strategic management.

Finally, we have to mention the strategic management synthesis provided by the English variant of Wikipedia. However, this synthesis focuses on reviewing the evolution of significant concepts and ideas, providing also a good "visibility" to authors of the field.

III. Methodology

The study analyzes the material issued by Romanian authors during the last twenty years in Romania, in Romanian language. The books issued at a national scale have been mainly taken into account, but also the university type textbooks with a local diffusion which are however "visible" when using search engines on the Internet.

On the other hand, articles and specialized conference works published in journals and proceedings have been reviewed. The analysis of this segment has focused on a category consisting of a number of journals categorized as B+ class and having a good visibility in Romania, and also of several conferences that seemed to have a more obvious orientation towards management and strategic management due to the titles of the proposed sections and of the selected works.

Two dozens of authors were selected as they were associated by Google with the search words "strategy" and "strategic management" in the Romanian context. The names were selected in

order to be analyzed only if the respective key words were to be found in the title of a work dealing with strategic management. The names of authors discussing the strategic management of a function of organization, as human resource management or marketing, were not selected for the analysis. There is no importance oriented delimitation between the twenty fourth author and the twenty fifth author of the list and the list doesn't involve any qualitative criterion of classification.

Several qualitative and quantitative features were taken into account for the dyads author-work selected, which could provide a general image of the standard related to the theoretical products belonging to the textbook type.

The qualitative comparison between the two types of works has taken into account both the identification of authors common to the mentioned types and a rather relative focus on certain topics of interest for the international literature of the field.

The analysis highlights a causal relationship between the features of the national policy involving the higher education and the characteristics specific to the state of facts related to the researched field of the theory.

Taking into account the aforementioned elements, the study can be described as having a descriptive character and providing some explanatory elements. The researched time span also provides the study with a longitudinal character. Finally, the developed domain of discussion proves itself to have an exploratory value.

IV. Landscape of the Romanian strategic management theory

In Romania, the strategic management is a subject specific to faculties of economic sciences and business administration, in most of the cases the named subject being available starting from the bachelor stage. During the last decade, the subject was also appropriated by the engineering faculties, and mainly by those of economical engineering. Thus, one can state that the subject is available in the curriculum of all the comprehensive universities. However, we should point out that the subject appears to be a pillar of the MBA programs framework provided by all the universities.

From public organizations to consultancy companies, there are numerous providers of formation courses besides the university type courses. Their activity is stimulated periodically by the appearance of certain opportunities such as the POSDRU European projects.

In this context, an evaluation of the written materials in the Romanian language by Romanians existing as a support for these courses represents a domain of real interest.

The most frequent generic title of the works associated to the field is "strategic management". Such a plain title supports the allegation that the respective book attempts to be mainly a textbook. Nicolescu (1996) issued as an author/editor a collection of authors who had discussed various general or functional topics related to the company by taking into account the "strategy" concept. In most of the cases, the references were rather awkward and the whole lacked substance because it referred to up-to-date strategic management. However, the work has the merit of being among the first works with diffusion at a national level.

Further on, Băcanu (1997) and Ciobanu (1998) came up with generic works related to the field. One should also take into account the issue of a translation with this title coming from Allaire and Fîrşirotu (1998). This work can be considered as a "landmark" for this analysis as one of the authors, a professor at a Canadian university, is of Romanian origin.

Starting with 1999 and during the following decade the most titles which are available on the market today or are being used as university course materials were issued. From these materials, roughly two dozen titles have visibility on the Internet, less than half of them being made available by the public system of book distribution.

An analysis of the amount of information these books provide shows that only few books count between 250 and 350 pages, most of them counting 200 or less pages. Due to the fact that the

average for western materials related to the field is of 350- 400 pages, one can infer that certain topics are discussed in a succinct manner and some topics are missing. Moreover, as in the case of the course materials conceived in the American manner an amount of 50-60% of the whole deals with case studies, within the Romanian materials the case studies are not often available besides the theory matters, the analysis identifying only five titles dealing with case studies from a list of 30 textbooks or similar materials.

Taking into account the bibliography used which further on generates the structure determining the approach available in the respective book, an Anglo-Saxon and mostly "American connection" becomes obvious, a connection to be distinguished at the majority of the Romanian authors, and also a "French connection". The latter is represented by Ciobanu (1998) and Niculescu (1996).

A content analysis proves an obvious tendency towards the textbook format, without taking into account the promotion of new idea, models or concepts. The labels or "innovations" to be afforded to the Romanian authors are seldom. It is less difficult, however, to distinguish the theoretical background of the author because certain aspects associated to his favorite subject are indeed emphasized. For instance, in the case of Niculescu's works one can distinguish the preference for the approach and topics related to financial analysis.

In what the coherence of structure related to the presentation of strategy or to the strategic process is concerned, this coherence is specific only to a small amount of the researched works, a segment of around 30% of the total amount of researched works.

In what the approaches involving the strategic management in the studies issued in journals or proceedings are concerned, a rather moderate representation can be distinguished. As the studies using the "strategy" label due to marketing reasons are excluded and a content analysis is developed, less than 5 % from the total amount of articles from a sample of B+ journals and conferences with ISI labeled proceedings may be considered as dedicated indeed to strategic management.

The research on authors who have issued both studies and textbooks shows that only a small amount of them write regularly on topics involving strategic management or provide a project materialized in a set of works sharing the same direction. Brătianu and Lefter (2001) stand an example for the university strategic management and Ţuclea (2003) for the strategic management involved in the field of tourism.

The depreciation trend of textbook quality appeared during the last three years and this tendency can be related to the fact that issuing Romanian material in Romania doesn't serve anymore in order to improve the assessment of the teacher performance. The lack of interest in academic books institutionalized by the decisions makers within the Ministry of Education is not at all counter-balanced by the appreciation of ISI articles and studies and, as a result, it hasn't increased the consistency of theory offer related to the field. The more turbulent the economic environment gets, the shortage is more obvious. As a result, theoretical orientations towards stability become a necessity.

Besides the educational materials on strategic management with which the name of an author may be associated, there are many books, textbooks and "course materials" with a local impact or belonging to the "no name" type. These materials are in fact compilations belonging to various categories of value, some of them being obviously affected by dilemmas associated to plagiarism. Their level of coherence and consistence suggest that both those who have issued them and those who have used them in order to support their explanations in front of their students lack the knowledge required in order to counter-balance the low quality of the printed material with the label "strategic management".

V. Conclusions

Even if focused on the most obvious and generic aspects, the analysis developed in this study proves the existence of a qualitative discrepancy between the offer of materials diffusing the theory and the offer of strategic management courses. These materials, mainly in book format, are adapted to the Romanian university requirements, being namely influenced by a time budget afforded to the respective curriculum subject. In other words, the detected "quantitative" standards are rather moderate in comparison with the ones available in the western world.

Even if there is indeed a tendency dictating any teacher to make up his own course material in order to avoid "the unique textbooks", the materialization of this quantitative flow hasn't yet provided a qualitative improvement. The plethora of "local sources" hasn't yet generated any great innovative ideas or approaches.

Finally, in contrast with the general diffusion of the strategic management subject within the curricula, a rather insignificant amount of teachers may be associated with the respective field.

Environmental wastes can be a symptom of a suboptimal system. can help the company to reduce waste and improve environmental performance leading to increased system productivity. Every major industry was once a growth industry. But some that are now riding a wave of growth enthusiasm are very much in the shadow of decline. Other which are thought of as seasoned growth industries have stopped growing. In every case the reason growth is threatened, slowed, or stopped is not because the market is saturated. It is because there has been a failure of management.
Keywords: quality management, environmental management, change management, flexibility equation, product knowledge
JEL : M11

Introduction

Every major industry was once a growth industry. But some that are now riding a wave of growth enthusiasm are very much in the shadow of decline.

Other which are thought of as seasoned growth industries have stopped growing. In every case the reason growth is threatened, slowed, or stopped is not because the market is saturated. It is because there has been a failure of management.

Method of research
A Equation of flexibility and Knowledge product

The equation of flexibility and knowledge product can be written in function of following variables for our improvement product matrix were: Q_p represent quality perception, Qa= quality action, Qd= quality decision, P_{q}-quality perception, P_a,-action perception, P_p- precision perception, T-technology, M-man, manufacture power, A-affect variable..

$$\text{EKP} = f(Q_p,\ Qa,\ Qd,\ P_q, P_a, P_d,\ T,\ M, A\ ) \qquad [1]$$

Once apart of data is selected the relationships represent the dependencies of all the selected data.
A model for knowledge product process it is presented in the following scheme which identify the way and the variables observed or affected which disturb the product process [15].
Knowledge it's part of every stage of life cycle product from the design stage, business information, organization work harmonize with the new environmental changes and finished with the new model of knowledge product (Figure 1).
The new trend of friendly product and friendly environment influence the enter activity of knowledge product because of the perception and the action of disturbance variables: noise, vibration, failures, damages, pollution.

The new provocation for designer will be to establish the connection and choose the best solutions and suitable programs for product, taking in consideration the matrix and learn from the each evolution of the cycle design [Klepper 1996]

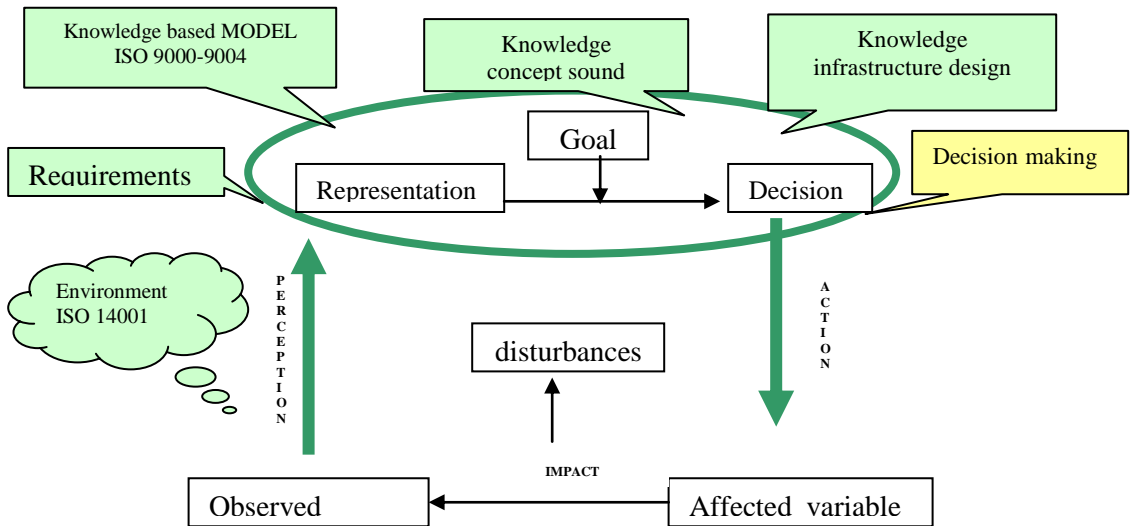
It is clear that stand alone solutions will not serve the designers needs, if he wants to have access to all relevant information for a sound product development, further research work has to prove this.


Fig.1. Modelling of Knowledge Product Process

On this platform information of various characters are located and shifted around for the purpose of being accessed from any point during the design process [Hubka 1996].

One approach is to have an integrated product data model and to create views upon this model. Each view represents a specific selection window which gathers all necessary information for a certain need of access [Cesaroni 2010].

However, for many this stage will prove to be the critical one; many wait until this period before acting, and it is the only stage where some sort of action is critical.

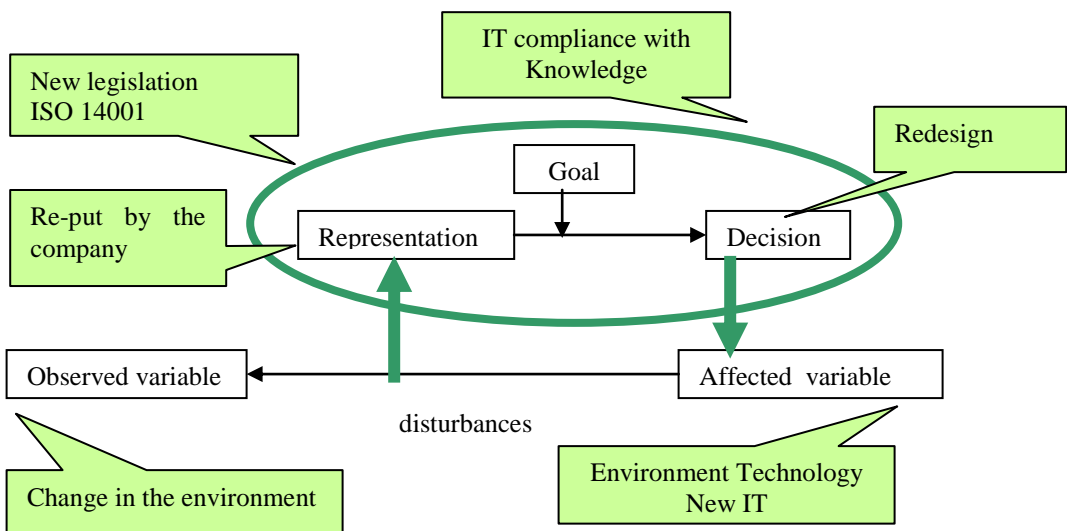
Theoretically the product life-cycle is a smooth and elegant curve; in reality there are constant short-term fluctuations due to external factors [Arvind Rangaswamy (1996)].


Fig.2. A Model concept for Product Improvement

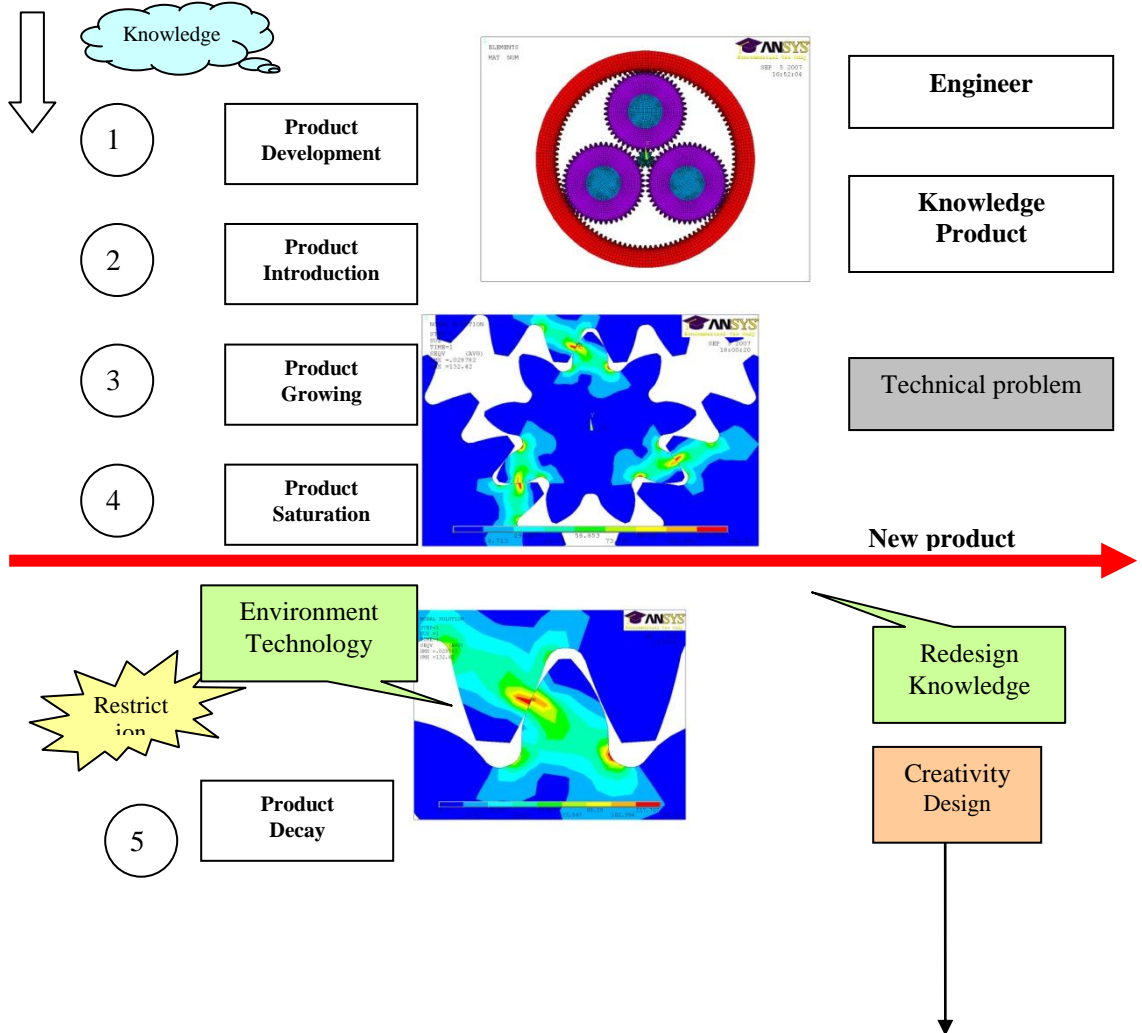
Knowledge it's part of every stage of life cycle product from the design stage, business information, organization work harmonize with the new environmental changes and finished with the new model of knowledge product (Figure 2).
The first common mistake is to assume that any reduction in sales signals the onset of the decline phase. We state, that the set of requirements of a product is a feasible and suitable set of relationships to hold all the data pieces together and that this (most unsettled) set can serve as an integration platform for a design support system [Allemby (1995)], [Ungureanu 2001, 2002].

Results
To the end of the article I preset the results that prove that it is possible to translate product life cycle PLC knowledge into the improvement product matrix like in Figure 3 a Model of the Life Cycle Product from theoretical trend - sales - manufacturing design.


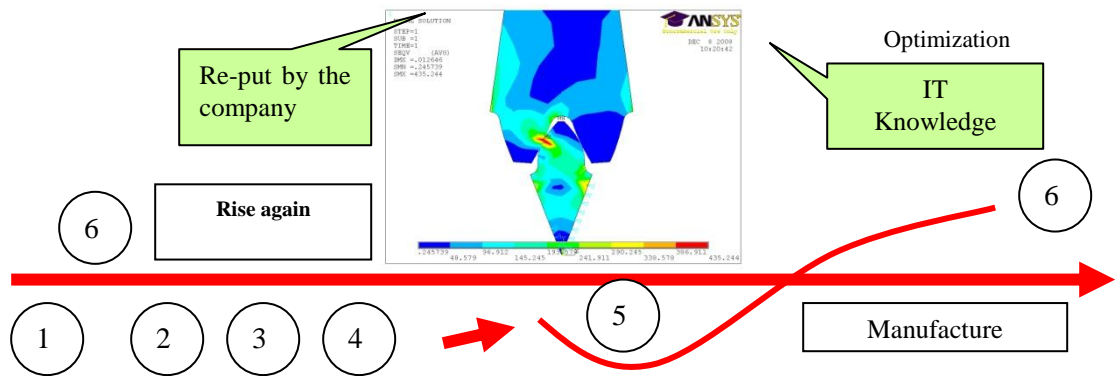


Fig.3. Life Cycle Product Model from theoretical trend -sales - manufacturing design

Conclusion

Moreover, a new design support system shall at least have those capabilities which the previous one had, it should as well of course provide more or better functionality.

It shall behave in the same manner as the previous one and be used in the same way. According to the research paper, the paper defines some models to relative environmental profiles of

new material choices or packaging options.

to reduce environmental impact at its source in the design phase.

to serve as a communication tool between companies and consumers

to establish from the design stage the re use of some materials,

to identify which are the recycle materials [Dankwort 1996],

to compare existing products with planned alternatives [Monolaisir 1999]

to compare existing company products with products of competitors

realize an internal information and training

new strategies in marketing, advertising policies

joining eco-criteria

environmental cost allocation

assess the gap from eco-label criteria

radical changes in product life cycle [Klepper 1993]

From economical point of view the target costing methodology represents a totally different approach to classic cost management. In either case, a successful product supplier must focus more attention on managing product cost.

Orients especially on drive product cost in preproduction phase of product life cycle and try to achieve lowest future product costs [Barbuta Misu 2009],

Target cost calculation can be characterized either as activity whose aim is to check up all possibilities of cost reduction in product planning phase.

Result those activities should be product design, which meet all consumers requirements and expectation and whose cost and price which will provide to company required profit.

From cost-plus pricing to market based pricing a view (Figure 3) describes the way to look a product and his properties during the product life cycle.

In this way we can describe mainly the content of information concerning the product and the usage of system functionality with regard to each stage of design/ development [Nishiguchi 1996].

Using the equation of flexibility in knowledge process we can define and provide some common basis for life cycle product knowledge (Table 1).

In compliance with the various approaches it seems that the matrix representation considering product properties and life cycle is quite suitable to represent engineering knowledge handled in

the systems and complete the circle of influence for the new model of knowledge product process.

Table 1. Life cycle costs

Recurring production cost =	Production labor + direct materials + process costs + overhead + outside processing
Non-recurring costs =	development costs + tooling
Product costs =	Recurring production costs + allocated non-recurring costs
Product price or acquisition costs =	Product costs + selling, general & administrative + warranty costs + profit
Life cycle costs =	Acquisition costs + other related capital costs + training costs + operating costs + support costs + disposal costs

THE EFFECTS OF NEW TECHNOLOGY ON PRODUCT KNOWLEDGE MANAGEMENT

Boca Gratiela Dana
Technical University Cluj Napoca
North Center University Baia Mare
Faculty of Sciences

In order to manage the market competition, rapid changes in technology, accelerating industry clock speed, increasing number of product variants, shrinking product lifecycles, limited supply, and price pressures, technology companies need to put more emphasis on managing product launches successfully and timely. Therefore, the focus of this study is to examine product of an manufacturer that operates in high volume and high clock speed industry. Furthermore, special attention is paid to how the company could learn from previous product launches and utilize this information internally when preparing for upcoming product ramp-ups.
Keywords:life cycle product, knowledge product, quality, technological innovation, change management,
JEL : M11, O33

Introduction

In his article Levitt [1965] describes the importance of the concept of product lifecycle and how it should be used as a competitive power.

A key factor in his article is the proactive way of anticipating future stages. Early planning, looking ahead, advance thinking, sample planning and acting are the topics that are discussed widely in his text.

Early planning is defined as the promotion of more frequent usage, developing varied usage, finding new users and uses.

By looking ahead the company can become a of competitive and market events and then make noticeable improvements to the short term tactics of the product. When these considerations have been made the company has to also be aware what the impact of one decision has in the following phase [Simula 2008].

All the effects cannot of course be forecasted and therefore, the company has to act on the basis of conclusions at its disposal the goal for a product for certain time intervals and therefore, provides the product should go time-in-market, can usually be define as introduction, growth, maturity and decline, four stages have been introduced in multiple sources, the strategic decisions that have to be made in different stages of a product profitable and successful.

Method of research

The article include a theoretical part based on existing research literature on product processes and product launches. That is followed by an empirical study of a case company.

The theoretical section covers topics such as new product development, productizing process, product lifecycle management, lessons-to-learn culture and best practices.

The empirical part of the study is performed as a descriptive case study. The study is descriptive, since it illustrates and describes the topic of management in its real-life context.

Study case:

A guide to understanding advances and production.

By identifying the dependencies between challenges created by external factors and the corresponding internal factors to solve the challenges companies can effectively maintain the inflow of profits. [Putkiranta 2007] (see table 1).

Table 1. Challenges from external factors and corresponding alterable internal factors

External factors	Challenges	Internal factors
Markets	Warehousing	Sales
Competition	Customer care	Marketing
Demand	Processes' collaboration	Manufacturing
Supply	Manufacturing capability	Product portfolio
Partners	Delivery	Human Resources
Technology	Forecasting	Supply Chain
Economy		Management

Demand factors such as delivery time, delivery flexibility, demand forecasts and customer specific product requirements are the main creators of challenges from the downstream.

In the upstream challenges originate from material delivery times, availability forecasts and delivery time accuracies. Also several of other external factors such as strikes and competitor pricing develop situations which are challenging for companies [Putkiranta 2010].

Due to short product lifecycles characteristic of the market, companies have little time to analyze and learn from their previous successes and failures in product launches.

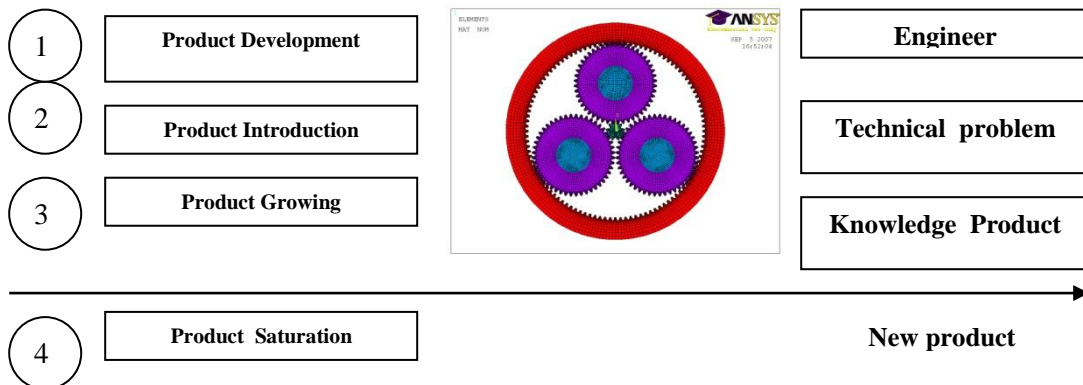
The effect of new technology on product development it's examined following the ramp of PLC cycle for a product (see figure 1)


Fig.1. The PLC cycle for a product

Therefore, the purpose of this study is to identify how past experiences in product ramp-ups can be best utilized in a fast clock speed industry.

Objects of study

The objectives of the study are the following [Moyer 2009]:

- To identify challenges in product ramp-up planning and management
- To recognize the ways of improving performance through learning
- To create a tool for describing and analyzing past product ramp-ups and storing gathered information.

Are improvements in technology responsible for the development of new products?

Are these technological advances responsible for successful new products?

Often those who write about future developments in industry and in lifestyles base their predictions on their expectations, often correct, of the advance of technology.

Customer needs and wants drive the development of successful products and the role technology plays is the opposite [Larson 2011].

The lack of the required technology holds back the development of products that, if possible and practicable, could be successfully introduced.

What drove the sale of our products (industrial automation devices and systems) was the needs and desires of the individuals working for our customers (manufacturing companies).

What held us back was the inability, usually due to technological limitations, to produce the desired product at a reasonable cost. [Barbuta-Misu 2010].

As technology improved, the limitations were lifted and new products were brought to the marketplace. [Korhonen 2008].

Results

The study also exhibited that the new product technology has effect on how the ramp up behaves. In products with new technology, issues with upstream, software and demand seem to appear. The products with technology that has been used before have complications with modifications that seem to pop-up in the later phases of product development. [Yin 2003].

The problems with demand, software and upstream in **new technology** appear as slow building order book, delays and supply shortages or quality issues (see table 2).

Table 2. Implication and solutions in new technology

New Technology			
Issue	**Upstream**	**Software**	**Demands**
Implication	Supply Mechanical quality Consumer quality	Over optimization Tight schedule	Slow slowly demands Sales adjustment
Solutions	Supply driven action	Realistic approach	Highlight the situation

In upstream problems like supply of mechanics and covers, the solution would be to follow the guideline set by the global supply situation.

Gaining momentum in the project start by collaborating with surrounding elements the probability of succeeding later on is remarkably higher.

Problems with software leading to delays and too tight schedules are common, but the only way to avoid surprises is to have follow-ups to constantly paint the readiness of the platform.

The products with **"old" technology** seemed to have one repeating problem: different types of modifications (see table 3).

Table 3. Implication and solution in traditional device

Traditional device			
Issue	**Supply problems**	**Cover problems**	
Implication	Low product design	Production output	
Solutions	Supply driven action	Focus on down stream	Maximize output

It is clear that stand alone solutions will not serve the designers needs, if he wants to have access to all relevant information for a sound product development, further research work has to prove this.

On this platform information of various characters are located and shifted around for the purpose of being accessed from any point during the design process. [Consoli 2011],

One approach is to have an integrated product data model and to create views upon this model. Each view represents a specific selection window which gathers all necessary information for a certain need of access.

In some cases the tooling in the production was changed or the diverse mix of sales package contents was not in control (see table 4).

Table 4. Implication and solution in using IC programs

Customers specification variants			
Issue	Sales push for high volumes	Inventory risk	
Implication	Volumes drop after channel fulfillment	Significant work in progress and investments	
Solutions	Close customer collaboration	Familiarize with customers strategies	Customers goggles

However, for much this stage will prove to be the critical one, many wait until this period before acting, and it is the only stage where some sort of action is critical.

Theoretically the product life-cycle is a smooth and elegant curve; in reality there are constant short-term fluctuations due to external factors. [Levitt 1965].

The first common mistake is to assume that any reduction in sales signals the onset of the decline phase.

The area between stages 1 and 2 may at first appear to be decline, but in fact are part of the growth stage. Similarly, the area between points 3 and 4 may at first be read as a new growth phase; in fact it is little more than a temporary increase that has no real significance (Figure 2.).

Fig. 2. Life Cycle Product Model theoretical trend vs sales (-----)

Conclusion

The purpose of this study was to establish a model PLC to support the daily tasks of a working community.

Due to the limited resources and experimental nature of the research quite a few possibilities were left for subsequent studies.

At least four types of topics could still be implemented in the case company to utilize the new technology power of learning in the case organization, namely the following:
1. Implementing the learning culture to support the whole lifecycle of a product
2. Integrating the tools described in this study
3. Making the tools and prevailing performance measures fully compatible
4. Establishing a similar learning culture at higher level to reduce the amount information sharing obstacles created by corporate silos

1.For the first topic the crucial part would be to find out if the learning culture was beneficial if it was used on the whole lifecycle of a product.

Would the possible output from the reporting input be greater and in that way be useful for the organization or would it be only additional workload for the employees?

2.The second topic would be based on the same topic as this research, but the scope would be to make the tools of the culture more user-friendly.

By combining the tools into one program the use would become easier. But again, it would need to be considered whether the output would be bigger than the input.

If the implementation required great amount of resources the project could be seen as a waste of money.

Though if it was enabled through witty solutions with basic programs, it would enhance and support the lessons-to-learn culture.

3.The third subsequent project goal would be to fuse the performance measures of the business unit to the learning tools and culture.

By combining the measures with learning reporting, the top management would also have a shortcut view on the plans on how the pitfalls from the past could be avoided.

4.The fourth research possibility would have the greatest magnitude.

Most of the functions at the case company have their own tools for lesson-to-learn reporting, but they all are completely separate.

By studying the ways of different corporate silos in learning common benchmarks could be found. In that way all the functions would use similar tools, which again would enable improved visibility when attacking common obstacles and challenges.

MANAGING CHANGE: SOME THEORETICAL AND APPLICATIVE ASPECTS

Botezat Elena
University of Oradea, Faculty of Economics

The strategic organizational change aims is the change of procedures and systems, organizational structures and responsibilities but especially acquiring new knowledge and skills. Significant authors (Drucker: 1999; Kotter: 1996; Buckingham & Clifton: 2001), supporters of the theory of strategic leadership show an inclination for the idea of optimal management of an organization, which depends on circumstantial factors as place and time, the individual and the context in which it acts. Many experts who studied organizational change saw as possible the future replacement of the current state, desired only after completion of specific phases, in a certain sequence. In this article we will focus our attention on the reduction phase of resistance to change. The research objectives targeted both theoretical aspects consisting in bringing to the forefront the relevant aspects related to organizational change in the current context and practical aspects related to identifying and analyzing the main elements that make it possible or on the contrary act as brakes in way of introduction and implementation of change. To achieve the research objectives, we used the method of direct observation and the questionnaire method supported by the gathering of more information from the organization's documents (Beton Construct SRL) and support discussions with the employees.
Data processing and analysis revealed that in the organization certain factors exist and manifest that constitute obstacles or inhibit organizational change, namely: the goal of the change is not clear, the rewards of change are not related to the effort needed to make them happen, change determines fear of failure, change is often imposed by coercion, change requires effort and commitment required for employees that think they do not have resources anymore.
Summarizing the results of usage for certain methods and techniques to implement change, we can say that the actions of an authoritarian management must be reduced at a necessary minimum and positive communication and motivation must be improved of those who contributed to the change.
Setting up an effective system to implement changes towards achieving and maintaining performance in our case, limited in time and space at contemporary bihorean space, like practical implication of our study, appears to be related to direct communication, the concentration of communication on solutions and not on problems, creating a climate of trust, time allocation and reconsideration for the notion of failure.
Keywords: strategic organizational change, obstacles, effective system
JEL Code: M13

1. Introductory elements regarding managing change

Over the years, carefully examining the factors that determine success or failure of an organization was a constant concern of management theorists and practitioners which gradually led to the crystallization of a specific methodology for analysis and strategic direction of business firms. "Strategic Management emerged and was designed as an advanced form of leadership, able to ensure anticipation of changes and to prepare the company to face them successfully, to increase its adaptive capacity and hence its speed of reaction and response to new challenges the business world is facing today" (Naneş 2000:37). Strategic management is often understood as a change management and it is. The literature has identified three types of change, namely: forced / required change, spontaneous change and strategic change, ie change that is chosen and formulated as an option. This requires an attitude and behaviour of anticipated adaption and voluntary organization and activity, in the event of a future environment more or less predictable.

The recent series of negative events with the devastating effects entitles us to say we are speaking about a future increasingly unpredictable. On the agenda of mankind dictated by their early warning signals there are discussions about the emergence of so-called *big shifts* or *inflection points* where the curves that describe the evolutions of different aspects so familiar of our daily rutine change direction. A new philosophy, a new way of thinking and action can be obtained only with effort and sometimes the price paid is very high. A great example is that of the ship Titanic, sank 100 years ago. It is important to realize that we must learn from such an accident. The assimilation of the "Titanic effect" submitted by its identifier as: "the size of disasters decreases as people think it possible and even design the prevention or the reduction of their effects" (Watt 1977:84) is, in our opinion, an important pre-requisite in managing strategic change.

The strategic change aims at achieving substantive changes in an organization and is the opposite of small changes, the one that involves unessential changes in the organizational structure, work program or people in different functions of management or execution. The strategic change is a process that lasts, often incomprehensible and painful, which leads people to oppose, either openly or concealed. The strategic change aims is the change of procedures and systems, organizational structures and responsibilities but especially acquiring new knowledge and skills. In the new situation in which they were forced to dive, people need new knowledge and skills to act. In addition, managers need to communicate a vision, a direction to align its people, to motivate and inspire them energy; meaning they must become leaders. "Being a manager means to put people to do what needs to be done. Being a leader means to convince people to want to do what needs to be done" (Bennis 1994). Significant authors (Drucker: 1999; Kotter: 1996; Buckingham & Clifton: 2001), supporters of the theory of strategic leadership show an inclination for the idea of optimal management of an organization, which depends on circumstantial factors as place and time, the individual and the context in which it acts.

There are no few who have asked "*Why change programs do not produce change?*". Michael Beer, published an article with this exact title-question in the "Harvard Business Review" in which he argued that in order to change the behaviour of employees, they should be put in an organizational context, which should impose them roles, responsibilities and new relationships (Beer et al. 1990:158-166). Many experts who studied organizational change saw as possible the future replacement of the current state, desired only after completion of specific phases, in a certain sequence. In this article we will focus our attention on the reduction phase of resistance to change, specifically on finding answers to questions like: What are the elements that determine resistance to change? What is their mechanism of action? What are the reasons why employees show resistance to change? What are their forms of resistance to change? What specific methods and techniques that can reduce resistance to change? Which are the specific situations where it is recommended to use a particular method or technique?

2. Research hypotheses and methodology

The research objectives targeted both theoretical aspects consisting in bringing to the forefront the relevant aspects related to organizational change in the current context and practical aspects related to identifying and analyzing the main elements that make it possible or on the contrary act as brakes in way of introduction and implementation of change. Managing them properly can be an important prerequisite to improving performance.

Hypothesis I: in the organization exists and manifests factors that constitute obstacles or inhibit organizational change; the elimination or reduction of their influence would be a major step forward.

Hypothesis II: the analysis of the effects of certain methods and techniques for change implementation can determine the configuration of a more effective system for implementation of change towards achieving and maintaining performance.

The research was conducted on the Beton Construct company, specialized in processing ballast, the production of sorted and crushed aggregate and manufacturing of concrete. Beton Construct always invested in continuous improvement of product quality, production capacity and technical facilities, becoming since 2008 the local leader in the production of concrete and aggregates. In 2003 the company has benefited from Phare funds that were used for the purchase of a ultramodern sorting and crushing station (production Sweden). The company has 33 employees that operate in different departments: administration, accounting, billing, quality control of products, production of crushed goods, concrete production, transportation, repair and installation for its equipment. Out of the 33 employees, 8 are women and 25 are men. The company is managed by a General Manager, assisted by a Economic Manager and a Technical Manager. In addition, there are 7 persons, 4 heads of departments and 3 persons, TESA responsible. Out of the 33 employees, 20 are skilled workers (60.60%) and 3 are unskilled workers (9.09%). By age, 5 belong to the interval 20-30 years, 10 match the range 30-40 years, 10 correspond to the range 40-50 years and 8 the range 50-60 years. Wages are set according to the quantity of products or work performed, work schedules and rates per unit of product or work.

To achieve the research objectives and hypotheses, we used *the method of direct observation* and *the questionnaire method* supported by the gathering of more information from the *organization's documents* and *support discussions* with the employees. We chose the questionnaire for the following reasons: the respondent can complete the questionnaire at its own pace; the chance to provide information about any doubt; the opportunity to collect additional information through dialogue, as the support factor of the questionnaire; the low cost, providing anonymity; the low influence on the respondent. The questionnaire included 23 questions following circumscribed areas: the importance given to the action of reducing resistance to change; the reasons that determine rejection to changes; agreed methods and techniques for reducing resistance to change. Data processing was performed using SPSS software for statistical processing. The analysis was conducted only for the data collected by the SC Beton Construct SRL, for a sample of 29 persons drawn from different departments and functions, and multiple ranges of age and seniority at work. The questionnaire was answered by: 2 engineers, 2 accountants, 2 economists, 12 workers, 4 technicians, 2 analysts, 2 head offices, 3 persons in leadership positions.

3. Presentation of research outputs

After data processing and analysis the following were revealed:
- the main technique for reducing resistance to change is communication, informing on changes that are intended to be implemented. 64% of respondents were in favor for the existence of a communication on change in the organization;
- there is now a management concern for the continuous training of employees;
- in the case of planned changes, managers adopt a participative management style, during and after the implementation they are more communicative with the staff, adopt a positive attitude towards employee proposals for improving the process. Over 51% of total respondents said that during major change a participative management is practiced, the communication is more used in relation with the employees, employees are asked for their own views on the implementation of change;
- in the methods and techniques used to reduce resistance to change, positive motivation has a low share. This is reflected in days off, bonuses, highlighting in the group, all being placed as a percentage of total motivation less than 15%;
- negative motivation is found in the organization through sanctions, employees fear of losing their jobs (34%), or in conditions of crisis by practicing an authoritarian management, which determines a rapid reduction in the employee's opposition to imposed change (51%);
- influence / manipulation (on an average level) is another method used by managers, in a large percentage, in the following ways: presenting the change as the only possible alternative to the

crisis (45%); the presence and action of the group leader, which influences the whole group to comply with changes (51%);

- more influence to the proposed changes is manifested the employees which are more than 45 years old, with a significant 58%, in comparison to young employees that embrace change with a greater flexibility. The reasons are varied, they can arise from a poor communication for the change as a burden compared to the routine that is much favored by this group of employees. On the other hand, people under 45 years manifest an opposition of 8% towards changes, resulting from this the flexibility and adaptation to new requirements and not least the avoidance of routine.

4. Conclusions and Discussions

The analysis of implementation organizational changes in SC Beton Construct SRL, of methods and techniques used to reduce resistance to change allow us to make the following statements:
- employee participation it is and it is not encouraged to identify solutions to business;
- an interest in communicating the changes that are intended to be implemented exists, but not enough objectives oriented;
- in the case of changes implemented in emergency situations, the communication with employees takes place after implementing them;
- there is concern for the continuous training of staff, but predomominantly technical orienteted;
- for some changes an authoritarian management was used;
- very low attention is given to the motivation linked to organizational change;
- employees who are facing the changes feel a great deal of fear, uncertainty and insecurity.

Checking the first research hypothesis. We can say that in the organization certain factors exist and manifest that constitute obstacles or inhibit organizational change, namely: the goal of the change is not clear, the rewards of change are not related to the effort needed to make them happen, change determines fear of failure, change is often imposed by coercion, change requires effort and commitment required for employees that think they do not have resources anymore.

Checking the second research hypothesis. Summarizing the results of usage for certain methods and techniques to implement change, we can say that the actions of an authoritarian management must be reduced at a necessary minimum and positive communication and motivation must be improved of those who contributed to the change.

Setting up an effective system to implement changes towards achieving and maintaining performance in our case, limited in time and space at contemporary bihorean space, *like practical implication of our study,* appears to be related to direct communication, "man to man" according to the principle "live what you say" ("*walk the talk*"). Essential seems to be the concentration of communication on solutions and not on problems ("*finding solutions vs. problem thinking*"). It is rightly said that it is beneficial to implement solutions at 60% than to dream at 100%. It is increasingly clearer the fact that to compete with more power, the company will need to consider developing its people in a environment supporting the manifestation of personality in socialized forms, as an objective as important as producing or delivering goods or services. In our opinion, *essential in the operationalization* of this is *creating a climate of trust, time allocation and reconsideration for the notion of failure.* Seen through the "transformational vocabulary" proposed by Anthony Robbins, when an idea does not provide immediate results, it should not be considered a failure but an experiment. The term used in 2011 by Forbes magazine is "*failling forward*", which emphasizes that any experiment, be it bad, is a step towards the right solution.

In our opinion, for Beton Construct and other bihorean firms, *the recommended change is the strategic change*, a proactive change that seeks to anticipate future changes and potential risks associated with the environment, as well as efficient and effective management by setting courageous goals and action. In planning strategic change, acording main findings of our modest study who confirms the guide lines developed by significant authors (Zwilling: 2011; Mehri:

2006: 21-42) it is necessary to consider that its success depends on taking into account the reality that both people and organizations can absorb limited number of changes in a certain amount of time, that differ from one employee to another, from one organization to another, from one country to another. It must be a participative change in which affected people / groups must discuss measures to be adopted and come up with proposals and solutions for effective implementation.

SOCIETAL CULTURE: A COMPARISON OF ROMANIAN, AUSTRIAN AND GERMAN STUDENTS PERSPECTIVE

Catană Gheorghe Alexandru
Technical University of Cluj-Napoca; Babes-Bolyai University

Catană Doina
Technical University of Cluj-Napoca

Our study compares the students' view on the existing cultural practices with their ideal societal value system in compared societies. For the purpose of this investigation, Austria and Germany were selected to represent Central European values since they are seen as a 'bridge' between Eastern and Western European societal values. The research findings are helpful in identifying signs of cultural convergence of Romanian societal culture with Central European values. In doing so, our study will hopefully broaden the body of knowledge about the cultural harmonization between newer and older members of European Union. As seen in the literature review section, such studies started only a few years ago. Comparison of Romanian, Austrian and German students' perspective on societal culture is performed for the first time by the authors of this study.
The underlying assumption of the study is that the future middle managers will mostly come from the graduates of business and engineering fields of study. The research sample consists of 1086 undergraduate and graduate students. The main research question concerns the differences between the Romanian, Austrian and German students' view on societal culture. The theoretical and methodological foundation of the study is rooted in GLOBE international research project. Our findings revealed significant differences between perceptions of actual practices and expectations between the compared groups.

Key words: cultural practice, cultural value, Romania, Austria, Germany
JEL clasification: M14, M19

1. Introduction

Starting from GLOBE (Global Leadership and Organizational Behavior Effectiveness) findings, GLOBE STUDENT project was initiated in 2008 (1). The present study is a part of GLOBE STUDENT project. While GLOBE project focused on present middle managers, GLOBE STUDENT focuses on *future* managers, to be recruited mostly from today's students in business and engineering. Based on this assumption, more than 90% of the sample was drawn from undergraduate and graduate students in these two fields of study. Our study is designed to reveal signs of cultural *convergence* of Romania with Central European countries. In doing so, our paper will hopefully broaden the body of knowledge about the cultural harmonization in a regionalized Europe. Specifically, we will try to answer the following *research questions*:
1) Which are (if any) the significant differences between Romanian students perceptions of actual societal practices and those of students from Austria and Germany?
2) How do Romanian students' societal values (expectations) differ (if) from those of students from Austria and Germany?

2. Theoretical foundation

It is well known that there is no single generally accepted definition of societal culture (Chhokar et al, 2007: 3). Our study shares the definition used by GLOBE international research project: "shared motives, values, beliefs, identities and events that result from common experiences of members of collectives and are transmitted across age generations" (House et al., 2002: 5). The

GLOBE project distinguishes between *practices* ("as it is") and *values ("as it should be")*, noticing that in all societies, the shared values become good predictors of *future practices*.

The GLOBE research assumes that shared values are incorporated in behaviours, policies and practices, measurable through nine *dimensions*: 1) Uncertainty Avoidance; 2) Power Distance; 3) Collectivism I (societal collectivism); 4) Collectivism II (in-group collectivism); 5) Gender Egalitarianism; 6) Assertiveness; 7) Future Orientation; 8) Performance Orientation; and 9) Humane Orientation (definitions of these dimensions to be found in House et al., 2002: 5-6).

A few studies focusing on students in business and engineering have been published since 2010 (see, for example, Čater&Lang, 2011; Catana&Catana, 2010). The present study is designed to compare the cultural foundations of prospective managers and leaders in Romania to their counterparts in Austria and Germany (referred to as the *A&G cluster*). We expect to find significant differences between the two samples, both in perceiving the cultural practices and their cultural expectations.

3. Methodological issues

GLOBE student project uses the GLOBE research project questionnaires (House et al., 2004) with some modifications required by the subjects' nature (students). *Culture dimensions* have been measured using the scales in section 1 (*as it is*) and, respectively, section 3 (*as should be*) of *Beta* questionnaire.

The population of interest was defined as engineering and business students studying in three Romanian Universities, one in Austria and one in Eastern part of Germany. Although the German subjects come from the Eastern Germany, we assume they caught up very fast with the Western part of Germany, thus could be taken as having similar perceptions and expectations (at least) with the Austrian sample.

Table 1 shows the joint sample structure with usable data. The surveys were carried out in individual participating countries in either 2008 or the first half of 2009. Collected empirical data has been processed with SPSS 17. Descriptive statistical analysis was carried out separately for the A&G cluster and Romanian sample. In comparing Romanian sample with A&G cluster, the *independent samples t-test* was used, with 0.05 significance threshold. The research results are briefly presented and discussed in the following paragraphs.

Table 1: Sample structure

Country of origin	What subject area/ study path do you study?			Total
	Business/ Economics	Engineering	Other	
Austria	148	110	54	312
Germany	162	133	40	335
Romania	166	261	0	427
TOTAL (valid answers)	476	504	94	1074

Made by the authors

4. Findings

Table 2 displays the significant differences between Romanian sample and the Austrians and Germans with respect to perceptions of societal culture *practice*s (usable answers: Romania = 427; A&G cluster = 654). *Figure 1* highlights the differences in the mean scores of the compared samples for all nine cultural practices. Romanian mean values are higher than their A&G counterparts for Collectivism II, Power Distance, Humane Orientation and Gender Egalitarianism (the lowest difference). Higher mean values among the A&G cluster were noted for Uncertainty Avoidance (highest absolute difference), Future Orientation, Assertiveness, Performance Orientation and Collectivism I. *T-test* of differences between the mean scores (two *independent*

samples) shows that the significant differences follow the pattern given by the absolute values of differences between means. According to these research results, it is hard to argue that Romanian cultural practices are very similar to average A&G cluster ones.

Table 2. Significant differences between mean values: societal practice in Romania and A&G cluster*

Cultural practice ("society as it is")	Romania	A&G cluster	Absolute differences	t-test (sig 2-tailed)
Uncertainty Avoidance	3.49	5.04	- 1.55	- 31.663 (0.000)
Future Orientation	3.44	4.72	- 1.28	- 24.219 (0.000)
Power Distance	5.81	4.97	0.84	17.165 (0.000)
Collectivism I (institutional)	3.78	4.40	- 0.62	- 11.661 (0.000)
Humane Orientation	3.83	3.43	0.40	7.506 (0.000)
Performance Orientation	3.66	4.46	- 0.80	- 13.142 (0.000)
Collectivism II (in group/family)	5.13	3.90	1.23	25.822 (0.000)
Gender Egalitarianism	3.99	3.84	0.15	3.316 (0.001)
Assertiveness	3.51	4.53	- 1.02	- 20.406 (0.000)

*two independent samples
Made by the authors
Figure 1. Differences in perception mean scores: Romanian vs. A&G students
Made by the authors

The data in *Table 3* compare the cultural values as desired by the two groups of prospective managers. *Figure 2* highlights the differences in the mean scores of the compared samples along with the nine cultural values. As seen, the Romanian students expect significant higher levels of Assertiveness, Uncertainty Avoidance, Future Orientation, and Institutional Collectivism than the group from Austria and Germany. Even though Collectivism II records the lowest absolute positive difference, it still shows that the Romanian sample desires a higher In group/Family Collectivism than the A&G cluster. The lowest absolute negative value between the two samples was noted with respect to Gender Egalitarianism. As for Performance Orientation values, the A&G cluster displays a desire for a higher concern of society in this respect. Finally, there is no significant difference in the expectations concerning the level of Power Distance and Humane Orientation between the two samples (p>0.05)

Table 3. Significant differences between mean values: societal values in Romania, A&G cluster*

Cultural value ("society as it should be")	Romania	A&G Cluster	Absolut differences	t-test (sig 2-tailed)
Uncertainty Avoidance	5.10	4.40	0.70	13.658 (0.000)
Future Orientation	5.23	4.66	0.57	9.830 (0.000)
Power Distance	2.65	2.65	0.00	- 0.127 (0.899)
Collectivism I (institutional)	4.94	4.65	0.29	6.178 (0.000)
Humane Orientation	5.41	5.38	0.03	0.674 (0.500)
Performance Orientation	5.89	6.00	- 0.11	-2.358 (0.019)
Collectivism II (in group/family)	5.70	5.59	0.11	2.146 (0.032)
Gender Egalitarianism	4.42	4.59	- 0.17	- 4.941 (0.000)**
Assertiveness	4.01	3.13	0.88	17.552 (0.000)**

* two independent samples
** equal variances not assumed
Made by the authors

5. Discussions

The prospective managers in Romania differ substantially from their "average" counterparts in Austria and Germany, both in *perceptions* and *expectations* related to their societal cultures. The highest significant difference in the Romanians' perceptions when comparing with the A&G group concerns the cultural dimension of Uncertainty Avoidance (t = -31.663; sig = 0.000) showing the Romanians perceive their society as not being concerned with creating a stable legal, political and economic environment or with long term planning. Our finding contradicts the differences between the levels of Uncertainty Avoidance indexes displayed on the official site of Hofstede's model: Romania 90 (estimated), Austria 70 and Germany 65 (http://www.geerthofstede.com/media/651/6%20dimensions%20for%20website.xls). Although Romania was not included in GLOBE related books (House et all, 2004; Chhokar et all, 2007), the level of Uncertainty Avoidance perceived by the students' sample (3.49) allows us to include

Romania in "band" C-D of GLOBE study, close to Georgia (3. 50), Venezuela (3.44) and Greece (3.39) (House et all, 2004: 622).

Could we take the Romanian students desire to have a higher level of Uncertainty Avoidance than the perceived one and, in the same time, higher than the expectation of actual middle managers, as a positive signal? If it means a legitimate need for a more regulated and stable business and work environment, yes! The negative experience of the last years of economic crisis, with lots of jobs lost and blurred perspective of creating new ones might be an explanation for the subjects' desire for a lower probability of unpredictable future events that might negatively affect their life and so, for more orderliness, consistency, well-defined structures, formalised procedures and laws in their lives. But, if it is about a call for return to communism, i.e. to a philosophy of "taking" ("getting") everything without "giving"/ "doing" something proactively, no, it is not a positive signal!

Related to the cultural dimensions as values, our findings show the Romanians, Austrians and Germans were highly similar in terms of their scores for Power Distance and Humane Orientation in their societies and this reveals a *certain degree of harmonisation* of cultures. While they are still significantly different, the ratings for Collectivism II suggest a possible trend toward harmonization in regard to this value as well.

On the opposite pole, the highest significant (positive) difference between the samples was recorded for Assertiveness (t = 17.552; sig = 0.000, equal variances not assumed). The concept of Assertiveness originates, in part, in Hofstede's cultural dimension of masculinity (House et all, 2004), including aggressive, tough and competitive ways people deal with others. Our finding suggests that the Romanian students have a desire to "catch up" with Western "masculinity" in terms of their competitive behavior.

This constitutes an important new finding since data concerning Romania were not included in GLOBE related books (House et all, 2004; Chhokar et all, 2007). According to data collected and analyzed by Catana&Catana, (2012) on 216 Romanian middle managers, the mean value of expected Assertiveness at societal level is 4.08 (very close to that of students sample: 4.01). The GLOBE research shows that "GLOBE societies are reported to be…very different in terms of Assertiveness values"(House et all, 2004: 32) and that "only the Southern Asia and Confucian Asia clusters' respondents indicate they want more Assertiveness, dominance and aggression in their relationships with others" (idem: 432). Based upon our findings, Romanians might be included among the respondents expecting higher Assertiveness in their societies.

Significant (negative) differences are noted with expectations concerning Gender Egalitarianism (t = 4.941; sig = 0.000) and Performance Orientation (t = 2.358; sig = 0.019). These two expectations reveal other "avenues" towards *increasing the convergence* in cultural values and future cultural practices (if the subjects holding such values/expectations will become managers and transform them in societal practices).

6. Conclusions

Our research findings offer specific answers to the research questions, specifically:

    1. Romanian students perceive the present cultural *practices* in their environment differently from their counterparts from Austria and Germany, with the highest difference for Uncertainty Avoidance (much lower mean value). The lowest difference is recorded for Gender Egalitarianism (Romanian mean value, higher). Based on these findings, cannot speak about a major degree of convergence in cultural practices perception.

    2. The *value* system hold by Romanians and A&G ones records significant differences, with the exception of the desire for a lower Power Distance and a more Humane Oriented societies. These common expectations, as well as the trend towards tighter relationships

in the family and groups of affiliation could signal future changes and a movement towards further *harmonisation* of cultural practices.

3. The fact that for all of the other cultural *values* (except Assertiveness in the case of the Austrians&Germans) the future managers assign higher mean values (that for the correspondent practices) lead us expect that they will act to change their cultural environments. Still, the cultural orientation of Romanian future managers will differ in many regards from the selected Central European sample averages.

4. The dissemination of our research findings among active managers, researchers, academic staff and management consultants may contribute to improving the management training of students and managers, and the management practices in Europe.

We are aware that our research findings have a few limitations. They are related to the sample structure (only two countries from developed Central Europe), assumption that business and engineering students will become a core part of the future population of managers, as well as comparisons with research findings based on different samples and in different periods.

Beyond the limitations, we believe that our findings offer certain insights into relevant issues for researchers, academics and consultants in management and leadership, as well as for today's practitioners. Future research should focus on studying cultural practices and value systems in directions like possible differences in respondents' relevant perceptions based on subjects' demographic characteristics. In addition, comparisons could be making with other countries taking part to GLOBE student project.

Notes

(1) The project is co-ordinated by Rainhart Lang from Chemnitz University of Technology. The Austrian data has been collected by Erna Szabo, from Johannes Kepler University Linz.

RISK MANAGEMENT APPROACHES AND PRACTICES IN IT PROJECTS

Didraga Otniel
West University of Timisoara, Faculty of Economics and Business Administration

Bibu Nicolae
West University of Timisoara, Faculty of Economics and Business Administration

Brandas Claudiu
West University of Timisoara, Faculty of Economics and Business Administration

Risk is identified in project management literature as an important factor influencing IT projects success, and it is relevant for both academic and practitioners' communities. The paper presents the past and current approaches to risk management in IT projects. The objective of this paper is to compare the different approaches and relate them to existing practices. Project management literature and practice have brought different approaches to risk management, and as a result, many projects ended in failure. We present how risk management is considered in the literature, and we compare the main two approaches: the evaluation approach and the management approach. The contingency approach does not consider risk management to be a specific process as it is an embedded process in the other project management processes. Then, we present the main practices in risk management. The methodology applied is based on documentary study review and analysis of the concepts used by the literature. We analyzed the literature published between 1978 and 2011 from the main journals for IT project management and found out that the essence of project management is risk management. The risk management practices have a considerable influence on stakeholders' perception of project success. But, regardless of the chosen approach, a standard method for identifying, assessing, and responding to risks should be included in any project as this influences the outcome of the project.
Key words: risk management, IT projects, risk management approach, risk management practice.
Code JEL: M15 – IT Management.

1. Introduction
Information technology plays a continuously increasing role in economy and successful IT projects are very important for companies. Mismanaged software (development and/or implementation) projects are very common and result in failure (Standish Group International, 2009).

Effective IT project management has been receiving attention from academics and practitioners since 1978 (Alter and Ginzberg, 1978). However, the effects of risk management are not always easy to establish.

There are several approaches to **risk management** in the IT projects literature, but the main ones are: the *evaluation* approach, the *management* approach and the *contingency* approach.

Risk management has become a key factor within organizations since it can minimize the probability and impact of IT project threats and capture the opportunities that could occur during the IT project life cycle (Alhawari et al., 2012).

The Project Management Body of Knowledge defines risk as an uncertain event or condition that, if it occurs, has an effect on at least one project objective: scope, schedule, cost and quality (Project Management Institute, 2008: 275).

There are causes for a risk and, if it occurs, there is and impact. Risk conditions can be related to certain aspects of the environment of the IT project or organization that may contribute to project risk, such as poor project management practices, lack of integrated management systems, concurrent multiple projects or dependency on external participants who cannot be controlled (Project Management Institute, 2008). Risk refers to all events, occurrences and actions that may

prevent the organization from realizing its goals. Risk is everywhere and is a potential problem that might happen. Regardless of the outcome, it is a good idea to identify risk, assess its probability of occurrence and estimate its impact (Alhawari et al., 2012).

Regarding the use of risk management in projects, professionals state that risk management must be conducted because all of the project management handbooks say so, and it should be done in the way the standard handbooks recommend it (Project Management Institute, 2008; Office of Government Commerce, 2007; Association for Project Management, 2006; 2004). This concept is found in literature that focuses on risk management (Ropponen and Lyytinen, 1997).

Project risk management has the objective to decrease the probability and/or impact of negative events in the project and to increase the probability and impact of positive events (Project Management Institute, 2008: 274).

Risks may have many manifestations: natural disasters, security breaches, failings of human resource, third-part vendors, financial turbulence, unstable business environments and project failures (Alhawari et al., 2012).

Researchers have had a common interest concerning risk and uncertainty in IT projects. Early authors (Alter and Ginzberg, 1978; Zmud, 1980; McFarlan, 1981; Boehm, 1991; Barki et al., 1993) treat risk management as an ex-post evaluation process (Bakker et al., 2010a).

Gemmer (1997) affirms that effective risk management requires functional behaviour of the stakeholders, which means that they may not necessarily comply with the risk management procedure. Dey et al. (2007) affirm that generally stakeholders must be involved in the risk management process, and this is crucial for the project's success or failure (Jiang et al. 2000).

2. Research methodology

The methodology used is based on documentary study and literature review and analysis of the concepts used in the literature. We analyzed the literature published between 1978 and 2011 from several journals including: International Journal of Project Management, Project Management Journal, International Journal of Information Management, The Journal of Systems and Software, Journal of Management Information Systems, having as research items: *risk management* and *IT projects*.

3. Results

3.1. Evaluation approach to IT project risk management

From the evaluation approach, the process of risk management is an analysis for determining the risk factors and causes of project failure. It aims to learn from past projects, by evaluating risks that have already occurred. The evaluation may result in modifying the use of the methodology of risk management or even changing the methodology. The contribution of the evaluation approach of risk management to project success is *indirect*, as the information gathered is used in future projects (Bakker et al., 2010a).

The *evaluation approach* answers the question *what* causes projects to fail and has three main elements:

- known risk factors as input for a project;
- the process of project risk management that collects information about risks and failure of the project;
- new factors that are added to the list of known risk factors.

This approach assumes that it is likely that knowledge of the risks and their causes will have a positive impact on the project outcome. The aim of this approach is to create project predictability in new projects by using information regarding risks and causes of project failure gathered from previous projects (Bakker et al., 2010a).

The promoters of the evaluation approach (Jiang and Klein, 2000; Procaccino et al., 2002; Wallace et al., 2004; Han and Huang, 2007) assume that knowledge of risks implies that they can and will be managed, therefore the project will end successfully.

3.2. Management approach to IT project risk management

This approach answers the question *how* to deal with risks in order to prevent project failure.

The management approach to risk management has processes based on rational decision making and complies with the engineering view on project management. It focuses on identifying the events and situations specific to projects that can interfere with the original plan and developing measures to keep the current project on track. The contribution of the management approach of risk management to project success is *direct*, as it focuses on the relevant and specific risks of the current project. The promoters of the management approach (Gemmer, 1997; Ropponen and Lyytinen, 1997; Jiang et al., 2000; Kutsch and Hall, 2005; Dey et al., 2007; Bannerman, 2008) generally recognize risk management as a process consisting of well defined steps of identification, analysis, response, monitoring and control (Bakker et al., 2010a).

The differences between the two main approaches are presented in table no 1.

Table no 1: Comparison of the two main approaches in risk management

The evaluation approach focuses on:	The management approach focuses on:
Finding generic IT risks	Finding specific IT risks
Future projects	Current project
Analysis only	Various activities and practices
Creating general applicable information	Achieving direct results

Source: Bakker et al., 2010a

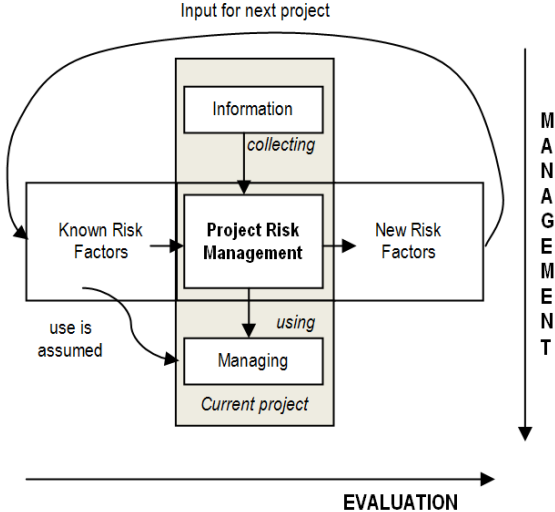
Figure no 1 presents a combination of the main two risk management approaches.


Fig. no 1. The two main approaches to project risk management combined
Source: Bakker et al., 2010a

3.3. Contingency approach to IT project risk management

One other approach discusses risk management from a contingency perspective (Nidumolu, 1995; Barki et al., 2001; Jiang et al., 2006; Sauer et al., 2007).

The *contingency approach* to risk management considers project success to be dependent on how well the project as a whole is able to deal with uncertainties in the project environment (Jun et al., 2011) as project uncertainty is negatively associated with project success (Jiang et al., 2002).

According to the contingency approach, risk management is not considered to be a separate management process. Instead it is embedded in the various processes and procedures of the project (Jun et al., 2011).

3.4. *Risk management practices*

Risk management has developed rapidly over the recent decades as an integral part of project management (Del Cano and Cruz, 2002). It includes the processes concerned with risk management planning, identification, analysis, responses, and monitoring and control on a project (Project Management Institute, 2008). Risk management is a discipline, which integrates knowledge from a variety of different business fields and where wide varieties of methodologies treat specific problems (Alhawari, 2012).

Risk management is very important and integral part of any business and well recognized by the project management institutions (Del Cano and Cruz, 2002). Risk management refers to strategies, methods and supporting tools to identify, and control risk to an acceptable level (Bruckner et al., 2001). The risk management objective is to identify all applicable risks in a project. This involves ranking the risks based on their importance, frequency of occurrence, level of impact and then establishes the actions needed to control the identified risks. According to the Project Management Institute (2008) and Besner and Hobbs (2006), the main risk management practices are presented in Table no. 2.

Table no 2: Risk management practices

Risk management practice	Description of the practice
Risk Management Planning (Project Management Institute, 2008; Besner and Hobbs, 2006)	Writing in the project plan about how risk management will be executed on the project, not writing a list of risks
Risk Identification (Project Management Institute, 2008; Besner and Hobbs, 2006)	Naming and identifying risks by: filling out questionnaires, consulting experts, doing brainstorm sessions, conducting interviews, etc.
Risk Registration (Besner and Hobbs, 2006)	Recording and maintaining the list of risks in: a database, one or more documents, spreadsheets, etc.
Risk Analysis (Project Management Institute, 2008, Besner and Hobbs, 2006)	Analysing risks: by estimating probability and impact, using simulations like Monte Carlo, etc.
Risk Allocation (Besner and Hobbs, 2006)	Assigning a person to be responsible for taking care of each risk
Risk Reporting (Besner and Hobbs, 2006)	Delivering information about risks and the status of risks to stakeholders.
Risk Control (Project Management Institute, 2008; Besner and Hobbs, 2006)	Organizing meetings with various stakeholders in order to present the status of project and establish actions for risks

Source: (Bakker et al., 2010b)

Kutsch and Hall (2009) conclude that little research has been taken to establish whether project managers involved in IT projects really apply risk management and what reasons lay behind their decisions to not pursue any active management of risk in some cases. The literature focuses on what project managers should do, more than on what they did do (reactive attitude instead of proactive attitude). As long as no evidence is produced to explain why IT project managers fail to apply project risk management, the acceptance of best-practices in project risk management standards is insufficient.

4. Conclusion

Risk is an inherent component of software development projects, as well as implementation projects. The essence of project management is risk management (Larson and Gray, 2011:234).

There are two main approaches in IT project risk management: the evaluation approach and the management approach. Also some researchers consider another one: the contingency approach.

Success or failure of an IT project often depends on the contributions of stakeholders: top management, functional managers, customers, suppliers, contractors, and others (Larson and Gray, 2011), and that is why stakeholders must be involved in the risk management process.

All of the techniques and practices of risk management try to increase stakeholder satisfaction and increase the chances of project success.

Risk management should be proactive not reactive, and although many managers believe that the analysis, assessment and treatment of risks depend on subjective judgment of the project stakeholders, some standard method for identifying, assessing, and responding to risks should be included in all projects. This is supported by the "self-evidently correct" risk management practice (Williams, 2005). The actual process of identifying project risks forces some discipline at all levels of project management and improves project performance.

Risk management is an iterative process and it occurs all through the project life cycle. When risk events occur, using an effective risk management technique will facilitate measuring the project performance in terms of schedule, cost and quality. The risk management practices have a considerable influence on stakeholders' perception of project success.

Effective risk management requires adherence to a thinking in which risks are treated, not denied and problems are identified and not hidden (Larson and Gray, 2011:234).

Regardless of the approach, a standard method for identifying, assessing, and responding to risks should be included in any project as this influences the outcome of the project.

This article is, because of its topic of study, a part of management and includes details regarding the important role of emotional intelligence in management and leadership. The importance of this problem is related to the fact that, in Romanian management, this concept (being of a psycho-management nature), is poorly understood. Emotional intelligence is still a highly publicized concept in the West, subject to many controversies between recognized experts in various fields: organizational management, leadership, psychology, sociology. The target of the article is to highlight the fact that there are few management or recruitment consulting firms in Romania that support emotional intelligence development programs, and fewer are the organizations that realize the impact it has in running a business. Since 1995, from the first publication of Daniel Goleman's book, "Emotional intelligence", EQ has become one of the most debated concepts in U.S management. The content of the article calls for a new business climate, ensuring professional excellence. We want this to be "a guide" in cultivating emotional intelligence in individuals, groups and organizations, through leadership, trying to validate the scientific aspect. Because we live in a time when future projects depend increasingly more on self-control and on the art with which we know to maintain interpersonal relationships, such guidelines are necessary to prevent future challenges. The contribution of the authors brings to the forefront the debate about management, behavior management, the concept of emotional intelligence and the importance of understanding, knowing its substance, and the manner in which the management process has to be adopted in order to achieve positive results in an organization, as a system. Businessmen with a preemptive mind will encourage and support such an education in business, not only to improve the quality of management in their organization but also for the vitality of the economy. Thus, the benefits will increase, not only for a new generation of managers, but also for our families and communities, and for society as a whole.
Keywords: emotional intelligence, management, leadership, ethics, organization.
JEL codes: A14, M12, M53.

The concept of "emotional intelligence" was first used in classical academic formula, in a doctoral thesis in the U.S., in 1985, by Wayne Leon Payne, Ph.D. at the Union Institute in Cincinnati. He believes emotional intelligence to be a skill that involves a creative relationship with the states of fear, pain and desire. This doctoral dissertation did not revolutionize the world, but it introduced a new concept that, more than fifteen years later, changed the theories about leadership, about the role of the manager or how it interacts with those he leads. The concept of "emotional intelligence" is published for the first time in the works of John D. Mayer and Peter Salovey (1990, 1993). They are considered the "parents of the new intelligence", the emotional one. Little publicized, the subject of their works is only taken into account in the medical world. In 1995, the article "What's your EQ?" signed by Daniel Goleman appears in "Time". Emotional intelligence becomes known after the publication, in 1995, of the best-selling book "Emotional Intelligence: Why it can matter more than IQ", a book that remained a top seller for about a year

and a half. Although this first book has more to do with education, with how people evolve over time, it has attracted the attention of many businessmen. Thus, the theory launched a few years ago, begins to change a practice of over 30 years in the working environment of large companies. Currently, EQ is synonymous with the concept of emotional intelligence. The measuring of emotional intelligence, using a scale of values, does not have as practical an importance as we might imagine. More important is a profile to help its development. This method was developed by professor Reuven Bar-On and tested on more than 100,000 people worldwide. This test method was also used and still is used by the U.S. AIR FORCE recruiting service. Since it was used, reductions in spending on recruitment and selection of nearly $ 3 million per year were accounted for. Staff fluctuations fell by more than 70%. In 1998, Daniel Goleman realizes the importance of emotional intelligence for business and publishes another book: "Working With Emotional Intelligence", which reached the bestseller's list in three weeks after release. The topic becomes particularly interesting, especially since it suggests a different way to appreciate the qualities of people. In 2000, together with Caruso, John D. Mayer and Peter Salovey, American psychologists and teachers of educational psychology at Yale University, who published the following books on emotional intelligence, probably give the most complete definition, at least until today. Emotional intelligence is "the ability to perceive and express emotions, to assimilate emotion in thought, to understand and judge with the help of emotions and to regulate own emotions and others'.

After this theory appeared, many businessmen understood that the success of a person at the work place depends largely on emotional intelligence. Besides intellect, an employee needs other qualities as well: perseverance, self control, motivation, interpersonal skills, etc., meaning an increased emotional competence.

Among the pioneers who were involved in the research and application of emotional intelligence, we can mention: American Express Financial Advisors, Johnson & Johnson, HayGroup, U.S. Air Force, L'Oreal, Xerox, AT & T, Colgate Palmolive, Marriott Corporation.

Why is emotional intelligence so important for business? Because it plays a significant role among all the factors that influence the effectiveness of a person or the organization it is a part of: relationship with the boss, uncertainty, uncertainty, decision making, motivation and job satisfaction, maintaining talented people in the organization and their verification, teamwork, quality of work etc.

There is a continuous need to have a clear picture of the phenomena involved in professional activities. To understand how an organization works, it is important to understand how leadership works. What are the characteristics of leaders, what are the factors that influence efficiency in leadership, how can performance be evaluated?

In the quality of being a good user of "emotional intelligence" enters the understanding that it is not and should not be intended as a substitute for skills, knowledge or abilities acquired over time. Emotional intelligence increases the chances of success of the manager but does not guarantee his performance in the absence of knowledge.

The most significant resource in business is leadership. But every leader is above all, a human being, as are his/her subordinates. In the position of leader, the importance of EQ tends to be positioned around 85%, and IQ at 15%. The ability of a leader to manage emotions in his processes and actions with people significantly affects the performance of an organization. It is important that he is be able to transmit positive emotions, enthusiasm and energy in all circumstances. 98% of "top performers" have a high emotional intelligence quotient.

Although in universities and many other programs, we assimilate information and get the know-how, in fact we need wisdom too. One of the ways that lead to wisdom and balance is "coaching", as a practice for emotional intelligence. Essential component of leadership, EQ is an attitude, a way of life.

Leadership has to be lived, it's a state of mind, and the development of leadership comes from the inner desire to capitalize on the employees' actions in a human way. A modern leader creates, within the organization, a place where people thrive, so that they can contribute more to the common task they have to achieve.

There are two ways to effectively develop leadership skills:

- A lot of practice;
- Development of emotional intelligence.

Emotional intelligence is in high demand in managers in general. It is a complex requirement but, in order to be successful, they must have self-awareness, be able to adjust their attitude, be highly motivated, be able to motivate others, have empathy skills and also a wide range of social and technical skills. In the image below we can see the sudden drop for the titles of director and subordinates thereof, which reveals an incredible gap in terms of emotional intelligence among the hierarchical managers of an organization. This study, conducted in 2005 by Simon & Schuster (acknowledged today as well), shows that the EQ is lower for those in top positions than for those in the levels two-three of management.
Image no. 1. The level of emotional intelligence on levels of management "(7)"

To support this, one can check by following any man or group of people who have to perform a not so simple task and that may exceed their possibilities. It's good to especially observe when things start to go bad, at the very beginning. One will soon see signs that betray agitation, irritability, frustration, snappy lines. This is followed by the launch of apologies, withdrawal and blaming. The scene is full of emotions and it's not long until someone loses control and leaves, thus ending the process.

The same study indicates that positions once thought to focus a small amount of emotional intelligence have showed the exact opposite (in sales, finance, IT). The positions with the highest levels of EQ are occupied by those in the customer service sector, business development, and the lowest levels are for positions such as engineering and those unemployed (Image no. 2.).
Image no. 2. The level of emotional intelligence in some fields of activity "(7)"

Emotional intelligence substantially contributes to leadership. Undoubtedly, there is a link between who we are as a person and who we are as a leader. If we do not understand this, developing leadership skills will become an almost impossible task.

Training leadership skills and developing emotional intelligence take place together and involve understanding our own emotional side, harmonizing with the emotional needs of others and using that knowledge to motivate them, not only to increase their effectiveness at work, but in order to develop their potential.

Good leaders always have high levels of EQ. They might not always have many people following them; they are found at all levels of the organization and in all areas of life. Their behavior, almost certainly, will include many of the following characteristics:
- Complies with high ethical standards;
- Have strong sense of integrity;
- Always learning, immediately recognize if they don't know or understand something;
- Have a protective attitude;
- Have a presence that stands out;
- Have good decision-making capacity;
- Are confident, deeply aware of their own qualities and defects;
- Know when it is time to lead and when to comply.

Looking around us for leadership behaviors, we will inevitably find some "bad leaders". They might have excellent qualifications, experience and managerial skills, but they are likely to have a low EQ. They tend to impose themselves by fear, lack integrity, ethical standards and any sense of concern for others. Often, they use intimidation tactics, preferring that their subordinates stagnate in their development, rather than motivating them and helping them grow "(7)".

When leaders apply dissonant styles, the culture that is created is inevitably toxic. How is it to work in such an organization where there is no emotional intelligence? The negative style of the leader generates a series of extremely destructive cultural norms, visible in the results.

Revealing the truth and organizational reality is a fundamental task of the leader. However, too many leaders forget to seek the truth, becoming disconnected from reality and contact with others. Such leaders seem to not have time for important conversations and are unable to build those types of collegial and counseling relationships, leading to deeper dialogue about what works and what doesn't. They do not have enough authentic contact with people in the organization, so that they understand what is going on, living in a kind of atmosphere that doesn't contain information about the basic emotional reality of everyday life.

Leaders who use dominating, rigid styles in fact hinder people from telling the truth. They are naive or refuse to accept the reality of their organization. Although they might believe that things within the organization are good, they actually create a culture where nobody dares to tell them anything that might disturb them, especially bad news. This kind of silence may have a very high price.

Change begins when leaders equipped with EQ actively investigate emotional reality and the cultural norms underlying the daily activities and behaviors of the group. To create results, leaders must pay attention to latent dimensions: human emotions, flow of the emotional reality in the organization and the culture that encompasses all.

Emotional intelligence in the professional space is vital for the success of any organization. Developing a new style of leadership often means a fundamental change in the relation with others. But the paradox of trying to introduce new knowledge in an organization translates, at best, into a difficult task and not into one that can be achieved in a training room. Unfortunately, those who put the most effort into developing educational and leadership skills at executive level do not end up where they want, and not only because of the manner in which they undertake these, but also because of the things they don't do. Even the best development processes will not help the organization change if they focus only on the person and don't consider the strength of emotional reality and culture.

The real difference is that, while the components of individual skills of EQ can be applied directly to the teams' environment, organizations are more complex and thus the objective is broader: encouraging emotional intelligence leadership, extensively and intensively, on every level, and systematically creating the norms and culture to foster confidence and transparency, integrity, empathy and solid relationships. This kind of transformation begins with leaders who accept the truth, who can reveal the emotional reality of the organization and who can attract others into a compelling vision of a common future.

When a company develops this emotionally intelligent leadership at all levels and when the leaders face the reality that may arise – often, this happens - "a company is transformed."

In conclusion, the increasing attention that is given to this concept, internationally and recently in Romania, should raise an exclamation point regarding what was considered to be "intelligent", the support of emotional intelligence development programs representing genuine instruments of publicity and awareness of its impact on daily life and in the success of any business. For too long, managers have seen emotions in the working environment as "a noise", "polluting" the judicious operation of the organization. Now, organizations everywhere need to understand the benefits of leadership based on emotional intelligence, training managers and leaders who can generate that emotional resonance that allows people to develop.

Businessmen with a preemptive mind will encourage and support such an education in business, not only to improve the quality of management in their organization but also for the vitality of the economy. Thus, the benefits will increase, not only for a new generation of managers, but also for our families and communities, and for society as a whole.

CONCEPTUAL APPROACH OF LEADERSHIP AND EMPLOYEES' INDIVIDUAL PERFORMANCE RELATIONSHIP

Ispas Andreia
West University, Faculty of Economics and Business Administration

Resume
There is a need for more leadership research in the hotel industry. A reason is the better understanding of the effects and influences that manager-employee relationship can have. Further, this can improve employee performance at their work and clients would be more satisfied. Due to the emergent stage of this field of research, the leadership and employee performance relationship has a lot of potential for being investigated in the context of hotel industry.
There are many types of leadership styles recommended to be used in managers' daily hotels' activities. The most suggested is transformational leadership.
Hotel industry is part of hospitality industry and is providing different services such as accommodation, food &beverage, entertainment. This makes hotel industry very specific and the hotel products, services unique for each of client. That's why high standards of organizational performance, a good manager-employee relationship and a high perceived employee performance by the clients are the keys for a long and sustainable business. Leadership is important in getting people to do the right things at their job. More, it helps employee to work better, to be motivated, to strive for excellence and perform beyond expectations.
The first objective of this paper is to analyze the main approaches of leadership styles applied in the context of hotel industry studies. The second objective is to explore, from a theoretical point of view, the direct and indirect relationship between leadership style and employee performance based on two mediator factors: job satisfaction and organizational commitment. These two mediators are the most used in organizational researches and have a high degree of validity.
The methodology applied is based on documentary study review and critic analysis of the concepts used by the literature.
The results of the conceptual paper are: the construction of the conceptual model of scientific research, new approach of the term "leadership" in hotel industry's relations. The paper suggests a future research the operationalization of the concepts used in the conceptual model and test them through statistics methods.
Keywords: leadership, employee individual performance, hotel industry, job satisfaction, organizational commitment
Code JEL: M 10, L83

Introduction

The critical and conceptual analysis of the constructs such as leadership, job satisfaction, organizational commitment and employee individual performance was based on the review of the different theoretical and empirical studies. The purpose was to find out different results about the link between them and the influence relationship that can generate employees' individual performance in hotel. Based on this it was proposed a conceptual integrated model.

A short literature review upon relationship between leadership and employee performance
Studies about leadership and performance relationship found out that there are positives associations, negatives associations and no linkages between these two variables. Yousef (2000:8) made a review of them and concluded that the results are "not entirely consistent", "inconsistent". Positive associations between these two variables were found in studies of the authors: Dawsan et al.(1972); Swanson and Johnson (1975); Euske and Jackson (1980); Euske et al. (1982) (Yousef 2000:8). Negative associations between these two variables were discovered

by Pritchard and Karasick (1973); Sheridan and Vredenburgh (1978); Hampton et al. (1986) (Yousef 2000:8). Other studies showed that there is no link between them: Lowin et al. (1972); Graen et al.(1972); Downey et al.(1975); Weed et al.(1976); O'Reilly and Roberts (1978); Sheridan and Vredenburgh (1978) (Yousef 2000:8). In the context of banking services, the results obtained by Dolatabadi and Safa (2010:40) confirmed that leadership style influence employees' performance.

The relationship between leadership and job satisfaction was rarely investigated in the context of hospitality and hotel industry. The empirical results from boutique hotels from Turkey showed that transformational leadership stimulates the job satisfaction and organizational commitment of the employee (Erkutlu H. 2008:708). Employees' performance is based on job satisfaction through organizational commitment. The measurement of performance is made using efficiency, efficacy and quality (Lee et al.. 1999 quoted in Tsai 2010:4120).

In the context of hospitals services, the research results showed that job satisfaction depends of manager's leadership style. Also, it was demonstrated that not always the participative leadership style is good for the employees. It is recommended that managers to select their leadership style based on organizational culture and on the organizational maturity of the employees (Mosadeghrad, A.M. and Yarmohammadian M. H.2006:11).

The situational leadership paradigm, initiated by Hersey şi Blanchard since 1988, affirmed that successful leaders must to adjust their leadership style taking into account the maturity's employee stage to perform in a work position (Wu T.F et. al.:2006:436). The managers must have the capability to own different leadership styles and to adjust them based on the situation need it.

Hotels' context of the conceptual study

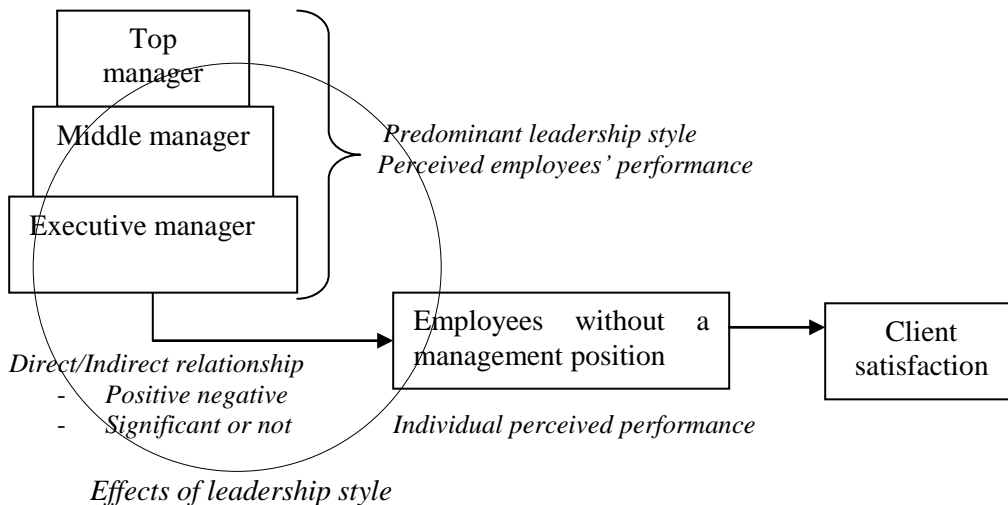
For a good understanding of the analysis context of this conceptual paper it is very important to highlight the elements that compose the hotel as it can be seen from the figure below (fig.no.1).


Fig. no. 1. Hotel context of the relationship study (made by author)

The first element that must be taken into account is the predominant leadership style influence. Wu T.F. (2006:443) demonstrated that the top manager leadership style has positive and also negative influences on the subordinates from the next levels of management. The study was developed in hotel research in Taiwan. The results pointed out that when the top managers adopt an autocratic and democratic leadership style managers from the next levels may use a telling,

participative and delegative leadership style. Telling leadership style is used when the top managers adopt an autocratic leadership style. On the other hand, when top managers adopt a democratic leadership style the managers from the next levels use frequently participative and delegative leadership style.

Second element is about the employees without a management position from the departments of the hotel: accomodation food&beverage, restaurants, housekeeping, marketing, human resources, mantenance and so on. The key employees are the frontline ones because they have a high contact with the clients and the managers leadership style influences in the most visible way.

Research methodology

The methodology applied is based on documentary study review and critic analysis of the concepts used in the literature. This paper is conceptual based on a short and specific literature review.

Results of the conceptual analysis

The conceptual integrated model of scientific research

After the review of the literature and the clarification of the context analysis it was developed a theoretical model of the constructs. It was theoretically investigated the direct relationship between leadership style and employee individual performance. Also using two mediator factors "job satisfaction" and "organizational commitment" it was established the indirect relation between the main constructs investigated.
Fig. no. 2 Integrated conceptual model of scientific research
(made by author)

The reason of using these mediator factors is because of their validity and reliability proved in different contexts research. Due to emergent stage, there are only a few studies in hotel industry that analyze this relationship. Further is presented the clarification of the constructs used in the conceptual integrated model of research.

Leadership approach in hotel industry

Ciulla found out reviewing almost 221 definitions of leadership that the most common element used when leadership is defined is "leadership is about one person getting other people to do something" (Ciulla 2002:340).

Based on this, the leadership approach proposed in hotel industry context is: leadership is a dynamic process based on influence relationship between a leader and a follower which recognize and accept him as a leader (Ispas A. 2010:219). In addition, the follower is adopting a moral behavior and conscientiously follow the leader. The relation is based on achieving the objective of the hotels taking into account the situational variables from the hotel (internal and external ones).

Leadership styles

From the conceptual model the leadership style was explored taking into account four types of leadership. It was reviewed and analyzed: autocratic, participative, transformational and transactional leadership styles. These where choosen based on their frequency of apparition in the

studies, their results relevance and the national culture. Autocratic and transactional leadership style are used more in collectivist cultures. Transformational and participative leadership style are used in individualistic cultures. Năstase M. pointed out that when a manager will use a participative leadership style, the employees will be become more involved, more responsible and their organizational commitment will grow (Năstase M. 2006:29).

Authors such as Muczyk and Reimann 1987; Yukl 1989; Bass 1981 agreed that **autocratic** leadership style is task oriented, is more convincing and manipulator being efficient to communicate a clear vision and conceive strategic objectives (Clark R., Hartline M., Jones K. 2009:212). **Participative** leadership style is more employee oriented. Managers involve their subordinates in the decision process taking into account their positive or negatives opinios. Due to this, employees become more loyal and dedicated (Clark R., Hartline M., Jones K.2009:213). Managers and leaders of hotels' department should pay more attention to developing efficient teams and to be more employee oriented through participative leadership (Ispas A. 2010, p. 218). The concept of **transformational** leadership style was developed by Burns (1978) and Bass (1985) and it became the most popular one. Transformational leaders transform the values, the need and the aspirations of the subordinates and help them to perform beyond expectations (Bass and Avolio, 1994 quoted in Walumbwa et al.:2005:236). It use idealized influence, inspirational motivation, intellectual stimulation and individual consideration of the followers. Boyne S. pointed out the review of 11 articles from EBSCO international database on hotel topics. Transformational leadership is the most needed by employees because the organizational commitment and job satisfaction will grow and it stimulates employees' wish for high quality of their daily work and for the hotel's guests (Boyne S. 2010:14-16). **Transactional** leadership style is associated with autocratic style and is based on reward of the subordinates' work (Burns 1978 quoted in Emery C.R and Barker K. 2007:1). It involves Contingent Reward, Management-by-Exception-(Active), Management-by-Exception-(Passive) and Laissez-Faire.

Job satisfaction and organizational commitment

These concepts are used in the model as mediator factors between leadership style and employees' individual performance. According to Smith et al. (1974) job satisfactions has the following dimensions: job in general, salary, opportunities for promotion, supervision and colleagues relationship. This concept originates from Hawthorne Tests of Mayo, Roethlisberger and Whitehead (1927-1932). The results suggests that employees' emotions influence their behavior for work and sociological and psychological factors are the determinants of satisfaction and productivity (Yin, 2002, quoted in Tsai, 2008:304).

Organizational commitment was often studied at employees' work place paying attention to employee dissatisfaction and dedication. If their organizational commitment is low, they will be less work-dedicated and they will look for opportunities to leave their job (Lok P., Crawford 2004:321). In the literature there are two approaches: one based on behavior (leaving costs from the organization), the other one is based on employees' attitude (the identification with values and organizational objectives).

Employee's individual performance

Hotels' performance depends on leadership practice applied in hotel unit. Church, A.H. confirmed that leadership style of managers at the workplace directly affects quality of services and organizational performance (Church, A.H 1995:30). According this, the paper analyzed the employees' individual performance and proposed to be studied taking into account two dimensions: efficiency and efficacy of their job. The results of The GLOBE Study showed that Romanian culture has a low performance oriented score (score 3,51), lower than Eastern European average score (3,71) and much lower than world average (score 4,10) (Bibu, N., Brancu L. 2008:3,11).

Conclusions

The results contribute to the development of leadership knowledge in hospitality and more specifically in the hotel industry. These results can help managers to understand better the role of leadership style in making subordinates work better and achieve individual performance. For academic and researchers it brings a new relationship model that can be investigated in many areas of hotel and hospitality. Results can show if indeed leadership is influencing in a significant way (positive, negative) the employees' individual performance taking into account the dynamic environment of hotels' activities. There can be added factors such as "organizational culture" and "national culture" to find out more information about the leadership style and employees' individual performance.

Abstract
In the professional field of business and management there is still little research done on the possibility if the Generation Y members (born between 1980 and 2000), which are the managers off the future, need a different approach in education and training to be prepared for the future. The authors will explain how a new didactical approach in business and management called "Gyroscopic Management" can prepare these new managers to be of added value for the business. This specific approach was the start in 2007 of a specific (international) HRQM Bachelor study programme at Arnhem Business School, HAN University in the Netherlands. During this study programme, students are confronting this specific training and didactical approach with characteristics as self-reliance, self-study, and Socratic dialogue, ethical and "gyroscopic" management. The programme has a clear vision and mission and didactical approach that triggers the above-mentioned elements. The approach focuses on the need for development of specific competencies like "Intercultural adaptability", "International business awareness" and "Social entrepreneurship" as added to the existing competencies needed for a Bachelor level in business and management education. As researchers, lecturers and trainers, the authors used and researched this approach during many lectures, seminars, trainings and workshops in the last years at Universities in Romania and The Netherlands. The authors present the characteristics of the members of the new Y generation and relate them to main elements of gyroscopic management as practice and the results of this practice for students. For this, the authors did a so-called "Grounded action research", from 2009 until 2012, among students of business and management studies. Further, the research was supported by focus groups over the same period. The authors have the opinion that this research is important because the new generation of managers seems to need different didactical approaches in education and training that fit better to their characteristics. The authors believe that this research can bring therefore added value to the field of management in the future
Keywords
Generation Y, Intercultural Adaptability, International Business Awareness, Social Entrepreneurship, Gyroscopic Management.

I. Introduction

The idea for this study is a logical continuation of the work experiences of the authors and relates strongly with current functions as researchers and (senior) lecturers at Arnhem Business School (ABS), HAN University, in the Netherlands. Together with colleagues, one of the authors developed, and practises a new approach in teaching and training in higher education in the Netherlands, based on "Gyroscopic Management". The authors consider this approach as adding to the needed management style for the future generation of managers. The vision behind this belief lies in the value of Human Resource and Quality Management (HRQM) for organizations. A more in detail described explanation for this can be found in earlier publication of the authors in 2011 and 2012. (See list publications. A short overview for the reader is in the next part.

1.2 The state of art of education and training in management and the need for new competencies

Nowadays most of the studies in management, in higher education in Europe still have, in our opinion and experiences, a strong focus on training participants in being the "controller of policies" and rarely on becoming a "partner" in business for management. Managers have to prove now and in the future that they are of added value for organizations. The new generation of managers will have to be, "partners" and "players" in organizations, helping organizations to reach their goals. Besides that, they have to align themselves as a response to a process of cross-functioning globalization.

1.3 A new generation of managers

Recent research shows that the field of management is facing the coming years the entrance of a new generation of managers. Quinn, S. (2010) gave in 2010 an overview, which the authors adapted to 2012:

Cohort name: (with also used names)	Birth year	Age in 2012
Veterans (Traditionals)	Born before 1945	67 and above
Boomers (Baby boomers)	Born 1946 – 1964	48 – 66
Generation X (Baby busters)	Born 1965 – 1976	36 – 47
Generation Y (NetGen, Millenials, Facebook gen	Born 1977 – 1997	15 – 35
9/11 (GenNext, Gen Z)	Born after 1998	14 and under

Figure 1. The generations (Quinn, S, 2010) (adapted by the authors to 2012)

Figure 1 shows that generation Y will be entering the business. Because the literature in this new field is very new and divers, the authors did extended literature research and formulated on the base of different authors (see list of publications) some common characteristics for this generation. As authors, we are fully aware that we generalize in this. However, we also believe that this gives insight in important elements for this study for our target group.

1.4 The generation Y

These "new" managers are just entering the organizations or preparing that and are also called "Millennials" or "Facebook-generation". Organizations already focus on them because they cannot ignore the needs, desires, and attitudes of this new generation. The members of this generation have the following common generalized characteristics: Tech-savvy, family based, achievement-oriented, team-oriented and attention-searching. They are seeking for different and creative challenges, personal growth, meaningful careers and are in need for supervisors, coaches, and mentors. They want to approach problems in new and innovative ways. Moreover, they want to be more "players". This is a much-overlooked value and to make better use of this, the authors believe that trainers and educators need to become more innovative themselves. One of the most important characteristic of the Generation Y members seems to be that they are more "out-of-the-box" thinkers. (Kovary & Buahene: 2011). The gyroscopic management approach adapts towards the preparation and education for that new group of managers and can support educators and trainers. However, the majority of educators and trainers are of other generations and adapting to this new approach has already proven to be a very big challenge.

II. Preliminary research
2.1 The study programme HRQM

Some of the answers for this needed change of roles for managers are, according to the authors, already given practised in the international study programme "HRQM" at ABS in The Netherlands. Added to the Dutch Bachelor Study (BBA) programme in Business and management Studies (BMS), this programme is in English and has a strong focus on additional and   important   competencies   like: "International   Business   Awareness",   "Intercultural

Adaptability" and (social) "entrepreneurship". These competencies already have proven to be needed extra competencies for the "new generation of managers" to become 'players" and entrepreneurs in business.

2.2 A change in didactical approach

The program also had a change in the didactical approach, which was based on an experiment, some years ago at Arnhem Business School (ABS) in which separated disciplines like HRM, Quality Management, Communication, and Business Ethics were integrated in one common lecture. This was done to get a new integrated perspective, in combination with a 'systems-thinking' style. In short, it means that the authors, in their gyroscopic approach, in which the authors took the metaphor of a turning "gyroscope" (see earlier publications), as trainers or lecturers; do not pretend to be able to give the answers to any management oriented problem, because this would "stop" the turning gyroscope. This "not answering approach", creates the opportunity for the participants to constantly, find a new balance themselves. It is obvious that this does not always take place in a secure environment. In preparing participants for their professional career, this creates, on purpose, situations and atmospheres that reflect this professional field. This does not feel like a secure environment, especially from the point of view of participants. To re-create this business environment we do things the participant does not expect and we get their "gyroscopes" to start. This change can be as mentioned by Johansen (2004) *"an exhilarating experience".* In an applied research, the authors have looked at the actions and results that the approach brings to participants, educated and trained with this "gyroscopic management' approach. We will explain this research in short in the following part.

III. Research
3.1 Motivation and scientific context

The motivation for the choice of a special applied research method, called "Grounded Action", started with the general interest in the following field: *"Students at business schools that are achieving the change in their role from being a "student" to being a "professional" in business."* The authors believe that during this change the business roles as mentioned in the first part (policy controller, partner and player) are developing and that there is no clear way to understand what goes on in the students during this change. The approach and research of this field of interest was done in an inductive way, using own experiences, and practice in education in The Netherlands and Romania and making use of the research method called "Grounded Action" (Simmons & Gregory, 2003). This inductive research method, suits the content and context of "gyroscopic management" in a perfect way. Based on Glaser's opinion that *"All is data" (Glaser: 1967),* the core variables of "Gyroscopic management" were gathered and grounded during several years and presented in an explanatory theory that is formulated in the following way: *"The actual change of role from being a "student" toward being a "professional" consists of five stages. These are: listening, awareness, accepting, adapting, and advancing"* This led to the next step in which this theory was translated into a so-called "operational theory", which, according to Simmons & Gregory (2003), is needed for a "Grounded Action" methodology. In this part, the authors explain and describe in which way the stages, given in the explanatory theory can occur or take place in practise. The whole research included inductive sampling of data in the form of reflections, interviews, and observations, video and audio taping, memoing, evaluations, and field notes in a large database. The database consists of around 1000 written (and digitalized) evaluation forms, reading of more than 1500 written reflections, transcribed interviews, research papers and material from focus groups and more than 200 hours of taped audio and video material. Because the authors are aware that they have a very subjective and direct participation in this research, they also made use of focus groups as a program evaluation method. They used for this the criteria as given by Morgan & Krueger (1993) and the aim was to

evaluate and "test" the subjective view of the authors of the explanatory theory and conceptual framework. The groups tested and evaluated both in inductive and deductive ways the explanatory theory with the given data, the operational theory and the target groups. All focus groups did their research in 2011 and 2012 and came with results in separate research papers.

IV. Conclusions

4.1 The added value of Gyroscopic Management for the field of management

It is not the intention of the authors to define in this paper, in detail all competencies that the new generation of managers need for the future. The aim is more to focus on the attitude and different competencies that there are between the "executive" professional and the "improvising" professional. This difference is explained as follow: "The need for control from the "executive" professional is a stumbling block to creatively solving problems. There is not much willingness to listen and to explore new or unexpected outcomes." (Sabouring & Pratt, 2007)

These authors mention the need for more "Improvising" professionals and many of the missing competencies in trainings and lectures are, according to literature of several authors (see list of publication), related to the parts like: listening, awareness, accepting, narrating, and adapting. The authors believe that gyroscopic management covers all these elements and supports participants in becoming more "improvising" professionals, which the authors define as "players

4.2 The relation between the "new" generation of managers and gyroscopic management

The results of the literature study and research show that the stages of gyroscopic management are individual different and haves no real order or structure in the five stages. There are connections between the stages, but it is not always clear which specific following stage or occurrence the participant will enter. Participants make own choices and many of them experience derailing parts in the stages, bringing them back to other levels or stages. The authors do not aim to find a specific and clear structure to implement as the "right way" to train and lecture the new generation Y managers. There is more a focus on recognizing and admitting that it is the "power" and purpose of a constant turning "gyroscope" to find balance, by unbalancing. Schofield & Honeré (2010) wrote an article about their research on the learning characteristics of generation Y, the following: *"Generation Y may be missing out on exploring more deeply, enquiry and reflection. They struggle more than previous generations with 'difficult workplace conversations' and they need more support in becoming self-aware."* (Schofield & Honeré: 2010). The new managers in the generation Y want independence to decide on their own. They do not need authority, existing models or theories to approach problems and situation. They want supervising and coaching, but not by experts that tell them "how" to do it or that explains them "what" to do. They need feedback that stimulates them to come with own different and innovative ideas. Besides that, they want to be self-managers. In the approach of gyroscopic management, this is asking the "why!"

4.3 Preliminary outcomes of the research

The literature research and studies and the action based Grounded Action research done in Romania and The Netherlands shows some interesting outcomes as given by the participants themselves:
- "It is different and unexpected"
- "It uses the present situation and makes it real"
- "It is fun because there are many games involved"
- "It is very interactive"
- "It makes clear that making mistakes is part of learning and can be fun"
- "It is about "playing to play" instead of "playing to win""
- "It uses interactive methods like role-playing and improvising acting"

-"It is not based on theory, but it is still clearly related with it"
-"There is no clear structure for training; mostly there is only a "theme"."
-"The relation between the use of games becomes clear during and after the courses"
These remarks are individual reflections of participants during and after the trainings with the use of gyroscopic management. The authors come to the following preliminary conclusions.

-Participants experience the approach as, not pushing but more "pulling" giving full responsibility for the learning to the participants themselves.

-Participants recognize and are aware that they show the five stages as given in the explanatory theory, listening, awareness, accepting, adapting, and advancing

-During the action-based research, participants showed the occurrences as mentioned in first three stages of the operational theory: listening, awareness and accepting stage.

-In their reflections, participants show already the stages of accepting and adapting after some training. (On average after 5-10).

-The content of the training and the working of the gyroscopic approach are a lot depending on the approach of the trainer.

These preliminary conclusions show that "gyroscopic management" is a different approach towards the 'new' generation of managers for the future. The authors do not have the pretention to say this is "right" way to approach them. It only show a different way and the authors believe that this approach can be of added value for the professional field of business and management in the future.

SOME ISSUES OF THE AIRPORT MANAGEMENT

Marian Ovidiu
Academia de Studii Economice Bucuresti
Relatii Economice Internationale

Abstract
Internationally, the recommended standards for the operation and management of civil-use airports are provided by the International Civil Aviation Organization (ICAO). In most individual countries, airports are managed directly by the government, most often under the ministry of transport. In some countries, including EU countries, some airports are privately owned and operated, although, despite private ownership, they are still subject to much of the country's regulations regarding aviation operations. The complex system of civil airports is made up of individual airport facilities of varying sizes, serving various purposes, all organized into plans of regional, national, and international levels. The range of rules, regulations, and policies, administered from varying levels of government, cover the full spectrum of airport and aviation system operations. Furthermore, a large number of professional and industry organizations play a large part in influencing the policies by which airport management must operate their facilities. By understanding where an airport manager's airport falls within the civil aviation system, what rules must be followed, and what sources of support and assistance exist, the task of efficiently managing the complex system that is an airport, becomes highly facilitated.
Key words: airport management, airport authority, state-operated airport, public relations, local community

It is well understood that a viable and efficient transportation system is a fundamental and necessary component to the economy of any region. Transportation, by definition, provides the ability for people and goods to move between communities. This movement leads to trade and commerce between markets, which, in turn, lead to jobs, earnings, and overall economic benefit for a community's residents.

Even though there are a variety of transportation modes, such as automobiles, trucks, ships, and railroads, perhaps no other mode has as significant an impact on intercity trade and commerce as aviation. Travel in the aviation system allows for intercontinental travel of large volumes of passengers and cargo in relatively short periods of time. Access to markets around the world has resulted in the largest of communities reaping extraordinary economic benefit.

Airports are the gateways to the nation's aviation system, providing access to air transportation for the surrounding community. Commercial air carriers provide access to air transportation between many major metropolitan areas of the country. Thousands of smaller cities, towns, and villages have access to aviation by way of airports serving general aviation.

The airport has become vital to the growth of business and industry in a community by providing air access for companies that must meet the demands of supply, competition, and expanding marketing areas. Communities without airports or sufficient air service have limitations placed on their capacity for economic growth.

Airports and related aviation and non-aviation businesses located at the airport represent a major source of employment for many communities around the country. The wages and salaries paid by airport-related businesses can have a significant direct effect on the local economy by providing the means to purchase goods and services while generating tax revenues as well. Local payrolls are not the only measure of an airport's economic benefit to the community. In addition, employee expenditures generate successive waves of additional employment and purchases that are more difficult to measure but nevertheless substantial.

It is often said that managing an airport is like being mayor of a city. Similar to a city, an airport is comprised of a huge variety of facilities, systems, users, workers, rules, and regulations. Also, just as cities thrive on trade and commerce with other cities, airports are successful in part by their ability to successfully be the location where passengers and cargo travel to and from other airports. Furthermore, just as cities find their place as part of its county's, state, and country's economy, airports too, must operate successfully as part of the nation's system of airports.

Whether privately owned or part of a public system, there are fundamental characteristics of the administrative and organizational structure of an airport. Privatization refers to shifting governmental functions and responsibilities, in whole or in part, to the private sector. The most extensive privatizations involve the sale or lease of public assets. Airport privatization, in particular, typically involves the lease of airport property and/or facilities to a private company to build, operate, and/or manage commercial services offered at the airport.

The number of people employed at a given airport can range from as few as one, at the smallest of general aviation facilities, to as many as 50,000 at the world's largest airport authorities. Those airports that employ fewer numbers of people expect these people to accept a wider range of responsibilities. For example, an airport management employee at a small airport might be responsible for maintaining the airfield, managing finances, and maintaining good relations with the local public. At the larger airports, employees are typically given very specific responsibilities for a particular segment of airport management.

Airport management as a career

There are many career paths within the field of airport management as evidenced by the wide variety of job descriptions under the previous section. Even the job of airport manager varies greatly. At one extreme is the manager of a large metropolitan airport, an appointee or civil service employee of the city government or airport authority, who heads a large staff of assistants and specialists through which he or she manages a highly complex organization. At the other extreme is the owner-manager of a small private field near a rural community. The latter might combine activities as airport manager with work in some other business. Between these two extremes is the manager of a municipally owned or privately owned airport where there are a limited number of scheduled airline flights each day. Based at the airport are several fixed-base operators (FBOs) and a number of aircraft owned by individuals and corporations. The typical manager of a medium-size airport deals with all segments of the aviation community including the airlines, general aviation, and state agencies. In the early days of aviation, an individual could become an airport manager if he or she was a pilot and had several years of experience in some segment of the industry. Although the individual had to be able to manage the operation for the owner, his or her experience was likely to be in some area of flying rather than in business management. Today an airport manager must be primarily a skilled and experienced executive with a broad background in all facets of aviation and management in general. It is no longer necessary that the manager be a pilot.

It is also acknowledged that almost every airport manager's job situation is unique in some major respects because of the wide variety of size of airport and type of ownership and operation. There are also wide variations in government procedures in different communities. This sometimes causes the responsibilities, salaries, and authority of airport managers to be completely different from one city to the next. Even the job title varies. Director of aviation, airport superintendent, executive director, airport director, general manager, and other titles are often used instead of airport manager.

The airport manager [95] is often part landlord and part business executive. As a landlord, the safe condition and operation of the airport is the manager's greatest responsibility. The maintenance of the airport buildings and land is also important. As a business executive, the manager is in charge of public relations; financial planning; profitable and efficient day-to-day operation; and coordination of airline, concession, and airport facilities to best serve the tenants and flying public. The airport manager's primary duty is the safe and efficient operation of the airport and all its facilities regardless of its size. However, at least in the larger commercial airports, the manager does not have direct control over most flying activities. He or she must deal with all groups and individuals who use the airport facilities. These include representatives of the airlines that schedule flights, maintain and service their aircraft, and process passengers; all segments of the general aviation community and individual and corporate owners and operators of aircraft; and the government-employed staffs of the air traffic control facilities, customs, and so forth. All of these groups can be regarded as tenants of the airport, carrying on their independent activities. Besides dealing with the companies and individuals directly concerned with flying, the manager is in contact with concessionaires who operate restaurants, shops, and parking facilities, and with the traveling public.

The size of the airport and the services it offers its tenants and the public play an important part in determining the airport manager's specific duties. Some of these duties were enumerated earlier in this chapter under job descriptions. A manager must formulate fiscal policy, secure new business, recommend and enforce field rules and regulations, make provisions for handling spectators and passengers, oversee construction projects, see that the airport is adequately policed and that airplane and automobile traffic is regulated. The manager interprets the functions and activities of the airport to the city or other local government and to the public; he or she is a public relations expert as well as a business manager. This public relations function is extremely important and will be taken up at the end of this chapter in a separate section. Not all of these duties are required of all managers of airports. Many airports are too small to have Central Aviation Administration-staffed control towers; others have no scheduled airline flights. In these airports the job is simpler, but the manager must usually do all of the work personally. In large airports, the manager has many assistants and supervises the work The job of airport manager is obviously not completed between 9 a.m. and 5 p.m. The hours are often irregular and most managers have some weekend and holiday work. They will often have to work at night. In emergency situations they will usually work additional hours. Difficult weather conditions, labor problems, personnel irregularities, and flight schedule changes are only some of the things that will affect job hours. Even when not actually working, most airport managers are on call.

Education and training

---

[95] ***Airport director.*** The airport director is responsible for the overall day-today operation of the airport. He or she reports directly to the airport authority, the airport board, or governmental commission charged with the development and administration of the airport. This individual directs, coordinates, and reviews through subordinate supervisors, all aircraft operations, building and field maintenance, construction plans, community relations, and financial and personnel matters at the airport. The airport director also:
• Supervises and coordinates with airline, general aviation, and military tenants use of airport facilities.
• Reviews airport tenant activities for compliance with terms of leases and other agreements.
• Supervises enforcement of aircraft air and ground traffic and other applicable regulations.
• Confers with airlines, tenants and others regarding airport regulations, facilities, and related matters.
• Participates in planning for increased aircraft and passenger volume and facilities expansion.
• Determines and recommends airport staffing requirements.
• Compiles and submits for review an annual airport budget.
• Coordinates airport activities with construction, maintenance, and other work done by departmental staff, tenants, public utilities, and contractors.
• Promotes acceptance of airport-oriented activities in surrounding communities

The major requirement for the job of airport manager is business and administrative ability; this means the ability to make decisions, to coordinate details, to direct the work of others, and to work smoothly with many kinds of people. Perhaps the best college program to follow is one that leads to a degree in aviation management. College courses in engineering; management; accounting; finance and economics; business and aviation law; and airline, general aviation, and airport management are good preparation for a career in airport management. A large number of the primary airports in the world have 1- or 2-year internship programs that train college graduates for various aspects of airport management. Because the position of airport manager is the top job in most airports, advancement generally comes by changing jobs—usually by working for a larger airport. In a large metropolitan airport, an individual usually works up from managing various departments to become an assistant manager or director and finally manager or director. The important public service an airport provides along with its economic advantages to a community has caused city governments to recognize the need for professional management of airports. As the number of new airports increases and the facilities of many existing airports expand, new managerial positions will be created. Many of these will not be top jobs, but the airport of the future will require assistant managers specializing in one part of the huge operation.

Because the job of managing a medium-to-large commercial airport is a fascinating one that requires high qualifications, there will be tough competition for jobs; however, the motivated individual with a solid educational background and varied experience in the fields of aviation and management will find openings in a field of work that is and will remain comparatively small—but one that provides an interesting and challenging profession. Unquestionably, one of the most important and challenging aspects of an airport manager's job is that of public relations.

The airport and its public

Basically, every airport has four "publics" with which it deals, and despite the wide variance in size and scope of activities of airports, these publics are basically the same for all airports:

• *The external business public.* These are the past, present, and future airport customers for all the services offered on an airport. It includes all segments of the business, government, educational, and general flying public.

• *The external general public.* These are the local citizens and taxpayers, many of whom have never been to the airport but who vote on airport issues or who represent citizen groups with particular concerns.

• *The internal business public.* These are the businesses and enterprises whose interests are tied directly to the airport—the airlines, other members of the general aviation community, government officials, and other aviation and travel-oriented local businesses and trade organizations, and the employees of all of these enterprises.

• *The internal employee public.* This group includes everyone who works for the airport and its parent organization.

These are the most important airport publics. These are the sources of vital information that management must have in order to know what and how it is doing, and they are the ones who must be informed and persuaded if any airport objective is to be achieved

The airport manager and public relations

Public relations **is a** management function that attempts to create goodwill for an organization and its products, services, or ideals with groups of people who can affect its present and future welfare. The most advanced type of public relations not only attempts to create goodwill for the organization as it exists, but also helps formulate policies, if needed, that of themselves result in a favorable reaction. Aviation and airports have such great impact on people's lives, and on the life of a nation, that it is difficult to find a person who has no knowledge or opinion of airports.

Despite the tremendous growth in all segments of aviation over the past 25 years, and the resulting challenges, problems, and opportunities, aviation has not been exempted from the controversies that inevitably are part of any endeavor affecting or touching the lives of a large number of people. This controversy is the reason why every opinion, whether positive or negative, will be a strong one. The net result is that every airport has an image—either good or bad. The great problems of airports are always related to the original and elemental images resulting from the collective opinions of the public. These images are really the balancing or compensating factors that correspond with the problems the public encounters with airports. These images are deposits representing the accumulated experience of jet noise, hours of struggle to reach the airport on clogged highways under construction, the frustration of trying to find a closer parking place, the lines to obtain tickets, the time waiting for luggage, and other inconveniences. In this respect, some of the public will have an image of the airport as a very exciting place that makes major contributions to our society through commercial channels, and even more valuable contributions of a personal nature, by offering a means to efficient travel, and thus greater personal development and greater enjoyment of life. Despite the hundreds of positive impacts of aviation, negative images do arise. Perhaps such negative images result from the fact that the industry has been so intent on the technological aspects of resolving problems that it has overlooked the less tangible components. The industry has the technology and resources to resolve many of the problems of the airport-airway system; however, the important link or catalyst in bringing together technology and community opinion is the airport public relations effort.

Regardless of the size of an airport, there are several basic principles underlying the public relations process:

• Every airport and every company and interest on the airport has public relations, whether or not it does anything about them.

• Public goodwill is the greatest asset that can be enjoyed by any airport, and public opinion is the most powerful force. Public opinion that is informed and supplied with facts and fair interpretation might be sympathetic. Public opinion that is misinformed or uninformed will probably be hostile and damaging to an airport.

• The basic ingredient of good relations for any airport is integrity. Without it, there can be no successful public relations.

• Airport policies and programs that are not in the public interest have no chance of final success.

• Airport public relations can never be some kind of program that is used only to respond to a negative situation. Good public relations have to be earned through continuing effort.

• Airport public relations go far beyond press relations and publicity. Public relations must interpret the airport interests to the public, and should be a two-way flow with input and interpretation of public opinion to airport management and community leadership. Public relations must use many means of reaching the various segments of the public interested in airport operations, and must try to instill the public relations spirit into all facets of the airport's operation.

Public relations objectives

The primary objectives of an airport's public relations activities are as follows:

• Establishing the airport in the minds of the external public as a facility that is dedicated to serving the public interest: Many airports work closely with the local chamber of commerce in developing a brochure or pamphlet citing various accomplishments and activities at the airport that would be of interest to the local business community and the community in general.

• Communicating with the external public with the goal of establishing and building goodwill: The airport manager and other members of his or her staff often serve as guest speakers at various civic and social organizations. They also become active members of local or civic

organizations in order to informally promote the airport and determine the pulse of the community. Public announcements of new developments at the airport are made through all media. This is a continuing part of the communications process.

• Answering general and environmental complaints on an individual basis. It is important that the airport develop a good rapport with its neighbors and concerned citizen groups. Working closely with the airlines and other internal business publics, airport management attempts to work out such problems as noise by changing traffic patterns and adjusting hours of flight operation. Tours of the airport are given to various community groups in order for them to get a better understanding of operations. Civic-oriented activities are also conducted at the airport to improve relations with airport neighbors and address their concerns. Citizen participation in airport planning and public hearings is another means by which airport management is continually apprised of community feelings about airport-related activities.

• Establishing good working relationships with internal business publics whose interests are similar to those of airport management.

• Promoting programs designed to enhance and improve employee morale.

Both the airport and the community have a responsibility to work together to solve their mutual problems, attain desired goals, and ultimately achieve a better community. It takes continuing contributions—and sometimes sacrifices as well—to the general welfare on the part of individual citizens and the aviation industry to earn the opportunities and rewards of a good community for the public. This two-way relationship has its problems too. Many are spawned by misunderstanding that can arise and grow to disproportionate size, and in this context, result in a negative image for the airport and a loss of public confidence in the aviation industry. Ensuring that problems are met head-on, with full and explicit information made continuously available to the public to prevent misunderstanding, is the point at which airport public relations enters the picture.

Like any other facility that serves the total community, an airport requires total community understanding. A well-executed public relations program can make the community aware of the airport and its benefits and create an atmosphere of acceptance. Attitudes are not changed overnight, so the public relations effort must be a continuous campaign to build understanding and develop attitudes of acceptance.

PROPOSAL OF THE SOCIAL CONTRACT IN MANAGEMENT AS INSTRUMENT OF ANALYSIS FOR THE EMPLOYMENT RELATION. THE EXPERIENCE OF AUTOMOTIVE INDUSTRY IN ROMANIA

Muresanu Doina
Department of Management
Université du Québec in Abitibi-Témiscamingue, Canada

The communication presents the partial results of a research proposing the social contract as a new instrument of analysis for the employment relation in a social context in change, such as the case of Rumania. Until then, the research which aimed at the employment relation which is formed between the employer and the employees widely appealed to the concept of psychological contract (Rousseau, 1989; 1995). The psychological contract, defined as the perception of the mutual obligations assumed by the employee and by the employer, benefited from a fashion effect in the 1990s, when the economic difficulties questioned the model of classic employment relation based on loyalty.

However, most of the empirical works on the psychological contract are static studies, for the greater part elaborated by questionnaire, which do not allow to define the impact of the social context change on the evolution of the employment relation. Although certain studies are interested in a context of change (Dick, 2010), most of the past works describe the contents and the evaluation of the psychological contract in an unchanging social environment. Yet, we saw it in the case of the ex-communist countries or those of the Northern Africa, the change in the environment of the employment relation is more present than ever.

Our communication proposes a research frame which would be more suited to the understanding of the employment relation in a society in change. To do it, we rely on the social contract in management, which we define as the ensemble of the norms and of the tacit laws existing in a society or a group given with regard to the relation of employment.

The approach by the social contract presents the advantage of including multiple elements bound to a societal context, such as the laws, the national culture, the faiths shared by the business environment, etc. (Rousseau, 1995). It offers a new frame of analysis for the employment relation by suggesting that it is through the systematic and global vision of the values and standards relating to the employment relation, that we can better comprehend the consequences of a change of the employment relation.

Given its exploratory character, we use an inductive, thus qualitative, methodology, to perform this research. The partial results of the analysis of the interviews led in two Romanian companies during the summer of 2010 allowed us to identify several components, which we called "terms" of the social contract. These results will deliver to the practitioners and to the researchers in management a relevant tool to better understand the relation of employment in different national cultures as well as a measuring instrument for the quality of the employee-employer relation.

Our communication ends by proposing various paths of reflection which will allow to use this approach in future researches concerning the employment relation.

Keywords: social contract, psychological contract, change, employment relation, national culture

I. Introduction

We live in a world in change. Technological, competitive or social and cultural changes harmonize to transform profoundly the context of the employment relation (Chaudhry, Wayne and Schalk, 2009). These changes put important challenges for management practitioners as well

as for the scientific world that look for answers to the problems of adaptation and management of the change of the relation employee-employer.

In order to analyze this relation, the psychological contract turned out to be for more than twenty years a powerful and relevant instrument. Defined as "the ensemble of the promises which play the role of obligation between the employee and the employer" (Rousseau, 1995, p. 5), the psychological contract has, according to the results of hundreds of research studies, important impacts on the attitudes, behaviour and affect of the employees. So, the perception of the respect for the psychological contract was connected to the job satisfaction (Turnley and Feldman, 2000) and to the intention of staying in the company (Dabos and Rousseau, 2004). It also has important influences on the affect of the employees and on their well-being (Guerrero and Herrbach, 2008). On the other side, the defiance of the promises (i. e. the breach of the psychological contract) contributes to the increase of the intention to leave the organization (i.e. turnover) and to the decrease of the commitment, of the job satisfaction and of the behaviour of organizational citizenship (Zao and al. 2007).

The concept of psychological contract was especially instrumented and used in North American and British studies by taking for granted a relation of employment in a stable social context. Furthermore, the psychological contract is a reflection of the individualistic vision of the relation employee-employer, such as it is perceived in the Anglo-Saxon countries. Nevertheless, after having made the review of the literature in human resources management of the last twenty years, we arrived at the conclusion that in situation of change, as in the ex-communist countries or those of the Maghreb, the modification of the foundation of the employment relation could turn out rather strong, in order to disturb the standards, the faiths and the ancient way of conceiving and of functioning for the employers and the employees. In these circumstances, an instrument as a psychological contract which represents a "photo" of the organizational reality at the moment "t", stable and shielded from any movement, becomes, in our spirit, restrictive and even old-fashioned.

In order that the researchers and the practitioners understand more the foundations of the employment relation of a certain country, we propose as instrument of analysis the *social contract in management*. By relying on the ideas of Rousseau and Schalk (2000), we define the social contract as "the set of norms, faiths and presuppositions concerning what is acceptable and tolerated in the employment relation". So, we want to go further than the notion of "promise", central in the conceptualization of the psychological contract. In our spirit, " making a promise ", whether it is on behalf of the employee or of the employer, is not always connected to the free will of these two actors, but, sometimes, to what " everybody does " in a given entity, whether it is an industry, a private or public sector or a state economy.

The research that we lead at the moment and whose partial results will be the object of this communication suggests identifying the components of the concept of social contract in management, facts that were performed in a sporadic and superficial way in the existing literature. Thus, we ask the following research question:

What would be the conceptualization the most suited to measure the social contract in management?

We hope that our approach will open promising ways of research for the other researchers who are interested in the analysis of the employment relation and who could refine this conceptualization.

II. Literature review

The term of "social contract" is used for the first time in 1762 by Jean Jacques Rousseau to speak about the functioning of the human society. In the light of the revolutions which were prepared in the Europe of those times, J.J. Rousseau asserted that the rules according to which functioned the societies were not natural, but resultants of the decisions taken by the members of the society

who act as free agents (Bernadi, 2010). The social contract represented, according to him, an unwritten "agreement" which included mutual rights and obligations between the State and its citizens. Paying the taxes, complying with the laws by receiving protection from the State, here are some examples.

Rousseau's social contract was resumed in works of law (for example Donaldson and Dunfee, (1994) or Keely (1995) for describing what is considered as "marks of evaluation of an acceptable minimal level for the moral standards" (Donaldson and Dunfee, 1994, p. 265), namely *hyper norms*. Thus, in this approach, in order for a norm to be imperative in a society, it has to be guided by principles of morality and ethics. According to them, it is important to identify well the "real" moral norms, by means of the following reasoning:

The norm (N) is an authentic norm in the situation (S) for the members of the community (C) if:

1. The submission to the norm (N) is accepted by most of the members of (C)

2. The abnormality with regard to (N) is disapproved by most of the members of (C)

3. An important percentage (indeed beyond 50 %) of members of (C) is going to act in agreement with (N) when they meet the situation (S) (Donaldson and Dunfee, on 1994, page 264).

Later, the literature in management begins to take interest in the idea of social contract in order to define the norms/standards which determine the behaviour considered to be suited in a given entity, whether it is at the level of a company or of an industry (for example Ivens, (2006); Edwards and Karau (2007). These researchers criticize the level "too much abstracted" and remote from the real life of the organisations of the "classic" social contract and ask for a "democratization" of the social contract at the microeconomic level. According to them, even at the level of a workgroup, we can assist to the emergence of "small social contracts" that people accept and follow because they answer their needs of compliance with the morality in the company (Edwards and Karau, 2007).

We strongly believe that the social contract in management could turn out to be an instrument richer than that of the psychological contract for analyzing the employment relation, because it is the resultant of the dominant values and standards in the culture of a country. According to Rousseau (1995), the social contract is built through the influences of the law system, of the media, of the educational system or as a result of the business environment pressures. These influences are going to determine, after all, what is acceptable in the employment relation, what constitutes the rights and the duties of the employers and of the employees as well as the vision on the employment in terms, for example, of mobility or employment durability.

III. Research methodology

In order to identify the characteristics of the social contract which we call "terms", we performed a qualitative-type research in two Romanian companies functioning in the automotive industry in the region of Sibiu. Because we speak about an exploratory study, only the inductive method could give the best results (Suddaby, 2006). According to the requirements of the inductive methodology, we used a "theoretical" sample (Pratt, 2006), thus we chose to question approximately 40 persons coming from a company with Romanian capital and from a branch of a multinational company. By means of semi-structured conversations, we asked to the participants to speak about the employment relation before and after the fall of the communism in order to identify the big themes of what people considered as "usual" thus "common practice" in their companies. Furthermore, by contrasting two philosophies of management (Romanian and foreign) we hope to enrich the understanding of the social contract in this industry.

IV. Research results

In a previous research (Muresanu and Guerrero, 2011), we forwarded the idea that the point of departure in the analysis of the social contract in a given entity would be its economic ideology. So, we identified in the literature of the field, two ideologies that we placed to the two extremities

of a continuum, namely the ideology of the planned economy and the ideology of the market. In the present research, we analyzed two cases of social contract, namely the one of the centralized economy, such as perceived by the people who worked during the communist period in Romania and that of the very competitive market economy of the automotive sector. We went further in our analyses, by trying to identify the elements of the market economy social contract in a state-owned company and in a multinational one. Having identified the elements of the SC, we passed at the following abstraction level by grouping these elements in categories which we call "terms" of the social contract. Consequently, we reminded the hyper standards that "made justifiable" the social contract, namely that make so that the norms of the SC become acceptable and tolerated. The Table 1 presents the matrix of the elements of the social contract in management.

Table 1. Terms of the social contract in management

Hyper standards	Terms of the SC	Elements of the SC
Morality	Protection	*Lifetime employment*
		Employability
Equity		*No link between the performance and the reward*
		Unemployment in employment
Justice	Valuation of the others	Remuneration according to the performance and to the educational level
Good will		Consultation concerning the decisions taken by the company
Fair deal		Creation of a friendlier atmosphere at work
	Self valuation	*Employability*
		"Fight" to move forward in the career because " I deserve it "
	Recognition	Authoritarian / equalitarian hierarchical relation
		Lack / existence of recognition for a work well done
		Lack of initiative and implication
		Incompetent employees promoted based on politics or " on highly placed acquaintances"
		Depreciation / valuation of the work
	Dialogue	*Consultation concerning the values of the company*
		More equalitarian hierarchical relation / very hierarchical relation
	Implication in the work	Lack / encouragement for the implication and the initiative at work
		Passive / active attitude at work

Source: realized by the author

Let us take the example of the United States for an application of this analysis diagram. According to the information of the literature in management and according to our own experience, we can assert that at work, the American employers offer little protection to their employees: the employees are judged according to their performance and they worry to a big extent of their capacity of finding a job quickly. The most deserving are the most appreciated and, generally, people are ready to make everything to distance themselves from their colleagues. Given the small hierarchical distance, the recognition of performances and the dialogue are made very quickly. The North American culture encourages the initiative and the implication in the decision-making process.

V. Conclusions

We started the development process of a more dynamic instrument of analysis for the employment relation, by trying to fill this lack in the literature of management by a concept filled at the same time with the major principles of the hyper standards and with its practical character.

From the practitioners' point of view, the social contract in management can represent a frame of understanding for what is tolerated, acceptable, even expected in an employment relation. By performing the exercise of describing " the terms " of the social contract that we propose, the leaders of foreign companies, for example, will be more warned and better equipped in their strategy choice as regards the human resources of the host country. The local leaders can also use our approach to manage changes which can affect certain "warm core", as for example, assuring the job safety that represents the centre of the social contract in the public sector. From the scientific point of view, our research will deliver to the researchers a tool more structured than that which existed so far in the literature. For example, we go further from the approach proposed by Edwards and Karau (2007) who see the social contract as a kind of "ideal psychological contract" or from the other approaches which consider the social contract only a material of " high moral principles" (e.g. Donaldson and Dunfee (1994) or Keely (1995).

We encourage the researchers to continue to refine the concept of social contract in management and to propose quantitative measures, by means of questionnaires, for the same concept. Other future research could be interested in the links which are woven between the social contract, representation of the more "collective" level of the employment relation and the psychological contract, the expression of "individualization" of the employment relation. Furthermore, an interesting research approach would be the analysis of individuals' adaptation to the changes of the social contract in management.

HUMAN RESOURCES MOTIVATION – AN IMPORTANT FACTOR IN THE DEVELOPMENT OF BUSINESS PERFORMANCE

Nicu Ioana Elena
West University of Timişoara
Faculty of Economics and Business Administration

It is well known that the people of a company are a strong resource for business and that the human resource function is valuable in assisting the workforce in order to accomplish the objective of the company.

The productivity of a company is strongly related to its people and its strategies. Therefore, a powerful human resources management system has started to develop in Romania as well. The people that are hired in companies bring along a wide range of qualifications, abilities and knowledge, which might as well be useless to the company needs. Some of them identify with the company and are motivated in helping reaching goals, while others see the company as a vehicle meant to satisfy their own targets.

This paper touches upon the importance of human resources motivation when it comes to accomplishing individual performances and, implicitly attaining organizational performances. Many human resources scientific researchers have discussed the subject of human resources motivation, have sought to understand what prompts people and how they have been motivated. The question 'Why do we need motivated employees?' is so often asked by chairmen. Motivated employees help the business survive and they are more productive. When aiming at efficiency, managers must understand what motivates the employees, according to their tasks. Of all the functions of a manager, motivating human resources is probably the most complex.

Keywords
Human resources, human resources management, motivation, reward, performance measurement
Jel codes: O15, E24

1. Introduction

As early as 1960, John Kenneth Galbraith was pointing at the importance of human resources compared to the technical resources: "*Should machines represent the decisive aspect, the social arrangements that help us develop our infrastructure and the equipment are those of prime importance. But if people are the ones that matter, our first concern should be creating those arrangements that help conserve and develop personal talents.*" (Niţă 2010: 17)

During the period between the end of the year 1970 – the beginning of the year 1980, the term personnel was known under various names, but at the beginning of the year 1980 the term "human resources" department has started to take shape. This change has proven the acknowledgement of the fact that employees are important resources, not just simple employees that occupy certain functions. This change has also admitted to the fact that employees are not mere costs, but vital income and profit sources. In very many companies this change has been rather symbolic, since many managers have remained skeptical about the added value brought about by managing human resources. For example, in his book, The Human Equation, Jeffrey Pfeffer (1988) reports that only approximately half of the CEOs believe that human resources truly matter. This issue may be partly explained by the fact that human resources investments (such as training sessions or stimulation programs) may be extremely visible, while the results of these investments can be rather difficult to measure (Liu et al.2007: 504).

Human resources represent an extraordinary human potential, which needs to be understood, motivated or stimulated for an in-depth involvement of the employees in reaching organizational goals. From this point of view, the individual, through its structure, mentality and culture, forms into a biological entity that will always represent the vast 'unknown'. (Manolescu 2007: 37).

Modern human resources management concepts are based on various research directions of this issue. During the last hundred years, the rank of human resources management in the managerial system has changed repeatedly, sometimes even undergoing radical transformations. The visions, approaches and theoretical principles of scholars and practitioners from this field have been reconsidered. Presently, especially human resources are strongly emphasized in scientific, methodological and applied studies in the field of management, unlike terms such as 'work resources', 'workforce', 'wageworker', which have been more popular in the past. This position has nothing to do with a certain trend and it is not merely a scientific terminology juggle, but a present imperative and it was crystallized by thorough researches, based on worldwide experience, the characteristic of the national human resources management. The national and foreign practices have known various stages in the conceptual approach of the productive person, so that nowadays, we can definitely state that *approaching a person from the point of view of its efficiency* is unique and of future importance.

2. The necessity of human resources motivation

On an individual, organizational and national level, productivity has extremely important implications for the spirit of competition of the company. The company can cope with the changes required by competitiveness and progress only by orienting the efforts of the managers towards motivation and satisfaction of the employees. In order to succeed in the activity provided by subordinates, managers must be good commanders of the motivation process (Certo 2002: 465).

Of all the human resources processes that can be developed within companies, the motivation process occupies a central place since all the others derive from its healthy functioning, to a certain extent. Motivation is the inner state that determines a person to act in a way that ensures the accomplishment of all the objectives. (Rudolph and Kleiner 1989: 1-4). In other words, motivation explains why people act the way they do.

In the management of the company, the true meaning of the actions and behavior of the employees cannot be discovered without knowing the motives that has triggered them. This accounts for the frequency of the questioning of the motives behind our and others' decisions. Knowing the motives does not only help enhance action efficiency, understand motives that generate a certain behavior, but it also helps us acknowledge its moral value.

Why is motivation important? Between motivation and performance there is a relationship of interdependence. Unlike money, raw material or other production factors, people mean much more to the company. Their need and value systems, their motivation and satisfaction degree will always determine individual and organizational performance. In fact, no company can exist without the human resources that shape it. But paradoxically, people are also the only factor that can act against organizational purposes. Company owners are often blinded by profit and consider human resources less important, forgetting that profit can grow if employee motivation and satisfaction grows. The costs of this objective are smaller than the losses caused by unsatisfied employees.

The role of motivation is not solely that of making people work, but that of making them work well, that of determining them to make full use of their physical and intellectual resources. Where there is motivation, there is productivity and performance and the people are grateful. In other words everybody wins. Motivation is crucial not only to the organizational success, but to the success in each department, project or plan and it undisputedly represents one of the most important fields of responsibility.

The prestige companies that have learned the lesson regarding "how we can turn human resources into a force" in good time are now at the top of economical development and apply entrepreneurial strategies in the human resources management and stay among competitive

companies, year after year. This is why it is important to consider the human factor before the competitors discover its weaknesses.

Why is it important to motivate employees? Nowadays, in this tough economy, it is very important to have a motivated workforce, even more important than ever. A motivated employee is a productive employee and a productive employee is a profitable one! When people are not motivated they become less productive, less creative and stop showing interest for the company. Why is human motivation so important? So that you can continue your activity!

3. The principles of the motivational theory

Managers are more and more preoccupied with motivation in their work, especially since employees demand acknowledgement and involvement in the need fulfillment, without the external authority and control to have the impact it used to. First of all, in order to explain motivation, we need to try to understand the "whys" of behavior. "Why does an individual act one way or another?"; "Why does the individual stop doing a certain thing even if it is necessary?"; "Why is it that the same motive can trigger different behaviors?" (Mathis et al. 1997: 39). Many scientific researchers have tried to answer these questions by investigating the mechanisms of human psychology, founding motivational theories. Motivational theories differ among themselves according to how they explain behavior through motivation content or through determined psychological processes. Most of these theories can be divided in three basic types: content theories, process theories and strengthening theories.

Content theories identify factors that incite or trigger the motivational behavior. These gravitate around a larger or smaller set of needs, which underlie behavior.

The process theories regard factors that direct the behavior. These refer to perspective systems and look for interaction patterns of more variables that together shape behavior. Therefore, process theories focus on the interaction of the person with the environment, laying emphasis on understanding the decisional process that underlies behavior.

The strengthening theories refer to the factors that determine the repetition of a behavior.

Table no. 1. Classification of motivational theories (Mathis et al. 1997: 40)

Categories	Characteristics	Theories	Examples
Content theories	Refer to factors that incite or trigger the motivational behavior	- Hierarchy of needs; - Theory X and Theory Y; - Dual factors; - ERG (ERD).	Motivation through money, social status and accomplishments
Process theories	Refer to factors that direct the behavior	- Expected performance; - Porter-Lawer; - Equity; - Setting goals.	Motivation through the inner urge of the individual towards work, performance and recognition
Strengthening theories	Refer to the factors that determine the repetition of a behavior	- Operant conditioning	Motivation through rewarding a certain behavior

The motivational process is based on a series of needs that signal the existence of a deficit at the individual level. For example, if a worker is dissatisfied with his/her salary, this deficit causes a need at an individual level. In order to satisfy this need, the worker has more options: he/she can

ask for a salary increase, he/she can work harder in order to prove he/she deserves a salary increase or he/she can look for another work place.

Although there still are 'old-fashioned' employers that believe that offering too many advantages means a costly investment for the budget of the company, the reality is totally different: motivating human resources does not involve high costs, on the contrary.

The manager has to make sure that each employee is motivated so that, in this way, the manager will know that the employee in question is also productive. In other word is accepted from the beginning that employees have various needs that must be satisfied. The fact that a person is motivated by money is not less honorable than the fact that someone is motivated by the opportunity of getting better qualifications.

Human resources underlie the competitiveness of a company and its subsequent prosperity. They represent one of the most important values of a company and the efficient human resources management is essential for the success of a company in the present context.

It is worth making efforts in order to have motivated employees. They ensure:
- enhanced quality of the offered products and services;
- greater effort to please the manager;
- positive attitude towards the company;
- better observance of deadlines;
- low personnel fluctuation;
- small absenteeism rates;
- creativity and assuming of responsibilities.

Approaches in understanding motivation are different because some theoreticians have developed their own opinions with regard to motivation. They have approached motivation starting from different points of view, from ideas determined by the social conditions of the time. None of the approaches can be considered the correct one. Each contributes to the understanding of the human behavior and each has its limits.

Many of the theories and motivation patterns are difficult to apply by the managers. The most frequent procedures form a reward system within a company, a reward system which represents the official mechanism for defining, assessing and rewarding the performance of the employees (Chaşovschi and Albu 2006: 28).

In conclusion, it can be stated that in the future, an educated, motivated and modernly managed workforce will be strategically beneficial in any field. As a consequence, only those companies that will prove to be capable of ensuring an adequate and inspired management and that will offer an attractive image will be able to be of interest to a well-prepared workforce. Once aided by employees with a proper level of training, quantifying, enhancing and maintaining human resources will fall under the responsibility of the managers on all levels.

4. Rewarding the human resources performance

Rewarding the human resources is one of the most important functions of a company and, therefore, a main priority for the human resources management. People look for work places, mainly to make a living. They expect a good salary and benefits in exchange for their work. Having a properly satisfied work force has a circular impact, since, if employees are happy with their rewards, they will be more productive and the company, in its turn, will enjoy more benefits. When the employees are not happy with their rewards, they are less productive and the company is held back. Developing an equitable rewarding program is therefore extremely important for all companies, but there is also talk of a social impact. People depend upon their work to make a living and their involvement in the society represents a direct impact on the way in which their word is being rewarded.

Many employers consider monetary reward to be the only one motivating the employees. But if the owner raises the salaries and the employees are still not motivated, this means something is wrong in certain aspects.

One of the concerns of scientific researchers from the field of the human resources is that of determining what exactly motivates them to work harder.

A reward system reflects what the company cherishes and why it is willing to pay for the aspects in question. Wanting to offer proper rewards and sending a message to everyone about what is considered important in a company underlies the system.

In a company, the performance is also influenced by the way in which rewards are being used. As well as other markets, the labor market has its buyers and its sellers. The economic factors that act on the external labor market are determinants for the wage levels.

A correct reward management takes into account the philosophy, politics, plans and processes used for maintaining and developing rewarding and, implicitly, motivation systems. On the one hand, reward as a process supports the economic strategy planning of the company and is integrated with other strategies, especially with those that regard human resources development. On the other hand, it focuses on developing abilities and competences among employees in order to enhance resources organizational capability.

According to the researchers and to the managerial practice, in order for a reward or a work result to act like an efficient motivator, the following essential requirements must be observed (Sasu 2007:10):

- the person in cause must wish for the reward, otherwise it will certainly not become a motivating factor;
- the person must be convinced that his/her additional effort will lead to performance increase, which must not be prevented by factors that he/she cannot control;
- the person must be convinced that his/her increased performance will bring him/her, as a result, the reward he/she wants. The connection between the additional effort, reaching a superior performance and receiving the reward must be clear, direct and strong or, at least perceived in this way.

5. Measuring human resources performance

If the human resources that define the company are characterized by satisfactory knowledge and competences, the company generates proper conditions for its durable development. But if the human resources that define the company are not characterized by satisfactory knowledge and competences, then the company generates conditions for stagnation or even bankruptcy.

These aspects lead us to strongly affirm that the human resource is extremely important for the company. The decision makers of a company must pay special attention to this field in this macro-social context of the conceptual reshaping of human resources and their strategic role within the company.

The employee represents the modern man/woman, constrained by his/her life conditions and has ceased to make philosophical assumptions, trying to accomplish as much as possible. Therefore, a specific set of capabilities and qualities, which are reflected in the work result and in the individual professional performance, underlies each employee.

When it comes to evaluating employees it is necessary to establish the most adequate assessment criteria of individual performance, i.e. the complex of features that guarantees for professional success. Limiting these criteria to the dimension of the professional performance is a complex issue, often imbued with uncertainties and subjectivity, which makes failures quite frequent.

Measuring the individual professional performance represents a necessary and rightful action with personal as well as collective implications. When it is not perceived in a positive way and it seems a mechanical action at the end of each year, influenced by the results from the last period, the evaluation will prove to have a detrimental impact upon the future activity of the collective.

Determining the individual professional performance at the end of a certain period of activity represents a balance sheet, a source of information towards which we cannot be indifferent and which triggers questions and influences individual and organizational decisions. This is why the measurement of individual performance needs to be objective and entails great responsibility.

Practically, the performance of an employee is successfully measured in a certain professional activity when the correct instrument is used. Therefore, a certain present stage of the professional success, which in time will reach a different level, is determined. The dynamic character of the individual performance is a reality that should not be neglected.

The incorrect measurement o individual performance leads to the establishment of a negative climate which has a detrimental impact upon productivity due to unfulfilled targets and work tasks and due to the bad quality of products, works and services. The negative work climate is characterized by high lateness and absenteeism rates, inobservance of tasks and deadlines, etc., which ultimately leads to a high personnel fluctuation rate.

When having to assess their personnel, managers may do so with or without discernment. Imprecise personnel evaluation represents a cause of future failure. For example, considering everyone 'very good' leads to demotivation of the ones that are truly very good, for the fact the result of their work is considered equal to that of the mediocre employees, which, in turn, will consider they have worked hard enough and can therefore reduce their effort.

6. Conclusions

The performance of the companies has nowadays become a major attribute of the employees, of the existent human resources, respectively. The success, meaning the degree of competitiveness and the profit of the companies depend mostly upon the human resources management, motivation and upon the degree of involvement of the employees. Under these conditions, it is necessary that the manager proves to be concerned with assessing and training quantitative and qualitative development regarding human resources, in the present and in the future, so that they are adapted to the development and variety of products and services offered by the company.

In order to understand motivation, managers must first understand the motives which trigger a certain individual behavior and certain reactions in threatening situations or the motives which have a certain influential impact. Motivation is an internal process, not an imperative that can be imposed from the outside.

Managers must understand motivational strategies, the way in which these succeed or fail based on how they manage to influence the internal motives of the employees. The theories of human needs give us an insight to what motivation means. According to Maslow, certain internal needs are located closer to the base of a personal hierarchy than others and people aim at satisfying certain needs located on higher levels only after the basic needs are fulfilled. Therefore, manages must provide opportunities for self-fulfillment or the employees will be unmotivated.

Managers are permanently concerned with the way in which they can motivate their employees to work better, considering the idea that a manager can take measures that will have an impact upon the quantity and quality of the employees' performance. For example, a manager concerned with determining the employees to produce more, may be interested in determining the enhancement of the quality of their work or in convincing them to spend less time resting and more time thinking about their work and careers.

The power to change ones behavior is in the hands of the person whose behavior the administration tries to change; motivation is therefore a process that takes place inside of a person. The manager needs to find a strategy to reach the inner state of the employee, determining him to be motivated, to act according to his/her own feelings. Even though managers often ask themselves how they can motivate someone, they are not the ones that motivate the employees. People are motivated or demotivated according to their inner state. In trying to

influence this inner state, the best approach managers can choose is trying to influence people's motivation.

If all companies from a field have similar technologies, the company that handles the motivation issue the best, is the one to be ahead. If employees on all levels are motivated to stay in the company, do their job at the highest efficiency level possible and try to work things out the best way they can, that company will be more efficient than the ones with lower performances, where no one tries to be innovative or to find ways of increasing the performance level.

Vinke Joop
HAN University of Applied Science, Arnhem Business School, The Netherlands

The current paper is aimed at identifying the social enterprises according to EMES criteria by investigating the social economy actors in Romania. As an emerging field of study, social entrepreneurship and social enterprise have captured the attention of both practitioners from Europe and North America, and in recent years on other continents. In Romania, very little research has been conducted into the field, mostly as part of academic research papers from doctoral study students or masters, both from Romania and abroad. In Europe, several studies have been conducted among member state of the European Union, to bring to light this new emerging field.. Investigations in regard to social entrepreneurship in Europe have revealed the existence of this field among social economy actors, in the form of social enterprise, namely work integration social enterprises and social cooperatives. So far, Romania has not been included in them This papers tries to fill the gap of knowledge on this phenomena, by exploring, from a European perspective, the actors of social entrepreneurship in Romania. The methodology used was an analysis of secondary data in the form of legal documents (laws), reports of the social economy sector and scholarly articles related to social entrepreneurship in Romania. The assessment instrument is the EMES set of economic and social criteria that the social enterprises need to meet. Also, parallels have been made with the entities of the same nature in the European Union. The paper concludes on the state of social enterprise in Romania, with an underline on what its and implications for their further study. As main finding, two types of organizations fit best with the EMES criteria, authorized protected units and companies set up by associations and foundations. Also, further developments are expected as Romania is preparing for a law defining the social enterprise and social economy. The main implications of this research is drawing the lines, in the current state of the social economy who are the actors that can best fit with the concept of social enterprise in Romania. Our main contribution to the study of social entrepreneurship is to investigate what European scholars have done with most of the existing member state countries. Using the EMES criteria in the social economy sector in Romania has yet to have been done till this point.
Keywords: social enterprise, EMES criteria, Romania, social economy

1. Introducing the social enterprise in Europe.

Social entrepreneurship is a topic of growing interest for scholars in many fields, including management, sociology, psychology or economics. As a growing field of study, the literature on

the topic is very fragmented and widely dispersed and represents "a multitude of challenges and research opportunities" (Desa, 2007:20). Social entrepreneurship literature abounds in research paradigms, showing an increasing interest in its emerging nature. From this wealth of perspectives, the current paper explores social entrepreneurship as a "product" of the third sector, in the shape of a social enterprise. This view, also popular on the American continent, is the most widely spread on the European land. .The concept of social entrepreneurship in the social economy in Europe, has been so far associated with the existence of the *social enterprise*. The term *social enterprise* "is American in origin and distinguishes from non profits by having moved away from reliance on more traditional forms of income, such as grants, towards a more entrepreneurial and business-like approach to raising revenue. " (Arpinte, 2010:154). At the European level, two definitions for social enterprises are widely recognized. The first was developed by the British government, in 2002, in the paper entitles *Social Enterprise: A Strategy for Success* as "a business with primarily social objectives whose surpluses are principally reinvested for that purpose in the business or in the community, rather than being driven by the need to maximize profit for shareholders and owners"(DTI 2002). The second belongs to EMES (European Research Network) in 2006, which considers social enterprise as "organisations with an explicit aim to benefit the community, initiated by a group of citizens and in which the material interest of capital investors is subject to limits. They place a high value on their independence and on economic risk-taking related to ongoing socio-economic activity"(EMES - European Research Network 2012). Unlike the UK definition, the EMES definition takes into account various national traditions and sensitivities present in the European Union, as it is the result of an extensive dialogue among scholars from different disciplines and countries of the continent.

In Europe, the concept of social enterprise has become known starting the 1990's, when a new type of (social) cooperative organizations have been approved by law by the Italian government.

These "social enterprises" or "social cooperatives" have had over time additions with models in countries like Great Britain, France and Belgium. Conceptually, the social enterprise can be seen as a bridge between two spheres of thought in the not for profit (social economy) literature: the cooperative and traditional associative forms or general interest organizations (associations, foundations) (Defourny and Nyssens, 2006). These two areas of the social economy, by themselves don't share anything else but the fact they start of as actors of the social economy. The cooperatives, along with mutual societies offer their output on the market for sale, whereas associations and foundation, have very little economic orientation and depend almost entirely on outside financing. Just like in the case of the social enterprise in North America, this gap between being totally non economical and being only economical oriented is being blurred more and more. As the Foundation for the Development of the Civil Society presents it, the concept of social enterprise represents an extension of the concept of social economy, adding to the basic elements that define the social economy (social mission, democratic control, limited profit distribution) three new elements: entrepreneurial orientation in providing social services, aiming for a wider spectrum of beneficiaries and growth of the quality of the democratic control. (Fundația Pentru Dezvoltarea Societății Civile 2011). In order words, being a non profit organization aiming for the good of the community and people is not enough. The organization needs to survive and provide for all the stakeholders involved. The debate is still opened whether there is a need for a new term to define what has been there already for a long while.

2. The social enterprise in Romania
2.1. Earlier attempts to make social enterprises visible
Social enterprises in Europe have been so far clearly defined as originating and developing in what is known as social economy (Defourny, 2001). As a member of the European Union since 2007, Romania has taken up fully the challenge of developing its social economy, while

embracing the largely accepted views regarding this on the continent. Next to the term of social economy, which is new for Romania (known to the general public after the EU accession), the sector itself is younger than some of the existing members of the European Union. With a history of civil society oppression and communist totalitarian regime, Romania has a "young" social economy sector (in the real meaning of the word). Although some of the traditional forms of social economy were present during this regime (cooperatives, mutual societies associations), they were state governed and controlled. Only starting with 1990, after the revolution, the real third sector has begun to develop. Romania recognized by law and encourages all the basic forms of social economy: associations, foundation, cooperatives, mutual societies and recently, social enterprises. Along with Romanian's accession to the European Union and the emergence of the concept of social economy in our country, a series of steps to identify both the social economy actors (according to the European view) and the social enterprises have been noted. Although not legally defined and visible, social enterprises in Romania, have the benefit of taking various shapes among the organizations of the social economy.

Recent steps to create a social economy law in Romania, currently in public debate, include new legal categories assimilated to the social enterprise: the social cooperative and the enterprise of social integration. Until the initiative is finalized, social enterprises are partially defined in legislation but are not officially recognized along with the other organizational forms of the social economy. Both international and national literature focused on social entrepreneurship as social enterprises in Romania is constituted by both academic views and those of practitioners. Although the number of studies is still low, the study of literature and secondary and tertiary sources have revealed a few delineations of social enterprises in the Romanian geographical space.

Table 1. The results of the studies on social enterprises in Romania

Name of study / Institution	Criterion for identifying social enterprises	Type of organization identified with social enterprise	Number of organizations identified
SELUSI , 2011 *Survey of Social Enterprises in Europe*	Organizations with a social, economic purpose and entrepreneurial approach	Organizations with operational models for income generation	74 organizations
GEM, 2010 *Global Entrepreneurship Monitor*	Persons or organizations involved in entrepreneurial activities with a social mission	Organizations with strong social / environment missions and income generation strategy	2,5 % of the population
NessT 2007/2010	A business, profit or nonprofit, created to address critical social issues in a financially sustainable manner	Financially sustainable business	10 organizations
European Commission, 2007 *'Study on Practices and Policies in the Social Enterprise Sector in Europe'*	Entrepreneurial spirit, social mission and non distribution of profit	Cooperatives for the disabled, Authorized protected units.	41 organizations

Source: Own processing, 2012

The studies presented above have used primarily the criteria of social mission, economic purpose and entrepreneurial approach as criteria for identifying the social enterprises in our country. One important point related to these studies is the difficulty of access to information related to social enterprises. This is mostly due to the lack of clear cut definition in the Romanian law of entities that can be considered social enterprise as well as a law for the social economy.

2.2. The social enterprises in Romania – using EMES criteria

As mentioned above, the approach to identify social enterprises in this research are the EMES criteria. The identification of social enterprises was done theoretically by the author, following the economic and social criteria of the EMES academic view, in light of legal regulations.

The types of organizations analyzed in terms of the EMES criteria are the organizations considered in the study of the Ministry of Labor, Family and Social Care (2010) as specific forms of the social economy: associations, foundations, cooperatives, mutual societies and mutual benefit societies. From the category of general forms relevant to the social economy, authorized protected units were also considered. The reason for choosing UPAs is the overlap with the concept of social enterprise both in the legal proposal of the social economy of Romania and with the existing forms of social enterprises in different European countries (Great Britain, Italy, the Netherlands, Spain). An analysis of the legal regulations of the social economy actors in Romania and considering the EMES criteria therein revealed the possibility of the presence of the social enterprise status under any of the forms of social economy in EMES's ideal conditions, provided that forms such as cooperatives, CARs, mutual or protected units are organized as associations and foundations. The closest forms of organization to the theoretical concept of EMES are UPA and companies set up by associations and foundations. For a more clear understanding of this analysis, the breakdown for each of the EMES criteria is presented further. The explanations for each criteria are also provided as accepted by the EMES network and published in (Defourny, 2001).

Table 2. Analysis of the EMES criteria within social economy organizations in Romania

EMES criteria		UPA	Companies by NPO's
ECONOMIC			
E1	Continued activity of production of goods and / or services	Yes	Yes
E2	High degree of autonomy	Yes	Yes
E3	A significant level of economic risk	Yes	Yes
E4	A minimum number of employees	Yes	Yes
SOCIAL			
S1	An explicit goal dedicated to the community	Partially applies (not stipulated by law, applied through the scope of the organization)	Partially applies (not stipulated by law, depends on the organization)
S2	An initiative launched by a group of citizens	Partially applies (if the organization has more than one founding members)	Partially applies (if it is considered a form of association as a citizens' initiative)
S3	Decision-making power not based on the principle of capital ownership	Partially applies (not made compulsory by law)	Partially applies (not made compulsory by law)
S4	Participatory nature involving various parties affected by the activity	Yes (beneficiaries are involved in the production of goods in some cases)	Partially applies (not made compulsory by law)
S5	Limited distribution of profit	Yes (profit has to be reinvested in the organization)	Yes (profit has to be reinvested in the organization)

Source: Own processing, based on legal regulations. 2012

One conclusion of this analysis is that at least two of the actors of the social economy in Romania come very close to the EMES "ideal type" of social enterprise. The lack of legal regulation

specific to social enterprise has not prevented social economy actors in Romania to become more entrepreneurial. Recent efforts made by the Romanian government to encourage transparency and support in the social economy sector has led to the creation of a Social Economy law. Although still under debate, the law gives attention to the social enterprises and the definition considered is "Social enterprises are private legal entities carrying out economic activity, as well as nongovernmental organizations or other association forms stipulated by law that meet simultaneously, according to the documents on the basis of which they operate, the principles laid down in Art. 3, as well as conditions regarding governance, profit distribution and employee structure (at least 40% vulnerable group). What is also relevant for this law is that the concept of UPA is replaced by social enterprises. It is still not clear what the outcome of this law will be for these organizations in regard to the segment of work integration for people with disabilities. The law does however encourages all the application of all the EMES criteria for the social enterprise. As a sector still maturing after decades of absence during the communist era, there are still doubts about the credibility and reliability of these organizations. One idea is that companies set up by associations and foundations were chosen for the purpose of tax evasion, and with a declared social purpose, they lack their pursuit. Other examples, like football clubs, which are founded as associations and then with a company attached, have large revenue and profits and have a questionable social aim. In regard to UPA, phantom protected unites have been discovered, that is, companies which have presented themselves to the state agencies as employing persons with disabilities, and in reality have served their founders for tax relief.

2.3.Social enterprises in Romania - what do they do

After identifying the social enterprises based on the legal aspects that define the actors of the social economy, a further inquiry was considered to discover what is the nature and contribution of these organizations to the social economy and not only. The benefits that hybrid organizations of the third sector bring for the community and society that they exist in needs only reminders, and not justifications. The entrepreneurial nature of their structure create basis for economic added value and social problem alleviation. In Romania, the UPA and commercial companies set up by associations and foundations represent a small section of the social economy sector in the country. A recent study of the social economy sector in Romania (F.D.S.C., 2011) showed that indicated the existence of approximately 70,000 registered organizations, of which 25,744 were identified as organizations active in INS statistics. These organizations have had a combined income of 6 billion RON in the year 2009, and over 163,000 employees, hence 3.3% of the total employed population (FDSC, 2011).

A recent list of existing UPA (authorized protected united) reveled a number of 476 such organizations in 2011. An important elements of novelty is that a limited number of these organization have a pure legal structure as UPA, as the majority constitutes small and medium , limited liability companies. As legally created entities, organizations that include disadvantaged groups on the labor market, have fiscal relieve, as long as the profit gets reinvested for the most part (75 %) back in the company. UPA organizations can be found in almost all the areas o the economy, the most prominent ones being manufacturing, trade and professional services. The manufacturing sector includes carton, crafts, textiles, fields that allow easier access for people with handicap to work. Out of the 2700 associations and foundations which produced income in Romania in 2009, according to listafirme.ro, a database updated with official information from Ministry of Finance, only 727 associations and foundations were founders of a commercial company. The companies set up by associations and foundations include companies supporting activities of professional associations, religious charities, forest exploitation. The main fields of activity include wholesale and trade, manufacturing, agriculture and professional scientific services. Is it important to notice that both types of social enterprises tend to activate in the same fields.

2.4.Social enterprise in Romania and social enterprises in Europe

An important milestone in the study of social enterprises in Europe is represented by the work of Defourny and Nyssens, over the past decade, the authors draw attention to the fact that social enterprises across Europe adopt legal forms that have existed for a long time: associations, co-operatives or companies limited by share or guaranty. In countries where selling goods and services have a larger degree of freedom is allowed for associations, this form was often considered. In countries which don't offer this freedom, social enterprises take the form of either co-operatives or traditional business forms. In Romania, the law allows associations and foundations to conduct economic activities, up to 50 % of their total income, as well as set up companies, with the restriction that most of the profit has to return to the association or foundation. The authors also underline that one of the most dominant forms of social enterprises in Europe are *work integration social enterprises (WISE).* Fact is that for some disadvantaged groups on the labor market, such social economy organizations can increase the employability of, and provide employment for the labor force (Bibu, Lisetchi and Năstase, 2012). More specifically, the work integration social enterprises address the problems related to longterm unemployment and occupational inactivity of disadvantaged people in the labour market. According to Davister et al. (2004) there are four main groups of WISE organizations: enterprises offering occupational integration supported by permanent subsidies, WISE that provide permanent, self-subsidized employment, third group includes (re) socialising people through productive activities and the last group includes WISE offering transitional employment of traineeship. For a detailed description please visit (Davister, Defourny and Grégoire 2004). Among these four groups, the WISE groups which resembles the most the UPA – authorized protected units is the first group - enterprises offering occupational integration supported by permanent subsidies. These WISE organizations provide open-ended work contacts for handicapped people. They satisfy the gap between the capabilities and productivity required by the labour market and the special needs that these disadvantaged groups require. Many times these WISE organizations are known as sheltered employment. Although the UPA in Romania exist where there is at least 30 % of paid employees belonging to handicapped people, their main aim is to provide this group with a working place and means to self sustain.

3. Conclusions and limitations

Romania has the traditional forms of social economy, out of which two suit the best the EMES criteria for social enterprises, UPA and companies set up by associations and foundations. The number of these organizations that could be named social enterprises is very small compared to the overall sector of social economy, showing a less orientation for entreprenurial ventures in this sector. As limitations of this study the databases used may suffer from lack of full data. Another limitation is the fact that the analysis focus on the legal regulations regarding the social economy organizations in Romania. The main implications of this research is drawing the lines, in the current state of the social economy which are the actors that can best fit with the concept of social enterprise in Romania and facilitate further inquiries can be made into studying the managerial and economical implications of this emerging field – social entrepreneurship.

SOCIAL RESPONSIBILITY - A NEW PERSPECTIVE FOR THE MANAGEMENT OF PUBLIC ORGANIZATIONS IN ROMANIA

Popa Oana[96]
University of Craiova- Faculty of Economics and Business Administration

This paper presents the theme of social responsibility as a strategic tool to manage modern public organizations in Romania. The literature gives a high interest in corporate social responsibility, but the approaches to implementing social responsibility in public organizations is still at an early stage. The research purpose is to highlight the perception of the concept by officials from 15 public organizations in Dolj County. The study reveals the limitations that hinder the development of social policy and implementation of appropriate solutions of social responsibility in the public organizations, in order to achieve sustainability.
Keywords: Public Organizations, Social Responsibility of Organizations, Sustainable Development
JEL codes: M14, H0, R1

I. INTRODUCTION

This paper presents an analysis of the perception of social responsibility (SR) by the Romanian public organizations in Dolj County. The topic is of high interest because social responsibility is a modern tool to implement sustainable management organizations. Starting from the difficulty of defining the notion of social responsibility of organizations and other relevant studies, the paper mainly aims to analyze the perception that employees of 15 public organizations of Dolj County have of social responsibility.

The research objective is to analyze the degree of awareness of the concept of social responsibility and the limits that prevent the implementation of new social policy in the public organizations. The study analyzes a series of proposed solutions to increase public involvement of social responsibility, according to the perception of public employees in Dolj County.

II. DEBATE ON SOCIAL RESPONSIBILITY ORGANIZATIONS

Social responsibility of organizations is a relatively new concept that has encountered numerous controversies due to differences of interpretation discussed in the literature. To remove ambiguities in the definition of social responsibility, in November 2010 was issued a new international standard ISO 26000: Guidance on Social Responsibility, by which CSR is defined as a means of achieving sustainable development through seven lines of best -practices: accountability, transparency, ethical behavior, respect for stakeholder interests, respect for the law, respect for international norms of behavior and respect for human rights.

Nationally, the way of SR understanding and organizational involvement was rudimentary. The first organizations that addressed social responsibility strategy in Romania were the ones with foreign heritage, by adopting policies promoted by the group (Popa, 2011).

Social responsibility is understood by the Romanian organizations as ways of strategic actions of community involvement, philanthropy, employee volunteering, setting up foundations and collaboration with various stakeholders to practice good actions, based on a code of ethics and Pressures of international organizations on the implementation of social responsibility in organizations have favorable effects on society and on building long-term sustainability for organizations. In Romania, the state support has been limited until recent years. There is no

corresponding legislation requiring organizations to be transparent regarding disclosure or conduct audits of social responsibility, as it is processed in other countries (Burlea Şchiopoiu et all., 2008).

In recent years, the Romanian Government, through the National Strategy for Promotion of Social Responsibility (2001-2016), aims at encouraging the implementation of social responsibility in organizations in Romania, based on directives promoted in Europe and internationally. The Ministry of Economy, Trade and Business Environment makes the first steps at national level in terms of increasing transparency and attracting funds for the promotion of social responsibility.

III. CASE STUDY: THE **SOCIAL RESPONSIBILITY** OF THE **PUBLIC ORGANIZATIONS IN DOLJ COUNTY**

Research Methodology

In order to create the database needed for the study was used a quantitative research method. Data were obtained by distributing questionnaires in public organizations of Dolj County. The sample set is diverse and includes 15 of the most representative public organizations of the Dolj County, Romania. In the research participated individuals in positions of leadership and subordinate employees. We believe that information from the survey are relevant and true as they respect the confidentiality and anonymity guidelines.

Depending on the number of total employees were accounted 4 categories of public bodies: up to 10 employees, 10 to 50 employees, between 50 and 250 employees and over 250 employees. It was intended that the number of respondents for each public body is proportional to the total number of employees in the organization. The total number of respondents who answered the questionnaires is 139.

Areas of activity are varied. The figure below highlightes the areas of activity of public organizations included in the survey.
Fig. nr. 1.- Fields of activity of the public organizations of Dolj County used in the sample

Processing and analysis was performed using SPSS Statistics 17.0.

The questionnaire is structured in three parts: the first part contains information that show the degree of involvement of public organizations in social responsible social actions, the second part provides information about the perception of public organizations on RS, the limits restricting the sustainable development of organizations and the solutions that the public organizations consider appropriate in order to build a more responsible management. The third part provides general information on the questionnaire respondents and on the analyzed organizations. In this paper we present only the results of the second part.

IV. THE RESULTS OF THE RESEARCH

The research shows the perception of social responsibility by the interviewed employees. To define the organization's social responsibility there have been used six statements outlining specific areas of organizational responsible behavior.

Statement 1. *SR is the voluntary actions of organizations regarding the use of natural resources and the protection of the environment in order not to affect the future generations*

Statement 2. SR *is the voluntary way of organizations to contribute to a better society and a cleaner environment*

Statement 3. *SR is the good communication and networking with stakeholders (employees, suppliers, customers, community partner organizations, NGOs, State etc.)*

Statement 4. *SR is a work of charity, donation, sponsorship*

Statement 5. *SR requires the implementation of a code of ethics and conduct*

Statement 6. *SR requires social projects in order to improve and promote the image of the company*

Based on the information obtained from the research we conclude that the representative share of 19.13%, defining social responsibility suggests the need for a code of ethics and good conduct in order to build a good cooperation in the organizational activity. 18.46% of respondents saw SR as a means to help improve the environment and to involve in the community through various social projects. 18.37% of respondents believe that social responsibility must also be defined in terms of stakeholder theory, so that organizational management should ensure good relationships with partner organizations and employees. 18.31% of employees consider the organization's social responsibility as a means of promotion and marketing and 17.18% define social responsibility in terms of sustainable development of the organization. Only 8.55% of respondents believe that social responsibility can be defined by a policy of philanthropy and charity.
Fig. nr. 2– The perception of the public organizations employees in Dolj County regarding the definition of social responsibility

The lack of implementation of SR policies in public organizations is based on a number of barriers that have to be identified and removed in order to have a responsible and sustainable management. The study shows that the main limit to implement a policy of social responsibility is the lack of financial resources, as perceived by a percentage of 36.14% of respondents. 21.29% suggest that the lack of authority for decision within the organization prevents them to be involved in social action or to pursue best practices in the workplace. 14.86% of employees suggests that the emergence of economic crisis negatively affected the political involvement of social responsibility. Lack of information on how to implement, to define and to obtain the benefits of social responsibility is another limit in the development of responsible behavior of organizations (13.65%). Only 2.01% of respondents believe that social practices are not needed by the organization they belong.
Fig. nr. 3– The perception of the public organizations employees in Dolj County regarding the barriers in adoption of a SR policy

The study shows that understanding of the role of social responsibility for public organizations grew, but the lack of funds for socially responsible actions inhibits the development of the organizations.

The main solutions for implementing new SR policies and management strategies revealed by the study are the the establishment of additional funds for social responsibility projects (33.47%) and gain of financial or other support from state bodies (33.06%). Employees of public organizations show interest in the ethical motivation of top managers in the adoption of best practices in the organization (14.92%). Further information or participation in sponsored conferences on social responsibility have a less favorable impact for the development of new social projects (12.1% and 6.45%).
Fig. nr. 4– The perception of public organizations employees regarding the required solutions to implement social responsibility

We conclude that increased funding for training and employee involvement, involvement in the community through various projects, or financial support and information from the state can help develop a responsible and sustainable organizational environment, which is the foundation of a healthy society.

The main limitation of the carried out research is the small number of public organisations that was review. Although results cannot be generalized to national or regional level, we consider that the study may be an early important step of an extensive research.

IV. CONCLUSIONS

So far, the implications of social responsibility in the public organizations are still at an early stage or lightly considered. It is necessary to analyze the influence of social responsibility and the management of public organizations, not just at a corporate level. The paper makes an important contribution in the sphere of analysis and implementation of social responsibility in the Romanian public organizations.

The study results provide useful information for the national or international authorized bodies, which can act to develop responsible behavior in public organizations. Solving financial difficulties faced by organizations in Romania could be the main tool for sustainable development and build a responsible social behavior.

Removing barriers described above and adopting new management strategies of social responsibility build a new perspective for the management of the Romanian public organizations.

PURCHASING MANAGEMENT AND ITS IMPORTANT ROLE IN PROVIDING VALUE ADDED TO ORGANIZATIONS

Pop Sitar Corina
Scholar of Romanian Academy
Iasi Subsidiary

Nowadays, in the knowledge based society, purchasing management has become one of the most important tool for improving the profitability of organizations. Because of its important role, purchasing is the function that has a tremendous impact on these efforts to create value in the organizations. This article summarizes the main value that can be provided by the purchasing function to the organizations. The paper starts with the presentation of the evolution stages of purchasing management Furthermore, we present the strategic role of the purchasing management in the knowledge based society. Based on the results of a questionnaire we summarized the main value added by purchasing in the companies from Maramures county. Finally, we draw conclusions and we elaborate some guidelines for managers.
Keywords: purchasing management, value added, knowledge based society
Coduri JEL: O32, M19

1. Introduction

The term "knowledge society" was used for the first time in 1969 by Peter Druker but it was better defined by Mansell & When (1998) and Stehr (1994). We can find the keys to knowledge society following the steps of what we call the information society, heading towards a much more collaborative global world of knowledge sharing: a globalization of knowledge.

The proliferation of information technology create opportunities and threats for organizations. The adoption of E-procurement helps member of the supply chain networks to penetrate new markets and find new customers' segments. Lederer et. al (2001) suggested that an organization can use E-procurement to create strategic advantage through improved customer relationships resulting from greater business efficiency and better information access and flexibility.

The aim of this article is to present the strategic role of purchasing management in the knowledge based economy. The article starts with the evolution stages of the purchasing management. Furthermore, the paper presents the main value added that can be provided by purchasing management. Next, we summarized the main value added by purchasing in organizations from Maramures county. The paper ends with conclusions and recommendations for managers.

2. The evolution of purchasing management

The purchasing function has became lately one of the most important tool for improving profitability of the organizations. This reputation was received because of its important contribution to the costs reduction and to the quality improvement.

Until it has reached this stage of development and the recognition from management, the purchasing function has passed through several stages over time. In the first stage, purchasing management was focused only on the supply of raw materials necessary to carry out the production process and purchasing was considered only an administrative function.

In the next stage, purchasing is receiving a commercial orientation due to the achievement of short-term profit by negotiating prices and selecting the suppliers which offered the lowest prices. In the third stage, purchasing had a logistic orientation which aimed at obtaining the smallest total cost of purchasing through the optimization of the purchasing process. Nowadays, purchasing management has a strategic orientation and contributes to the achievement of long term benefits.

In table 1 you can observe some of the differences between the traditional and the strategic role of purchasing. We identified the differences at the organizational level, at the suppliers' level and at the operational factors. As you can notice, the role of the purchasing has change at all levels and it became a strategic function of the organizations.

It has been changed also the way managers look at the purchasing function. This is visible through the hierarchical position occupied by the purchasing function in the structure of organizations. Thus, if the purchasing is seen only as an administrative function, it does not occupy an important place, only a low position in the organizational structure.

If is viewed as a commercial function, purchasing is reporting directly to the top management. If purchasing is part of the logistics, it is integrated with the other functions in the organization. As purchasing becomes a strategic function, it is represented in top management of the organization.

Tabel 1: The main differences between the traditional and strategic role of purchasing

Concept	The traditional role of purchasing	The strategic role of purchasing
I At the organizational level		
The decision process	Limited at the operational decisions or at tactical decisions	Implication in the strategical decisions
The contribution to the organizational profit	Costs reduction through negotiation of better prices and discounts	Main tool for improving profitability of the organizations
The organizational structure	Accent on centralization	Accent on descentraliza-tion in order to be closer to the possible problems
The purchasing department status	At the lower levels	At the highest levels, demonstrating profesionalism
I I At the suppliers level		
Relationships with suppliers	The suppliers are considered as an enemy which has to be caught	The suppliers are considered as partners
Negotiations with suppliers	Win or lose	Win-win
Suppliers' porfolio	Big, based on the asumption that more suppliers can assure better the resources needed by the organization	Small and based on an efficient logistic
Suppliers' location	Localy or national	Globally
I I I Operational factors		
Strategy	Departmental plan	Business plan
Decision	Fragmented decisions	Decisions based on total cost

		analysis
Systems	Simple IT system	Advanced and integrated IT system
Employees	Without special education	Higher commercial and technical education

Made by the author

3. The strategic role of purchasing management in the knowledge based society

Plăiaş (2006) considers that an eficient purchasing management can produce the following types of impacts onto the organizations:

-fundamental impact;

-information impact;

-impact on the organization image.

Fundamental impact

In many organizations the purchasing volume reprezents an important percentage from the total turover. In the romanian economy, the purchasing volume reprezents aproximately 62% from the total turover, and in USA the purchasing volume is around 60%. In figure 1 you can observe that the savings made when purchasing goods and services contributes directly to the profit of the organizations.

The purchasing impact on the organizations can be direct and indirect. The direct impact refers to the purchasing price. So, if the purchasing price can be reduced without to affect the quantity, quality and the delivery conditions, then the savings made will contribute to the profit increase. In other words, every RON saved will be added entirely to the organization profit.

The numbers from the boxes that you can see in figure 1 reprezent the curent performances of the organization. What you see between brakets are the new performances that rezults from a reduction with 7% (0,25 milion) of the purchasing expenditures for buying goods and services.

This reduction of the purchasing expenditures will determine the increase of the profit rate from 9,87% to 12,96% and of the return on assets from 1,22 to 1,29. This will determine the increase of the return on investments from 11,09% to 14,25%.

As you can notice, every RON spent when purchasing goods and services leads to the icreasing of profit with one RON. We can observe thus the importance of the purchasing function for the increasing profitability of the organizations.

Information impact

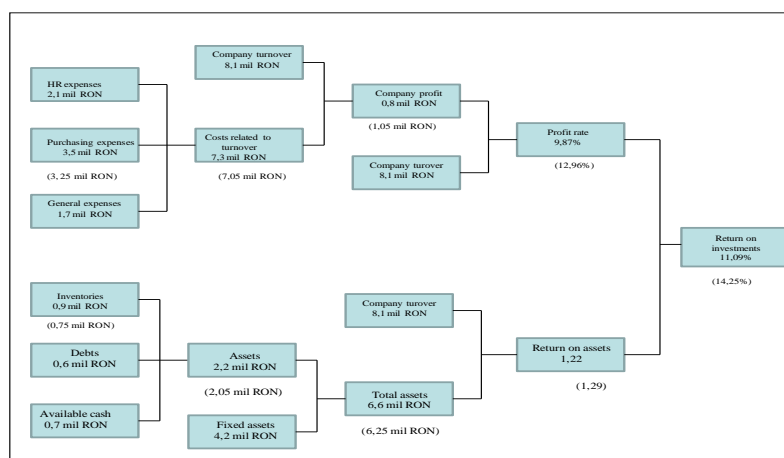
Purchasing can represent an important source of information because of its unique position in the organization. Due to its position, purchasing has a direct interface with the market where the organization is operating and also with the specific needs of the organization.Therefore, the information received from the current and pottential suppliers and also from other purchasers can be useful and valuable for the other departments from the organization.


Figure 1: The relations betwwen the purchasings costs and the rentability of investments
Source: Plăiaş, I., Marketing of aquisitions,Risoprint, Cluj Napoca, 2006, p.38

The manager of the purchasing department can play an important role in the organization based on the important information that he has.

Impact on the organization image
Purchasing can affect also the organization image in the environment where it operates. If an organization does not have an etiqual behaviour against its current and pottential suppliers, then the organization image is in dangeour.

4. Main value added by purchasing in the romanian companies
Purchasing has become an important activity also for romanian companies because of the main value added that can be provided by purchasing management. In the attempt to discover how are things in practice regarding to the main value added by purchasing management we applied a questionnaire to 75 companies from Maramures county. The companies were selected from different sectors of activity.
The questionnaire had two parts. The first part of the questionnaire contained questions about general data of the companies (name, object of activity, number of employers, turnover, etc.). Also, respondents had to indicate the organizational structure of the purchasing department and to attach the organizational chart.
The second part contained information about the purchasing department. In this part of the questionnaire we made several statements about the purchasing department, which respondents had to evaluate on a scale of 1 to 5 (Likert type scale).
The statements we have made include the following aspects:
- the recognition of the strategic importance of purchasing function;
- the main added value provided by the purchasing management;
- the total amount of money spent by organization on purchasing.

From the total number of questionnaires sent, we received back forty one questionnaires. Next, we present the analysis of survey results and major conclusions we have drawn from this study.
Regarding the recognition of the important role of purchasing function we received the following results (see fig. no 2). In this respect we asked the respondents to express their satisfaction on the statement formulated (Management recognize the important role of purchasing in the

organization) on a scale from 1 to 5 where: 1 = completely against; 2 = mostly against; 3 = neither agree, nor against; 4 = mostly agree; 5 = completely agree.
Figure 2: Recognition of the important role of the purchasing function in the organization
Made by the author

If we analyze the data received we can observe that:
- most managers from Romanian companies began to perceive the huge potential of purchasing within organizations (30%);
- there are some managers who are completely against (11%), mostly against (13%) or neither agree nor against (19%) with the statement that we formulated.

In order to analyze which are the main value added provided by purchasing, we made a with the most important value added and we asked respondents to rate them on a scale from 1 to 5 where: 1= very often, 2 = often, 3 = sometimes, 4 = very seldom, 5 = never. The results obtained are presented in figure 3.
Figure 3: The main value added provided by purchasing
Made by the author

We can observe that the main value added by purchasing is costs reduction. This is followed by improved efficiency of the purchasing process and improved relations with the suppliers. Gaining competitive advantage was the value added which was very seldom provided by the purchasing management.

5. Conclusions
Based on the obtained results from the questionnaire we can conclude that most managers from Romanian companies began to perceive the huge potential of purchasing within organizations. In

the same time there are also some managers that do not realize the important role of the purchasing function in the organizations.

Based on the results from the questionnaire, we can conclude that in the majority of the managers could not identify the total amount spent by their organizations on purchasing. They didn't know how much is spent on what in their organizations. This means that purchasing is not treated by managers as a strategic function of their organizations. Because of this undervaluation, managers are missing opportunities for adding value to their organizations.

With this article we want to draw the attention of researchers and managers on the huge potential of the purchasing function to provide value added to the organizations in the knowledge based society. In order to achieve this, managers should pay more attention to the procurement process and they should create special policies and procedures for the purchasing process which can improve the efficiency and effectiveness of the procurement process.

EXTERNAL FORCES DRIVING CHANGE IN THE ROMANIAN SMALL AND MEDIUM SIZED ENTERPRISES

Predişcan Mariana
West University of Timisoara, Faculty of Economics and Business Administration

Roiban Roxana Nadina
West University of Timisoara, Faculty of Economics and Business Administration

Change is a constant in everyday life confronting organizations to continuously adapt their strategy, structure, processes, and culture in order to survive and stay competitive on the market. Implementing organizational change is one of the most important skills required for managers and in the meantime the most difficult one.

The forces driving change within an organization, that can be either external or internal, are those that propel a company forward towards change and in order to identify the need for change and make the proper changes, managers have to develop a tool that allows them to analyze how does the environment influence their business activities. A vision for change will clarify the directions in which the organization needs to move, starting from its current state and taking in consideration the existing opportunities and threats from the environment that allow to move to a future desired state.

The purpose of this paper is to identify the concern for change in the Romanian small and medium sized enterprises by presenting and explaining the past and present influences of the main external forces that have determined the need for change in the last 3-5 years and to make recommendations about future possible changes that have to be performed by managers for a better harmonization with the environment. The research method used for this study is the interview on a sample that contains some of the most relevant SME's from the western side of Romania, from different industries. We analyzed the main external forces that had an impact on the small and medium sized enterprises and how were they generating the need for organizational change, in order to see which present and future changes are required.

Key words: organizational change, need for change, environment, forces of change, SME's

JEL classification: M10,M19

Introduction

The environment shows various influences on the activities undertaken by companies, so an analysis of its factors is important in order to establish clearly the organization's current situation and the steps required for change that will allow a certain level of development which leads to performance.

The need for change must be identified as necessary by the managers of the organization, because as Rosbeth Moss Kanter stated, "*organizational change is not driven by pressure from the environment, resulting in a set of problems that trigger an automatic response, but the perception of key actors on the environment* ".

The potential changes identified in the environmental analysis should be carefully studied and correlated with the resources and the particularities of the organization, establishing first a hierarchy and then implementing the most important ones, because the success of the organizational process of change depends on the quality of this stage.

The paper aims to identify all the external forces that have shown their influence on small and medium sized enterprises from the western side of Romania, in the last 3-5 years and how are they currently acting, while identifying also their future development. The focus is on how managers perceived those external influences and the changes they have made, but also on

proposals for potential organizational changes for the Romanian SMEs, which can be made in the future, for a better adaptation to the environment.

The study was conducted on a total of 50 SMEs from the western side of Romania, by applying an interview to top management.

External forces driving the need for change in Romanian SMEs

According to Article 3 of Law nr.346/2004 on stimulating the establishment and development of SMEs, the SME are those organizations which satisfy the following conditions:

,, a) have an annual average number of employees less than 250;

b) have an annual turnover equivalent to 8 million euros or a loss in the balance sheet not exceeding the equivalent of 5 million euros;

c) meet the criterion of independence (any form of organizing the economic activity, autonomous patrimony and authorized under applicable law to acts and acts of trade, for profit in competitive conditions, namely: companies, cooperatives , individuals engaged in independent economic activities and family associations authorized under the law in force) ".

,, SMEs are classified according to the average annual number of employees in the following categories:

a) up to 9 employees - microenterprises;

b) between 10 and 49 employees - small enterprises;

c) between 50 and 249 employees - medium enterprises. "

(Law nr.346/2004, Article 4, paragraph (1)).

The external forces that generate the need for change are:
-Economic forces;
-Technical and technological forces;
-Natural (ecological) forces;
-Political forces;
-Legal forces;
-Socio-cultural forces.

1. Economic forces

The main economic forces that have shown and continue to show their influence on SMEs in Romania are:
-The domestic and international market;
-The development pace of the economy;
-The purchasing power of the population;
-The financial potential;
-The infrastructure.

1.1. The domestic and international market

This category of factors had a major influence on the activities of SMEs in Romania, causing recently significant changes. Following the events that occurred worldwide, after 2008 the economic recession caused a continue decrease in the market's absorption capacity, having a negative impact on many businesses from different industries.

The most affected was by far the construction industry. Primarily this was caused due to interest rates that have offset the growth in prices, people being encouraged to consume more and more, by borrowing to buy real estate because of the nonsense anticipation of continuing growth in their prices. This increase in demand has led to increased offer, companies lending as well in order to build more. Commercial margins in such cases were extremely high in order to cover rates and bank interest and when the financial blockage has occurred, followed by lack of liquidity, the

situation has become dramatic. Sale of real estate and prices have fallen, many companies being forced to lay off most of their staff due to the reduction of demand and the lack of funds to pay salaries, many of them even coming close to bankruptcy.

Unfortunately the forecasts are not optimistic, and future trends show a rise in prices and decrease in volume, bankruptcies and takeovers, while the new investors are not willing to enter the market, especially for the fact that the amount of existing production capacity is exceeding the current needs.

Micro enterprises are addressing almost exclusively to domestic markets, having no ability to promote their products and to penetrate on foreign markets.

Changes needed to be done in order to minimize these negative influences are: to identify niches in existing businesses, to identify consumer needs that are not currently met or are met inadequately, to identify business ideas which may have a chance of success even in times of recession, or orientation to other businesses (e.g. online businesses that require minimal investment, poor storage facilities resulting in lower costs and hence prices). The micro can focus on the export trade in traditional organic products (such as brandy, palinka, ham, sausages), with an attractive manner of presentation.

*1.2. The pace of economic development potentia*l had a negative impact of small business in Romania, because they are the first affected by its contraction.

The influences of the crisis on large companies have also affected the small enterprises that were providing certain services to those large companies.

The more difficult economic conditions in Europe and elsewhere, the budget deficit, inflation and unemployment rate, will lead to a small future growth of the Romanian economy, having a negative influence on the SMEs.

The absorption of European funds for our country is low, so any changes required for improving the small business activities are related to writing projects and attracting grants used to develop, creating new production units, upgrading the existing ones or purchasing intangible assets such as software, patents, licenses etc.

1.3. The purchasing power of the population shows a direct influence on the micro enterprises due to the fact that the Romanian citizens are mainly their customers. The reduction of wages in the public sector by 25% in 2009 and the reduced wages in other fields, has affected in a negative way the people's purchasing power. Also, taking in consideration that the economic crisis has manifested itself in other European countries, where a large number of Romanian citizens left in search of a better job, the impact on their purchasing power is obvious.

The measures taken recently in Europe have made more difficult for the Romanians to access a decent job (see legal restrictions imposed in Spain), have led to a continuing decrease of financial support for the family members that were left behind, affecting the purchasing power of the Romanian citizens that also affected the sales made by SMEs. This decrease, along with increasingly pessimistic information about the evolution of the purchasing power of EU citizens, the dangers of euro area, the economic problems faced by some countries (such as Greece, Spain, Portugal), generates a prudent behavior for Romanian citizens. All this adversely affects the chances of development of micro enterprises in the present and future, because in order to survive on the market, they must reduce the prices, given that production costs remain unchanged, or in most cases even increase.

The changes needed in this case, refer to the businesses reorganization primarily in terms of their size for a better flexibility that allows them to easily adapt to new requirements, and finding new ideas, less costly to allow costs reduction and prices. As we stated above, online commerce is becoming more popular mainly due to very competitive prices compared to the ones of traditional stores.

1.4. The financial potential

Although there is a strong banking system in Romania, access to credit for micro enterprises is extremely limited. The main reasons for this are: the lack of possibilities to guarantee loans, particularly high interest rates that discourage a loan, state guarantee funds for SMEs relatively low. Appetite for credit is generally low for private entrepreneurs, their development being based on previous profit or from loans provided by partners or shareholders, without resort to external financing sources - mainly bank loans.

We believe that the future actions of accessing bank loans by SME managers will be limited, for the same reasons as before, but is recommended to study carefully the various programs offered by Romanian banks, designed just for this type of business in order to encourage external financing that will allow SME's to indentify new opportunities.

1.5. The Infrastructure

Two thirds of the total area of Romanian infrastructure has to be rebuilt and international studies show that the poor state of roads and lack of investment in this segment is a major impediment to economic development. This is why many investors choose to invest in other countries, the negative effects of such decisions being manifested also on SME's.

Unfortunately the actions that can be taken to remedy this situation are limited. The business location is a very important decision, so that access to necessary resources that allow an effective activity to be as easy as possible.

2. Technical and technological forces include the technical level of machinery, equipment and facilities that may be purchased by organizations, the number of patents, licenses etc.

These factors have not created in recent years great pressure for change in small companies. In general, we cannot talk about technology and performance at this level. The interest for the latest achievements of science and technology, justified by the nature of the micro activities is low. Purchases of new equipment (which mainly relate to computers and cars) are rare and only in those companies engaged in productive activities.

The main changes that can be made are: more focus on IT, a better use of the Internet for research, a better management through better communication with employees, a better record of management using software for management, accounting, employee records, employee evaluation, relationship with the bank, online payment.

It is also recommended to take in consideration the high growth potential of online shops. Although in Romania there are many Internet users, the number of such businesses is relatively small.

3. Natural (ecological) forces including all natural resources (atmosphere, climate, soil, subsoil, vegetation, etc.) had a strong impact on the SME's.

As a result of alignment with the EU law, Romania has adopted a series of laws that protect the atmosphere. Restrictions on smoking have generated additional investments in order to create spaces for smokers and nonsmokers.

The increasing purchasing price in certain raw materials has generated the need for change, such as orientation to other cheaper materials (e.g. the increasing price of fuel has led to the adaptation of vehicles to use LPG, especially for those businesses in the area of transport - taxi). Future changes that should be made in this direction include the orientation towards natural products, speculation in the consumer trends, and greater emphasis on investments for environmentally friendly actions.

4. Political forces including the political system and the activity of political parties' showed

multiple influences in our country due to changes in fiscal policy, budgetary policy and the calling for foreign loans to cover the budget deficit.

Major changes in EU policies, implementation of austerity measures for countries that have a high debt burden (like Greece, Italy, Spain and Portugal), changes of prime ministers in Greece and Italy have led and will lead to future changes in Romania as well.

The political decisions of European countries with high unemployment rates have influenced the Romanian citizens that weren't able to find a job in those countries (especially Spain), some of them returning home and trying to establish new business as a result of the experience gained in other European countries (mostly in agriculture).

As future possible changes that can be made regarding the political factors, the entrepreneurs should have a greater involvement through existing bodies and political forces to propose actions that support the development of the entrepreneurial phenomenon in Romania.

Such proposals addressed to various political parties and their support to promote legislation will ensure a greater protection for small businesses.

5. Legal forces refer to all laws, decrees, decisions, regulations etc. specific in a certain country. Their impact upon Romanian SMEs was mostly negative. For example the change of the taxation system by the appearance of the so called "minimum tax" led to the closure or suspension of over 200.000 small businesses. Later this law was reversed, returning to the micro income tax.

Another legislative change with a strong negative effect was the increased VAT rate from 19% to 24%.

As further actions in order to minimize the negative effect of the legal forces, the entrepreneurs should be aware of legislative changes in the EU that are implemented in a relatively short period of time in our country.

6. Socio-cultural forces (social structure of population, education, science, culture, etc.) don't have a great potential to influence the micro enterprises.

Although the number of young graduates with higher education has increased, most of them are working in many jobs below their training.

In recent years some micro enterprises had problems hiring qualified trades (especially in catering and production) because of the very low interest of young people for these professions.

Because of these deficiencies many businesses started to provide training services for youth who want to qualify in a trade.

Possible future changes that can be made include trainings in accordance with the requirements of economic agents, human resources training under the new labor code, organizing teambuilding to stimulate employees' creativity which are very important in finding solutions for change and innovation.

Changes in terms of mentality and attitude towards work are still needed for a better quality of work.

It is desirable to increase the appetite of young people to develop businesses, to become entrepreneurs (through education and values promoted by society).

At the micro level exchanging experiences with similar businesses in other countries (if there are such opportunities) or even organizing presentations of new elements of business from other countries can motivate and change attitudes of their employees.

Conclusions

The need for change must be primarily associated with the need for survival because without identifying the need for organizational change as being opportune, managers can not ensure on

reaching long term planned goals, which will lead to the organization's decline or even bankruptcy.

The interest in making changes in the SMEs in Romania is very low, among the main reasons being the perception of the Romanian managers that do not consider that by making changes, things can get better in order to obtain increased performance. The daily routine and lack of studies in management or even economic science (managers usually apply empirical management based solely on experience and intuition) does not give them time to depart from current concerns and try to evaluate what happens around them.

Most managers do not give a great importance to the changes taking place in the business field and do not consider that change can influence their business activities. Changes are not considered a success factor in the organization. The managers often think of change only in critical times, in situations where changing is required (primarily changes in legislation: VAT rate, income tax, separate rooms for smokers and nonsmokers, winter tires, new labor code provisions etc.)

In order to identify the need for change as being opportune, managers should start with an environmental analysis that allows a clear view upon the organization's current situation and the necessary steps for change that assures a development which leads to performance. Not all factors manifest their influence with the same intensity, so it is important for managers to primarily identify the key factors with the highest power of action and then to focus their attention on factors less influential.

Possible changes identified by this analysis should be carefully studied and correlated with the resources and the particularities of the organization, establishing a hierarchy and then implementing the necessary actions.

CHOOSING THE RIGHT FORM OF LICENSING A BUSINESS IN ROMANIA

Predişcan Mariana
West University of Timisoara, Faculty of Economics and Business Administration

Roxana Nadina Roiban
West University of Timisoara, Faculty of Economics and Business Administration

Choosing the most appropriate form of licensing a business is an important decision not easy to be made by an entrepreneur and it should be taken only after he has the required skills and abilities to do so. The business idea should harmonize with the business environment and its future trends, with the existing opportunities and the future products or services that the company will provide and not least the entrepreneur has to make sure that he has sufficient resources to get started.
We consider that every business has a number of features that make certain forms of licensing to be more suitable than others.
This paper aims to present a multitude of items to be reviewed by an entrepreneur at the start-up in order to choose the most appropriate licensing type for his business.
Given that our country's law allows entrepreneurs to license their businesses in several forms, the decision to choose between many existing possibilities is a very important one for the future good of the business.
Currently in our country there are two major laws governing the licensing of a business. The first one is the republished and subsequently amended Company Law number 31/1990 and the second, the Government Emergency Ordinance number 44/2008 regarding the economic activities of the Sole traders, Individual enterprises and Family enterprises.
The Company Law number 31/1990 allows companies to choose between one of the five types of business entities that can operate in Romania: General partnership (in Romanian SNC), Limited partnership (in Romanian SCS), Limited partnerships by shares (in Romanian SCA), Joint stock company (in Romanian S.A.) and Limited liability company (in Romanian S.R.L.).
GEO number 44/2008 on economic activities of the Sole traders, Individual enterprises and Family enterprises regulates the licensing and the activity of a Sole traders, Individual enterprises and Family enterprises.
Key words: business licensing, types of business entities, Sole traders, Individual enterprises, Family enterprises
JEL Classification: M10,M19

Introduction

Certainly, not every person has the necessary skills and abilities to license and develop a business. Once a potential entrepreneur succeeds to auto evaluate himself and concludes that he holds a minimum of necessary knowledge for starting a business, that he has certain qualities that recommend this approach, that he is an ambitious person with a very good health condition that allows him in the near future to initiate and develop a business, the next step has to be taken. This future entrepreneur must find an answer to the question: "which business type would be the best for me?" In order to answer this question correctly, the entrepreneur should start from his own knowledge, skills, abilities, but also has to take in consideration the business environment's characteristics, trends and peculiarities that may occur, the aim for business analysis being to identify the business's opportunities, specific for a certain area and period.
Only after getting to know the idea of a business, the entrepreneur should focus on another question: "Which is the best licensing type for my business?"
As stated above, the legislation in our country allows various forms of business licensing. These authorization forms are largely presented in two main acts: the republished and subsequently

amended Company Law number 31/1990 and the Government Emergency Ordinance number 44/2008 regarding the economic activities of the Sole traders, Individual enterprises and Family enterprises.

The Company Law number 31/1990 allows companies to choose between one of the five types of business entities that can operate in Romania: General partnership (in Romanian SNC), Limited partnership (in Romanian SCS), Limited partnerships by shares (in Romanian SCA), Joint stock company (in Romanian S.A.) and Limited liability company (in Romanian S.R.L.).

GEO number 44/2008 on economic activities of the Sole traders, Individual enterprises and Family enterprises regulates the licensing and the activity of Sole traders, Individual enterprises and Family enterprises.

The selection of an appropriate type of business entity according to the business features

Each stage that the future entrepreneur hast to follow is extremely important and has an essential contribution to the future business success.

In this paper we propose to present and make an analysis of the key elements that future entrepreneurs must think of and that need to be correlated with the business particularities for finally choosing the most appropriate form of licensing the business.

We believe that the best decision on a business authorization form may be taken by the entrepreneur after analyzing its business following features:

      -the activity that will be organized;
      -the size of business and its future development opportunities;
      -the future number of business partners;
      -the involvement and responsibility level assumed by business partners;
      -the available capital correlated with the needed one;
      -the future tax liabilities;
      -the specific characteristics of each legal form stipulated by the law.

1. The activity that will be organized

Not every activity can be organized in a legal form. The two major laws governing the licensing of a business provide full information for the entrepreneurs regarding the activities that can form the business domain for a business entity or Sole traders, Individual enterprises and Family enterprises.

2. The size of business and its future development opportunities

According to the estimates on the size of business, on its future development opportunities, entrepreneurs can choose a simple form of licensing (GEO 44/2008 on economic activities of the Sole traders, Individual enterprises and Family enterprises) when the business is small and has no future development possibilities. In this case, the licensing as a Sole trader is recommended for those that are working alone and are unable to hire more staff. An Individual enterprise offers the opportunity to work with staff, while a Family enterprise operates only with family members. In order to establish a big business, with future development opportunities, it is better to opt for one of the types stated by the republished Company Law 31/1990.

3. The future number of business partners

Depending on the number of business partners, entrepreneurs may opt for different types of businesses. If the business will have a single partner then the only legal form that can be used is the Limited liability company. If however the number of partners or shareholders willing to join in order to form a business is more than 50, then they cannot authorize as a Limited company. Generally, an entrepreneur decides to license as a business entity when he has at least one associate.

4. The involvement and responsibility level assumed by business partners

There are significant differences between the presented types of business entities that can operate in our country in terms of degree of involvement and responsibility assumed by the partners. Thus, in a Limited liability company each partner has a limited liability correlated with his contribution to the capital. Not the same thing happens with the administrator.

The administrator's liability can be grouped into three categories:
- Ordinary liability to the company and associates;
- An outstanding liability to third parties;
- Aggravated liability in case of bankruptcy of the company.

For a General partnership (SNC) the social obligations are guaranteed with the social patrimony and unlimited joint liability of all partners. Within Limited partnership (SCS) and Limited partnership by shares (SCA) the limited partners respond with all their wealth while the general partners respond according to their contribution to the share capital (SCS) or they pay shares (SCA).

5. The available capital correlated with the needed one

Currently the limit provided by law for share capital is relatively low. We refer to the 200 RON, the minimum for Limited liability companies. Certainly for starting a business, much larger resources are needed, depending on what the new business is intended to achieve. There are different possibilities for authorization of economic activities stipulated in the GEO 44/2008 on economic activities of the Sole traders, Individual enterprises and Family enterprises where share capital is not required. The Company Law 31/1990 also offers the possibility of an authorization without capital in the case of the General partnership (SNC). For this type of business the law does not require and does not set a minimum capital. Partners are free to determine, after their own interests, the value of the social capital. General partnership, Limited partnership and Limited liability companies are obliged to pay fully the share capital, on its constitution date.

The highest minimum capital required by law is to establish a Joint stock company (S.A.) or a Limited partnership by shares (S.C.A) than cannot be less than 90.000 RON. The Government may change the minimum capital at most once every two years , taking into account the exchange rate so that the amount in RON be equivalent of 25.000 EUR. At the constitution the share capital, paid by each shareholder cannot be less than 30% of the subscribed one, unless the law provides otherwise. The remaining capital will be paid within 12 months from registration.

6. The future tax liabilities

A very important element in choosing a legal form of licensing relates to the future tax liabilities that the entrepreneur should pay.

As shown in the Tax Code Law, Law number 571/2003 updated by the GEO 125/2011 and valid in 2012, the tax system for business entities are different than the tax systems for Sole traders, Individual enterprises and Family enterprises. Thus, companies can be taxed at profit tax or income tax on small enterprises if they meet certain conditions prescribed by law.

Profit tax is the amount of 16% and applies to taxable gross profit. Gross profit is determined as the difference between the total taxable income and the total expenses contributed to the income adding deductible expenses.

Micro income tax is the amount of 3% and applies to gross income of a business entity that is called microenterprise. To do this, that business shall cumulative meet on the 31th December of the previous fiscal year, the following conditions:
- To have other revenues than those referred to in art. 112 ^ 2. (6);
- To have from 1 up to 9 employees;
- To have achieved revenues that did not exceed the equivalent of 100.000 EUR;

- Its capital to be held by persons other than the state and local authorities.

According to art. 112 ^ 2. (6), from the Tax Code Law, cannot choose to pay income tax on micro, Romanian legal entities which:

"a) are engaged in banking activities;

  b) are engaged in the insurance and reinsurance, capital market areas, except for legal persons conducting brokerage activities in these areas;

  c) are engaged in activities in the field of gambling, and management consulting;

  d) have the share capital held by a legal shareholder or associated person with over 250 employees."

Depending on the estimated revenue and expenditure on the share of gross profit in the turnover and on the fact that the business entity qualifies to pay income tax for micro, entrepreneurs can opt for a taxation system or another. For example, if the gross profit share in total business turnover is low, the profit tax system is recommended. In this category we include businesses in the wholesale trade or retail.

If a business has a high percentage of gross profit in total turnover and it is not a business in the management consulting area, the income tax for micro is recommended. For example, for a real estate agency this tax system is more advantageous than the profit tax one. Under no circumstances businesses that have low return rates should choose this type of system.

For the three forms of licensing governed by GEO 44/2008 is likely to pay tax on income from independent activities but is determined differently than the one for micro.

For Sole traders, Individual enterprises and Family enterprises the tax on income from independent activities does not reflect the correct method of calculating the payable tax. In fact, income tax is determined as a profit tax. The tax rate is the same, 16% and the base to which this percentage is applied is determined as the difference between total revenues (collected) and total expenditures for these revenues, adding additional deductible expenses.

Sole traders, Individual enterprises and Family enterprises have also the possibility to choose between two tax systems: tax on income from independent activities in real system, determined on the information from the simple base accounting and annual net income tax based on income norms.

General directions of territorial public finance shall:

- Set the roster, for which net income is determined based on income norms;

- Set the level of income standards;

- Public annually, during the fourth quarter of the preceding year to be applied.

Income norms for each employed person that generates commercial revenue cannot be less than the minimum gross salary at the time of its determination, multiplied by 12. Taxpayers engaged in activities for which the net income is determined based on income norms are not required to organize and conduct simple bookkeeping task.

The future entrepreneur is the one deciding between the two tax systems, the one based on income norms or the real system one.

Future tax liabilities may also refer to the option of paying or not the VAT (value added tax). For a turnover that exceeds 65.000 EURO, taxpayers are required to pay VAT. Up to this limit it is possible to be non-taxable. Considering that the VAT rate is currently very high (24%), the decision to opt for non-taxable business is extremely important for future entrepreneurs. Small businesses are selling their products directly to the consumer so it is advisable to not register as a VAT payer, if they are not exceeding the 65.000 EUR limit. This recommendation is also valid for businesses that do not require large initial investment in machinery and equipment.

If the products or services of a business are primarily addressed to other businesses, it is advisable to register as a VAT payer by choice, right from the start up. If in order to get started the business needs major investments in acquisitions (tools, machinery, furniture and so on) the entrepreneur should register for VAT by choice, even if the turnover is less than 65.000 EUR.

This will allow the VAT deduction from the purchase prices of the investments that are made. For example, for a real estate agency, that does not require large investments and provides its services mainly to consumers, the VAT registration is not recommended until the 65.000 EUR turnover is reached.

If the entrepreneur desires to establish a production unit for textile, where investments are needed in order to build space for its arrangement, for the purchase of machinery, sewing machines, cutting, ironing and so on, and the products are sold to other companies that are paying VAT, we recommend registering for VAT from the start up.

7. The specific characteristics of each legal form stipulated by the law, other than those outlined above.

Conclusions

The decision to choose a particular type of business licensing can be based on other issues such as the authorization costs of the business, the complexity and difficulty of the licensing, the business administration costs, business funding opportunities, development opportunities etc.

Comparing companies that may be authorized in accordance with Law 31/1990 and Sole traders, Individual enterprises and Family enterprises, authorization forms regulated by GEO 44/2008, we can identify several advantages and disadvantages.

The advantages of licensing under a certain type of company governed by Law 31/1990 are:
- Greater opportunities for business development;
- Greater opportunities for business financing. Projects providing guarantee for SMEs to have better access to credit;
- Higher tax breaks. Most government programs that support entrepreneurship and increase the number of SMEs concern companies. The introduction of micro income tax in 2001 is only applicable to companies that meet certain conditions;
- There is no limit for the number of employees, unlike in the case of Sole traders, where the entrepreneur is the only one allowed to work, or in the case of Family enterprises where only family members are allowed to work.

The disadvantages are:
 - The authorization procedure takes longer and it's more complicated;
- License fees are higher;
- The accounting system is more complicated - double entry bookkeeping for businesses and the simple bookkeeping for Sole traders, Individual enterprises and Family enterprises or even lack of any records, when opting for annual income tax based on income norms;
- Higher costs for the bookkeeping. For signing the annual financial statements, balance sheet and profit and loss account, a company must pay a qualified person - chartered accountant, an auditor or an accountant who is a member of CECCAR (Body of Accountants and Licensed Accountants of Romania). For a single entry accounting, and for preparing the "Register of receipts and payments" and other specific documents needed, the contractor can hire anybody, without high qualification. Total costs can be even eliminated when Sole traders, Individual enterprises and Family enterprises choose for the annual income tax based on income norms.

STUDY ON THE PROBLEMS IN THE STAGES OF FILLING OUT THE APPLICATION FORM AND TECHNICAL-FINANCIAL REPORTING ENCOUNTERED BY THE PUBLIC INSTITUTIONS IN THE CENTRE REGION IN ACCESSING EUROPEAN FUNDS

Ranf Diana Elena
"Lucian Blaga" University of Sibiu
"Hermann Oberth" Faculty of Engineering

Dumitrașcu Dănuț
"Lucian Blaga" University of Sibiu
"Hermann Oberth" Faculty of Engineering

The article has as main field the project management, specifically, identifying the negative factors on European projects. The article assumes that there is a connection between the absorption of European funds and the maturity of the Romanian society in terms of project management.

The main objective of the research is to identify the problems faced by public institutions from Centre Region in accessing European funds. The purpose of the research is to identify the causes that led to the low absorption of European funds, with devastating effects on the current economic situation.

The present research is based on a preliminary analysis performed by the author on the rate of accessing European funds published in an article entitled "The current state of European funds absorption through funding programmes – measure of the Romanian performances in the project management practice". The small degree of absorption of European funds resulting from the analysis shows a poor practice of the theory on project management. To identify the causes of this problem, a research was carried out to recognise the issues that led to this situation.

The investigation included two successive surveys, the first one qualitative, exploratory type, interview-based, meant to demonstrate the qualitative aspects of the investigated phenomena and the other one, quantitative, based on a questionnaire in the form of occasional surveys. The qualitative and quantitative research methods are used in combination; this approach has become necessary especially due to the very complex reality whose trueness cannot be captured through one method. The investigation has however a highly quantitative character, the purpose of the qualitative research being to provide the prerequisites for achieving the quantitative research.

The qualitative research revealed the existence of some problems faced by institutions in relation to accessing and developing projects that focus on several directions: when filling out the application form, the technical-financial reporting, at the contracting phase of the projects, problems of partners. The article deals with the first two, and from the respondents' answers, the phase with the greatest number of problems was that of filling out the application form, followed by the technical and financial reporting.

Regarding the usefulness of the results, it should be noted that the information obtained from the conducted research supplies, theoretically speaking, the studied field and brings an important contribution not only to possible beneficiaries of European funds (public, private organisations, NGOs, the state, etc.), but to the entire Romanian society through the economic growth it generates

The authors' main contribution is to integrate this study into the logical thread of the thesis entitled "Strategic management in European project funding". The research conducted in the project management specialty literature emphasises the uniqueness and originality of the

proposed and researched theme, which meets a current and pressing requirement of the Romanian society.
Keywords: funds, projects, problems, access, reporting.
Cod JEL: M16.

1. INTRODUCTION

The central goal of a research is the discovery of certain hidden truths that have not yet been explored, to approach truths that have not been discovered and that help find solutions for the identified problems.

At the beginning of this 3rd millennium we notice that the term "project management era" is more often used to describe the period we are going through and it is increasingly more used by managers and specialists from almost all areas of economic, social and political life. But there is the question: How is this term found in the contemporary Romanian economic reality?

Although we always hear talking about projects and European funds, the signals drawn towards us refer to the low rates of absorption of those funds. Assuming that there is a correlation between the degree of maturity of project management in the Romanian society and this low degree of European funds absorption, identifying a solution to prepare Romanian for the next programming period 2014-2020 in view of obtaining higher rates of absorption becomes a necessity.

The article has as main objective identifying the problems faced by the public institutions from Centre Region during the stages of filling out the application form and technical and financial reporting, and also the causes that have generated their occurrence.

2. PREVIOUS RESEARCH

As noted in the summary, the study is part of the approach of a PhD thesis which began with identifying the current stage of the scientific knowledge in the field of project management. Research has revealed that the study theme is unique and it completes the studied field.

An article published earlier by the authors (Ranf and Dumitrascu 2011: 153-163) ended with the conclusion of a low rate of absorption of European funds of approximately 17%. This is the starting point for beginning a research on identifying the main negative factors on the European projects from Centre Region. These results indicate the existence of an immaturity of the project management practice in Romania. Identifying the causes of this low level of maturity in the field of project management should be a priority for the whole society, in order to turn structural funds into opportunity.

Improving the capacity to absorb European funds – has become a constant concern and worry of government so far – means, first of all, to identify the main gaps, insufficiencies or inefficiencies encountered by the people responsible with writing projects and implementing them.

3. METHODOLOGY OF RESEARCH

The investigation combines methods of qualitative and quantitative research. But the investigation has however a pronounced quantitative character, the purpose of the qualitative research being to provide the prerequisites for achieving the quantitative research.

The conducted interviews among the respondents revealed that the problems encountered by institutions in relation to accessing and developing projects focus on several directions: when filling out the application form, the technical-financial reporting, at the contracting phase of the projects, problems of partners. The article deals with the first two: filling up the application form and reporting the application form. This conclusion of the qualitative research formulates the premise that the questionnaire-based quantitative research started with.

The population of interest for the study, namely the population chosen for the sample, is composed of public institutions (town halls, county councils, foundations, public administrations,

prefectures) or NGOs located in Centre Region (the counties of Alba, Brasov, Covasna, Harghita, Mures and Sibiu), the greatest part that have accessed European funds, in order to have the opportunity to identify and analyse the main difficulties they faced in accessing and implementing projects.

A number of 95 questionnaires were correlated, of which 73 questionnaires were processed, the remaining 22 respondents being institutions that have not accessed any type of funds (European, governmental) and whose processing would have vitiated the results.

4. RESULTS OF THE RESEARCH

An important objective of the present research is to identify the difficulties faced by institutions in accessing and implementing these projects. Therefore, institutions were surveyed about the degree of difficulty they encountered when filling out the application form and the technical and financial reporting.
Figure 1 The degree of difficulty in filling out the application form and technical and financial reporting (made by author)
Figure 2 Problems faced by respondents in filling out the application form (made by author)

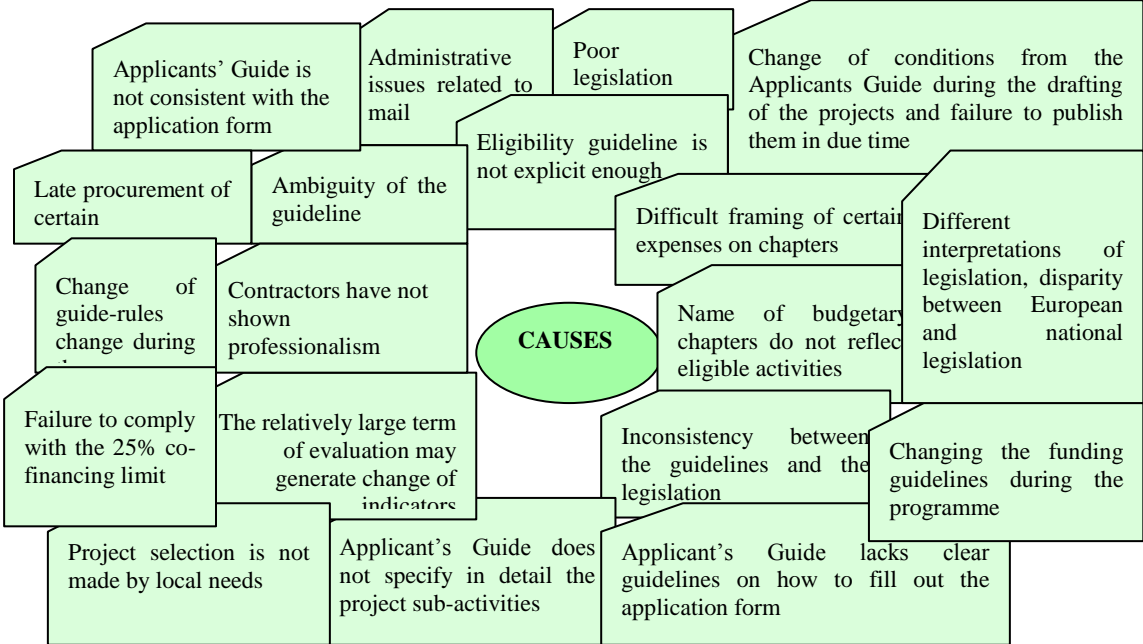
In terms of identifying the main problems encountered in filling out the application form, as well as their causes, we started from a series of problems identified in primary sources, problems published online for each operational programme, but essentially similar. Respondents added to them causes and, according to the situation, other problems they encountered. Respondents associated a series of causes to these problems, outlined below.


Figure 3 Causes of the problems encountered by respondents in filling out the application form
(made by author)

Analysing the figure above, it can be noticed that the main problems encountered by the public institutions in filling out the application form originate in the complete understanding of the Applicant's Guide, their eligibility criteria and also of some changes in those guidelines during the projects and their late publication. Respondents also accuse consulting firms they are working with of lack of professionalism.
Figure 4 Problems faced by respondents in the technical and financial reporting (made by author)

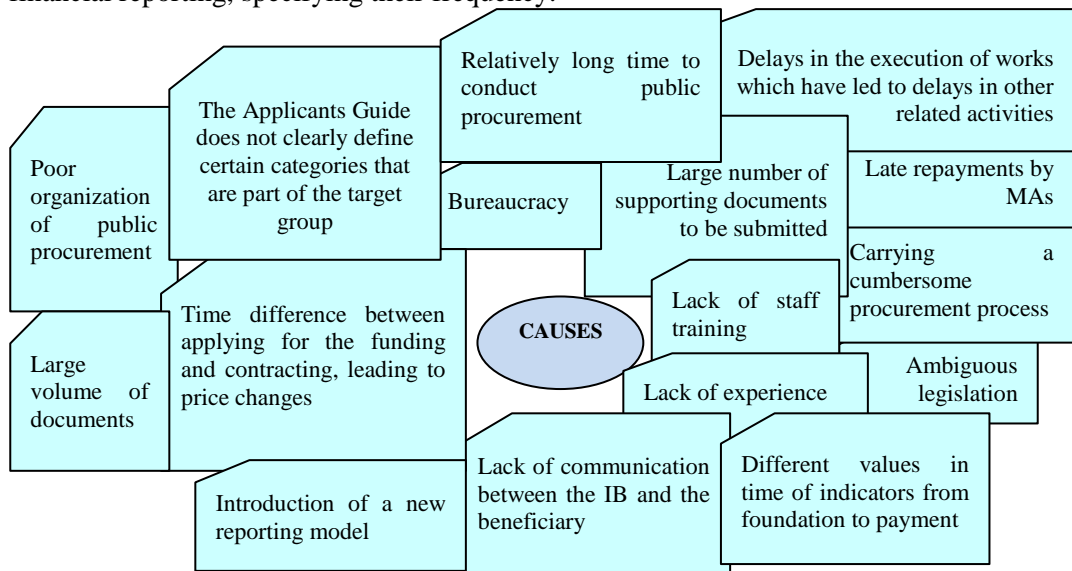
Figure 4 deals with the issues encountered by the surveyed institutions in the technical and financial reporting, specifying their frequency.


Figure 5 Causes of the problems encountered by respondents in the technical and financial reporting (made by author)

The main reasons for which respondents claim they faced problems during the technical and financial reporting stage include a large volume of documents that need to be reported, sometimes the same documents must be forwarded at different stages of reporting. Respondents also accuse the poor organisation of public procurement: during the evaluation period, acquisitions have been merged in the same activity and expenses came during the 3rd different

procedure of procurement. Institutions also had to forward certain documents due to changes in reporting formats.

5. CONCLUSIONS AND RECOMMENDATIONS

The research, whose target groups is the institutions from the Centre Region, aims to obtain information from the respondents regarding: the problems encountered by them in carrying out projects in two phases: filling put the application form and the technical and financial reporting.

From the respondents' answers, although they have reported a higher degree of difficulty in the technical and financial reporting stage, the filing out of the application form was the phase with the greatest number of problems (a total of 55 problems). For each of the stages, respondents added a series of reasons that have caused these problems. Problems reported by respondents appear because of lack of commitment and professionalism of fund management institutions , and also because institutions that accessed funds.

Although the target group is represented by public institutions, the information obtained after processing the data become useful to any organisation, be it public or private. The methodology for accessing European funds is the same for any institution, the difference being the conditions from the Funding Guide, conditions that should be studied in detail by each applicant for European funds.

Among the benefits that the present research brings to institutions which carry out European projects or plan to develop projects in the future, there are:

- quantifying the problems encountered so far by the institutions that have developed projects or that have tried to access European funds enables institutions to get an advantage when they decide to take advantage of the opportunity provided by European funds;

- from the experience of the institutions that have developed projects, either successful, or unsuccessful, we should learn that the strictest coordination of time, human and financial resources is essential.

Obviously, the usefulness of the research lies in the fact that its results allow us to develop recommendations, both for the institutions that carry out projects and for the institutions that deal with the management of European funds in Romania (Intermediary Bodies and Management Authorities).

A recommendation for the project development institutions to obtain better results in the development and implementation of projects would be the studying in detail of the Funding Guide in order to reduce the number of problems encountered during the stage of filling out the application form, a stage, in many cases, underestimated by institutions as degree of difficulty.

Recommendations for institutions dealing with European funds in Romania:

- elaboration of Funding Guide that would provide detailed and explicit information to possible applicants on projects to ease the filling out of the application form;

- approval in advance of possible changes that occur in the Funding Guide;

- correlation of information from Funding Guides to the current legislation;

- reducing projects' evaluation periods which have exceed even a year.

6. NOTES

(1) This research is conducted within the project SOPHRD/6/1.5/S/26, cofinanced by the European Social Fund through the Sectoral Operational Programme "Human Resources Development" 2007-2013.

RESEARCH ON PROBLEMS WITH PROJECTS AND PARTNERSHIPS THAT PUBLIC INSTITUTIONS IN THE CENTRE REGION FACED IN ACCESSING EUROPEAN FUNDS

Ranf Diana Elena
"Lucian Blaga" University of Sibiu
"Hermann Oberth" Faculty of Engineering

Dumitrascu Dănut
"Lucian Blaga" University of Sibiu
"Hermann Oberth" Faculty of Engineering

European project management is the main filed of the article. Assuming a connection between the degree of absorption of European funds and the degree of maturity of the Romanian society in terms of project management, the article seeks to identify the negative factors on accessing and carrying out European projects.

The identified problem is a low degree of absorption of European funds in Romania, and the main objective of the research is to identify the problems faced by the public institutions in the Centre Region in accessing European funds and also the causes that led to the low absorption of European funds.

This article's research is based on a preliminary analysis performed by the authors on the rate of accessing of European funds published in the article called "The current state of European funds absorption through funding programmes – measure of the Romanian performances in the project management practice". The conclusion of this article was a low rate of absorption of European funds in Romania, a fact that reveals a poor practice of the theory on project management. This article identifies part of the causes of this situation by identifying a part of the problems that stood in the way of beneficiaries of European funds

The qualitative and quantitative research methods are used in combination in the research. The investigation has however a highly quantitative character, the purpose of the qualitative research being to provide the prerequisites for achieving the quantitative research. The interview-based qualitative research enabled the researcher to get acquainted with the subjects' problems related to the theme of investigation, the causes that have generated these problems. This preliminary investigation to the questionnaire-based research aims to provide information that would help the researcher prepare the questionnaire, so that the questions allow getting the most comprehensive information to solve the identified problems.

The qualitative research revealed the existence of some problems faced by institutions in relation to accessing and developing projects that focus on several directions: when filling out the application form, the technical-financial reporting, at the contracting phase of the projects, problems of partners. This article deals with the problems encountered during the projects' contracting stage and problems caused by partners. The respondents' answers place the problems of partners on top of the categories of problems that stood in the way of European funds' beneficiaries. A series of causes that have led to the occurrence of these problems have also been identified.

It should be stated that the information obtained from the conducted research supplies, theoretically speaking, the studied field and brings an important contribution not only to possible beneficiaries of European funds, but to the institutions managing European funds in Romania, who have a lot to learn from the experience of the first period of programmes. The authors' main contribution is to integrate this study into the logical thread of the thesis entitled "Strategic management in European project funding". Both articles, part of a research in the field of

project management are unique and original and meet a current and pressing requirement of the Romanian society.
Keywords: funds, projects, problems, partnership, absorption.
Cod JEL: M16.

1. **INTRODUCTION**

The present article continues the study on identifying the problems that beneficiaries of European funds in Centre Region faced, as well as their causes. The first article dealt with the problems encountered during the stage of filling out the application form and the technical and financial reporting stage. The research continues with dealing with the problems faced by beneficiaries at the contracting stage and problems with the partners.

The research which integrates the two articles assumes that there is a correlation between the degree of maturity of the project management in the Romanian society and the low degree of absorption of European funds, thus, identifying a solution to prepare Romanian for the next programming period 2014-2020 in view of obtaining higher rates of absorption becomes a necessity.

Certainly, the usefulness of the present articles is not limited to European funded projects. A contribution of the research is the attempt to include the European projects into the wider notion of projects. Consequently, the chances of creating a coherent vision on European funds increase, on their characteristics, but also on the common elements with the actions any project involves.

Therefore, the preparation for European funds absorption should enter into a broader vision: in the future, we should not focus only on attracting structural funds, but on attracting any type of funds meant to stimulate development. Training in the field of projects must not end after the structural funds have been attracted, but it should be destined to modernize our thinking and actions. We should not forget about the next period coming up: 2014-2020 and that must find us prepared, more capable to prove seriousness and professionalism.

2. PREVIOUS RESEARCH

The study is part of the approach of a PhD thesis entitled "Strategic management in European project funding", which began with identifying the current stage of the scientific knowledge in the field of project management. Research has revealed that the study theme is unique and it completes the studied field. They show the authors' interest for the studied field.

The conclusions of an article published by the authors (Ranf and Dumitrascu 2011: 153-163) identified a low rate of absorption of European funds of approximately 17%, and now, a year later, of 25%. This analysis of the rate of absorption of European funds in Romania has identified the problem that led to the research of these articles. These results indicate the existence of an immaturity of the project management practice in Romania. Identifying the causes of this low level of maturity in the field of project management should be a priority for the whole society, in order to turn structural funds into opportunity.

But, in order to improve the ability to absorb European funds there must be first identified the main gaps, insufficiencies or inefficiencies encountered by the people responsible with writing projects and implementing them during the first period of programmes, so that we are better prepared and more efficient in the second period.

3. METHODOLOGY OF RESEARCH

The investigation included two successive studies, the first one being an exploratory qualitative research, meant to outline the qualitative aspects of the investigated phenomena and the other one a quantitative research, in the form of occasional surveys.

The exploratory qualitative research had several purposes: a more thorough expression of problems aiming European projects and accessing European funds; clarifying certain concepts;

elaborating new hypotheses; establishing further research priorities; generating new solutions and ideas. This research was designed and carried out only as a preliminary stage, meant to facilitate the development, under better conditions, of the quantitative research.

The interviews conducted among respondents revealed the fact that the problems encountered by institutions in relation to accessing and developing projects focus on several directions: when filling out the application form, the technical-financial reporting, at the contracting phase of the projects, problems of partners. The present article deals with the problems encountered in the stage of filling out the application form, the technical and financial reporting, the projects' contracting stage, problems with the partners. This conclusion of the qualitative research formulates the premise that the questionnaire-based quantitative research started with.

The population of interest for the study, namely the population chosen for the sample, is composed of public institutions (town halls, county councils, foundations, public administrations, prefectures) or NGOs located in Centre Region (the counties of Alba, Brasov, Covasna, Harghita, Mures and Sibiu), the greatest part that have accessed European funds, in order to have the opportunity to identify and analyse the main difficulties they faced in accessing and implementing projects.

A number of 95 questionnaires were correlated, of which 73 questionnaires were processed, the remaining 22 respondents being institutions that have not accessed any type of funds and whose processing would have vitiated the results.

4. RESULTS OF THE RESEARCH

With regard to the first stage studied, namely that of contracting projects, problems are fewer, but still existing, namely there is a 21% who answer yes and 16% who answer sometimes.
The reason of this question is the great number of projects that were approved and have not been completed through a contract. There are various other problems after signing the contract that may result in its termination.

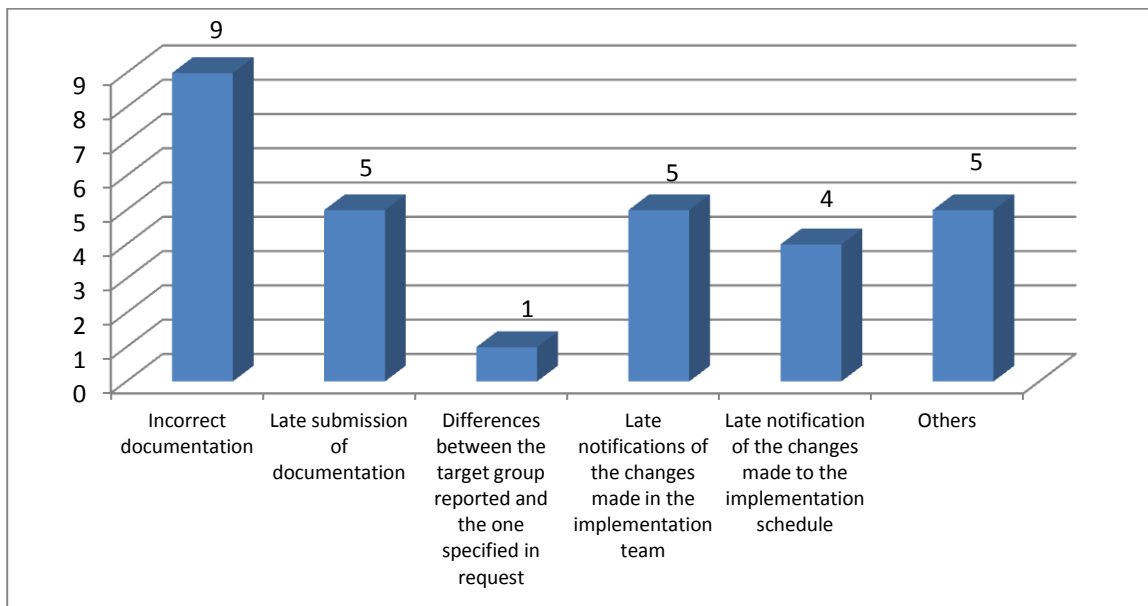
Figure 1. Situation of projects that had problems in the contracting phase (made by author)


Figure 2. Problems faced by respondents in the contracting phase (made by author)

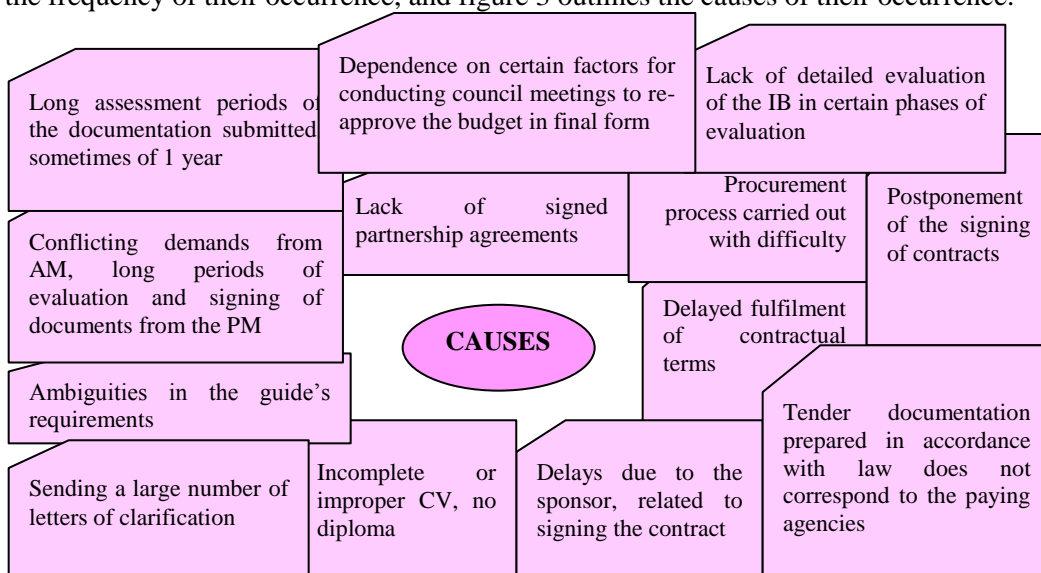
Figure 2 shows the frequency of problems encountered by respondents in the contracting phase and the frequency of their occurrence, and figure 3 outlines the causes of their occurrence.


Figure 3. The main causes of the problems encountered by respondents
in the contracting phase (made by author)

Problems in the contracting phase are due both to the beneficiaries that have sent inconsistent documents such as inappropriate CVs, unsigned partnership agreements or they have sent too many letters of clarification and to the Intermediate Bodies and Management Authorities that require long assessment periods of the documentation, periods that exceed even a year, damaging the good course of the project. From the respondents' answers it appears that there are projects that are approved and then put on hold for long periods of time.

When asked if they had problems from partners in carrying out projects, 53% of the respondents answered that they did not, while 47% admit that they sometimes did.
Figure 4. Frequency of problems from partners (made by author)

The respondents who had problems with partners were asked to mention the types of problems they encountered and their frequency. To make the answer easier, the questionnaire contains a number of problems identified from other sources, which might represent problems encountered from partners in the implementation of projects. These are outlined in figure 4.

From figure 4 it can be noticed that the frequency of such problems is relatively similar, most encountered problems being related to the late reporting of certain changes, planning problems such as those related to the inconsistency with the time schedule.
Figure 5. Comparison between problems faced by beneficiaries (made by author)

Figure 5 compares the frequency of the studied types of problems until now in both articles. It can be noticed from the figure that most problems faced by beneficiaries in carrying out projects are those from partners, followed by the problems encountered when filling out the application form. Although this category of problems is usually underestimated, respondents consider as a degree of difficulty the technical and financial reporting on the first place but they have also faced a great number of problems caused by partners, with negative effects on the performance of projects.

5. CONCLUSIONS AND RECOMMENDATIONS

The research, whose target group is the public institutions in Centre Region aims to obtain information from the respondents regarding: the problems faced by them in the projects' contracting phase and problems caused by partners.

As expected, the contracting phase had fewer problems from the beneficiaries, but with effects on the long term. For example, sometimes (24% of the cases) big delays at the signing of contracts were encountered, reaching periods that exceeded one year (17 months), delays which may bring significant changes between what was declared in the application form and later reporting from the beneficiaries.

Respondents accuse a great number of problems encountered from partners (89), the most problems faced by institutions in carrying out projects.

Regarding the **usefulness of the results**, it must be stated that the information obtained from the research we consider useful not only for the possible beneficiaries of European funds (public, private organizations, NGOs, the state, etc.), but for the entire Romanian society, because the money that these investments bring will contribute to the increase of economic stability or will even generate an economic growth with direct benefits on the population, such as the increase of jobs, the development of the social sector, etc.

Obviously, the usefulness of the research lies in the fact that its results allow us to develop recommendations, both for the institutions that carry out projects and for the institutions that deal with the management of European funds in Romania (Intermediary Bodies and Management Authorities).

Recommendations for the project development institutions to obtain better results in the development and implementation of projects would be:

- studying in detail of the Funding Guide in order to reduce the number of problems encountered during all four situations studied in both articles;
- putting a greater emphasis on the quality of "partner", because, although they have encountered several problems from partners, the interviewed institutions (53%) were themselves partners in 1 or more projects.

Recommendations for institutions dealing with European funds in Romania:

- elaboration of Funding Guide that would provide detailed and explicit information to possible applicants on projects to ease the filling out of the application form;
- approval in advance of possible changes that occur in the Funding Guide;
- correlation of information from Funding Guides to the current legislation;
- reducing projects' evaluation periods which have exceed even a year.
- reducing the periods between approval of projects and signing the contracts, periods that have reached even 17 months;
- simplification of public procurement procedures.

Romania should prepare thoroughly for the 2014-2020 financial period. The best lesson for this purpose is the institutions' experience from the period 2007-2013. Under these circumstances, the information obtained from this study are useful not only for project development or managing institutions, but also to any bodies responsible with spending European money, with great contribution to the development of the Romanian society.

RISK MANAGEMENT: AN INTEGRATED APPROACH TO RISK MANAGEMENT AND ASSESSMENT

Szabo Alina
Member of the Institute of Internal Auditors (IIA)

Purpose:
The objective of this paper is to offer an overview over risk management cycle by focusing on prioritization and treatment, in order to ensure an integrated approach to risk management and assessment, and establish the 'top 8-12' risks report within the organization. The interface with Internal Audit is ensured by the implementation of the scoring method to prioritize risks collected from previous generated risk report.
Methodology/approach:
Using evidence from other research in the area and the professional expertise, this article outlines an integrated approach to risk assessment and risk management reporting processes, by separating the risk in two main categories: strategic and operational risks. The focus is on risk prioritization and scoring; the final output will comprise a mix of strategic and operational ('top 8-12') risks, which should be used to establish the annual Internal Audit plan.
Originality/value:
By using an integrated approach to risk assessment and risk management will eliminate the need for a separate Internal Audit risk assessment over prevailing risks. It will reduce the level of risk assessment overlap by different functions (Tax, Treasury, Information System) over the same risk categories as a single methodology, is used and will align timings of risk assessment exercises.
The risk prioritization by usage of risk and control scoring criteria highlights the combination between financial and non-financial impact criteria allowing risks that do not naturally lend themselves to a financial amount to be also assessed consistently.
It is emphasized the usage of score method to prioritize the risks included in the annual audit plan in order to increase accuracy and timelines.
Keywords: risk management, risk assessment, audit universe.
JEL cods: G320

1. Introduction

Risk management is a range of activities undertaken to control the strategic and operational risks within the organization. It can be defined as a business process whose purpose is to ensure that the organization is protected against risks and their effects.

In The Project Management Body of Knowledge Guide, (Duncan, W., R., 1996), risk management is defined as a systematic process of identification, analysis and response to the project risks, process comprising the risk identification, risk quantification, risk response plan, risk response control sub processes. By a closely look the reader can observe that, depending on the author of the methodology, the name or the order of these sub-processes is different. Thus, risk identification and risk quantification are sometimes taken together and are called risk assessment or risk analysis; the risk response plan is sometimes met under the name of risk mitigation plan; the risk response plan and the risk control plan are sometimes taken together under the name of risk management plan. (Valentin P. Mazareanu, Risk Management and Analysis: Risk Assessment (Qualitative and quantitative), Analele UAIC Iasi, 2007)

Going further, we can affirm that, without risk, there is no reward or progress. Unless risk is managed effectively, organizations cannot maximize opportunities and minimize threats. Risk is all about uncertainty, or more importantly, the effect of uncertainty on the achievement of objectives. By performing the risk management process steps, the emphasis is shifted from

something happening – the event –to the effect on objectives. Every organization has objectives to achieve, and in order to achieve them, any uncertainty that could interfere with their realization must be effectively managed. (Kevin W. Knight AM, Main Focus Magazine, ISO FOCUS, 2009) As stated in the well-stocked toolbox for risk management featuring (ISO 31000:2009 –Risk Management –Principles and guidelines; ISO/IEC 31010: 2009 – Risk management –Risk assessment techniques): "Risk needs to become an integral part of how things are managed*; it should* not be an add-on, or a separate activity divorced from the mainstream management of the business." This refers to the mandate and commitment of the organization's board and top management to the implementation, review and continual improvement of how risk is managed. The end goal: to ensure risk is fully focused on the achievement of objectives by using a common language and process throughout the organization.

As related to risk management reporting responsibility, the organization has to nominate a Risk Coordinator to facilitate the internal risk assessment and reporting process. Unless there is any top management person appointed to be the company's Risk Coordinator, it is anticipated that this will be the local Head of Internal Audit; although it is possible for the coordinator to come from any discipline. If this happens, the organization should ensure local Internal Audit is involved in the risk assessment. This will help ensure they have sufficient understanding of the risk assessment process and outputs to enable them to develop a risk-based internal audit plan.

2. Inside Risk Management: overview of risk management reporting process

We will present an overview of the approach to risk management starting from the main idea that: "Risk management is a range of activities undertaken to control the strategic and operational risks within the organization." Underpinning the approach is an initial separation of the strategic and operational risk assessment processes, recognizing that they serve different purposes. The key definitions of the two main risks are below:

> -Strategic risks are uncertain future events that could negatively impact the achievement of the vision and strategic objectives.
> -Operational risks are risks that could negatively impact the performance or efficiency of the day-to-day operations.

The Strategic risk report should be used to summarize the key strategic risks faced by the organization that could negatively impact on the achievement of their vision and strategic objectives. The strategic risks detailed in the risk report represent the inherent strategic risks before taking account of any risk responses.

Once the key strategic risks have been identified, the risk responses which are currently relied on to reduce the inherent level of a risk to a more acceptable level need to be detailed. Consideration should be given to operational risks that are sufficiently significant/ material that they may have strategic consequences. The strategic risk report will have a dual purpose of supporting the strategy and planning process and as an integral part of the risk management process.

The first step in the operational risk assessment is to identify potential inherent risks using the Risk Universe tool. This Risk Universe contains risk categories grouped under value chain and support headings. It is not intended to be a comprehensive list of all operational risks but it should assist in ensuring all the relevant risk issues for the business are incorporated within the assessment process. Using the categories contained in the Risk Universe, it should be involved the relevant management staff in the risk assessment process to make the outputs accurate and reliable by considering different risk assessments that need to be prepared. There is no set number of separate operational risk assessments prescribed. Examples of sub-categories of operational risks within risk universe are:

Value chain:

> -*Sales and Marketing:* customer understanding, customer relationships, exclusivity arrangement, pricing and profitability, promotion and brand management, innovation;

-Procurement: quality, scheduling, costs, commodity exposure management;
-Manufacturing: efficiency, quality, capacity, product recall, product security;
-Health and Safety: incident management, regulatory reporting, preventive programs;
-Physical assets: safeguarding and security, business interruption, natural perils;
-Warehousing and distribution: logistic, obsolesce, loss/damage, cost, distribution channel;
-Invoice and service customer: customer support, credit control, billing completeness& accuracy, product/service failure;

Management and support:
-Improvement and change: cost control, realization of planned benefits;
-Human resources: incentives & remuneration, recruitment & retention, unethical behavior;
-Financial Management: reporting, fraud, budgeting & forecasting, insurance, treasury;
-Legal and compliance: contracting, litigation management, regulatory reporting, intellectual property;
-Taxation: tax legislation, customs & excises, documentation, planning;
-Information resources and technology: strategy, integrity, security, obsolescence, availability;
-Sustainable development and environment: energy efficiency, supply chain, resource availability;
-Corporate affairs: communication, reputation management, community affairs.

Once the key operational risks have been identified, the controls which are currently relied on to reduce the inherent level of a risk to a more acceptable level need to be detailed.

The next steps in risk assessment process should be their prioritization as "high", "medium" or "low", according to the criteria outlined below. Each risk should be prioritized on a "current" basis (assuming the application of existing risk treatment). Prioritizing risks will involve judgment, but the criteria below, evaluated in the context of the local business are designated to help ensure that the prioritization process is more consistent. In this order each risk will be scored according to likelihood and impact, using consistent and defined assessment criteria:

Likelihood – taking into account the risk responses in place over the risk, assess the probability that the risk event will occur in the organization. If it is highly likely (>50%) that the risk event will occur (for example, it can be anticipated to happen within 5 years or is already occurring in the company, or a similar organization has experienced such an event), then the likelihood is "high". If it is reasonably likely (25% - 50%) that the risk event will occur (for example the event can be envisaged within 5 years but may not have occurred yet in this area or in the company), then the probability is "medium". If it is unlikely (<25%) that the risk event will occur (for example the event is considered very difficult to realize within 5 years and only under exceptional circumstances in the company, or has not occurred in a similar organization) then the probability is "low".

Impact – should the risk event occur; assess the impact that this would have on the organization. It should be consider not only financial but also nonfinancial impact, because the nonfinancial impact criteria allow risks that do not naturally lend themselves to a financial amount to be also assessed consistently. The highest non-financial impact rating for a particular risk should be used in the risk report. If there would be a highly damaging impact to the financial results or reputation of the organization, then the impact is "high". For example, the event would result in >10% impact on budget/ EBITA, or serious production disruption, or a major safety/ environmental incident or breach of regulatory requirements, or sustained media coverage.

If the impact to financial results or reputation would be significant, but not highly damaging, then the impact is "medium". For example the event would result in 2-10% impact on budget/ EBITA, or some production disruption, or a significant but limited safety/ environmental incident

or breach of regulatory requirements, or limited media coverage. If the impact of financial results or reputation would be not particularly significant then the impact is "low". For example the event would result in <2% impact on budget/ EBITA and minimal production, regulatory or media impacts. The table below contains the classification of financial and non-financial impact as described: (Table 1)

Table 1: Classification of Impact

Financial	Production	Compliance	Reputation
>10% of budget/EBITDA	Serious production disruption	Major safety/environmental incident Major breach of regulatory requirements	Sustained media coverage International media coverage
2- 10% of budget/EBITDA	Some production disruption	Significant but limited safety/environmental incident Significant but limited breach of regulatory requirements	Limited media coverage National media coverage
<2% of budget/EBITDA	Minimal production disruption	Minimal safety/environmental incident Minimal breach of regulatory requirements	Minimal media coverage

Overall priority – Once the likelihood and impact of the current strategic or operational risk has been assessed then use the matrix below to assign an overall priority to the risk. (Fig.1)

The Risk Assessment Matrix
There may be some risks within the business where actions are still under development to control the risk. Where this is the case, it should be described what further actions the organization is taking to address these areas, together with the expected timescale to complete the actions and the person responsible. The overall planned risk, if these further actions were implemented also needs to be identified and included in the risk report.

After the completion of previous steps, the information captured in strategic and operational risk reports should be finalized and checked for accuracy by the Risk Coordinator. Even if the Risk

Coordinator is facilitating the 'top 8-12' risk determination process, the decisions should involve either the senior management or the preferred option of Risk Governance Committee.

The strategic risk report and the operational risk reports should then be collated and the 'top 8-12' current risks for the organization determined. These will comprise a mix of strategic and operational risks and will be a judgmental issue given the different types of risks being considered.

An effectiveness review over the risk assessment and risk management reporting process should be performed at periodic intervals to satisfy corporate governance requirements and identify any further opportunities to increase efficiency and effectiveness.

Interface with Internal Audit

The detailed operational risk assessment process (and to a lesser degree the strategic risk assessment) will be used by Internal Audit for the purpose of completing their annual plan. This risk report will identify prevailing higher risk areas that may require further review or assurance by Internal Audit in the upcoming year. These risks are likely to include strategic and operational risks. The need for Internal Audit to produce a separate risk assessment to determine these prevailing higher risk areas will therefore be eliminated.

In addition to the prevailing risks above, Internal Audit is required to identify and review additional areas, based on inherent process risk or compliance requirements, where risks may be static. Some additional flexibility should continue to be retained in the Internal Audit plan, to respond to any further ad-hoc requests for Internal Audit reviews from senior management.

Based on the risk report previous described, the Internal Audit will score the risks by considering the following: time since fraud was identified in this area; calculated gross risks and net risks based on the risk assessment matrix (see up) and transforming them in cumulative gross and net risks; time since last audit; significance of past audit findings in this area; significance of trial balances (use balance sheet accounts and income statement accounts). The scores might vary between 1 and 30, depending on their identified relevance; the total range obtained by each risk will be the basis of the annual audit plan coverage.

3. Conclusions

We conclude that, by using an integrated approach to risk assessment and risk management will be eliminated the need for a separate Internal Audit risk assessment over prevailing risks. It will reduce the level of risk assessment overlap by different functions over the same risk categories as a single methodology is used and will align timings of risk assessment exercises. The usage of the score method to prioritize the risks included in the annual audit plan is a useful and recommended tool in order to increase accuracy and timelines.

On the other side, we emphasize the recommendation that, each organization must develop its own risk management reporting manual/policy. The policy must clearly state the organization's commitment to the management of risk; the organizations have to identify risk owners to ensure accountability and authority. It must be clearly differentiate between those who are " accountable " for managing risk (those persons with a liability, either corporate or legal, for their decisions or lack of decision) and those who are " responsible " for specific tasks (those persons with an obligation to carry out an instruction from a competent authority). (ISO 31000:2009 Risk management –Principles and guidelines)

The Faculty of Economics and Business Administration

Logistics outsourcing is considered to be an excellent source of competitive advantage for companies. Its benefits are long praised about in the specialty literature, but its risks are often briefly described. We believe that both the benefits and the risks of outsourcing logistics extremely important and must be regarded as a source of success or failure as it will be described in this paper.

Our research objectives refer to investigating the main outsourcing risks and benefits in the contemporary Romanian industry sector, in order to be able to identify which are the most threatening risks and also the most wanted benefits in the opinion of the production companies.

We regard logistics outsourcing as an exceedingly captivating and up-to-date topic, because it provides a satisfactory solution to various company issues that pertain to increased specialization, collaboration and integration in efficient and effective supply chains. The management of this activity with its main functions including the benefits and the risks will be approached in our research. The outsourcing of logistic services is a complex concept that our paper undertakes to discuss in some costs, access to new and costly technologies, scale economies, of its aspects.

Our study is developed on 108 Romanian companies that have more than 50 employees. Based on our previous studies in Romanian industry, we decided that our research is best based mainly on quantitative methods. The instrument of our research is the structured questionnaire. The general goal of our research is to investigate the way in which companies manage the risks and the benefits both expected and attained in the process of outsourcing logistics.

The implications of our research for the field of logistics refer to the fact that we were able to identify which are the most important and attainable outsourcing logistics benefits out of the large number stated in the international literature. Furthermore, we structured the risks encountered by Romanian companies which took a chance on outsourcing logistics. All in all, we consider that this is an excellent starting point for our future research in this field as we plan to investigate further on this topic by analyzing the outsourcing logistics benefits and risks also from the perspective of logistics service providers from Romania.

Key words - logistics outsourcing, strategic decision, benefits, risks.
JEL - M11

I. Introduction

At a first glance, the process of outsourcing logistics appears to be quite smooth, but reality shows that it is rather complex, sophisticated and strenuous. It is this complexity that made the vast issue of outsourcing logistics a worthwhile object for our research. Our curiosity is understandable, if we consider the large number of failed outsourcing agreements, i.e. more than 55% within the first five years (Donath, Mazel, Dubin, Patterson 2002).

We regard logistics outsourcing as an exceedingly captivating and up-to-date topic, because it provides a satisfactory solution to various company issues that pertain to increased costs, access to new and costly technologies, scale economies, specialization, collaboration and integration in efficient and effective supply chains. The management of this activity with its main benefits and risks will be approached in our research.

It should be however noted that in spite of all arguments in favour of outsourcing, managers haven't always achieved the expected outcome and some even declared themselves utterly disappointed. Bengtsson claims that the effects of outsourcing have generated a rather small amount of inconclusive, contradictory results, explaining that only a few studies consider the relationship between the reasons of outsourcing and its effects, while other explanation does justice to the fact that outsourcing is a trade-off and a dilemma (Berggren and Bengtsson 2004).

To exemplify: the outsourcing that aims at reducing costs may also impair the capacity to design and assimilate new products and therefore, the capacity for innovation (Berggren and Bengtsson 2004; Dankbaar 2007). There are also situations where the results of outsourcing depend on the balance of internal and external integration (McIvor 2008; Espino-Rodriguez, Padron-Robaina 2006). The high level of complexity and interdependence of activities, processes and systems is often regarded as hindrance in the way of efficient and effective outsourcing.

II. Literature analysis
Logistics: concept demarcations
The concept of "logistics" appeared under several "guises", i.e. alternative designation, throughout recent history: distribution, physical distribution, technical & material procurement, marketing logistics, logistic distribution, material management, logistic material management, procurement chain management, supply Chain Management, industrial logistics, business logistics (Lambert, Stock 1993: 4).

The list remains open for any further designation used in history, but we believe that the quoted ones are quite relevant and it should be noted that all these designations referred in fact to the same phenomenon: the management of the goods' advancement from the production to the consumption site. At present, the most popular term among experts is *logistics management* and we therefore chose to adopt it for the purposes of this paper also, along "logistics".

In 1986, one of the group experts in this field, known as The Council of Logistics Management, formerly known as The Council of Physical Distribution Management SUA, provided a compehensive definition of the management concept under analysis. According to this definition, *logistics management denotes "the process of planning, implementation, efficiency and effectiveness control related to the transfer and storage of raw materials, inventories, finished goods and information from the source to the final consumer in order to satisfy the customers' requirements"* (Stock, Lambert 2001: 3).

This is considered to be a relevant definition of logistics and is therefore still in use, after all these years. Emphasis is placed on meeting the customers' needs in this case. The only shortcoming of this definition would be the fact that it ignores service companies.

Outsourcing of logistic activities and services: concept demarcations
Outsourcing is a quite encompassing term in Romanian, it may assume various form, that are easily and often mistaken for each other. In contrast, there is marked difference between *outsourcing* and *offshoring* in English. The latter may itself assume various forms, i.e. it may be performed within one and the same major transnational company ("*captive offshoring")* or in cooperation with a foreign third party *("offshore outsourcing")* (Gorp 2008: 14).

The two forms of outsourcing denote various strategies applied by some companies to penetrate foreign markets, as the term itself always conveys the notion of a company performing various activities in a foreign location. It is important to bear this detail in mind, because the phenomenon

under our scrutiny, i.e. outsourcing, may take place either domestically or abroad, but always through a third party.

In Romanian, there is no marked distinction between these notions and English original terms are often used to avoid confusion. This paper will focus on the term *outsourcing*, construed as the strategic employment of external specialized suppliers to execute or manage activities or services that do not count as core competences for the company that resorts to outsourcing (Rushton, Walker 2007).

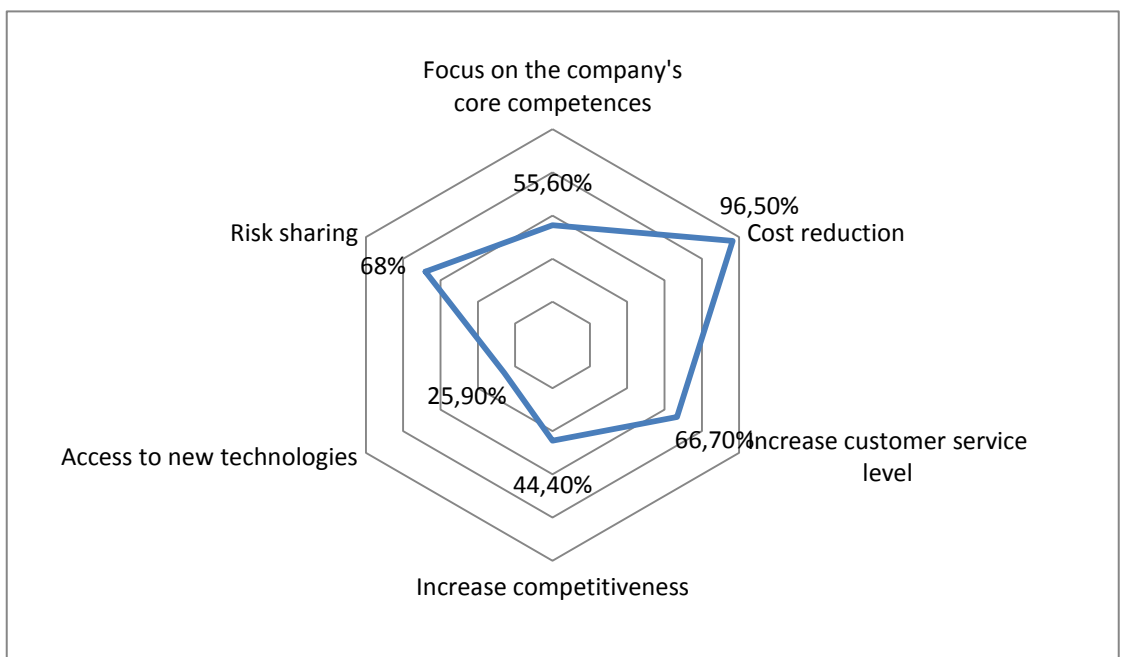
III. Research methodology

The main objective of our scientific endeavour concerns the analysis of outsourcing of logistic activities and processes among Romanian industrial companies in terms of identifying the main benefits and risks. We chose to base or research of non-probabilistic sampling, namely on rational theoretical guided sampling. For our empirical study we have selected industrial companies with more than 50 employees located in the North-West region of Romania.

As the application of the questionnaire regarding the outsourcing of logistic benefits and risks is concerned we chose to put together a sample of 300 companies to which questionnaires were sent either by e-mail or fax. This approach yielded a very high response rate: 125 questionnaires have been returned, 17 thereof being invalid. The questionnaires were collected and checked for validity. The 108 valid questionnaires were numbered and loaded in data processing software. The graphs and frequency tables were generated by this software.

IV. The results of the research

The participating companies have identified the fundamental benefits reaped from the outsourcing process. In addition to those suggested by us, some respondents have mentioned benefits related to the conservation of their own capitals in the blank space at the end of the question. Fig. no. 1 summarizes the benefits of outsourcing according to the participants.

As shown in fig. no. 1, the respondents consider cost reduction to be the most important benefit of outsourcing. This choice is justified, because logistic costs make up approximately 29% of a product's total cost (Fredrinksson, Johansson 2009: 281). This is an effective motivation for resorting to outsourcing, given the fact that outsourcing contains a promise of cost reduction.


Although cost reduction seems to be the most wanted outsourcing logistics benefit, our studied population claims that risk reduction is the second most valuable benefit that they obtain in the process of outsourcing logistics. 68,5% of our respondents believe so.

Furthermore, Romanian companies also target to optimize the customer service level. 66,7% of our respondents stated that increasing the level of customer service is a popular benefit that they get by outsourcing some or all of their logistics activities.

Encountered risks

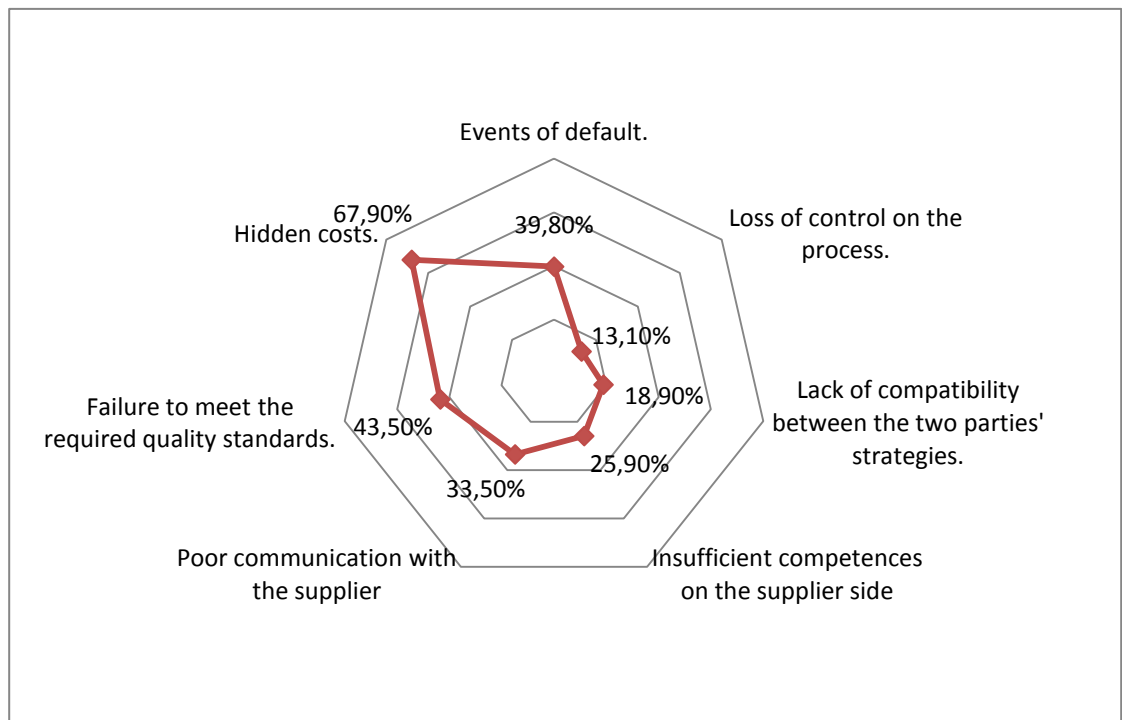
During our research we had the opportunity to notice that the most frequently cited outsourcing – related risks were: the supplier's failure to meet the required quality standards (43,5%), events of default (39,8%), poor communication with the supplier (33,3%). All problems encountered in the outsourcing process are listed in fig. no. 2. It should be noted that the respondent companies had several response alternatives to choose from.


Figure 2. Problems encountered during the outsourcing of logistic activities
Source: made by the author.

Our respondents admitted that all of these risks are truly endangering the outsourcing process and that what their fear the most are all the hidden costs that they encountered only after they enrolled in the process. The risk related to the hidden costs can be minimized through a solid outsourcing contract, but for doing this the companies must benefit from a large experience in this field. This matter will be subject of our future research in which we will identify the most suitable ways to eliminate or reduce the outsourcing logistics related risks.

V. Conclusions

The decisions regarding the outsourcing of logistic services are designed to optimize the performances within the value chain if the compatibility with the competitive strategy of the company is secured. A company whose competitive drive is the performance of the logistic system will provide a competitive edge in terms of costs, quality and innovation in case of outsourcing. In order to benefit from the advantages of logistics outsourcing, managers must treat this area as a source of competitive edge.

As a company grows, one of the most challenging tasks is to choose the outsourcing strategy, in which the outsourcing of logistic services plays an important part, securing a medium- and long-term competitive edge.

Today many companies with a significant position on the domestic and international markets resort to suppliers of logistic services that – given the complexity of the global logistic chain - establish regional, national and international distribution centers. This fact compels managers to scrutinize the external environment, the market respectively, with utmost attention, to plan logistic activities and processes, to analyze their necessity and adequacy, to develop control procedures and to monitor their success or failure.

The aim of outsourcing logistic activities and processes is to develop optimal logistic systems for the targeted market and for each market area.The increasingly limited opportunities for growth in terms of efficiency and effectiveness among manufacturing and services companies motivates intensified efforts for the discovery of new "critical area" in the companies' activities that might enable the companies reach their targets ducts, services and customer service level. These critical areas are also linked to the area of logistics, that offers considerable opportunities for increasing competitiveness and securing a competitive edge and still provides unexploited or insufficiently exploited resources, in which the drawing up and implementation of outsourcing strategies play an important part.

The limitations of our research refer to the fact that we only found respondents from the North-West region of the country. We intent to extend our future research to investigating companies from the entire country. Another limitation includes the fact that our research does not establish any ways in which the outsourcing logistics related risks can be minimized or even eliminated. For this reason our future work will focus on this matter.

THE INTELLECTUAL CAPITAL IN KNOWLEDGE-BASED SOCIETY AND ECONOMY

Sabău Remus
"Vasile Goldis" Western University of Arad, Faculty of Economics

The management improvement in the educational public institutions from Romania owns an undeniable priority in each state government. The necessity of the changes in institutional management related to the administrative system and, mainly, to the management of the intellectual capital defines the utility and the efficiency of meeting the necessities in the respective educational environment and sets as one of the main problems, recently emerged, the elaboration of a number of structural-organisational and functional-operational measures, stimulating management modernization at an educational level, including the higher education institutions, with a main reference to the intellectual capital.

In the national literature, these problems are not highly scientifically examined. In my opinion, in Romania, at present there isn't any well-defined framework in connection with the management of the intellectual capital from the educational institutions. That's why I considered that this isn't just an actual topic but it is also a central subject. I'm convinced that a more thorough examination of the intellectual capital will be able to contribute on a long and a medium term to the administrative growth and development. The intellectual capital has a key role in the international relations development and triggers, in my opinion, radical structural changes, which are very important for the amplification of the educational institutions value. The ability to create, use and increase the intellectual capital value is, in my opinion, the foundation on which it is based the public management of educational institutions in a country, the welfare and the life quality for her citizens.

The knowledge valorification is a long process, which doesn't offer rapid results. But the effects of promoting and propagating of knowledge are, firstly, on a qualitative structural level and can lead to beneficial effects on long term.

In my opinion, in countries in course of development, knowledge itself isn't yet perceived as an active which can be used at its maximum capacity. As a consequence, in my opinion, both the real management and the researches in the management domain should be oriented especially towards this subject.

The main aim of this article is to underline the managerial essence of the intellectual capital and to highlight its effects on the organisational performance of an educational institution – and at the same time- to determine managers, generally, and top managers, especially, from educational institutions in Romania, to understand the intellectual capital management importance.

The main objectives which I have proposed myself to attain in this paper are science-oriented especially, meaning that I have tried to illustrate the place and the role of the intellectual capital for the socio-economical development, as well as the most important characteristics of the intellectual capital intended to facilitate the creating of the management institutional framework and proficient management of the intellectual capital under the conditions of changing specific to a society and an economy based on knowledge.

Key words: intellectual capital, management, knowledge, economy, performance.
JEL – K11; J24; O34; M12.

I. Introduction

According to the established objectives I defined the essential activities which aim at attaining them:

-The identification and systematization of the main theoretical-methodological concepts for defining the term "intellectual capital" on the basis of investigations on papers from local and worldwide specialized literature.

-The exploration of the composing elements from the structure of "intellectual capital" ;

-The analysis of the manner in which, along time, various economical schools representatives' opinions have evolved, in connection with the integration tendencies in the economical sciences of some concepts such as: the human capital, the intellectual capital, the intangible assets etc;

-The justification of the necessity of promoting some managing policies and of intellectual capital management as a possible mechanism for the developing of the intellectual capital in educational institutions;

-The highlighting of interdependencies existing between the intellectual capital and the investment in education, as main factors of growth and development in a society based on knowledge;

-The applying of my own method of investigation in Romania, at the level of schools in Marghita;

-The proposition of some recommendations related to the development perspectives of the intellectual capital in educational institutions in Marghita;

-The attempt to maximize the attention of scientists, of politicians, and of the main governors on the intellectual capital role in the economic progress and for promoting the making of a positive image in relation with the importance of education for our society professionalization and for attaining a superior qualification level.

The attaining of objectives implied both the analysis of theoretical-methodological concepts and of the manner in which decisional factors can create, develop, utilise the intellectual capital for the attaining of strategic objectives of an educational organisation.

II. The theoretical framework

The first researches in the intellectual capital area started from the second half of the twentieth century, at the time when scientists realised that resources and the quantity of the existing resources of an institution, don't have a decisive role in the results. Because of this, in the last five decades of the century, a great number of researchers in this domain have developed a new trend based on the resources efficiency. In the 80s of the past century, researchers wondered why institutions with the same financial resources, physical and human, give birth to different levels of value. The answer to this question revealed that the factor which explains these differences has in view the various levels of productivity and market value. The disputes emerged when the market value seemed to be bigger than the accountancy value of an institution. The researches proved that this fact emerges because the intangible assets and especially the intellectual capital are also taken in consideration.

This discovery underlines the fact that educational institutions have various resources and competences. The intellectual capital and its management have at a theoretical level three distinct origins which come from the following researchers: Hiroyuki Itarni, David Teece and Karl-Erik Sveiby.

The first was Hiroyuki Itarni from Japan, who studied the effect of the invisible assets for the management of Japanese educational institutions. Unfortunately, his educational paper in Japanese language from the year 1980 *"Mobilizing Invisible Asstes"* has been translated into English only in the year 1987, and only since then it became accessible to the wide educational public.

The second important author is David Teece and his partners Penrose, Rumelt, Wemrfelt, who researched various theories. Teece presented his survey in 1986 in an article about the technology of marketing. His article *"Profiting from Technological Innovation"* proved the importance of extracting value from innovations.

At last, the papers of the Swedish Karl-Erik Sveiby refer to the human capital as a dimension of the intellectual capital. Sveiby is the one who created *"The Swedish Movement"* in the theories related to the intellectual capital and the knowledge management. He was the first who revealed the importance of measuring the human capital. His first work was educational and was written in 1986 in Swedish. The first book which debates the subject of the knowledge management was educational and was written in 1990 in Swedish.

Sveiby revealed that, unlike the conventional actives, knowledge increases when it is shared and disseminated with and to the others (Agndal 2006:91). In the field of specialized literature it is considered that especially Itami and Sveiby's contributions had a great meaning for the institutional strategy. Due to the fact that certain actives of the educational institutions are intellectual, the acquisition of the aptitudes, knowledge management and the know-how management are targeted, so that learning becomes the basis of the strategies.

Leif Edvinsson is the follower of Sveiby, who made up the first annual report of intellectual capital at Skandia in 1995. In fact, he grouped those invisible actives and he named them as the intellectual capital. Leif Edvinsson created the manners to explain what Skandia called *"the hidden values"* and developed a national intellectual capital management (Edvinsson 2008: 525). The researches continued even later, in the twenty-first century. Thus, Malhotra sustains that, the intellectual capital in the educational system is difficult to control, because of its intangibility, and that is why, it is hard to establish what represents the intellectual capital itself. (Malhotra 2003). Later, Jan Mouritsen and his partners showed that it is not possible to created absolute models of the intellectual capital indicators. (Stahle 2008).

We are going to present, in short, some definitions of the intellectual capital from the educational institutions.

Stewart defined the intellectual capital as an intellectual element which has been formalized, triggered and utilised in order to produce actives of a higher value. He defines the intellectual capital naming it "*the packet of knowledge which can be used*" (Stewart, 1997:288) in an educational institution. Another definition of Stewart given for the intellectual capital is: *"The intellectual capital is the intellectual element- knowledge, information, intellectual property, experience – which can be put into practice"* (Ibidem).

The definition of the intellectual capital after Annie Brooking is that it represents the combination of four elements, and these are: the actives of the exterior environment, the actives of the intellectual property and the actives of the infrastructure. The market actives are those which emerge from a positive relation of the educational institution with the exterior environment, such as contracts, the citizens' loyalty level (Kok 2007). The actives of the intellectual property refer to know-how, copyright and other regulations.

The actives of the human resources are the capacity and the creativity in solving the problems, and other aptitudes of the employees in the educational institutions. Brooking defines the intellectual capital as *"the term given to the combined intangible actives which allow the functioning of the institution"* (Brooking, 1996:24).

The intellectual capital, being analysed by a lot of scientists, received various definitions. Edvinsson (Edvinsson 1997) said that, the intellectual capital of an educational institution can be compared with the root of a tree, both being invisible, and having a great contribution to the quality of the educational institution results. This is also the model of the intellectual capital which is being referred to many times. Edvinsson and Malone's model divides the intellectual capital into two parts: the human capital and the structural capital. The human capital refers to the employees of an institution, their competences, their creativity, their social capacities, and others. But at the same time, the human capital refers to the value, philosophy and the educational institution culture. They showed that the educational institution cannot have in its property the human capital. On the other hand, the structural capital, in its turn, is divided into the institutional capital and the consumer capital. Here, the institutional capital refers to the innovations of the

educational institution and to its processes. Figure no. 1 presents the model of the intellectual capital after Edvinsson and Malone.

Figure no. 1. The model of the intellectual capital after Edvinsson and Malone.
Source: Figure drawn by the author, after the theoretical model

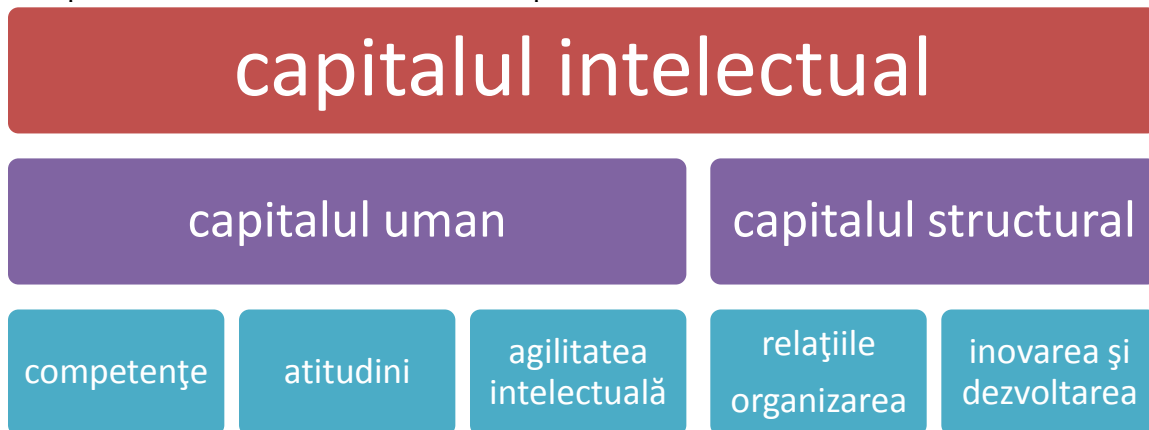
Another structural division of the intellectual capital in the educational institutions was presented by Roos and his partners, who were of the opinion that the intellectual capital divides itself between the human capital and the structural capital, the human capital containing competences, the attitude and the intellectual agility, and the structural capital containing the relations, the institution, the innovation (so-called "renewal", by Roos) and development (Roos 1998). Figure no. 2 presents the model of the intellectual capital after Roos.


Figure no. 2. The model of the intellectual capital after Roos
Source: Figure drawn by the author, after the theoretical model

Professor Bratianu defines the intellectual capital as the hidden part of an educational institution value, because it "represents the intangible resources of the institution, which cannot be measured with the financial instruments used in measuring the tangible resources" (Bratianu 2009:22). Lacks in the analysis in this area are due to the fact that the models of the intellectual capital don't explain the way the intellectual capital is utilized for creating value. What was discovered by Leitner and Warden in 2004, is that the theory wasn't able to explain the correlation between the elements of the various models of intellectual capital (Canibano 2008:24).

As a conclusion, in my opinion, the intellectual capital of an educational institution represents the sum of all the knowledge detained by the officials in an educational institution, which brings about an increase in efficiency, and at the same time, that part in the educational institution which can be created together with the increase of the personal value of the employees, by correctly

using knowledge, aptitudes, learning capacity of employees, and also through investment in employees. But all these focus on the knowledge of the consumers, as a final element to attain by increasing the employees' value.

2.1. The structure of the intellectual capital

The intellectual capital includes both the intangible actives and also the actives which represent the intellectual property. The intangible actives are the human resources, the interpersonal relations in the educational institutions, the organisational culture, the mode of organisation and functioning, and the intellectual property is represented by the name of the organisation, the author rights, the registered marks, as well as the inventions patents. The majority of the consecrated authors in this domain divide the intellectual capital into: human capital, structural capital, and relational capital.

The human capital is composed of knowledge, aptitudes, personal agility, experience, intuition, and personal opinions of employees. This is not property of the public institution, so the staff takes it when they leave that institution (Hung 2009:51). In other words, the human capital is based upon the individual capacities of the employees, which are useful at a collective level for attaining the aims of the public institution. The know-how, imagination and creativity of the employees are as important as the tangible resources for an institution (Petrescu 2008:76).

The structural capital is made up of patents, models, administrative systems and information technology. This represents the structure, strategy, culture and knowledge from the processes of a public institution. It means that, the documents of know-how, the rights of intellectual property and the patents, the software of the public institution, the marks which have been registered, and respectively, the procedures, the data bases and others. These are the actives which remain in the organisation even after the staff leaves the institution.

The relational capital refers to all the relations of the organisation with the exterior, that means the relation with "the clients, citizens, the private environment, the partners, the allied, and others" (Ross 2011:6707), influencing the satisfaction and the loyalty towards the educational institution. The stress is put especially upon the personal relation with the clients (Dumitrescu 2010:2).

III. Methodology

3.1. The design of the research

For the attaining of the research objectives related to the effects of the intellectual capital over the organisational performance in an educational organisation a survey based on a questionnaire was realised. The questionnaire elaborated in order to answer to the research topic is composed of three constitutive parts of the intellectual capital having the aim to test its efficiency: human capital, structural capital, relational capital. For the assessment of the questionnaire answers a scale with five levels of appreciation on the manner of meeting a certain request was utilized, from : 1 = "Total disagreement", 2 = "Disagreement", 3 = "Neither agree nor disagree", 4 = "Agreement", 5 = "Total agreement" (after cases).

The research part contains 19 questions referring to the human capital -which allow the obtaining of data connected with efficiency through:
- Learning, education, improvement (questions 1-9);
- Experience and competence (questions 10-14)
- Innovation and creation (questions 15-19);

Taking into consideration variations of the greatness of organisations involved in this research, we propose that the analysis of the obtained data to be made depending on the staff number, for the following three categories:
- Category 1: 10-14 employees
- Category 2: 15-24 employees

-         Category 3: over 25 employees

The first category comprises the number of employees between 10-14, because an organisation with less than 10 employees is not representative for the present research. Moreover, we consider that small organisations with a number of employees under 10 persons don't have a management system clearly highlighted. Thus the intellectual capital management in the above-mentioned organisations is less obvious.

IV. Results

Following the analyses, it has become evident that learning investment, education and improvement investment of the staff has a major importance for an educational institution efficiency. Starting from the highlighted data, the respondents in the educational organisations with a limit of 19 employees appreciate that the attained level of the criterion related to "learning, education and improvement" is very low, when compared with the results obtained in bigger organisations, which depicts a higher level of attaining education (16%, 38% respectively). Analysing this situation it is clear that large institutions invest much more in learning and improvement of employees. This fact is possible due to the fact that a lot of institutions have specialized trainers and this type of organisations allocate much more funds for the staff improvement and education, granting a great importance to the institution efficiency. According to the results, the organisations having over 30 employees appreciate that the percent of the competent employees with a satisfactory experience is of 57%, while in smaller institutions this figure is equal with 71%. This fact can be explained due to the reality that in large institutions with over 30 employees is a lot more difficult to have an evidence of all the staff and their level of competency, even if the staff selection is realized after well-defined parameters. Thus, the less staff the institution has got, the better the above established criterion is highlighted.

In connection with the criterion of "innovation and creativity", the organisations with a limit of 19 employees appreciate that the attained level of this criterion is pretty low, but very near to the organisations with a limit of 29, when compared with the results obtained in large organisations, which shows a bigger level of innovative realization (24%, 29%, 37% respectively).

The results obtained with this criterion are very much alike with the results from the first criterion related to "learning, education, improvement". This is possible because in the first case it is about investments, and not any type of investments, but some very serious and very costing. Large educational institutions invest pretty much in technology modernization and the creating of new products, which could cope with the competitors. These institutions address the large public and generally detain a various range of services. However, we consider that small institutions should invest much more in innovation, because it is more and more difficult to resist the pressure from large institutions, in the first turn. Secondly, this fact would be useful for the continual growth and development.

V. Conclusions

Analysing the presented facts, we can conclude that at present, the human capital is the most important part in the intellectual capital structure. Moreover, without this part the other two parts of the intellectual capital cannot exist.

The created image shows that the analysed town experiences a transition period at present, from a post industrial town which wants to be based on knowledge, but it still has a long way. Here we can debate two opposed facts, but also very important. First, Marghita is a town with a medium level of living conditions or we could say it is low when compared with the developed towns in Romania. Under these conditions the most part of the population from here aims at surviving and this fact prevents them from thinking of developing the intellectual capital. On the other hand, without development, investments in education, learning and staff improvement, innovation,

creation, we cannot pass to the level of a town with an economy and a society based on Knowledge.

The Questionnaire Questions
Section 1: Introductory Questions

Gender
  ☐ Male   ☐ Female
Age
  ☐ 18-29   ☐ 30-39   ☐ 40-49   ☐ 50-59   ☐ +60

Educational background
  ☐ High School   ☐ University   ☐ Postgraduate (MSc)   ☐ Doctoral (PhD)

Institution employees
  ☐ Category 1: 10-14 employees
  ☐ Category 2: 15-24 employees
  ☐ Category 3: over 25 employees.

Section 2: Elements of the questionnaire:

HUMAN CAPITAL

1	The competence of the employees meets their responsibilities and job requirements?	1	2	3	4	5
2	Does the institution value employees' team work?	1	2	3	4	5
3	Do the employees benefit of continuous learning and training programs?	1	2	3	4	5
4	Does the institution make efforts for developing knowledge and competences of their employees?	1	2	3	4	5
5	Training costs per employee are effective?	1	2	3	4	5
6	Employees learning determine the profitability of the institution?	1	2	3	4	5
7	Does the employees' learning affect the profitability of the institution?	1	2	3	4	5
8	Institution's employees are motivated enough?	1	2	3	4	5
9	Does management quality positively influence the development of the institution?	1	2	3	4	5
10	Lately, the market share of the institution was in a continuous growth?	1	2	3	4	5
11	Institution's employees are professionals in their field?	1	2	3	4	5
12	Institution's employees have been working for a long time in it?	1	2	3	4	5
13	Employees contribute to the effectiveness of the institution?	1	2	3	4	5

14	The managers of the institution are constantly on track with new ideas for the institution development?	1	2	3	4	5
15	Institution's employees contribute with innovative ideas?	1	2	3	4	5
16	Does the organization constantly propel new ideas coming from employees?	1	2	3	4	5
17	The institution develops more ideas, services and products than any other institution in the education system in the town?	1	2	3	4	5
18	Institution's employees are encouraged to bring knowledge and ideas and to share knowledge with colleagues?	1	2	3	4	5
19	Institution's employees are satisfied and happy with innovation policies and programs of their institution?	1	2	3	4	5

ACTUAL REQUIREMENTS REGARDING THE INTELLECTUAL CAPITAL AT AN EUROPEAN AND INTERNATIONAL LEVEL. THE ASSESSMENT OF QUALITY MANAGEMENT SYSTEMS IN ORGANISATIONS PROVIDING INSTRUCTION SERVICES

Sabău Remus
"Vasile Goldis" Western University of Arad, Faculty of Economics Sciences

Neacșu Dănuț
"Andrei Șaguna" University of Constanta, Faculty of Law and Administrative Sciences

The European Union Council had and still has in view the profound changes taking place in society: globalization represents for Europe a competitors intensification in all the economical sectors, while the developing and the diversification of the information technologies can lead to a radical change of the whole learning and educational system, opening the perspectives for learning possibilities and accumulating knowledge during all one's life.

The topic actuality of this article consist from the fact that, due to the globalization and the international competition intensification the request for workers with a low qualification level decreases; the new jobs presuppose high performances, flexibility, stress on qualities such as: high level of performance, creativity, openness to change, initiative. People will be obliged to possess much more knowledge, competences and they will have to work in multi spheres teams. Of course that not all the people can become conceptual analysts, something like this cannot be required, but an adaptation to the new system, to the new economy is required.

At present, more and more people work in domains in which information is created. In the future this percent will grow. The utilizing on a large scale of machines and installations will determine that even workers from the basic domains to be better and better prepared. In the countries OECD the unemployment rate is higher for the persons with a second education, unlike the persons with a higher education, the manpower being in this way forced to become more qualified. On the other hand, as more and more work is taking place at an intellectual level, the detaining and manipulating of information becomes an essential quality for each employee. This article has as a main objective the highlighting of actual requirements regarding the quality assurance in instruction services at an European and international level. Thus, the permanent learning strategies from the European Union are presented, which aim at realizing a European space of knowledge. The concept of permanent learning is being analyzed as a new vision in the instruction domain, which is centered on the individual. An important aspect is the developing of basic personal competences and the validation of these through flexible qualification structures.

Due to the complexity of the processes and the context in which they are functioning, the instruction organizations should orient themselves to the models TQM, even though the standard ISO 9001 offers advantages at implementation, connected especially with the processes management, the document control and registrations. The proposed model being a TQM model adapted to the instructional domain and integrated with ISO 9001, can be easily utilized by these organizations.

Key words: intelectual capital, management, quality, TQM, performance.
JEL – K11; J24; O34; M12.

I. Introduction

The central problem of knowledge, as a defining element of the new society, does not reside in its existence, but in the new content of knowledge, in its role in the entire society and of the economy, as well as in the ways of stimulating its formation.

Along time, two types of learning have existed: for maintaining and for change. In a traditional manner, societies and individuals adopted the type of learning of continual maintaining. This learning is interrupted by short periods of innovation, triggered often by the shock of exterior events. As a matter of fact, learning for maintaining consists from acquisition of rules, methods and fixed regulations, in order to cope with known and unknown situations. The maintaining of some given situations is very important, on a short term it is simply exceptional due to its normality.

On a long term, and especially in a time of changing and searching, in order to survive it becomes essential the type of learning which could facilitate change. It is about that type of learning which can generate revival, restructuring, problem reformulating. Recently, this type of learning has been called innovating.

Thus, a new mode of developing is imposed, which integrates the human dimension from another perspective- that of the complexity and diversity, in which an important role is detained by education (Ciobanu, 2003:13).

The European Union Council had and still has in view the profound changes which take place in society: globalization represents for Europe a competition intensification in all the economical sectors, while the development and the diversification of the information technologies can lead to a radical change of the entire system of learning and education, opening the perspectives on possibilities of learning and accumulating knowledge during one's life.

The Council has established as a fundamental strategic objective that, the European Union to become the most competitive economy based on knowledge. It was considered that the most important problem of the majority of the member states is unemployment. Eliminating unemployment can be made if consistent reforms in the domain of job occupation will be realized, the existent obstacles will be eliminated, and if necessary resources will be utilized. The elimination of unemployment was defined as an other priority of the European Union. Another established objective on the summit agenda in Lisabona (the Lisabona agenda) was improvement in employing the manpower and work quality1. At the summit new recommendations have been made and the priorities have been stressed (learning during the entire life, acquiring abilities, mobility), reflected already in the Directing Rules regarding Occupation, by means of the new horizontal objectives.

II. Theoretical framework

Much time education has been perceived as a system in which young persons entered in order to make a formation for themselves and they came back into society after a decade or two of theoretical accumulation of information, necessary for the productive work. No matter how much we pretend to humanize the educational process by attributing to it a lot of affective, moral or aesthetic dimensions, the reality is that changes are difficult to manage, because learning remains a system with an input and an output, being efficient as long as statistics, costs, infrastructure and utilized personnel indicate this thing (Matei 2002:2).

Education becomes essential for each economy, on one hand because by education, relations between people and society are being diversified, the individual having the capacity to contribute as a member of the society with something which should balance the things he gets as a consequence of living together with other individuals. On the other hand, the actual economy necessitates a well-prepared manpower, in a time of globalization and technological revolutions, which necessitate the development of competences, of creativity, solid knowledge, an increase of responsibility. In a world like ours, subject to continual changes, stagnation with regard to learning is an inadequate behaviour or even dangerous for the contemporary individual. (Anghelescu 2003:21). The economical performances of a country depend more and more on the access to the new technologies, on their adoption and on the new requirements being imposed to the manpower from a point of view of the professional training.

2.1. The European common framework of promoting training in the intellectual capital

Until now, the European Union acted steadily for the developing of the national policies and the identification of domains of inter states cooperation, with the aim of coping with usual provocations such as: facilitating of adapting to changes, supporting the integration of adults on the work market and promoting the equality of chances between men and women. The opinions common to the social partners have also constituted a point of reference at the level of the European Union, contributing to the developing of modes of approaching the professional training.

Some key aspects have been approved by all the member states of the European Union. We can enumerate some of these:

-Assimilation of a vast quantity of knowledge and professional training with a view to employment are not contradictory elements. The importance of general knowledge for the capitalization of professional competences is more and more recognized.

-Connection points between education, professional training and economical sector are being established. The provocation at which learning institutions and economic agents are subjected to is that of accepting the institutions as partners in the process of professional training. The role of an economic agent doesn't imply only recruiting the qualified individuals or the providing of extra professional training. The institution is now viewed as an important generator of knowledge and technologies. The process of professional training, especially in transverse domains, is accompanied by a very large partnership, involving local authorities, associations of consumers and specialized organisms.

-The equal rights to education and professional training are viewed in the context of ensuring equal chances, including the positive discrimination in the favour of the disadvantaged ones.

-The informational society reveals new requirements from the part of educational systems and professional training, by means of new methods regarding teaching and learning, facilitating continually the developing of contacts and connections between teachers and institutions at a European level.

Many of the problems regarding the developing of learning on the entire course of life affect the content and the organization of the professional training. The European framework of the professional training policy at European level must take into consideration the fact that that answer to the usual problems can differ from one country to the other, depending on its historical, social, cultural and economical characteristics. It can't be stated that there is only a European solution for all the aspects connected to the training. The recommendations of the European Commission for the next period refer to the implementation of strategies for permanent learning. The same approach oriented to the developing of human resources is detailed in the cohesion Policy, as a support of the economical boom and job occupation, for the period 2007-2013.

2.2. The European model of quality assurance in organizations providing training services

The European framework of quality assurance for education and professional training (CQAF) proposes a European model of quality assurance management based on the principles TQM, the standard ISO 9001:2000 and the excellence model EFQM. We can identify convergence points between EFQM principles and the ones which are the foundation of standards ISO 9000. There have also already been made steps in the direction of formalizing the activities related to the implementation TQM. Because of the recent elaboration of the European model in the professional training domain (CQAF), until now it hasn't been studied and experimented on this model implementation. We propose next in the research methodology a parallel implementation method of the standard ISO 9001:2000 with the model CQAF adapted for the organizations which provide training services.

III. Methodology
3.1. The Design of the Research
For the attaining of the research objectives regarding the implementation of quality management systems in organizations which provide training services a research based on a questionnaire was made.

The research part contains 13 questions which allow us obtaining data referring to:

-Company identification (name, field of activity, number of employees) (questions 1-6);

-Types of training programs offered (questions 7-8);

-Implementation and certification the quality management system (types of standards and quality management models implemented, accreditation of organism which made the certification) (questions 9-10);

-Accreditation of training programs (questions 11);

-Preoccupations concerning assurance of quality training services (questions 12-13);

Taking into consideration the differences which appear in the implementation process of quality management systems, between the organizations from the training area, according to their size, we propose that the data analysis is made according to the number of employees, for the following 5 categories: 1-5 employees, 6-20 employees, 21-49 employees, 50-249 employees and over 250 employees.

For achieving our purpose, a number of 385 questionnaires were distributed to training organizations either accredited or having the quality management system certified according to the international standard ISO 9001. A number of 197 questionnaires were returned.

IV. Results
The questionnaire which stood at the basis of the research included the following question with several types of answer: „The standard of reference/ model of the quality management system implemented in the organization", with the following variants of answer: SR EN ISO 9001:2001, EFQM, Romanian Award for Quality Juran, CAF (TQM in public institutions) CQAF (EFQM for providers of education and professional training), others. It results that, between 6,6% and 11,1% have not yet implemented any system of quality management. It can be noted the high degree (over 73,7%) of organizations providing training services which have implemented the quality management system according to ISO 9001. The fact that between 7,3% and 14% of the questioned organizations have already implemented EFQM and CQAF models represent an optimist indicator concerning the success of the proposition of implementing both the ISO 9001 and the CQAF model for the organizations from the training field. In these organizations, implementing ISO 9001 standard can improve management activities, measuring and controlling proceses.

Quality assurance should be implemented in the same manner as daily teaching and studying activities. Implementation covers a wide range of activities. The implementation stage has 2 basic quality criterions: instructors' and other staff categories management and processes management.

In the case of the first criterion, it is evaluated the manner how plans concerning the staff are developed, focusing on the recruiting system, performances assessment, career development, reward system and the manner how staff's potential is valued for the organization's objectives. The emphasis is on monitoring and continuous development of skills and knowledge of trainers, instructors. Also, encouraging staff to formulate suggestions and further implement them, providing appropriate working conditions and achieving an efficient internal communication represent requirements which are taken into account when assessing the performance of this criterion.

Small organizations up to 20 people appreciate that they "broadly" fulfill requirements of this criterion. It may be noted that medium and large organizations consider that the criterion is satisfied "fully".

For the second criterion, "processes" is directly related to quality management system described by international standards ISO 9000. Thus, for organizations that have implemented a quality management system such requirements should be fulfilled. However, although 74.1% of organizations with up to 5 employees are certified ISO 9001 and 73.7% of organizations with 6-20 employees are certified, the value of criterion fulfillment is inversely proportional. The same situation occurs for large organizations, of which 85.7% are certified compared to 79.6% for medium-sized organizations, and the value of meeting the criterion is lower for large organizations.

For the second criterion, „processes"

V. Conclusions

The purposed methodology has been applied within a research concerning the evaluation of conformity with the TQM model criterion of the studied organizations. The research was made on 5 different categories of organizations classified according to the staff number.

In this research, an application of the methodology considered the representation of the maturity levels of surveyed organizations. We established the conditions for determining the maturity levels of the organization, through the correlation between TQM proposed model criteria, goals, generic and basic practices, represented through the questionnaire responses.

Analysis was made by type of organization, highlighting the quality criteria that define the location of each maturity level.

Medium and large organizations, with over 50 employees have general performance indicator values that rank them first in terms of compliance with the proposed TQM model criteria.

CORPORATE SOCIAL RESPONSIBILITY VERSUS TAX AVOIDANCE PRACTICES

Stoian Ciprian Dumitru
Babes-Bolyai University Cluj-Napoca
Faculty of Economics and Business Administration Cluj-Napoca

Worldwide crisis has made multinational companies that are engaged in corporate social responsibility actions to manage their businesses through the lens of various tax avoidance practices. The content of this paper is important due to the fact that tries to identify the impact in case of companies active in corporate social responsibility actions versus their tax structures orientation.

Corporate social responsibility literature did not paid enough attention on the impact of the tax avoidance practices of companies. Tax, as a concept, brings in itself an important corporate financial impact with subsequent effects for the life of multiple citizens in countries where private entities are operating.

Even though companies are usually expressing their ethical and responsible conduct in respect of the social environment, there are many cases when the business practices were not aligned with the declared corporate behaviour. This paper seeks firstly to examine whether companies engaged in tax avoidance practices (ex. offshore tax havens) consider that continue to act socially responsible. Secondly, the paper examines the influence on attending the stakeholders' goals for those companies practicing tax avoidance and its implications on corporate social responsibility actions. Moreover, the paper focuses also on the aspects described before from the perspective of the corporate entities operating in Romania.

This paper's intention is to use and to develop the results of previous research carried out by Lutz Preus (University of London) and, subsequently, by Senators Levin, Coleman and Obama in their "Stop Tax Haven Abuse Bill".

The implications and the objectives of this material are to highlight, to identify and to spot clearly the relations and the influences of the tax haven practices of corporations versus their undertaken social responsibility actions. Moreover, this paper brings a fresh perspective of this topic from the Romanian market.

I consider that this paper triggers in itself a good presence in nowadays business environment, due to the fact that stakeholders are becoming more and more aware on both corporate actions versus their tax efficient structures. Many of the aspects described were already "tasted" in practice by various stakeholders, while many multinational corporations started to become realistic about the risk of being "socially responsible" through tax schemes.

Keywords Corporate social responsibility, Tax haven, Tax avoidance, corporate financial implications, Investments
M14

1. Introduction

One of the most important elements when referring to corporate social responsibility (CSR) is the notion of legitimacy of the actions. It is all related to the fact that a potential failure in disposing valuable services of private entities to the stakeholders may trigger the permission of private entities to exist. In this respect, companies involved in CSR actions should pay more attention on all their business activities. One aspect of their corporate activity relies on taxes that should be paid based on domestic or multi-national legislations. As a part of the taxes structure, the concept of tax avoidance may be seen as a controversial business factor in relation with CSR policy of each company.

The paper brings up the evidence of how companies involved in tax avoidance practices still consider being socially responsible.

Moreover, the relation between tax avoidance practices, CSR image and actions is in the scope of this paper. It is relevant to understand if both, the stakeholders' and shareholders' objectives were influenced by the decision of corporations to be based offshore and to apply various tax avoidance structures.

Even though in Romania the concept of CSR is still an on-going process, some previous steps have been undertaken in this respect. Thus, there may be followed some particular cases in order to assess whether the tax avoidance practices have influenced in different manners both the stakeholders and shareholders of the entities.

2. CSR and tax avoidance practices

Tax avoidance practices (TAP) are, in most of the cases, the business structures pursued by companies in order to obtain a more convenient tax position. In practice, TAP is related to the fact that corporations are moving their headquarters in more tax convenient locations, especially offshore (in places so called tax havens).

Tax havens typically offer secrecy to protect investors against scrutiny by outside authorities, thus preventing the effective exchange of information on tax payers. Furthermore, many tax havens do not require substantial corporate activities within their borders for a company to benefit from the preferential tax treatment. In many cases, this may actually apply only to corporate activities that are undertaken beyond their borders.

2.1. Companies involved in TAP (offshore in tax havens) - are still CSR aware?

In order to assess whether companies involved in TAP consider that are continuing their CSR policies without any effect on their corporate behaviour, Lutz Preus, from University of London, considered in the paper "Tax avoidance and corporate social responsibility: you can't do both, or can you?" a research study in this respect. The research was pursued by using the Stop Tax Haven Abuse Bill tabled by Senators Levin, Coleman and Obama in 2007, as a starting point for identifying tax havens from US. Moreover, the list with tax havens was compared by the factors from the OECD model. As a result, a final list with tax havens was identified. Then, by using the Forbes Global 2000 list of 2008 companies, a list containing 24 companies for Bermuda, four for the Cayman Island, two for Panama and one for the Channel Islands was identified. Thus, the paper analyzed a combined list of 27 companies from Bermuda and the Cayman Islands.

The smallest of these – Bermuda insurance company Allied World Assurance – still had an annual turnover of US$ 1.45 billion in 2008. The study analyzed codes of conduct as displayed on the web sites of the 27 companies, which were checked during autumn 2008 for a presence of a code of conduct. For the purposes of comparison, a sample of US companies was also checked for codes of conduct.

The result of the study into the position on corporate social responsibility by companies that are based in tax havens found that such companies indeed make claims that they engage in socially responsible business practices. It was also surprising to find that 38 per cent of the sample firms operating offshore claimed to obey both the legislation in the offshore and domestic locations. Also, the study identified that companies have made significant efforts to design codes of conduct and mentioned the commitments of the TAP companies to provide shareholders with a satisfactory return for their investment and commitments to employees to avoid harassment, to promote diversity and to safeguard health and safety at work.

In respect to organizational legitimacy, the findings of the study point to a complex picture where companies based offshore engage in acts of strategic legitimacy to be seen as socially responsible (communicating CSR commitments through codes of conduct).

As a result of the study, the most important companies (part of the study) operating offshore consider that are continuously looking at their CSR status and in order to act responsible, even though the TAP are being used in their business frame.

2.2. CSR hypocrisy – reports and facts

As a follow-up related to the study presented above, Prem Sikka, from University of Essex, United Kingdom, observed the hypocrisy of companies in respect of CSR. Why hypocrisy? Very simple because, generally, companies are labelling all their activities (including tax positions) as very responsible, transparent to all stakeholders and with good financial results for the shareholders.

Related on taxes, in the real conditions, few companies make any direct reference to payment of taxes in their social responsibility reports, but their claims of ethics, integrity, honesty, transparency and responsibility are meant to apply to all aspect of their operations. Since the payment of democratically agreed taxes in an important part of corporate citizenship, this assumed that the declared standards also applied to taxes. The researches conducted in this field presented that there is a considerable difference between corporate discussion, corporate decisions and action. All these aspects are conferring a so-called corporate hypocrisy. In this respect, it can be considered that in the real business environment corporations have developed two cultures:

to promise ethical conduct to external audiences and

to improve profits by avoiding and even evading taxes.

Developed companies elaborate practices to appropriate returns due to society on its investment of social capital. In order to do that, companies are nowadays using various methods, such as: transfer pricing, royalties, offshore tax havens and planning structures just to avoid taxes. Behind of the very popular CSR reports, interviews and other PR materials, there is a general problem related to the fact that corporations did not communicate their TAP to stakeholders and did not explain the possible social consequences of avoiding taxes.

In a formal manner, real and used TAP are considered to have a legal character. By aligning together CSR policies and TAP, it is true that there is no legal or moral link between them. Managers are pursuing tax avoidance for reaching higher profits, remuneration, status and media accolades. The contradictions between reports and facts have been exposed by so-called whistleblowers, other investigators and law enforcement agencies. The implosion of this hypocrisy has resulted in fines, imprisonment for some company executives and hostile press coverage. The negative outcomes may have persuaded some to take steps to align corporate culture with publicly espoused claims, but the systemic pressures to maximize profits, share prices and executive financial rewards present considerable barriers to securing long-term cultural change.

The exposure of organized hypocrisy challenges corporate claims of social responsibility. There is a need to go beyond the carefully cultivated corporate image and engage with actual corporate practices and consider their impact on the lives of people. In many cases, this tax avoidance evidence has real human consequences even though corporate CSR reports remain silent. Tax revenues provide the most durable resource for any country, in order to finance social infrastructure and to provide much needed economic and social development to improve the quality of life of millions of people.

Moreover, the consequences of organized tax avoidance affect developed countries too and limit the support that the state can provide to the less well-off, the elderly and the vulnerable. In this respect, it should be mentioned the fact that the UK state manages poverty through the provision of a variety of tax credits and social security.

The UK state pension is a major source of income for retired citizens, but it is almost the lowest in Europe. Each state can provide support if it in position to collect sufficient tax revenues and

corporations live up to their promises of responsible and ethical conduct. The possibilities of social responsibility rest on the alignment of corporate culture with the social expectations that companies will put in practice their espoused goals. In principle, the state could be mobilized to exert pressure on companies by requiring greater disclosures about corporate strategies for avoiding taxes and changing the nature of corporations

so that diverse social groups are represented on company boards. This element may be considered as a source of tendency to avoid taxes, nor make the tax avoidance industry go away. In any case, the states compete to attract capital and in that process offer tax holidays, inducements and concession to encourage mobility of capital, which in turn fuels schemes for avoiding taxes.

It is a beginning of a long and complicated process that should begin from stakeholders - the most affected part of these TAP. It seems that there are few signs that stakeholders are to take some measures, in a way that to become more aware about the well labeled reports of companies and the real fact behind these reports. Even though from a legal perspective and in many cases there is nothing to do in respect of tax avoidance, there should be addressed more attention on how these tax avoidance practices may be in a way or other reflected.

An interesting idea would be that companies to publish in their CSR report a special form related entirely to tax avoidance practices linked with CSR principles. In this way, an initial image of this process can be obtained and it may be seen as a starting point in order to develop more complex methods. Also, international organizations should consider these tax practices related to CSR policies and should develop them in further recommendations.

Another form of gaining advantage in front of this issue may result in developing a rating for each company operating CSR projects. It may be granted an inferior evaluation score for companies established offshore or TAP companies.

There is a lot of work to do in order to start presenting the disadvantages and incompatibility of TAP with CSR policies and projects.

2.3. Status of the CSR and TAP in Romania

Romania holds and important place, if not absolute record, in respect of the number of duties and taxes, fiscal and non-fiscal. There are almost 500 taxes, as well as the number of hours a taxpayer – economic agent – must spend paying them: 200. This severe taxing situation made the English Consul in the Romanian Principalities, sir Wilkinson, to write almost 200 years ago that: *"there is no person in this world more oppressed by despotism and overwhelmed by duties as the Romanian peasant in Walachia and Moldavia and no one could suffer with the same patience and resignation as he does, even half of the duties burdening him".*

As a result, many of the foreign experts considered that Romania was not in a position to study and follow a successful tax model, the one of Portugal for example, or to simplify the tax system and reduce the number of duties and taxes due to the tax system, so as to reduce bureaucracy, the costs for tax collection and the time lost with its payment. Also, it was considered that Romania was incapable to offer to the population and to the economic agents a tax system that observes the elementary rules of taxation.

In light of the aspects mentioned, there is no doubt that a lot of companies (in all categories) have started to seriously think about moving their business premises abroad or to find out methods for reducing the tax burden. This was the moment when TAP started to develop in Romania.

Thus, Romanian companies or local subsidiaries of multinational companies had the reasons to look towards the "fiscal paradises" and to register businesses there. And, for them, there was no reason, argument or interdiction that can stop them from the desire to do business in a fiscal paradise, except the lack of courage to intelligently exploit the opportunity that such a business movement offers or the narrow-minded visions of those incapable to understand that the model to be followed is the one that works well and not the one that makes you run from it. And the one

that works with results that attract any investors can only be stopped by taking risks that the states have no interest to assume.

The American writer - Walter H. Diamond (1914-2008), expert in commerce, taxes and economy, author of 81 specialty books did not express his conviction that the offshore investments shall develop fast in the future, but concluded that *"actually, I believe that the 21st century will be known as the century of offshore offices"*.

In the moment when businesses operated in Romania understood the model of TAP and considered that operating business in a "fiscal paradises" represents a great opportunity that cannot be ignored and that the "escape" to the offshore does not imply a fraudulent tax evasion, there were and continue to be a lot of companies that are using the tax planning structures in order to avoid taxes in Romania. Also, by taking into account that CSR is in the development process in Romania and there is no more professional environment developed, the stakeholders in Romania have a minimum "voice" to record their complaints.

In this respect, important companies from Romania that have a clear CSR policy have decided to apply TAP structures, in order to avoid some of the domestic taxes. As a consequence, we can consider that CSR hypocrisy was already accomplished. In the company reports (or special CSR reports, for some companies) there were no mentions related to the fact that operating abroad may result in less taxes to be paid in the domestic countries.

Moreover, the companies considered to act in a transparent, social and trustful manner for the social environment. It is also important that CSR is not a well-known concept in Romania and, based on this, no organized body or NGO may claim this offshore concept of companies in relation with CSR.

As a result, the Romanian corporations may have the possibility to continue their TAP until the social environment from Romania or legal entities from Romania may react and may consider that reports and facts of entities are somehow different from the reality. For a non-professional stakeholder environment from Romania, it is an honor that companies started to invest a part of their profits for the society and, furthermore, links between CSR and TAP were not bring up until now.

3. Conclusions

CSR and TAP are nowadays in the common sense of the worldwide corporate actions of the companies. Even though a company socially responsible is very useful for the social environment, its way of reducing tax burden may impact the average image of the social behaviour. Taxes are an important corporate financial contribution with subsequent effect for the life of multiple citizens in countries where private entities operate. By taxes, a lot of social payments are possible to be made for citizens. Even though companies are usually expressing their ethical and responsible conduct in respect of the social environment, there are many cases when the business practices were not aligned with the declared corporate behaviour – as TAP were put in-force.

This paper sought firstly to examine whether companies engaged in tax avoidance practices (offshore tax havens) consider that are continuing to act socially responsible. In this respect, a study carried out recently pointed out that even though there are clear evidences that companies are somehow hiding their profits into TAP, these companies consider to have a well-known CSR approach and not to mention anything about their profits movements.

Secondly, the paper examined the influence on attending the stakeholders' goals for those companies practicing tax avoidance and its implications on corporate social responsibility actions. Another study carried out recently presented practically the hypocrisy situation by which many of the companies are engaged to. There are various talks and attitudes of the companies engaged in CSR project but their actions have the result of moving capital outside the domestic countries. The amounts of taxes that are in this way not paid to the local budget have an impact

related to social assistance each country needs to manage. In these situations, stakeholders started to be present and to initiate different dialogues. It is a long on-going process that may produce some results in the near future.

Moreover, the paper focused also on the aspects described before from the perspective of the corporate entities operating in Romania. In Romania, CSR has a more initial approach and companies started to align their policy based on this criteria. It was easier for multinational corporations that, based on globalization, have developed easier steps to rely on CSR policies into each domestic country activity. Romania is known also as a tax burden country. As a result, a lot of companies moved their capital by using TAP and without any kind of reconsideration for social environment. These types of companies are continuing to publish into their annual report the part of the CSR, without mentioning anything about the TAP. In the course of these actions, an important aspect is related to the stakeholders' power – in Romania stakeholders have no previous experience and, as result, it may last a period until something is going to change in this respect. As a result, it is very probable that companies from Romania that operate through TAP to have enough time to re-consider their activities from a social point of view.

INTEGRATION OF ENVIRONMENTAL MANAGEMENT SYSTEM

Tomescu Ada Mirela
University of Oradea, Department of Management and Marketing, Romania

Abstract
The relevance of management as significant factor of business activity can be established on various management systems. These will help to obtain, organise, administrate, evaluate and control particulars: information, quality, environmental protection, health and safety, various resources (time, human, finance, inventory etc).
Environmental management should embrace recent change in the area of environmental protection, and suit the recently regulations of the field -entire legal and economic, as well as perform management systems to meet the requirements of the contemporary model for economic development. These changes are trailed by abandon the conventional approach of environmental protection and it is replaced by sustainable development (SD).
The keys and the aims of Cleaner Productions (CP) are presented being implemented in various companies as a non-formalised environmental management system (EMS). This concept is suggested here as a proper model for practice where possible environmental harmful technologies are used -e.g. Rosia Montana.
Showing the features and the power of CP this paper is a signal oriented to involve the awareness of policy-makers and top management of diverse Romanian companies.
Many companies in European countries are developing corporate environmental strategies to reduce negative impacts on ecosystems. This involves adopting environmental mission statements, conducting audits and monitoring performances. But we have not to forget that the ecosystem is unique for us.
Keywords: Environmental management, quality management system, sustainable development, cleaner production
Cod JEL: M11, Q56.R11

Introduction

The complexity of nowadays days development, forced us to think 'integrated'. Sustainable development principles require that environment management policies and practices are not good in themselves but also integrate with all other environmental objectives, and with social and economic development objectives.

Environmental management concern latest improves in sphere of environmental protection, as well as implemented management systems to should meet the requirements of the new model for economic development. These can be confirmed by leaving the conventional approach to environmental protection, using instead it sustainable development. [1] Shortly, we recall what does it means the Sustainable Development. It consists in a continuous economic growth, despite the fact that keeping integrity of **the triad: economy - society - environment**. Sustainable Development (SD) is significant mainly at macroeconomic level (e.g. national or regional). This paper deals with enterprises as an addressee of Sustainable Development. To implement Sustainable Development at the company's level, it is necessary to understand the enterprise as a system and to integrate it as a unit developing an environmental management too.

The Sustainable Development promotes protective strategies, dealing with the pollution prevention looking to build up environmental quality [2] and to diminish unrestrained use of resources (in particular the non-renewable resources). As a result this strategy is a broad-spectrum balance linking economic growth and the use of natural resources. It provides a new approach to a long-term development, as well as taking into account the environmental requirements, in contrast to restrictive view of economic growth at any price.

On this framework Cleaner Production (CP) assigns the same goals and settles on the indispensable measures to be engaged for sustainable development. It points out the importance of reduction of raw materials, consumption of energy and prevention of production of waste and pollution emissions [1]. The possibility is quite wide and cleaner production has been acclaimed to be one of those topics today that accommodates a significant spectrum of disciplines pull out from engineering, designing, sociologists, economists, politicians, and the civil society.

CP as one of the strategies planning environmentally sustainable development has in its sense seen the development and growing importance of other strategies within itself, such as:

-focus on product design and development based on the life-cycle analysis (LCA);

-focus on safer production (management of hazardous materials);

-recognition of the role management systems in introducing environmentally-sound technological change (EMS);

-focus on creating environment conducive for CP rather than interventions at the enterprise level.

The sphere of the Cleaner Production concept found a good niche in economic development. CP is considered as a means to supplementary dialogue between policy-makers and industry. This movement is comprehensive across global boundaries in addressing global environmental issues. The CP concepts have significant implications into areas such climate change and global warming because of its links to efficiency improvement in energy utilization.

In many countries the responsible companies have discovered that some benefits can be obtained by "going green". This can be achieved by enhancing the efficiency in production, by new mission adapting ecological, and finally improving company image.

Nowadays days is very usual for the people in charge to find the advantages from follow "green" goals. Actually, the companies must understand the competitive advantage to offer ahead of minimum conformity with regulations. If we analyse the issues that are influencing the companies to improve their environmental performance and adopt the environmental strategies we can note that these differ by level as: product, firm or even sector.

Business activity that can be established on various **management systems**. These will help to obtain, organise, administrate, evaluate and control particulars: information, quality, environmental protection, health and safety, various resources (human, finance etc) [2].

Environmental management systems

It is clear that the concepts regarding the environment has changed from the very beginning when it had conventional and dogmatic meaning related to pure the ecological sphere exonerate of economic development, management topics, technological change, social needs and political arguments. No doubt that the new theme surrounding the environment today is management, and the organisation as system.

The management systems can be carried out either autonomously or as an integrated management system that assume as a whole all the problems linked to the management of an organization, no matter which type.

Afterwards the management systems we can identify as:

-Formalised systems, of course these are based on some reference points as standards (standardised systems) or on laws;

-Non-formalised systems [1].

The previous consist of management systems based on the standards series as ISO 9000, 14000 or 18000, as the second point to Cleaner Production or TQM.

Now in Europe there are being used mostly, two formalised environmental management systems (EMS):

-EMS based on BS 7750:1992 –Environmental Management and Audit Scheme -EMAS;

-EMS based on the ISO 14000 series.

The first one (EMAS) was approve by the Council of the European Union in 1993 (Council Regulation No. 1836/93). As other standards is a deliberate scheme for industry. To join in Environmental Management and Audit Scheme a company must review their own environmental performance on a regular basis, and this means to develop an environmental management system. The goals of EMAS are:

-To initiate cleaner technologies;

-To reduce, avoid and remove all emissions prior to leave the process;

-To diminish the use of natural resources.

-This system presumes that companies are fully responsible for their environmental impact. Consequently the company's main responsibilities include:

-To assume a favourable direction to has an environmental policy that will promote continuous improvements in its environmental performance;

-To develop an action plan of environmental area.

-To acquire efficient training programme to enhance employees' environmental awareness;

-To do Eco-audits;

-To put together available, relevant information to the community.

This management system –EMAS- is approachable mainly to the companies that operate industrial fields; still, the method can be accomplish into other economic sectors such as distribution or public services.

Environmental Management System (EMS) is definite:

"An element of general management system that involves organisation chart, planning, responsibilities, codes of practice, procedures, processes and necessary means for developing, implementing, managing, reviewing and maintaining of environmental policy"[4].

For instance management system promotes a continuous improvement in environmental performance by repeating cyclic the subsequent activities:

-To design and implement an environmental policy (environmental planning);

-To achieve the environmental objectives;

-To validate and to prevent (measurement and assessment of effects);

-To scan (permanent evaluation and control);

-To review management activity (continuous improvement of system).

The experience shows clearly that the system requires on-going improvement in comply with environmental performance, thus leading to improvement in environmental management system.

Implementation of environmental management system by a company is a value for their positive and truthful environmental approach, as well as for the local communities. This is a reason for which we strive to develop this approach in Romanians enterprises.

Non-formalised environmental management system

Cleaner Production Programme published in 1989 in Paris by the Industry and Environment Programme Activity Centre at the United Nations Environmental Programme (UNEP). In fact Cleaner Production is a preventive environmental strategy based on this program.

UNEP defines Cleaner Production: "The continuous application of continuous integrated preventive environmental strategy to processes, products and services, to increase efficiency of production and services and reduce risks to humans and the environment".

The key of CP is to promote preventive strategy as opposed to traditional waste reduction approach. Accordingly, it involves in progress pollution prevention for manufacturing processes, as well as products to reduce environmental impacts during production and along the entire life cycle of the product. We stress the strategy of reduction of waste and emissions before they leave the process.

Cleaner Production facilitates the implementation of sustainable development on the company level. It can be also understand as a non-formalised environmental management system. Its aims consist of:

-Improving of environmental quality of manufacturing processes and products;

-Employing cleaner technologies (energy and materials save);

-Accessibility to training programme for employees.

-Cutting off toxic raw materials and products;

-Carrying out technical solutions of high reliability;

-Encouraging efficiency by reducing the generation of waste;

-Implementing closed material cycles along the entire life cycle (design, production, distribution, use and re-used of by-products);

-Supporting environmental products and technologies;

-Nearby recycling industrial waste;

-Decreasing all emissions and waste to the environment.

Cleaner Production can be included in integrated management systems [3]. The CP certification procedure involves four steps procedure:

-1. Application for Cleaner Production Company's Certificate (after completing the second level training on CP), along with required documentation.

-2. Verification of application at the Cleaner Production Centre.

-3. Evaluation of applications by the Qualification Committee.

-4. Awarding to the company the Cleaner Production Company's Certificate.

-This procedure can be approachable to all companies operating in the industrial and service sectors that want to implement the CP strategy as an environmental non-formalised management system. So far in Romania there is no company reported awarded the Cleaner Production Company's Certificate.

-The companies granted the Cleaner Production Company's Certificate are subject to site audit on a two years basis to check for proper function of environmental management system based on Cleaner Production.

There were reported numerous ecological accidents in Romania last few years. That point out the responsible of the companies must reflect and decide how to avoid the repetition. This allows the communities, as well as the companies to achieve not only considerable environmental benefits but also large profits.

Generally, the programmes endorsed to be implemented as a non-formalised environmental management system.

It must be done an initiative regarding an Romanian Cleaner Production Centre based on an Agreement on Cleaner Production and Sustainable Development for Industry. The Romanian of Engineering Associations (AGIR) and the Technology Agency and the Romanian Centre for Environment (Testing and Certification) must be aware of Cleaner Production Company's Certificates. The companies that implemented Cleaner Production as an environmental management system can benefit of financial founds [1].

We must take in consideration the favourable access to financial founds based on environmental performance this must be a driving force.

Conclusion

Current condition requires that the environmental policy, also the policy-makers of any country, as well as any other stakeholders have to be more aware of environmental and sustainable development. Cleaner Production is a shielding environmental strategy. It can be used as a non-formalised environmental management system in a company. In our opinion is more appropriate for Romanian business environment.

The benefits of the implementation of this system are the subsequent:

-To the environment by reducing environmental impacts;

-To the company by additional savings and reduced operating costs.

Similar to the formalised environmental system, Cleaner Production involves the improvement of company environmental performance. The experience reports that the companies that were involved in the Cleaner Production programmes assume to decrease waste and emissions, utilization of raw materials and consumption of energy in addition to decrease production costs and environmental fees. All these are completed by continuous improvement through implementing the CP projects.

The costs related to operate a Cleaner Production project are paid back within short time (months or years -depending on project).

Many companies in European countries are developing corporate environmental strategies to reduce negative impacts on ecosystems. This involves adopting environmental mission statements, conducting audits and monitoring performances. But we have not to forget that the ecosystem is unique for us.

All of us, individuals and communities, small enterprises and multinational companies, national policy-makers, are responsible of preserving it for the future generations.

The theme paper consists in a comparative analysis of European preuniveristary education decision makers.
Decision makers in preuniversity education management remain the key issue in the political agenda of most European countries.
The diversity of educational policies in each European country aims to increase school autonomy, in a way that allows comparison of their main elements of management.
Scientific research carried out aimed both theoretical and practical terms:
- comparative analysis of how the makers of European schools are responsible for the management practiced in the educational institution.
- identification of the achievement of school autonomy.
Lately, in terms of policy makers and school autonomy, schools have gone through many reforms. It was felt the need to improve the democratic management and the quality of the educational process.
The analysis and the approaches differ in terms of pace of reform, scale transfer of authority and areas that apply.
No approach can be chosen as the ideal one or more effective than others, because the contexts in which they were made are so diverse. However, as it moves along, educational policy makers can learn from the approaches and experiences of others.
The methodology was based on: the study of scientific literature from the country and abroad, on the theory and practice regarding the decision in the management of school education activities.
Comparative analysis was conducted based on questionnaires distributed to managers of educational institutions respectively partners with the school Romanian Technical College Matthias Hd.
Following the research conducted, the results have shown that due to political differences between countries in European schools are not governed by the same principles regarding the type of autonomy and its extension.
In some countries, schools have been granted considerable freedoms, such as in Belgium and the Netherlands. At the other extreme, Spain and France, the transfer of responsibilities was limited.
In order to ensure that the information in this study is an accurate representation, questionnaires were distributed to several schools in the countries surveyed. Processed data are related to school year 2010-2011.
The data obtained from research can help in better understanding partly the diverse nature of school autonomy policies and models in their takeover by the makers of Romanian school units.

The implications of work on management school education are to link the level of autonomy granted and the intensity of monitoring procedures put on the bodies at the school and the staff involved.

This study examines the correlation that exists between the degree of autonomy delegated power and the responsibility of school measures that were implemented.

The added value of the work lies in the fact that the study focused on several sides of the school management process from the authorities in charge of appointing school managers to autonomy in terms of managerial strategy.

Cod JEL:I

1. Introduction

Decision makers in schools

Since the forms of autonomy at school level and general organizational policies vary from country to country, resulted a wide array of school accountability.

The three main schools court decision (management bodies located in the school) are:

- Managers
- Teachers
- Management bodies

2.Managers

In Europe, schools do not have responsibility for choosing the Manager. Where school management has responsibility for choosing the manager, this tends to be in countries generally grant broad responsibilities of such bodies: Belgium (Flemish Community, and only for subsidized sector, the French and German), Ireland (ISCED 2) and England.

In the degree of school autonomy it is considerably across countries:

- either autonomy is complete for all areas (selection, deciding on job descriptions, defining disciplinary measures and dismissal).
- or there is no autonomy. Only a few countries are outside the general rules.

In more than half of the countries, schools are not given autonomy in choosing directors.

In England the Director role is defined not only by statute and employment conditions, bound at the central level, but also partly by the aims and objectives of the management body of each school.

In Austria schools have autonomy in both areas.

In Belgium (Flemish Community and subsidized sector of the French and German), Ireland (ISCED 2) and Slovenia are given complete autonomy to schools in all areas.

Denmark and Sweden only give autonomy to decide the job description and Spain, Poland and Portugal for selection.

In Denmark, the schools have autonomy in deciding the Director job description while selecting replacement staff can be delegated to the authority.

In Finland, any dismissal not related to reference and disciplinary measures may be delegated by the competent authority.

In the Netherlands, recruitment, dismissal and conduct job description defining directors as may be delegated by the competent authority (bevoegd gezag), but firing and conduct of directors remains in the competence of authority.

In Poland, the committee includes representatives elect the management body of the school, regional education authorities, teachers and parents, while in Portugal teachers choose the directors among them.

In Spain the school principal choice is made jointly by the representatives of the school and higher education. Educational administration decides the total number of members of the

committee, but at least one third of them must be teachers elected by professorial council. Another third are non-teaching staff of the school.

In Slovakia - recruitment and dismissal of directors is made jointly by representatives of the school and the education authority.

In Slovenia, teachers are also directly involved in approving the appointment of the Director. Here, the directors are appointed by the school management body, which must obtain a preliminary opinion from professorial council, the municipality and to the parents.

Only Ireland (ISCED 1), Cyprus and Malta do not give any autonomy. This is the case, to a lesser extent in public sector schools directly by the ministry of education in French and German communities of Belgium (only job description is the jurisdiction of the school), Greece (in some cases schools may choose whether to pay or not the staff for overtime hours worked) and in Luxembourg. This situation exists in Portugal (schools can choose teachers to replace absent staff or approved by higher authority or without it).

a.Selection
b.Firing
c.Job description
d.Discipline

Complete autonomy   Without autonomy

Limited autonomy   Delegate discretionary
Figure 1: Autonomy of schools regarding directors, ISCED 1 and 2, 2011/2012-realizat de autor

Spain: Selection is made by a committee comprising representatives of the school and the education authority.

France: ISCED Level 1: the position of "director" does not exist as such. Heads of primary schools have only a function of leadership.

Ireland: No autonomy at ISCED level 1.

Luxembourg: ISCED Level 1: there is no job as director.

3. Teachers

The key of the quality of education is held by staff, managers and, above all teachers. This is a general requirement, however that address, especially to teachers and managers. The teacher, in the concept of CE represents the primary agent of change in education. Teacher education is the main agent. Level of competence, quality of work are reflected - in terms of the various - the quality of the school, the training of skills, abilities, ethical and civic values of the school population. And later, in economic performance, creative, innovative, participatory.

The number and percentage of women who, as teachers, working in education and training decreases compared to previous levels. In Europe, initial teacher training is usually at tertiary level, or in the universities or by non-university education programs.

Generally, there are two models of initial teacher training:

- the competitor model
- the consecutive model

The competitors include two components:

a. Course covering the content, general education and a series of studies on one or more specific topics;

b. The component is addressed to professional training courses dedicated to teacher qualifications (teaching skills) and the school in which he will find a job, a placement.

Usually, theoretical and practical training of teachers can be made at the same time as general courses.

The consecutive, unlike the competitor, separate in time the two types of theoretical education and practical respectively. In the first period of study the focus is on general education theory. The practice education, training is done in a second step, after learning the competitor model.

Upper secondary education granting certificates are required for further education qualifications included in the competitor model, while in some cases issue certificates for tertiary education skills.

Eventually, the essential difference between the two models is that: in the competitor model students decide to become teachers with their entry into university or other institution of education and training, in the consecutive model, the decision to become a teacher is taken after the first stage of higher education.

In European countries for preschool and primary school, teachers are trained in accordance with the requirements of the competitor model.

For secondary education, also competing model is the most common, there are also cases / opportunities of possible route options using in this case, consecutive model, as there are cases where only consecutive model is used (Spain, France, Italy, Cyprus and Bulgaria). The consecutive are used more to prepare teachers to work in upper secondary education. Such education teachers are trained by competitor model in Germany, Czech Republic, Poland, Slovakia and **Romania.**

In preschool education, initial training is done in most cases in education and training. In the Czech Republic and Slovakia are used two forms: one in which training is senior high school and two university level;

In Austria: upper secondary or higher secondary non tertiary. In France, Cyprus, United Kingdom initial teacher training for preschool and primary education are the same. System applies in Ireland and the Netherlands, underlining that this does not work separately pre-primary education (primary education are included.In Austria, the duration is two years post secondary education and 5 years in upper secondary education.

Primary education in most countries, teachers are preparing for this level in universities.

In Belgium, Luxembourg, Austria and **Romania** are initially trained in non-university tertiary education. In Lithuania and Poland are used both forms of training. The duration of training depends on the forecasts. There are however a number of minimum standards, usually set at national level: 3 years where teachers are trained in non-university tertiary education (in institutions), except for Lithuania over 40% of the time is devoted to professional training in Belgium (Community French and Flemish) and in Romania in Luxembourg - 90%.

Secondary education: Initial teacher training for lower secondary education is done at university level in some countries - Belgium, Austria - non-university tertiary education graduates can practice their profession in junior high school. Many countries have necessarily a final period of training at work. During training is 4-5 years except Belgium and Austria. Usually training is by "the competitor model."

Upper secondary education. At this level initial is required teacher training in universities and generally lasts 5 years, 10 countries provide brief training period. Whether the training is done by the rules "competitor model" or the "consecutive" ratio theory and practice professional training includes a qualifying phase work, which usually is not more than 30% of the total - the countries it is between 14-30%.

4.School management body

School managerial bodies had either a consultative or decision-making role. Management bodies structure was imposed by general legislation or administrative measures which have ensured the transfer of responsibilities to schools.

The structure of school management bodies are three main types of structures:

- school management body are composed of members of the immediate beneficiaries of the school: teachers, parents and students.

This structure is present in Belgium (German-speaking Community), Denmark, Germany, Italy and Luxembourg (ISCED 2).

In some countries, may be included and external MEBRA, but this decision is left to school.

- school management body includes members of the local authority responsible for school and, more rarely, representatives of the wider community.

This structure reflects a desire to establish a balance of power between different professional groups and beneficiaries involved (school management, teachers, parents, students, local authorities) and representatives of the wider community (business environment, social and cultural groups, etc..).

In the Czech Republic, school body is composed of members of the third local authority responsible for school, one third of representatives of school staff members and one third of the beneficiaries (parents and students).

In England, all shareholders are represented in school, including parents, school staff, local authority, community and, for some schools, "the Foundation" or relevant religious body. School management body structure reflects the desire to provide decision-making role of one of the groups. Thus, the power lies in the hands of school staff in countries like France and Luxembourg while the opposite end, in bodies formally established in Flemish Community of Belgium, Estonia and Latvia, external representatives (parents or representatives of the wider community) seem to have powers higher. Conclusions are drawn based on the law in force in each country.

- In some countries there are councils with additional duties.

This trend in development leads to increased complexity in school governance. This is the case of Portugal where the powers are exercised jointly by the Council Executive Director (management body composed of school staff) and School Assembly President (open external representatives).

Such bipolarity lies between management bodies and governing bodies of the Belgian Flemish Community. Work school bodies are increasingly more of teachers together with that of councils whose role are to plan the teaching of the school. This is common in Italy, Latvia, Lithuania, Romania and France (ISCED 2).

In some other European countries, establishment of management bodies of the school are left to the school. In Bulgaria, Latvia, Poland school management bodies are listed in general legislation or regulations that define school autonomy, but their settings are optional.

In Hungary, was provided a body type school (school board) which may include representatives from school, parents of students and local community representatives.

In countries like Bulgaria, Denmark, Estonia, France, Lithuania and Slovenia have provided compulsory school management organization bodies.

In England, the management bodies governing schools have a long history, but LEAs had a wide discretion and the creation and was not compulsory for every school to have its own governing body up to the 1980 Education Act.

French and German Communities of Belgium have adopted this model: in 1997, legislation (Decree Missions) demanded that in French community to be established a board of participation (conseil de participation), and in teaching the German community council (Rat Pädagogischer) in all schools, regardless of sector or 'organizational body' (subsidized private and public sectors).

In the Czech Republic, school bodies, which were originally optional, became mandatory in 2005.

In other countries such requirements are limited to certain parts of the school network. Thus, in the Flemish community in Belgium only schools responsible to The Community are required to establish management bodies.

HOW TO IMPROVE EMPLOYEE MOTIVATION AND GROUP PERFORMANCE THROUGH LEADERSHIP – CONCEPTUAL MODEL

Ţebeian Adriana Elena
West University, Faculty of Economics and Business Administration

We live times of intense change, due to fast technological development, when information and knowledge are certain factors of power. Organizations today must not underestimate the importance of capable employees, owners of these great factors like information and knowledge. The key to success, as many organizations have shown, is, of course a mix of attributes, but one of much importance stands in the quality of employees and their performance. How to motivate and keep such employees is a real challenge in the actual business world. Employee fluctuation is a big risk, because it brings many losses: loss of expertise, of know-how, of time, it breaks relationships and teams. One solution to this problem is creating a good and attractive environment, so that employees are motivated enough to bring up the best in them and rise their performance to a high level.

The main objective of this study is to present a new approach in motivating employees and raising their performance. In this approach, the leader is the main pawn, the generator and sustainer of a healthy environment. By reviewing the literature and the most recent works in this domain, two styles of leadership come into focus: transformational and servant leadership. Both are relatively new concepts, with common but also different attributes, and both having the same final goal: performance, but through a different approach.

Based on a vast literature research, the conceptual model was built, considering the main attributes of the two leadership styles, their impact on motivational factors, their influence on job satisfaction and ultimately on team performance.

The intermediary results of the research sustain the conceptual framework and main hypothesis of the study.

One important contribution of this research is introducing elements of servant leadership together with transformational leadership in the empirical research and also creating an overall conceptual framework which can be applied into practical context, in order to help organizations improve their performance through nonconventional methods.

Keywords. servant leadership, transformational leadership, motivation, team performance, job satisfaction.

Code JEL. M 10

Introduction

Any organization that aims at staying on the market in the current environment should not underestimate the importance of capable, well- trained staff with proven skills and capabilities. The first element of the present study is the leadership and its influence on employees: how different leadership styles can influence employee behaviour.

The leadership has seen many dimensions over time, theories have complemented each other, reality and practice have brought about new elements and opened new lines of research. Perhaps a clear and unanimous definition, a method or theory will never be widely accepted. Nowadays leadership must value teamwork, recognize the importance of diversity, know how to share power, knowledge, success and failure with subordinates. Power is an ingredient of leadership, which skillfully used and shared with subordinates may bring about unexpectedly good results. Employees feel valued and important, self-confidence may increase as a result, individual and group performance levels may be higher. Motivation through leadership may be the ace in the sleeve, now that studies have shown that people are essentially different and traditional methods of motivation do not work the same in each individual. The present study advances an approach

that makes the link between the leadership, as a pawn generating and supporting a high level of employee job satisfaction, and the application of a continuous motivational model.

Consequently, the present study aims at analysing the influence that a leadership style that is appropriate for the organizational cultural environment may have in solving, or at least in improving the above mentioned issues. The leaders' involvement in the implementation and support of the motivational model proposed in the present research may lead to increased job satisfaction of employees. Starting from the assumption that there is a bidirectional link between job satisfaction and the performance achieved, the present study focuses on increasing performance at the level of the group as a final result.

Literature review
Transformational Leadership
As Bass call it, transformational leadership is a "new paradigm" (Bass, 1998 in Zlate 2007:234). It is 'a new approach to management', and the roots of this new concept date back to 1978, when Burns used the term for the first time: Leadership. Unlike transactional leadership, which was based on the exchange between leader and subordinate, transformational leadership goes one step further, turning that profitable exchange into one with a strong emotional connotation. Special attention is paid to the subordinates' emotional attachment to the organization, to their identification with their leaders, to increasing motivational resources, to sharing the vision of the leader and the organization as a whole. Emotional involvement is the key factor in choosing this type of leadership in order to build the model of "management" of the work team, but not the only one, as it will result from the following paragraphs.

Transformational leadership, as initiated and developed by MacGregor Burns (1978) and Bernard M. Bass (1985), becomes more and more useful within the organizational framework. Researcher Yukl (1998) stated that transformational leadership is first and foremost a process of engagement in achieving joint objectives of the organization and only secondly a process of encouraging the disciples to meet them (Stone, Russell Patterson, 2004: 350). In his book "Leadership and Performance Beyond Expectations", Bass (1985) transferred the concept of transformational leadership into the organizational context and examined the characteristics of transformational leadership, both public and private organizations and emphasised four transformational leadership factors: charisma or idealized influence, inspirational motivation, intellectual stimulation, individualized consideration towards disciples. (Avolio, 1991 in Stone, Russell Patterson, 2004 p.350)

Servant Leadership
Majoritatea studiilor recente se opresc la leadership-ul transformaţional, ca fiind cel mai complex. O nouă concepţie cunoaşte avânt, prin care lucrurile capătă o nouă viziune: cine este de fapt conducătorul? Cine pe cine serveşte? La aceste întrebări Greenleaf a dat un răspuns prin modelul său asupra leadership-ului.

Între leadership-ul transformaţional şi servant leadership au fost identificate o serie de similarităţi pornind chiar de la conceptele de bază: *viziune, influenţă, credibilitate, încredere, suport, servire.* Dar în ceea ce priveşte servant leadership, se poate argumenta, din studiile teoretice că acesta depăşeşte dimensiunea leadership-ului transformaţional prin simpla aliniere a motivelor ce îi animă pe lideri cu motivele care îi însufleţesc pe discipolii acestora.Conceptul de bază al leadership-ului în cadrul echipei este 'primul între egali' ("primus inter pares").

În 2002, Barbuto şi Wheeler au descris Servant Ledearship prin unsprezece caracteristici. Această imagine, bazată pe cele mai influente lucrări în domeniu este fundamentală pentru cercetările ulterioare, deoarece respectă ideea originală a lui Greenleaf. Tot în 2002, Russel şi Stone restrângeau numărul atributelor la nouă, atribute pe care autorii le-au numit în lucrarea lor atribute funcţionale datorită repetitivităţii acestora în lucrările de specialitate: Viziunea,

Onestitatea, Integritatea, Încrederea, Servirea, Formarea, Pionieratul, Aprecierea celorlalţi, Împuternicirea.

Motivational model of team performance

The "motivational capital" of an individual has had impressive dynamics over time, therefore, organizational-managerial psychology must be concerned with getting to know the individual as much as possible (...) and with refuting a series of misconceptions existing in organizational environments. (Zlate, 2007 :389).

In their article published in the Haward Business Review, 2008, Nitin Nohria, Boris Groysberg and Linda Lee-eling put forth a new model of employee motivation starting from Maslow's principles and valuing new discoveries in the neuropsychological fields.

Having the advantage of knowledge and technology, nowadays researchers may ground their studies on concrete results, scientifically proven, and not only on objective observation, no matter how documented it may be.

The four drives or needs identified by Nitin Nohria, Boris Groysberg and Linda Lee-eling are interconnected at the brain level, and the level of fulfilment of each of them directly influences emotions, therefore behaviour as well.

It is scientifically proven that transformational leadership coordinates organization members in order to accomplish the vision, beliefs, values and skills through team goals and a positive performance. Podsakoff et al. (1990) (in Chen-Tsang (Simon) Tsai, Ching-Shu Su, 2011, p.1918) have identified the following dimensions of transformational leadership as the most representative in terms of employee satisfaction: "identification and accentuation of vision", "providing an appropriate model", "encouraging and accepting team goals", "high levels of performance", "individualized support", " intellectual stimulation".

In 2008, Mayer, Bardes and Piccolo conducted a study that would reveal the influence that servant leadership may have on job satisfaction as a consequence of meeting the employees' needs and perceptions concerning the fairness of organizational systems. Drawing on theories of satisfaction, such as those of Herzberg (1959), Hackman and Oldham (1976), the authors identify three essential needs: "autonomy", "competence", "networking". Because of the fact that organizational performance is achieved by obtaining the advantages of each member, job satisfaction is also achieved. (Chen-Tsang (Simon) Tsai, Ching-Shu Su, 2011, p.1918).

It may be concluded from the discussion above that the more satisfied a team member is, the more likely is that he will exceed the previously set performance standards and the better he performs, the more professionally satisfied he will be.

Metodology
The conceptual model of scientific research and research hypotheses

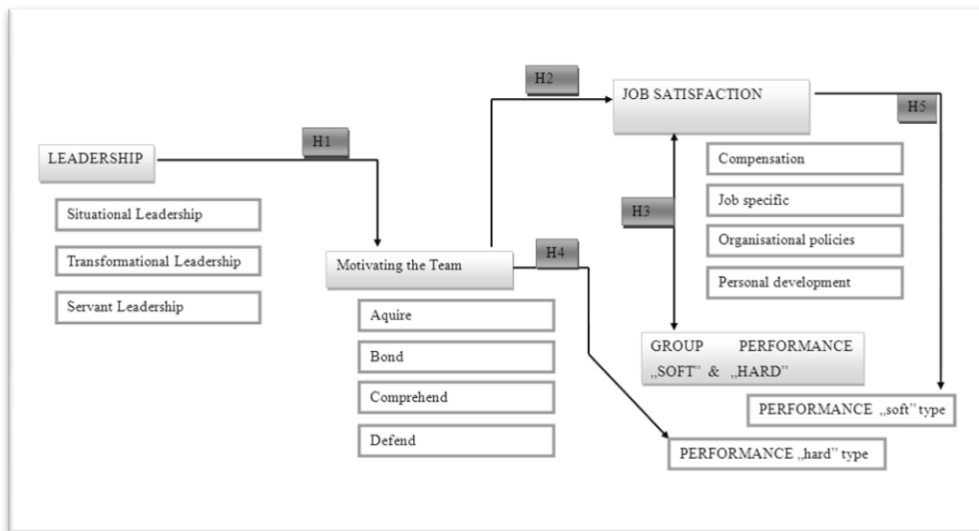
Literature review and identification of the real problems were the basis for addressing research hypotheses and for building the conceptual model, listed below.
- The leadership style has s a direct, positive and statistically significant effect on the subordinates' motivation.
- There is a direct, positive and statistically significant relationship between the motivational model and job satisfaction at the individual level.
- There is a bidirectional and statistically significant relationship between job satisfaction at the individual level, and group performance.
- There is a direct, positive and statistically significant relationship between the subordinates' satisfaction and 'hard' performance.
-Job satisfaction at the level of the individual mediates the relationship the subordinates' motivation – 'soft' group performance .


Fig. no. 1. Leadership styles and group performance-conceptual model (made by author)

The present study aims at analysing the influence that a leadership style that is appropriate for the organizational cultural environment may have on group performance. In order for the study to reach an empirical level, the present scientific approach started from the already existing theoretical framework by systematically and critically analysing specialized literature. Quantitative research is used due to the distinctiveness of the objectives and methods. Qualitative research focuses on in-depth research rather than on an in-width one. It is rather intensive than extensive – the generalization problem. (Anne-Marie Ambert in Chelcea, 2007:79). As a measuring method, quantitative research calls for methodological monism, which involves explaining phenomena / events in relation to their causes, and individual causes conform to general   laws.

In order to have a comprehensive overview, starting from the identification of the research scope - increasing group performance and reducing turnover- theoretical investigations have been conducted, analysing possible factors of influence. Therefore the documentary study helped narrow down the area of analysis to the following main factors: leadership, ways of motivating employees, job satisfaction and group performance. After having defined and clarified the concepts under discussion, the exploratory research supported pursuing the stated objectives and research hypotheses in order to build a conceptual model subject to further analysis using quantitative research and using the sample survey.

Results – pilot study

What was aimed at along the whole scientific approach was the continuity of ideas and the identification of those variables that bear relevant implications on the research issues.When speaking of leadership, at the empirical level, one may not consider a pure style based on only one concept defined theoretically, and especially when considering a larger number of leaders for the analytical approach. For this reason, and adding the characteristics defined theoretically, three similar but with distinguishing characteristics leadership styles have been selected in order to characterize current management styles in multinational companies in Romania. A questionnaire was submitted to twenty employees of a multinational company, out of which only fourtteen were validated.

The preliminary data that were obtained come in support of the theoretical aspects that had already been highlighted, the two similar leadership styles (Servant leadership and transformational leadership. Hence one may draw the conclusion that either the item needs further explaining because it may not have been fully understood by respondents, or that the

preliminary results are not representative in terms of positioning the servant leadership style in a centralizing scale.

A drawback of the research approach is the lack of an analysis of the Romanian cultural environment. Studies such as those of Hofstede, Trompenaars and Globe are seen as losing relevance when applying the instrument within multinational companies in a period of great economic change with a globalization effect that cannot be neglected. Obviously one may not speak anymore about a pure national or organizational culture. According to the statistical interpretation one may notice that, concerning the motivation construct, the highest percentage was held by "networking" - 80% and the lowest by "having" - 72%. Consequently, one may draw the conclusion that in order to achieve a higher degree of employee motivation, leaders must pay more attention to this stimulus. Promotion opportunities represent the weak element concerning "job satisfaction". The highest score was held by "the workplace in general" - 88% of the respondents being satisfied with their workplace. The last element analysed with the help of the questionnaire is group performance, subjectively identified as the level of cohesion or the intent to leave the group. It highlighted the prevalence of a strong sense of belonging to the group, only 23% of respondents declared themselves neutral in this respect. Together with the feeling of belonging to the group as a factor of cohesion, the intent to leave the group was also analysed. As it can be seen from the charts below, whenever there was a very strong feeling of belonging to the group (31% of respondents), the intent to leave the team is totally absent. 100% of the 31% of respondents with a very strong feeling of belonging to the group also represent a 31% of the sample.

One may notice that as the intensity of feeling of belonging to the group decreases, the percentage of those willing to leave the team is rising.

Conclusion

In order for the leadership theory to continue to exist, it must be admitted and accepted that the leadership is a complex process that interacts with behavioral, relational and situational elements. The leadership does not concern only the individual but also resides at the individual, dyadic, group and organizational levels. The leadership is promoted at the top of the hierarchical pyramid of the organization and from the bottom towards the top. The leadership motivates both intrinsically by improving expectations, and extrinsically by improving reward systems. (D. Van Seters, R. Field: 2007). Motivating employees is an extensively researched topic. If the first studies were based on the mere observation of the human behavior, the evolution of science in the field reveals new facets that are worth of consideration and application. Job satisfaction is brought about by the attitude that employees have towards work as such and by the rest of the elements involved in everyday life. There is an obviously close interdependence between the degree of satisfaction and the motivation of the employees, the two having a bidirectional connection between them. Group/team performance is the expected outcome in any organization, irrespective of specificity of the activity.

MAIN MILESTONES OF LABOUR MOBILITY STRATEGIC MANAGEMENT

Vasile Valentina
Institute of National Economy – NIER, Romanian Academy

Bălan Mariana
Institute for Economic Forecasting – NIER, Romanian Academy

The development of migration flows for the last decades and the emphasis laid on labour force circulation shifted the interest focus from managing crises generated by conjectural migration flows to inter-country cooperation for coordinating policies regarding labour migration.

Labour migration as multinational process can be dealt with by efficient management at international, national and local level that would aim maximising the advantages of all involved actors, taking into account its fluid character and dynamics, its permanently changing features.

The complexity of the labour migration phenomenon and the lack of a coherent and sufficiently comprehensive data base hindered the development of some management models, and the recommendations of local/national/regional policies took into account particularities of labour market, labour force location and difficulties of covering labour force deficits, but also socio-professional particularities of potential migrants, as well.

Labour force migration management gains importance also from the perspective of increased demographic aging both in EU developed countries and in the new member-states where the aging dynamic on labour market is marked also by the labour mobility to western and northern European countries.

The paper intends to present the main milestones defining migration management, and the policies in the field. General coordinates of labour migration strategic management are analysed at European level, the policies in the field of workers' mobility, and elements of immigration management as well, during the period of the crisis.

For Romania, labour migration management on exit flows must represent a strategic concern of putting to good use the national labour potential and ensuring return incomes, the effective value added of the national education system. Within this context, the paper is a succinct analysis of policies promoted for the employment of graduates in attractive jobs that would allow for career development and, implicitly, remaining in the country, as well as of the measures adopted for returning into the country after pursuing improvement or temporary migration.

Key words: migration management, policies, migration flows
JEL Classification: E24, E61, F22, J24, J62, J68

Introduction

Migration for labour, as multinational process, can be dealt with by efficient and correlated management at international, national and local level by which is aimed to maximise the advantages of all involved stakeholders and to take into account the its fluid character and dynamics, the permanently changing features. The policies in the field should be, hence, flexible, strongly influenced by the evolutions of world economy, of the political situations, and subject to the influence of different factors, such as natural and social ones, etc.

Individuals' mobility in the last decades was based on creating some migrant workers' networks in association with or independently of the Diaspora present in the respective regions. These networks of migrant workers have influenced increasingly more the political decisions in the field and have supported also the development of some cooperation and economic assistance systems for the countries of origin. Additionally, the development and modernisation of communications and transport networks have eased the spatial connections between individuals, generating the "transnational migration space". This has substantially increased the mobility area of workers who could commute between several locations.

1. The requirement of labour mobility management

Migratory developments in the last decades and the emphasis laid on labour force migration have shifted the interest focus from managing crises generated by conjectural migration flows to inter-countries cooperation for coordinating policies regarding migration for labour, in order to be able to ensure the balancing of migrant labour force supply with local deficits of employment by facilitating *legal mobility channels* that ensure compliance with migrant workers rights and social and political acceptance of migratory flows and of the migrant contingent.

Both experts in labour migration study, and real economy represented by the governing authorities and the business environment have acknowledged the need of an efficient global labour market, taking into account the projections regarding the imbalances between labour force demand and supply in the following years which indicate an intensifying in this respect on the background of demographic ageing and population decline in developed countries in parallel with its increase in developing countries. It should be mentioned, in this context, also the maintenance and even more marked disparities with respect to wages' level and opportunities in finding a job between and within the developed countries and for the developing ones, fact that will generate new triggers for mobility and migration (Appave and Cholewinski, 2007).

Europe was and shall continue to be a geographic area with strong migration flows in various directions, but it shall represent particularly an area of destination for the future. In the last 30 years, *the European policies* in the field of migration had a more strongly restrictive character, these changing after 1990 when a better opening and acceptance degree for immigrants from third countries were attempted. Demographic decline associated with qualifications' decline at European level shall determine a decrease in the working-age population of Europe in the future. Hence, emerges the necessity of identifying some solutions for eliminating the negative effects of demographic decline. In this context takes place the opening of the European Union towards migrant workers from third countries. Thus, legal immigration is regarded currently as a way of counterbalancing the working-age population decrease in Europe. It is considered that a controlled migration at the level of the Community area is more beneficial than leaving the migration policy at the latitude of each Member-State. Consequently, a common immigration policy was formulated at Community level which shows openness towards labour force from third countries (Constantin DL, 2008).

The most used solution in the period after 1990 was represented by the bilateral agreements for facilitating mobility, as in some cases migration routes on medium- and long-term were built up, the agreements defining the nature, content and profile of the migrant worker adequate to labour demand in the host-country (for instance, the agreements Romania-Germany during the transition period, in the pre-accession period). Additionally, the programmes developed according to the bilateral agreements can be particularised as policies corresponding to the economic profile/particularities of labour migration. In order to avoid pressures of the de-structured labour supply, and for facilitating return or circular migration advantages/incentives were developed, etc. which were guaranteed by the concluded labour contracts. The programmes developing circular migration have represented an important qualitative step in labour migration management representing a socially acceptable solution to definitive migration (including) of the unskilled workforce to European developed countries in full demographic decline where the ageing dynamics on labour market affects directly and intensively sustaining the technological renewal processes as competitiveness support on the market for the products and services from these countries.

Circular migration as form of sustaining economic growth is more profitable for the host-country and contributes to developing the human capital by facilitating the international transfer of competencies, trade and transnational investments' development, and prevents the separation of families for long periods.

The complexity of the labour migration phenomenon and the lack of a coherent and sufficiently comprising data bank did not facilitate the development of some management models and the local/national/regional policy recommendations have taken into account especially the particularities of the labour market, the location and difficulties in ensuring the labour force considering the deficit and the socio-professional particularities of potential migrants. Moreover, the national/international policies mix required for balancing demand and supply of labour force differ to a significant extent and depending on the demographic characteristics, and on the level and development model of the host-country. A stable and equitable business and social climate, as well as good governance at local/national level for economic growth and poverty alleviation shall improve the quality of migration flows.

Labour force migration management gains in importance from the perspective of marked demographic ageing not only in developed countries of the EU but also in the New Member-States, where the dynamic ageing on labour market is more noticeable also due to the labour mobility to western and northern European countries.

Migration flows during the first transition period and during pre-accession were defined as dimensions and intensity as outcomes of the (in)efficient political and economic reform and knew two important development channels: on one hand, by the facilities ensured based on bilateral agreements regarding labour migration and, on the other hand, by the informal migration routes that fed the illegal migrant population stock.

An aggravating factor of illegal migration was represented, in the first transition stage, by the lacking or weak official information about labour migration with respect to conditions, criteria, restrictions and opportunities.

As result, the importance o regulating and defining a legal and institutional national and regional framework for labour migration has generated the development of *acquis communautaire* regarding the free movement of persons, in the context of general liberalisation of capitals' movement (implicitly of human capital). Pertaining to the sphere of "soft" acquis, the regulations in the field have supported the development of a migration management from the perspective of risks and strategic approach, based on quantifying the economic and social effects.

The viability of such an approach, even though difficult to accept in many EU member countries has been proved right especially after the accession waves of 2004 and 2007 which shaped the myth of massive workers' flows and reconsidered the importance and role on medium- and long-term of the legal and illegal migrant population stock. Thus, the management of the migrant population stock and legalising to the largest extent possible the illegal migrant workers staying on local labour markets in the developed EU countries have turned into priorities within national policies. At the same time, the importance of migration management increased also in the origin countries from the extended EU area, as result of the new status as transit immigration countries for workers' flows from countries outside the EU area.

Knowing the stock sizes and the migration flows on qualitative structures/attributes (gender, age, education level, profession, etc.) shall allow for diminishing the de-structuring between labour force supply and demand at local/national/regional level.

Due to the complexity of the labour migration phenomenon, no "standard" policies can be developed for balancing the international supply and demand for labour. Bilateral regulations between countries represent an important step in regulating migration routes. The second important step is defining the duration and form of migration, depending on which emerges the need for complementary support policies, both in the origin and in the host country.

2. Main milestones of labour mobility strategic management

In the field of labour mobility, by the den Hague Programme for strengthening freedom, security and justice in the European Union, and thereafter by the Solidarity and Migration Flows Management Programme for the period 2007-2013 (2006) were defined 10 priorities of the EU

for strengthening the freedom, justice and security area many of these having direct incidence on workers' mobility. To this end is promoted a balanced approach of legal and illegal migration, concrete implementation plans being set up, such as: a) the Plan regarding legal migration and migrants' integration pursuing particularly immigration from third countries; b) the European Action Plan regarding jobs' mobility for 2007-2010 by which is envisaged geographic mobility and the mobility on professions within the European Union. If we refer to legal migration which makes the object of the present paper, the fields of maximum interest of the policies pursue: a) better regulation (improving current legislation and administrative practices regarding workers' mobility); b) facilitating access to information (strengthening the EURES role as sole instrument for facilitating workers' and their families' mobility); c) migrant workers' integration (determining a better adaptability of the education and vocational training systems to the labour market and training individuals for mobility by foreign languages learning; eliminating legal and administrative obstacles and promoting the transnational recognition of qualifications) and d) cooperation with origin countries (guaranteeing the fact that authorities at all levels support policies regarding mobility).

For a better management of migrant workers' flows on the EU territory were introduced *Blue Card* visas after the US Green Card model in order to attract top professionals and for remediating the low birth rate and increasing the number of pensioners. Through this instrument is clearly defined the position towards migrant workers and their profile. – "We send a rather clear signal with the aid of the Blue Card visas. Highly skilled workers are welcome in the EU". (Barosso, J.M. EC President, 2008). The Blue Card programmes open a new way to the EU, but the 27 immigration systems shall continue to exist. The EU Member-States have now available the most advantageous system for gaining highly-skilled foreign workers. The Blue Card holders have total rights on the labour force market, but the access to the social system is restricted by the national policies in the field (the right to social houses, social assistance, minimum wage, etc.).

The blue card: a) is valid for two years and can be renewed; b) allows circulation freedom within the EU for the holder and his/her family (after the two years); c) after five years, the holder has the status of long-term resident; d) does not allow for permanent residence. By this measure is aimed to institutionalise an easy and possible instrument for statistical management by which a more efficient allotment of skilled labour force could be achieved on areas and geographic regions with deficits within the EU. In fact, it is an answer to the increasing demand of skilled workers in certain fields such as information technology and engineering. By adopting the Klamt Report, the European deputies have insisted on some more clear definitions and have ensured a system that provides certain flexibility to Member-States by reaffirming the principle of "community preference" which is also in the interest of Romanian citizens. But, the main reason for which this system was called on is represented by the higher propensity of highly-skilled workers to choose other mobility routes outside the EU: "50% of the highly-skilled immigrants head to the USA or Canada and only 5,5% come to the EU" (Klamt E, 2008). The directive is not applicable to asylum applicants, to self-employed or seasonal workers, and pursues two objectives: introducing a special procedure based on common criteria for EU admittance of citizens from third countries, with the purpose of developing labour requiring high-skills for a period longer than three months; issuance for those admitted of a residence permit, the so-called EU Blue Card, as well as ensuring a number of rights for them and their families and the possibility of working, under certain conditions, in another Member-State after a legal stay of at least two years in the first EU Member-State. Moreover, it is provided for establishing some wage criteria, respectively the compulsory minimum wage related to the average wage from the respective Member-State. By virtue of the right to promote own immigration policies, the Member-States can establish certain immigration quotas for the number of highly-skilled immigrants. Before passing a decision about a EU Blue Card, the Member-States can analyse the situation on their own labour markets and can apply national and community procedures with

respect to employment conditions for vacancies, considering the labour force demand at national and regional level.

2.1. Policies in the field of workers' mobility in Romania

In Romania, the policies regarding migration have been strongly influenced in the last years by the European Union accession of the country, respectively by the requirement of harmonising national legislation to the acquis communautaire in the field of migration, of improving the institutional framework and of inter-institutional coordination for both legal and illegal migration management.

The main milestones defining migration management and the policies in the field refer to: the National Strategy on Migration (GR 616/2004) and the National Strategy on Immigration for the period 2007-2010 (GR 1122/2007). The main arguments substantiating the two strategies are: individuals' mobility for labour is a normal phenomenon of the modern economies which must be managed; this phenomenon triggers both positive and negative externalities for all stakeholders/participants and therefore it is necessary to potentiate positive externalities and diminish or internalise negative externalities.

In view of establishing a unitary concept on immigration management at national level, in 2004 were approved the National Strategy on Migration and the Inter-institutional Mechanism for its implementation, a fact which led for the first time to bringing together around the same table for discussions all institutions with attributions in the migration field. The strategy was implemented by annual action plans which ensured the realisation of some objectives by means of coordinated efforts of the institutions in the field of controlled migration, preventing and combating illegal migration, asylum, social integration and voluntary return/repatriation of foreigners residing illegally.

After the EU-accession, the main objective of Romanian authorities was to maximise the positive effects and limit the negative effects of immigration for our country and, implicitly, for Romanian citizens, elaborating for this purpose the national strategy regarding immigration for the period 2007-2010 which, just as the strategy on migration, is implemented by Annual Plans of Action. By this strategy, was pursued the modernisation of the immigration management process on the national territory, for a better approach of the phenomenon in the interest of the Romanian society. At the beginning of 2011 was submitted to public debate the Draft National Strategy on Immigration for the period 2011-2014. The labour emigration phenomenon is regulated by Regulation no. 1612/68 regarding free movement of workers within the Community as a strategy regarding the circulation management of Romanian workers was not realised. In the case of Member-States of destination that do not enforce transitory measures regarding free movement of workers, is applicable the Community law in the matter, so that Romanian citizens may work in these states without requiring a labour permit. *The countries that imposed restrictions to the free movement of Romanian labour are Germany, Great Britain, Ireland, France, Austria, Belgium, Italy, the Netherlands and Malta.* In order to be able to work in these countries, Romanian workers require a labour permit. The access is realised based on the measures of domestic law applicable in the country of destination or based on bilateral agreements in the field of free movement of labour concluded by Romania with these states. The circulation of Romanian labour force in the states pertaining to the European Economic Area (Lichtenstein, Island and Norway) and in Switzerland is restricted, meaning that there is the obligation of obtaining the work and stay permit.

As result, emigration is left to the free choice of the individual and in compliance with the Community provisions in he field and the regulations regarding immigration in the host-country. Consequently, the employment policy and, respectively attractiveness and efficiency of the national labour market are the only instruments for a policy of retaining and performance employment on the national labour market. Thereby, the practice regarding Romanian labour

mobility within the EU area and in other host-countries is resumed to, possibly, bilateral agreements and communication and information instruments of the potential migrant workers about the employment and admittance conditions of immigrant workers on the labour market of the host-country.

MARKETING

ANALYSIS OF MARKETING TOOLS AND ACTIVITIES WITHIN EDUCATIONAL SERVICES ORGANIZATIONS, IN ORDER TO INCREASE THEIR EFFICIENCY

Barbu Andreea Mihaela
Bucharest Academy of Economic Studies, Marketing Department

Romanian education, which is an important pillar for human resource forming process and the basis for economic development, suffered a lot of changes in the last decades. The main factors that have influenced the undergraduate and university training programs are the political and social-cultural ones. Educational services organizations are facing various challenges as: creating and maintaining a good institutional image, managing all types of resources efficiently, motivating the academic personnel, satisfying the community needs and supporting the public policy. The marketing tools and activities help these entities to improve the educational programs and adapt them to the individual needs of the clients, to keep under control the production costs, which are limited by the small public budget and to perform and promote these services efficiently, leading to an increased organizational performance.

The paper begins by presenting the current situation of higher education in Romania, underlining the fierce competition among the universities, the increased market potential and the financing sources. It continues by mentioning the advantages of strategic marketing planning for universities, as superior results and effectiveness, improved decision making and multiple benefits for the people involved. The paper reveals also the characteristics of segmenting and positioning on higher education market and the specific of marketing mix. Thereby, educational product is more easily adapted to customer needs when it is designed in collaboration with existing and future students, their parents, with other universities in the field or even with graduates. Students themselves can contribute to the increase the quality of their education. Price may be a factor of choice when future student chooses to pursue a university course, especially in those situations where the price does not include only the payment of annual fees for education. Distribution takes into account school location, or method of providing educational services. The educational institution can achieve a corporate identity on the market through the undertaken promotional activities.

Keywords: educational services, marketing tools, marketing activities, marketing mix, efficiency
JEL classification: M31

1. Introduction

At the beginning of the last century, higher education was considered a symbol of the privileged high-class society, but over time increasingly more young people have been able to enjoy both social and financial benefits derived from specialization in a higher education institution. The measures implemented within each state, at the central administration, regarding grants, budgets, and investment, led to the expansion of university education.

Nowadays, in Romania, within state universities, there are more than 230,000 students that study in the budgeted programs and over 250,000 students that pay for their studies, while in private universities there is learning over 350,000 students. (www.agenda.ro 2011)

On the other hand, the number of higher education institutions – according to HG 676/2007 – enrolled in an uptrend, currently acting nationally: 56 state institutions, 27 accredited private institutions, 21 private institutions authorized to function temporarily and 5 private institutions authorized to work temporarily in the accreditation process (Romanian Ministry of Education, Research, Youth and Sport). The number of universities is currently much higher than the existing higher education institutions in the year 1989 (46 universities, most of them were institutes of technology in the field of mining, oil, mechanics).

This significant increase of the students' market potential over the past 20 years, and the increasing competition among universities, will cause educational service providers to use effective measures to attract more students. A further reason is related to Romanian higher education funding, which is made from the budget of the Ministry of Education, Research, Youth and Sports, at the proposal of National Council on Higher Education Funding. The two components of funding are core funding (faculty expenses paid on the principle of student numbers, forms of education within a profile and quality of education) and additional funding (for social spending). Other fundamental principles underlying the formulation of proposals for funding are: the strategic development priorities of higher education and the basic principle that "resources should follow students". (Romanian National Council for Higher Education Financing)

Challenging the fierce competition, expressed by other public or private universities, attracting a certain segment of students (large or select), and obtaining substantial funds from the state budget and other private sector sources are goals of the higher education institution. These goals are met successfully only by understanding the marketing concept and the need to adopt it within educational services units.

As noted in the specialty literature, marketing is needed in public service organizations, because it leads not only to more efficient public services, but also to customer focused services (Mitchell 2005). In addition, market orientation can lead also to an increased performance and there are studies whose results confirm a positive relationship between market orientation and overall performance of public services organizations (Caruana et al. 1998; Cervera et al. 2001; Kara et al. 2004).

2. Advantages of strategic marketing planning for universities

First of all, in order to be market-oriented, the universities should analyze their past and current actions, review their mission and decide what activities should be conducted in the future. To achieve this goal is necessary to identify the strengths and weaknesses of their own demarches, as well as opportunities and threats that educational organizations may face at a time. Given the mission of the university, individual customer needs and the experience of other competitors, the next step is regarding the decision on developing various activities, reducing or eliminating certain services representing parts of its educational offer.

After completing these steps, there should be a formulation of action strategies. Implementing marketing strategies in universities should consider the image and position of the organization among the target audience, identifying the best ways to communicate with different market segments (especially potential clients) and a realignment of marketing mix components.

Following these steps consciously, consistently and continuously leads to an efficient implementation of a classic tool of the management-marketing literature, namely strategic marketing plan.

The stages of marketing plan can be found in a precarious form even in the writings of Sun Tzu, who says: "To evaluate the outcome of a war, there should be compared the conditions of the opposing armies in the light of five constant factors - moral influence, weather, terrain, commander and the doctrine. These five constant factors should be familiar to any general. Who owns them, wins, who does not master them is defeated." (Michaelson 2007: 22). It can be made an analogy between the five factors listed above and the company's mission, external marketing environment, market, marketing manager and guiding principles.

Currently, the strategic marketing plan has the following stages established: a mission, the financial summary, a market overview, SWOT analysis, assumptions established, marketing goals and optimal strategies, resources allocation, with details of time, responsibilities and costs, but also forecasts and budgets .(McDonald 2002)

There are studies that examine the relationship between strategic marketing planning and financial non-financial, or corporate performance, (Rudd, Greenley, Beatson and Lings 2008; Andersen 2000), and marketing capabilities that are necessary to increase the performance (Phillips, Davies and Moutinho 2001).

Also, research shows a direct correlation between qualitative strategic planning and superior institutional performance (Oliver 2007: 16). Decisive and significant evidence confirm that firms, which have assimilated marketing planning gain superior results compared to those, which haven't been oriented towards this kind of planning (Pop 2000: 191).

Moreover, according to Bryson (2004), strategic planning has taken off within the public sector, bringing numerous benefits, including: (1) promotion of strategic thinking, acting, and learning; (2) improved decision making; (3) enhanced organizational effectiveness; (4) enhanced effectiveness of broader societal systems; (5) benefit the people involved.

3. Segmenting and positioning on higher education market

In higher education field, as in private sector, the identification of market segments, whose needs must be satisfied, is a basic step, specific to any marketing activity. The argument that supports the process of segmentation is a simple one. More precisely, people are different one from another and they also have different needs, and any university in the private or public sector should consider this.

In Romania, there is still a mass marketing in educational field that is characterized by lower costs, easiness in implementation, but neglect the differences between consumers' needs and preferences. It is therefore recommended that universities identify both the relevant segmentation criteria such as customer preferences for an education form (in campus or distance learning), customers' income or education level, and those viable market segments, which are homogeneous groups of consumers whose needs are to meet. The segmentation is followed by targeting, positioning and marketing mix development for each target market concerned.

An efficient positioning will lead to the formation of a favorable image.

Future students, as potential consumers can choose an educational institution taking into account only the image. The image can be changed or enhanced by creating a distinct identity. Positioning regards the differentiation of an educational institution's offer from other possible alternatives on the market. By determining the causes of attraction or rejection of an institution by its clients, can be determined its position in the market, can be explored and identified the best positioning methods and can be outlined several strategies in order to reach this position.

If the university is characterized by well-trained teachers or exclusive study conditions, it is possible that some private companies to propose their association with the image of the educational institution concerned. The consequences of this combination can be advantageous for both partners. Thus, the university can attract sponsorships and can provide attractive practical stages for students, while the private company has a positive image, differentiating from its competitors, due to involvement in the community life and in the professional education of youth. In fact, according to research conducted in 2007, most Romanian considers that among the most important things for an educational service unit to be considered good are: good teachers (72.1%), school facilities (37.0%), prestige, reputation, tradition (16.9%), and quality of school management (16.9%). And for a professor to be considered good, the most important is to be well prepared (68.6% of respondents) and a good teacher (39.2%), but also have moral qualities (25.6%), and to maintain good relations with students (23.3%). (Direction for Governmental Strategies 2007)

In addition, results of research conducted among students or doctoral students may be a factor influencing the decisions made in schools and universities, in the public or private sector. For example, only 13% of the 1,101 students of state universities in Romania, respectively 13.4% of the 1102 students of private universities in Romania consider that the Romanian education is

better than the West one and only 12.5% of the first sample, and 16.7% of the second believe that what is taught in Romanian universities is useful for them in life. (Direction for Governmental Strategies 2008)

4. Higher education marketing mix

Marketing mix consists of four components: product, price, distribution and promotion. If the mission was clearly defined, then this will influence the marketing mix elements. Also it will help create a balance between all four components and a course of development for each. The development of an effective marketing mix is basing on a market research. The need for a marketing research is justified by the rapid changes that are recorded in the demographic and economic environment in Romania.

a) Product

Educational product is more easily adapted to customer needs when it is designed in collaboration with existing and future students, their parents, with other universities in the field or even with graduates. Students themselves can contribute to the increase the quality of their education.

Higher education offer, as other types of services, includes three elements. Basic services are those that assure the transfer of information from its owner (the teacher) to the customer (the student) and are conducted during classes and seminars. Secretarial services, which involve the enrollment of students in the academic year, establishment of program and working groups and the release of diplomas and certificates are auxiliary services, while accommodation and catering services provided by the university are supplementary services.

In order to sustain and adopt a product strategy, universities, as tangible goods providers, take into account three essential strategic elements: (1) the quality of the educational program, (2) the degree of renewal of the education service and (3) range size and structure.

Universities' strategic decisions can be affected by limited financial resources whose use must be reflected in tangible results, as the performance indicators. Thus, a state university whose offer is no longer found in the preferences of high school graduates or among employers' requirements can not allow funding marketing research to identify the main customer segments and their psychosocial characteristics. Moreover, if the manager lacks the marketing vision, he will consider these costs unnecessary, because from his point of view there are other pressing responsibilities to be carried out successfully, such as providing the academics standards and a modern and pleasant working environment.

Therefore, due to these considerations, there is likely that the educational offer to include within undergraduate or master programs some disciplines that can be overcome in terms of information value, without assuring graduates a good training in a specific field, or a well-paid job. This is why the universities can lose their clients or damage the organizational image.

There can be noticed that the four causes of a poor-quality service (Zeithaml, Parasuraman and Berry 1990) can be found in the field of education, too: (a) poor knowledge of customers' needs and aspirations, (b) establishment of inappropriate quality standards, (c) employees' insufficient training and/or lack of motivation, (d) the difference between organization's promises on the service provision and what it really offers.

b) Price

Price may be a factor of choice when future student chooses to pursue a university course. The price includes not only the payment of annual fees for education, but also includes accommodation and food costs, especially if students come from another city than where is located the faculty, but also costs related to transportation or telephone conversations with parents. There should not be neglected the emotional and psychological costs, as the price paid by a student for being away from home and family, nor the constant effort required to achieve satisfactory academic results.

The total price can be reduced by obtaining financial aid as scholarships, sponsorships, potential earnings during internships or by reducing the courses length, as these take place intensively.

c) Distribution

Distribution takes into account school location, or method of providing educational services. In light of demographic change, the educational institution must adapt their offer on the continuously changing needs of clients. Sometimes there are necessary the distance-learning programs that offer two advantages: students can deepen the information at their own pace and in addition, they have sufficient time to enable them to carry other activities.

Also, regional education centers meet the needs of those customers who would like to attend a university, but are restricted by the inability to leave their current job in another city, because this can be their main source of income.

d) Promotion

The educational institution can achieve a corporate identity on the market through the undertaken promotional activities. The organization must inform its customers about all the activities it carries and the portfolio of goods and services it offers. This communication consists both of promotional and continuous demarches. At a high level of importance stand the university's logo and architecture, which can create for the educational provider an exclusive image and help it to differentiate from its competitors.

Information that institution wishes to transmit to its future students may take the form of brochures or leaflets distributed in schools and high schools, posters placed on campus, high-traffic spaces, or can be shared on the official website of the institution. The public relations can not be neglected, taking into account that this technique is recording an upward trend in all marketing communication. Alumni organizations can be effective also, but their influence on the university image shows on long term.

All elements of the marketing mix are interrelated. The quality of an educational program that is effectively promoted can attract a larger number of customers. The university's location and quality of educational services influence the price level. It is very important for a university to establish the price level low enough to attract a large number of students, but high enough not to sacrifice the quality of the product, or give rise to a negative image of the institution. It is also essential to know the needs of current students, but also of the future ones, so the university to adjust its marketing-mix in order to provide them an attractive educational package.

5. Conclusions

Addressing a proper marketing orientation, higher education institutions will seek to better understand the needs and wishes of the people they serve and also seek to develop services to suit their needs best. In addition, it should be noted that actions of these organizations have an impact on their image, on their ability to attract new customers and at least to maintain if not to improve the existing customers' satisfaction level, on building loyalty and attracting the volunteer donors.

Moreover, it can be said that the role of marketing is to create a link between communities and educational units through a system of mutually advantageous relations. To maintain these advantages, the universities must use instruments to collect and analyze data, so to conduct marketing research, to follow the right steps in choosing the target market, and through marketing strategies to adapt the educational offer according to potential students' needs and preferences.

Efficient training means the greatest amount of learning for the least expenditure of time, money and effort (Waheed, Mansor and Ismail 2011: 37). This is why the universities in Romania need to control the budget, to coordinate all marketing activities and to be coherent and consistent in all their actions. Thus, they can integrate all efforts in a strategic marketing planning process, and ultimately achieving economic efficiency and organizational performance.

A future research direction may result in a comparison of universities in Romania, in terms of efficiency using Data Envelopment Analysis.

CONCEPTUAL MODEL OF MARKETING STRATEGIC PLANNING SPECIFIC TO PUBLIC ORGANIZATIONS

Barbu Andreea Mihaela
Bucharest Academy of Economic Studies, Marketing Department

Ionescu Florin Tudor
Bucharest Academy of Economic Studies, Marketing Department

In public services, the political component of the marketing environment has a major importance, as all decisions adopted within central administration influence both the objectives and measures implemented by units of local government and other public service providers. Any discontinuity in the activity of such entities might result in neglecting the real needs of citizens and slowing the reform process in the public sector. Therefore, all initiatives of public organizations must have a unitary goal and integrate harmoniously within a single process. A tool from the management-marketing literature that both contributes to this purpose and leads to an increased customer satisfaction and organizational performance is strategic marketing planning.

This paper presents, firstly, requirements and particularities of this process in the public sector, focusing on the need for bottom-up planning, meaning from the functional levels of public service organizations, to the corporate level, where strategic decisions are taken. To achieve this goal, there should be included in the planning process the clients and other audiences, which can provide useful information about the services they want, the quality or the accessibility thereof, and news about the services they need in the future.

There are also mentioned the factors that can influence the quality of strategic marketing planning in public services domain: the importance of marketing within the organization, marketing knowledge of employees in marketing departments and/or of management personnel, the efficiency of activities within the organization, and the manager's marketing vision.

In the final part of the paper there are presented the stages of the conceptual model of strategic marketing planning in public services field: (1) accepting the idea of bottom-up planning, (2) avoid or eliminate discrepancies between measures taken at high levels and executions carried out at operational levels, (3) formation of work teams, setting tasks of members and appointment of a coordinator, (4) data collection, (5) establishment of strategic alternatives, based on information gathered from the market, (6) choosing the optimal strategy, which will lead to achieving the objectives set in an earlier phase and (7) establish and implement marketing programs.

Keywords: marketing, strategic planning, public services, conceptual model, political factor
JEL Classification: M31

1. 1. Introduction

The influence of political factor is strongly felt in public services, especially by those public entities that receive funds only from the state budget. Decision-making power of these providers is limited, since their responsibilities are limited to management of state assets. The change of governments brings sometimes the change of national strategies according to priorities established by political candidates, in order to the gather an increasing number of votes. As a consequence, the objectives and initiatives of local public services providers can be changed also, as they should follow the high-level established directives. Real needs of citizens are therefore neglected, and public administration reform process is discontinuous.

In this context it can be realized the need for strategic marketing planning in public organizations. Over time, this process conducted within companies brought many benefits, including the

following: (a) greater capacity to predict the evolution of external marketing environment's components, (b) the efficient management of resources, (c) a better organization of managers' work, as they are facing numerous, difficult and sometimes unpredictable tasks, (d) improving the firm's position in the market. (Kotler 2004)

Sometimes, can be identified obstacles in this process, as employees are required to collect and incorporate information regarding the present situation and, using the current data, they have to predict the marketing environment in which the organization will act in the future. However, these obstacles can be overcome by intuition, logical thinking and judgment of experts in marketing and management, which will take decisions and implement fundamental action in such order as to answer questions raised by the very process of strategic marketing planning. Anyway, this process, which involves setting deliberately some objectives related to a desired situation in the near or distant future, and developing ways of achieving these goals can be simple or complex, as necessary, and the strategic plan should be seen as a tool that restores all the activities within the organization and guides them with a purpose, and not as a good piece to put in a shelf, after being completed. (Schraeder 2002)

Finally, strategic planning, though described as very well put together, is not a smooth process, but a creative one, with many reminders of previous decisions, so that organization to make optimal choices.

It is therefore necessary to design a model of strategic marketing planning in public services, outlining some rules and recommendations for increasing the performance of providers. The basis of this conceptual model will be the strategic marketing planning requirements specific to public sector and various influencing factors. These theoretical considerations are presented in the following sections of the paper.

2. Requests of strategic marketing planning in the public sector

First of all, strategic marketing planning in public services domain must be the result of cumulative efforts of different providers, institutions of central government, especially ministers, and institutions of local administration, as town halls, local councils and county councils.

The stages of the corporate level planning in public services field are: development of the Government mission, naming the ministries, establishing the state budget and the funds allocated to various divisions.

Thus, if "governance is to set the main directions for a country to follow: economic, cultural, and social policies", with "the public authority right to dictate general rules, top directives of state life and work", "administration has the right to decide the means through which to achieve the general goals pursued by the government and implement these means to obtain the result" (Costea 2000: 51-52).

Instead, the local administration organizations adopt both measures specific to corporate or divisional level and to strategic business units, when they are planning their activities. They have the decision power in the management of public services and can choose one of the following forms of management: direct (direct, depersonalized, or autonomous administration), delegated (concession, lease or interested administration), and half-direct (joint management).

This is why a public institution, like any private firm, should "set up a specialized department, directly subordinated to corporate management of the company that will deal exclusively with the review and revision process of the product portfolio". (Ionescu 2011: 157)

It can be noticed, therefore, that it is necessary to involve all stakeholders in the public sector in this highly complex and continuous process.

Moreover, planning should not be done from top to bottom, but bottom-up, meaning from the functional levels of public service organizations, to the corporate level, where strategic decisions are adopted. To achieve this desideratum, there should be included in the planning process the clients and other audiences, which can provide useful information about the services they want,

the quality or the accessibility thereof, and news about the services they need in the future. Thus, specific instruments of planning in the public enterprise are the mission, market segmentation and positioning the public services in the minds of potential customers. These tools are necessary because the state institutions can get in touch with the following audiences (Popescu 2003: 163):

the organization's internal audience: heads of offices and departments, officials, public managers;

external audience of public organization: press, government, customers, local community;

primary, secondary and marginal audience – categories representative only for certain types of public institutions such as ministries, agencies;

traditional audience (employees and current citizens) and future audience (young generation);

opponent, uninvolved and supportive audience.

Second of all, all stakeholders involved in strategic marketing planning must have a common view on the enterprise market position and image of public services. Thus, there are no inconsistencies between strategic and tactical decisions that unnecessarily complicate and prolong the process.

In addition, management of public enterprises should pay attention to the whole process of organizing work teams and training of their members. Planning teams will be composed of employees from several departments, so that all perspectives of constituent groups are known and their coordinators are managers of functional areas within the organization. These coordinators will subordinate to one manager, and together they ensure smooth implementing of marketing strategic planning.

Following a general meeting, work teams will be informed and will receive instructions to begin and go through the above-mentioned process, in order to set a high quality level. In the marketing literature and practice there have been highlighted both the favourable consequences of strategic planning, with a high quality level and determinants of this process, which is very important for any business.

Thus, research shows a direct correlation between qualitative strategic planning and superior institutional performance (Oliver 2007). In other words, companies that have a good market position have previously developed an efficient planning process.

Moreover, in some cases strategic planning is not optional but mandatory for the business to survive on the market (Fiddler 2007). In the specialty literature, most authors (Leighton, Ansoff, Thune and House, Denison and McDonald in Pop et al. 2000: 191) believes that exist decisive and significant evidence confirming that firms that have assimilated marketing planning gain superior results compared with those who did not oriented towards this planning.

Also, in the international literature (Dew 1997), quality is defined as that value which "defines an organization and establishes the expected performance", which leads to the idea that quality managers should coordinate strategic planning process.

3. Influencing factors on conceptual model of marketing strategic planning

The factors that may influence the quality of strategic marketing planning in public services are:

-importance of marketing within the organization;

-marketing knowledge of employees in marketing departments and/or of management personnel;

-efficiency of activities' organization and conduct in the public unit;

-manager's marketing vision.

The first of these four factors, namely the *importance of marketing within the organization*, is determined by the position of marketing department in an organization, by the number of employees in this department, and by the marketing activities carried out within the specific marketing structure.

Marketing knowledge of employees from marketing departments and/or of management staff reflect their training in the field of marketing, but also their willingness to deepen certain

concepts or to acquire new ideas from the specialty literature or from the practice of successful companies.

A high efficiency of the organizational activities means to accurately establish the responsible employees and their duties. It is also necessary to stay within the time required or necessary for their activities, so that problems will not be postponed or avoided. Also, a good control helps to increase efficiency.

Manager's marketing vision is finally defined by attention to customers and all marketing processes, without allowing their development simply because they were included in the marketing plan, or because this is how the staff's initiatives within marketing departments are justified.

In fact, this vision must be shared by all employees of public enterprise, so that the whole team working to have the power to look beyond the "borders" of their organization, but not out of reality.

As Steven M. Hronec stated (in Struebing 1996: 22), companies that want to succeed, must assess the strategic planning process and focus on strategic thinking, a dynamic process that requires constant review of the mission, strategies and operations related to consumer needs and market forces.

Thirdly, the planning team must design some strategic options, based on data collected from the market and from correct identification of institution's competencies, but also based on its weaknesses, and finally must select the optimal strategy and develop the necessary plans.

4. Stages of conceptual model

In the specialty literature there are many models for strategic planning. One of them belongs to H. Igor Ansoff and was created in 1965 (Ansoff in Mintzberg 2008). This, the precursor of other models that have entered the literature so far, attempts by an incredible amount of information and scenarios to standardize the complex process of planning, but focusing so much on operational activities, leaves in shade the stage of strategy establishment.

George Steiner, more pragmatic than Ansoff presents strategic planning process in a much simplified form (Steiner in Mintzberg 2008). But both his model and Ansoff's model follow mainly the same steps as mentioned by Mintzberg (2008: 53) in one of his works on planning:

-external evaluation, which involves identifying environmental threats and opportunities and success key-factors;

-internal evaluation, which consists in assessing the strengths and weaknesses of the organization, and distinctive competencies;

-creating strategy, stage influenced by social responsibility and managerial values;

-evaluation of alternatives and choice of one strategy;

-implementation of the strategy.

About strategic planning other authors have written (Ginter and Swayne 2006), who addressed the field of health services. Although they advocate for the implementation of strategic management practices specific to private sector also in the healthcare domain, they believe that certain strategic alternatives successfully adopted in other companies are not realistic for healthcare organizations. This is due to the specificity of these services, the difficulty of staff to perform other activities in addition to the basic one and the limits on diversification or vertical integration.

Other findings of the study were:

-health organizations have a unique culture that influence the style of strategic planning and the involvement in this process;

-healthcare was controlled by external environmental factors belonging to the providers;

-society and its values put some requirements on organizations in this field, by the fact that health care is viewed as people's right, the way to care, indicating the quality of life, which has unfavourable effects on strategic planning process.

Health services were also in the area of interest for the authors Dey, Hariharan and Brookes (2006), who developed a quality management model with seven stages: performance analysis, identifying problems, elaborating objectives, determining the logical framework, project planning - implementation - evaluation, operations and organizational performance measurement. Far from being a model of strategic marketing planning, in its structure are found, however, some common elements: resource assessment and therefore identification of problems (like marketing audit), setting goals, offering solutions (the strategic alternatives) and development of the necessary framework for its implementation (operational level).

Returning to the stages of strategic marketing planning model specific to public services domain, these are:

-Achieving the conception that is necessary to involve current and potential customers, and other participants in the creation and delivery of public services, and in the strategic marketing planning process;

-Closely related to this step is accepting the idea of bottom-up planning, because of its special advantages.

-Preventing or eliminating discrepancies between measures taken at high levels and the executions carried out at functional levels;

-Forming work teams, setting tasks for members and appointment of a coordinator;

-Training the planning team members (including communication of objectives).

-Data collection;

-Establishing strategic alternatives based on information collected from the market;

-Choosing the best strategy that will lead to achieving the objectives set in an earlier phase;

-Establishing and implementing marketing programs (launching of tactical actions).

Depending on the values of influence factors and the ways of covering the stages of marketing planning, this process can have a high or low quality level. Consequently, public service organization may or may not be successful on the market where it activates. In fact, in this area, success can be measured by different indicators for providers such as public institutions, respectively for other public service providers, which activate in the private sector.

In the first case are concerned:

-Favourable image among citizens and thus among state authorities, which may lead to allocation of increased budgetary funds for this particular public services domain;

-Getting into the allocated state budget, which means avoiding financial deadlock, rewards for the employees based on their efforts and activities conducted in a given time.

In the second case, the following advantages are of interest:

-Building and maintaining a good position on the market, which means overcoming competitors, large market share, numerous and/or profitable customers, high sales volume, significant profits;

Identification in a given time of market opportunities and high capacity of organization to adapt rapidly to changes in marketing environment, which leads to winning situation.

5. Conclusions

Like any other major event, strategic planning has an appropriate time and place in the organization. There are several organizational elements to be considered to ensure that the strategic planning process will bring maximum benefit to public service providers. Before resorting to strategic planning, is indicated for the organization to ensure the following:

-The organization management is active and involved throughout the entire strategic marketing planning process;

-Analysis the possibility of appearing major problems during the planning;

-Management employees and those on lower hierarchical levels are not involved in any conflict and they understand together the purpose of marketing strategic planning;

-A commitment of resources to be adequate to current programs and the analysis of the ability to meet current and future customer needs.

It is also undeniable the fact that successful strategic planning has many advantages. This key instrument determines the public organization to pay particular attention to external marketing environment and especially to customers, leading to provider's market orientation. Thus, it obtains high quality data from the market and manages to motivate both employees and management staff, printing on the common activity a vision based on organization's values. Strategic planning involves a set of decisions about the tasks to be undertaken and carried out successfully, the reasons behind these responsibilities and how to act. Because it is sometimes difficult or even impossible to organize all activities necessary, due to strategic planning some decisions and actions take precedence and therefore should be adopted those decisions that are closely related to organizational success.

*The scope of relationship marketing is to retain customers and win their loyalty. This can be achieved if the companies' products and services are developed and sold considering customers' demands. Fulfilling customers' demands, taken as the starting point of relationship marketing, can be obtained by acknowledging that the customers' needs and wishes are heterogeneous. The segmentation of the customers' base allows operators to overcome this because it illustrates the whole heterogeneous market as the sum of smaller homogeneous markets. The concept of segmentation relies on the high probability of persons grouped into segments based on common demands and behaviours to have a similar response to marketing strategies. This article focuses on the segmentation of a telecom customer base according to specific and noticeable criteria of a certain service. Although the segmentation concept is widely approached in professional literature, articles on the segmentation of a telecom customer base are very scarce, due to the strategic nature of this information. Market segmentation is carried out based on how customers spent their money on credit recharging, on making calls, on sending SMS and on Internet navigation. The method used for customer segmentation is the K-mean cluster analysis. To assess the internal cohesion of the clusters we employed the average sum of squares error indicator, and to determine the differences among the clusters we used the ANOVA and the post-hoc Tukey tests. The analyses revealed seven customer segments with different features and behaviours. The results enable the telecom company to conceive marketing strategies and planning which lead to better understanding of its customers' needs and ultimately to a more efficient relationship with the subscribers and enhanced customer satisfaction. At the same time, the results enable the description and characterization of expenditure patterns for services that are continuously growing. Also, the study demonstrates this analysis model is efficient for a large customer base.
Keywords: market segmentation, profiling segments, telecommunication services, k-mean cluster, relationship marketing.*

1. Introduction

Companies now face severe competition in a highly dynamic and unstable marketing environment. In order to be successful and hold a leading place on the market, they have to provide quality service and respond to changes in their customers' needs, wishes, characteristics and behaviours. Thus, instead of looking at the customer base as homogenous and engage all customers in the same campaigns or marketing incentives, companies should approach customers differently, depending on their needs, characteristics and behaviours (Bose& Chen, 2010:197).

Given the severe competition and the highly dynamic environment, companies can no longer afford to simply attract new customers. They must place the same importance on strategies focused on retaining customers and bringing back former subscribers, rather than focusing on increasing their market share. Most of the times, retention and increasing the clients' profitability rates are equally important and easier to achieve then attracting new customers from the

competition (Tsiptsis& Chorianopoulos, 2009: 291). To develop a proper relationship with the subscribers, telecom operators need to implement and apply the principles of customer relationship management.

Introducing CRM enables operators to customize products, services and communication, to create and offer higher customer value, increase customer loyalty, improve business stability with higher customer retention rates and create value, boost sales and reduce the number of dissatisfied clients (Diller, 2000: 32; Bruhn, 2001: 117).

Relationship marketing focuses on identifying the customers most suitable and profitable for developing long term, mutually beneficial relationships (Niarn and Bottomley, 2003:243). Segmentation is an extremely important marketing concept because it is needed, together with better understanding of customers' needs, in order to improve the relationship with existing customers (Storbacka, 1997:480).

2. Literature review

Mobile operators' activity consists of gathering and managing a large amount of information and data. Thus, millions of people, in millions of places can perform tens or hundreds of transactions in a short period resulting in billions of events to be recorded. In order to handle such an enormous quantity of data, special analyses methods need to be involved. These have appeared and grown at the same pace with the information technology (Foss and Stone, 2001: 67).

Market segmentation is a fundamental component in the companies' strategic marketing planning in industrialized countries because goods and services can no longer be produced and retailed without taking into consideration the customers' needs and wishes and the fact that they differ (Wedel and Kamacura, 2000:3). The segmentation concept relies on the fact that it is more likely for persons grouped according to common behaviours and needs to have a homogenous response to marketing actions (Dibb 1999:108).

Market segmentation refers to the process of splitting current or potential customers into several groups both as homogenous as possible and as heterogeneous among themselves (McDonalds &Dunbar, 2004: 34; Paina &Pop, 1998: 103; Wedel and Kamacura 2000:3). The perspective of segmentation being just an organizational tool is shallow because it bears both strategic and tactical marketing implications. Strategically speaking, segmentation allows the identification of profitable customers, the stabilization of market decisions and market segments and placing the product or service on the market. At operational level it drives the companies to lay more stress on enhanced customer understanding to develop more efficient relations with them (Dibb, 2001:195; Storbacka, 1997:485).

The benefits of market segmentation for a company include: better customer understanding, identification of the most attractive consumer segments, efficient prioritisation of resources, proper positioning of product and market services both for the customer and against the competition, conception of personalised campaigns and incentives, selection of the best performing distribution channels, winning competitive edges after customization of products and services and creating value offers and making the most of market opportunities (Dibb&Simkin, 2010: 113; Kiang et al., 2006: 36; Feldman, 2006: 24; Tsiptsis&Chorianopoulos, 2009: 190).

The studies (Young, Oti and Feigin 1978:411, Dibb 2001:196; McDonalds and Dumbar 2004:431) prove that although segmentation brings benefits, marketers can also face difficulties when putting theory into practice: increased costs for marketing actions as compared to the previous market approach, obtaining reduced segments or mobile segments, segments that against their common features have different consumption behaviours, difficult implementation of marketing actions.

CRM segmentation has become more efficient in the recent years due to the development of database marketing techniques. Profiling techniques provide marketers with superior tools for

customer segmentation and adaptation of marketing strategies to the specific needs of each consumer segment (McCarty&Hastak, 2007: 656).

In general, in order to perform customer segmentation, companies use criteria that relate to geographical, demographical, psycho-graphical, socio-economic, behavioural characteristics and psychological attitudes toward the respective product or service (McDonalds and Dunbar 2004:35-37, Kotler and Keller 2006:247; Tsiptsis and Corianopoulos 2009:191-193). Most companies use segmentation based on demographics. In the case of markets that feature high competition, such as the telecom market, this approach is not enough. These companies also need to consider the information related to the customers' needs, consumer behaviour, service or payment preferences, perception of product, probability of leaving the network, growth potential and customer migration. To become subject to segmentation, a market needs to be heterogeneous (Dibb and Simkin 2010:115). Segmentation criteria need to fulfil the following conditions (Paina and Pop, 1998:106; Dibb 1999:108; Kotler and Keller 2006:248; Tonks 2009:345):

- Segments will be measurable so that the size, buying power and other characteristics can be quantified and determined;
- Segments will be substantial and have a potential for profit so that they justify the creation of special later created marketing programs;
- Segments are homogenous, each being distinct in terms of clients' profiles and needs;
- Segments are accessible and differentiable so that they can be differently approached marketing-wise;
- Segments enable action, namely they allow the formulation of efficient programs to attract and serve customers;
- Market segments are stable; they preserve their characteristics for a longer period;
- Market segments are compatible with the organisation's mission, culture and structure, with the marketing strategy, with the existing resources.

According to Bayer (2010: 248) mobile operators use basically the following segmentation types: subscriber value-based segmentation, subscriber behaviour-based segmentation, subscriber lifecycle-based segmentation and subscriber (possible) migration-based segmentation. They are used for different situations and focus on different aspects.

3. Consumption-based segmentation

This study was carried out on natural persons who are prepaid subscribers. These people do not have a contractual relation with the telecom carrier and they buy credit in advance. They receive no bill and pay for services before actually using them. This survey was carried out on 76,753 prepaid subscribers. Usage data refers to last year's second semester. The analysis excluded the people who failed to recharge within the past three months of 2011 and did not spend anything on calls, SMS or Internet in three months.

This analysis will identify the subscribers' profiles in the overall population and determine the efficiency of the K-mean cluster analysis in the case of high data volumes. Since extracting the profiles within a population presupposes learning unknown information, the definition of hypotheses is not possible (Foss and Stone 2001:84).

We continue by presenting the classification of subscribers into several categories using the following variables: the sum of the amounts recharged in 6 months, the value of the SMS sent within the 6 months, the Internet traffic value in the 6 months and the value of calls made in the 6 months.

To group subscribers into segments we used SPSS, the K-Mean Cluster non-hierarchical method. This algorithm follows the segmentation of the populations so that the variation inside the clusters will be down to a minimum. This analysis pursues the grouping of subscribers into various segments based on their behavioural values (recharge values, call values, SMS expenditure and Internet expenditure). The ANOVA analysis revealed the following order in the

case of the factors' contribution to the splitting of the population into groups: recharge value, call value, Internet expenditure and sent SMS value. The value of Sig. is smaller than 0.05 thereby results are significant.

The data was submitted to the logarithm to reduce the differences among values, and the values were standardised.

To examine and assess the solution of the segmentation analysis we took the following aspects into account: the number of segments and the size of each segment, the clusters' cohesion and the differences among clusters (Tsiptsis and Chorianopoulos, 2009). After the analysis (the internal homogeneity of the groups resulted and the distances among the groups) and considering the practical aspects (increasing the size of the segments, so they can be substantial, and the number of consumer groups that can be managed by the mobile operator) we concluded that the analysed population should be split into seven segments. The analyses revealed the absence of a dominant segment which would require the analysis of another segmentation of the population. In addition, no segment is too small, so no separate analysis is required.

To assess the quality of the cohesion of the clusters we analysed, for each cluster, the maximum (Euclidean) distance to the central values begot the first reduced values. Moreover, to determine the distance between the members of every cluster and the cluster's central value, we calculated the Average sum of squares error indicator, obtaining a value of 0.9820 which indicates high cohesion.

To determine the differences between the clusters we used the ANOVA test, which indicated the significant differences (at a 0.000 significance level) among groups in the case of each variable taken into consideration. The Tukey post-hoc test confirmed (at a 0.000 significance level) that the averages of the four variables differ significantly in the case of the seven clusters.

The following segments were identified inside the population:

Cluster 1. This cluster consists of 12,366 people and includes subscribers with a small recharge value. On average, these subscribers recharged by 92.06 monetary units (m.u.) in the past 6 months. These subscribers feature credit used for making calls, then to connect to the Internet and then to send SMS. In absolute value, they used 38.76 m.u. for calls, 26.87 m.u. for Internet and 4.31 m.u. for SMS. In percentage, of the spent (recharged) value, they spent 55.42 % (42.10%) on calls, 38.42% (29.19%) on data and 6.16 % (4.68%) on SMS.

Compared to the entire population's average values, subscribers in this cluster spent 25.62% less on calls, 43.68% less on SMS and 54.48% less on their Internet connection. These consumers are comfortable surfing the web and communicating at ease. Against the population's average, they consume (recharge) by 43.67% (50.26%) less. These subscribers used 75.98% of the recharge on the three services.

Cluster 2. This cluster consists of 8,209 people and includes subscribers with small to average recharge values. On average, these subscribers recharged 123.14 monetary units in the past 6 months. They use the credit to make calls and send SMS, and have no interest in Internet. In absolute value, they spent 67.32 m.u. on calls, 17.22 m.u. on SMS and 0.59 m.u. on Internet. Percentage-wise, of the recharge value they spent 79.08% (67.32%) on calls, 20.23% (13.99%) on SMS and 0.69% (0.47%) on the Internet.

Compared to the average values for the entire population, subscribers in this cluster spend 29.19% more on calls, 41.55% less on SMS and 99% less on Internet surfing. These clusters indicate the subscribers' preference for traditional phone services and reluctance to use the handset to surf the web. Compared to the population's average, their recharge value is 39.46% (24.65%) smaller. These subscribers used 69.14% of the recharge on the three services.

Cluster 3. This cluster consists of 11,389 people and includes subscribers with the greatest recharge value. On average, these subscribers' recharge value in the past six months is 403.24 m.u. They use the credit on all mobile phone services. In absolute value, they consumed 165.86

m.u. on calls, 83.89 m.u. on SMS and 107.31 m.u. on Internet. Namely, of the entire recharge the calls took 46.45% (41.13%), the SMS 23.49% (20.80%) and the Internet 30.06% (26.61%).

Compared to the average values for the entire population, subscribers in this cluster spend 218.29% more on calls, 184.74% more on SMS and 81.77% more on Internet. Referring to the structure of the population, although the subscribers in this cluster use all services, they tend to employ traditional services: voice and SMS. Compared to the population's average, they recharge 153.94% (146.75%) more. These subscribers spent 88.54% of the recharge value.

Cluster 4. This cluster consists of 20,816 people and includes subscribers with an average recharge value. On average, these subscribers' recharge value in the past 6 months was 166.14 monetary units. These subscribers use the credit to connect to the Internet, then to talk and then to send SMS. In absolute value, they spent 61.30 m.u. on Internet, 44.87 m.u. on calls and 38.28 m.u. on SMS. Percentage-wise, they allotted 42.44% (36.90%) of the recharge value on the internet, 31.07% (27.01%) on calls and 26.50% (23.04%) on SMS.

Compared to the average values for the entire population, subscribers in this cluster spend 13.88% less on calls, 29.90% more on SMS and 3.83% more on connecting to the Internet. This cluster indicates the subscribers' high preference for voice communication. They recharge 2.73% (1.67%) more than the average population. These subscribers only spent 86.94% of the recharge value.

Cluster 5. This cluster consists of 13,227 people and includes subscribers with small to medium recharge value. On average, these subscribers' recharge in the past 6 months reached 134.51 monetary units. They use their credit to surf the web, then to send SMS and only last to initiate calls. In absolute value, they used 97.62 m.u. on Internet, 22.30 m.u. on SMS and 8.50 m.u. on calls. In per cent, the Internet used 76.03% (72.57%) of their recharge value, SMS used 17.37% (16.58%) and calls 6.60% (6.30%).

Compared to the average values for the entire population, subscribers in this cluster spend 83.73% less on calls, 24.31% less on SMS and 65.34% more on the Internet. This cluster indicates higher preference on written rather than verbal communication. Compared to the population average, their recharge value is 8.69% (17.69%) smaller. These subscribers spent 95.46% of the recharge value.

Cluster 6. This cluster consists of 4,864 people and includes subscribers with the smallest recharge value. On average, these subscribers' recharge value was 18.38 monetary units in 6 months. These subscribers use their credit to connect to the Internet, then on voice services and ultimately for SMS. In absolute value, they used 4.72 m.u. on Internet, 4.33 m.u. on calls and 1.64 m.u. on SMS. Of the recharge value, they used 40.5% (25.68%) on internet, 44.13% (23.56%) on calls and 15.37% (8.94%) on SMS.

Compared to the average values for the entire population, subscribers in this cluster spend 91.69% less on calls, 94.42% less on SMS and 92.01% less on the Internet. This segment is the least attractive for the company since it includes people who spend little money on mobile services and are careful not to exceed their recharge value. Compared to the population average, their recharge value is 92.40% (88.75%) less. These subscribers only spent 58.18% of the recharge value.

Cluster 7. It consists of 5,882 people and includes subscribers with a small recharge value. On average, these subscribers recharged 80.61 monetary units in the past 6 months. These subscribers use the credit for Internet and show a complete lack of interest for other services. In absolute value, they used 64.93 m.u. on Internet, 1.98 m.u. on SMS and 1.92 m.u. on calls. In per cent, the Internet consumed 94.33% (80.55%) of their credit, SMS 2.87% (2.45%) and calls 2.80% (2.38%).

Compared to the average values for the entire population, subscribers in this cluster spend 96.31% less on calls, 93.3% less on SMS and 9.97% more on connecting to the Internet. This

cluster indicates very high preference for the Internet. Compared to the population average, their recharge value is 51.05% (50.67%) less. These subscribers spent 85.38% of the recharge.

4. Conclusions

The study pursued the applicability of the K-mean cluster method to provide business intelligence. The method employed proved its efficiency in processing large data volumes leading to obtaining consumer segments featuring high internal homogeneity of the segments and high heterogeneity among segments.

The hereby study also has several managerial implications. An obvious conclusion of the segmentation analysis is the fact that most subscribers use their credit for certain purposes. The fact that most prepaid cards owners focus on certain types of services only indicates that the respective market is not mature. Only subscribers in the 3rd and 4th clusters use their credit for all types of services. Analyses indicate that in six months 19.9% of the subscribers spent less than six monetary units on calls, 33.3% spent less than 6 monetary for SMS and 23.6% spent below 3 monetary units to connect to the Internet. Therefore, marketing activities must be conceived to encourage subscribers in the rest of the segments to use their handsets for all types of services provided by the mobile network operator.

PERCEIVED RISK AS A MODERATOR IN THE CAT MODEL TO EXPLAIN E-COMMERCE ADOPTION

Bertea Patricea Elena
"Gh. Zane" Institute of Economical and Social Research

Ever since Cox and Rich (1964) argued that perceived risk is a major behavioral determinant, a lot of literature has emerged trying to establish how it really influences consumer behavior. Nowadays, a real point of interest for marketing academics, as well as for practitioners, is the impact that perceived risk has on consumer adoption of e-commerce. Previous studies have proved that perceived risk can be a barrier for e-commerce usage (Bhatnagar, et al., 2000; Liebermann & Stashevsky, 2002). Moreover, perceived risk came forward as an important factor affecting attitudes toward e-commerce (Jarvenpaa, et al., 1999) and, as a consequence, the intention to adopt Internet as a new shopping channel (Vijayasarathy & Jones, 2000; Featherman, 2001; Pavlou, 2003; Featherman & Fuller, 2003; Featherman & Pavlou, 2003; Li & Huang, 2009). For a long period of time, TAM (Davis, 1989) was used to explain e-commerce adoption; however, recently Kulviwat, et al.(2007) proposed a new model – Consumer Acceptance Technology (CAT) - that incorporates not only a cognitive component, but also an affective one. This work in progress aims to apply the CAT model using as a moderator variable perceived risk. This study is expected to show that CAT can have a better prediction power when the perceived risk variable is introduced in the model with its two dimensions: cognitive and affective. By separating perceived risk and including it in the new model we may better understand the influences that the research variables have on adoption behavior. This research is expected to provide a theoretical extension of the CAT model and an improvement of its predictive validity.
Keywords: perceived risk, consumer technology acceptance model, cognitive behavior

1.Introduction

Most of the research aiming to explain e-commerce adoption through the moderating role of perceived risk has used as a basic framework the Technology Acceptance Model (TAM) which has been introduced by Davis (1989). Among the first studies that looked for an explanation on the relationship between perceived risk and adoption intention is the one developed by Featherman (2001). His research objective was to extend TAM by including perceived risk as an explanatory variable to better predict e-services adoption. Even though at that time TAM had an extended version (Venkatesh & Davis, 2000), the author preferred to use the original, more parsimonious model. Results showed that by adding perceived risk in the model, researchers can improve understanding of evaluation and adoption patterns.

Another application of TAM in e-commerce belongs to Pavlou (2003). His work started from the following hypothesis: purchase intention influences actual transaction; purchase intention is positively influenced by trust, usefulness and ease of use; perceived usefulness positively affects ease of use; consumer intentions are negatively affected by perceived risk; trust is positively related to usefulness and ease of use; perceived risk is negatively related to trust. To validate the proposed model the author took precautionary measures and controlled for the effect of site reputation, satisfaction with previous online transactions and web shopping frequency. By performing Partial Least Squares, Pavlou (2003) tested the model and found strong reasons to confirm all nine hypotheses. Thus, he showed that perceived risk and trust are antecedents of transaction intention, moreover that trust acts as an indirect antecedent through perceived risk,

ease of use and usefulness. Data analysis confirmed that perceived risk influences e-commerce adoption, yet the model took into consideration only one type of risk: the e-retailer risk.

A more comprehensive study that analyzed multiple facets of perceived risk in relation with e-services adoption belongs to Featherman and Pavlou (2003). The authors argue that adopting e-services involves a much higher risk than e-commerce adoption as users must engage in a long term relationship. In analyzing the influence of perceived risk on e-services adoption intention, they used the basic TAM and the multi-dimensional perceived risk approach (performance, financial, privacy, social, psychological, time risk and overall risk). What they found is that perceived risk has a direct influence on adoption intention, but also an indirect one, through perceived usefulness.

Further research was undertaken by Featherman and Fuller (2003) who extended TAM by inclusion of brand related perceived risk in the case of e-services. They investigated the effect of perceived risk as a main effect of ANOVA and regression models, as a segmentation variable and as a moderating variable. In the first case, perceived risk had a negative effect on ease of use, usefulness, adoption intention and subjective norms. In the regression model, perceived risk proved to be a negative factor for usefulness and adoption intention. In the second case, perceived risk was used to divide the sample into three groups: high, medium and low risk. The analysis showed that when perceived risk was modeled as a predictor of usefulness, the influence was relevant only for high and low risk groups. When modeled as a moderator variable between ease of use and usefulness, a negative effect of perceived risk was salient.

An approach that integrated TAM and perceived risk to explain e-commerce adoption was developed by Li and Huang (2009). First of all they found that perceived risk negatively influences perceived usefulness and perceived ease of use, the two major components of the basic TAM. Secondly, the positive relationships between perceived usefulness and behavioral intention and perceived ease of use and behavioral intention were confirmed. Also, the positive relationship between ease of use and perceived usefulness was established. Moreover, they validated the relationship between behavioral intention and actual purchase. Limits of their research are related to the fact that respondents were experienced Internet users and the authors did not control for that. In addition to that, the multi-dimensionality of perceived risk was not considered in the research model.

2.State of knowledge
As one can see, a good number of studies concerning perceived risk and e-commerce adoption have concentrated on TAM as a basic framework. However, there are voices which argue that TAM is mainly a cognitive model and that it has neglected one aspect in predicting adoption of new technologies: the affective component.

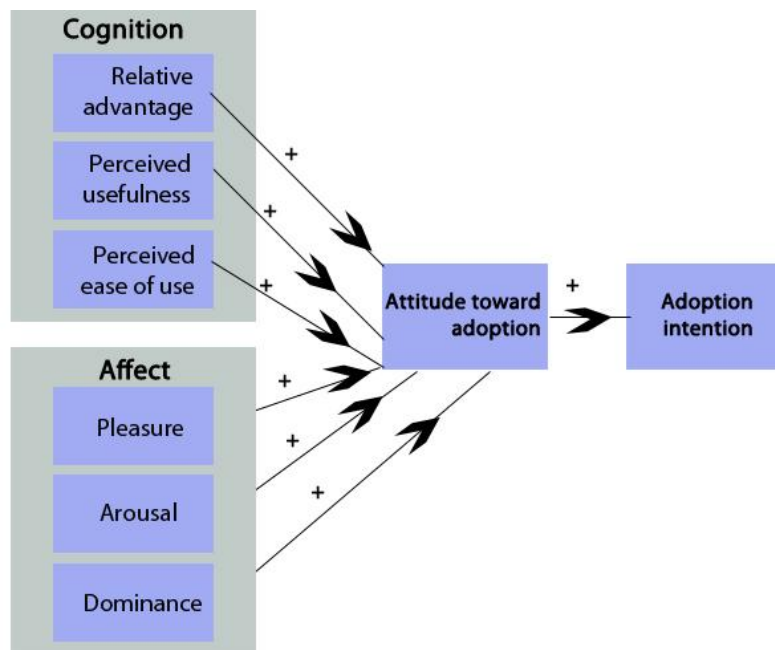
To overcome this limit, Kulviwat, et al. (2007) proposed a new model: Consumer Acceptance Technology (CAT) emerged from the unification of TAM and PAD (the Pleasure, Arousal and Dominance paradigm of affect). The reason for choosing a two dimensional perspective: cognitive and affective (fig. no. 1) is that consumers may adopt technology not only to obtain benefits, but also to enjoy it; moreover, when taking the decision to use technology, consumers must deal not only with thoughts, but also with feelings.


Fig. 1 – CAT model

The step taken by Kulviwat, et al. (2007) was a big one, as they succeeded to surpass the dominance of the management information systems approach by including a psychological view of consumer behavior. Their aim was to create an integrated model which captured both aspects that define human nature: cognition and affect.

The cognitive part of the model enriched the basic TAM with a variable called "relative advantage", which is defined as the benefit that a new technology offers in comparison with the old technology that is being replaced. The authors argue that relative advantage is unlike perceived usefulness, because the latter refers to the extent to which the technology helps to execute a task, while the first one evaluates the difference between two technologies. However, results showed that the two concepts are strongly correlated; that was one of the limits of the study and this is why the authors called for further research in developing better measures for the relative advantage construct.

The affective component consists of three variables: pleasure, arousal and dominance, which form the PAD paradigm. None of the predecessors used such a complete version of the affect influence on technology acceptance. Usually, pleasure formalized as enjoyment or fun is the most encountered affective factor that had been researched so far in relation to adoption intention. For instance, Childers, et al. (2001) found that enjoyment is a strong predictor of attitude toward online shopping in both utilitarian and hedonic environments. Furthermore, Dabholkar and Bagozzi (2002) provided evidence that fun can be an enhancer of technology adoption for four types of consumers: novelty seekers, high self-conscious people, high self-efficacy people and consumers in need for human interaction. Their findings are in line with Koufaris (2002) who confirmed that shopping enjoyment is a characteristic of online commerce and that it can determine consumers to return to an e-shop and make unplanned purchases. Less attention was given, however, to the other two variables – arousal and dominance.

Kulviwat, et al. (2007) managed to validate the model and to obtain a better prediction of technology acceptance. Nevertheless, the cognitive dimensions had a predominant impact on attitude toward behavior; a smaller, yet significant, impact was attributed to pleasure and arousal,

while the dominance factor was found insignificant. Because of that, Nasco, et al. (2008) engaged in further research and tested an interaction effect between dominance and perceived ease of use, which proved to have an impact on attitude toward adoption. They included also a social influence term for which a direct effect was supported.

3.Research questions
The present research proposal has as main objective to apply the CAT model to explain e-commerce adoption, using perceived risk as a moderator variable. In order to fulfill our aims we must first answer some questions:

1.Does perceived risk have cognitive, as well as affective dimensions? If so, what are the sources of cognition and affect for assessing perceived risk in e-commerce?

There is little research dealing with this proposed structure of perceived risk. Most of the studies concentrate on the two components of perceived risk defined by Cunningham (1967): probability of loss and importance of loss or on the multi-dimensional construct developed by Jacoby and Kaplan (1972) that includes five types of risks: financial, physical, performance, social, psychological. A sixth dimensions was suggested by Roselius (1971): time risk. An attempt to explain the cognitive and affective roots of perceived risk belongs to Chauduri (2006), yet the author tested only for the emotion/affective influence on perceived risk. Thus, further research should be undertaken to see how affective and cognitive perceived risk emerge in the e-commerce environment. Can we distinguish between the six dimensions of perceived risk the ones that surface from affect and others from cognition?

2.Can CAT be improved by creating a better measure for relative advantage?

Kulviwat, et al. (2007) measured relative advantage using the scale developed by Moore and Benbasat (1991). The problem discovered was a very high correlation with the perceived usefulness term, even though authors argued that they are distinct concepts. And, indeed, they are. But how can you assess relative advantage when you do not compare one technology with another? They should have expected such correlation seen that the relative advantage scale is formed by items expressing advantages of only one technology used. Consequently, what we propose is that a better measure could be obtained by comparing e-commerce with in-store shopping or other types of home-shopping channels.

3. Can perceived risk improve the CAT model in predicting e-commerce adoption? If so, what are the expected relationships?

Researchers brought significant proofs, so far, that perceived risk has improved TAM's power to explain consumer adoption of e-commerce systems. The usual relationship discovered was a direct one between perceived risk and adoption intention and an indirect one through perceived usefulness. We expect that cognitive risk should have an impact on perceived usefulness and relative advantage, while affective risk should influence arousal and dominance. Overall risk should have an effect on adoption intention.

4.Research methods
The methodology used in the study will be appropriate for a quantitative approach. Qualitative methods will be used for item generation in developing the scale for measuring affective and cognitive risk, but also relative advantage. Scale development will involve three stages as described by Forsythe et al. (2006): qualitative inquiry and initial scale proposal, scale refinement and purification and scale validation.

Structural Equation Modeling will be used to validate the CAT model with the new measure for relative advantage and the moderator variable perceived risk with the affective and cognitive components. There will be several samples used in the study which will be provided by students. Vinson & Lundstrom (1978) argue that students cannot be used in marketing research as surrogates for their parents, yet, in our case, students represent an important target segment for e-

commerce entrepreneurs. Moreover, Gemunden (1985) found evidence that the falsification rate in studies of perceived risk was higher for consumers than it was for managers or students.

5.Expected contribution
This study is expected to show that CAT can have a better prediction power when the perceived risk variable is introduced in the model with its two dimensions: cognitive and affective. By separating perceived risk and including it in the new model we may better understand the influences that the research variables have on adoption behavior. This research is expected to provide a theoretical extension of the CAT model and an improvement of its predictive validity.

PERCEIVED RISK IN PSYCHOLOGY AND BUSINESS ADMINISTRATION

Bertea Patricea Elena
"Gh. Zane" Institute of Economical and Social Research

Perceived risk has been defined in psychology as the judgment made by people when asked to characterize and evaluate hazardous activities and technologies. The origins of psychological research regarding risk perception are to be found in studies about probability assessment, utility assessment and decision making. Nevertheless, the most important paradigm that dominated risk research in psychology has been the psychometric paradigm that aims to explain how people react to risky activities. As far as Business administration is concerned, several business areas deal more with objective risk, than they do with subjective, perceived risk. In Accounting, Finance, Information Systems and Management we have the means to calculate real probabilities and to assess an objective risk. A very common case we find in Management where managers' risk perceptions are investigated in relation with investment decisions. An even more familiar domain with the concept of perceived risk is Marketing, where specialists explore the consumers perceptions regarding several types of risk (product risk, shopping channel risk etc.
Keywords: perceived risk, psychology, business administration, psychometric paradigm
JEL: M31

1.Basic concepts in Psychology

The concept of risk has no standard definition as we encounter it in several situations expressing each time a different perspective. We can talk about business risks, investment risks, natural risks, military risks, political risks and social risks. If we stop in the psychology area, there are researchers that say risk means danger, while others argue that danger becomes risk only when a person decides to make a choice that is dangerous. Hazards are usually associated with dangers and have been intensively studied by psychologists in relation with risk. Either we talk about hazards or dangers the main idea is that there are negative consequences that emerge from activities undertaken by humans. These consequences or outcomes are sometimes presented in the literature as being the risk itself, but most of the times risk is seen as a combination between consequences and probability of occurrence. Thus, risk refers to a situation where a decision should be made, that has certain outcomes, for which we have to estimate probabilities (Lopes, 1987).

The talk about probability when defining risk is important as it separates objective risk from subjective risk. There are cases in which probabilities can be calculated by using historical data if the risk is known, yet if the risk is new, assessing probabilities becomes a problem. This is why objective risk can be characterized only by stating objective facts about the physical world (Hansson, 2010). Subjective risk on the other hand does not refer to any objective facts of the physical world since there is no previous event to report to in order to estimate a real probability. In this situation probability is more the expression of someone's belief that something will happen (Hansson, 2010). When our knowledge of probabilities is not exact, then we deal with uncertainty (Lopes, 1987; Knight, 2002). Uncertainty is a psychological construct that influences human behavior where outcomes are unknown (Sjoberg et al., 2004). Subjective risk is also known as perceived risk (Kaplan & Garrick, 1981) which is defined by relativity – different persons register different levels of risk due to subjective interpretation of certain circumstances (Bauer, 1960). Perceived risk can achieve a level of objectivism only if the people have some prior experience directly or indirectly (Sjoberg, 2002). Still, to perceive risk one should evaluate the probability that an event could occur and the importance of its consequences; the differences

between calculated probabilities and probabilities based on intuition were found to be significant (Tversky & Kahneman, 2000).

Finally, a complete definition of risk, no matter the type, could be obtained by answering the three questions proposed by Kaplan and Garrick (1981):
> -*What can happen if I undertake this action? (scenario)*
> -*How likely it is to happen? (probabilities)*
> - *If it does happen, what are the consequences? (outcomes*)

According to Lopes (1987) psychologists studying risk are divided into two groups: the experimentalists who have a more mathematical perspective on risk analysis, measuring probabilities and amounts in gamble experiments and the personality psychologists, who concentrate on the differences between people characteristics when getting involved in risky activities. If in the first case, the research reveals strategies on which people rely on to choose between risky alternatives, while maximizing their utility function, the latter case refers more to people's perception of several risky activities which has been investigated using the psychometric paradigm.

2.Perceived risk. The psychometric paradigm

Slovic (1987) defines perceived risk as the judgment made by people when asked to characterize and evaluate hazardous activities and technologies. The origins of psychological research regarding risk perception are to be found in studies about probability assessment, utility assessment and decision making. Nevertheless, the most important paradigm that dominated risk research in psychology has been the psychometric paradigm that aims to explain how people react to risky activities. By using psycho-scaling techniques and multivariate analysis researchers tried to create cognitive maps so as to explain risk attitudes and perceptions (Slovic et al., 1982).

The work of Fischhoff et al. (1978) is considered the starting point for the progress brought by the psychometric paradigm in risk research. The model they proposed analyzed perceived risk in relation with perceived benefits and acceptable levels of risks for 30 activities. Moreover, these activities were rated on nine dimensions of perceived risk retrieved from the literature. Each dimension was actually a factor that influenced people's perception of risk: voluntariness of the activity, immediacy of the consequences, knowledge about the risk, control over risk, newness, chronic catastrophic, common dread and severity of consequences. The authors computed geometric means instead of arithmetic so as to cancel the influence of extreme values. These means were intercorrelated and factor analyzed. Results showed that to factors explained much of the variance in perceived risk: dread and novelty.

Even though it has shown popularity among researchers studying perceived risk, the paradigm has an important weakness: the analysis is made an aggregate level. So, if explained variance reaches 70-80% when the analysis is made across all activities, it diminishes to 20% when perceived risk is regressed across respondents (Sjoberg, 2002). Furthermore, it doesn't tell anything about what happens at an individual level.

3.Variables influencing perceived risk in psychology research

The psychometric paradigm and further studies based on it concentrated on revealing qualitative dimensions of perceived risk and their influence on risk ratings. However, research investigated many other variables affecting risk perception. For instance, Sjoberg (2002) argues that *real risk* should be the first source of perceived risk to be studied. Previous work has shown that when there was a real risk characterized by data, people's perception was veridical assessed. This happened always in the cases where the population had some kind of knowledge about that risk, directly or indirectly. It is important to mention that usually the risk perception regarded risk in general with no clear *target of risk*, which could also be a factor of influence. People perceive

risk differently when the target is themselves than when other persons are involved, known or unknown. This is why we talk about *personal risk* and *general risk.*

Another important variable that influences risk perception is attitude (Sjoberg, 2002). *Attitude* is an important component of human behavior, with a strong influence behavioral intention as proved by the Theory of Reasoned Action (Fishbein & Azjen, 1975). Attitude is formed by beliefs about a certain action one could undertake. Behavioral intention is simultaneously influenced by subjective norms, which are beliefs of other people that could encourage or discourage the action. If that action is characterized by a certain degree of risk, then attitude as well as social norms could have a role in the decision taken.

Risk sensitivity should be, nevertheless, studied by any researcher that wants to isolate factors that influence risk perception. If for attitude we have variation depending on the risky activity under analysis, risk propensity tends to be constant as there are people who are very concerned with virtual hazards, while others are simply indifferent.

Personality traits are also of great importance, especially when risk propensity is under research (Wildavsky & Dake, 1990). This were we distinguish between risk averse and risk taking persons and their relation with risk perception. The Big Five personality dimensions were investigated in relation with risk judgments. Olson and Suls (2000) found a positive connection between risk taking and the degree of openness and agreeableness and negative for emotional stability. Nicholson et al. (2005) examined risk taking in domains such as recreational, financial, career, safety and social and learn that self rating of frequency or risk taking was positively correlated with high extraversion and openness and with low neuroticism, agreeableness and conscientiousness. An interesting approach belongs to Soanea et al. (2010) who explain the relationship between personality traits and risk taking behavior through perceived costs and perceived benefits. Their findings advocate that risk related choice can be partially explained through a combination of personality traits, perceived cost and perceived benefits.

We leave the area of psychological variables to determine societal factors that influence risk perception. Gender is one variable intensively investigated (Weber et al., 2002), as well as age. Women were found to be more risk averse than men, while age was positively correlated with perceived risk (Siegrist et al., 2005). Education and income are negatively correlated with perceived risk (Boholm, 1998).

This review is not exhaustive and, as a consequence, the list of variables could continue. Interest on risk perception has passed over the borders of psychology entering areas such as economics, business administration, politics, military and natural sciences where we have to deal with new variables affecting the concept. Nowadays, a multidisciplinary trend is supported in research giving the opportunity to enrich knowledge by translating concepts, adding more value just in favor of science development.

4. Perceived risk in Business Administration

It is difficult to give a definition of perceived risk in Business Administration since there are so many sub-domains involved, such as: Management, Marketing, Accounting, Finance and Information Systems. For each of those we will find totally different approaches and diverse methodologies used to examine risk perception. Yet, there is a separation we can produce based on the literature; several business areas deal more with objective risk, than they do with subjective, perceived risk. In Accounting, Finance, Information Systems and Management we have the means to calculate real probabilities and to assess an objective risk. For instance, in the case of Finance we can easily calculate credit portofolio risk as well as insurance risk (Wilson, 1997). Financial theory is largely dominated by risk analysis. The aim has been to develop models that predict levels of corporate dividends or capital asset pricing. Accounting data supply assistance for risk assessment, offering a strong foundation for decisions to be taken in companies (Farrelly et al., 1985). Examples could continue; however, perceived risk can also be

encountered in any of these domains as long as the object of the analysis is a person faced with a risky decision and the research interest is on the perception emerged from this situation.

A very common case we find in Management where managers' risk perceptions are investigated in relation with investment decisions (Forlani et al., 2000). An even more familiar domain with the concept of perceived risk is Marketing, where specialists explore the consumers perceptions regarding several types of risk (product risk, shopping channel risk etc). The use of Psychology in Marketing research is no novelty since one of the main purposes of the Marketing science is to explain consumer behavior. And how could we do that without appealing to concepts and instruments from Psychology? The analysis of perceived risk in Marketing could be associated with the psychometric paradigm, except for the fact that in this case people do not evaluate hazardous activities, but products and other components of the Marketing mix. Perceived risk was found to be a major behavioral determinant; this is why currently it still represents a source of knowledge development for researchers in the field.

Bauer (1960) makes the inference from risk taking to perceived risk, as he says "the individual can respond and deal with risk only as he perceives it subjectively." So, this is the moment where he clearly separates real, objective risk from perceived risk, which, in fact, has little to do in many cases with the real world and which comprises the idiosyncrasy of consumers. Each consumer has a different perspective of the risk he might take when making a certain purchase.

This is due to many internal and external factors that have an influence on perceived risk and which will be analyzed in another chapter. A closer look to the consumer behavior as risk taking shows us that we are dealing with a perception of the consumer as most of the methods used to reduce risk can only affect the perceived risk and certainly not the real world (Bauer, 1960).

Brand loyalty, advertising and opinion leaders are strategies for reducing risk; they do nothing but to ensure the consumer that he took a good decision, but they never interact with the objective risk that the product might fail consumer's expectations.

With a more elaborate and specific research, we find Cox's (1967) work on risk handling in consumer behavior. Of great importance is the conceptualization of perceived risk that he proposed. Cox (1967) separated perceived risk into two concepts: amount at stake and the certainty that the decision taken will have favorable consequences. He defines the amount at stake as a function of the buying goals the consumer has in connection with satisfaction of needs; when the consumer does not succeed in fulfilling his goals then he risks the possibility of losing the means he used for satisfying his needs. The subjective feeling of certainty affects the amount of perceived risk being independent of the amount at stake. This means that if the amount at stake is kept constant, the higher the certainty the lower the perceived risk.

Naturally, the division of the concept of perceived risk into these dimensions allowed Cox (1967) to make further assumptions regarding strategies of reducing risk. One could easily see now that decreasing the amount of perceived risk has two possibilities: to reduce the amount at stake or to increase the certainty of favorable consequences.

A significant contribution to the theoretical development of the concept of perceived risk in the marketing field belongs to Cunnigham (1967a). What emerged from Cunnigham's study can be classified in three categories: major components of perceived risk, measurement issues and perceived risk dependency on product category. He gives an operational definition of perceived risk by splitting it into two components: *perceived certainty* that an event should happen and the *consequences* of this event.

Marketing literature takes into account two ways for analyzing perceived risk: one in which perceived risk is indeed a multidimensional construct, and the second, in which each type of risk is assessed independently, with its specific importance. However, the contribution of each component in assembling the risk variable varies for each individual and from a buying process to another.

The strategic marketing phase is one of systematic and continuous analysis of market needs in which the concepts of high performance products or services are developed, further provide the qualitative difference to customer, and which target different categories of consumers, ensuring long-term competitive advantages while increasing their personal welfare and the one society in general. The term of quality of life has been introduced in the marketing literature in the last decade and is defined as a marketing practice designed to improve the welfare of clients while maintaining the welfare of other stakeholders of the company. This concept comes as a sequel of the concerns of the relational marketing specialists to provide a high quality offer to customers and add value to all other stakeholders interested in the smooth running of the company (suppliers, distributors, shareholders, employees, general public and various public bodies interacting with the company).
Key words: strategic marketing, quality of life, marketing strategies, relationship marketing, quality of life marketing
JEL classification: M31

I. Introduction

Marketing is a managerial process by which organizations, groups or individuals get what they need and want by identifying, providing, communicating and delivering value to others (Kotler 1999:78).The basic concepts that marketing applies are the needs and desires of consumers, the creation of value, products and services, exchange, communication and networking (Doyle 2000:233-245) (Table 1.).

Strategically speaking, marketing deals with managing long-term activities undertaken by the organization in order to gain competitive advantage. The organization allocates and uses its resources in a continuously changing marketing environment aimed at meeting consumer needs constantly while trying to raise to the expectations of different categories of "stakeholders". The strategic approach involves using a strategy which allows the organization to compete, to identify new market opportunities, develop and trade new products and services, to guide allocation of resources among the main activities of the market and also to guide the development of an organizational structure that helps to achieve predetermined performance levels.

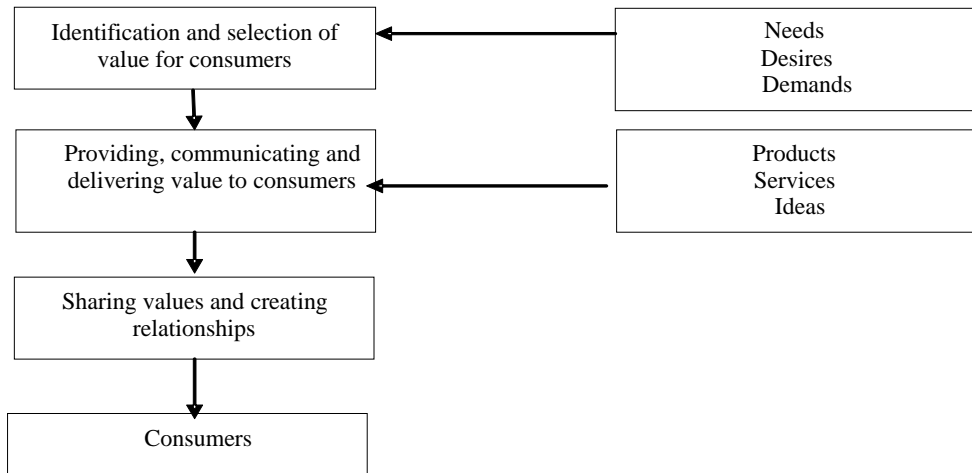

Figure 1.Basic concepts of marketing
Source: Adapted from Doyle P., (2000), Valuing marketing's contribution, European Management Journal, Vol. 18, p.233- 245

Modern marketing is essentially strategic marketing, feature resulting from the very content, that requires the use of a specific mechanism whose operation is as shown above inextricably linked to the concept of strategy. Therefore, understanding the concept of strategic marketing requires first understanding the *strategic role of marketing*, coupled with understanding the place held by it in the enterprise management system.

Conducting today a comprehensive research in the departments of organizations from different industries and countries, would have undoubtedly staff involvement in a large number of marketing related activities. This could include collecting information about customers and competitors, development of the promoting and direct marketing strategy, interaction with scientific research and development department in the development of new products or in preparation of materials and necessary support for the sales force. No doubt most of these activities add value to the organization's market activities. The questions which naturally arise are the following: which of these activities are critical for the organization?, what are the basics of strategic marketing?, what are the roles that strategic marketing must meet to ensure that the its function within the organization is relevant?

II. Strategic Marketing - Roles and Basic Principles

The key roles that strategic marketing should fulfill within the organization are the following (Capon & Hulbert 2001: 102):

-role 1: identifying and recommending market segments that the organization has to address to with its products;
-role 2: identifying and targeting market segments;
-role 3: setting strategic direction;
-role 4: building the market offer;
-role 5: ensuring support from other functions of the organization;
-role 6: monitoring and assessing the performance;

Having clarified the main roles of strategic marketing, a natural step is to define the *strategic marketing principles.* Four principles are considered fundamental to the successful execution of marketing tasks. They are (Capon & Hulbert 2001: 133):

-the principle of selectivity and concentration;

-the principle of value offered to the consumer;
-the principle of differential advantage;
-the principle of integration;

Considering the roles and basic principles of *strategic marketing* we can say this concept that is becoming widely used in the literature and practice of large companies, is thus a logical continuation of the process of marketing evolution. In general, the literature insists more on strategic marketing components, rather than on trying to define the actual concept. Thereby, strategic marketing is defined as "S.T.P." marketing, given the importance of segmentation, market target selection and positioning within marketing activity (Kotler 1999: 313). Other authors emphasize the importance of marketing in the management mechanism; defining strategic marketing as the strategic analysis and decisions process that management must perform in any organization to meet customer needs (Cravens 1987: 213). Finally, another category of definitions relies on the existence of strategic and operational processes in marketing planning (McDonald 2000: 216).

The strategic marketing phase is one of systematic and continuous analysis of market needs in which the concepts of high performance products or services are developed, further provide the qualitative difference to customer, and which target different categories of consumers, ensuring long-term competitive advantages while increasing their personal welfare and the one society in general. (Dumitru 2004:43).

Strategic marketing is not just a step in the development of marketing. He represents a core component of it. Viewed and addressed independently, this part represents a different, specialized field of marketing, reflecting itself in an occupational specialization and making subject to a distinct specialization within the educational systems. As a part of marketing this has developed along with the extensive development of it, being found mainly within areas of marketing as: internal and international, consumer goods, business to business, agro marketing, social, political, etc.

III. Evolution of the quality of life concept

In the last three decades, the quality of life has become a major interest in the EU. An example is that the European Foundation for the Improvement of Living and Working Conditions (established in 1975, European Foundation for the Improvement of Living and Working Conditions, is based in Dublin, Republic of Ireland) launches regular research and monitoring programs in matters of quality of life (Marginean 2004: 215). The quality of life at a macroeconomic level has been discussed even since the '50s (EEA Report 2009: 13), when the main areas covered were the degree of happiness of individuals and society welfare. Up until that moment, in marketing theory and practice we found the orientation towards production, which mainly implied that, for whatever was produced there, there was a demand. Given the fact that during the period before the '50, supply and demand were in balance at that moment in the market, in the company there were no major concerns regarding the inability to find the necessary products, also because people needs and expectations hadn't yet known a major development either extensively (their number) or intensively (their intensity).

The concept of quality of life gained theoretical valences in the '70s, first in Scandinavian countries and the United States (Wallace and Abbott 2004: 109), for then to be found in thousands of scientific articles that debated the importance that society and each individual must give to improving life quality.

The starting point for developing the concept of quality of life in the United States was the fact that, although in full economic development, the society still faced with increased violence, crime and public disorder. Economic growth was not sufficient to describe the quality of life, thus in order to judge a nation's welfare, social indicators were important too. The source of quality of

life research is the development of awareness that economic development does not bring wealth and happiness (Bălțătescu2009:13)

The consumerism of the '60s and '70s was considered to have a destructive effect not only on individual lives, but also on society. This leads to material overproduction which substantially affects the limited natural resources and destroying the environment. Herby, specialists of the period considered necessary to limit industrial development to mitigate its destructive effects on humanity, which can be obtained by limiting overconsumption (Marginean 2004: 220).

To some extent this attitude is contrary to the marketing objectives by which companies try to promote the consumption and purchase of products and services. In terms of evolution of the concept of marketing, during this period we encounter an orientation towards sales, when companies were trying to convince consumers of the need for products through an arsenal of techniques and marketing tools, sales forces being used mainly in direct relationship with the customer, even by going to his home.

The society's reaction to this attitude of the companies has resulted in the emergence of hippie ideologies when people protested against possible damage that large companies can bring to quality of life.

Although normally a continuation of the trend occurred in the 60s and 70s would have been the materialization of social policies to promote a high quality of life through non-economic instruments, the 80's recorded an economic trend to meet any kind of human need. Thus for the quality of life and the welfare of society it was resorted to market mechanisms, taking into account a high quality products and services. This was the period in which it was highly developed an objective evaluation of the quality of life.

In terms of marketing, the '80s were characterized by a competitive strategy development in which the companies were trying to differentiate themselves on the market through items of interest for the consumer, such as satisfying the needs at a top level , all based on providing products that could solve almost any problem or need of an individual. Given the changes in society and social trends in the periods presented above, the quality of life has gained increasing importance, primarily due to ecological movement that enforces valences both at a macroeconomic level (through guidelines and legislation) and at an individual level (by imprinting a socially responsible behavior).During this period, the individual was concerned about his welfare, but also about the one in the society he lives, taking into account the warnings that were drawn regarding the planet's limited resources, and the imminent danger that excessive industrialization can bring to the environment. Immediate influence on marketing activity was noticed in the policy of reallocation of resources (McDonald 1998: 23), but also in environmental campaigns that appear on the market to improve the corporate image of organizations.

Such campaigns were based on a trend that has also materialized in our country in the last decade - corporate social responsibility. Through specific activities for this kind of direction, companies are trying to give back to the society in which they operate, in order to balance as much as they can the resources consumed - value given to society.

In Romania, researches on quality of life have emerged in the '70s, when politically, our country was trying to separate from the Soviet government, which encouraged the promotion of some western concepts, such as concern for the welfare and quality of life. These concepts were somehow promoted even by the state institutions, in order to highlight the desire of getting close to the Western countries. Following the opening to the West, in this period, namely in 1972, the concept of marketing appears for the first time in Romanian's higher education level, which was introduced as a discipline at The Academy of Economic Studies (Balaure 2002: 17).

During this period we have for the first time researches targeting population's satisfaction level on living standards. They established a national empirical research, which used as model the American quality of life measurement, research results being published in 1984.

A few representative works for the beginning of conceptualizing quality of life in Romania are: "Lifestyle and Quality of Life" (coordinators Ion Rebedeu and Catalin Zamfir- Political Ph., 1982), "Lifestyles. Their Dynamics in Contemporary Society "(coordinators Catalin Zamfir and Ion Rebedeu – Academy Ph., 1989)," Interpersonal Relations Culture "(Elena Zamfir - Political Ph., 1982)," Journey in the Human Universe "(Albatros Ph., 1989) (Marginean, 2004).

After the 1989 revolution, the quality of life has become more important in the context of the population's new expectations on improving the standard of living. This was also increased by the establishment, on January 2, 1990, of the Institute for Research of Quality of Life (ICCV) within Romanian Academy. The appearance of this institute, together with other organizations that target in their activity the study of quality of life, lead up to a vast specialized literature and a scientifically approached practice addressed with specific methods and indicators.

IV. Changes in marketing strategy

In terms of marketing, the period that followed the revolution of 1989 represented a development opportunity both extensively (marketing being applied in more and more companies from various industries) and intensively (companies deepening their techniques and marketing tools for an accurate adjustment of supply to demand).

Romania's EU accession opens further horizons of research on quality of life, taking into account the European directives promoting general programs to improve the quality of life and its certain specific components (such as health, welfare, public services, ecology, etc.).

Thereby various legislative directives appeared also in our country, directives which promote a certain lifestyle and therefore improving quality of life, such as the National Strategy for Sustainable Development of Romania - 2013-2020-2030 Horizons.

These European directives influence marketing activities of the companies through rules and guidelines that companies must comply with regarding the manner in which the products are made, the packaging they use, their recycling, pollution control and promotion of organizational behavior socially responsible.

The link between quality of life and marketing is even more obviously given by the new paradigm of it - relationship marketing. It focuses on building long term relationships with clients, based on their level of satisfaction felt in relation to company products and services. Starting from this philosophy of relationship marketing, we can say that marketers tend to a subjective definition of quality of life, depending on individual needs and their level of satisfaction.

The term quality of life has been introduced in the marketing literature in the last decade, which is defined as a marketing practice designed to improve the welfare of clients while maintaining the welfare of other stakeholders of the company (Lee 2004: 45). This concept comes as a sequel of the concerns of the relational marketing specialists to provide a high quality offer to customers and add value to all other stakeholders interested in the smooth running of the company (suppliers, distributors, shareholders, employees, general public and various public bodies interacting with the company).

ATTENDING LIVE PERFORMING ARTS EXPERIENCES. WHY AND HOW IS THE DECISION TAKEN?

Ciceo Andreea
Academy of Economic Studies Bucharest, Faculty of Marketing

Across the last years, researchers around the world have shown a greater inclination towards the arts marketing, acknowledging its importance for the well being of arts organizations. Researches have been conducted for all kind of subjects trying to understand better both phenomena: the audience and the provider. However, these studies have their own particularities as they refer to certain cultures. Therefore, we need to look into our own yard and see whether or not such interests have been raised. Unfortunately, researches conducted in this area, in Romania, are very few. That is why the knowledge regarding the live performing arts audience is actually non-existent and from this fact comes the need of discovering more about this unknown. This paper attempts to make one of the first steps in this direction by exploring the audience's motivations to attend live performing arts events and, moreover, the buying decision process. Why do audiences choose to attend live performing arts events? How they decide for it? Which are the sources of information they use? What makes a live performing arts event be a pleasant experience? Or rather an unpleasant one? These are all questions to which this paper provides answers. The way the author have chosen to answer these matters is by conducting a qualitative research that has the aim to explore the universe of this subject and to denote insights for a better understanding. The best method was considered to be the focus group for its advantageof bringing together people who have something in common – namely their frequency in live performing arts events, and facilitate communication between them in order to discover the needed information. Thus, it has been discovered that audiences' motivations are mainly related to social and esteem needs, that is to say people attend these kind of events from their desire to spend their time in a pleasant manner with the people they like or because attending is „trendy" and makes one look more like a cultivated person. However, their motivations are second by the sources of information they use, namely personal sources (e.g. family or friends) because they seem to be more trustful than others, as well as experential sources, meaning consumer's own experience that makes him a true expert in choosing. Whatever they have chosen, the live performing arts event may or may not raise their expectations. The reasons for this stand both in the performance itself and the audiences' behavior. In conclusion, this paper aims to encourage the further discovery of the performing arts sector from the marketing perspective.
Keywords: arts marketing, arts consumer, motivation, buying decision process
JEL Classification: M31

I.Introduction

Marketing is a social and managerial process through which individuals and groups obtain the things they need and want, by creating and trading products and value with other groups or inviduals (Kotler and Armstrong 2005: 6). Unlike the general perception, marketing can be and is, indeed, applied in a variety of sectors, including the arts;although, at a first view, there seems to be an incompatibility between the two concepts.

Marketing, as it relates to the arts, is not about intimidation or coercion or abandoning an artistic vision. It is not hard selling or deceptive advertising. It is a sound, effective technology for creating exchanges and influencing behavior that, when properly applied, must be beneficial to both parties involved in the exchange (Kotler and Scheff 1997: 30).Therefore, it is common sense to assume that the arts sector is subject to market research.And this is the premise from which this paper starts.

The paper attempts to demonstrate the importance of studying audiences' behavior in the arts sector, namely live performing arts.According to the Ministry of Culture and National Patrimony and National Institute of Statistics, live performing arts category consists of: drama theatres, opera houses, musical comedy and variety theatres, philarmonic and symphonic orchestras, ballet and contemporary dance.The importance of studying the audience of these arts resides in the arts organizations' need of knowing to whom they address to and how should they do this.Moreover, the paper attempts to explore the universe of such an audience and reveal profound insights regarding it.

The main goal of the conducted research is to uncover the in-depth motivations that drive the audience to attend live performing arts events and zoom the entire buying decision process. Therefore, the research aims to answer to questions such as: Where does the audience get the information regarding live performing arts shows? How do they choose it? Which are the aspects taken into consideration when choosing? What makes a live performance be great? What makes a live performance be the worst ever seen?

II. Literature review

Research on audience participation in the arts can be traced back to 1966 in the field of cultural economics. Since that time, many researchers have sought to identify various reasons for participation in the arts, in an attempt to inform arts management and education (Turrini 2006: 44).

Nowadays, this range of reasons is as complex as the definition of „audience" is. The term „audience" can take on a variety of meanings in a variety of contexts – audiences as arts receptors, as stakeholders or as customers (Hill, O'Sullivan and O'Sullivan 2008: 36).

From the „arts receptors" point of view, an audience consists simply of those who experience art. However, from a marketing perspective, this definition is of limited value as it excludes the notion of intention. Still, it may be useful in considering the audience for public art. Public art, such as a sculpture in the centre of the city, may or may not be actively sought by those who see it. It may simply be an expression by the artist which exists in people's lives, therefore making them members of its audience even in the absence of any intention on their part to view it (Hill, O'Sullivan and O'Sullivan 2008: 37). An audience can also be thought of as comprising all those with whom an individual or organization has some form of communication (audiences as stakeholders). For an arts organization, this may include all those who support the arts in any way or who have an interest in their development (Hill, O'Sullivan and O'Sullivan 2008: 37). However, it is the audience as customers that please best the marketers. According to this approach, the audience is seen as being involved in an transaction with an artist or arts organization. This means that people make choices about the art forms and events that they wish to be involved with and are willing to offer something in return for that participation (Hill, O'Sullivan and O'Sullivan 2008: 37).

So, how people make choices and what are they influenced by?

First of all, audience's behavior is influenced by five major factors: macroenvironmental trends, cultural factors, social factors, psychological factors and personal factors (Kotler and Scheff 1997: 68). Macroenvironmental trends including social, political, economic and technological forces influence our attitudes, our values, our important decisions (education, career and job choices, investment decisions), and our day-to-day decisions (including how to spend our leisure time). Of the several groups of factors that affect audience behavior, it is the cultural factors – from national identity to membership in small social groups – that exert the broadest and deepest influence. A growing child acquires a set of values, perceptions, preferences and behaviors through the process of socialization into his/her culture(s). Social factors such as reference groups, family, social roles and status affect a consumer's mind-set and behavior. For instance, reference groups refer to informal primary groups such as family, friends, neighbors, but also to

more formal secondary groups such as religious and professional groups. Within these groups the involvement and attendance patterns are highly influential. Still, people are also influenced by groups they do not belong to. Someone aspiring to be a member of the board of trustees of the local opera society may make large donations and attend special events to cultivate acceptance by the group's members. Psychological factors suh as personality traits, self-concept issues and emotions also affect people's attitudes and behavior. For example, personality may be described in terms of self-confidence, dominance, autonomy, deference, sociability and adaptability. Cultural innovators and opinion leaders are likely to be more self-confident, dominant and autonomous than the less innovative people, who may be more deferential and more interested in the social benefits of arts attendance (Kotler and Scheff 1997: 68-81).

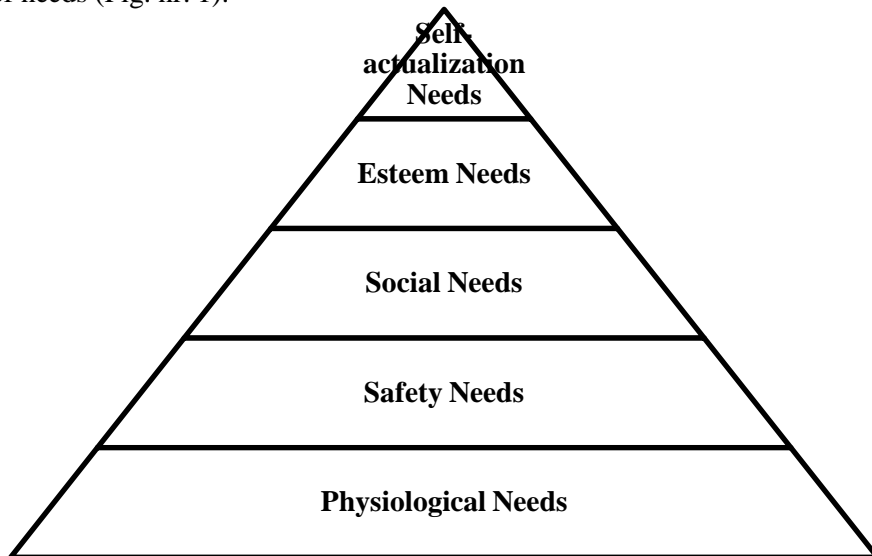
Motivation is also a psychological factor, directly correlated with the concept of „need". In order to understand what needs are, it is vital to refer to Maslow's Hierarchy of Human Needs and its five steps of needs (Fig. nr. 1).


Fig. nr. 1. Maslow's Hierarchy of Human Needs
Source: Processed after (Maslow 1987: 16-22)

Physiological needs (breathing, food, water, sex, sleep, homeostasis, excretion) are the most prepotent of all needs. This means that in the human being who is missing everything in life in an extreme fashion, it is most likely that the major motivation would be the physiological needs rather than any others. A person who is lacking food, safety, love and esteem would most probably hunger for food more strongly than anything else. If all these needs are unsatisfied and the organism is then dominated by physiological needs, all other needs may become simply nonexistent or be pushed into the background (Maslow 1987: 16).

If the physiological needs are relatively well gratified, there then emerges a new set of needs, the safety needs. These include security, stability, dependency, protection, freedom from fear, anxiety and chaos, need for structure, order, law and limits, strength in the protector, etc. The organism may be equally wholly dominated by them. They may serve as the almost exclusive organizers of bahavior, recruiting all the capacities of the organism in their services (Maslow 1987: 18).

If both the physiological and thesafety needs are fairly well gratified, there will emerge the love and affection and belongingness needs (social needs), and the whole cycle will repeat itself with this new center. The love needs involve giving and receiving affection. When they are unsatisfied, a person will feel keenly the absence of friends, mate or children. Such a person will

hunger for relations with people in general – for a place in the group or the family – and will strive with great intensity to achieve this goal. Attaining such a place will matter more than anything else in the world and he or she may even forget that once, when hunger was foremost, love seemed unreal, unnecessary and unimportant. Now the pangs of loneliness, ostracism, rejection, friendlessness and rootlessness are preeminent (Maslow 1987: 20).

Regarding the esteem needs, all the people from our society have a need or desire for a stable, firmly based, usually high evaluation of themselves, for self-respect or self-esteem, and for esteem of others. These needs may therefore be classified into two subsidiary sets. First, it is the desire for strength, achievement, adequacy, mastery and competence, confidence in the face of the world, and independence and freedom. Second, it is the desire for reputation or prestige (defining it as respect or esteem from other people), status, fame and glory, dominance, recognition, attention, importance, dignity or appreciation. Satisfaction of the self-esteem needs leads to feelings of self-confidence, worth, strength, capability and adequacy, of being useful and necessary in the world. Otherwise, they give the feeling of inferiority, weakness and helplessness (Maslow 1987: 21).

Even if all the above needs are satisfied, we may still often expect that a new discontent and restlessness will soon develop, unless the individual is doing what he or she, individually, is fitted for. Musicians must make music, artists must paint, poets must write, if they want to be ultimately at peace with themselves. What humans can be, they must be. They must be true to their own nature. And this is called self-actualization (Maslow 1987: 22).

Nonetheless, not to be forgotten, a variety of other personal characteristics (personal factors) affect a consumer's preferences and behavior. These factors include the person's occupation, economic circumstances, lifestyle and life cycle stage.

Secondly, the decision to attend a live performing arts event is the result of an elaborated process consisting of five stages (Fig. nr. 2).

Need Recognition	→	Information Search	→	Evaluation of Alternatives	→	Purchase Decision	→	Post-purchase Behavior
Fig. nr. 2. Buying Decision Process
Source: Processed after(Kotler and Armstrong 2005: 286)

The buying process starts when the consumer recognizes a problem or need, which may be triggered by either internal or external stimuli. An internal stimulus may be a desire for an enjoyable, entertaining evening or a desire to support an organization by means of a subscription and a donation.external stimuli include advertisements and word-of-mouth recommendations from friends and colleagues. Knowing which stimuli are more relevant for consumers, may help the marketer to develop marketing strategies that trigger consumer's interest (Kotler and Scheff 1997: 86).

Still, an interested consumer is inclined to search for more information. Consumer information sources may be personal (family, friends, colleagues), commercial (advertising, posters, leaflets, etc.), public (mass-media, award-granting institutions such as „Uniter") or experential (based on previous experience with similar products) (Kotler and Scheff 1997: 86-87). However, consumer's selectivity in their information search depends on their ability to process the information, which can be related to experience, age or education (Guillon 2011: 34).

Nevertheless, consumers do not evaluate their alternatives only based on the collected information. The process of evaluation is influenced by the cultural, social, personal and psychological factors described above. So, the consumer sees each product as a bundle of attributes, which have varying capabilities of delivering the sought benefits and satisfying certain

needs. Consumers will differ as to which product attributes are seen as relevant or salient. One person may choose to attend a certain concert because of the simphony being performed, another because she likes a featured soloist, another because she was invited to join friends with whom she wanted to spend the evening (Kotler and Scheff 1997: 87-88).

The decision-making process in arts attendance is made more complex by the fact that the target consumer is often not an individual, but a group. Five different roles may be played by people involved in the decision process: initiator (the person who first suggests or thinks of the idea of becoming involved in a particular exchange), influencer (the person who offers or is sought out for advice), decider (the person who decides whether to take action, what action to take, how, where and when to take action), transactor (the person who completes the transaction) and consumer (who may or may not participate in the actual purchase) (Kotler and Scheff 1997: 89).

After the purchase, the final step in the process is that of the consumer performing a post-purchase evaluation. At this time, the consumer will decide whether their quality expectations have been met or even exceeded, or whether they have been disappointed with the experience (Kolb 2005: 102-103). Yet, a distinction should be drawn between a cognitive approach in which value is the outcome of a cost-benefit analysis with a view to transaction and choice (evaluation before purchase) and an affective or experential approach in which value derives from a relative preference for the product with a view to consuming or owning the product (evaluation during and after consumption). This dichotomy between value established before purchase and value defined during or after consumption ties in with the distinction between purchase value and consumption value (Bourgeon et all 2006: 36).

III. Research methodology

As mentioned above, the aim of this research is to explore the motivations and the buying decision process related to the attendance of live performing arts events. For this, the author considers that the most appropriate manner is the qualitative research, namely the focus group; as this is considered to be the ideal place to begin understanding what products mean to consumers in their deep psyches rather than their deep pockets (Goebert and Rosenthal 2002: 3).

A focus group is a special type of group in terms of purpose, size, composition, and procedures. The purpose of a focus group is to listen and gather information. It is a way to better understand how people feel or think about an issue, product, or service. Participants are selected because they have certain characteristics in common that relate to the topic of the focus group (Krueger and Casey 2000: 4), in this case their attendance – with a certain frequency, to live performing arts events.

However, the question that is raised is: Why focus groups are a better alternative of exploring and why do they work? The answer is that the intent of the focus group is to promote self-disclosure among participants, as there is the desire to know what people really think and feel. Forsome individuals, self-disclosure comes easily—it is natural and comfortable. But for others, it is difficult or uncomfortable and requires trust, effort, and courage. Or disclosure may be easy in some settings but not others. Children have a natural tendency to disclose things about themselves, but through socialization they learn the value of dissemblance. Over time, the natural and spontaneous disclosures of children are modified by social pressure (Krueger and Casey 2000: 7-8).

In order to make the choice of focus group as a research method more clear, it would be useful that its main characteristics to be presented.Focus group interviews typically have five characteristics or features. These characteristics relate to the ingredients of a focus group: (1) people who (2) possess certain characteristics and (3) provide qualitative data (4) in a focused discussion (5) to help understand the topic of interest.Focus groups are typically composed of five to ten people, but the size can range from as few as four to as many as twelve. The group must be small enough for everyone to have an opportunity to share insights and yet large enough

to provide diversity of perceptions. Focus groups are composed of participants who are similar to each other in a way that is important to the researcher. The nature of this homogeneity is determined by the purpose of the study. This similarity is a basis for recruitment, and participants are typically informed of these common factors at the beginning of the discussion.The goal of a focus group is to collect data that are of interest to the researcher—typically to find the range of opinions of people across several groups. This differs from other group interactions in which the goal is to come to some conclusion at the end of a discussion—reach consensus, provide recommendations, or make decisions among alternatives. The focus group presents a more natural environment than that of an individual interview because participants are influencing and influenced by others—just as they are in life.The questions in a focus group are carefully predetermined. The questions are phrased and sequenced so they are easy to understand and logical to the participant. Most are open-ended questions. These questions appear spontaneous but are developed through considerable reflection and input.Focus groups work particularly well to determine the perceptions, feelings, and thinking of people about issues, products, services, or opportunities (Krueger and Casey 2000: 10-12).

IV. Research results
The main reasons why people attend live performing arts event are related, preponderently, with their social and esteem needs. Attending these events is a way of relaxation, of escaping from the cotidien problems; a way of socializing and spending good-quality time with friends; a way of introspecting yourself; as well as a way of confirming one's status as an intelectual person.

The decision of attending a live performing arts event can be taken both on the spot (according to its state of mind or „appetite" for such an event) or following a buying decision process as presented below.

The need recognition is related whether to internal stimuli (mainly the reasons discussed above) or external stimuli (hearing from someone about the worth of an event or seeing an advertisement related to it), both managing to trigger consumer's interest.

When searching for information, consumers use a variety of sources. However, one of the most trustful source is the personal one, namely family, friends or acquaintances that are familiar to the performing arts sector. That is why taking a decision based on their advice it is safe and time efficient, as well. Consumers'own experience is equally important, as they are already accustom with the process itself. Moreover, the instutitutions'sites – that host the event, are another reliable source of information. Still, one disadvantage could be the friendless interface of these sites that seem to make consumers more reluctant to its usage. Consumers tend to actively seek for information in free publications such as „24 FUN" or „Sapte Seri", whether online or offline, while the passive presence of posters for these events does not seem to be appealing enough for consumers nor to drive their attention upon them.

While evaluating their alternatives, consumers pay attention to various aspects, among the most important ones seem to be: the name of the event (e.g. the name of a certain theatre play or symphony or piece of ballet), the distribution/performers (e.g. actors, musicians, dancers) and the director/conducter/choreographer. These „ingredients" tend to assure consumers of the event's quality and, therefore, certify their decision. Apart from these aspects, there others that are taken into account, although not so influential as the previously mentioned ones. The hour the event starts might persuade consumers to go or not, according to the availability of their schedule; the price that in case of lack of discounts (e.g. students, retirees) or desire for a good place in the auditorium may a demanding one, requiring certain financial resources; the way of purchasing the tickets, if consumers can't go by themselves to buy them or can't purchase them online, they find themselves in the incapability of participating to that specific event.

Furthermore, the purchase decision is rather difficult to be attributed to someone in particular, as attending live performing arts events is a „team sport", in which everyone plays his role – one

comes with the proposal of attendance, another tries to persuade the others, another one puts the boot in and certifies the attendance, other purchases the tickets and all of them become consumers of that event.

Still, that event may or may not be a pleasant experience for consumers. A positive experience in the live performing arts, from the consumers' point of view, is a successful event. By a successful event consumers understand the following aspects: „performers gave everything they had and made me be part of that experience", „I was very, very, very impressed after their performance", „it made me vibrate", „on my way home I was thinking about the message of that performance". It seems that a successful performance has the power to change consumers' state of mind: „complete euphoria", „it has cheered me up", „emotional achievement". So, a positive experience implies a communion between performers and audience, as well as a good understanding, communcation and mutual respect.

Negative experiences influence profoundly consumers' next decision of attendance. By negative experiences, consumers refer to: „I almost fell asleep", „I saw errors, abstract things or kitsch", „a lot of kitsch", „I did not understand whichwas the message", „nothing was coherent in that performance". In addition, a negative experience is not entirely related to the performance itself, but also to the audience's behavior such as: applause at the wrong time, cell phones ring tones, eating and drinking inside the auditorium in a manner that disturbs the rest of the audience.

Yet, it should be beard in mind that the results from above represent the conclusions of a qualitative study, meaning they are a general view over the matter brought into discussion, providing rather insights than representativeness for the cause. In order to assure the representativeness of these results, a quantitative research should be conducted. Such a research could enrich the actual results by confering the possibility of classifying the studied aspects according to their importance from the consumer's point of view. For instance, one could know for sure which are the most powerful motivations for attendance? Which are the most relevant sources of information? Which are the most important aspects taken into consideration when evaluating alternatives? All for the sake of improving audience's experience regarding live performing arts.

V. Conclusions

As a final remark, this paper has underlined the importance of the arts marketing for the performing arts sector, as well as the usefulness of research for the same sector. The results of the conducted research are vital for any live performing arts organization who desires to know better the consumer to whom it addresses – which is the trigger for attendance and how does he choose. Such researches have been few so far, in the Romanian expertize literature. Therefore, the author hopes that this paper may be an inspiration for other researchers who want to further explore the performing arts sector from the marketing point of view.

HOW FAR WOULD YOU GO FOR LUXURY? AN EXPLORATORY STUDY AMONG ROMANIAN FEMALE STUDENTS THAT CONSUME LUXURY

Ciornea Raluca
Babes-Bolyai University of Cluj-Napoca, Faculty of Economics and Business Administration

Pop Marius Dorel
Babes-Bolyai University of Cluj-Napoca, Faculty of Economics and Business Administration

Babes-Bolyai University of Cluj-Napoca, Faculty of Economics and Business Administration

The main purpose of the paper is to identify actions that Romanian female students consuming luxury have been taken and would be willing to take in order to obtain the desired luxury products, deepening the "compromise" dimension. Although not based on previous studies, as is the only one of its kind in the luxury domain, the study took into account the "sugar daddy" and the "extreme saving" phenomena, mentioned in few books and considered to exist among young female luxury consumers. The research is based on primary data collection, where a questionnaire-the data gathering tool-was applied among female students under 30 years, resulting 273 luxury consumers. The results that were obtained using the statistical program SPSS 19, showed that a small percent of the respondents mentioned that have made compromises to have luxury goods and services, like telling lies, engaging in relationships or have been financially supported by someone. The lack of past compromises for the other consumers is mainly due to the inconsistency between compromises and their moral and ethical standards, respectively to the low importance(desire) given to luxury. However, some of those who mentioned the previous reasons believe that in future there is a certain probability to make some compromises for luxury, especially for luxury cars, homes or clothing. In addition, many of those who have made compromises in the past are also willing to make in the future. But, in order to obtain luxury products, most consumers are willing to save or to get a job, seeing savings as a form of compromise. The authors contribution is given by the originality and uniqueness of the subject discussed, as there are no similar studies in the luxury domain both in Romania and at international level. Although the study has as a limit the use of a sample from a single city, we believe that the research is significant for the luxury sector, contributing on the one hand to outlining of the general profile of Romanian luxury consumer by identifying aspects related to consumer behavior, and secondly by identifying a new segment of Romanian luxury consumers, without high income but willing to take various actions in order to have luxury products.
Keywords: luxury consumer, consumer behavior, compromise, luxury products, luxury
JEL classification: M 31

I.Introduction

The increasing academic interest in the domain of luxury products and services (Tynan, McKechnie and Chhuon 2010: 1156-1157) had lead to a diversification of the areas approached, but nevertheless, compared to many other sectors, there are still numerous aspects that were scarcely addressed or even not at all. Due to its complex sociological and psychological nature (Pop et al. 2009: 810), luxury still doesn't have a universally accepted definition (Godey, Lagier and Pederzoli 2009: 528). One of the most complex approaches regarding the luxury's features and which allows to differentiate between luxury and other products is proposed by Ciornea et al.

(2011: 98). Bringing some additions to the model of Wiedmann, Hennings and Siebels (2007: 5), the previous mentioned authors consider that luxury is characterized by a set of values: price value, investment value, usability value, quality value, uniqueness value, heritage value, self-identity value, hedonic value, materialistic value, conspicuousness value and status value.

The paper aims to study the extent to which female students in Romania- luxury consumers, were or will be willing to take various actions in order to have luxury goods and/or services, deepening especially the problematic of the compromises. Through compromise, the authors have referred to issues such as consumers' willingness to lie, to financial fraud, to engage in different types or relationships with or without emotional involvement and even more radical actions such as having a child. Although in the luxury literature there are published researches based on samples of students, the authors haven't identified studies to address this taboo subject. We consider that the present research is especially important as the subject wasn't yet approached for any other segment of luxury consumers, either in Romania or internationally. In addition, because of the existence of a very limited number of studies on the Romanian luxury market, we believe that our study has significant consequences on outlining the profile of luxury consumers in Romania.

II. Literature review

Even though the research is not based on previous studies, as the authors haven't identified similar researches in the luxury literature, however has as a starting point issues and ideas met in few books on luxury. One of the most important issues identified in literature, is the existence of the „sugar-daddy" phenomenon among young female luxury consumers, a phenomenon that assumes to make compromises especially of sexual nature to afford/obtain something- in luxury field this means luxury goods and services (Kapferer and Bastien 2009: 19, 23; Thomas 2007: 11, 169; Chadha and Husband 2006: 48, 61-62). Even if in Asia this phenomenon is much wider, its intensity varies from a country to another, ranging from simple forms as „the simple company" up to extreme forms of „part-time prostitution" (Chadha and Husband 2006: 61). However, some authors (Leclerc-Madlala 2003: 215-218) argue that the sugar-daddy phenomenon (not associated strictly to luxury) seen as transactional sex relationships, shouldn't be identified with the prostitution, although both focus on intimate relations exchanged for money or gifts. The main distinction is that girls involved in the sugar-daddy phenomenon, don't consider themselves prostitutes, because in most cases the „transactions" occur in relationships where love, desire and pleasure are essential (Gbalajobi 2010: 2). If in the past most of the studies discussing the sugar-daddy phenomenon identified it with forms of „survival sex" (to satisfy essential needs), in the present it more motivated by consumerist desire (Leclerc-Madlala 2003: 215-216). This makes us we believe that in the luxury field the sugar-daddy phenomenon arises from the desire to satisfy needs placed on higher levels of Maslow's pyramid, such as belonging to a group (Kapferer and Bastien 2009: 19; Chadha and Husband 2006: 62), esteem and self-esteem, admiration or even self-improvement.

Another form of „sacrifice" common among luxury consumers from Asia, is „the extreme saving", which implies a limited life-style- renting very small apartments, living with parents, reducing costs with various products even essential like food, etc. (Thomas 2007: 73-77; Chadha and Husband 2006: 61). Although the Asian countries are characterized by more pronounced behaviors in order to obtain luxury products, however we believe that the phenomena of saving and various forms of relationships are found in all countries, but the intensity varies depending on aspects as the importance played by luxury in the society, household incomes, etc. Also we believe that these behaviors are more common among young people (Chadha and Husband 2006: 61) and especially among females, thus the present research was conducted among young females under 30 years old.

III. Research methodology

The study is based on a primary data collection, using the questionnaire as a data gathering tool and face-to-face interviewing. The questionnaire had both closed and open questions, giving to our respondents the opportunity to express personal opinions and viewpoints. The ambiguity of the luxury domain required to support of each respondent through the questionnaire to avoid possible mistakes and clarity certain issues. The studied population is represented by female students from different years of study and specializations in the Faculty of Economics and Business Administration of Cluj-Napoca- one of the largest university centers in Romania. Although questionnaires were applied to a sample of 380 people, only 367 were lately validated.

The questionnaires were applied only to female students, regardless if were luxury consumers or not, afterwards using as filter the responses to two questions, have been separated the luxury consumers from non-consumers. Adopting the proposal of Dubois and Laurent (1996: 470-477) regarding the existence of an „Excursionist" luxury consumer, through "luxury consumer" we will understand the person who had "consumed" at least once a luxury product or service. Considering that among the most affordable luxury products are the fashion luxury products, the respondents were initially asked to check a list of luxury fashion brands (proposed by Okonkwo 2007: 45-47); based on the list they had to check from all categories of luxuries given in the questionnaire (in total 29) those from which they "consumed" products or services at least once. Data processing was performed using the statistical program SPSS 19 and given the objectives of the research and the nature of the variables wanted to be discussed, the main analyzes used were frequencies and Chi Square Test with the Contingency Coefficient.

IV. Research findings

In the present paper, the authors didn't focused on testing hypothesis, but rather on the identification of past and future actions of the luxury consumers, respectively on the identification of a possible new segment of luxury consumers. However, for a complete discussion, we aimed to determine whether some variables as age, monthly family income and the importance given to luxury can influence the respondents' actions. From 367 validated questionnaires only 273 were included in the category of luxury consumers.

To identify the past behavior, consumers were asked to indicate if they have ever made compromises in order to have desired luxury products or services. The list with the compromises to which we'll refer the entire study includes the variables: „to lie", „to be engaged in a relationship with a man", „to get married", „to be the mistress of a married man", „to make a child", „to be financially supported by someone", „to engage in intimate relations without emotional involvement" and „to financial fraud (at work or similar context)".

Table no. 1 Consumers' past willingness to make compromises for luxury

Willingness to make compromises -in the past	Frequency	Honesty<100%*
No, never	88,6%	26,85%
Yes, few times (maximum 5) and I did regret	4%	45,45%
Yes, few times (maximum 5) and I didn't regret	6,7%	33,33%
Yes, frequently	0,7%	50%

* percentage depending on the "willingness" chosen options

Source: made by the authors

In Table no. 1, one can see that 11,4% of consumers made compromises to afford or to obtain luxury products. Same table shows that not all respondents were 100% honest (they were asked to modify the percent of honesty only if they had lied intentionally when answering some questions- seen from the beginning as a possible consequences of the taboo nature of the subject approached). Testing the link between willingness to past compromises and the honesty of the respondents, it was observed a relationship between them of small intensity (Contingency

Coeff.=0,271, Sig.=0,032). On the other hand there is no significant statistical relationship between the willingness to past compromises and the monthly family income (Sig.=0,633), the age (Sig.=0,473) or the importance attached by consumers to luxury (Sig.=0,313). The selected categories of compromises made in the past for luxury, are distributed as follows in Table no. 2.

Table no. 2 Categories of compromises made in the past in order to have luxury

Categories of compromises made in the past	Frequency*	Honesty<100%**
To lie	66,7%	37,5%
To be engaged in a relationship with a man	19,4%	28,57%
To be financially supported by someone	13,9%	0%

*percentage from total responses   ** percentage based on the selected „categories" of compromise

Source: made by the authors

Thus the categories of compromises made by consumers for luxury products were: „to lie", „to be engaged in a relationship with a man", respectively „to be financially supported by someone". As some of the respondents weren't 100% honest during the interview, test showed a relationship of small intensity between the respondents' honesty and the variable "to be financially supported by someone" (Sig.=0,038, Contingency Coeff.=0,348). For each mentioned category, most consumers have a monthly family income under 4000 lei, thus there weren't discovered significant relationships between the variables (Sig.=0,209, Sig.=182, Sig.=0,305). Also, has been found s relationship of small intensity between the variable "to be financially supported by someone" and the importance given by consumers to luxury (Sig.=0,05, Contingency Coeff.=0,386). There are no significant relationships between the categories of compromises made in the past and the age of the respondents (Sig.=0,429, Sig.=0,834, Sig.=0,429).

Consumers who mentioned that had never made compromises for luxury, were asked to select the main reason behind their decision, and the final situation is as follows: "never had the opportunity"(9,3), " it's not necessary as I have the financial means to afford most of the luxury goods desired"(6,9%), " such behavior doesn't meet my moral and ethical standards"(59,5%), "the luxury products are not that much important/I don't wish them so much in order to compromise"(23,9%). There is a relationship of medium intensity between the lack of past compromises for luxury and the monthly family income (Sig.=0,000,Contingency Coeff.=0,498), and a relationship of small intensity with the importance attached to luxury (Sig.=0,036, Contingency Coeff.=0,268). There is no significant relationship with the age (Sig.=0,891).

Related to the future intentions of consumers regarding the willingness to take various actions in order to have the desired luxury products, there were mentioned the following possibilities (percent of total answers): „ to save from the money given by my parents"(37,6%), "to save from the salary, reducing costs with other products"(29,9%), "to get a job, even for a short period of time" (20,9%), "to borrow money from my friends, boyfriend, parents, other family members"(5,3%), "to make compromises"- from the given list (3,7%), "other option" (2,6%). Although the answers show that only 17 consumers would make compromises for the desired luxury goods, a following rechecking question showed that 77 of consumers have a certain future willingness to make compromises.

Has been found a relationship of medium intensity (Sig.=0,000, Contingency Coeff.=0,564) between the lack of past compromises and the future willingness to make compromises for luxury. Thus, 65,21% of those who mentioned that "never had the opportunity" consider that there is a certain probability to make compromises for luxury in the future ("probably no", "probably yes", "yes"), 5,8% of those who have the financial means to buy luxury products see a future willingness, while 10,88% of those who consider that compromises don't meet their moral or ethical would be willing in a certain measure to compromise and 20,33% of the consumers who think that for them luxury products are not so important (or don't wish) are willing to make

compromises in the future. Although many respondents didn't mention the categories of luxury that could tempt them to make compromises, however the stated ones are: cars (28,7%), houses (17,85%), clothing and accessories (26,78%), travels(16%), cosmetics(7,1%), other service(3,57). No significant relationships were found between the future willingness to compromise for luxury and the monthly family income (Sig.=0,916) or the age (Sig.=0,733), but there is a significant relationship of small intensity between future willingness and consumers' honesty (Sig.=0,000, Contingency Coeff.=0,277). The categories of compromises possible to be made in future by consumers for luxury are given in Table no.3.

Table no. 3 Categories of compromises possible to make in the future to have luxury

Categories of future possible compromises	Frequency*	Honesty<100%**
To lie	56%	21,14%
To be engaged in a relationship with a man	32 %	12,5%
To be financially supported by someone	26%	61,53%
To get married	14%	28,57%
To financial fraud	4%	50%
To be the mistress of a married man	2%	100%
To engage in intimate relations without emotional involvement	2%	100%

*percentage from total responses   ** percentage based on the selected „categories" of compromise
Source: made by the authors

Have been identified significant relationships between the honesty's level of consumers and the categories „to be the mistress of a married man"(Sig.=0,002, Contingency Coeff.=0,439) , „to be financially supported by someone"(Sig.=0,038, Contingency Coeff.=0,348), „to engage in intimate relations without emotional involvement"(Sig.=0,000, Contingency Coeff.=574). But there aren't significant relationships between the willingness for future compromises and monthly family income or age. More, there is a relationship of medium intensity between the past willingness for compromises and the willingness for future compromises (Sig.=0,000, Contingency Coeff.=0,580). Thus, 16,1% of the consumers who never made compromises for luxury believe that there is a certain probability to compromise in the future, while from those who made compromises in the past few times and regretted or not, a percent of 81,8% respectively 77,7% take into consideration this possibility in the future.

V. Conclusions
Even if only 11,4% of the luxury consumers have mentioned that have made in the past compromises in order to have luxury products (to lie, to get involved in relationships, to be financially supported by someone), the percent of those willing to make in future compromises is higher, even though some of the respondents willing to compromise mentioned that luxury is not important for them (or don't want it), compromises don't meet their ethical or moral standards or even some afford most of the luxury products desired. The most mentioned types of possible future compromises are lying, getting engaged in relationships, getting financially supported or getting married, while the most mentioned categories of luxury that would tempt consumers to compromise are the luxury cars, luxury houses, luxury clothing/accessories and luxury travel services. Although there is a tendency for those who have made compromises for luxury in the past to be willing to make compromises in the future, however, the main actions that consumers would do in the future to obtain luxury products are to save from the money given by their parents, to save from the salary or to get a job. Regarding the influence of different variables, tests showed that there aren't significant connections between age and actions done/will be done in future for luxury, while for the variables monthly income of the family, importance given to luxury and honesty of the respondents some significant link were found for some of the actions.

Therefore can be observed the existence of a category of luxury consumers willing to take various actions in order to obtain the desired luxury products, being essential to note that most respondents of the study have a monthly income of the family smaller that 4000 lei (almost 1000 euro). The identification of this category of consumers can have major implications for the luxury sector as due to the small personal/family income they are not taken into consideration while studying luxury domain (research companies take into account the family wealth, annual income, etc.) and most likely the produces don't consider them existing or possible clients. Most probably, in this category of consumers most are "excursionists" and could represent a significant market. We believe that the present study has a significant contribution to the luxury literature through the uniqueness of the subject approached (both nationally and internationally) but also duet o the results obtained, namely the identification of a different segment of Romanian luxury consumers. However, one of the main limitations of the study is the collection of data from a single faculty in a single city, even if is one of the greatest university centers in the country, and we consider that is possible to obtain slightly modified results is the study takes into consideration young female students from less developed cities or on the contrary from the capital. For the future, the authors intend to extend the study among other categories of young female consumers under 30 years old, which will require data collection among girls in high-schools and among young females with medium studies. Therefore, the results can be considered interim results of a much larger study.

Strategic marketing planning requires that the marketing objectives strategies for a specific product-market configuration be in full correlation with the directions and the resources allocated at the corporate level or at the strategic business unit one. Such a correlation is more than necessary under the current market conditions, when the economic crisis affects both consumer behavior and corporate decisions. This article focuses on the particularities of strategic marketing planning in sport, given the fact that the vast majority of sports organizations in Romania, although very active on the reference market, do not have a marketing activity correlated with the medium and long term market needs. One of these needs refers to quality of life improvement, knowing that sport activities have positive influence on many dimensions of quality of life, such as health, education, social inclusion, relaxation and leisure. The improvement within the population participation in sport (both as an active participant and as a spectator), the increased duration of leisure and the development of private financing have led to the creation of a large market, where marketing plays a central role. Therefore the marketing management process must also be implemented within the sports organization, in order to make it easier in building and maintaining a relationship with the customer, especially if the organization wants a customer orientation strategy. Such an orientation includes identifying the current needs as well as the future ones in terms of target audience, to offer a series of sports products and services that bring their significant contribution to improving the quality of life. In this paper are highlighted the influences that consumer requirements concerning quality of life have on all components of marketing management process, starting with sports organization mission statement, up to establish strategies for the marketing mix (product, price, distribution and promotion).
Keywords: strategic marketing planning, quality of life, sports marketing, marketing management
JEL classification: M31, I31

1. Introduction in strategic marketing planning

The concept of strategic planning in marketing management has evolved from the interaction between marketing management, strategy and planning. As a definition, the term refers to ensuring the management of strategic business units in order to anticipate and respond to changes occurring in the marketing environment, so that decisions that are taken today should allow the strategic unit to be ready to avoid threats and take advantage of future opportunities (Abbel 1978: 236).
Among key features of strategic planning in marketing management can be mentioned (Wilson and Solomon 1978: 68):

- The management orientation beyond the immediate issues. This approach means involvement in issues different from the operational ones which the management is facing in the everyday activity. Thus we can conclude that tactical actions undertaken every day are not part of the strategic planning;

- A specific set of decisions and activities. The concept of strategic planning in marketing management implies not "philosophizing" about the future of the organization, management, marketing or strategy, but rather implies carrying out specific actions to be taken so as to enable the objectives, while succeeding in avoiding threats and taking advantage of potential market opportunities;

- Top management involvement. In general, strategic planning in marketing management is an activity primarily implemented at the top management of the corporate or strategic business unit level, as opposed to marketing strategies and tactics that are implemented at lower levels;

- Holistic perspective. It is important for strategic planning to undertake a corporate-wide approach, not only to ensure that it won't be excluded any element which would later prove to be of utmost importance, but also to ensure optimization of all related items so as to ensure success in all strategic business units (Bendaputi and Robert 2005: 93);

- Flexibility. This implies as a starting point the fact that each organization operates in a marketing environment that is constantly changing. Considering this, the organization should always know how the marketing environment elements will change and the direction in which they will move. Therefore, while developing marketing strategies to achieve pre-defined targets, there will be developed backup plans which will consider alternative strategies for alternative objectives defined by the changes that will occur in the marketing environment;

- Proactive nature. Proactivity implies the development of the future (Drucker 1999). The development of the future does not involve making decisions for the future, because, as was mentioning by Drucker, decisions may be taken only at present. It implies rather the idea of building the future as the organization would like it. If the future revealed by changes in marketing environment is not pleasant for the organization, the marketing managers should make the necessary changes so that it can be in the benefit of the organization.

2. Applicability of marketing management process in sport

The marketing management concept has been widely debated in the economic literature, in the attempt to conceptualize it and also classify it at the organizational level. The best known approach is that of Philip Kotler that defines marketing management as "the art and science of selecting the targeted segments and building profitable relationships with them" (Kotler and Armstrong 2004: 13).

The improvement within the population participation in sport (both as an active participant and as a spectator), the increased duration of leisure and the development of private financing have led to the creation of a large market, where marketing plays a central role.

Therefore the marketing management process must also be implemented within the sports organization, in order to make it easier in building and maintaining a relationship with the customer, especially if the organization wants a customer orientation strategy. This represents the base in implementing sports marketing.

Definitions of sports marketing are highly varied, ranging from defining or, better said, matching the term with sport sponsorship up to considering it as a different field, with methods, techniques and its own instruments. However, whatever the approach in defining the concept, the literature outlines two dimensions for sports marketing: marketing for sports (marketing for products and services from the field of sport) and marketing through sports (marketing of other products by using sport as a promotional instrument).

3. Sports marketing strategic planning and its influence on quality of life

As mentioned above, the customer orientation should be highlighted in the overall management of the sports organizations, so the company can fulfill the two objectives of marketing: meeting customer needs and maximizing the profits. These two objectives are interconnected, considering that a long term profitable organization is the one that takes into consideration the customers needs (Filip 2011: 4).

One of these needs refers to quality of life improvement, knowing that sport activities have positive influence on many dimensions of quality of life, such as health, education, social inclusion, relaxation and leisure.

The concept of quality of life can be defined as "the degree to which the objective needs of the individual are met in relation to subjective perception, individual or group, on welfare" (Costanza 2008: 1). While the objective needs relate to subsistence, reproduction, security, affection, etc, the subjective perception focuses on happiness, life satisfaction and personal utility.

Quality of life is defined by experts in the marketing area mainly through the relationship which is built between consumer satisfaction and the quality of his life (Huang and Chen 2008). It is thus seen that the connection between marketing and quality of life lies in its subjective approach, therefore this paper will focus on how strategic marketing planning of sports organizations influence consumer satisfaction, with direct implications on quality of life.

Marketing management process is a joint effort of all levels of organization of a company, but what differ are the techniques and tools used. Therefore, in theory were identified three levels of application: the corporate level, the business unit level and the functional level. In sport, this separation of the marketing techniques and tools depends mainly on the size and coverage of the sport organization, as can be seen in Table no. 1.

Table no. 1. Identification of marketing management process steps according to the size and coverage of the sport organization

Type of sport organization	Marketing management process steps		
	A) *Market oriented strategic planning*	B) *Activities strategic planning*	C) *Strategic marketing planning*
Sportive Federations	At the top management of the federation	At the level of the County Associations	At the level of the County Association affiliated clubs
Multi-sports clubs	At the top management of the club	At level of each sport branch	
Single-sports clubs	At the level of the club's management		

Realized by authors

Planning at the corporate level is the broadest level of strategic planning, as here are defined the company's mission, strategic business units, each unit resource allocation and the planning of new activities. These decisions do not directly influence consumer satisfaction and the quality of life, but they represent the base for decisions at lower levels, levels at which we find the interaction between the organization and the client.

The mission for a sports organization must present the company "philosophy", its long term "vision" on what it aims to be and especially what it wants to achieve (Olteanu 2003: 84). The mission must be clearly defined, with no room for interpretation.

Depending on the mission defined, the sports organization establishes its operating areas to clearly highlight the market/markets where the offer of products and services will be presented. Defining such operating areas can sometimes prove difficult in the sports field, given the fact that there are many criteria of classification of these areas. For example, a sports federation can have as criteria of defining its operating field the age group of the athletes (juniors and seniors) or the level of the competition where the affiliate athletes are participating (domestic and international competitions). A club may define its operating areas depending on types of sports it is active in (football, basketball, handball, tennis, etc.).

Once the operating areas are defined, the sports organization must establish the development strategies. In other words, they should consider a plan for the future activity of the organization that will allow them to better capitalize on its own strengths and the market opportunities.

Seen at the level of the strategic business unit, strategic planning is an integral part of specific processes undertaken by the company. This stage can be broken down into distinct phases in the following sequence: segmentation, targeting, positioning and marketing mix. In this phase, the company will perform marketing research based on defined objectives at the level of the strategic business unit, thus the company can identify key market segments and select those targeted for the organization's products or services.

Strategic planning at the level of the strategic business unit implies the following steps:

- Market segmentation to identify the main categories of consumers to be targeted by the sport organization and determining how these segments will be targeted, activity that is achieved by designing the positioning strategy (Trout and Ries 1981);

- Life cycle analysis of products/services and establish appropriate strategies depending on the specific life cycle phase in which the product/service is;

- Developing methods and techniques of marketing mix in terms of its components – product, price, distribution and promotion, using at each level several instruments: a) at the level of product policy, are develop and launch new products, is design the service and warranty policy, is set the level of product quality, brand strategy and product strategy, b) at the level of pricing policy, we have the price construction, price list and discounts, negotiated price and price strategy, c) at the level of distribution policy, we have marketing channels, push and pull strategies, selection and role of intermediaries, analyzing relationships and conflicts within the marketing channel and distribution strategy, d) at the level of promotion policy, we have personal sales and sales management, fairs and exhibitions, public relations, advertising and sales promotion.

The most important aspect of marketing with direct influence on the level of individual satisfaction, and therefore on quality of life, is related to the marketing mix, in which sport organization should establish the product/service offered to consumers, the price for its sale, how it will be distributed to reach the customer, and the way to promote it in market.

Sports marketing specialist should identify and design the best version of a *product* so as to meet the requirements identified in the market. Currently, is no longer only the merchandise requirement, but also the requirement of a certain lifestyle, which starts with the specific environmental orientation from the last two decades. Improving quality of life is based on consumption behavior for products and services so that each individual will try to consume products that will help maintain a healthy lifestyle and will want to benefit from services that will enable him to lead a better life. To meet the requirement of improving the quality of life, sport organization should highlight the link between products/services sold and the welfare of the individual, often making the association with health and social inclusion.

In most markets, not only the quality of the supply determines the buying decision, but also the allocated *price*. Most researches in the field of quality of life are based on financial indicators, so the cost of products is also a factor influencing the perceived quality of life at the individual level

(through the accessibility of certain products and services) and at the society level (in terms of purchasing power and inflation index).

In price setting may also intervene state institutions, by subsidizing the access to certain products and sports services that can help improve the health of the population. Such an approach requires the strategic marketing planning even within the public service organizations, which will align them with the market and thus become more competitive (Barbu 2011: 88).

Maybe not as important as price, but with particular significance for the modern consumer (characterized by high levels of convenience), is the *distribution* of sports products and services. Through an efficient distribution system sports companies are trying to facilitate individual's access to products and services, so his satisfaction in relation to the offer will be as high as possible. Quality of life is often defined through the access of population to products and services, for example the indicators considered in determining the Mercer Quality of Living Index, where the availability of products and services is one of the ten major factors influencing quality of life.

The fourth component of the marketing mix is *promotion*, activity that facilitates access to information for each individual to the most appropriate products and services in relation to his needs. Through promotion, the marketing specialist presents to the customer the options regarding the purchase and consumption so that he can improve his quality of life. Campaigns show why the product should be bought and consumed, most reasons being based on achieving a good standard of living.

It should not be omitted the educational function of promotion, sport organization being able to highlight the benefits of carrying out sports activities, educating the consumer ultimately contributing to increased living standards and to much more active involvement in labor market (Aceleanu 2011).

4. Conclusions

Sports organizations have an impact both within the microeconomic and macroeconomic environment, considering the significant revenues that sport can bring into the economy; therefore a coherent and efficient marketing management process needs to be implemented by these organizations, leading to a better relationship with the customer and long term profitability for the organization. The sports marketing specialist must take into consideration that a satisfied customer is the one that, besides having his needs fulfilled for the moment, has also an opportunity to improve his wellbeing.

Also, the social side of sport should not be omitted, considering the fact that a person involved in sport activities is a healthier one, and more integrated in the community, with better social skills and communication techniques. Thus, not only the business environment should consider the marketing management process for their activities, but also the entities that coordinate the national sport policies.

IS THE WEBSITE MARKETING STRATEGY CORRELATED WITH THE COMPANIES OUTCOMES? EVIDENCE FROM ROMANIAN IT INDUSTRY

Constantinescu-Dobra Anca
Technical University of Cluj-Napoca
Electrical Engineering Faculty

With a constant yearly growth of more than 20% over the last five years and adding up to10% of the GDP, the Romanian Information Technology (IT) sector has an important potential for development. Emphasizing on websites marketing in this sector could enhance more profitability. Even though this tool is considered to be much depersonalized, the users like getting a sense of the company behind the website. Having a wide range of information facilitates this understanding. In a very competitive environment, the IT managers have to realize that the overall site is what represents their organization to users. Prospectors look at product pages and read the site content when they are evaluating an organization as a possible vendor, business partner, employer, investment opportunity. Therefore, websites marketing is one of aspects that need to be constantly reevaluated in an ever-changing word of communication.

Given this facts, the present study identifies the extent to which the most valuable IT Romanian companies practice webpage's marketing. Specifically, we examine the content, in-time communication tools, navigability and style of the websites in correlation with their outcome and size. Moreover, the paper analyzes the differences between websites characteristics of Romanian IT SMEs and large companies from top 100, according to their turnover. The specific objectives in order to investigate the websites marketing of Romanian IT companies are:

-To evaluate the websites marketing policies of the software developer, hardware and IT distributors;

-To analyze in depth the Romanian IT companies websites performance in correlation with their profit, turnover and number of employees;

-To assess the differences between websites policy of SMEs and large companies from Romanian IT industry;

This study is exploratory and consists in a qualitative assessment of websites from top100 software, hardware and IT distributor companies. The sample consists of 93 functional websites. The corporate website of each company was analyzed and subsequently codified on 97 variables clustered in four dimensions: content, handling, interactivity and layout. The results outline the fact that firms engage in websites marketing activities to a relatively high extent. There is a strong correlation between websites content and companies' turnover, profits and number of employees. Moreover, a positive correlation was revealed between interactivity and turnover.

The research outcomes reflect high disparity between Internet marketing policy of software, hardware and distributors.

Key words: websites marketing, SME, IT industry, Romania
JEL Codes: M31, M15

Introduction

The IT sector is considered strategic for the development of the national economy, as it can drive and enhance development and competitiveness of every other industry.

Romania is one of the strongest markets in Europe for technology investment and trade, with a highly skilled technology workforce and good cost/quality balance. Romania has a competitive advantage in the following IT areas (Tartavulea et al. 2010: 97-105): mechanical engineering sourcing, research and development, systems integration and security software development outsourcing. In Romanian IT industry is acting more than 45% SMEs.

Many studies (Manyka and Roxburgh 2011:1-10; Mattos 2007:1-4; Pavic et al. 2007:320-351) proved that productivity in the case of companies which are using the Internet is at least 10% bigger. In addition, evidence shows that these companies grow and export about twice as much as the others. However, there is a lack of analyses on the webpage quality of companies acting in IT industries. Visitors to companies' web pages want to determine whether the organization has experience, proven success, and an understanding of the challenges unique to their business. Marketers should also make it easy for customers to write reviews and leave comments on product and service pages because partners are more likely to purchase something based on current-user comments.

Therefore, the present study performs *the correlations between best Romanian companies' web pages quality and their outcomes and size. Moreover, we intend to analyze the SMEs in comparison with large companies that are in top 100 of Romanian IT ranks.*
In addition, the papers emphasize on disparities between the main object of activity, according the studied dimensions.

The following questions were addressed in order to investigate the websites marketing of Romanian IT companies:
-Which of the investigated dimensions are prominent in this sector?
-What is the situation of websites marketing policies in the three main field of activity: software, hardware and distributors?
-Does the performance of websites marketing depend on their size and financial results?
-Which are differences between websites policy of SMEs and large companies from Romanian IT industry?

This study is exploratory and consists in a qualitative assessment of websites. The paper is divided in five sections. The following part depicts the most used methods from assessing web pages. The next chapter describes the applied methodology for exploratory research and after that, the results are presented. The discussions and conclusion provide a summary of implications.

Theory and research review
In the literature, there are wide ranges of websites assessment methods that are continuously evolving directly related with the growing efficiency of a company website. The environments movements, especially concerning IT progress and consumers behavior, have determined the existence of different perspective in evaluation techniques of the sites quality. A great number of authors made recommendations about how to create a quality website (Head 2000:1-220, Mich et al. 2003:34-43; Nielsen 2008:1-253). There are also official e-government guidelines that have been produced by the Office of the E-envoy (2008). The most used criteria encountered in almost every specialists approach include elements such as purpose, source/authority, content, currency, style and functionality.

Other researches (Chakrabortyet al. 2002:51-72; Nielsen 2008:116-121) demonstrate that effectiveness of a website is influenced of, *level of information, organization, transaction-related interactivity*, and *personalization* while other factors have no direct impact: non-transaction-related interactivity, privacy/security, accessibility, and entertainment.

Perceived information quality affects perceived value and loyalty intentions and perceived value influences loyalty intentions toward IT websites (Kim and Niehm 2009:221-233). In addition, entertainment and trust directly influence perceived value, while online completeness and entertainment strongly affects the loyalty.

On the other hand, the *most of IT sites from CEE are business- to- business* (B2B). Nielsen, one of the gurus in websites assessment, considers that *ought to emphasize usability more*, because they must help users accomplish tasks that are more advanced and research more specialized products. B2B sites *must provide a much wider range of information than what is common in*

business-to-consumer (B2C). It must also offer information to help prospects understand concepts like total cost of ownership, ROI, and whether and how the product or service will integrate with the customer's existing environment.

In relation to the approaches for assessment (comparison and improvement of websites quality), the literature specifies the following:

1.) *Methodologies focused on the Websites technical quality* that use models or standards of software quality and methods focused on the usability, derived from research in human-computer interaction area: analyzing the degree of conformity with IT - quality assessment of Internet resources (Bauern and Scharl 2000:31-41), based upon the used software (Mendoza et al. 2002:70-84), methods from the offered on-line services perspective (Diniz et al. 2005:41-50), methods focusing on transaction security and trust (Schubert 2002:51-80), from browsing perspective (Schubert 2002:51-80).

2.) *Methodologies focused on the Websites content quality,* approach emphasizing on design and the importance of the interface (Rocha and Victor 2010:173-178) *taking into account the user´s view* (Bernstam et al. 2005:3-19).

The present study uses methodology for assessing the *technical quality of a website*.

Research methodology

The present study is an exploratory study of websites policies of Romanian IT companies.

The study goal is *to analyze the degree by which best Romanian IT companies use websites* as a marketing tool in order to become more competitive on the market. Specifically, we are going to reach the following objectives:

-To examine the websites marketing of the software developer, hardware and IT distributors;

-To analyze in depth the Romanian IT companies websites performance in correlation with their profit, turnover and number of employees;

-To assess the differences between websites policy of SMEs and large companies from Romanian IT industry;

The data was collected during the period January -February 2012. We assessed the software, hardware and distributors companies in top 100 IT/2011 according to their turnover (from 2010) made by doingbusiness.ro. The research sample consists of 93 websites, because at the assessment time, 7 sites were under construction or were not functional.

The sample structure by size and fields of activity is displayed in (figure no1). The majority in the sample is represented by software developers (58%), followed by distributors (25%) and, finally, by hardware producers (17%).The SMEs are predominant in distributors' field (59.11%).
Figure no 1. *The structure of the research sample by size and fields of activity*
Source: made by the author

In order to accomplish our goal, we use specific dimension for assessing IT sites, based on *Profnet Institute from Munster website assessment method,* aiming at ranking worldwide web

sites in different branches (www.profnet.de). *In this approach, all the items will be clustered in* four criteria: content, navigation, interactivity and layout.

We have cut some of criteria according to Nielsen's recommendations described in the above section. Finally, every websites in the sample were *qualitatively* assessed through 97 criteria, grouped around the above-mentioned complex variables, as following: 38 criteria for *content*, 24 criteria for *handling*, 19 criteria for *interactivity* and 16 criteria for *layout.*

For each criteria, we got 1 point for the existence and we have considered the same importance rate for each of items. The maximum score of a site is 100 points, split on the four variables as following: 40 points for *content* and 20 points for each of the other three variables (layout, handling and interactivity). For example, some of analyzed dimension for content are: history, download forms, information about products/services, calendar events, frequently asked questions, information about industry, the managers, jobs, contact. For navigation, we have evaluated: the navigation path, holding a security certificate, search functions, for interactivity: Intranet/Extranet, personalized pages for the customer, callback service, hotline, e-cards, chat, online tour, schedules, online activities as well as online request for company information and for layout: the presence of Avatars, live images, a web camera, phone web, etc.

We have computed the data in SPSS 17. For a better correlation between websites quality and their turnover, profit and number of employees we applied Pearson correlation.

Results and discussion

Using the methodology and procedures described above, we have obtained the scores of the 93 sites according to their quality, at the time of assessment. Table 1 presents the average scores of Romanian sites by field of activity and the company size.

The findings reveal an upper medium propensity of Romanian IT company toward using websites policy (64.2 points from 100 possible). This result is related to the fact that IT companies have the necessary know-how (and required hardware) for implementing and properly managing their websites. The gap between large companies and SMEs is, surprisingly, rather small (69.33 vs. 59.11points). This means that SMEs try hardly to be active by offering actual and meaningful information, through adequate and fast access supports, possibility to interact and an elaborate design for websites public. Moreover, the hardware field got the lowest score (58.55 points) and the distributors the higher one (70.2 points). These disparities are present mainly due to different target segments: businesses vs. businesses and consumers. Distributors display more transparency and flexibility than the others; meantime the software websites try to build more credibility for potential partners.

Table no 1. Relative quality of the IT SMEs websites by field of activity and size

Average scores		Content 40)	Handling (max 20)	Interactiv. (max 20)	Layout (max 20)	TOTAL
Software	Large companies	25.3	17.2	10.1	17.5	70.1
	SMEs	21.03	15.2	8.7	12.8	57.73
Hardware	Large companies	26.1	14.9	8.5	16.9	66.4
	SMEs	17.2	14.1	7.8	11.6	50.7
Distributors	Large companies	24.8	15.6	14.3	16.8	71.5
	SMEs	25.6	14.9	13.2	15.2	68.9
Whole sample		**23.34**	**15.32**	**10.43**	**15.13**	**64.22**

Source: made by the author

As we expected, a facile navigation is present, *handling* getting the higher score (15.32 points from 20 possible). IT companies are adapting very fast to IT progress. Therefore, the great majority of companies in the sample *offer a different version for* widgets and mobile that make it

easy to access needed information *(adapted version for I Pad, I Phone, Blackberry, Android, Windows phone7 etc.).*

Interactivity is the feature most neglected by managers operating in Romanian IT industry (10.43 points from 20 possible). The explanation for this result can be the particular business model such as outsourcing. The most companies in the sample are software companies and have only few (large) clients, usually international ones. Therefore, the IT managers probably consider that there is no need to disseminate information for other category of prospective clients. Although, we have to mention a positive fact: 42% of companies posted comments on industry blogs with a track-back link to their own sites. Customers and prospects can share stories and tips, interact with the company directly and find new ways to use products.

The *content* dimension is also average (23.34 points from 40 possible). Stakeholders can be involved in a proactive relation through offering industrial information and could enhance preferences in the future, with no extra cost.

The feature "*Layout*" has upper medium scores (15.13 points from 20 possible). Regarding the presentation style, IT companies have a very impressive business style, using the latest specific soft version in the field (very good resolution vs. speed ratio). However, IT industry does not make any connections to audio-visual identification system (company colors, slogan, logo etc.) meaning that the managers do not pay much attention on unitary marketing strategy.

The relation between IT SMEs size and outcomes and their websites performance

The results regarding connections between IT SMEs turnover and their websites performance are presented in (table no 2).

Table no 2. *Pearson correlation between the assessed four dimensions and turnover, profit and number of employees*

		content	handling	interactivity	layout
turnover	Pearson Correlation	.362[**]	.024	. 329[**]	.017
	Sig. (2-tailed)	.733	.049	.624	.034
profit	Pearson Correlation	.059[**]	.074	. 024	.027
	Sig. (2-tailed)	.786	.054	.714	.484
No of employees	Pearson Correlation	.254[**]	.013	. 071	.044
	Sig. (2-tailed)	.521	.062	.036	.016
	N	93	93	93	93

**. Correlation is significant at the 0.01 level (2-tailed); Source: computed by the author

The outcomes validate the existence of *three direct strong correlations between content and turnover/profit/number of employees,* which means the more employees and important (and profitable) business IT companies run, the more information is in the content section. Probably a bigger company can afford to administrate itself its websites marketing activities and has more achievements than another smaller. Another reason could be the overall marketing strategy that is more important when the company is more developed than in previous stage. But this assumption has to be further investigated. Finally, another positive correlation is revealed: those between interactivity and turnover. This fact proves *that websites can be a great tool to increase the sales*, mainly due to B2C online platforms, which implies more possibilities for gaining prospective consumers.

Conclusion

Our research sheds new light on websites marketing policy of the best Romanian IT companies and helps explain how managers can improve content, interactivity, handling and layout. The most efficient companies according to their turnover deploy an *"upper-medium" development stage of websites marketing*.

Nevertheless, navigation tools and layout are more sophisticated while content and interactivity are pointing an average level. The Romanian IT companies (especially SMEs) do not fully use de advantage offered by Internet. Even though they have unlimited free space to be used, most of the companies in the sample display minimum information.

The results pointed out strong correlation between the displayed content and their turnover and profitability. The interactivity dimension is directly related with the sales: the larger the company is, the more information on the websites is available.

Finally, given that the main trend under economic crisis is outsourcing in Far East, Romanian IT companies should be aware of their competitive advantage that could be threatened. Thus, we consider that even though the best companies in Romanian IT have good websites positions, they have to improve their websites marketing and to offer a complete online instrument as an "offensive wall." It manager should consider to improve the real time communication with current, prospective partners and the enhance trust and credibility by displaying general and specific information related to the business and to their target segment interests.

EMPIRICAL RESEARCH ON THE IMPACT OF LOCATION AND SERVICE ON THE RETAIL BRAND IMAGE

Abstract
Developing and consolidating store image in the consumer's psyche is undoubtedly an essential psychographic goal of decision makers from a retail enterprise. Regardless of the tools used to draw customers—assortment and particularly the unit's own brands, assisted service or friendly and competent, attentive and carefully dressed personnel always eager to help customers, the selection of a proper location near the customer's workplace or domicile or very close to other units—the retail enterprise must undertake sustained efforts to properly understand the consumer's wishes and fancies.
Moreover, the food or non-food retail enterprise will have to adapt itself to the customer's ever-changing desires and, in the end, will have to take the necessary measures to make him/her return to the store, purchase again and develop retail brand associations. In order to attain this goal, the store will naturally seek to imprint a proper, strong, even unique image on the consumer's mind. As the literature (Keller, 1993) highlights, in order for a consumer to form an opinion in time about a particular brand, s/he must first perceive the brand, get to know it and undergo positive experiences with it.
The current research advances a model designed to emphasize the contribution made by a store's location and assisted service to shaping the store image. After the model's theoretical concepts are operationalised, the data are validated by means of the reliability analysis. Finally, pertinent interpretations are provided through the existing correlations between the identified dimensions.
The empirical research was conducted on a sample of 1800 Romanian consumers and reveals, for the selected retail formats, notable differences between the two characteristics of the retail brands in terms of their significance and impact on the store image. Finally, the research outlines several managerial implications that are relevant in taking future decisions concerning the best course of action to be taken with the aid of these two elements of the retail marketing mix.
Keywords: retail marketing, retailers attributes, location, service, store image
JEL Classification: M3, M31

Introduction

Much like the service and customer loyalisation policies, the location policy originates in the physical evidence policy and the integration of the external factor (customer, information, nominal and material commodities) into the service provision. The unit proper, that is, the store (Cora Cluj-Napoca, Carrefour Orhideea) represents the interface between consumer and provider (retailer). Location is obviously an integral part of the distribution policy as it represents the geographical area where the enterprise expends its resources with a view to offering performance to its customers (Zentes & Swoboda, 2001: 505). Service, and the quality thereof in particular, delivered through the personnel of the store is another aspect that has a strong bearing on consumer behaviour, on building and consolidating the image perceived by consumer, on his/her

return to the store, repurchase as well as on the recommendation of the unit to friends, relatives, acquaintances or any other people (Dabholkar & Shepherd & Thorpe, 2000: 139 -173; Osman, 1993: 136). The concept of store image has been intensively studied in the literature over time. Some authors (Martineau, 1958: 48-52; Lindquist, 1974-75: 31-32; Hildebrandt, 1988:95) equate store image with retail brand equity whereas others believe that retail brand equity is the outcome of the combined action of different marketing tools which contribute to developing retail brand equity and to properly imprinting the brand image on the consumer's psyche/mind (Sirdeshmkh & Singh & sabol, 2002: 34).

Literature review

In most countries, store location has undergone constant evolution (changes) over time. Initially, retail units were clustered together in village/town/city centres or in the centre of districts but later on the outskirts became the preferred place for erecting retail units. Town and city centre areas captured again the attention of retailers because more and more public establishments and service providers appeared in these areas. However, retailing has lately been "relocated" to business centres and districts. Location is chosen depending on the type of retail unit (Liebmann & Zentes & Swoboda, 2008: 494). Proximity, specialty and discount stores are particularly to be found in densely populated areas, very close to people's homes, near places with heavy flow of people (pedestrian zones and walkways) or near places where public establishments (hospitals, banks, schools) abound. Supermarkets are also placed in crowded or densely populated areas and, in addition, they have to provide customers with parking lots. Hypermarkets, cash &carry or DIY units are built on the edge of, or outside, the localities and can be reached by public or their own transportation means.

When choosing a particular location, the retailer will take into account a number of factors such as the distance from people's homes, the competitors' format and assortments, areas with busy (foot or road) traffic, the existing infrastructure, public transportation, the existence of other establishments in the area, the demographic factors (population size and density, ethnic composition, the number of single-, bi- or multi-parent households), the psychological and social factors, the competition in the area as well as the possibilities to expand or improve the location, its value and degree of attractiveness (Müller-Hagedorn & Natter, 2011: 133-142).

Last but not least, when determining the place for a new subsidiary, the retailer will ensure that the ratio between the potential income forecast by the opening of a new location and the investments necessary to inaugurate and operate the store is optimal. Finding the best location for a new subsidiary equals finding an area with very good custom (Matmüller & Tunder, 2004: 321). The selection of the best custom/location can be made by the retailer through a range of specific methods and procedures such as the concentric circles model, the method of temporal distance (measuring how much time is needed to reach the new location), the profile method (use of scoring models), the analogy method (the utility of a new retail location is assessed by analogy with an existing retail unit), the gravity models (studies the attraction or gravity that a retail pole exerts upon consumers) or the degree of centralization.

The importance of studying personnel policy emerges from the fact that after the investment in building and opening a new store and the costs associated with the merchandise procurement, the staff is the third most significant expenditure for a retailer. This is, perhaps, the very reason why some retail chains – such as the discounters Lidl, Aldi, Penny Market – strive to give up the human factor, substituting it with a sort of standard arrangement of the store, and simplistic, but somehow logical, layout of the products on the shelf. The opposite is true, however, in the case of hypermarkets, supermarkets, department and specialty stores where the personnel abound. Naturally, the number of necessary employees in a retail unit is decided depending on other factors as well retail format, store's location, customers' daily or weekly frequency of visits to the store, structure of the department, employee fluctuation from one period to another, store's

business hours as well as the days of the week when the store is open or the promptness with which an employer manages to serve a customer (Ahlert & Kenning, 2007: 221).

Personnel play a key role in attracting consumers and „binding" them to the store. Therefore, personnel must have very good communication skills, show appropriate training, a good appearance and care, competence and objectivity in the expression, be helpful and attentive to the problems identified by clients and always have a friendly approach to their problems (Deery & Iverson & Walsh, 2002: 3-16). There is a strong relationship between customers and personnel particularly in the case of proximity stores, the mutual trust and kindness usually simplifying the acquisition act and leading, as a consequence of this, to its repetition. As part of the personnel policy, the retailer must pay attention to the planning, recruitment, selection, development, motivation, organization, remuneration, evaluation and loyalisation of employees (Ahlert & Kenning, 2007: 223-231; Müller-Hagedorn & Natter, 2011: 418-422).

Self-service, specific to the majority of retail formats, and in particular to discounters, means the absence of personnel qualified to advise customers from the sections or departments of the retail unit. Basically, the merchandise shall be chosen by the customer, taken off the shelf and carried to the cash register, where it is scanned by the personnel or even by the customer himself/herself (Ahlert & Kenning, 2007: 224). Personal selling may be regarded as belonging both to service policy and to communication policy, the options varying in the technical literature. There are considerable differences between retail chains concerning the extent to which a retailer resorts to personnel to advise customers and promote sales.

Personal selling conducted by means of customer advising is manifested in two forms, namely, the intensive one and the simple one. Whereas the first form of manifestation involves going through all the stages required to complete the sale, the second form only includes addressing the customer, delivering the goods and finishing the payment. For that reason the simple selling may be regarded as the "bridge" between personal selling and self-service (Mattmüller & Tunder, 2004: 291).

Retail brand image is a mental and behavioural concept which conveys the consumer's perception of the store and the entire retail chain, respectively. Brand image may also be described through the emotional and cognitive brand associations which together make up the brand behavioural value. Brand behavioural value can be analyzed in terms of behaviour effects generated by the brand strength on condition that the latter is correlated with marketing tools effectiveness. There are certain indicators whereby brand strength can be assessed such as loyalty, trust and appeal as well as brand acceptance in general and the consumer's willingness to pay more for the preferred brand. In fact, brand image, which some authors equate with brand equity, is the totality of the cognitive (verbal and visual) processes which emphasize the "knowledge" about a particular brand. Brand knowledge, in turn, is the sum of all verbal associations and interior impressions and reflections on the brand (Morschett, 2002: 70-76).

There are several attributes that make up brand image, such as attitudes, that is, the emotional and cognitive aspects associated with the brand, the intensity of brand commitment and the verbal and non-verbal representations of brand associations. These associations are understood as those cues that a consumer "sees" when s/he thinks of a particular brand. The clearer the cues are, the easier for the consumer to choose a particular brand. Brand image may also depend on how accessible and relevant brand associations are to consumers or on the number of possible associations. The strength of the brand image can also be built through the unique associations that consumers make with the preferred brand, namely, a plethora of individual characteristics whereby the brand is marked as different (unique) from competing brands (Keller, 1993: 1-22; Krishnan, 1996: 389-405).

2.2 Research operationalisation

The theoretical concepts pertaining to location and service have been operationalised by paying attention to similar empirical studies published in the technical literature. The operationalisation of location took into account how optimal is the site where the unit is to be located ("The location of the preferred store is optimal"), how close the store is to other food, non-food units or service providers and the accessibility and convenience of location as these are perceived by customers ("The location of my preferred store is convenient for me"). Service operationalisation took into account aspects such as service impeccability ("The preferred store provides excellent service") as well as personnel competence and amiability ("Personnel is amiable at the preferred store"). Also, attention was paid to the extent to which service is customer-oriented ("Through the service provided, the preferred store treats me seriously when I encounter difficulties") as well as how fairly customers are treated by the store through personnel (Anselmsson, 2006:122; Birtwistle & Freathy, 1998: 322; Chowdhury & Reardon & Srivastava, 1998: 74; Porter & Claycomb, 1997: 380; Sirdeshmkh & Singh & Sabol, 2002: 34). Finally, Brand image according to Keller (1993) has been operationalised by paying attention to the characteristics of his model: awareness ("The preferred store is a well-known brand"), uniqueness ("…is a unique brand"), strength ("… is a strong brand") and attractiveness/appeal (…is an attractive brand").

3. Research methodology

In order to provide the means for quantifying the previously described theoretical concepts, they were assembled into a questionnaire administered to Romanian consumers in the food and non-food retailing. The statements with similar meaning were made with the aid of the seven-level Likert scale. The data were collected in 2011 under direct supervision of the author. Out of 2000 received questionnaires, 732 were deemed valid for non-food retailing and 1084 for food retailing. The respondents were interviewed with regard to their preferred store but the retail format to which the stores belong was not made known to them. Classification according to retail formats has been made by the authors in accordance with the guidelines of the technical literature (Barth, 1999; Liebmann et al., 2008). The formats which made the object of investigation in the food retailing were the hypermarkets, supermarkets, the "category killer" stores (a type of stores that differentiate themselves through two or more characteristics which traditionally belong to different retail formats), the cash & carry units (very familiar to the investigated consumers for issuing them quite easily with loyalty cards), the proximity and discount stores. Non-food retailing was represented by DIY stores, electrical and household appliances stores, and shoe, textile or sports stores. The sample selection was made according to sex and age groups. The interviewing process generally respected the limits of the original structure, although slight deflections were recorded on several of these groups. The testing of data validity and reliability was made by using Cronbach's alpha coefficient, the "item-to-total" correlation and the exploratory factor analysis. The contribution of location and service to the creation of a retail brand image was subsequently studied by means of the multiple regression analysis/model as presented in Figure 1.

4. Research findings

4.1. Validity and reliability analysis

The alternate application of Cronbach's alpha coefficient and item-to-total correlation highlighted the fact that the operationalisation carried out for each theoretical construct may be validated for service, location and store image. Cronbach's α coefficient takes on the value 0.807 for location, 0.909 for service and 0.853 for store image. The use of exploratory factor analysis confirms the stability of the theoretical constructs *location, service* and *store image* as the value that they take on for the Kaiser-Meyer-Olkin (KMO) criterion is 0.835 for location, 0.840 for service and 0.730

for store image. Although these values are not optimal, we believe, however, that they can be validated and employed in subsequent analyses.

4.2. Regression analysis

The application of regression analysis on the model presented in Figure 1 revealed that both location and service exert an important and great impact ($***p<0.001$) on store image. As can be noticed, service exerts greater impact on store image than does location, leading to a positive contribution to building retail brand image. The impact of location in the consolidation of the brand image is slightly greater with non-food retailing (0.102***) than with food retailing (0.096****). This is probably due to the fact that, with non-food retailing, location has increased involvement in the decision making process. Service has greater impact on building non-food retail brand image than building food retail brand image (0.376**** as against 0.314****). This seems quite logical if we are to consider the fact that much more customer advising is needed in household appliances or clothes stores than in super- or hypermarkets.

Figure 1. Findings of regression analysis for the overall sample
(Legend: n.s. – not significant; *p<0,1; **p<0,05; ***p<0,01; ****p<0,001)
Source: own research.

The breakdown of findings according to food retail formats reveals that location exerts the greatest impact on building store image in the case of cash & carry units which, at least theoretically, consumers should not be familiar with. However, this significant impact of cash & carry units (in our case Metro and Selgros) may probably be attributed to the former which has been on the Romanian market for more than 15 years. By the time the Romanian market was penetrated by other retail chains, particularly hyper and supermarkets, Metro was for the Romanian customer the only viable alternative to traditional proximity stores. Moreover, it seems very likely that Metro has become for the Romanian consumer as a sort of benchmark against which other retail brands are judged. For this reason, consumers will likely be willing to cover a longer distance so that location may no longer be the most important element in building the image of this retail format.

The impact of service on building brand image is insignificant in the case of proximity stores, represented in the current research by several chains (mic.ro or CBA), and some independent units, which indicates that these units fail to properly embed their image in the consumer's mind through personnel or the processes taking place in the store. As can be seen in Table 1, contrary to our expectations derived from the literature, service exerts a strong and significant impact in the case of Lidl and Penny. It should be, however, weak and less important, much like that provided by Kaufland. It seems likely that, according to the Romanian customers' perception, Lidl and Penny fail to gain a dominant position within consumer's mind through proper price policy, unlike Kuafland which oftentimes uses specific slogans such as "the lowest prices in Romania" and "if you find a cheaper product we pay you back the difference" etc. We believe that the two units are perceived by the Romanian customers as a retail format resembling hyper and supermarkets rather than the category in which the literature includes them.

Table 1 – Impact of location and service on store image in grocery retailing

Retail format	Discount	C&C	Hyper-market	Proxi-mity	Super-market	CK	Food retailing

Location → SI	0,218***	-0,148[n.s.]	0,127**	0,275***	0,111*	0,184**	0,096****

As far as food retail is concerned, discount and proximity stores are the formats in the case of which location exerts the greatest impact on store image building which indicates that their perception by consumers is relatively similar. Location has a positive influence, albeit low in terms of intensity and significance, in the case of hypermarkets. Thus, the significance of location according to food retail formats reveals that this characteristic does not hold a special place in building retail brand image.

In the case of non food retail, all retail formats feature strong influence of service in building store image, the greatest impact being recorded with DIY stores (0.530****). The product range of the DIY stores is the very reason for which they have to hire personnel capable of advising properly the customer and putting forward the best solutions to his/her problems. Interestingly, service has greater impact on building brand image in the case of textile and sports stores than in the case of electronic and household appliances stores. The low impact of service is likely to be the result of the fact that by the time of the purchase act, the consumer already analysed carefully the offer of electrical and household appliances so that his/her consumption decision is not made based on the advice received from the store personnel during purchase but well in advance. It is also possible that the customer, upon entering a household appliances store, should know precisely what s/he wants and appeal to personal advising only for finding information about maintenance, warranty or compatibility with other products. On the other hand, location has an important and strong impact only in the case of shoe stores which bespeaks the Romanian consumer's care when choosing the unity where s/he will buy shoes. Surprisingly, location has very little, if any, impact on building retail brand image in the case of household appliances and sports stores, and a negative one in the case of DIY stores. This is accounted for by the fact that, in order to attain their objective, that is, obtain the desired items, consumers are willing to cover a longer distance just as they do in the case of cash & carry units.

Table 2 – Impact of location and service on store image in non-food retailing

Retail format	DIY	Electro	Textile	Shoes	Sports	Non-food retailing
Location → SI	-0,236*	0,017[n.s.]	0,143**	0,319***	0,140[n.s.]	0,102***

Source: own research.

6. Implications

The obtained findings reveal that service has a greater and more important impact on store image whereas location makes a smaller contribution thereto. By comparison, notable differences can be noticed between the analysed retail formats as to the impact of service on store image. In the case of food retail, some formats (supermarkets, hypermarkets, discount units) feature relatively similar impacts, the only difference being the cash & carry stores where service has a very great

impact on brand image. Non-food retail formats feature significant differences in terms of service and its impact building store image. On the other hand, store location contributes to building store image only in the case of some retail formats, with notable differences between them.

One of the main limits of the current research consists in the fact that non-food retail formats are much more heterogeneous than their food counterparts. Likewise, the number of questionnaires for the analysis of retail formats must have an as equal distribution as possible for each particular format. However, the present findings may serve as a basis for pertinent conclusions about the impact of service and location on the consolidation of the retail image.

AN ASSESSMENT OF THE RELATIONSHIPS BETWEEN THE CULTURAL HERITAGE, TRAVEL AND TOURISM, AND SUSTAINABLE DEVELOPMENT IN THE CENTRAL AND EASTERN EUROPEAN COUNTRIES

Dugulan Diana
Academy of Economic Studies in Bucharest

Popescu Ioana Cecilia
Academy of Economic Studies in Bucharest

Vegheş Călin
Academy of Economic Studies in Bucharest

The cultural heritage, including, according to the UNESCO definition, the assembly of monuments, groups of buildings, and sites which are of outstanding universal value from the historical, aesthetic, ethnological or anthropological point of view, represents an important asset that can be engaged and capitalized in order to support the sustainable development. Meeting the needs of the present without compromising the ability of the future generations to meet their own needs in order to provide a better quality of life for everyone, now and for generations to come, has become a concern and, in the same time, a priority for all the stakeholders of the society.

Turning to the best account of the cultural heritage also represents an important driver for the sustainable development of the travel and tourism industry, as the cultural sites, institutions, goods and services, appropriately capitalized, represent significant attractions for the international and domestic tourists. The integration of the principles of sustainable development in the current functioning of the travel and tourism industry led to the development and implementation of the concept of sustainable tourism.

The paper explores in a distinctive manner the relationships between the cultural heritage and the travel and tourism industry, respectively the cultural heritage and the sustainable development based on a set of related statistical indicators, and the specific secondary data, expressing the extent of the cultural heritage, the development of the travel and tourism industry, and the attained level of sustainable development in ten Central and Eastern European countries, members of the European Union. There are two major research questions the paper aims to answer: (1) How significant is the relationship between the cultural heritage and the development of the travel and tourism industry? (2) Is there a noteworthy connection between the cultural heritage and the sustainable development in the selected countries?

Keywords: cultural heritage, travel and tourism, sustainable development, Central and Eastern Europe

JEL classification: M83, M31

Introduction

The cultural heritage, is defined by UNESCO as an assembly of monuments (including architectural works, works of monumental sculpture and painting, elements or structures of an architectural nature, inscriptions, cave dwellings and combination of features), groups of buildings (groups of separate or connected buildings which, because of their architecture, their homogeneity or their place in the landscape, are of outstanding universal value from the point of view of history, art or science), and sites (works of man or the combined works of nature and man, and areas including archaeological sites) which are of outstanding universal value from the historical, aesthetic, ethnological or anthropological point of view (UNESCO, 1972).

Together with other forms of capital – physical, natural, economic, human, social, and organizational, the cultural heritage represents one of the major resources that can be employed in order to support the sustainable development (Svendsen and Sørensen, 2007). The capitalization of the cultural heritage represents an important driver for development, including here the tourism activities in a specific area: when properly managed, it can enhance the livability of their surrounding areas and sustain productivity in a changing global environment (Pereira Roders & van Oers, 2011). Culture, cultural heritage and development have been making an incalculable contribution toward improving human livelihoods and well-being in lasting and sustainable ways (Bandarin et al., 2011).

According to the Leask and Rihova (2010), the heritage contribution in tourism development, based on the capitalization of the available cultural resources, can be enhanced through (1) implementing strategies of sustainable growth and effective diversification of the local economy, (2) developing heritage tourism policies and products that meet the needs of community, policy-makers and tourists, (3) improving the stakeholder communication and participation in the creation of the authentic and individual visitor experiences, and (4) connecting the sustainable tourism development with the heritage conservation, community integration, and stakeholders.

The most frequently quoted definition given to the sustainable development is that provided by the United Nation's World Commission on Environment and Development in the Brundtland Report (1987), stating that it refers to the development meeting the needs of the present without compromising the ability of future generations to meet their own needs. The European Union (2010) views the sustainable development standing for meeting the needs of present generations without jeopardizing the ability of futures generations to meet their own needs, providing a better quality of life for everyone, now and for generations to come.

At the intersection of the travel and tourism industry and the sustainable development stands the sustainable tourism, which, according to UNESCO should: (1) make optimal use of environmental resources, maintaining essential ecological processes and preserving natural heritage and biodiversity; (2) respect the socio-cultural authenticity of host communities, conserve their built and cultural heritage and traditional values, and contribute to inter-cultural understanding; and (3) ensure viable, long-term economic operations, providing fairly distributed socio-economic benefits to all stakeholders (UNWTO sustainable tourism development conceptual definition in Pomering et al., 2011).

Methodological Notes

In this context, the assessment of the relationships between the cultural heritage, travel and tourism industry, and the sustainable development aims to provide answers to the following questions, that can be seen in this context as *research objectives*: (1) How significant is the relationship between the cultural heritage and the development of the travel and tourism industry? (2) Is there a noteworthy connection between the cultural heritage and the sustainable development?

The *research hypotheses* associated to these objectives state that: (1) there must be a significant relationship between the cultural heritage and the development of the travel and tourism industry; and (2) the contribution of the cultural heritage (mainly through its capitalization) to the sustainable development is rather moderate.

The exploration of the connections between the cultural heritage, travel and tourism industry and the sustainable development has been conducted at the level of ten countries from the Central and Eastern Europe, member of the EU. The selected countries form a group of *observation units* including: Bulgaria, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, Slovakia, and Slovenia. These countries attracted, at the level of the year 2010, 41.7 millions of international tourists (representing 11.5 % of the total international tourists of the EU,

respectively 8.8 % of the total international tourists in Europe) and accounted for 33.8 billions of US$ in international tourism receipts (representing 10.2 % of the total international receipts of the EU, respectively 8.3 % of the total international receipts in Europe).

The selection of the *statistical indicators* expressing the extent of the cultural heritage, the development of the travel and tourism industry, and the level of sustainable development in the selected CEE countries has provided the following results:

-the *cultural heritage*: only the number of the cultural sites on the UNESCO World Heritage List has been considered, as the identification and selection of the indicators related to the cultural heritage represented a relatively difficult to accomplish task. There are few indicators measuring the cultural sector at the EU level, cultural statistics continuing to be an "under construction" field of the EU statistics, and there also are very few indicators describing the status of the cultural heritage;

-the *travel and tourism industry*: the international tourist arrivals, the international tourism receipts, and the contribution of the travel and tourism industry, respectively the travel and tourism economy, to the formation of GDP, respectively in generating employment were the indicators selected to express the performances of the industry;

-the *sustainable development*: GDP per capita, the share of GDP that is used for gross investment by the government, business, and household sectors, the energy intensity of the economy, and the employment rate of the population of 20-64 years old. The EU employs a system of more than 100 sustainable development indicators to provide an overall picture of progresses achieved towards sustainable development in terms of the objectives and targets defined in the EU's Sustainable Development Strategy. The indicators are organized in ten themes: socio-economic development, sustainable consumption and production, social inclusion, demographic changes, public health, climate change and energy, sustainable transport, natural resources, global partnership, and good governance. The selection of the appropriate indicators of sustainable development represented a challenge in the context of this research as an important number of them refer to the aspects that are, at least apparently, less connected to the cultural heritage and the travel and tourism industry. For the purpose of this study, only the above-mentioned indicators, related to the socio-economic development theme, have been selected.

Spearman correlation coefficients have been calculated in order to assess the relationships between the cultural heritage and the travel and tourism industry, respectively the cultural heritage and the sustainable development.

Main Findings

Values of the considered indicators related to the cultural heritage extent, travel and tourism development, and the state of the sustainable development in the selected countries are presented in the table below. The first impression after reading the data is that the countries of Central and Eastern Europe represent a sample characterized by considerable diversity in terms of the cultural heritage they possess (from 13 cultural sites on the World Heritage List – the case of the Czech Republic, to none – the case of Slovenia), the development of the travel and tourism industry (from 11.89 million international tourist arrivals – the case of Poland, to only around of 1.3 millions – the cases of Slovakia, Latvia or Lithuania; respectively, from international tourism receipts of 9.01 US$ billions – the case of Poland, to only 1.09 US$ billions – the cases of Estonia and Lithuania), and the level of sustainable development (a GDP/capita varying from 15300 € – the case of Slovenia, to 3500 € – the case of Bulgaria; respectively an energy intensity of the economy varying from 259.20 kgoe/1000 € – the case of Slovenia, to 853.77 kgoe/1000 € – the case of Bulgaria).

Also, the existing differences illustrate the strong dissimilarities between these countries considering their profiles as tourist destinations.

Table 1: Values of the cultural heritage, travel and tourism, and sustainable development considered indicators for the Central and Eastern Europe countries in 2009-2010

Countries	WHS	ITA	ITR	T&TI GDP	T&TI Emp	T&TE GDP	T&TE Emp	GDP / cap	Inv	Energ Int	Emp Rate
Bulgaria	7	5.74	3.73	1.57	86	5.95	324	3500	0.00	853.77	65.4

		N	9	10	10	10	10	10	10

**. Correlation is significant at the 0.01 level (2-tailed).

*. Correlation is significant at the 0.05 level (2-tailed).

The number of the cultural sites included on the UNESCO World Heritage List correlate significantly with the international tourism receipts, but not with the international arrivals (although the value of the Spearman rho suggests the existence of a relatively significant association). This could mean that, although the cultural sites in the Central and Eastern European countries do not attract as many international visitors as it should, the revenues they generate are important for the overall performances of the travel and tourism industries. In this context, the appropriate capitalization of the cultural heritage seems to be important as attracting more international visitors will determine an increase of the international receipts. Also, the cultural heritage seems to contribute to the performances of the travel and tourism industry regarding the formation of GDP and employment.

The analysis of the associations between the cultural heritage and the sustainable development selected indicators reveals the lack of significant connections: none of the bivariate correlations proved to be significant, which means that the number of the cultural sites included on the World Heritage List does not have relevant associations with the socio-economic indicators describing the sustainable development, i.e. GDP per capita, share of the gross investments in the GDP, the energy intensity of the economy, or the employment rate of the population aged 20-64.

Table 3: Correlations of the cultural heritage and the sustainable development indicators for the selected Central and Eastern Europe countries

Correlations

			Number of World Heritage Sites	GDP per capita	Share of Total Investments in GDP	Energy Intensity of the Economy	Employment rate (20-64)
Spearman's rho	Number of World Heritage Sites	Correlation Coefficient	1.000	.261	.294	.176	.034
		Sig. (2-tailed)	.	.498	.442	.650	.931
		N	9	9	9	9	9
	GDP per capita	Correlation Coefficient	.261	1.000	.467	-.358	.389
		Sig. (2-tailed)	.498	.	.174	.310	.266
		N	9	10	10	10	10
	Share of Total Investments in GDP	Correlation Coefficient	.294	.467	1.000	-.018	.237
		Sig. (2-tailed)	.442	.174	.	.960	.510
		N	9	10	10	10	10
	Energy Intensity of the Economy	Correlation Coefficient	.176	-.358	-.018	1.000	.103
		Sig. (2-tailed)	.650	.310	.960	.	.776
		N	9	10	10	10	10
	Employment rate (20-64)	Correlation Coefficient	.034	.389	.237	.103	1.000
		Sig. (2-tailed)	.931	.266	.510	.776	.
		N	9	10	10	10	10

Apparently, an increase in the number of the cultural sites included on the World Heritage List will generate a positive but less significant impact over the GDP per capita and the gross investments, and a positive but extremely less significant over the employment rate of the population aged 20-64, all these with the price of increasing the energy intensity of the economy. Overall, the capitalization of the cultural heritage seems to have a rather modest contribution to the sustainable development of the selected CEE countries.

Conclusions and limits of the research

The exploratory assessment of the relationships between the cultural heritage and the travel and tourism development, respectively the cultural heritage and the sustainable development has been conducted at a level of sample including countries with significantly different profiles as tourist destinations. The indicators used in the assessment, although relevant, are obviously not sufficient to allow drawing consistent conclusions about the relationships between the cultural heritage and travel and tourism, respectively the cultural heritage and sustainable development.

Still, the measured correlations of the related indicators support the following conclusions:

-there are significant relationships between the cultural heritage and the travel & tourism industry – an appropriate capitalization of the cultural heritage may determine improvements of the performances of the travel and tourism industry and supports the overall contribution of the industry to the GDP formation and to the employment;

-the relationships between the cultural heritage and the sustainable development are rather poor: on the one hand, the cultural heritage is an asset less turned to the best account in the selected CEE countries, and, on the other hand, that capitalization of the cultural heritage, where conducted, generates a very modest contribution to the sustainable development of these countries.

These results should be considered in the context of the two limits of this exploratory approach. The first refers to the limited number of variables considered in the assessment of the relationships between the cultural heritage and the travel and tourism industry, respectively the cultural heritage and the sustainable development. Obviously, a set of eleven variables, although relevant for the scope of the research, could not provide a solid basis for the analysis of these relationships. Further improvements should be made consisting in the increase of the number of research variables by including more indicators regarding the extent of the cultural heritage, the level of development of the travel and tourism, and the state of the sustainable development.

The second refers to the limited number of observation units considered in the assessment of the relationships between the cultural heritage and the travel and tourism industry, respectively the cultural heritage and the sustainable development. Further improvements in this respect, depending significantly on the existence of the statistical data for the considered indicators, should lead to an enlargement of the list of countries involved in the assessment process.

Everyone's belief is that marketing plays a fundamental role in all economic or uneconomic areas of business. However, what becomes very clear is that, in addition to the many positive aspects that it generates, marketing produces unwanted effects as well.
The paper tries to prove the relationship between marketing and axiology (its value and its perception on the people), on the one hand, and one of its most obvious effects - visual pollution, which already starts to be in the attention of those who can counter it, on the other hand. Value, as a concept, is a result of a long and laborious research, both economic and uneconomic (philosophical, psychological, etc.). The visual pollution and the ecological architecture are recent approaches and it cannot be said that there is a very rich experience or a proper literature in this domain. But the interest is growing undoubtedly.
The authors consider that the demarche of the paper, to sit marketing, value and pollution alongside, is at the beginning of the road and certainly will arouse the interest of further research.
The paper is the result of an office research of secondary sources of information. They are limited and also limiting, the domains being studied separately. The result of the paper is the noting on the fact that marketing can be extremely harmful. We agree with the idea that marketing supports businesses and the economy of an area, but it is better to be aware that the pollution it produces is increasingly significant so the rules by which marketing plays must be rewritten.
If the authorities, the business itself and those involved in education will focus and will exactly understand their role in a sustainable development of the society, than the aim will be achieved. We believe that the authors' concerns, which are dedicated to the idea that by means of marketing one should not destroy but build, will be of public interest as well.
Keywords: axiology, value, pollution, marketing, ecology.
JEL classification: M31, Q56

1. Introduction

Nowadays, the conviction of everyone, professional or not, is that marketing undoubtedly plays a fundamental role in all economic or uneconomic areas of business.

According to the marketing study in terms of axiology, we can highlight the values followed by this activity, compared with those generally accepted. We define value as a specific axiological relationship between a natural or created object and the human subject, by means of which he expresses his appreciation for its qualities that are meant to satisfy some specific needs. Value appears as well as the relationship between subject and object, in which by means of polarity or polarization and of hierarchy, we express our differentiated appreciation for certain things or their

qualities, for certain persons or human acts, for certain works created by virtue of their ability to satisfy some specific needs, aspirations or interests.

2. Concepts used

A classification of values is as follows: economic values, legal values, political values, ethical values, historical values, aesthetic values, religious values. The first four values are determined by the constituent and regulating functions of the social life. The other three are determined by the frame in which the social reality exists and evolves.

For our study we only discuss three of these values, which are directly related to marketing, and have impact on this activity, namely: economic, ethical and aesthetic values which, depending on the way they are perceived, lead to visual pollution.

The economic value is generally understood as the awareness of the usefulness of the goods comparing to others, which satisfies a certain need. The needs are physical and mental, so we distinguish between two kinds of values: spiritual values and material values. The economic values are material. The value theory is more likely a theory of cost, since it addresses a crucial moment of the value, that meaning the cost, a labor required to produce the goods and the limited usefulness.

The economic values are constituent for the social reality; they represent only a part of the social values that span multiple levels with different functions in the social life.

The ethical values relate to our desires which can be numerous, so we always require the same question: Which is the best goal? For some people it is happiness for others wealth, virtue, etc.

The psychological theory states that a ethical value has a mental basis, it is a product of the self will, of the will to upgrade one's personality.

The analysis of the moral conscience takes into account the opposition between sensitivity and the responsibility imposed by the categorical imperative, because the ethical value is an imperative that we all must obey.

The ethical value has life as an ultimate principle and the ethical laws are natural laws, whose inobservance brings evil. So, shall we sacrifice the ethical values to the detriment of the economic ones?

The aesthetic values relate to the aesthetic pleasure by the existence of an object that has a value and a subject for which that value exists. Beauty is the central aesthetic value, to which all the other ones report. By their specifics, the aesthetic values are significantly related to sensitiveness. The aesthetic values can be intuited, felt, experienced, represented and imagined. And then we might ask ourselves: where is the beauty in all the examples that will be further presented?

3. Research on the marketing negative effects on the environment

Mankind has a spectacular rate of development and marketing has the main position in greatly contributing to this development. This one actually "pushes" forward the world economy and the contemporary society, but it is also responsible for many negative effects which are difficult or even impossible to be repaired, attracting more and more criticism this way.

The oversized consumption of resources (e.g., the paper used in much larger quantities than normal, the lights burning all night), the shopping addiction, the excessive consumption of unhealthy foods leading to obesity, cancer, etc. are negative aspects that began to be reported a few years ago. Their influence reflects on individuals, as consumers, their age being in a rapid decline.

We live in a dense environment, with attempts to influence. Much of the population seeks to make the others conform to their demands. The estimates of this type of research suggest that a person can receive up to 400 persuasive marketing calls during an only single day. Managers boosting the productivity, a policeman directing the traffic, a vendor selling something are numerous attempts to influence every day.

In fact, the company is a massive group of people seeking for influencing, persuading, requesting, asking, urging, or manipulating each other. We call it society because it convinces us instead of physically restraining us. We cannot even imagine what it would be like if every attempt to influence would be replaced by coercion: the store owner would hit the customer who would not buy the shirt, the boss would hit the employee to make him work harder, the police officer would beat the driver who would drive by 60 km / h in an area of 50 km / h. After a typical day, everyone would be a physical wreck.

Persuasion, on the other hand, allows the work in a company to be performed without problems - while the physical coercion stops it. The successful conviction is when the physical coercion is useless. As a result, the society benefits from persuasion and those who do not know how to persuade benefit the most from society.

Lately, another negative effect is quickly to install: pollution, which is a consequence of the oversized and unjustified consumption. The forms of pollution are: air pollution, water pollution, soil pollution, radioactive contamination, and noise (sound) pollution, thermal and visual pollution. It is noticed the possibility to group them into three basic categories: chemical, sound and visual.

We shall next refer, in detail, to the final form, the visual pollution, which seems to be the least dangerous. This statement can not be demonstrated though because the „evidence" that show exactly the opposite are very numerous.

We live in a civilization based on image, this phrase becoming an automatism in expression which seems to not send any message any more. The initiator of the concept of society of the spectacle, derived precisely from this media explosion, G. Debord argues, „Where the real world changes into simple images, they become real beings and effective motivations of a hypnotic behavior. The spectacle, as a tendency to make the world, which is no longer directly perceptible, be visible by means of various specialized mediations, finds the sight as the privileged human sense, as once was the touch; the most abstract and the easiest to mystify sense perfectly corresponds to the generalized abstraction of the contemporary society" (Pascu 2002: 97).

In a simplistic and easy to understand manner, the visual pollution can be defined as the damage to the landscape issue, in a manner which can be perceptible to the human visual sense, and with effects on the psyche of the person. In the matter of fact, everything that is around and does not delight us and that has even a negative impact on us and on our psychic as well can be defined as visual pollution. Although the negative effect is much less harmful than the one of the other forms of pollution, by the full accumulation of the specific factors, the issue becomes a drama.

We can state as visual pollution the vandalized buildings left in ruins, the abandoned sites, the large advertising blades placed on the vertical surfaces of the high blocks (damaged by weather and environmental pollution) and on the large stores in cities, the display on the side roads which has lost its validity, but which nobody ever updated, the parking spaces organized for a possible halt or garbage disposal, but which have been destroyed, and even panels that advise to protect the forest, but which have themselves become a pollutant because they are rusted, warped and torn. Examples may continue indefinitely.

And since this phenomenon involves the person's visual sense, we cannot limit to the quality of "images", but also to their quantity, which induces the individual in a state of hypnosis, in which he can no longer discern. Most critics of this category are directed against outdoor advertising, because the print ads in the newspapers are easily ignored by turning the page and the ones in television by changing the channel. As shown, both the "by mail" advertising as well as the billboards and the street display lead a struggle against those who wish to apply legal restrictions against the use of these promotional techniques, which use images par excellence (Russell and Lane 2002: 870).

It must be mentioned that all living organisms (plants, insects, birds, animals, humans) are affected by visual pollution.

In this paper we shall refer primarily to people, but also note that anything that affects other creatures listed above, actually distorts the functioning of the ecosystems and hence of the human. If the bright light prevents insects to move, they can no longer be food for birds, the latter ones receive and transmit their influences in their turn, and the weaknesses chain continues.

Visual pollution on humans is manifested in two forms which have been already recognized:

- *direct*, the effects being psychological and physiological;

- *indirect,* the effects being various, from road accidents caused by distraction, to the economic decline of a community.

The authors, A. Dumitrescu and D. Manolache, define the visual pollution by the presence, in the visual field, of some human-made implants, which are in disharmony with the landscape and which promote excessive, depressed or subversive messages, (www.imst.pub.ro/TCM/Dumi/Visual_Pollution.pdf).

This is strongly felt in the large urban areas where the aggressive outdoor advertising (posters, banners, billboards, pictures, neon etc.) became more than just unbearable. Experts consider that Graffiti, for example, has a strong negative influence, which may cause depression and acts of vandalism.

The **visual pollution sources** are:

- *administrative negligence* – the local public administration loses control over what is built or assembled in public spaces, it does not know what and where is displayed, does not solve the problem of buildings in ruins no matter who the owner is.

Logic, architecture, cleanliness, space harmony must be kept in the urban jungle, but they are all suffering because of the business interests and the obtaining of the profit.

It is well known the skyscraper building type, with 19 floors, ground floor and four underground levels, called the Cathedral Plaza, built near St. Joseph Cathedral in Bucharest by Millennium Development Building.

Other changes in the environment are determined by the location of all kinds of items (terraces, public transport stations, garbage cans, huge panels so powerfully illuminated that they can blind drivers at night, stalls, tents, booths installed for commercial purposes, different network cables, etc..) on the public spaces.

- *excessive advertising* - literally suffocating because not even the green areas (trees, land, parks, etc...) are not spared in the desire to ensure good visibility. The existence of giant billboards, outdoor display in general, which is present from the means of transportation to garbage bins is also suffocating.

A frequent complaint against advertising is that it is simply too much advertising and that is annoying. With the rapid introduction of the new communication technologies, the fragmentation and the interactive nature of the future advertising vehicles will undoubtedly reduce much of this criticism, obviously, when the interactive media will allow consumers to select programs, advertising or info-advertising you want, it is unlikely that advertising will be considered troublesome.

While the economic contribution of advertising is, specifically, the major preoccupation of both companies and consumers, in the recent years its social implications are increasingly analyzed.

Almost everyone, even the fiercest of his critics, agree that advertising plays an important role in informing consumers about the new products, locations, prices and markets. These are the economic functions of the institution of advertising. On the other hand, the social and cultural roles of advertising are much less clear and are increasingly becoming a subject of discussion in some circles.

Many observers point out that advertising is both a **mirror** and also a **shaper** of public opinion, social manners and standards. They state that by the absolute value of exposure, advertising sets a social agenda on what is expected, what is fashionable and what is of good taste for a considerable number of people. This influence is manifested especially on young people, poorly educated and impressed people.

But image is not universal language, even if there is an illusion that it forwards meaning because of its analog capabilities. There is this confusion between perception and interpretation
- *vandalism* – from the Graffiti mentioned above to offensive messages, obscenities, street markings of different groups, all made without the owner's consent of course.

The study of the individual and group territoriality is important in terms of reactions that can be caused by an intrusion into the intimacy of a person or in a group territory. Thus, the proxemical research, discipline that deals with the study of nonverbal communication through fixed distances between individuals reveals the characteristics of each culture regarding this issue. The communicational action in ET Hall's studies shows the trials of individuals, often unconsciously, to give a certain distance of communication (intimate, personal, social and public) (Pascu 2002: 79). The failure to comply, as the studies in this area emphasize studies, determines the feedback from participants in the process of communication, such as: the increasing of the blood pressure and heart rate; confusion; the trying to regain territory or the acceptance of an intruder; the lowering performance; the increased verbal aggressiveness; the diminishing of the sense of cohesion within the group.

According to the survey, we shall refer forward to the reactions resulting from intrusion. We have as types of intrusion the following: *violation of territory* by using the territory without permission and looking at someone when they are not expected to be observed, *invasion of territory* by trying to „grab" the group territory and *land contamination*, namely to leave something undesirable on the territory of a person/group.

4. Results of the authorities involvement in the visual pollution
In front of this wave of attacks on the human security made in the name of progress and marketing, the authorities in some states and cities have passed effective measures. Of a particular importance in this context is the need to develop anticipatory policies and to prevent, mitigate and monitor any adverse impact on the environment in general and in a transboundary context in particular.

In *Norway*, severe restrictions have been imposed in Bergen since 1990.

The great city of *Beijing* is recognized as a pioneer of this struggle. The layout of any street advertising is reviewed by a special commission, which sets out its beneficial or polluting role, the harmonization with the urban area, and the possible distraction of drivers in congested areas with heavy traffic and only after that it is approved.

In the *U.S.A.* we are witnessing a limitation on the size and number of panels according to various criteria, such as the number of houses on a street. In certain areas there are allowed only small panels, the large ones being history. States such as Alaska, Vermont, and Maine have partially or totally banned them and in about 1500 cities, the outdoor advertising is prohibited.

The Czech Republic took a number of measures on the visual pollution caused by the excessive use of neon.

The mayor at *Moscow* has introduced a regulation to reduce the size of the outdoor advertising.

But the most radical response was recorded in *Brazil*, in the largest city, Sao Paulo, whose population has exceeded 11 million. The outdoor advertising is considered illegal here. The metropolitan local council decided it in September 2007, which triggered strong reactions from firm's discontent. For example, lawyers from America `s Clear Channel Outdoor, the largest firm in the world, considers this decision as unconstitutional, saying that it would lead to the destruction of business and, therefore, they sued the government. The „Clean City" Law prohibits advertising on public transport and strictly regulates what can appear on the frontispiece of the shop signs.

The residents have noted that Sao Paulo became a more beautiful and clean city after this demarche. Taking the example of the city which became free in terms of advertising and being

inspired by its success, the authorities in Rio de Janeiro, Porto Alegre and Brasilia discussed similar measures.

The authorities in **Seoul** invest in innovative technologies and construction that respects nature, and they are also supported by the largest research and development institute in Europe, Fraunhofer Institute - Germany. The researchers here are working on developing an environmental project involving a prototype building efficiently built in point of energy, incorporating all the principles of modern technologies of saving the energy and using alternative energy like the sunlight, the wind and the geothermal heat.

The most recent reaction of the authorities in *Seoul*, however, is on the economic crisis and the increasing of oil prices, fueled by the turmoil in the Middle East and North Africa. They announced severe penalties for the „insignificant" lighting starting on 1 March 2011. Thus, many commercial buildings, bridges, houses etc. are obliged to shut down the lights after midnight. Amid the measures taken, the countries, regions and cities mentioned above are increasingly becoming a tourist attraction. In their promotion, there are sold as items of attraction the restrictions mentioned above, which is likely to offset any losses caused.

The localities and the urban population in **Romania** face the same problems and the voices and initiatives in the domain begin to be visible. For example, on 27 March 2010, 37 cities marked the Earth Hour by interrupting the lighting of prominent buildings in the hours 20.30 to 21.30. In 2011, the same action took place on March 26 at the same time slot, with extensive participation of 50 cities, which synchronized with the similar demarche of a great number of people, more than one billion in 5000 cities in 130 countries.

The increasingly used concepts are *the ecological landscape* and *the ecological architecture*.

Formed about 40 years ago, the *ecological architecture* has not yet been clearly defined. Two approaches are highlighted: the "green" (ecological) architecture and the sustainable one. The first one represents the practice of increasing the efficiency with which buildings and adjacent land use and take energy, water and materials, and the reducing of the negative impacts of such buildings on the environment and human health by improving the design, construction, use, maintenance and demolition, and the last one means the conformation of the „green" architecture with the principles of socio-economic and ecological sustainability. In practice, the ecological architecture products are represented by the passive housing, with zero emissions, green, ecological, durable and sustainable.

About *ecological landscape* it can be stated that it represents the dialogue between the buildings and their surrounding area, in compliance with the environmental regulations. In such an organization there cannot be outside display to jam this dialogue. Finally, the public spaces will not be used for private business, and the reducing of pollution will lead to social benefits that will delight many.

Even the problem of plastic waste, which often fly blown over us and which is known that they are not biodegradable has a very simple proposal to be solved, recently coming from a 16 years old student in Canada, Daniel Burda. He discovered the process of decomposition of the plastic bags in less than three months. Some water, very little carbon dioxide and Sphingomonas and Pseudomonas bacteria are needed for this.

The outdoor advertising supports businesses and businesses support the economy of an area. It is known that large amounts are collected by renting the public spaces and the rights of the display.

5. Conclusions

One will not definitely give up this kind of trade - *public spaces for information by means of advertising and money by renting*, due to the earnings. People are aware of the both sides of the phenomenon; the measures can be seen, especially in the local communities. It is a vicious circle, only that the rules will be better written! That is why business will give the both sides a strong impulse to work together.

SOLVING CUSTOMER COMPLAINTS: A STUDY OF MULTIPLE COMMERCIAL SETTINGS

Gurău Călin
Groupe Sup de Co Montpellier Business School, France

Theme: *Many reports stress the importance of solving customer complaints in order to maintain customer satisfaction, but also to learn from mistakes and further improve the customer service. However, relatively few empirical studies have been conducted regarding the effect of complains handling activities on customer satisfaction and on company-customer relationships.*

Objectives of research: *This paper attempts to identify the main elements of the complaints handling strategy that are considered essential for customers, and their effect on customer satisfaction.*

Literature analysis/previous research: *Previous studies define a complaint as a conflict between a consumer and a business organisation in which the fairness of the resolution procedures, the interpersonal communication and behaviour, and the outcome of the complaint resolution process are the principal evaluative criteria used by the customer. In our opinion, a complaint is not necessary a conflict, however, it can create a conflict between a customer and a business organisation, when the answer to the consumer's complaint is not satisfactory. Therefore, the way in which business organisations deal with consumer complaints can significantly influence the consumers' level of satisfaction and loyalty.*

Research methodology: *The empirical analysis of primary data collected through face-to-face interviews with 150 French customers provides a detailed picture of the specific elements of complains handling which are perceived as important in four different settings defined in relation to the perceived importance of the product or service, and the emergency of the experienced problem.*

Results: *The identified elements of the complaint-handling procedure have a variable importance from one element to the other, and in the context of various complaint situations. This finding highlights the fact that, depending on each situation, the factors that will determine customer's satisfaction, and that will shape the final perception of the complaint service, will be different. On the other hand, the study presents and discusses the effect of various dimensions of the complaints handling strategy on the customer satisfaction.*

Implications: *The findings of this study indicate the specific elements that should be improved by companies in order to enhance the quality of the complaint-handling process in various transactional situations.*

Contribution of author/authors: *The present paper compares the importance of the various dimensions already identified by researchers in relation to four different situations defined by the variation of two subjective dimensions: the importance associated by the customer to the product and the emergency level of the product/service failure.*

Keywords: *customers' complaints, customers' satisfaction, multiple commercial settings*

Introduction

Many reports stress the importance of solving customer complaints in order to maintain customer satisfaction, but also to learn from mistakes and further improve the customer service. However, relatively few empirical studies have been conducted regarding the effect of complains handling activities on customer satisfaction and on company-customer relationships. This paper attempts to identify the main elements of the complaints handling strategy that are considered essential for customers, and their effect on the customer satisfaction. The empirical analysis of primary data

collected through face-to-face interviews with 150 French customers provides a detailed picture of the specific elements of complains handling which are perceived as important in four different settings defined in relation to the perceived importance of the product or service, and the emergency of the experienced problem. On the other hand, the study presents and discusses the effect of various dimensions of the complaints handling strategy on customer satisfaction.

The effect of customer complaints

Tax, Brown and Chandrashekaran (1998) define a complaint as a conflict between a consumer and a business organisation in which the fairness of the resolution procedures, the interpersonal communication and behaviour, and the outcome of the complaint resolution process are the principal evaluative criteria used by the customer. In our opinion, a complaint is not necessary a conflict, however, it can create a conflict between a customer and a business organisation, when the answer to the consumer's complaint is not satisfactory. Therefore, the way in which business organisations deal with consumer complaints can significantly influence the consumers' level of satisfaction and loyalty (Blodgett, Hill and Tax 1997; Kelley, Hoffman and Davis 1993; Levesque and McDougall 1996). In the market environment, customers' complaints represents an opportunity for the business organisation to identify problems in its production or service process, to remedy these problems, and, by doing this, to positively influence consumers' perception about the professionalism of the organisation, which may determine an increase of customer satisfaction and customer loyalty (Blodgett, Hill and Tax 1997). From a relationship marketing point of view, consumer complaints are the external and visible manifestation of a crisis in the relationship between company and customer (Tax, Brown and Chandrashekaran 1998). This crisis can be successfully solved, determining the continuation of the relationship, or can deepen further, if the customer is dissatisfied with the way in which his/her complaint is managed by the firm (Dos Santos and Von der Heyde Fernandes 2008; Tax and Brown 1998).

Previous studies have attempted to identify the elements that define the quality of complaint resolution for customers (Gilliland 1993; Goodwin and Ross 1992). Tax, Brown and Chandrashekaran (1998) focused on the concept of justice, as it is perceived by customers in relation to complaint resolution activities. The three main dimensions of justice identified by researchers (Blodgett, Hill and Tax 1997; Smith, Bolton and Wagner 1999; Tax, Brown and Chandrashekaran 1998) are distributive, procedural and interactional justice. Distributive justice can be considered as an expression of the equity theory (Dos Santos and Von der Heyde Fernandes 2008), which involves the allocation of benefits and costs between the parties interacting in a transaction situation. For customer complaints resolution, the focus is rather on the tangible compensations offered by the company to the wronged customer (such as product replacement or refund).Procedural justice involves the procedures used by the company during the complaint handling process, which can be evaluated from the point of view of flexibility, accessibility, process control, decision control, response speed and acceptance of responsibility (Blodgett, Hill and Tax 1997; Tax, Brown and Chandrashekaran 1998). Finally, interactional justice concerns the way in which the company interacts with the wronged customer during the complaint-handling process, in terms of courtesy, honesty, offering explanations, empathy, endeavour and offering apologies (Tax and Brown 1998; Tax, Brown and Chandrashekaran 1998).

The existing studies have investigated the reaction of consumers to various elements of the complaint-handling process, using as basis of analysis specific situations of product or service failures, however, no comparative studies have been realised for various types of products and/or services. However, the complaint behaviour and the requirements of the same customer can vary in relation to the subjective importance associated to various products and/or services, and with the emergency level of the failure. The present paper attempts to address this literature gap, by comparing the importance of the various dimensions already identified by researchers in relation

to four different situations defined by the variation of two subjective dimensions: the importance associated by the customer to the product and the emergency level of the product/service failure. On the other hand, the level of customers' satisfaction regarding the dimensions of the complaint resolution process is also investigated.

Research methodology
To investigate the importance of various elements of the complaint-handling process, and their influence on satisfaction, both secondary and primary data have been collected and analysed. In the first stage of the research process, the existing literature on consumer complaints and on the influence of various elements of the complaints-handling process on customer satisfaction was accessed and investigated. These secondary data offered a clear perspective of the theoretical and practical aspects of this phenomenon, and provided the necessary information for the development of a list of questions for primary data collection. This list of question was tested in a pilot face-to-face interview with 10 consumers, the results being used to improve the order and the wording of questions. The resulting list of questions was used to realise face-to-face interviews with 150 French consumers. The consumers were approached while sitting in one of the cafes of a large commercial centre in Montpellier France, and invited to participate in this study concerning complaint resolution. The interviews lasted between 15 and 30 minutes, the respondents being asked first to consider their behaviour during the complain process, and identify the essential elements of the complaint-handling process. Then, the respondents were asked to remember specific situations in which they addressed complaints about products or services to business organisations, in four different situations.

The situations were selected by the respondents from their own experience since the perception of importance and/or emergency is subjective. Among the situations selected by consumers, the following are exemplifying well the four categories of complaints:

-high importance-high emergency: complaint about a new car, or complaint about medical services;

-low importance-high emergency: complaint about the service in a restaurant, complaint about Internet or mobile phone connection;

-high importance-low emergency: complaint about newly acquired furniture;

-low importance-low emergency: complaint about the quality of a music CD or of a DVD.

Although a large number of respondents have experienced a large variety of complaint situations in the last three months, not all of them were capable to provide answers for all the four situations described above.

Considering each type of complaint situation, the respondents were invited to associate specific levels of importance to the elements of the complaint-handling process identified above, associating a number from 1 to 10 to each element (where 1 indicated very low importance, and 10 very high importance). Each respondent then provided the level of satisfaction associated with each element of the complain-handling situations that he/she experienced recently. The answers were recorded on a separate document for each respondent, the interviewer realising together with the respondent a clarification/standardisation of various elements indicated by the consumer. Then, the answers were codified and introduced into the SPSS for general descriptive analysis. The quantitative results were complemented by the qualitative interpretation of the comments provided by various respondents regarding the complaint situations, their perception and their behaviour towards to business organisation.

Presentation and analysis of findings

The general profile of answers

As indicated above, not all 150 respondents were able to remember a complaint situation for each of the four categories of circumstances defined in the project. The number of answers was also restricted by the time limit considered for analysis - the last three months. Table 1 indicates the number and the percentage of complaint situations discussed by respondents for each of the four categories. 96% of respondents indicated that they had a complaint situation of low importance, low emergency in the last three months. For the other situations, the percentages are less important; however, even the most extreme situation characterised by high importance, high emergency circumstances was experienced by 28% of respondents. The possible explanation of these findings is either that the quantity of the goods and services provided nowadays by companies is less than satisfactory in many cases, or that the respondents are very exigent and complaint-active. Indeed, previous studies have indicated that French customers are more inclined to express their dissatisfaction in comparison with other nationalities (Jasper 2007). Finally, both these explanations can be true and inter-related, the general quality of the goods and services provided determining a behavioural transformation in the general mass of consumers.

Table 1. The number and percentage of complaint situations described by respondents

Situation	Frequency	Percentage
High importance-high emergency	42	28
High importance-low emergency	101	67.3
Low importance-high emergency	123	82
Low importance-low emergency	144	96

The essential elements that define the quality of the complaint-handling process

The essential elements that define the quality of the complaint-handling process do not correspond exactly to the criteria identified by Tax, Brown and Chandrashekaran (1998), and then categorised as distributive, procedural and interactional justice. This classification is rather abstract and although represents a useful bundling of various elements under the same general logic, in reality it does not correspond to the natural perception of the customer, who tends to consider these elements in relation to the logical order of activities in a complaint-handling situation. The respondents have indicated the following elements:

-accessibility: the complaint service should be easily accessible in terms of location, communication channels and availability of personnel;

-reactivity: the attitude of the complain personnel should be reactive rather than passive; as soon as they receive a complaint, the specialised service must adopt an active attitude to guide the dissatisfied customer through all the phases of the complaint resolution process;

-personalisation: the complaint personnel should address every customer as a specific person, with particular needs, wants and feelings, adapting in a flexible way the process of complain resolution to the specific personal circumstances of the plaintiff;

-responsibility: the complaint personnel should accept the responsibility of the company, apologise and provide explanations, and have a responsible behaviour in handling and solving the complaint;

-rapidity: the complaint service should apply professional procedures for a quick resolution of the complaint situation;

-quality: most respondents indicated here the quality of the solution provided to the complaint situation, but some of them have also emphasised the quality and the professionalism required for each stage of the complaint resolution process.

It is interesting to note that in the mind of respondents, the criteria identified and classified by Tax et al. (1998) are not isolated and static, but rather dynamic and interactive, influencing, and being influenced by other elements. The vision provided by the respondents in this study is more synthetic and holistic than the criteria defined by Tax et al. (1998), which provide an interesting insight in the order and structure of subjective perceptions regarding the evaluation of the complaint-handling situation.

The subjective importance of various elements of the complaint-handling process
The average importance of the elements described above varies from one complaint situation to another (see Table 2). The circumstances of each specific situation clearly influence the subjective perception of respondents. In a high importance, high emergency situation all the elements of the complaints-handling process are associated with high levels of importance. The most important elements are reactivity (9.32), rapidity (9.21), and personalisation (9.05). When the complaint situation is characterised by high importance but low emergency, the level of importance associated with accessibility, reactivity and rapidity decrease; however, personalisation, quality and responsibility become more important. The hidden message of respondents is that they are willing to wait more time for complaint resolution, but on the other hand they expect a high quality, customised solution to their problem.

Table 2. The average values of the level of perceived importance

	H.imp.- H.em.	H.imp.- L.em.	L.imp.- H.em.	L.imp.- L.em.
Accessibility	7.85	7.14	7.06	6.36
Reactivity	9.32	6.21	8.55	4.78
Personalisation	9.05	9.08	5.27	2.69
Responsibility	7.23	7.66	5.36	5.72
Rapidity	9.21	6.69	8.48	3.56
Quality	9.17	9.23	5.34	5.29

For the complaints characterised by low importance and high emergency, the reactivity, rapidity and accessibility of the complaints service are significantly important for customers. However, the low importance associated to the product/service which is the subject of the complaint determines lower expectations in relation to quality, responsibility and personalisation. For a low importance, low emergency complaint situation, the average importance of all elements decreases below 7. The customers are expecting a good accessibility and responsibility of the complaint service and a good quality of the solution, but are less exigent regarding the reactivity, rapidity and personalisation.

The presentation of these data using average values does not permit a detailed analysis of the various groups of consumers, based on the level of perceived importance. In fact, 15-20% of the respondents have indicated high importance levels to all the elements of the complaint-handling process, in all the four categories of situations, arguing that the complaint resolution service has to be characterised by overall quality and professionalism in all complaint situations. 25-30% of respondents have provided very similar above average values to all the elements of a situation, introducing some differentiation among various situations. Finally, the rest of respondents provided differentiated levels of importance both among the various elements of the complaint-handling process, as well as from one complaint situation to another. These respondents provided rich comments to explain their perception, and spent more time thinking about the most appropriate answers.

The level of satisfaction associated with the complaint-handling process

The respondents have indicated a variable level of satisfaction in relation to various elements of the complaint-handling process. On the other hand, the perceptions about the level of importance and the emergency of the complaint significantly influence the level of satisfaction indicated by customers. In order to simplify the presentation of data, the score between 8 and 10 was interpreted as high satisfaction, the score between 4 and 7 as a medium level of satisfaction, and between 1 and 3 as a low level of satisfaction.

Table 3. The level of high satisfaction associated by respondents with various elements

	H.imp.- H.em.	H.imp.- L.em.	L.imp.- H.em.	L.imp.- L.em.
Accessibility	57.7	75.3	63.5	77.9
Reactivity	44.8	62.4	75.1	45.8
Personalisation	70.3	51.7	71.9	33.8
Responsibility	71.2	49.6	46.4	29.3
Rapidity	35.7	62.3	66.1	48.9
Quality	42.4	38.5	53.8	42.6

For all elements of the complaint-handling process in a high importance-high emergency situation, the percentages are not very high. Responsibility has the highest percentage of highly satisfied customers (71.2%), but at the other extreme, the respondents indicate that rapidity, quality and reactivity should be significantly improved. In a high importance, low emergency complaint situation, the percentages of highly satisfied customers increase regarding accessibility, reactivity and rapidity, maybe because the expectations of respondents are more moderate. On the other hand, the customers perceive significant problems with quality, responsibility and personalisation. The interpretation in this change of perceptions is the expectation of consumers that the quality the service should be significantly improved in the case in which the company does not have to respond quickly to the complaint. The respondents that provided information about their satisfaction in a low importance, high emergency situation seem to be quite satisfied with the reactivity, personalisation, rapidity and accessibility of the complaint service, but many indicate that responsibility should be improved. For a low importance-low emergency complaint situation the percentage of highly satisfied respondents is quite important in what concerns accessibility, but the scores are lower than 50% regarding the other dimensions of the complaint-resolution process. This situation can be explained by the low level of resources invested by firms in solving this type of complaint situation, which may be determined by the low value of the product/service sold.

Concluding remarks

This study has attempted to investigate the way in which French customers perceive the complaint-handling process in various complaint situations. The complaint handling process was analytically decomposed in a number of elements that are considered important by the respondents. These elements have, however, a variable importance from one element to the other, and in the context of various complaint situations. This finding highlights the fact that, depending on each situation, the factors that will determine customer's satisfaction, and that will shape the final perception of the complaint service, will be different. The respondents have also indicated the level of satisfaction that they associate with every element of the complaint-handling process in four different complaint situations, which can provide important information regarding the dimensions that should be improved during customer-company interaction.

This paper has a number of research limitations determined by the applied methodological approach. The presented findings do not permit a deep understanding of the way in which individual customers perceive the complaint-resolution process managed by companies. The

results are descriptive and synthetic, despite the attempt to define and contrast four different complaint situations. Future studies should attempt to combine the quantitative analysis of data with a more qualitative approach, based on mini case studies, in order to complement the general description of the investigated phenomenon with an understanding of the particular factors and elements that can ultimately influence the decision of the consumer to continue or not the relationship with the company. On the other hand, a similar study should be initiated in the area of B2B marketing.

ANALYSIS OF MARKETING MIX IN METALLUGY (MMM)

Ioana Adrian
University Politehnica of Bucharest
Faculty of Science and Engineering Materials

Abstract: This paper presents an algorithmic analysis of the marketing mix in metallurgy. It also analyzes the main correlations and their optimizing possibilities through an efficient management.Thus, both the effect and the importance of the marketing mix, for components (the four â€œP-sâ€) are analyzed in the materialsâ€™ industry, but their correlations as well, with the goal to optimize the specific management. The analysis of the correlations between the 4 â€œP-sâ€¢ (the four components of the marketing mix) and their management in metallurgy are also very important. The analysis of the main correlation between the 4 marketing mix components in a case of a product from the materialsâ€™ industry highlights the importance of management in order to optimize that product. In order to obtain an optimal marketing mix for a product from the materialsâ€™ industry, the technological optimization management must focus on both functional and constructive betterments. The functional betterments need constructive betterments and constructive betterments generate functional betterments. An important component of the marketing mix for a product in the metallurgical industry is the quality and the cost control activity. The technological optimization in the metallurgical industry is based on functional and constructive betterments. The optimization of the biunivocal correlation between them (need-determination) assures the efficiency of the marketing mix of that product.
Keywords: Marketing Mix, Management, Correlations, Metallurgy
Jel Codes: M

1. Overall view

The four components of the marketing mix (the four "P-s"):
    -Product (P1);
    -Price (P2);
    -Promoting (P3);
    -Placement-Distribution (P4).
and their correlation is very important for an efficient management in materials' industry. The analysis of the correlations between the 4 "P-s" (the four components of the marketing mix) and their management in metallurgy are also very important (Nicolescu 2000, Ioana 2004a).

2. The main correlations between the marketing mix components in metallurgy

In figure no. 1 there are briefly presented the main correlations between the 4 marketing mix components (the 4 "P-s") for a product within the materials' industry.
    Aspects regarding management:
– The biunivocal correlation Product (P1) - Promoting (P2) is based on assuring the quality of the product.
– An important role in optimizing the correlation (1) is held by advertising directly correlated with the product' s quality level.
 – The Product (P1) needs and determines technological development for assuring the quality technical requirements.
 – The biunivocal correlation Product (P1) – and Price (P2) is based on cutting of production costs.

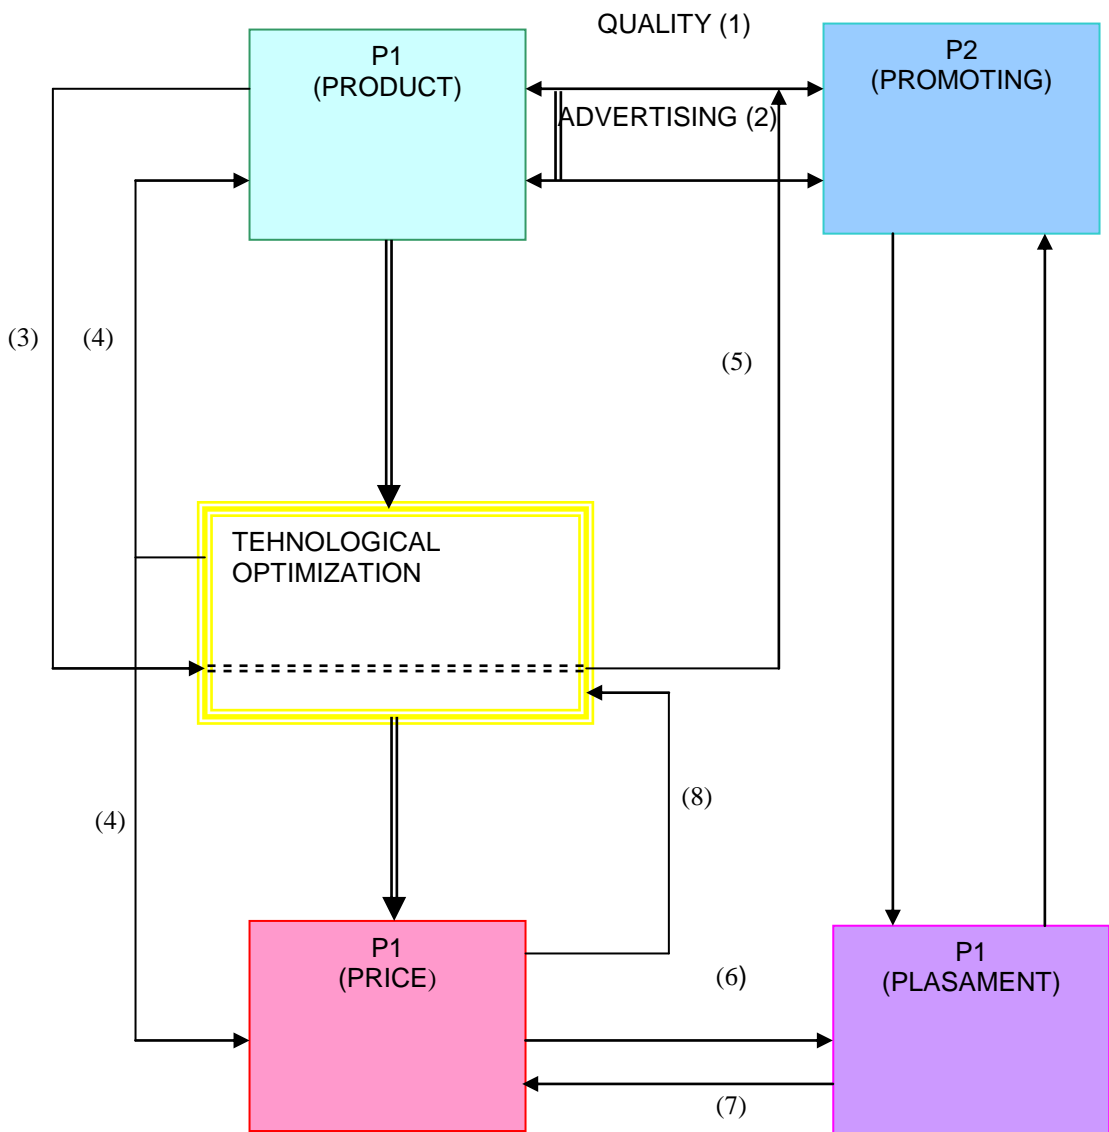
– The level of technological optimization is directly correlated with the product's quality
– A good (low) price of the product assures good placement condition of it.
– A good placement of the product can lead to a good price (optimal in direct correlation with the sales level).


Figure 1. The main correlations between the 4 marketing mix components for a product with the materials' industry

The lower the price (P2) is (witch is facilitated by a high level of technological optimization), the higher the profit (benefit) is, which allows investing it in research-development.

The analysis of the main correlation between the 4 marketing mix components in a case of a product from the materials' industry (presented in figure no.1) highlights the importance of management in order to optimize that product.

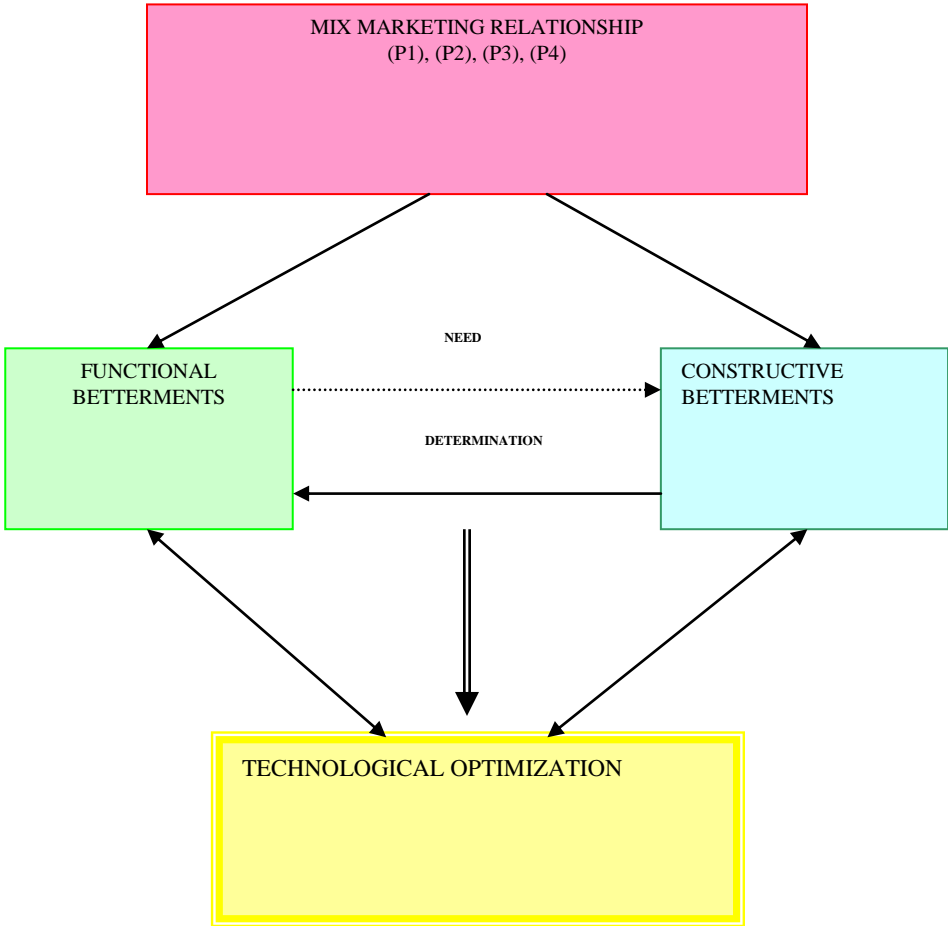
Figure 2 presents the main correlations between the functional and constructive betterments regarding a product from the materials' industry (Ioana 2004b).


Figure 2. The main correlation between the functional and constructive betterments in the technology of a product from the materials' industry, needed in order to assure an optimal marketing mix

It is to be noticed that. In order to obtain an optimal marketing mix for a product from the materials' industry, the technological optimization management must focus on both functional and constructive betterments.

The functional betterments need constructive betterments and constructive betterments generate functional betterments.

An important component of the marketing mix for a product in the metallurgical industry is the quality and the cost control activity (Ioana 1998, Kotler 2003).

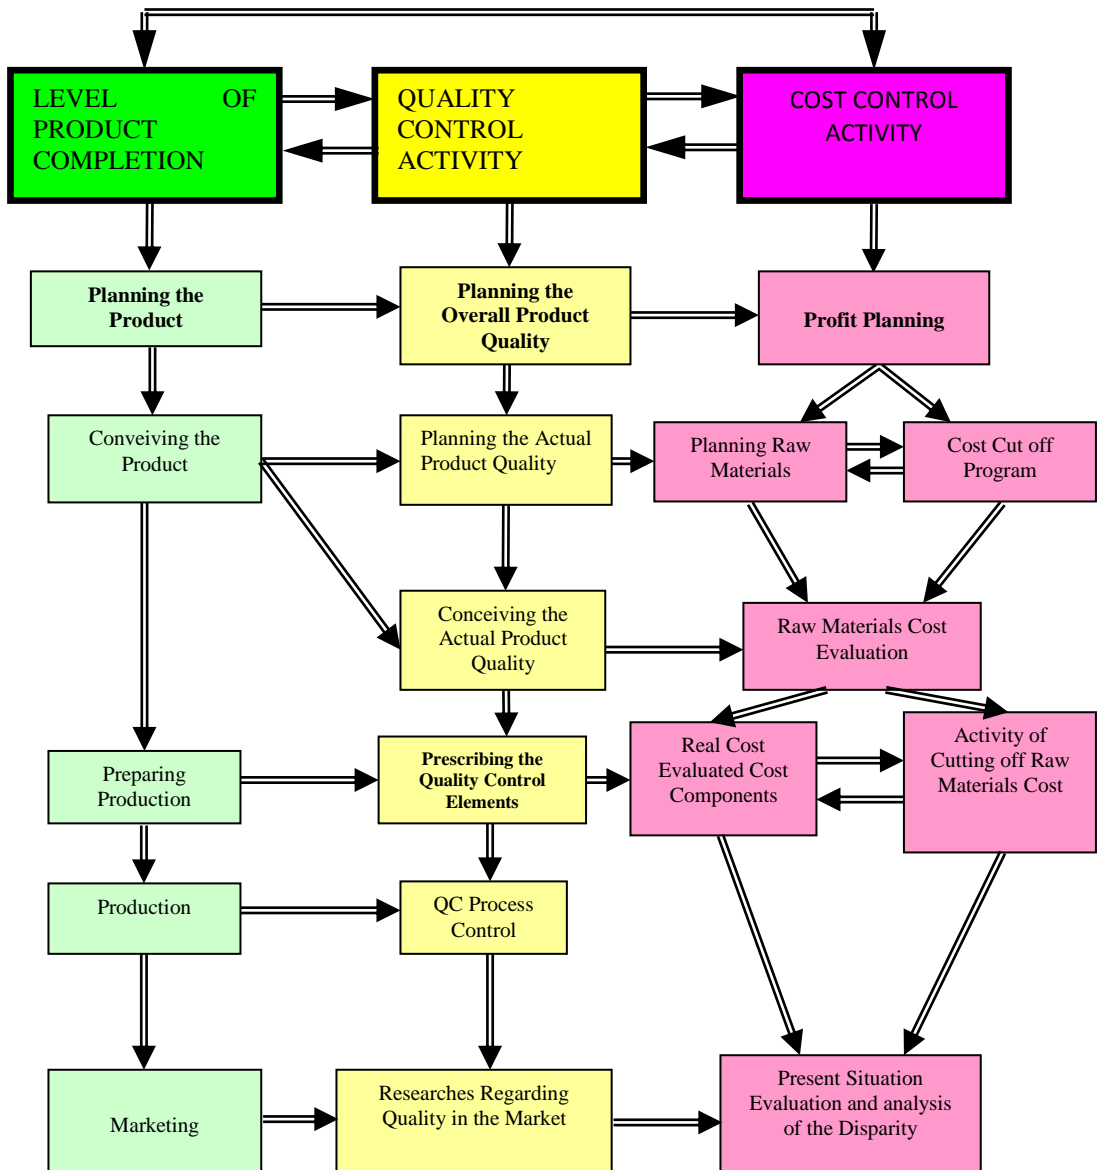
The main steps (and their correlations) of the quality and cost control activity management for product in the metallurgical industry are briefly presented in figure no. 3.


Figure 3. The management of the quality and cost control activities for a product from the metallurgical industry

The level of the product's completion is to be noticed. This based on the following activities: planning the product, conceiving the product, preparing production and marketing (Patriche 1994, Scarlat 2003).

3. Conclusions

The marketing mix analysis for products in the metallurgical industry highlights the importance of the technological optimization in order to obtain an optimum in the field.

The technological optimization in the metallurgical industry is based on functional and constructive betterments. The optimization of the biunivocal correlation between them (need-determination) assures the efficiency of the marketing mix of that product.

Ioanas Maria Elisabeta
Academy of Economic Studies of Bucharest, Faculty of Marketing

Aldea Roxana Elena
Academy of Economic Studies of Bucharest, Faculty of Marketing

In this paper we studied the influence on the Asian products over the consumer decision making. We observed that because of the economic crisis most of the people are buying products made in China, although they now that the quality and the price are lower. The factors that change the habits and the consumer behavior decision making are: the lower wage, the small number of work places and the prices of the products. Regarding the low price of Chinese products quality, some times arouses suspicions. Romania is a parts of the European Union and on the market there are various products made in European countries but also products made in China. People with low wages from the last step of social classes are prone to buy lower prices products. Other consumers on the contrary became more sensitive and they prefer to pay more than to buy products made in China. The quality prevails over the price and sometimes over the quantity although the money to spend are dwindled.

The crisis affected consumer behavior, consumers have become more attentive to the country of origin and the disposable income for shopping. In order to validate some of the ideas the authors undertook a quantitative online research. The research had as purpose to identify the main influences of the decision making when the consumer buys Chinese products. The chosen investigation was the selective survey, the research technique was the exploratory interrogation and the research instrument – structured in online questionnaire. After research we found that the economic crisis caused consumer behavior change as a result of diminishing the income buyers, the consumer is placed in a position to buy products of questionable quality at low prices, mostly from China. Lower purchase price often makes Chinese goods represent an attractive option for consumers. On the other hand, the quality of Chinese products has proven to not comply with the quality expectations of the consumers, based on the use of products manufactured in other countries. Romanian consumer has been shifted his chooses because of the very low income and at the same time the culture purchasing pattern. For this reason, this research focuses on the changing buying behaviour in the period of economic crisis.

1. Introduction

United States economic crisis began in the summer of 2007, no one ever dreamed that could affect the worlds economy. A year later, the economic crisis affected dramatically the developed countries, including countries in Europe, and possible candidates to the European Union. The Global Financial Crisis has brought also new challenges to European integration and the EU institutional architecture.

The EU integration project, which has been progressing successfully for more than half a century, is now facing what is likely to be the most serious sustainability test in its history. In particular, this relates to such crucial components as the Single European Market and the Economic and Monetary Union (EMU). The roots of the tensions that have appeared since the late summer of

2008 can be attributed to the incomplete nature of the EU project and its various asymmetries (Dabrowski, 2010).

The economic integration through European countries was much faster than political integration. The economic level in the countries from EU was different. For example Romania because is an emerging country, had loans from IMF for developing different economic sectors.

With European integration, Romanian consumers had the possibility to choose from a wide range of products made in Europe. The broad range of products coming from EU changed to some extent the consumer motivations to buy. On the other hand the economic crisis had a negative impact over the consumer behavior.

The consumer had a dilemma: the reduced income was due to the economic crisis and had changed his behavior and motivations of buying. In some cases consumers had preferred quality rather than quantity purchased, the price, was a decisive factor in purchasing decisions. He become more aware of the financial crisis and become more money minded. The consumption basket was also affected, the consumer could not spent money on premium products, although some consumers could afford. Most consumers bought only their necessities, switching to cheaper brands and had a more rational view on promotions. They started to compare different products and select based on price compromising quality (Nistorescu and Puiu, 2009).

In recent years, Chinese products are found increasingly more on European markets. European Union was the perfect marketplace for Chinese products, and encouraged European economic crisis thus purchasing cheaper products and lower quality. Although European markets were flooded with Chinese products, including the Romanian market, some consumers remained loyal to products from countries such as Germany, Spain, Italy, Norway etc.

Before describing the influence of the Chinese products on the market there will be a short analysis of the economic crisis in the Europe and Romania (section 2), followed by section three with the consumer behavior with the motivation of buying of the Chinese products and their opinion about the quality and the price. Section four focuses on the analyses of the research and discussions about the conclusion that we reached including a short overview about the Chinese products in Romanian market. The paper has three perspectives: the Romanian consumer profiling on the basis economic crisis, the influence of the Chinese products and the social factors.

2. Economic crisis

The crisis caused disturbances to powerful European and Asian economies putting them on the brick of deep recession. Other weaknesses in the global financial systems have surfaces. The crisis caused inflation and fluctuations in the prices of commodities, and hence, consumers started to take a shifted action towards their needs and wants. The social impact of the financial crisis can be seen more obvious in the developing countries where the poor are being severely hurt during the crisis as demand for their labor falls, prices of essential commodities rise substantially and social services are cut. The consumers cannot prevent the fall in total expenditure; they tend to adjust the basket of goods purchased. People may start buying less quantities, or switch to larger size items to avoid repeated purchases. They also started to switch brands, and focus on price rather than quality and they also have started to intensify the search on the web looking for valuable bargains (Durra Mansoor, 2011).

The buying behavior is considered a very complex phenomenon because it consists of a wide set of prior and after purchase activities (Hansen, 2004, p. 9). The buying process has five stages: recognizing the problem or need, searching for information, evaluating the alternatives, the purchase and the final stage, reevaluating the choice made.

There are four distinctive classes of consumer buying behavior identified by the literature. What differentiate these classes can be observed thorough the frequency of occurrence, emotional involvement, decision making complexity and risk. These types are known to be: programmed

behavior; limited decision making buying behavior; extensive decision making buying behavior and impulsive buying (Arnould, 2002, p. 172).

Programmed behavior (also called habitual behavior) is distinguished by low complexity and little information search, this process is usually known as routine purchase of low cost items that consumer is used to buy out of habit: such as coffee, newspapers, bus tickets, etc. (Learn marketing, 2008). Limited decision-making buying behavior involves reasonable level of decision making and relatively low amount of information search in order to generate a purchase (Mansoor, 2011).

The extensive decision-making buying behavior is identified as being the opposing type to the limit decision-making buying behavior (Foxall and Goldsmith, 1994, p. 165). In this process the consumer would spend a relatively longer share of time in information search and would take longer period to make a decision regarding this purchase because this process is usually adopted when purchasing infrequent expensive product that takes a large share of the consumer's income and involves higher psychological risk (Peter and Olson, 2007, p. 89).The consumers pay more attention with their budget to spent, so they reduced the quantity of the products or changed the brands that they used to buy into cheaper ones, most of the times searching for the best price and bargains. These is a shift from expensive to inexpensive substitute, a shift from luxury to essential, a shift from huge quantities to small quantities and a shift from consumption to saving (Mansoor, D. and Jalal, A, 2011).

Alignment with the consumer needs in different countries, allocating product or service correctly is a challenge for the company. Consumers can choose products not just because they can bring the greatest satisfaction at the lowest price, but also to express personality, social status or group affiliation of consumer needs, choices and the consumer preferences for a particular product are generally affected by significant social cultural influences.

3. Consumer behavior

This paper's main objective is to analyze the influence of the Chinese products on the European markets, especially on the Romanian market, with special attention given on factors that influences consumer behavior. Before the European integration, Romania was a market with a great potential for the European products. Being a part of EU countries was a challenge because economical speaking the country was having an intense economical growth, but after a year the European countries faced the financial crisis on the global scale. So indirectly Romania was affected too.

Meanwhile in the Asian countries the global crisis was perceived on a smaller scale. China was developing to the fullest and was exporting a wide range of products. Republic of China is the largest country in East Asia and the most populated in the world. State is a booming economic and social. This has made Chinese consumers faced a new challenge, he must choose between maintaining traditional buying habits or total rethinking buying habits to effectively absorb the supply of foreign products in China.

Alignment with the consumer needs in different countries, allocating product or service correctly is a challenge for the companies. Consumers can chose products not just because they can bring the greatest satisfaction at the lowest price, but also to express personality, social status or group affiliation of consumer needs, choices and the consumer preferences for a particular product are generally affected by significant social cultural influences (Kiefer Lee, 2009). Monroe and Guiltiman (1975) reckoned that consumers select a store first and then determine the product to be purchased within the store. In addition, they also considered that store choice is affected by the attitude towards store which, in turn, is influenced by the store's image. However recent studies made have seldom considered brand/store choice for a product that the purchaser buys for some to consume or use. (Yau, Chan si Lau, 1999).

In terms of empirical, emotional state is a decisive factor determining consumer purchasing decisions. The products that most of the time have a low monetary value at very low level of excitation of the senses, may induce to the consumer a habit behavior. As the product is more expensive to both emotional level and monetary resources, the enjoyment will be higher. Purchase satisfaction, but previous acquisition and utility product directly influence consumer behavior. Chinese products are charged according to their utility (kitchen utensils, items of clothing, appliances and electronic items - laptops, iPads, mobile phones, tablets, e-readers) as having lower prices than products coming from the U.S. or Western Europe.

The financial crisis has increased the sensitivity of both buyer price and quality but unlike the previous crisis period, the origin place of the product is part of the top 10 reasons when the consumer plans to buy it. Lately the origin of the products is a crucial factor in purchasing decisions of consumers. They attribute the home to the product. Products manufactured in China can be seen in almost every category of goods, in world markets and the Romanian market could not be excluded. (Masoud Karami, Shahrzad Pourian, Omid Olfati, 2012).

In the sphere of marketing, reputation of products from certain countries has resulted in the concept "country of origin effect". The country of origin can be defined as any influence on the country of production, assembly, or the country where the product has been designed on consumer perception and behavior. A company competing in global markets produce goods worldwide, when the consumer becomes aware of the place of production, it is possible that this element to influence brand image (Ph. Cateora., 2006).

The country of origin means the influence of all factors associated with a country that plays a role and the assessment process products from that country. Lampert and Jaffe (1998) defined the home as "the impact that generalizations and perceptions about a country have on how an individual evaluates the products and brands." Country of origin is used rather as a strong indication in terms of quality brand than a precise definition of it. (Jean-Claude Usunier, Julie Ann Lee, 2005).China is the largest importer to the United States, with Chinese imports equaling $321,443 billion in 2007, an increase of 11,7 % over 2006. China alone accounted for 16.5 % of U.S. total imports in 2007. Other major importers to the United States include Canada, Mexico, Japan and Germany. Significantly, none of these countries has experienced major recalls or safety issues rivaling the magnitude of Chinese goods. (Berman and Swani, 2010). A disproportionately high number recalled goods have been produced in China.

4. Methodology

In order to validate some of the ideas mentioned above, we applied an online questionnaire to various types of people. The scope was to obtain information about the Asian products and their quality and prices and the Romanian consumer. The quantitative part of the research identifies the reasons that economic status of the country pushes the consumer to buy. The four objectives of the research had focused on the factors that influence the buying decision, the products country of origin, income and group that influences the buying decision.

The population of this study was formed of male and female shoppers that had 18 and above, from Bucharest Romania. The study was applied online and the majority were university graduates. 42 % of respondents go shopping twice a week. There were only 112 questionnaires with a response rate 77%. However 26 questionnaires were incomplete, resulting only 86 completed. 74% of the respondents had between 20 and 40 years old, and 60% were females, and 40% were males. Usually, when buying people are influenced by family state of mind, attitudes towards products and recommendations of the friends or previous usage.

Research goal is to determine Romanian consumer attitudes towards products imported from China.

Research hypotheses

H1. Romanians believe the consumer products imported from China have questionable quality.

81% of respondents believe that the likelihood that products imported from China have questionable quality is high or very high.

H2. Romanian consumers associate low price with low quality. For over three quarters of respondents, the low price is a factor that arouses suspicions regarding the quality or inducing the idea that the product is inferior.

H3. Romanian consumers are willing to pay a higher price to buy a product from another country if they had a higher shopping budget. 46% of respondents said they are willing to pay a higher price to buy a product imported from another country than China, while for 40% of them is not important country of origin of the product.

H4. People believe that great brands image was not affected by outsourcing production to China. 67% of respondents feel great brand image was not affected by outsourcing production to Chinese market, either because they are not aware of this outsourcing, either because they have noticed changes in terms of product quality.

5. Results and Implications

The paper makes two important contributions to the existing literature: the first one is an empirical research, of the Romanian consumer that chooses Chinese products, and the second the paper extends the knowledge of a short Romanian consumer profiling that most of the times buys Chinese products because are cheaper.

During research it was observed that Chinese products on the Romanian market influences the consumer buying through the price, quality and the way is used. Depending on the type of product (clothing items, food, toys) and their frequency of purchasing, is higher in the household, unlike electronic products that have a frequency purchase lower (mobile phones, notebooks, tablets, e-readers).

They show that although the quality is low the Romanian consumer is unable to buy items with a higher quality or price so he prefers the Chinese products. But there the consumers with low to medium income prefer to make an effort and buy products with a higher quality or prefer to wait for bargains and promotions.

At the question ‚Have you ever bought Chines products?', 35% of respondents didn´t buy such products, because they think they have a low quality, 11% because it would affect their image and 25% are afraid of some allergies that could be caused by counterfeit products. On the other hand, purchasing these products was made because of low income in most cases. 16% prefer to buy Chinese products because they are cheaper than the original products made in other countries, and 8% because they have a low budget. Only 5% of respondents said they had not noticed any difference in terms of quality between the two types of products. International brands have always been an inspiration to production in China. The luxury products concerned are generally food, drinks, clothes, perfumes and mobile phones. 37% of the respondents said they rarely or very rarely check the country of origin on product labels. 31% check it sometimes, and the remaining 32% check the labels frequently or very frequently. "Have you ever changed his mind about buying a product that has drawn just because it was produced in China?'', 38% of respondents admit that they changed their mind about buying a product after they learned that it was produced in China. For 62%, the country of origin is not disturbed and not a hindrance in buying the product.

China is the largest importer to the United States, with Chinese imports equaling $321,443 billion in 2007, an increase of 11,7 % over 2006. China alone accounted for 16.5 % of U.S. total imports in 2007. Other major importers to the United States including Canada, Mexico, Japan and Germany. Significantly, none of these countries has experienced major recalls or safety issues rivaling the magnitude of Chinese goods. (Berman and Swani, 2010).

6. Discussion and conclusion

This paper is focused on analyzing the factors that influence the consumer behavior during the crisis and chose that they made about Chinese products. Consumer behavior can vary depending on a number of factors, such as income, demographics, social and culture factors.

International economic crisis that was installed in Romania in recent years has reduced the number of jobs and income. For this reason, consumers have begun to turn to cheaper products, such as those imported from China. Noticing this trend, retailers have entered the Romanian market more and more products like this,having held such an invasion of Chinese products. Today, consumer goods from China dominate many markets. Lower purchase price often makes Chinese goods represent an attractive option for consumers. On the other hand, the quality of Chinese products has proven to not comply with the quality expectations of the consumers, based on the use of products manufactured in other countries. Thus, compared to products manufactured in other countries, the Chinese are perceived as having low quality and a lower value.

Because the study was conducted on a homogeneous sample that may not be representative and the results generalized to a larger scale would be difficult. It is therefore necessary to perform other more complex studies about consumer perception about luxury products from China or the changing trends in the consumer buying behavior in global economic crisis.b

D.P.M. METHOD - A PERFORMANCE ANALYSIS INSTRUMENT OF A STRATEGIC BUSINESS UNIT

Ionescu Florin Tudor
Bucharest Academy of Economic Studies
Marketing Faculty

Considering the uncertain economic conditions, the market dynamics, the fundamental changes in the attitudes and aspirations of the consumers along with the strong growth of the political role and interventions in the economy, currently characterizing both Romania and other countries of the world, it can be said that the need for strategic planning was never so acute as now. The strategic planning process is an ongoing organizational activity by which managers can make decisions about their present and future position. A number of analytical portfolio tools exist to aid managers in the formulation of the strategy. The use of these tools within the broader context of the overall strategic planning process allows managers to determine the obstacles and opportunities existing in the company's environment and to define and pursue appropriate strategies for growth and profitability. The present paper aims to highlight from a theoretical standpoint the D.P.M. method, its strategic consequences, advantages and disadvantages.
After conducting this analysis I have found that restricting the business portfolio analysis to the D.P.M. matrix is not a very wise decision. The D.P.M. matrix among with other marketing tools of business portfolio analysis have some advantages and disadvantages and is trying to provide, at a time, a specific diagnosis of a company's business portfolio. Therefore, the recommendation for the Romanian managers consists in a combined use of a wide range of tools and techniques for business portfolio analysis. This leads to a better understanding of the whole mix of product markets, included in portfolio analysis, the strategic position held by each business within a market, the performance potential of business portfolio and the financial aspects related to the resource allocation process for the businesses within the portfolio. It should also be noted that the tools and techniques specific to business portfolio analysis do not give accurate answers, despite the appearances created by the analysis stage, where the businesses are plotted rigorously. However, their main virtue is simplicity, as these highlight the managers' need for further investigations.
Keywords: matrix, strategic business unit, portfolio, profitability, competitive position, strategic directions
JEL classification: M31

Introduction

At the beginning of strategic business planning, almost all companies put emphasis on diversification. Over time, due to changes in the marketing environment, generated by the tightening competition, technological, social and political pressures and not only, it became obvious that a company can no longer solve the problems brought by these changes, simply by action of diversification of the business portfolio, leading to the company's business portfolio to grow quantitatively. As a result of this approach in the '70s the companies' attention switched from the actions of diversification to the optimization of the entire businesses portfolio.

Over time, a series of methods have been created with a view to support the strategy assessment and the selection process of the strategic business units within a business portfolio. Of these, the methods corresponding to business portfolio analysis stands out.

Although the concept of strategic planning has been strongly debated in the literature abroad and has been applied both in private and public sectors in highly developed economies, in Romania there have not been conducted marketing research on using this marketing tool (Barbu 2011: 87).

Business portfolio analysis is an analytical approach, whereby a company manager can view the company as a sum of strategic business units that must be managed in a profitable manner. The business portfolio analysis must become routine activity undertaken by the company, through its carrying out on a regular basis, so that decisions of earmarking of financial resources may be monitored, updated and modified with a view to accomplishing corporate objectives, correlated to the process of generation thereof carried out in an efficient way by each product (Armstrong and Brodie 1994: 2).

The D.P.M. method
Within the list of significant contributions to the business portfolio analysis domain, must be disclosed the one made by S.J. Robinson, R.E. Hichens and D.P. Wade. These management consultants developed in 1975, for the Shell International Chemicals, a method in order to analyze the competitive position within the market of the company's divisions. First, it was built to be used only in the petrochemical industry. Later was modified and reconfigured in order to be used in a large number of industries (Robinson and Hichens and Wade 1978: 8).
Figure 1.- **D.P.M. Method**

Source: Hussey, David (1999), *Strategy and Planning – A Manager's Guide*, John Wiley and Sons Ltd, pag. 153.

Regarding its structure, the D.P.M. method has two main axes and consists of 9 squares, being a 3x3 type matrix. This matrix is illustrated in Fig. 1. The horizontal axis measures the profitability of the economic sector (industry attractiveness) and the vertical axis measures the competitive position of the company (Thompson and Martin 2005: 427).

Thus the method examines if the market opportunities worth to be considered or not and also measures the success degree of the company in those markets (Hussey 1999: 150).

The D.P.M matrix uses a scoring method based on two indicators, which reaches a maximum of 12 points. However, other companies have adapted the scoring method, according to their needs. The scoring system used by the present matrix manages well enough to differentiate the strategic business units within an enterprise (Hussey 1999: 150).

Looking at Figure 1, it can be seen the presence of some fictive strategic business units, represented as circles of different sizes. The size of the circles represents the size of the market within the strategic business units activate and the shaded portions inside the circles represent the market share held by the strategic business units. Also, the managers must not overlook the fact that the lines of the nine quadrants can be considered flexible. This should be considered when one or more strategic business units are located very close to the edges of the nine quadrants. In practice, this should not raise problems to managers, since the matrix does not claim to be

considered a method that provides specific answers but rather a way for managers to shape a strategic perspective and to take strategic decisions.

The two indicators of the Ox and Oy axes are taking into consideration a complex set of factors. Thus, the Ox axis is based on three factors, which are: market growth rate, quality and market profitability and market supply (Hussey 1978: 2).

Regarding the market growth rate, it must be said that this is an important factor in determining the market forecasts. Also it is relevant during the decision making process regarding the investment decisions for the enterprise. Therefore, for an enterprise is more appropriate to make investments in growing markets than markets experiencing slower growth.

The second factor, of the Ox axis considered for analysis is the quality and the profitability of the market. Thus, for the analysis of this factor is recommended to give answer to the following questions: What levels of economic profitability of the industry occurred in the past?; There are many consumers and few producers or there are many producers and few consumers?; There are alternative products on the market and which is the risk for the enterprise? ; How restrictive is the technology?; There are in the market place enterprises offering post-sale products or services that complement the sales of another enterprise?

The answers to these questions will vary from company to company, depending on the particularities of their businesses. However, some of them might not be important for some companies, because there are other vital factors in the market to be included in the analysis.

The last factor to be analyzed is the supply ability owned by the suppliers within the market place, correlated with the market growth. This is not only a capacity analysis, but also an analysis of the availability of components and raw materials.

The Oy axis is based on the following factors: the position held within the market place, the production capacity and product research and development (Hussey 1978: 2).

The factor "market position" is somehow related with the market share indicator. Using this indicator the managers are trying to assess the position held by the company within the market place, in terms of its ability to lead in prices. Basically, the market position can be classified as follows: leadership, major producer, viable producer, minor manufacturer, insignificant producer (Hussey 1999: 152).

The second factor of the Oy axis refers to the company's ability to sustain their own resources, necessary in the production process and not depending on raw material suppliers. The last factor of the Oy axis covers the enterprises capability to sustain the research and product development, the distribution, the after sales service and other necessary items.

After completing the analysis of all influencing factors specific to the Ox and Oy axes, the managers can move to the next step which establishes the position held by the strategic business units, within the D.P.M. matrix. Following the graphical representation within the D.P.M. matrix, the managers start to identify the strategic options for each strategic business unit, included in the company's business portfolio. This last stage of the company's business portfolio analysis is discussed in detail in the following section which presents the implications of strategic nature.

Strategic implications of the D.P.M. method

After the process of establishing the position of the strategic business units within the D.P.M. matrix, the next step regards the identification and selection of strategic directions.

In figure 2 there are presented the strategic choices specific to each of the nine quadrants of the D.P.M. matrix.

The eight categories identified, were based on some combination of the company's strengths and the prospects offered by the respective economic domain and are ranked according to degree of importance as follows:

Leader – the strategic business units, which fall in this quadrant, are characterized by the lowest unit costs, the largest market share and the strongest competitive position. Thus, the

recommended strategy is to maintain this position. It should be noted that, initially, these types of units may need an infusion of cash from other sources of income, in order to develop. However, managers should give them high priority;

COMPETITIVE CAPABILITY	Weak	**Disinvest**	**Phased Withdrawal**	**Double or Quit**
	Medium	**Phased Withdrawal**	**Custodial**	**Try harder**
	Strong	**Cash generator**	**Growth**	**Leader**
		Unattractive	Medium	Attractive
	PROSPECTS FOR SECTOR PROFITABILITY			

Figure 2 - D.P.M. strategies

Source: Drummond, Graeme and Ensor, John (2001), *Strategic Marketing – Planning and Control*, 2nd Edition, Butterworth Heinemann, Oxford, p. 102

Try harder – this quadrant corresponds to strategic business units, which have the potential to improve their position held within the market place, but this can only be achieved through judicious allocation of resources. As such, the company should strive to push the product in the position of "leader";

Double or Quit - this quadrant includes those strategic business units that have the potential to become the flagship of the company. As such, managers should carefully assess the market attractiveness, and then select those strategic business units, to be abandoned and those units to be supported and developed. Thus, the strategy required in this situation is to abandon their development;

Growth – the strategic business units that lie in this position are characterized by high production capacity and also high capacity for research and product development. Most times, these kind of strategic business units generate sufficient financial resources which are necessary to their development and self-financing. As such, the strategy recommended in this case is to enable the strategic business units to develop in the same rhythm with the market;

Custodial – the strategic business units within this quadrant activate on markets in which there are some strong competitors. The strategy that should be applied in this case is to maintain their position, but not to allocate additional financial resources;

Cash generator - in this quadrant lays the strategic business units with a slow growth and an unattractive economic context. Also, these strategic business units are approaching the last stage of their life cycle and there will be replaced by new ones. As such, they should not receive additional financial resources for expansion, although normally they would have to hold capital to maintain its current position within the market. However, as long as they are profitable, they should be used as a source of financial resources for other businesses within the company's portfolio. So, the recommended strategy for this situation is to maximize profits and cash flow;

Phased withdrawal – the strategic business units within this quadrant are characterized by a small market share held within a market in stagnation or decline phase. Because they are not able to generate reasonable cash flow they should be "milked". Further, the financial resources collected must be invested in other businesses which are more profitable. So the strategy

indicated in this situation is phased withdrawal, correlated with the evaluation of the strategic business unit's assets, in order to redirect the available resources to other business;

Disinvest – the companies holding strategic business units within this category must immediately withdraw them from the market because they represent real financial traps. More specifically, they consume resources allocated by the company without generating measurable results. The strategy recommended in this situation is undoubtedly to reduce investment to that business in order to be eliminated from the company's portfolio.

If the portfolio is composed predominantly of mature strategic business units which are generating financial resources, the company must identify new business opportunities.

In an opposite situation, if the company has strategic business units that need cash infusions, it must find a balance between this kind of units and the cash generators units (Robinson and Hichens and Wade 1978: 15).

Advantages and disadvantages of the D.P.M. method

The D.P.M. matrix can raise some problems to managers arising from their inability to assess the competitor's moves. In other words, the accurate information about competitors is of major importance in order to determine the position occupied by the company's strategic business units within the D.P.M. matrix.

Also, the managers must define the economic domain and the market of the strategic business units in which they operate. The accuracy with which managers conduct this process may affect the place of the company within the market place and the strategies that it adopts. The measurement of influence factors, individually, adds more accuracy to the evaluation process of various aspects specific to the internal and external environment of the company (Robinson and Hichens and Wade 1978: 15).

However, it should be remembered that the measurement of influence factors is largely based on subjective assessments of managers (Drummond and Ensor 2001: 101). Also, this process depends on the access degree of managers to information and on a variety of factors, which may be mentioned: the limits of the budget, the short-term objectives and the internal policies of the company.

Given the disadvantages mentioned above, I must consider a number of strengths offered by the D.P.M. method.

As I mentioned earlier, the present method was developed in order to be used within the petrochemical industry. Thus, the adoption of this method by companies operating in completely different industries, involves the change of all evaluation factors and their measurement system. Even so, the method shows a high level of flexibility because it can be adapted to reflect the priorities and specific characteristics of any type of enterprise (Newton 1981: 52).

The D.P.M. method is an analytical financial instrument and therefore is not dependent on the boundaries of the company's financial reporting procedures.

The results of the analysis can be easily interpreted and the manager can also identify a number of meanings. Even if the conclusions are general, without going into detail, they can be used to indicate the positive and the negative directions. Thus, the D.P.M. method gives managers the opportunity to make a diagnostic analysis, both of the company and of the products.

In addition this method allows the managers to consider a variety of factors during the evaluation process of the profitability prospects of the economic sector (industry attractiveness) and of the competitive ability of the company. In other words, The D.P.M. method provides a starting point within the strategic decision making process and facilitates communication with other people, which represent decision makers within the enterprise, by reducing the large amount of information that managers are facing day by day.

Given the advantages and disadvantages of the D.P.M. method, in conclusion I can say that this is a challenge for managers because it urges them to focus on strategic thinking by which they can measure the potential of the strategic business units, in order to correctly allocate resources.

Conclusions

Finally based on the theoretical analysis I consider appropriate to insert some comments in the form of recommendation that managers can consider in the future. Thus, according to the information mentioned above, it must be highlighted that limiting the portfolio analysis to the D.P.M. method is not a very wise decision.

The tools of business portfolio analysis facilitate discussion and shape the competitive position of a company, generating at the same time questions related to the contribution of the current allocation of resources to the success and long-term vitality. However, besides the fact that these tools help managers to control the allocation of resources and to suggest realistic goals for each strategic business unit, they also offer the possibility of using strategic units, as vital resources within the process of fulfilling the objectives established at corporate level.

Therefore, the recommendation for the managers consists in a combined use of a wide range of tools for business portfolio analysis. This affirmation is strengthened by the results of a study undertaken in 2001, that highlights the fact that companies that rely only on financial instruments fail to build strong business portfolios and the companies that combine the financial instruments with the marketing and management methods obtain in the end much more competitive product portfolios in the markets (Cooper 2001).

In conclusion, I recommend the combination of the financial and strategic instruments because the top managers will better understand the whole mix of strategic business units, the strategic position held by every strategic business unit within a marketplace, the performance potential of the whole strategic business units portfolio and the financial aspects of the resource allocation process for the strategic business units of the company. It should also be noted that the tools specific to business portfolio analysis do not give accurate answers, despite the appearances created by the analysis stage, where the strategic business units are plotted rigorously. However, their main virtue is simplicity, as these highlight the managers' need for further investigations.

DEVELOPING AND PROPOSING A CONCEPTUAL MODEL OF THE FLOW EXPERIENCE DURING ONLINE INFORMATION SEARCH

Lazoc Alina
Dimitrie Cantemir Christian University, Faculty of Management in Tourism and Commerce Timisoara

Information search is an essential part of the consumer`s decision making process. The online medium offers new opportunities and challenges for information search activities (in and outside the marketing context). We are interested in the way human information experiences and behaviors are affected by this.

Very often online games and social web activities are perceived as challenging, engaging and enjoyable, while online information search is far below this evaluation. Our research proposal implies that using the online medium for information search may provoke enjoyable experiences through the flow state, which may in turn positively influence an individual`s exploratory information behavior and encourage his/her pro-active market behavior.

The present study sets out to improve the understanding of the online medium`s impact on human`s exploratory behavior. We hypothesize that the inclusion of the online flow experience in our research model will better explain exploratory information search behaviors. A 11-component conceptual framework is proposed to explain the manifestations of flow, its personal and technological determinants and its behavioral consequence in the context of online information search.

Our research has the primary purpose to present an integrated online flow model. Its secondary objective is to stimulate extended research in the area of informational behaviors in the digital age.

The paper is organized in three sections. In the first section we briefly report the analysis results of the most relevant online flow theory literature and, drawing on it, we are trying to identify variables and relationships among these. In the second part we propose a research model and use prior flow models to specify a range of testable hypothesis. Drawing on the conceptual model developed, the last section of our study presents the final conclusions and proposes further steps in evaluating the model`s validity. Future research directions include improving the model and hypotheses testing.

Keywords: flow experience of online search, structural and conceptual modeling, behavioral outcome
JEL classification: M30, M31, M39, D83, L86

1. Introduction

Flow helps anticipating users` behaviors in an indirect way. It supports prediction of some mental states that further influence behavioral patterns. We consider that expanding the body of work on online flow in the information search area may improve marketers understanding of informational behaviors in the digital age and provide inspiration for more efficient communication strategies. Investigating factors that facilitate flow experience in online information search is of both theoretical importance and practical relevance. An in-depth understanding of how consumers experience information gathering online is critical to marketing programs.

Our study sets out to create a better understanding of the factors affecting entering and maintaining a flow experience during online search. We posit that flow is important to the study of informational behaviors in the digital age because it serves as a key antecedent to a more

exploratory mindset and thus to more consumer generated value. The article presents a summary of the reviewed literature and a new model which combines cognitive and design elements.

We propose that the levels of interactivity and usability of web platforms, as well as the innovativeness towards web 2.0. search applications and web literacy of the users or the state of being telepresent in the online medium are critical for entering a flow state during online information search and becoming more exploratory in one`s information behavior.

2. Theoretical Basis of the Conceptual Model Proposal

The research model proposed in the present study is an empirically based integrative conceptual one, built upon previous causal flow models (Figure 1).

Figure 1 Theoretical foundations of the research model proposed
Source: developed by author

Hoffman and Novak (1996:57) defined online flow as "the state occurring during network navigation which is: 1) characterized by a seamless sequence of responses facilitated by machine interactivity, 2) intrinsically enjoyable, 3) accompanied by a loss of self-consciousness, and 4) self-reinforcing". They developed a conceptual model which considered *challenges*, *skills*, *focused attention*, *interactivity* and *telepresence* as flow state antecedents, while the complete list of flow consequences mentioned by them includes: *increased learning*, *perceived behavioral control*, *exploratory mind-set*, *positive subjective experience*. Flow itself is an one-dimensional construct in their view.

The initial conceptual model of Hoffman and Novak (1996) was further improved and tested by Novak et al. (1998; 2000). One of the main changes brought to the original Hoffman and Novak's model (1996) is that the new model (Novak et al., 2000) considers the construct of *control* as being an antecedent instead of a consequence. However, flow is also considered an one-dimensional construct, and is tested only in the context of general web usage.

All further major flow structural models indentified by our literature review are, more or less, built upon the pioneering work of Hoffman and Novak (1996). Koufaris (2002) uses the flow theory to investigate how emotional and cognitive responses to online shopping affect online consumer behavior, especially their intention to return to an online shop and the probability to make spontaneous purchases. His model relates constructs from the flow theory with elements from the Technology Acceptance Model (Davis, 1989), such as *ease of use* and *perceived usefulness*, as well as other determinant factors for emotional and cognitive responses, for instance *product involvement* and *value-added search mechanisms*.

Huang (2000) uses a multi-dimensional structural model that proposes and tests *complexity* (represented by information load), *interactivity* (here, the level of information exchange) and *novelty* (new, unfamiliar, surprising events) as flow antecedents – that is as defining factors of commercially compelling websites. Skadberg and Kimmel (2004) empirically evaluate visitors` flow experience while browsing a website. Their flow operationalization is three-dimensional, including *time distortion*, *enjoyment* and *telepresence*. Guo and Poole (2009) test the complete structure of the flow model, as it was originally formulated, in an online shopping context. Their model posits that the impact of an informational technology`s features on flow would be mediated by the three preconditions of flow: *balance between challenge and skill*, *goal clarity* and *feedback mechanism*.

3. Design Methodology of Conceptual Model

In this section we will present a detailed picture of the empirical background of each hypothesis proposed and will reveal the methodology of building our research model. Drawing on a thorough flow literature review we have categorized flow factors into flow antecedents, flow dimensions and flow consequences.

In the reviewed articles we have identified some major antecedents of a holistic flow experience (Table 1). These include the *skills* necessary to overcome online *challenges* – as well as the challenges themselves, which need to go beyond the average daily level (Novak et al., 2000; Koufaris, 2002; Skadberg and Kimmel, 2004; Guo and Poole, 2009). Important technological antecedents of flow in the online medium tested by the reviewed empirical studies are: *interactivity* (Novak et al., 2000; Koufaris, 2002; Huang, 2003; Skadberg and Kimmel, 2004; Guo and Poole, 2009), *complexity* (Huang, 2003; Guo and Poole, 2009) and *telepresence* (Novak et al., 2000; Skadberg and Kimmel, 2004). Another category of online flow predictors (or of the similar state of *cognitive absorption*) identified by the literature review are the personal factors – others beside *skills* (Finneran & Zhang, 2005; Moore & Chipp, 2005; Li & Browne, 2006), from which we have selected the user`s *innovativeness towards information technologies* (Agarwal and Karahanna, 2000).

In developing our research model we have opted for a multi-dimensional flow conceptualization, as suggested by the some of the reviewed empirical studies (Koufaris, 2002; Pace, 2003; Huang, 2003; Skadberg and Kimmel, 2004; Guo and Poole, 2009). *Attention focus/concentration* (Koufaris, 2002; Huang, 2003; Li and Browne, 2006; Guo and Poole, 2009) and *control* (Koufaris, 2002; Huang, 2003; Li and Browne, 2006; Guo and Poole, 2009) are fundamental flow dimensions. While in a flow state, people do not have any room in their minds for any distractions, worries or irrelevant thoughts. They also feel a sense of control over their actions, which drives away concerns about failure. A flow activity is also a *self-contained activity* defined by intrinsic pleasure (Koufaris, 2002; Skadberg and Kimmel, 2004; Li and Browne, 2006; Guo and Poole, 2009). Another commonly reported dimension of the flow experience (Skadberg and Kimmel, 2004; Li and Browne, 2006; Guo and Poole, 2009) is *time distortion* (also called *transformation of time* or *temporal dissociation*). A distorted sense of time makes time appear to pass very slowly or very rapidly compared to an ordinary experience.

A particular consequence of the flow experience of online search is of special interest to this study: exploratory informational behavior patterns. Several studies explore the connection between flow and exploratory behavior (Novak et al., 2000; Korzaan, 2003; Richard & Chandra, 2005). The theoretical underpinnings of exploratory behavior in these studies involve needing, seeking and processing information as an activity for its own sake.

Table 1

Antecedents of flow in the reviewed empirical studies

Studies	Factors determining a flow state	Proposed/Validated relations to flow
Novak et al. (2000) **Contexts of study**: general web usage	skill/control interactivity (speed) challenge/arousal focused attention telepresence/time distortion	+/+ +/+ +/+ +/0 +/+
Huang (2003) **Contexts of study:** general web usage	complexity interactivity novelty	-/0 +/+ +/+
Koufaris (2002)* **Contexts of study**: online shopping on a selected web site	skills product involvement challenges value-added search mechanisms	+/+ +/+ +/+ +/+
* statistically significant relations exist only between antecedents and one of the flow dimensions (*shopping enjoyment*)		
Skadberg & Kimmel (2004) **Contexts of study**: browsing a tourism related web site	skill (visitor`s knowledge of the web site topic) attractiveness interactivity telepresence challenge (information in the web site)	+/0 +/+ +/+ +/0
Li & Browne (2006) **Contexts of study:** general web usage	need for cognition mood	+/+ +/+
Guo & Poole (2009) **Contexts of study**: online shopping on multiple web sites	web site complexity (direct influence) web site complexity (direct influence) goal clarity congruence between skills and challenges feedback mechanisms	-/- -/- +/0 +/+ +/+
Agarwal & Karahanna (2000)* **Contexts of study:** general web usage	personal innovativeness in the domain of information technology computer playfulness	+/+ +/+
* this study uses the construct of *cognitive absorption*, a construct similar to the of flow		

Note: += positive relationship; – =negative relationship; 0= statistically non-significant relationship.
Source: developed by author

H1: The perceived level of online search skills is positively related to the intensity of the flow experience during online information search activities.
H2: The perceived level of challenges is positively related to the flow state intensity during online information search activities.
Novak et al. (2000) and Koufaris (2002) confirmed the positive relationship between the level of skills and the flow intensity, as well as between the level of perceived challenge and the flow

state (Table 1). However, flow itself has different operationalizations in the two studies. While in Novak et al`s (2000) research it is conceived as a one-dimensional construct, Koufaris (2002) measures flow indirectly through a set of related concepts (control, pleasure, concentration, usefulness, ease of use). In Skadberg and Kimmel`s study (2004) only the hypothesized positive relationship between pleasure and flow was validated, while time distortion`s (the second flow dimension) relationship to flow proved statistically non-significant (Table 1). Guo and Poole`s (2009) empirical tests also confirmed a positive influence of the balance between challenge and skill, and the feedback mechanism on flow in an online shopping context. Flow itself was measured through the constructs of concentration, merging of action and awareness, time distortion, loss of self-consciousness and autotelic experience.

Based on these results, we propose that high levels of search skills and search challenges (such as finding the right keyword or recognizing relevant results) determine high levels of flow during online search. We anticipate that, when information search is challenging and the online searcher is knowledgeable about using information and information technologies, he is likely to enter a mental state characterized by deep concentration, enjoyment and no concerns about losing control or feeling under pressure.

H3: The level of personal innovativeness towards online search tools positively influences the flow state intensity during online search.

Innovativeness in the domain of information technology is conceptualized (Agarwal and Karahanna, 2000:677) as "an individual trait reflecting a willingness to try out any new technology." Based on this definition, Agarwal and Karahanna (2000) posited that the users` beliefs about, or their perceptions of information technologies have a relevant impact on their technology usage behaviors. In their study they have validated the anticipated relationship between personal innovativeness and the flow like state of cognitive absorption. Innovativeness explained 42% of the variance in the respondents` involvement state with technology.

Based on these results we have formulated our own research hypothesis. We build on the premise that the higher the level of innovativeness (openness) towards the online search tools, the more intense the flow state experienced by the user during a web session. Willingness to try out new web search solutions can enhance users` emotional and cognitive involvement in information search activities.

H4: The level of web usability positively influences the flow state intensity during online information search.

H5: The level of online interactivity positively influences the flow state intensity during an information search activity on the web.

A series of studies regarding online flow support the importance of web page design elements as antecedents of the flow state (Huang, 2003; Guo and Poole; Koufaris). Novak et al. (2000) confirmed a statistically significant relationship between the *speed of interaction* and flow. Huang (2003) tested web site *complexity*`s and *interactivity*`s influence on flow. The validation of their hypotheses revealed the fact that users' *attention* (a fundamental flow dimension) is distracted by the complexity of the web site and that interactivity is a key factor in creating hedonic flow experiences.

Unlike their predecessors (Novak et al., 2000; Skadberg and Kimmel, 2004; Huang, 2003), Guo and Poole (2009) underlined that the effects of the *site complexity* on the flow state are mediated by pre-conditions of the flow state, that is, by the *balance of challenge and skill, the clarity of goals* and the *feedback mechanism.* However, the results of their empirical study only confirmed the positive relationship between the *balance of skill and challenge,* and the *feedback mechanism* – on one side – and the flow state, on the other. The research also validated the effect of the web site complexity on flow through strong negative correlations with all the three of its pre-conditions and proved the superiority of indirect influence over direct influence.

Based on the multiple results presented, we posit that the degree of interactivity of the online search interfaces and the usability level of the online informational medium enhance flow experiences during online search. High levels of usability correspond to reduced levels of complexity.

H6: The telepresence state induced by search interfaces is positively related to a flow experience during online information search.

Novak et al. (2000) tested the positive relationship between telepresence and flow during online activities with relevant results. Through a model fitting process, Skadberg & Kimmel`s empirical study (2004) identified telepresence as a flow dimension, rather than a flow antecedent. Even if early flow studies and models developed in the 90s and in the year 2000 couldn't imagine telepresence appearing during online search (as compared to online games, for example), we consider that the latest social and video search instruments online facilitate complete online telepresence during information search. Based on this argument we have formulated our sixth hypothesis.

H7: The intensity of online flow is positively related to the level of exploratory informational behavior.

Hoffman and Novak (1996) were the first to hypothesize a positive relationship between the flexibility o a hypermedia environment and the consumers` exploratory behavior, a hypothesis later successfully tested by Novak et al. (2000). Based on this and further empirical findings (Korzaan, 2003; Richard and Chandra, 2005; Huang, 2006) that validated exploratory behavior as a consequence of flow in online contexts, we suggest that individuals deeply involved in online information search activities will exhibit more exploratory informational search behaviors. Exploratory information behavior is one of the exploratory behavior`s dimensions – alongside of exploratory buying behavior.

4. Conclusions and future research directions

The conceptual model we have developed in the present study owes an important debt to previous models of flow conceptualized in the context of human-computer interaction, but it is unique in specifically representing information experiences in the new hyper-interactive online medium conventionally called *web 2.0*. Our literature review proved that the various constructs used in flow models changed in importance over time (especially those representing technological factors) and that this fact requires a permanent re-evaluation of theoretical constructs used in connection to web technologies.

The individual components of the model need to be further investigated and empirically tested. The overall approach will be a field study using a survey methodology for data collection. A quantitative measure of the model`s constructs will be adopted by developing questionnaires, along with a reliability check of the different underlying factors. Subsequently, a testing of the hypotheses is needed to demonstrate complete validation of the instrumentation.

ELABORATING A MEASUREMENT INSTRUMENT FOR THE FLOW EXPERIENCE DURING ONLINE INFORMATION SEARCH

Lazoc Alina
Dimitrie Cantemir Christian University, Faculty of Management in Tourism and Commerce Timisoara

Luiza Caraivan
Dimitrie Cantemir Christian University, Faculty of Management in Tourism and Commerce Timisoara

Flow is a construct imported in marketing research from social sciences in order to examine consumer behavior in the online medium. The construct describes a state of deep involvement in a challenging activity, most frequently characterized by high levels of enjoyment, control and concentration. Researchers found that the degree to which online experience is challenging can be defined, measured, and related well to important marketing variables. As shown by our extensive literature review, flow measurements include antecedents, dimensions and consequences of flow.

The present paper represents a detailed description of the construct`s operationalization in the context of online information search. In this respect, our main goal is to produce a basic instrument to evaluate the flow experience of online search, in order to capitalize on the premises of an interactive, complex informational medium – the World Wide Web – and on the consequence of an exploratory informational behavior of users. The instrument is conceived to offer a primal possibility to collect data.

The composition, source and significance of the 11 scales used to measure the multiple factors of the flow experience during online search are detailed in this study with the aim to ensure the compliance with scientific rigors and to facilitate correct reports of data related to the reliability and validity of measurements.

For further research, we propose factor analysis to test the resulted instrument and to ensure that the measures employed are psychometrically sound. Factor analysis refers to a wide range of statistic techniques used to represent a set of variables in concordance with a reduced number of hypothetical variables called factors. Factorial analysis is used to solve two types of problems: reducing the number of variables to increase data processing speed and identifying hidden patterns in the existent data relations.

However, we expect our scales to perform different in the context of information search with second generation web tools and suggest further qualitative research concerning web determinants of flow.

Keywords: operational definitions, multi-dimensional construct, scale development
JEL classification: M30, M31, M39, D83, L86

I. Literature review

Novak et al. (1998; 2000) are the first to demonstrate the measurability of flow factors as well as the fact that they all relate to one another in predictable ways. Further studies have operationalized, tested and applied flow in numerous ways. They have adopted alternative operational definitions, often with different terminology of the major dimensions related to the flow construct. Collectively, these operationalizations proposed that any measurement of the construct should include its antecedent conditions, consequences, and dimensions.

Measuring skills and challenges as essential flow preconditions

The original flow theory (Csikszentmihalyi, 1990) cites *balance of skills and challenges* as the most important factor to flow experience. If challenges exceed the skill levels, people feel overwhelmed and anxious; on the other hand, if the activity is too easy, people get bored. Both challenge and skill should be situated on a level above daily average, so that the person may live a compelling experience.

However, as authors like Guo and Poole (2009) or Finneran and Zhang (2005) have noticed, most flow studies (Koufaris, 2002; Skadberg & Kimmel, 2004) analyze skills and challenges as separate constructs, which may represent a distancing from the original flow model imported from social sciences. It is generally accepted that operationalizing the skills/challenges ratio is troublesome.

Moreover, in the reviewed literature there is still a persisting ambiguity of what types of challenges and skills should be measured (those focusing on the medium, or those regarding the underlying activity).While most researchers of online flow relate online skills and challenges to interface usage issues, Skadberg and Kimmel (2004), for example, consider a vision of challenges that are provided by the available information, that is, by *the site content,* and a vision of skills that are given by the *knowledge* on a certain topic.

The multi-dimensional measure of flow itself

Flow dimensions represent indicators of the experience described by construct and they exist on a different level from the flow level (Guo and Poole, 2009; Siekpe, 2005). In other words, each dimension is necessary but not sufficient to define the flow construct. The structural models which propose multi-dimensional flow measurements start from the consideration that there is a certain inter-correlation level of these dimensions, which indicates the effect of a underlying higher-order construct.

The central dimension of the online optimal experience is *enjoyment,* the most common flow measure. The state of mind associated with flow is extremely gratifying and self-motivating (Koufaris., 2002; Huang, 2003; Li and Browne, 2006; Guo and Poole, 2009). Focusing attention on the task also represents a major indicator of the flow state. Koufaris (2002) considers *concentration/attention focus* a flow measure and he studies it in the context of online shopping activities. The attempts to operationalize control as a flow dimension include Koufaris' (2002), Huang`s (2003), Li and Browne`s (2006) and Guo and Poole`s (2009) structural models. Huang (2003:429) speaks about "a sense of control over the computer interaction". Li and Browne (2006) define *control* as the individual's perception of the fact that they have the responsibility of an activity or of an environment.

Operationalizing and measuring design factors of a flow experience

The Web offers a special environment for the flow experience (Chen, 2006; Huang, 2003; Skadberg and Kimmel, 2004; Novak et al., 2000; Koufaris, 2000; Guo and Poole, 2009), as it provides rapid feedback and orientation, which support users` concentration, offer them intrinsic motivation and a feeling of control over their actions.

In flow models, rapid feedback and orientation are operationalized using the constructs of: (1) *interactivity* (Novak et al., 2000; Skadberg and Kimmel, 2004), (2) *value added search mechanisms* (Koufaris, 2000) or (3) a *fast, unambiguous feedback mechanism* (Guo and Poole, 2009). Novak et al. (2000) build upon Steuer's (1993) three-part conceptualization of interactivity: *speed*, *range* and *mapping*. The *speed of interaction* refers to the rate at which input can be assimilated into the environment – a variable which has a maximum value represented by real-time interaction (a common value for broadband Internet today). *The range of interactivity* refers to the number of possibilities of action at a certain moment, and *mapping* refers to natural and intuitive reactions of the system to actions initiated by users. Guo and Poole`s (2009) conceptualization of *a clear feedback mechanism* entails its capacity to show the user his/her progress in achieving an online goal (search goal, shopping goal, etc). For Skadberg and Kimmel

(2004), interactivity is determined by *response speed* (as suggested by Steuer) and *ease of use*. *Ease of use* refers to the navigational characteristics of the web site.

A related concept both to *interactivity* and *ease of use* is *usability*. *Usability* is a concept largely used in information systems and marketing literature, which generally refers to the totality of attributes which make a technology easy to use (Pearson and Pearson, 2008). One of the elements which ensure increased usability is *coherence* – that is applying a unitary pattern of presenting information, instruments and surfing clues and/or a unitary interface for similar tasks. Guo and Poole (2009) study the web site complexity (a concept opposed to that of usability) as one of the important interface design variables that influence flow.

If *navigability* and *usability* refer mainly to those characteristics of the Web that determine or support users' decisional processes, the construct of *telepresence* describes an online state that does not require cognitive involvement of the user, but can resume to a multi-sensorial engagement in the virtual reality. Telepresence is the perception that the virtual environment one is interacting with is more real/dominant than the actual physical environment. Authors like Novak et al. (2000) or Skadberg and Kimmel (2004) tested telepresence as a flow antecedent, while others like Pace (2003) proposed telepresence as one of the flow dimensions.

Proposing and measuring personality factors of flow

Considering that flow is less about predicting behavior and more about predicting a person`s affective state (which may in turn influence behavior), Finnerang and Zhang (2005) suggest that individual differences can yield very different flow experiences from the same activity. The difference among individuals is not merely in their online skills, but also in their underlying attitude towards web technologies. Agarwal and Karahanna (2000) proposed and tested *personal innovativeness* as an important determinant of a flow like experience (*cognitive absorption*).

II. A Measure of Flow during Online Information Search

In order to measure challenges and skills related to them in an online search activity, we have adapted and rephrased the original scales used and tested by Novak et al. (1998; 2000) with positive results (α alpha=0.86 for the skills scale and α alpha=0.87 for the challenge scale). In the context of the present research, both skills and the challenges correlated with them refer to the online search process, ignoring other general informational abilities and offline literacies of users:

> - *I am extremely skilled at web search.*
> - *I consider myself knowledgeable about effective search techniques on the web.*
> - *I know somewhat less than most users about web search. (-)*
> - *I know how to find what I'm looking for on the web.*

Beside the user's perception about his/her skills, we have supplementary introduced a second personal factor in our measurement instrument: *innovativeness towards online search applications (tools)*. To be able to measure it, we have adapted Agarwal and Karahanna's (2000) *personal innovativeness* scale, positively tested by the authors in the context of general web use (α alpha=0.87):

> - *If I heard about a new online search application, I would seek modalities to test it.*
> - *Generally, I hesitate to try out new online search tools. (-)*
> - *From all the people I know, I am generally the first to try out new search applications.*
> - *I like testing new online search applications.*

In order to evaluate the *navigability* of the web environment, we have rephrased in our study a subscale of interactivity suggested by Novak et al. (1998) using Steuer's (1993) interactivity model. From our point of view, *navigability* represents the adaptability of the information system to users' surfing needs offering them a relevant map to manage the complex, often oppressive, informational space.

> - *Surfing the web with the available browsers is natural.*

- Web interaction is intuitive.

We have considered *navigability* essential in defining web 2.0 experiences and we have reintroduced it into flow measure, although previous tests did not obtain good results in the context of an incipient stage of web development. In light of this, we recommend further qualitative studies to perfect operational definitions of navigability in the context of exploratory search interfaces.

In order to measure *telepresence*, we have partially used the scale designed by Novak et al. (1998). The original scale (Novak et al., 1998) operationalizes a subjective experience generated by the multi- and hypermedia attributes of the web and it was successfully tested by the authors (α alpha=0.69) in the context of general web usage:

- During online search I forget about my immediate surroundings.

- During online search I feel rather in the online environment than in my immediate surroundings.

- During online search I feel that I am in a virtual reality.

A concept closely related to *navigability* is *usability,* a term that is used especially in information systems research (Pearson and Pearson, 2008; Guo and Poole, 2009), where efficiency of structural web organization is described. Broadly, *usability* comprises aspects related to the utility of web content. Guo and Poole (2009) measure the perceived complexity and speak about the necessary cognitive effort to understand websites. We have taken some items from the *perceived complexity scale* referring to dynamic complexity and we have transformed it, by rephrasing the positive pole, in the expression of web *usability* (that is, approaching it from a structural point of view):

- The web is a coherent medium.

- The web is a logical medium.

- The web is a predictable medium.

- The web is an organized medium.

Based on the conceptual multi-dimensional flow definition, we have applied distinct operational measures for each aspect of flow experience (Table 1) and we have used a common measure accomplished as a simple arithmetic mean of the four scales.

Online search requires special skills, providing users special satisfactions, both extrinsic (related to search results) and intrinsic (related to enjoyment of using digital devices and applications). For the present study we have used a scale to measure intrinsic enjoyment of online search, a scale that uses items from Koufaris's (2002) scale (α alpha= 0.81) and from Guo and Poole`s (2009) scale (α alpha= 0.91).

The dimension called *sense of control* is operationalized in a narrow sense, that of the user`s capacity to control online search. In the reviewed literature, conceptions regarding control measurement are extremely varied and they often include both elements describing user characteristics and elements related to the system`s capacity to respond to users' initiatives (or to transfer initiative). To measure the sense of control in the context of online search we have used a variant of Guo and Poole's (2009) scale, tested by them in the context of online shopping (α alpha=0.90).

In marketing literature, the construct of *attention focus* is often a synonym for involvement and it describes the cognitive dimension of active participation in the consumption experience (including media consumption). In our research, we have used Guo and Poole's measure (2009) for *focused attention* (α alpha=0.90) and we have extended it with Huang's items (2003) from his *focused attention* scale (α alpha=0.82). We named the resulted scale *attention focus*.

The measure of *time distortion* entirely uses Guo and Pool`s scale called *transformation of time*, that has proven consistent reliability (α alpha=0.92) in the context of online shopping.

Table 1

Describing scales used in flow dimensions measurement

Construct measured	Significance	Scale items
Sense of control	It measures the level of trust in one`s own capacity to control the evolution of an online search session.	- *I feel in total control of the search process.* - *I feel like I could control the search process.*
Attention focus	It evaluates the degree of focusing attention exclusively on the online search process.	- *My attention is focused entirely on the search process.* - *It is no effort to keep my mind on what is happening.* - *I have total concentration.* - *I think about other things. (-)* - *I am aware of factors that distract attention from the search. (-)*
Intrinsic pleasure	It evaluates the degree to which a search activity is enjoyed for its own sake, irrespective of attaining one`s initial search goals.	- *Search is generally interesting.* - *Search is generally fun.* - *Search is generally exciting.* - *Search is generally enjoyable.* - *I really enjoy the online search experience* - *I love the feeling experienced by online search and I want to capture it again.* - *The online search experience leaves me feeling great.* - *I find the online search experience extremely rewarding.*
Time distortion	It measures the degree to which the user sets free from time pressure.	- *Time appears to go by very quickly when I`m searching online.* - *Time flows when I`m searching online.* - *I`m losing track of time when I`m searching online.*

Source: developed by the author

To measure exploratory behavior as a result of online search experience, we have used a three-item scale adapted after Novak et al. (2000). The exploratory behavior scale measures the degree to which the user is open to experiments and innovation in his information search behavior:

   - *I like experimenting during information search.*
   - *I enjoy exploring the web just to see what information it offers.*
   - *I like to click on a link just because it seems interesting.*

III. Future research agenda: data collection and data analysis strategy

The plan that we have conceived to collect data includes the creation of a survey which has questions referring to the six antecedents of the flow experience (skills, challenges, innovativeness, interactivity, usability, telepresence), to its four dimensions (pleasure, sense of control, attention focus and time distortion) and to exploratory behavior as flow consequence. The eleven flow related constructs are going to be operationalized with five-point rating scales (scale values from strongly disagree to strongly agree). The survey will be an online form, based on a web application specially designed and developed for our future research.

Using PHP and HTML, the online application will be adapted to the type of collected data and will ensure the possibility to select the questions and variants for answers from the data base, as

well as that of posting them on the user interface. Security and efficiency of stocking questions and answers will be ensured by the data base engine MySQL, especially due to the large variety data that it can stock.

Moreover, MySQL will offer enhanced flexibility in manipulating data during research, allowing a real-time intervention and the possibility to improve the research instrument based on incipient feedback from respondents.

After collecting data, we will test reliability and validity of the scales using factor analysis. First we will apply an exploratory factor analysis to confirm the constructs` unidimensionality. In the second stage we will use a confirmatory factor analysis to test the construct`s validity, by identifying which items load on a particular factor and establishing a factor loading threshold. We will also test the reliability of each scale using Chronbach`s coefficient alpha.

BARTER-BASED TRADE – THE ENGINE OF THE ECONOMIC RECESSION

Lăncrănjan Andrei
Faculty of Economics
Babeş-Bolyai University Cluj Napoca

Through this paper I would like to identify the main reasons that encourage firms to make barters. I would also like to find out who are the more likely to do this exchange and what are the main objects or services which are the subject of barters. This kind of exchange was present in ancient economies like the ones of the egyptians or indians. Even though there was no currency, an account unit was present, generally gold. I am attracted by this subject because the barter economy didn`t disappeared totally when the currency based trading began growing. In my opinion, a healthy economy should have a strong currency economy, but the businesses should seek partners willing to make barters. This kind of trading makes both partners happy – they get what they want, they don`t have to pay any money and they reduce their stock.
If all economic agents would understand the benefits of being a barter trade practitioner than the economic growth would appreciate faster. This research is a small incentive for business owners to grow their deals even more. It`s very likely that after gathering some knowledge and finding out all the benefits of barter trading more and more company owners would like to do swap goods for any kind of needed service or product. The working hypothesis is that respondents are aware and make barters in proportion of 80%.
Key words: economy, barter trade, recession, economic growth
JEL code: M31, F19

1. Introduction

Since ancient times, mankind had the need to swap things, ie to do barters. This kind of economy is present from prehistory. People`s needs and preferences evolved a lot, from the need to get some meet to satisfy their hunger, offering anything else in exchange, to the need to go in a luxurios cruise by paying a large amount of money. The difference between those days and these are that we have money as a standard. In this evolution, gold, silver or copper was also a standard. The economic system has strong concepts and money or gold are, and were, a very good standard, except the time when they are missing from the market… Why are they missing? Because someone or an interest group wouldn`t like them to be the subject of market transactions in order to have cheaper products, services or workforce. Due to the lack of currency, the barter is a very precious way to get goods or services during a recession, not being forced to pay money in exchange. Through this process you can satisfy your specific needs and offer your partner the goods or services that you provide. It`s very difficult to find the business comrade that offers the good you need and needs the good you offer. To solve this problem a web page can be created. For example www.barterstockmarket.com is a free domain. This swap need is more and more present on social networks and people appreciate this kind of swap. For example Florida Barter`s Facebook page has over 1012 members. Romania also has a group of 2640 members, most individuals, not economic agents. The greek town of Volos has it`s own barter market where people share products through the TEM virtual currency. The value of the goods a person brings is stored in a local computer network allowing him to spend that value on whatever he choose(mostly food). The network numbers over 800 members and it`s still growing. Due to the high unemployment rate, people that desperately need a place to work are accepting jobs paid in TEM`s. A flower producer from Volos is one of the companies that offer TEM in exchange of money. The employees are happy that they have a job and can "buy" their essentials from the

barter market. This is the perfect example that shows that the weakest economies resort to barters.

It`s more likely that an absolut barter economy could not exist due the fact that governments wouldn`t collect working equipment or cows as taxes. In nowadays economy money are the main enginge, but barters sure play an important role in market transactions. It also can avoid inflation and maintain stability. For this shift to be made a cooperation and understanding system is needed, based on real needs, direct exchange of goods, services and information between partners. Free market and the awareness that each person has, being interconnected creates the system. The individuals are more likely to do barters because firms have a very difficult hierarchical order and if you, as a business partner, do not talk to the decision maker, ie the owner or administrator of the other company, you are wasting your time. If a barter-based economy would be created there should be a very precise exchange rate which should include all rates and the fluctuations should be very low.

2. The barter-based economy context

Profile studies show that the trend of barter adoption is more present in the whole world. From Queensland, Australia(Liesch and Birch 2000: Community-based LETSystems in Australia: Localised Barter in a Sophisticated Western Economy) to Johannesburg, South Africa(Mpinganjira and Oliver 2010: Impediments to barter trading: Analysis of practitioners and non-practitioners perceptions). In Australia the so-called LETS(Local Energy Transfer, Local Energy Trading, Local Employment Trading, Local Exchange Transfer, Local Exchange and Trading) barter Systems were created in 1998 and their main aim was to utilise more fully the skills and resources within the local community and to provide a mechanism by which the community can remain viable and self-sufficient. LETSystems are based on the premise that a community`s wealth lies in its goods and services, the skills of its people, rather the amount of money available to it, and thus is not linked to traditional "employmnet" which is heavily dependent on money(Jordan 1990: 1).

Some authors agree that the barter-based economy could refresh the modern economy by incresing the number of trades, on the other half other authors support the theory that the healthiest economy is the money-based one.

People begin to understand the opportunities that this kind of economy is providing. There are also some impediments in barter trading. Many factors can prevent goods and services exchanges, from a very restrictive legal system to the man`s need to have real money. By doing only swaps it`s very likely to run out of cash and not be able to pay your taxes and fees.

Barter is used for a long time. In 1979 the International Reciprocical Trade Association was founded to facilitate access on barter information.

All research has its limits due the fact that you cannot interview all economic agents.

3. Research methodology

This study was made on a sample of 30 firms, based in Alba Iulia, Romania. The research universe was divided in three intervals. The allowance method was used as a sampling method. Ie there were administrated 30 questionnaires, 10 for each interval. The criterion upon which the division was made is the turnover(a.<100 000 RON; b.[100 000 RON-1 000 000]; c >1 000 000). As a working tool a 13 questions questionnaire was used. It was pre-tested on a sample of 6 companies and administrated during 16-20 Aprill 2012. The data was analyzed with the help of SPSS.

    I.   *What kind of company do you lead?*
        a) Limited
        b) Corporation
        c) _____

II. How many employees do you have?
_____
III. The year you`ve set up your company?
_____
IV. What is your main activity?
_____
V. Your turnover is between(RON/year):
  a) <100 000
  b) [100 000; 1 000 000]
  c) >1 000 000
VI. You have available cash:
  a) Very few
  b) Few
  c) Much
  d) Very much
VII. Did you ever barter?
  a) Yes
  b) No(if this is your answer, please pass to question XII)
VIII. Where you pleased of the counter benefit?
_____
IX. What kind of goods or services were the object of the barter?
_____
X. Which was the highest barter value(RON/year)?
_____
XI. Are you willing to barter again?
  a) Yes
  b) No
XII. Which do you think the barter benefits are?
_____
XIII. Do you agree with money elimination?
  a) Yes
  b) No

4. Results

The results of the study are very intersting. My initial belief is true and I can say that the objectives of this study were met. 24 of my respondents said that they have made one ore more barters. The most firms are limited companies. Among the 6 who said they didn`t barter are a hairdressing saloon, a meat factory, a real estate company, a souvenir shop, a water distribution company and a bank. For the bank, it`s quite difficult to make a swap because it offers mostly money that are not the object of a barter. Ie they could offer their financial services in exchange of goods or services without added operations charges for the partners that have an account opened at their branch.

All corporations have theier turnover over 100 000 RON/year and 4 of them have turnovers over 1 000 000 RON/year. There are 6 limited companies that also have turnover over 1 000 000 RON/year. The most economic agents that didn`t barter at all(3) are the ones that have a turnover higher that 1 000 000 RON/year. Firms that have a bigger turnover are the ones that were set up earlier. There are no companies started after 2006 that have this turnover.

The activity domain of the interviewed respondents are vast: from commerce(4) or advertising(2) to hairdresser, IT, qurrying, pavements, consulting or souvenirs. The ones that have big turnover

are the firms where the main activity is agriculture, banking, gas, porcelain, advertising, sanitation or water distribution.

The biggest barter value was the one of a construction company that swaps new built houses at the periphery with central located apartments. The value is around 400 000 RON/year. Another big barter value is for a firm that produces pavements and made a swap with a construction materials company for raw materials in exchange of paving its yard. The smallest barter value was for a lake owner who offered fish to a cleaning firm to beautify the lake. The value was aroung 500 RON. Another small value was for a commercial operator that offered products that he traded for a cash register for 700 RON.

Only a firm from a total of 24 that made a barter said that it was not pleased of the counter benefit. It is a grocery store set up in 2008 that offered vegetables for tools. The reason that it`s now willing to barter again is that the tools were bad quality. The value was around 600 RON.

There are 2 economic agents that were pleased of the counter benefit but they are not willing to barter again. Both agents have their activity based on commerce and one of them bartered a health insurance for its employees.

The benefits of barter are seen different by my respondents: from advantage over competition answers of press and advertising firms to customer loyalty seen by the quarrying firm or the accounting services one. The most answers were that it hels you increase sales(7) and it reduces costs(6). 2 of the respondents said that this kind of swap is a win-to-win situation. Only 1 economic agent thought that the barter has no benefits.

From the total of 30, 29 afirmed that they don`t agree with money elimination. The only economic agent that said that it would be no problem for him to work only by barter was an advertising firm with low turnover. I can say that the answer is quite natural because he said that one of barters benefits it expanding the distribution channel.

Start-up businesses are the most that didn`t made a swap. 3 of them were set up after 2006. The old firms are likely to understand the benefits of this kind o exchange.

The number of employees is not conclusive when it comes to barters. There are 2 firms that have 1 and 2 employees that didn`t barter at all, as well as 2 that have over 140 employees.

5. Conclusions and further concerns

In conclusion, an analysis at a relatively small scale was made to overview the main reasons that encourage economic agents to swap goods and services. For the future, it would be very interesting to do a regional or national research and compare the data with the one obtained in this study.

The results reinforce my initial belief that most businesses are willing to swap goods and services due the lack of money on the market. Exchanging things you produce makes it easier for you to obtain the things you need "at a fair price". It is a win-to-win situation where the addition value paid for the product you need it is balanced with the addition value for the product you offer. You can say that you gain something with 20-30% less. Barter should be a very fair trade, therefor the added value of assets that make the exchange object should be the same.

Nowadays due the financial crisis, small firms are even more desperate to swap goods or services. If they don`t find out a need for the products they make, at an economic agent from which they need a good or service, they try to find out another company that needs their good and fulfill the need of the second partner in order to make a 3 way barter.

This habbit was present in mens life from the beginning of time by trading food, tools or goods; it couldn`t dissapear suddenly because it has many benefits. It is still present at a reduced scale due governments interest in collecting fees and taxes. There is another important player that wouldn`t like this system: banks. They are the most powerful and influent players on the market. All important decisions are taken by bankers. The more money they produce, the more power they

have. If a barter-based economy would appear, than they would disappear, and who would like this…

A barter-based transaction it`s generally considered a fair one and partners tend to do business again and even befriend. I think that it`s because it removes the idea of man`s quest for money.

It is observed that the main subject of swaps are services. Those are the ones that are not at the base of the need`s pyramid, they are harder to sell and people tend to empty their pockets harder.

So if you would really like you business to thrive you must adapt to market conditions and give barter a chance. I guess this is the engine that gets us out of the recession because it`s based on fair trade!

ROMANIAN MOBILE TELECOMMUNICATIONS CLIENTS' CONSUMPTION BEHAVIOUR WITHIN THE CURRENT ECONOMIC-FINANCIAL CRISIS

Marcu Nicu
University of Craiova
Faculty of Economics and Business Administration

Meghisan Georgeta-Madalina
University of Craiova
Faculty of Economics and Business Administration

The paper will analyze the consumption behaviour of the Orange mobile telephony company's clients towards its services' characteristics within the current economic financial crisis, taking into consideration the following elements: the low tariffs (for calls/ subscriptions/ other services), the quality of calls/ of sound, the network coverage within the territory, the company's reputation, the negotiated offer, the quality and availability of the customer care service, the diversity of the auxiliary services, the range and prices of the mobile telephones, the costs that pay those who make calls towards this network, the loyalty programs, the usage of a last generation technology, the friends have subscriptions in the same network and the promotional offers. For a thorough research we will divide the operator's clients into natural persons clients and legal persons clients, each group having its specificities. The data gathering method was the questionnaire sent by post office to all the Orange Romania branches (a total of 225 branches). We received a number of 64 responses, what means a responses rate of 28.4%, which were analyzed using the SPSS informatics program focusing on the correlation analysis and factor analysis. The main results emphasize the fact that the fight to attract clients becomes more and more powerful. The very competitive market leads to the growth of the importance of the price in choosing a provider. The operators' short term gains from the clients that prefer low prices represent a long term risk of image. Choosing some services packages is sometimes very difficult due to the complexity of the offer. The clients expect the service to work, be simple and easy to use. They want to benefit from rapid and efficient assistance if errors occur and the operator respects the clauses of the contract. The results obtained through this study, allowed us to make an opinion on the perspective that the operators have on the mobile telecommunications market from Romania. The authors' contribution consist in making a research in a specialised field covering both the natural persons clients and the legal persons clients of the mobile telephony operators from Romania..
Keywords: consumer behaviour, mobile telecommunications industry, economic-financial crisis
JEL Classification: M31, G01

Introduction

The current research is based on the intersection of the theoretic element (that of the methods, techniques and instruments of marketing) with the development of the mobile telecommunications companies that are present on the Romanian market within the context of the economic-financial crisis. There comes the need for the analysis of this extremely competitive sector. The main research direction can be defined as follows: *How do the mobile telecommunications companies' clients behave in choosing the providers' services within the economic-financial crisis environment?* The results obtained through this study, allowed us to make an opinion on the perspective that the operators have on the mobile telecommunications market from Romania.

Literature review

Stopka (1996, p. 72) analyzes the demands of three groups of consumers: *natural persons, legal persons – small and medium businesses, legal persons – big businesses. **The business clients** represent the most important part of the telecommunications' services clients. The new technologies and services' success is due to the business market (McGinty, 1997). The spread of new technologies in the business sector is sustained, firstly, by the high financial resources of the companies and, secondly, by the rational decisions of obtaining a competitive advantage. The natural persons users are not preoccupied by the competitive advantages and, thus, they will adopt the new technologies within a longer period of time. (Seufert, 1996).

An approach in two stages is made for the ***segment of the natural persons clients***. Within the first stage, the different groups of consumers from this segment are described, allowing the identification of the most attractive and valuable clients for the operators from the local sector. Within the second stage, the factors needed for the competition's existence on this segment are analyzed. The amount of money that the natural persons clients spend on telecommunications services depends on a diversity of factors. The most influential factors are: the incomes, the technology and the socio-demographic repartition of the population or the households. (Langen Windler, 1997, p. 91). The income factor is determined by the amount that a household can spend on telecommunications services. The households with high incomes can use last generation telecommunications equipments. Thus, we can say that the higher the incomes of the households are, the higher the amount of money spent on telecommunications is. The telecommunications services for the natural persons consumers are seen as homogeneous goods for which the subscribers pay the lowest possible price. The natural persons clients represent almost 60% of the operators' total incomes. They also represent the demand services at low prices. The natural persons' clients are more homogenous regarding their needs than the business clients. They can use the basic telecommunications service and network services with added value. The access technology and services are less sophisticated than those for the business consumers. Thus, the owner of an access network to telecommunications can offer a standard service, from which the subscribers can choose the wanted services. In exchange, a connection for a natural person client needs high costs and, due to the low turnover, the return of investment period is very long.

Research methodology

The data gathering method was the questionnaire sent by post office to all the Orange Romania branches (a total of 225 branches). The addresses of these mobile telecommunications branches were taken from the Internet site of the Orange Romania mobile telecommunications operator (www.orange.ro). We received a number of 64 responses, what means a responses rate of 28.4%, which were analyzed using the SPSS informatics program focusing on the correlation analysis and factor analysis.

The purpose of this research consists in determining the consumer behaviour of the Orange Romania mobile telecommunications operator within the economic-financial crisis. For accomplishing this goal, we formulated a series of questions that we tried to answer through a questionnaire:

-Why do the natural clients choose the mobile telecommunications services of the Orange provider?

-Why do the natural clients choose the mobile telecommunications services of the Orange provider?

Hypothesis no 1: The natural persons clients chose the services of Orange mobile telecommunications operator for: the low tariffs (for calls/ subscriptions/ other services), the quality of calls/ of sound, the network coverage within the territory, the company's reputation, the negotiated offer, the quality and availability of the customer care service, the diversity of the auxiliary services, the range and prices of the mobile telephones, the costs that pay those who

make calls towards this network, the loyalty programs, the usage of a last generation technology, the friends have subscriptions in the same network and the promotional offers.

Hypothesis no 2: The legal persons clients chose the services of Orange mobile telecommunications operator for: the low tariffs (for calls/ subscriptions/ other services), the quality of calls/ of sound, the network coverage within the territory, the company's reputation, the negotiated offer, the quality and availability of the customer care service, the diversity of the auxiliary services, the range and prices of the mobile telephones, the costs that pay those who make calls towards this network, the loyalty programs, the usage of a last generation technology, the friends have subscriptions in the same network and the promotional offers.

Research results

Analysis of the hypothesis no 1. According to the Tables no 1 and 2, the main components analysis attests the one-dimensional nature of this concept. This factor solution explains 57.159% from the total dispersion. The KMO test (0.612) validates the factor solution.

Table no 1. KMO test

KMO test	
Kaiser-Meyer-Olkin measurement	.612

Source: SPSS informatics program data analysis

Table no 2. Explained variation in percentage, number of factors

Components	Total	% dispersion	% cumulate	Total	% dispersion	% cumulate
1	1.715	57.159	57.159	1.715	57.159	57.159
2	0.765	25.513	82.673			
3	0.520	17.327	100.000			

Source: SPSS informatics program data analysis

Here, the quality and the availability of the customer care service, the low tariffs (for calls/ subscriptions/ other services, and the promotional offers are well represented. The quality of the representation for the variable the quality and availability of the customer care service is 0.663. This signifies that a percentage of 66.3% from the variable dispersion is taken into consideration by the extracted dimension. (Table no 3)

Table no 3. Representation quality

Answers	Initial	Extraction
Low tariffs (for calls/ subscriptions/ other services) are preferred by the natural persons clients	1.000	0.623
Quality and availability of the customer relationship service are preferred by the natural persons clients	1.000	0.663
Promotional offers (discounts, gifts etc.) are preferred by the natural persons clients	1.000	0.429

Source: SPSS informatics program data analysis

The results also indicate a correlation. If the coefficient of correlation and significance (Sig.) < 0.05, we can say that there is a correlation between two variables. We can observe that the preference of the natural persons clients for low tariffs (for calls/ subscriptions/ other services) is strongly linked to the preference for the quality and availability of the customer care service

(0.47; p < 0.01). However, their preference for customer care quality and availability is strongly linked to the preference for the negotiated offer – the client negotiated the contract (0.436; p < 0.01). There is also a correlation between the preference for promotional offers made by an operator and that for the usage of the last generation technology (0.432; p < 0.01).

Analysis of the hypothesis no 2. Regarding the legal persons clients, we can analyze the correlations between the different characteristics of the mobile telephony services. Thus, we can observe the connection between the preferences of the legal persons clients for the diversity of auxiliary services, range and prices of the mobile telephones (0.50; p < 0,01), on one hand, and, on the other hand, the costs that those who make calls towards this network pay for (0.56; p < 0.01). However, between their preferences for the range and prices of the mobile telephones and the customer care service quality and availability is a correlation (0.48; p < 0.01).

Using the exploratory factor analysis, we will identify the main preferences of the legal persons clients regarding the mobile telecommunications services. The KMO indicator (0,747) validates the acceptance of the results of this factor analysis. (Table no 4) The representation quality allows the verification of the initial variables to see if they are taken into consideration in a correct way by the extracted variables.

Table no 4. KMO test

KMO test	
Kaiser-Meyer-Olkin measurement	0.747

Source: SPSS informatics program data analysis

The total dispersion table can explain the two dimensions that summarize the information. (Table no 5) The first dimension allows the explanation of the dispersion phenomenon in a percentage of 30.769% what means that the variables which compose this first dimension synthesises the phenomenon in a percentage of 51.63%. The second dimension explains the dispersion in a percentage of 27.625%. The two dimensions explain the total dispersion in a percentage of 58.394%.

Table no 5. Explained variation in percentage, number of factors

Components	Total	% dispersion	% cumulate	Total	% dispersion	% cumulate	Total	% dispersion	% cumulate
1	2.953	42.186	42.186	2.953	42.186	42.186	2.154	30.769	30.769
2	1.135	16.207	58.394	1.135	16.207	58.394	1.934	27.625	58.394
3	0.837	11.959	70.353						
4	0.791	11.298	81.651						
5	0.532	7.605	89.256						
6	0.392	5.599	94.855						
7	0.360	5.145	100.000						

Source: SPSS informatics program data analysis

The Table no 6 presents the components of the extracted dimension. These are:
The network coverage within the territory;
The quality and availability of the customer care service;

The auxiliary services diversity;
The range and prices of the mobile telephones;
The costs that pay those who make calls towards this network;
The usage of the last generation technology;
The friends are subscribers within the same network.

Table no 6. Components matrix (structural coefficients)

Answers	Components	
	1	2
Network coverage within the territory is preferred by the legal persons clients	0.443	0.551
Quality and availability of the customer relationship service are preferred by the legal persons clients	0.611	0.313
Diversity of auxiliary services is preferred by the legal persons clients	0.789	-0.274
Range and prices of the mobile telephones are preferred by the legal persons clients	0.759	0.065
Costs that pay those who make calls towards this network is an element preferred by the legal persons clients	0.737	-0.252
Usage of a last generation technology is preferred by the legal persons clients	0.602	0.426
Friends are subscribers of this network is an element preferred by the legal persons clients	0.530	-0.639

Source: SPSS informatics program data analysis

The Table no 7 presents the calculation of the alfa Cronbach coefficient. Its value is 0.756. For an exploratory study, a lower value of this coefficient is accepted (0.7), while, in a fundamental research, it has to be higher than $> 0,8$.

Table no 7. Alfa Cronbach coefficient

Alfa Cronbach	Number of elements
0.756	7

Source: SPSS informatics program data analysis

Conclusion
The hypothesis no 1 is partially verified. The natural persons clients chose the services of the Orange mobile telephony operator for: the low tariffs (for calls/ subscriptions/ other services), the quality and the availability of the customer care service and the promotional offers. Between the preferences of the natural persons clients for low tariffs (for calls/ subscriptions/ other services), the quality and availability of customer care services, the negotiated offer – the client negotiated the contract and the usage of the last generation technology is a correlation.
The hypothesis no 2 is partially verified. The legal persons clients chose the Orange mobile telecommunications operator's services, for: the network coverage within the territory, the quality and availability of the customer care service, the diversity of auxiliary services, the range and prices of the mobile telephones, the costs that pay those who make calls towards this network, the usage of a last generation technology and the friends are subscribers within the same

network. However, there is a correlation between the legal persons clients' preferences for the auxiliary services, the range and prices of the mobile telephones, the costs that pay those who make calls towards this network and the quality and availability of the customer care service.

NEW APPROACHES TO CUSTOMER BASE SEGMENTATIONFOR SMALL AND MEDIUM-SIZED ENTERPRISES

Meleancă Raluca-Cristina
The Academy of Economic Studies - Bucharest
The Institute of Doctoral Studies

The primary purpose of this paper is to explore current praxis and theory related to customer segmentation and to offer an approach which is best suited for small and medium sized enterprises. The proposed solution is the result of an exploratory research aiming to recognize the main variables which influence the practice of segmenting the customer base and to study the most applied alternatives available for all types of enterprises. The research has been performed by studying a large set of secondary data, scientific literature and case studies regarding smaller companies from the European Union. The result of the research consists in an original approach to customer base segmentation, which combines aspects belonging to different well spread practices and applies them to the specific needs of a small or medium company, which typically has limited marketing resources in general and targeted marketing resources in particular.

The significance of the proposed customer base segmentation approach lies in the fact that, even though smaller enterprises are in most economies the greatest in number compared to large companies, most of the literature on targeting practices has focused primarily on big companies dealing with a very large clientele, while the case of the smaller companies has been to some extent unfairly neglected. Targeted marketing is becoming more and more important for all types of companies nowadays, as a result of technology advances which make targeted communication easier and less expensive than in the past and also due to the fact that broad-based media have decreased their impact over the years. For a very large proportion of smaller companies, directing their marketing budgets towards targeted campaigns is a clever initiative, as broad based approaches are in many cases less effective and much more expensive.

Targeted marketing stratagems are generally related to high tech domains such as artificial intelligence, data mining and marketing analytics and presuppose the availability of sophisticated computer software and specialized personnel. The methodology proposed in this paper takes into consideration the fact that, due to financial and time-related constrains, smaller companies need a more practical and straightforward solution for segmenting their customer base. The simplicity of the solution, however, should not come at the expense of its efficiency. The original contribution of this paper resides precisely in the fact that it aims to offer the best of two worlds: the simplicity and cost-effectiveness of plain methods which can be used without the aid of specialized software and the high return on investment given by the use of artificial intelligence algorithms such as clustering.

The main implications of this paper relate to the fact that it draws attention to how targeted marketing can be performed successfully by companies with restricted budgets by providing an actionable set of guidelines which can be put into practice by smaller enterprises using limited efforts and resources.

Keywords: segmentation, customer base, small and medium sized enterprises, cluster analysis, targeted marketing

JEL classification: M31

I.Introduction

Data about customers is extremely important, as it constitutes the basis of efficient marketing decisions. The business logic of performing a customer base segmentation is concisely described by Philip Kotler: "The key point is that the marketeer needs to define the target market as

carefully as possible. The *mass market* is too vague. It is hard to make a product that everyone will want. It is easier to make a product that some will love. This has led businesses to pursue niches and mini-markets. But the downside is that as markets become sliced into finer segments, the resulting low volume in each will permit only one or a few companies to survive in that market." (Kotler 2003: 122)

This is why many businesses go out of their way to collect as much customer-related data as possible. However, for those businesses which deal with a large clientele, collecting customer profiles and sales data is not a solution all by itself and the real challenge is making sense out of great volumes of data. The end goal of dealing with customer data is developing marketing segmentation strategies and tailoring marketing activities to customer characteristics in order to use resources more efficiently and increase the success of the activities. For this purpose, patterns need to be recognized and, furthermore, shaped according to the business objectives. Identifying groups of customers which have similar needs is a first step for targeting marketing efforts and budgets towards the most rewarding groups of customers. Sometimes, segmenting the customer base is as simple as performing a classification of customers by one or more characteristics, while at other times a complex cluster analysis may be required, which is often done with the aid of specialized computer software.

The most common data sources available for the purpose of performing a customer base segmentation are data sets of commercial transactions, third party marketing research data and data obtained from customized research. The main advantages of customer segmentation are the following:

- it simplifies the data related to customers for analysis, as it groups together data sets which are relatively homogenous and therefore facilitates pattern recognition and helps reveal hidden relationships
- when building a model to predict future purchases, it is useful to group the data in order to reflect the underlying characteristics of different segments of customers; if several models are generated - one for each customer segment - the predictions will be, in most cases, simpler and more accurate
- response models can be developed for marketing campaigns based on past behavior of a certain customer segment

Segmenting the customer base is derived from categorical or continuous data and can be done based on various criteria, among which:

- geographic criteria - customers can be divided into local, national and international or can be categorized into groups based on their geographic location
- demographic criteria such as age and sex
- psychographic criteria such as behavior and attitudes, including brand loyalty and product preferences
- economic criteria expressed as values or ranges related to the amount of business transacted over a given period of time, the contractual value, profitability etc.

II. Customer base segmentation approaches

Segmenting the customer base can be performed in many different ways according to the business logic. However, all the approaches have one thing in common: they involve a pattern recognition process, which means assigning labels to each individual customer. These labels can be further on used to group together individuals which share one or more distinctive characteristics that differentiate them from the individuals which are not included in the group. Grouping customers based on some measure of inherent similarity facilitates choosing the most suitable target segments according to the marketing strategy and using resources more efficiently by customizing the marketing campaign to each selected target group.

Pattern recognition algorithms aspire to supply a reasonable output for all inputs and utilize fuzzy logic, operating with fuzzy logic variables which may have a truth value that ranges in degree between 0 and 1. The reasoning in fuzzy logic is similar to human reasoning and allows for approximate solutions. The simplest and most common approaches to customer base segmentation are performing a simple or multi-criteria classification and employing a cluster analysis.

Classification assigns each input to a set of classes. Statistical classification represents identifying the sub-population to which a certain new observation belongs, based on quantitative information on one or more characteristics and taking into consideration an initial training set of data containing observations whose sub-population is given.

Clustering is an application of associative rules mining and it aims to group the data into sets of related observations or clusters. Observations within each group are similar to observations within the same cluster and at the same time dissimilar to observations in other clusters. In contrast to classification, which is a supervised learning technique, clustering is unsupervised. There are no initial training data sets containing predefined classes and no examples to indicate possible relations among the data.

Due to the fact that market and customer base segmentation have in time been proven to be essential for the success of any regular business, from big corporations to medium and small enterprises, the domain is continually under study and various mathematical approaches, as described above, are designed with the aim of optimizing the results. In order to perform classifications and clustering on large sets of data, specialized computer software and personnel are required. While companies with large turnovers are generally in the position to be able to allocate significant financial resources and personnel to attain this objective, for the small scale enterprises the problem of customer base segmentation can be more difficult to control. The basic dilemma for most startups and the majority of established small and medium companies is the fact that marketing research requires time and money, while they generally operate in an extremely dynamic business environment and have a limited budget that must cover all their activities, including promotion and sales support.

III. Exploratory research regarding targeted marketing approaches suitable for small and medium-sized enterprises

The final purpose of the present research is to formulate a viable strategy for a small scale business that needs to develop but does not have the resources and the logistics that large companies employ in marketing and sales support research. In order to arrive at the conclusions presented in this paper and to create a set of guidelines to be used by small and medium-sized enterprises in planning targeted marketing campaigns, an exploratory research has been performed with the following objectives:

- to get familiar with the concepts of targeted marketing and customer base segmentation in general and in the context of small and medium-sized enterprises in particular
- to recognize the most important constraints which smaller companies have to face when planning marketing campaigns
- to determine the most important variables and to identify the most common alternative approaches available in customer base segmentation
- to generate ideas and create an original approach customized for smaller businesses

The following research methods have been employed:
- the analysis of secondary data from institutes of statistics, journals and publications
- case studies
- in-depth interviews conducted with marketing specialists or entrepreneurs with a background in small and medium-sized businesses

- focus group discussions with marketing specialists working in the small and medium-sized business environment

The research was done using a flexible approach, based on collecting ideas from various scientific writings and case studies and making intuitive associations, with a focus on qualitative aspects and formulating empirical conclusions. The results of the exploratory research consist in a set of guidelines created to be used by small and medium-sized businesses in the process of performing customer base segmentations. This research will be further expended in the future with a comparative analysis of different customer base segmentation approaches, taking into consideration the following aspects: costs, effort to implement, efficiency measured by key performance indicators such as activation rate, sales uplift and return on investment.

IV. Guidelines for performing customer base segmentations by small and medium-sized businesses

The result of the exploratory research performed consists in a model approach to the issue of customer base segmentation, which is intended to be at the same time effective, low-budget and fast so that it can be employed by small scale companies. The approach is based on principles related to computational data mining in general and cluster analysis in particular, but it can be applied in an empirical way, without the use of sophisticated software or data warehouses.

The end goal of the proposed method is to obtain a categorization of the customer base which facilitates addressing each group of customers with a customized offer, increases the success rate of the marketing campaign and makes business sense in terms of logistical and efficiency-related criteria. The method must also provide an easy way to incorporate new clients into the categorization and to adjust to the changes that take place with the customers that have already been assigned to a group. The most important issue is the selection of the criteria which will stand at the basis of the segmentation. In order to facilitate an empirical approach, the method proposes the recognition of 3 segmentation criteria which are most important. In order for a specific characteristic to be used, besides being relevant, the condition is that the company has and is further on able to collect the necessary data for estimating the value of the characteristic. The company will further decide whether or not to use all of the 3 criteria in performing the segmentation. However, the number of criteria should be limited to 3 in order to allow the graphical representation of the customers in a 3-dimensional space, having as axes the criteria identified as being the most important.

The next step involves the creation of "anchors", which will be defined as real or hypothetical clients which are representative for a whole group. For an established company, the selection of its "anchors", as a basis for the segmentation process, should capitalize on the Pareto principle (the 80–20 rule or the law of the vital few) that, applied in economy, states that roughly 80% of the sales come from 20% of the clients. Practically, the segmentation process starts with the graphical representation of the best clients. The number of customers which will be taken into consideration as "best clients" should be, for practical reasons, relatively small in order to facilitate performing the segmentation without the use of sophisticated computer software. The method can also be applied to a startup company, in which case the "anchors" can be based on theoretical (ideal) clients.

If collecting data on the 3 criteria selected as axes requires special efforts, the company should invest most of the resources in obtaining precise measurements about the most important clients. Data for the clients which are less important from a business point of view can be approximated without causing a great negative impact to the end result. If two or more of the best customers are considered to be situated graphically very close to one another, they will not form separate "anchors", but will be replaced by a single "anchor" whose coordinates will be calculated as an average of the coordinates belonging to the individuals. To increase the relevance of the

graphical model, the company can calculate a weighted average, considering as weights economic criteria related to the value of the customers.

After all the "anchors" have been established and graphically represented (Fig. 1), the 3-dimensional space will be divided in such a way as to obtain a distinct region surrounding each anchor. The division can be done in an approximate manner, based on business experience and intuition. If some "anchors" are considered more important than others, they can receive a larger space in the geometrical model. After the space has been divided, all customers belonging to the customer base can be graphically represented and assigned to a group (Fig. 2). However, it is no longer necessary to continue the graphical representation, as the classification can be further performed based on algebraic calculations involving coordinates. To speed up this process, the calculations and classifications can be automatically performed in a spreadsheet, with the aid of formulas.

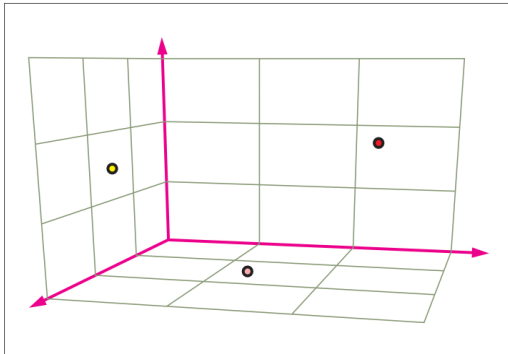

Fig. 1. Graphical representation of the
customer groups (created by the author)

Fig. 2. Graphical representation of the "anchors" (created by the author)

As a general rule, this whole process is designed as an iterative operation which involves trial and error and is being conducted, controlled and dynamically adjusted in strict correlation with the real feedback that is obtained from the market. The accuracy of the segmentation process is to be reevaluated periodically, whenever actual sales results or new sets of market data become available.

Companies that apply targeted marketing approaches need to pay attention to the following constraints:

- data set size: the selected target groups can only be used for marketing campaigns if they have an appropriate size; if a target group is too large for logistical reasons, it can be further divided into subgroups and if the size of a target group is insufficient in terms of the expected results of the campaign, it can be combined with other groups and addressed with an adjusted campaign message

- the identified target groups should be interpretable and actionable: the combination of characteristics based on which the groups have been defined should ideally be extremely relevant from a business logic point of view; the rationale behind the customer base segmentation should be intuitive and there should be a high probability that all the customers within a group would react positively and similarly to the campaign message

- if the customer base is segmented in different ways, according to different criteria, and the results of the segmentations are combined, special attention must be paid to overlapping groups, as it would be highly undesirable if some of the customers are included in more than one target group and addressed with many campaign offers, potentially conflicting, at the same point in time

- a balance must be obtained between the number of targeted segments and the corresponding campaign costs; the more customer groups are targeted, the higher the activation rate and, at the

same time, the higher the costs; when deciding which customer groups to target, the return on investment should be forecasted based on the expected activation rate and the decision should be based on trying to achieve the highest return on investment

- legislative constraints should be taken into consideration especially when having customers from different geographical regions or industries in the same customer group; the terms and conditions of the promotional offer targeted towards a group should comply with the legislation which affects all of the customers from that group

The customer base segmentation represents an important step in performing a targeted marketing campaign. The typical succession of steps can be described as follows: defining the marketing strategy; determining the available budget; performing the customer base segmentation; setting the planning parameters such as offer, discount value, promoted products; documenting the decisions made regarding the campaign and consolidating all data in the form of a campaign package containing the campaign objective, campaign message, campaign costs, available funds, and customer list including contact information; implementing the campaign based on the campaign plan; measuring the results of the campaign and collecting feedback; analyzing the results and drawing conclusions applicable in the future planning process.

V. Conclusions

Segmenting the customer base according to the proposed set of guidelines is not an automatic task, but rather an iterative process of knowledge discovery. The segmentation can be perfected over time by adjusting the parameters based on the feedback collected from the market. Even after a very good configuration of the model has been identified, changes still have to be made periodically to reflect the transformations that have happened to the customers. The proposed method is very effective assuming that a small number of customers generate a large percentage of the company's turnover, which is true for most small and medium-sized companies. In case of an atypical customer distribution, the model needs to be adjusted.

The original contribution of the model is the fact that it translates a scientific approach to customer base segmentation to an empirical method which can be employed with minimum resources by smaller scaled companies, without loosing much in terms of efficiency. The method applies the most important principles on which clustering algorithms are based and adapts the approach in such a way that it can be performed intuitively, without the use of specialized software, offering a guide for smaller companies to segment their customer base and perform targeted marketing activities.

The importance of this paper lies in its aspiration to draw attention to the fact that targeted marketing is a very important alternative for small and medium-sized businesses striving to invest their limited marketing resources in the most efficient manner available. Its role is both theoretical, as it aims to stretch out the concept of customer base segmentation to the small and medium-sized business environment and practical, as it provides an actionable set of guidelines for the use of smaller scaled companies.

Abstract:
In our days, the electronic communication media is important because the communication forms based on interactivity lead the participants in the act of sending and receiving information to become more than simply issuers, listeners or viewers, integrating them into a dynamic system.
In this approach, the study paper aims to prove the relationship between personal development and that of society determined by the new interactive communication instruments. At the individual level, training, education, health, interpersonal relationships are easier to be acquired and amplified Also, the local communities, companies, educational institutions or non-profit organizations increasingly approach themselves to the citizens, receive their problems and try to solve them efficiently. On the other hand, the expansion of the modern means of communication became possible by the steadily decreasing costs of information and of the appropriate management technologies.
Virtual communities may, however, only partially replace the traditional communities and the direct physical interaction between people, because online connections are made between people, not between places. Moreover, a high degree of interconnection involves the spreading of ideas, links and various discoveries or improvements of some already existing equipment and processes.
The content of this study paper is created using secondary sources of information – with limited and also limiting feature – in an office research, the areas of analysis being studied separately. The result of the study paper is to evidence the fact that the interest for the interactive electronic communication is increasing.
We support the idea that such communication contributes to business development in a particular field, in the social sector, but it is better to be aware of its less desirable effects from which we can notice the loss of privacy, the identity theft, the aggressive promotion etc.
In our opinion, in this study paper we only partially achieved to highlight the increasingly strong relationship between communication, interactivity and electronic media and, therefore, we hope that this demarche will be continued in other research.
Keywords: interactive communication, social networks, virtual communities, multimedia, target.
JEL classification: D83, L86

1. Introduction

The present period is expressed not only by the increasing quantity of information, but also by diversifying the ways in which it circulates. However, bear in mind that profound changes occur in the way information is required and provided, in the way the information providers are organized and in the one the information depositories are functioning and are being organized (Tran and Stănciugelu 2003: 17).

Regarding the multimedia communication of information, this is an interactive one, the user being able to intervene in requesting or changing what he receives. The new multimedia technologies prepare the conditions of communication in virtual worlds. Multimedia will suppress neither the content nor the traditional supports of information. They will complete, enrich and appreciate them instead.

2. Elements on the interactive communication by means of Internet

By means of interactivity, people learn how to faster and better communicate, their personal and professional concerns, traditions and customs, being in a permanent change. Thus:

- „virtual communities", based on common interests are formed or the contact and the collaboration between organizations are facilitated;
- contacts with people - individually or in group are initiated - in a more simple way, and new channels of collaboration can be developed;
- the access to information is made differently, it is important that they are received quickly, in various forms and from many sources.

Nevertheless, the most important aspect of the interactive communication is that it determines the participants in the act of sending and receiving information to become more than simply issuers, listeners or viewers, integrating them into a dynamic system. However, it is also a transformation of society and of many aspects of the human life which takes place. Local communities, businesses, educational institutions or non-profit organizations increasingly approach themselves to the citizens, receive their problems and try to solve them efficiently. At the individual level, training, education, health, interpersonal relationships are easier to be acquired and amplified.

On the other hand, the expansion of the modern means of communication became possible by the steadily decreasing costs of information and of the appropriate management technologies. Although many users still do not have enough money to benefit from the nowadays discoveries "at home", it is relatively easy and not too expensive to use them in some specially designed public places, such as educational institutions, citizens information centres, Internet cafés etc.

Individuals and groups with some connections or interests to the organization can maintain constant contact, with each other and with its management also; they can disseminate knowledge and experience to each other. Using the modern interactive communication, a user can contact his family, friends, colleagues by e-mail, social networking, forums; a reporter may be up-to-date by consulting the websites of organizations and receiving a newsletter or reading the corporate blogs.

The modern communication systems are able to be considered a factor in boosting the world, as they expand the cultural exchanges, reduce the physical distances and offer a different vision of life - an optimistic one, in terms of various interests. We can consider ourselves being involved in a fundamental change regarding: the way of dealing with reality, the access to information and their processing, the manifestation of purchasing and consumption behaviours in various fields etc.

The issues outlined above have formed the basis for the emergence of an integrated concept – „new media", which refers to the result of convergence between the traditional media system (television, radio, print), telecommunications, the digital technology and computer systems. These media are new both in terms of the technology development, and in those special features that require a different mindset on communication and society.

"New media" establish contacts between million people, in different regions, using computer networks connected to the Internet, telecommunications equipment etc. The computer performs, in this context, the function of receiving, storage and management of various information (text, sound, image) in digital form. It facilitates, subsequently, their transfer by digital telephone lines, optical fiber cables, communication satellites etc. (Manovich 2001: 19).

Thus, the online behaviour is determined by the way in which the virtual environment features interact with the features of those involved, so that we can refer to the users' traits such as: computer use skills, knowledge of the motivations for the Internet use and of the applications for which it provides support and information, demographic features (age, socio-economic status, occupation etc.).

Therefore, the Internet becomes an encouraging factor for interaction and success of the socio-economic plan because of its open standard for digital data transmission - voice, video and text - from one user to another, from one to many others remote.

Internet and World Wide Web are some extremely effective ways to accommodate and transport digital information around the world, presenting three important characteristics:

- *Global coverage*. The Internet and the Web sites have become the main platform for national and international contacts. They are landmarks for the educational institutions, which may present their offers of educational services to a world „market"; they give people from different countries an opportunity to exchange information and ideas and to learn about different cultures and social systems.

- *Convergence*. The Internet supports data transmission by electronic equipment used by the educational institutions, from the telephone to television systems for distance learning so that it creates a bridge between the continuous flow of information (TV model) and the facts oriented search (the website model).

- *Innovation*. Above all, the Internet has become the most powerful promoter of innovation. Due to its open and flexible protocol, many companies earn large amounts of money by developing new ways to use it. By means of the Internet, new ideas can be developed and launched quickly, the potential recipients can be found more easily, and the effects can be easily identified and tested. No other mechanism can provide such instant links between investors and their clients.

3. Research on the extension of social networks

Social networks are „maps" of relations between individuals indicating ways in which they are linked from casual knowledge to strong family ties. In the online environment, the social networks refer to a category of online applications that enable connection to friends, business partners and interest groups (Mitruţiu 2005: 5).

Thus, in these online communities, an initial set of founders send messages inviting members of their personal network of contacts to join the network. New members repeat the same process and help increase membership and ensure some global links. The sites provide services such as the online business cards updating which contain the email addresses of their acquaintances, the viewing of the members' profiles, the creating of some new contacts by providing services (Mitruţiu 2005: 27).

As the social interaction is increasing in the online environment, it was taking into account the question of an adequate management of virtual relations, such networks being more efficient as the number of participants increases. Individuals can become members of many different online communities based on the diversity of interests manifested in personal and professional life.

Statistics show that the number of the users of social networking sites internationally soared in the recent years, and their influence was confirmed in every major event, by benefiting from the continuous Internet access by means of wireless Internet and smart phones. For example, according to www.ziare.com the largest social networks have a total of over one billion users, the most popular being Facebook (845 million), which is followed by LinkedIn, with 150 million and Twitter, with 127 million.

Virtual communities may, however, only partially replace the traditional communities and the direct physical interaction between people, because online connections are made between people and not between places. Moreover, a high degree of interconnection involves the spreading of

ideas, links and various discoveries or improvements of some already existing equipment and processes.

We can notice that a growing role in media is supported by users - as producers of audio, video or text, while the Internet provides platforms underlying the change on patterns of behaviour in this area. The new culture on the Internet is a consumer content creation, consisting of things such as the 30 million blogs existing today or the about 80 million photos available on Flickr.com. Thus, the audience itself (estimated to one billion users) creates a new type of social media.

The phenomenon under review already led to the creation of a more promising „business" for the next period Internet, such as YouTube, Facebook, Twitter and MySpace, Hi5, Pininterest - to name just a few sites with the most growth rates on the Internet. They provide daily information, propose millions of photos and videos (some made by a user) for viewing and bring many people together. All these sites are free of charge, just a few generating profits. Their goal is to create communities and draw their attention to them and when they turn into companies, most of them will be purchased by the current „giants". And the phenomenon is expanding, Google competing, recently, with the social networks by adding to its email service, Gmail, some functions that allow users to change their status and share content with friends online (Google +).

Moreover, the expanding of the social networks has led many consumers to try to use them for promoting their business. The web technologies as well as the mass attraction offered by the opportunity to create online connections transform, thus, the social networks into some attractive means for businesses seeking to increase their popularity, credibility and influence (Radu 2010).

The social networks are growing not only in economics but also in health care - Sickweather will be a social networking service to monitor diseases in the circle of users' friends and to predict epidemics. Basically, the service collects public data from social networks like Twitter and Facebook as well as from the users, in order to provide information on trends in the disease. People can use the information to decide if their symptoms fall into the patterns of a certain disease and deserve a more attention or to prepare a healthy diet (Dulămiţă 2011).

In its turn, Microsoft has launched a social network called So.cl (read „social") which is available only to few people, but the representatives of the company have said that So.cl will be a social network for students, to help them to share information quickly, to build pages or to obtain information quickly, to transform the existing social networks in a large classroom (Nedelcu 2011).

4. Effects of the social networks extending - the appearance of Pinterest

The examples given above on the extending of the social networks are not unique; a proof of it being another social network that constantly attracts users, but also creates social media discussions. We refer to Pinterest, which already attracted 11 million unique visitors (according to compete.com) only in the United States by January 2012, increasing 9200% over the same period of 2011, when there were about 120,000 unique visitors (Crăciunescu 2012).

The idea of this network came in 2009 and belonged to a Google employee, who wanted to create a virtual environment where people could upload photos, where they could exchange recipes and advice regarding raising children and organizing weddings (Serghescu, 2012). But, with the passage of time, it has become increasingly obvious that Pinterest working tools can be used both for the personal use and for supporting companies, evidenced by the brands that are already present on this social network.

Specifically, Pinterest is a virtual panel which allows users to share pictures and links that they find interesting and inspirational, with others. After being transferred to other users, these images become "pins" which can be arranged on themed "boards" that can be customized according to any theme. If something was "pinned", then it may be repined by other Pinterest users. If the account was created, traffic can be made on a page of a product on its own website and its

Pinterest users are allowed to transmit these „pins” on Facebook and Twitter. This network slogan is „Organize and share things you love.”

Considering the analysis of comScore - a company that measures the digital world, Pinterest created a great stir in the United States and it seems to be growing ever more on the large markets in Europe. Thus, on our continent, the market with the largest growth in May 2011 - January 2012 was Germany, where the number of the unique visitors to the site increased by 2956%, and in January 2012 reached 67,000 visitors. Spain ranked second with an increase of 1348% over the same period and with 62,000 visitors reached this year in January. Pinterest increased by almost 80% in the UK, which has become the largest market for this social network with 245,000 unique visitors in January 2012. Dividing by gender shows that the majority of the Pinterest users are women, with 68.2%, half of them having family or having reached the middle-age (Crăciunescu 2012). The concerns of these users are directed towards the interior desing, cooking, child care, but also towards their physical appearance, different from that of girls.

In order to become a member of the network, there is needed an invitation, which can be requested from the Pinterest or may be received from a person who already has an account on the site. After receiving the invitation, the user can register either via Facebook or Twitter.

Among the sections of the network website they may find one for businesses, with suggestions of best practices for brands as well as a section where they are taught how to add the button „pin it” or how to give, if they wish, „pin” to the images on their own website or any other site. By pressing the „repin” button the interaction with others is allowed, each user being able to create his network of followers also.

Also, users can define as many panels covering a wider range of interests of the target audience, in order to avoid uploading images belonging to different themes only on one panel. This is important when you want to highlight the lesser known aspects of the life of an organization, but which may point out the target audience.

In order to make a brand better known, in the Pinterest network it was accomplished a staging of the actions required by the members of the „Mashable” social media platform (Nicholls 2012):

- reservation of space - ensuring the user name even if there it did not yet move to posting the content on the profile;
- using the brand values as an element of inspiration with the help of the pictures and promotional catalogues;
- using themes in the promoting of the products and in the interests grouping, by creating mood boards (state boards) relevant to a particular brand as well as its style and values;
- permanent including and updating of prices - that help customers identify certain items which are for sale;
- using hash tags - that offer support in organization, becoming important as the network expands;
- adding the „pin it” button on the e-commerce website of the brand, next to the "Facebook Like" button;
- interaction with the community - brands have to allow community members to post, on their boards, some content appropriate to the message that the organizations are trying to convey;
- focusing the brands attention on the copyright for the used photos.

However, the popularity and fast increasing of the Pinterest network use led to the emergence of some security threats specifically created for this. One of the weaknesses of the network is related to the use of some tools that promise an artificial increase in traffic by using robots that automatically post and re-post a series of images. In this case, the Pinterest users could increase their notoriety and, thus, earn money from advertising in this social network (Nedelcu, 2012).

Sometimes, some gift-cards issued by famous companies (Visa, Ikea and so on) are forcibly promoted, so that when people click to get the offer and agree to post notice on the gift-cards in their own account, the users are attracted to complete a set of questionnaires, without ever

reaching the promised card. Moreover, the completed details can be later used for more complex attacks.

5. Conclusions

The presence on Pinterest is not, especially for companies, a guarantee of the turnover growth, but is at least necessary as an additional test to enable consumers to increase their interest in this social network because of the many advantages it offers.

CONSIDERATIONS REGARDING THE USE OF MODERN MANAGEMENT METHODS IN PLANNING THE MARKETING ACTIVITY WITHIN THE SMALL AND MEDIUM-SIZED ENTERPRISES

Olteanu Valerică
Bucharest Academy of Economic Studies
Marketing Faculty

Curmei Cătălin Valeriu
Bucharest Academy of Economic Studies
Marketing Faculty

This paper aims to highlight, from a marketing perspective, the manner and conditions in which small and medium-sized enterprises can use modern management methods in planning the marketing activity. Using modern methods of management are particularly important for managers of these organizations and especially for marketers. Thus, the following methods play a significant role within the marketing activities' development for marketing specialists, namely: management by objectives, management by budgets, management by projects, and management by product. The high degree of understanding and using the above methods is, in the current economic environment, one of the determinants of the market success of small and medium-sized enterprises. In the current context, the adoption of the management by objectives is not a facultative option for the small and medium-sized enterprises, but rather a binding one in the context of adopting and practicing an efficient marketing with significant results on the development of marketing programs comprised within them. Similarly to the management by objectives, the use of the management by budgets within the small and medium-sized enterprises has a series of features required by their smaller size, features that should be considered by marketers. Regarding the use of management by projects, this method has to constitute the foundation for the elaboration of marketing programs developed within the small and medium-sized enterprises, thereby allowing shaping an action that can be accompanied by success in achieving the goals comprised within the marketing programs. Finally, the role of the management by product is extremely important in the marketing activity within the small and medium-sized enterprises, especially in the operationalization of concepts such as strategic marketing and tactical marketing. This paper thus outlines from a marketing point of view the main issues aiming at understanding and using modern management methods in the marketing activity planning process within SMEs.
Keywords: marketing, SME, management, planning, methods
JEL Classification: M31

Introduction
The planning of the marketing activity within the small and medium-sized enterprises is achieved by using a set of specific methods and instruments included in the broader frame of the instrumental management tools. Planning the marketing activity, in general, and the one developed within small and medium-sized enterprises, in particular, involves the use of modern management methods, out of which the following are distinguished as more important: management by objectives; management by budgets; management by projects; management by product.

All these methods have a significant contribution in the development of the marketing processes, especially in substantiating and operationalization of the marketing programs within SMEs.

Management by objectives within the marketing activities

In the course of marketing processes, the objectives and their manner of fulfillment lean on the organization's management system. On this basis it is necessary for SMEs to adapt management objectives and use management methods that facilitate the achieving of these objectives. One of them is the management by objectives.

Management by objectives consists of rigorously determining the objectives up to the executants' level, thus outlining accurate responsibilites, as well as calendars regarding the execution of the activities on some predetermined terms (Nicolescu and Verboncu 2007: 347).

As a method, *management by objectives* has some features that managers within SMEs should take into account when substantiating and elaborating marketing plans and programs. Among these features of the management by objectives method the following demarcate as more important (Ursachi 2001: 91): top management involvement; participation of all levels of management; frequent performance control and assessment based on the obtained results; freedom in the choice of methods by which objectives are met; assessing and rewarding performance takes into account the obtained results.

From this point of view, many organizations practice the *management by objectives* (Robbins şi Coulter 2007: 192) as a process of defining objectives and using these objectives to assess the employees' performance. The system of objectives appears out of this perspective as being structured on several levels that allow their delimitation as follows (Verboncu 2000: 142): fundamental; derivatives 1; derivatives 2; specific; individual.

Specifically, within the marketing activity in general and that within SMEs in particular, the system of objectives is operationalized by means of the marketing policy (Olteanu 2007: 58) reflected by the strategies and tactics used in carrying out the activities of SMEs. In substantiating and elaborating the objectives one should consider to define them so as to allow an easy assessment in relation to the obtained results, i.e. they have to be realistic, measurable and achievable.

Therefore we can assert that the activity of formulating the objectives is a complex process that takes into account all these features that have direct implications on the marketing programs developed at the level of SMEs. Such features of the substantiation process of the objectives (**Figure no. 1**) should be considered by marketers in order to successfully use the *management by objectives*.

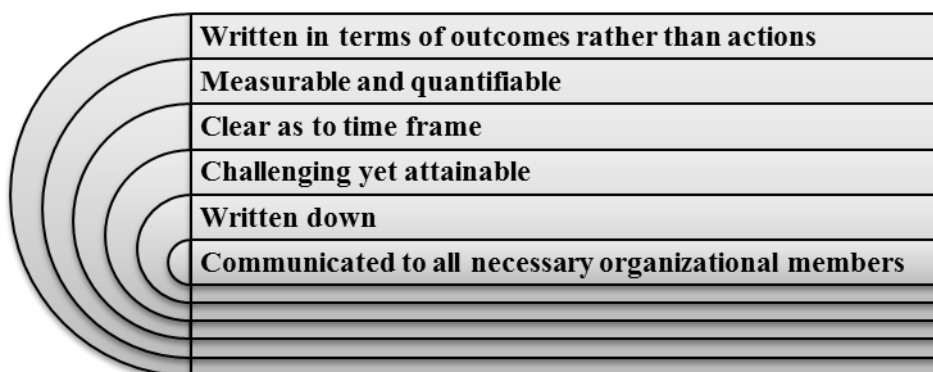

Figure no. 1. Characteristics of Well-Designed Objectives

Source: Adapted from Robbins, Stephen P. and Coulter, Mary. *Management*. 6th Edition, New Jersey: Prentice Hall, 2007: 193

We may note that the management by objectives is also retrieved in the strategic marketing planning, where we do not identify a single objective, but a group of objectives, such as those related to (Kotler 1999: 126): profitability; sales growth; market share increase; risk reduction; innovation. Following this approach we find within the strategic planning process objectives afferent to each organizational level, namely (Kotler and Keller 2008: 59): the entire company level; the division level; the business unit level; the product level.

The instruments that operationalize these objectives are presented in sequence as follows (Kotler and Keller 2008: 59): marketing plan; strategic marketing plan; tactical marketing plan. In the case of the marketing planning process, the system of objectives (**Figure no. 2**) is adequately reflected at each strategic planning level.

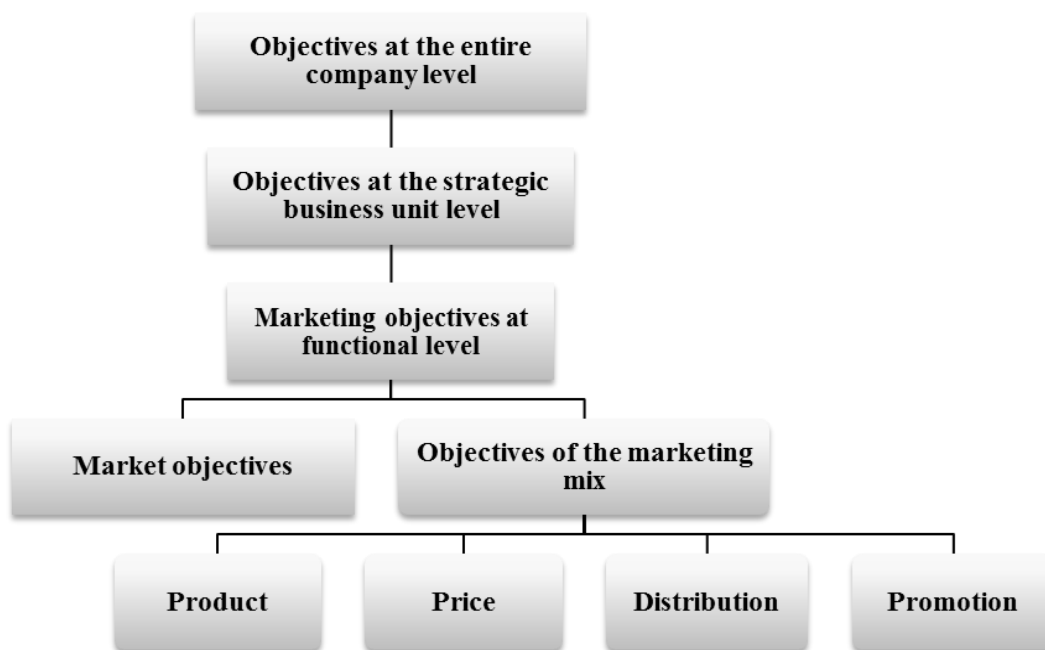

Figure no. 2. The system of objectives within the strategic planning

Source: Adapted from Olteanu, Valerică. *Management – Marketing*. Bucureşti: Editura Ecomar, 2007: 59

SMEs who are considering the adoption or improvement of the management by objectives within their organizations and consequently the marketing activity should not ignore a series of criteria that can generate most favorable results from using the method of management by objectives. Among these we mention as significant the following four criteria (Kotler and Keller 2008: 59): the objectives have to be arranged hierarchically, from the most important one to the least important one; the objectives have to be specified in quantitative terms whenever it is possible; the objectives have to be realistic; the objectives have to be correlated.

Management by budgets within the marketing activities
In the planning of marketing budgets are an important determinant of success or failure of a marketing program, and not necessarily in terms of resources that are greatly diminished within SMEs relative to large companies, but especially because of their deficient manner of allocation and management, which is mainly reflected by the execution of these budgets. Thus, all these elements are assumed by the management by budgets, a modern method of management,

providing a coherent vision in managing and executing budgets, method that consistently supports the marketing processes within the organization, be it on marketing research, strategic planning, or scheduling marketing activities.

Obviously, all these marketing processes cannot run without a fundamented, fair and flexible allocation of resources at the enterprise's disposal, especially the small and medium-sized one.

As a method, using the m*anagement by budgets* (Nicolescu and Verboncu 2007: 368) ensures in a financial expression the sizing of objectives, expenses, revenues and results at the level of management (profit) centers and, finally, the assessment of the economic efficiency in comparison with their budgeted level. Thereby, the marketing processes undertaken within the company appear to be separate in terms of the previously mentioned mechanism, but interconditioned in terms of planning their marketing activity.

Consequently, the management by budgets, as a managerial tool included in the management system, separates the marketing activity generated by adopting this method in two categories:

- delimitation of the marketing processes as profit center (Olteanu 2007: 61);
- elaboration and substantiation of budgets.

As such, the *research budgets,* for example, appear to be distinct and delimitated in relation to the *promotion budgets* (Olteanu 2007: 61) thus allowing not only a more adequate evidence of the achievement level of the objectives assumed within each marketing process, but also the analysis of the results in relation to the allocated budget.

It is true that the process complexity decreases when SMEs determine the allocation of budgets for marketing activities as a percentage share of profits or turnover (Anghel and Petrescu 2002: 210), which is correct and recommended within these enterprises, noting that such a mechanism has certain limitations with regard to assuimg some daring objectives within the marketing programs.

In terms of strategic planning we can mention that different levels of planning require the allocation of resources by considering these levels and the objectives established at their level, delimiting the allocation of resources for each strategic business unit – USA (Kotler 1999: 112) at the entire company level, concomitantly there is an intercorrelation within the entire process.

In conclusion, we mention that the usage of the management by budgets method is necessary for marketing processes even from the design stage, constituting a support in their implementation, the operationalization being properly reflected within the procedural and structural organization (Verboncu 2000: 182), which requires adjusting and adapting the enitre management system. Such an approach should also be considered within the SMEs, allowing an increased flexibility and a prompt manner of solving their marketing activity. Finally, marketers should consider analyzing the expenses-sales ratio (Kotler and Keller 2008: 652) as well as the impact of bugets' allocation on the results obtained by different marketing programs within the SMEs, taking the appropriate measures.

Management by projects within the marketing activities

Marketing activity in general and the operationalization of the marketing program in particular requires that in carrying out the marketing processes within the organization to also take into account a series of features that require the usage of management by projects as a management tool of the marketing activity within SMEs.

As a method, *management by projects (*Nicolescu and Verboncu 2007: 361) can be defined as a process that must: have a limited duration of action; be designed to solve complex, but precisely defined problems; benefit from the contribution of a wide range of different specialists; the specialists must be part of different organizational subdivisions of the enterprise; be temporarily integrated into an autonomous organizational network.

An entire series of similarities is ascertained at the level of the marketing program with regard to their content in relation to the management by projects, which determines its integration at enterprise level in the management system that operates at the entire company level.

Since the initial design stage of the marketing program one can distinguish such similarities as the *establishing of responsibilities and schedule regarding the development of activities* (Olteanu 2007: 62), which concretely reflects the implementation of the management by projects within the marketing activities. With regard to the organizational structure of management by projects (MbP), it involves the incorporation of some requirements among which we mention (Nicolescu and Verboncu 2007: 361): general definition of the project; designation of the project manager; organizational project definition; climate preparation for the MbP implementation; establishment of control modalities; implementation of the MbP; periodic assessment of the project fulfilment stage. In this context it seems that the usage of the marketing program is at least difficult, if not impossible (Olteanu 2007: 63) without reflecting these requirements of the management by projects, knowing that many of the failures of marketing programs are based on ignoring such requirements.

Management by product within the marketing activities

Although apparently not of equal importance within the SMEs in relation to the above described methods, the management by product can be used in addition to the management mechanism within the organization together with the methods mentioned above.

Thus we retrieve within SMEs systems that consider criteria regarding certain market segments or geographical areas and even markets on which the company operates or intends to operate in the future. Therefore the *management by product* system (Nicolescu and Verboncu 2007: 366) is characterized by assigning main management tasks, competences and responsibilities regarding the manufacture and marketing of a product or of a group of similar products with significant importance in the organization's production to a management framework that deals exclusively with the decision-making and operationalization of actions for maintaining and increasing its competitiveness.

From a marketing perspective, the *management by product* is of particular importance within the strategic planning process conducted across the entire firm, which refers particularly to (Olteanu 2007: 64):
- defining the scope of products and markets;
- establishing the strategic activity units (USA).

Thus, defining the scope of products and markets is the starting point in using the management by product, a profound understanding of its operationalization mechanism ensuring within the SMEs, too, a proper use of instruments specific to the marketing activity and especially the use of those contained in strategic planning (Olteanu 2007: 65), such as: market segmentation; positioning; brand policy.

Conclusions

In conclusion, the adoption of the ***management by objectives*** is not a facultative option for small and medium-sized enterprises, but rather a binding one in the context of adopting and practicing an efficient marketing with significant results regarding the development of marketing programs contained within them.

The usage of the *management by objectives* by these enterprises has a number of peculiarities generated by their reduced size, out of which the following stand out:
- *The objectives' degree of detail is much lower*, corresponding to the reduced hierarchical levels. Most times, SMEs set goals related to profit, production, sales across the entire firm that are broken down at an operational level, either quantitatively on employees or work teams, or by work tasks by whose concatenation the achievement of the general objective is ensured;

- *Increasing the size* has the effect of more pronounced separation of the levels and consequently of the objectives used for each level, for which reason the objectives are detailed horizontally at each level and vertically between hierarchical levels;

- More numerous production centers appear within the medium-sized enterprises that are organized as *profit centers, where a detailing of the objectives corresponding to these centers, addressed separately, takes place.*

Similarly to the management by objectives, the usage of the **management by budgets** within SMEs has peculiarities imposed by their reduced size, as follows:

- Most SMEs use the method in its simplest form, by preparing the income and expense budget at the entire company level, within which the marketing activities are provided separately, usually comprised within the expenses;

- Along with the increase in size and especially with the development of several operational, production or distribution units, SMEs constitute income and expense budgets specific to them, which are usually transformed into profit centers;

- In medium-sized enterprises, profit centers are transformed into strategic business units, gaining a wide autonomy and specific marketing function.

As regards the usage of the **management by projects,** this method has to constitute the foundation of elaborating the marketing programs developed within SMEs, thereby shaping an action that can be accompanied by success in achieving the objectives contained within the marketing programs.

In its simplest form, the *management by projects* is reflected in the (daily, weekly, monthly, eventually quarterly) scheduling of production, sales, by preparing "work programs" that provide specific tasks for the personnel designated to execute them.

In a more evolved form, the *management by projects* is reflected in "distinct programs" prepared temporarily for the carrying out of some activities that have such a nature. For example, participation in fairs and exhibitions, with sale, requires the use of programming the actions connected to this participation.

In an even more evolved form, usually in SMEs, the *management by projects* is reflected in the development of distinct projects properly designed on distinct business areas: production, sales, procurement, marketing, etc.

Finally, the role of the **management by product** is extremely important within the marketing activity of SMEs, especially in the operationalization of some concepts such as strategic marketing and tactical marketing.

Such a role is evidenced especially in SMEs, whose line of business comprises different businesses that appear as separate products out of the *management by product* perspective. In most cases such companies organize their businesses separately, each area being constituted in a "profit center" with a specific management system that stands for just an application of the product management. To the extent that the business areas thus constituted use distinct brands, the management by product takes the form of the management by brand.

MARKETING AND INNOVATION: YOUNG PEOPLE'S ATTITUDE TOWARDS NEW PRODUCTS

Onişor Lucian-Florin
The Bucharest University of Economic Studies
Institution for Doctorate Studies

This paper explores the perceptions of young students, who are training in the field of economics, to the very new products and outlines the role that marketing plays in bringing to market products based on innovative technologies. The study is conducted in Romania and tries to highlight Romanian specific features about the relationship between marketing and innovation.

The goal is to outline in a clear and actual image of young people thoughts about new technologies insertion on the market. The pursued objectives are: motivation investigation of option for new products; determining predisposition to the radical or incremental innovations, assessing perceptions of the link between marketing and innovation.

Research have been made in this field on various areas of activity. At the level of the European Community there are several organizations which activate in the field of innovation research. Eurobarometer through its subdivision Innobarometer brings in the attention of the public on a regular basis, through a series of publications, the results of researches undertaken from the business perspective, and are concerning all areas of action.

Research aims to identify the impact that new technologies have on the consumers most open to innovation. This exploratory research is based on a direct gathering of information, using an online questionnaire. Data are processed using SPSS software package, and the results show the type and nature of links between variables to be examined by applying bivariate and multivariate correlation tests.

Analysis report provides descriptive, easy to follow, for all the situations covered and investigated in the questionnaire. The results show a clear output of the relationship between compromises that those open to using new technologies are making to obtain superior advantages from the newest products on the market. Research carried out by the author being the first one in this area, only manages to outline the general framework of marketing in the process of bringing new innovations to market. Other research focused on several areas of participants in the process of bringing innovations to market, like inventors, distributors, intermediaries and final consumers, will be undertaken in the future.

The study bring into the attention of all participants in economic exchanges that marketing tools can be used to accelerate or to stop different directions of development. Marketing strategies and techniques can be implemented centrally in the economic environment of a country or communities, with immediate impact in the development (subject to certain priorities) of the society as a whole. Marketing can facilitate all socio-economic activities, starting from helping people interested in obtaining patents, attract their results into the economic cycle (production), going through transfer of the products to consumers (distribution), continuing to explain and inform all parties involved (promotion) and ending with the recording and collection of profits (price) of any kind (tangible or intangible).

Although the literature treats for a long time and in various ways the relationship between marketing and innovation, research on this direction in Romania are relatively few undertaken. Identification and assessment of consumer perceptions is an important step in any development process, especially in processes with a high innovative component, and this study tries to highlight Romanian characteristics of the relationship between marketing and innovation.

Keywords: radical innovation, incremental innovation, marketing, young consumers, Romania
JEL Classification: M31, M21, O33, N70, L11, Q55

I. Introduction

The study starts on the premise that marketing tools and its specific elements of action may attenuate undesirable effects that can be recorded at the time of the adoption of new thinking and new lines of action on all plans and in all areas, especially when there are forecasting an imminent series of elements that may make it more difficult for transition from one form of economic organization to another. The study tries to highlight features noticed by Romanian about the relationship between marketing and innovation. The aim is to have at the end of the research a clear and present image of young peoples ideas about the marketing of new technologies. They are more oriented towards radical or incremental innovation? They realize that there is a close link between marketing and innovation? And if so, what motivates them to seek products that incorporate innovative technologies? These are questions to which this research is trying to answer.

II. Literature review / previous research

In a proinovative approach, various authors (A. Coskun 2011: ix) (Lederman 2010: 606) argue that innovation is a very important economic factor which cannot be ignored. Marketing and innovation (Maciariello 2009: 35) can be viewed as two basic functions of any economic activities. Innovation may determine the position that a company or even a country can hold at a time. Companies that rely on innovation activity may call for an economic growth sustained by influencing other industries or by creating new jobs in new established business segments. Innovation can trigger, the development of niche markets (Fig. No. 1) and overall socio-economic advancement. Development of trade, growth and emergence of market niches, all can lead to the development of new industries. These new industries can contribute greatly to the economic development of a country, on one hand, but they also have incorporated related risks to the dissolution of other industries, and can contribute to this end, on the other hand, to the increase of unemployment.

Another approach (Ram and Sheth 1989: 5) comes from the consumers of innovative products, which in the industrialized countries adopted an proinovative attitude, but when they must opt for innovative products or services, are reluctant to do so. The more radical innovation is, the more opposed to adopt it were the consumers. Researchers believe that this kind of rejection of products incorporating the most advanced technologies, is due to several factors including insufficient motivation for consumers to make a change, augmented perception of the risk of new discoveries and personal beliefs of each person. All these obstacles found were classified into different market entry barriers to innovation. Of these are to remember the barriers of use, barriers on perceived value of the benefits gained against a greater price paid, physical and personal security, economic, social, and functional or psychological barriers related to traditions or certain image formats.

Researchers found the answer on how to implement the marketing tools used to achieve success in the adoption of innovation, and that is not laid in adapting and bending of these barriers to consumer requirements in the face of change, as well as in understanding the causes of resistance and its removals.

Figure 1: The general model of innovation's role
Source: A. Coskun, 2011:ix

Figure 2: Outcomes of nurtured thinking
Source: A. Coskun, 2011:34

The option to bring to market innovative solutions of the two methods, the method of small steps (successive improvements of existing products) and new methods, independent (radical invention/development of innovative approaches are totally different solutions on the market at a given time) some authors believe that radical solutions must be preferred to incremental solutions. And opt for this version under the premise that "what we have is good, but what we may have is infinitely better" (A. Coskun 2011: 33). Figure no. 2 illustrates that thinking, showing the difference between adding value to and create real benefits to enterprises and human society as a whole. Radical innovations can be successful even if they are not taken immediately. Some experiences have shown that other breakthroughs have been waiting even 20 years before they has been widely adopted and start to make profits for the companies which have placed it on the market initially (Lee Blaszczyk 2002: 96). Fast rhythm of development has however, a negative impact on radical innovation, while on incremental innovation has a positive impact (Hoonsopon 2009: 159).

For removing or shortening the time needed by diffusion of innovations, were composed by researchers from all over the world (Frenzel and Grupp 2009: 49) (Fanelli and Maddalena 2012: 648) (Sorescu et al. 2011: 14) theoretical models on diffusion of innovation to come in practical helping of the marketing people. These models take into account the most diverse aspects relating to both on those who bring innovations to the market, as well as the users or consumers.

III. Research methodology

Direct exploratory research has been undertaken based on a questionnaire completed online, to study youth perceptions about brand new products that incorporate innovative technology. The main reason to chose this form of information gathering, has been the attraction of a large number of participants, for reduced costs in a short period of time. The online environment is, as it will be seen from the analysis of data, the place where subjects subjected to investigation, spend a significant period of time. While electronic completion of a questionnaire provides comfort and great flexibility for participants. A disadvantage of collecting data needed for research may be the lack of representation among young people, being only selected students who are preparing for economics, are in the last year at the university and are enrolled at the Faculty of Marketing from The Bucharest University of Economic Studies.

The invitation to complete the questionnaire has been made in class, and participation was not imposed. Have filled in the questionnaire only students who have wanted to do so. Data was collected at the beginning of April 2012 and it made up a sample of 142 persons, 83% females and 17% males. And as an area of residence, taking into account major geographical-historical Romanian areas, 91,7% of them are from Muntenia, 6,3% of Moldavia and 2,1% from Transylvania.

Have been three categories of questions:

- filter questions, to separate respondents are not concerned about the innovative aspects of economic activities, or have not heard about them from those who are interested;
- questions used in the analysis of youth perceptions about marketing and innovation;

- demographic questions.

The objectives were:

-delimitation of the people who have heard about the innovative processes of those who have not heard, and the latter were investigated for the reasons why they have not heard, and has been composed a profile of the sources of information they use;

-defining the motivation for which they are or are not inclined to use innovative products;

-determination of their option for incremental or radical innovations;

-evaluation of perception of subjects of analysis about the link between marketing and innovation.

IV. Research results

Among those 142 people, 25.5% haven't heard of innovation or innovative processes and the remaining 74.5% have heard and will constitute the basis for the subsequent interpretations that follows. People who are not concerned with new discoveries of the present time, do not read newspapers, books or brochures and leaflets and have never participated in conferences or discussions or scientific meetings. The main sources of information used by them are browsing the Internet or talks on the phone with family members or friends or colleagues and watching the television. Unlike those people, the ones interested in innovation, are using all available media of communication, mainly browsing the Internet and online social media. When they want to inform themselves about certain issues, use the internet or read books, newspapers, are discussing with the members of their family, friends or colleagues.

Based on research it has been identified what primarily young people understand through innovation. Summing ideas provided, innovation means for the people investigated, bringing a change, an improvement, enhancing the usefulness or registration of added value and contribution to development. On their vision (Figure no. 3), products based on innovation, in the first place must use renewable energy and materials which can be recycled, and then must have a reduced impact on the environment, and for their arrival on the market, companies must use transparent business practices.

Figure 3: The sense of the concept of innovation
Source: own research

Most of the people have declared that they use or want to use products that have built-in innovations, out of curiosity, for performance, in order to contribute to the process of innovation but also by the desire to differentiate and to keep up with time fashion. All have recognized, however, when given the option of choosing a very new product they are documenting more than they would do, for a typical product. On the whole, a technology to be considered innovative by young people, must be new, must contribute to current improvement, need to contribute to increasing personal comfort and must be environment friendly. In the decision to use these products (Figure no. 4), the most important weighting is assigned to desire of being among the

first users of new discoveries, widespread adoption and to the maintaining of the latest fashion. The barriers that stop to purchase new products (Figure no. 5) are prohibitive price and scarcity of resources in the market.

Figure 4: Proinovative motivations
Source: own research

Figure 5: Proinovative barriers
Source: own research

From the perspective of companies that introduce products made with innovative technologies on the market, young people believe that companies are more motivated to do this for the gaining of a better position on the market, in the attempt to differentiate themselves from their competition and to rise the improvement of competitiveness (Figure no. 6). After which take precedence recording of greater profits and the facts that there would be a demand for such products or that will contribute to the increased quality of life.

Figure 6: Motivations of open to innovation companies
Source: own research

Running at a more general level, above companies, promote innovation to consumers is determined in the first row, by the concentration of research on the new challenges of the moment (such as climate change, more efficient exploitation of resources and the energy of any kind). In the second row, on the existence and the increase in the financial support allocated to research, and in the third row, young people have identified the role played by *setting up and ongoing campaigns of marketing for improvements* in all of the areas of activity. Then encouraging cooperation between researchers, and free access to information.

Returning to the opinion of the consumers of very advanced products, they said that they had a positive inclination to companies which adopt innovative processes or promote products obtained from these processes (Figure no. 7), related in direct proportion to the level of high confidence that they have in the proinovative companies (Figure no. 8).
Figure 7: Image of open
to innovation companies
Source: own research

Figure 8: The trust in open
to innovation companies
Source: own research

As a method of bringing innovative solutions on the market (Figure no. 9), students considered that would be more adequate, the small steps method, i.e., bringing successive improvements to existing products on the market, and not the method of radical inventions that involve development of approaches totally different from previous solutions.

Figure 9: Bringing innovative solutions on the market
Source: own research

There are many who believe that innovation can be brought to market without expensive research and development, but recognize that progress depends on innovations in research and development investments. This shows that young people are aware of the individual capacity of each of us to come up with new approaches. *Ideas should not be investigated, but research helps maturation and putting ideas into practice*. Responsibility to generate innovative strategies after rank ordering analysis (Cătoiu et al. 2009: 168) falls under the authority of research and development departments, *marketing* and production. On the following places, young people are putting, management departments, consumers, any employee - regardless of the position they occupy, NGO's and other entities (Table no. 1).

Table 1: Responsibility to generate innovative strategies

Entities responsible for the generation of innovative strategies	Rank I (%)	Rank II (%)	Rank III (%)
Management departments	14,71	20,59	17,65
Departments of research and Development	**55,88**	23,53	14,71
Department of Marketing	26,47	**32,35**	20,59
Departments of production (engineers and technicians)		14,71	**35,29**
Any employee, no matter what position he occupies		2,94	
There mustn't be a (Department) responsible within the company premises			
Other institutions (governmental bodies and/or non-governmental)		5,88	2,94

	2,94		5,88
Consumers	2,94		5,88
Other entities			2,94
Total	**100**	**100**	**100**

Source: own research

Other research results indicate that innovation is perceived as an element which leads always at much higher earnings than would be recorded in the absence of it. Respondents have confidence in future use of products which are very new and think that the appearance rhythm of the innovative products on the market, if it will not be maintained close by the current one, for sure it will increase. Are willing to pay greater amounts of money, counting between 21-30%, on new products that they have other benefits in addition to the usual ones. And with regard to the marketing techniques used in placing on the market of new technologies, considers that, they must be different and must be highly innovative too.

In evaluating online social networks, it is recognized that can be used to debate controversial and may possibly ensure political support in the promotion of innovations. But are seen as a new form of manipulation of information, a good environment in which they can express their views and comments on the decisions, and political factors can motivate people, this way, to take part in the implementation of various measures with economic impact. Exploring the Internet and socializing online occupies the first place among methods of information of the moment. However, young people are not considered very much aware of the level of knowledge and some information can still be kept away from the great mass of the population.

As an specific indicator of purchasing products that incorporate brand new technologies, was considered the change rate of personal mobile phone for a period of time. Thus, 97,1% have changed mobile phone in the last 5 years, mostly due to the fact that they have received a new phone as a gift. However, those who have deliberately changed the phone were the ones who wanted to benefit from increased performance, followed by those to whom the phone have failed. Of those *who have changed*, in the last 5 years, mobile phone *to get increased performances* 41,2% of them have done it twice, 20,6% only once, 17,6% three times, 11.8% four times, and 2,9% have either changed five or more often times, or have not changed at all. Young people have a horizon of time ranging from one and a half to two and a half years, during which time they collect information about a new product and acquires it. Or in other words they are willing to buy a product based on new technology once at a time, which varies between 1 and 6 months to 2 years and 6 months.

V. Conclusions

In summary, the conclusions drawn are:

- ideas should not be expressively researched, they may come from any person or individual, but research activities helps in the development, maturation and in the act of translating them into practice;

- proinovative people, are heavily internet users, they socialize online, read specialized books, newspapers and are discussing every mater with their family's, friends or colleagues;

- Politics does not play an important role in bringing innovations to market, rather innovations reach the market first and afterwards the governments think about and attempts to reshape hostile legislation to accommodate innovative ideas.

Since the identification and evaluation of consumer perceptions is an important step in any development process, especially in processes with a high innovative component, the main contributions of this article are related on shaping and presenting a clear picture of what the Romanian young people think about the introduction on the market of new technologies, the role of marketing in innovative processes and awareness of the close existing links between marketing and innovation.

Limitations of this study are related to the low rate of response, which led to the formation of a reduced sample, further research will be undertaken and it will try to cover wider categories of respondents.

THE INTERDEPENDECY OF ECOLOGICAL AND HEALTH ISSUES IN THE CHOICE OF ORGANIC FOODS

Pál Zsuzsa
Babeș-Bolyai University, Cluj-Napoca, Faculty of Economics and Business Administration

In the last two decades the number of the studies on actual and potential consumer's behavior toward the organic foods has been increased considerably. The main issues investigated by these studies are concentrated among themes like motivation, purchasing intention, barriers of the adoption, and their impact on the marketing strategy and operational tasks in an organization. Most of the studies in this field appeal to the one of the most influential behavioral intention model, namely to the theory of planned behavior. In an organic food context the researchers try to adopt this model including some specific aspects. In this paper, based on a brief literature review, we propose a conceptual model for the organic food buying intention. In our structure the two key purchasing drivers, the health and environmental concerns are interrelated, and the last one exert their impact on the buying decision trough the health attitude. This paper presents the argument for this proposed model. The proposed model, after testing it, could serve as a way of harmonizing the different attribute and benefit-related messages to the consumers' motivations.
Keywords consumer behavior, theory of planned behavior, organic food

Introduction

In the last two decades the number of the studies on actual and potential consumer's behavior toward the organic foods has been increased considerably. A wide range of the specialists are interested on this topic, from the marketers to the regional and rural development specialist, from the governmental organisms to the profit oriented sector. The main issues investigated by these studies are concentrated among themes like motivation, purchasing intention, barriers of the adoption, and their impact on the marketing strategy and operational tasks in an organization.

According to the EC council regulation No. 834/2007 organic products are those which coming from organic production. This regulation presents requirements for the production systems. In the agricultural production and in the processing phase the usage of pesticides, insecticides, fertilizers, genetically modified organisms, antibiotics, hormones, artificial additives, components, colorants or even conservants are minimized or forbidden. The processing phase should be mild to preserve all naturally beneficial components, such as vitamins, minerals or other useful enzymes and organisms. The definitions given by the authorities, such as EC or WHO, are focused on the production process, phase which could not be observed by the consumers. They should have trust in the certification bodies and in their signals to buy organic food products.

Regarding the consumers studies, the ecological and health concerns are the most mentioned factors motivating consumers to choose an organic product. In some studies or in case of certain segments the ecological features has higher impact, while the others indicate the prominence of the health concerns.

The environmental friendly (consumer) behavior is often characterized as ethical or moral behavior, driven by the social norms and the moral considerations. In these days many of the human's activities of their way of the life are connected to a consumption context. Taking a lunch, wearing, spending their free time, working at the workplace or simply living in a house, all of these activities have an impact on the environment. In the same time, the health issue is one of the timeliest topics covered by the society, economy and governmental sector. The healthy living

and avoiding health risks are endless source for inspiration for product innovation and advertising message design (Luomala, Paasovaara and Lehtola 2006). Both of them have gained the interest of the consumers, the policy makers and the actors of economy as well. In this paper we propose a modified planned behavior model for a further research, which includes the ecological and health concerns and the interrelation between them. There is a connection between these two aspects. Ecology means the health of the living area, which indirectly has an impact on the humans' health. Protecting the environment, indirectly we protect ourselves and our family's health. Even so, due to their longer time perspective of the positive effects, the environmental concern's influence on organic food choice is tempered comparing to the health issues.

1. Main concepts
1.1.Healthy and ecological attributes of the organic food
Previous researches identifies the health and ecological issues as key motivating factors of the organic food choice (Cicia, Del Giudice and Ramunno 2009; Essoussi and Zahaf 2008). In this chapter we underline the nature and the similarities of these factors in order to found a possible interdependency of them. These factors have dominance among the motivation factors. Organic consumers view the chemicals and pesticides used in conventional food products as being environmentally harmful, while organic foods are perceived as being environmentally friendly.

As we pointed above, the definitions given by the authorities for the organic products are concentrated on the producing procedure. From the consumers' viewpoint, the organic food product has a range of observable and unobservable attributes. The literature call the observable attributes either search attributes, if they can be tested before the acquisition, or experience attributes, if they can be evaluated only after the purchasing, during consumption or use. Search attributes are the package's design, the price, experience attributes could be the taste, freshness, and short-term health effects. However, the key attributes of the organic products are of the credence nature, which means that they could be evaluated in a short run neither after nor before their consumption. To this category belong the health and the ecological features near the animal welfare issue and the local origin (Bonti-Ankomah and Yiridoe, 2006). The consumers can't verify easily if these attributes are true or fake, they are dependent on the third party certifications (Cole and Harris 2010). So, as the nature of the attributes the healthy and ecologically friendly attributes belongs to the credence category, and therefore they need trust from the consumer in order to become motivating factors.

The literature of the organic food consumer behavior indentifies two types of motivational factors: egoistic and altruistic drivers. The egoistic motivations refer to the personal benefits conferred by the use or consumption of the products, while the altruistic motivations refer to the considerations which influence the decision by their effect on a larger community. The first category cover the health concerns, the effect of the fashion, the better taste and higher nutritional value. Altruistic motivating factors are the environmental sensitivity, animal welfare and local farmers' support. The majority of the studies underline the health issues as primary motivating factors of the organic food choice (Chinnici, D'Amico and Pecorino 2002; Ureña, Bernabéu and Olmeda 2008; Tsakiridou, et al. 2008). The main reason within this perception is the avoidance of the artificial additives, stabilizators, colorants and sweeteners in the conventional prepared foods, the pesticides and insecticides, genetically modified component in the conventional agriculture.

Let's see the most common motivational framework elaborated by Maslow. From a motivational viewpoint these two can be positioned on different levels. While the health issues represent somehow a form of physiological and safety motivational level, the pure ecological concerns could be included on a higher level in the Maslow-s piramyd. As we see this distance between the two motivational factors it seems to be unusual the researchers' result according to them these two motivational areas has a similar impact on the organic food choice.

As the readiness to react to these two attributes the literature define and study two type of consumer habit: health and ecological consciousness. These motivational, more complex behaviors are used often as determinants of the organic buying behavior. Michaelidou and Hassan (2008) define health-conscious consumers as those who "are aware and concerned about their state of well-being and are motivated to improve and/or maintain their health and quality of life, as well as preventing ill health by engaging in healthy behaviours and being self-conscious regarding health". They tend to be aware of, and involved with, nutrition and physical fitness. An ethical or green consumer is ecologically conscious and tends to buy products that are environmentally friendly and not harmful to the environment or society

1.2. The Theory of Planned Behavior
The TPB is one of the most utilized, discussed and influential conceptual frameworks designed to describe human action. An overall support of this theory is offered by Armitage and Conner (2001) in a meta-analysis of the 161 researches. The central dependent variable is consumer intention, which is an indication of a person's readiness to behave in a certain way (Ajzen, 1985), for instance, the intention to buy organic products. The TPB identifies three antecedents of intention: the attitude toward behavior (Ab), subjective norm (Sn) and the perceived behavioral control (Pbc). It has been used successfully in many studies regarding the organic food purchasing behavior as well, including the buying intentions and its antecedent.

The predictor power of the attitude toward an organic context action has been underline by many studies (Magnusson et al. 2001; Chen 2007; Arvola et al. 2008; Gianluigi, et al. 2010; Aertsens et al. 2011). The innovativeness for most of these studies based on TPB has been represented by various forms of the antecedents and factors which influence or shape the attitudes, the buying intention or the correlation between these two. Tarkiainen and Sundqvist (2005) tested the TPB in an organic purchase context, and the emphasis was placed on the role of the subjective norms. Practically they defined the subjective norm as an antecedent of the attitude toward behavior. The result was significant. Arvola et al. (2008) included to the TPB the affective and moral attitude as drivers for organic purchase. Michaelidou et al. (2008) used a simplified TPB without Sn and Pbc. As antecedents of the attitude toward behavior, were proposed the health consciousness, ethical self identity (including ecological consciousness) and the food safety. He found that all of these factors affect positively the attitude toward behavior, but only the ecological consciousness influence directly the purchasing intention. Aertsens et al. (2011) included in their TPB model the influence of the objective and subjective product knowledge.

2. The proposed model
Based on TPB model and its derived version for the organic food choice we propose a model which includes the attitudes toward the health and the environmental concerns. Our hypothesis is the ecologic attitude exerts his impact trough the health one.

We examined papers about consumers' behavior toward organic food. We considered both the quantitative and the qualitative data based studies. Studies based on quantitative data did not analyze the correlation or the interdependence of these two issues. Generally, they set up a top list of the purchasing motives, or they handle them as two of the components of the general attitude. Usually the health concern is more important than the environment (Chinnici, D'Amico and Pecorino 2002; Ureña, Bernabéu and Olmeda 2008; Tsakiridou, et al. 2008; Cicia, Del Giudice and Ramunno 2009), which is understandable regarding the dominance of the egoistic motivating factors. The ecological concern is present mainly in social norm, and a part of the attitudes. The animal welfare is often included in ecological concerns (Honkanen, Verplanken and Olsen 2006).

In case of the organic foods there are some studies based on the qualitative data, however most of the researches apply quantitative methods. In our case, the qualitative studies could help us to

base hypothesis and make clear how the people are thinking on the universe of the organic food attributes. For these the laddering interviews and means-and chains can offer a clear draw.

In Makatouni's (2002) research this dependence of the human's health on the environment's health is shown trough the animal welfare concern. The environmental value chain does not, but the animal welfare value chain shows a health-related end (healthier animals→responsibility for familly's and own well-being and health). Generally the laddering interviews discovered independent chains in which the environmental and/or animal and health issues appear as terminal values, in distinct value-chains.

Zanoli and Naspetti (2002) in case of the regular consumers found a between the two concepts (ecology and harmony, sustainable future→healthy and long life→well-being). In case of the occasional consumers the environmental concern does not appeared. Research made by Baker et al. (2004) does show any connection of the health concern neither with ecological nor with animal welfare issues. The same result has been found by Padel and Foster (2005). The researcher appealed on the in-depth interviews to investigate attitudinal concerns of the organic foods. Most of these studies do not investigate a possible interconnection between these two motives; they just marked a frequency of the statements regarding this topic. They identify the presence but do not underline any interdependence (Hill and Lynchehaun 2002; Essoussi and Zahaf 2009).

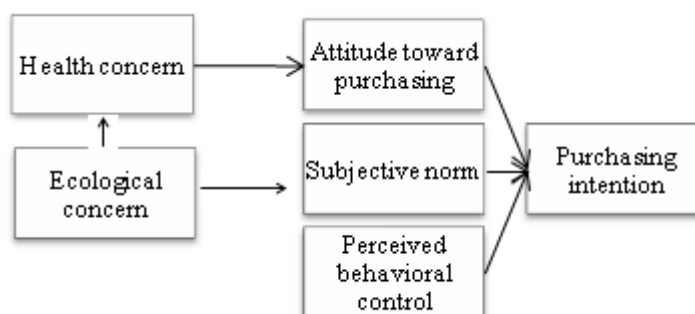

Fig. 1. The proposed model for TPB toward organic foods
Source: own construction based on Ajzen (1985)

However, the most promising result for our hypothesis is carried out by Chen (2009) after a research in Taiwan. He investigated the relationship between the two key factors motivating organic food choice. They used a more specific factor for attitude's antecedent, namely the healthy lifestyle. They suggested and then proved that the health attitude and the environmental attitude influence the attitude toward the consumption by this healthy lifestyle issue. We suggest a direct influence of the health attitude on overall organic food purchasing attitude and an indirect influence of the ecological attitude trough health attitude (Fig. nr. 1.). In our model we keep all three antecedents of the classical TPB model and complete them with the health and ecological attitudes.

3. Implications

In a year the number of certified organic producers in Romania has been tripled (www.madr.ro), and the distribution channels expand visibly. The results from such studies could base a communication strategy. Based on motivational power of the two key factors we can conclude that there can be a conflict between these two factors. That is why we propose for examination the possible interconnection between these two aspects. The results can be useful for marketing communication. In present the marketing communication efforts are relatively spread. There is not a consistent universe of the information regarding the benefits of the organic foods. The

information regarding the health benefits of the organically grown product are complex (Vindigni, Janssen and Jager 2002).

This proposed model should be tested, and then could serve as a way of harmonizing the different attribute and benefit-related messages to the consumers' motivations.

INVESTIGATING THE RELATIONSHIP BETWEEN PERCEIVED SACRIFICE AND B TO B CUSTOMER SATISFACTION IN THE INSURANCE INDUSTRY

Petrişoaia Carmen
Academia de Studii Economice Bucureşti, Şcoala doctorală de marketing

Nicolae Al. Pop
Academia de Studii Economice Bucureşti, Departamentul de marketing

The Romanian insurance market expanded rapidly during the last two decades. Presently, the Insurance Supervisory Commission (CSA) reports 43 insurance companies and 567 insurance brokers. In this extremely dynamic and competitive environment, it is compulsory to control key elements that generate and maintain customer satisfaction.

Therefore, the hereto paper concentrates on the influence exerted by perceived sacrifice over the business to business customer satisfaction in the insurance industry. More precisely, the objective is to investigate the impact of effort, time and money spent by the business to business customer over satisfaction.

The concept of satisfaction has been intensively explored in the literature due to the fact that both practitioners and academics understood that it held a great significance in determining and preserving customer relationships and therefore, long-term profitability. In the service sector, much research has been conducted in the business to consumer context, especially concentrated on the relationship between service quality and satisfaction, whereas the business to business setting received less attention.

In order to explore the relationship between perceived sacrifice and satisfaction, a descriptive research design was used. A questionnaire was created using multiple items for measuring satisfaction and perceived sacrifice and also a number of identification variables. The survey concerned companies that had had benefitted from the services of an insurance broker at least once. Copies of the questionnaire were sent by email to company managers from all the main industries. A total of 85 answers were collected. With the help of SPSS tool, the two measurement scales were tested for reliability and validity and a factor analysis was performed. The next step was to calculate the composite scores for each of the two variables and to carry out the simple linear regression analysis. Our linear model considers that perceived sacrifice is the independent variable, whereas satisfaction is the dependant one.

The calculated R2 indicated that perceived sacrifice explained 25% of satisfaction's variation. We also carried out a multiple linear regression in order to investigate the impact of each of the three components and we found that unlike price and time, effort doesn't have an influence on satisfaction.

The results obtained allow a better understanding of the relationship between perceived sacrifice and satisfaction making management decisions more effective.

Keywords: satisfaction, perceived sacrifice, services, business to business, insurance broker
JEL codes: M31, M39

I. Introduction

The hereto paper concentrates on the influence exerted by perceived sacrifice over the business to business customer satisfaction in the insurance industry. More precisely, the objective is to investigate the impact of effort, time and money spent by the business to business customer over satisfaction. We decided to focus on the services offered by the insurance brokers because this is a very divers and dynamic market. An insurance broker is an authorized legal entity who negotiates for clients insurance or reinsurance contracts and assists them during the prescribed

period, in order to establish circumstances, reclaim insurance damages, certify the insured's responsibility (CSA Annual Report, 2010: 39)

II. Literature review

Satisfaction is a positive or negative feeling that results when comparing expectations and performances related to a buying or to a consumption experience (Kotler and Keller 2012: 150; Lendrevie, Lévy and Lindon 2009: 858-859). It has a positive effect on developing customer loyalty, it represents an essential element that prevents customer defection and it holds a key role in building customer's attachment for the organization (Pop et al. 2006: 484-493). The research concerning satisfaction was developed in the context of an extended preoccupation for motivational studies. It is considered that the studies on satisfaction have been oriented towards elements that would explain the feeling rather than towards the mechanism of its formation, development or loss (Pop and Petrescu 2008: 107). However, satisfaction is not an end in itself, but a way to enable customer loyalty even though the relationship between the two key constructs is not linear (Kotler and Keller 2012: 150).

Fornell et al. (1996: 7-18) have created the American Customer Satisfaction Index, a type of market-based performance measure for firms, industries, economic sectors, and national economies. The authors consider that overall satisfaction is a fundamental indicator of the firm's past, current, and future performance (Fornell et al. 1996: 7). Satisfaction is perceived as "a key determinant of organizational success" with a positive influence over repeated sales and/or repurchases intensions and increase customer loyalty (Lewin 2009: 283).

Only a limited number of studies have deled with business-to-business services and customer satisfaction (Lapierre, Filiatrault and Perrien 1996: 92; Homburg and Rudolph 2001: 15; Neumann, Williams and Khan 2009: 319-333). In the business-to-business context the relationships are long term oriented, enduring and complex, often bilateral, and the products are customized to buyer's needs, thus making him an active partner (Homburg and Rudolph 2001: 16). This particular implication of the business to business customer during the service delivery emphasizes the importance of a better comprehension of the determinants of satisfaction. Along with service quality, perceived sacrifice is considered to be one of them. Perceived sacrifice is a relatively new concept, developed by the authors in order to define costs supported by the customer with the purpose of receiving benefits such as service quality. The construct can be divided into monetary and nonmonetary sacrifice associated to money and respectively to effort and time (Lapierre, Filiatrault and Chebat 1999: 236). Some authors added other "cost" elements such as risk and associated them to the service quality dimensions in order to obtain a multidimensional measure of perceived value (Gil, Berenguer and Cervera 2008: 926). Others preferred discussing these three constructs separately and observe some of the exerted influences (Lapierre, Filiatrault and Chebat 1999: 238-240). A third category of studies uses the term of "value" when measuring items associated to perceived sacrifice such as price or quality-price ratio (Caruana, Money and Berthon 2000: 1346; Chen 2008: 712). Nevertheless, it is important to say that value remains a complex construct defined as trade-off between the costs supported by the customer and what he receives in return (Gil, Berenguer and Cervera 2008: 922; Chen 2008: 710).

The study of Lapierre, Filiatrault and Chebat (1999: 235-246) revealed that customers believe that what they give is more important than what they get. They are more conscious of both monetary and nonmonetary costs. Caruana, Money and Berthon (2000: 1348-1349) made the same observation but they only referred to the role of low price and its positive effects on satisfaction in the case of audit firms. However, no research has yet concentrated on the insurance industry and used this particular measurement scale.

III. Research methodology

According to Churchill's paradigm (Churchill 1979: 66), when developing better measures, one should first of all specify the domain of construct, generate the sample of items and collect the data in order to purify the measure and second of all, collect a new set of data, asses its reliability, asses its validity and establish norms. However, collecting data in the business to business environment is very difficult so we performed this action only once.

As stated previously, our survey concentrated on companies who were customers of an insurance broker. We prepared a questionnaire including 3 overall satisfaction statements (Fornell et al. 1996: 10). These items formulated for evaluating the overall satisfaction have been used by other researches in their studies (Woo and Ennew 2005: 1183; Lewin 2008: 288). A 5-point Likert scale was employed for their measurement.

We have included thee more items concerning the perceived sacrifice referring to monetary cost, time and effort spend by the customer when dealing to the insurance broker. All of them were adapted from Lapierre, Filiatrault and Chebat (1999: 240) and for their evaluation a 10-point scale was used. The last 5 questions concern classification elements such as the industry, the annual turn-over, the number of employees and the paid premium.

Because the survey takes place in several cities in Romania, all the original items had to be translated. In order to avoid confusion or ambiguous terms, the back translation method has be applied. We had the questionnaire pre-tested by 6 managers who discussed each item and expressed their opinion.

Copies of the questionnaire were sent by email to company managers from all the main industries: agriculture, constructions, transportation, engineering, retail, IT, online media, manufacture, consultancy, education. A total of 85 answers were collected during a period of four weeks. With the help of SPSS tool, the factor analysis was carried out in order to purify the measurement scales and also reliability and validity got tested.

IV. Results

Because our study deals with motivational aspects of behavior, the 85 observations collected are considered to be a sufficient sample for analysis, without any intention of generalizing the results. Considering that the measurement scales used had to be translated and adapted to a particular context, we tested their dimensionality, reliability and validity. The dimensionality was verified through the factor analysis.

The Bartlet Sphericity test allows testing the significance of the correlations between certain variables (Jolibert and Jourdan 2011: 298). The Kaiser Meyer and Olkin test uses both multiple and partial correlations between pairs of variables. A weak KMO coefficient indicates that the factor analysis is not appropriate (Jolibert and Jourdan 2011: 299-300). Table no. 1 shows that the value of the test KMO (0.716) is higher than 0.5 which means that the factor analysis is adequate (Malhotra et al. 2011: 546). Also, the statistic Chi-square for Bartlett's Test of Sphericity equal to 189.972 with 15 degrees of freedom is significant at 5% allowing us to reject the hypothesis of zero correlation between items (Malhotra et al. 2011: 543).

Table no. 1: KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0.716
Bartlett's Test of Sphericity	Approx. Chi-Square	189.97
	df	15
	Sig.	.000

Made by the authors

For the factor analysis (Table no. 2) we chose the maximum likelihood method followed by a Varimax rotation. The Varimax rotation is one of the three orthogonal rotations that aim optimizing the loadings in order to see if the link with a factor is either very strong or very weak. As anticipated, two factors were identified corresponding to satisfaction (factor1) and to perceived sacrifice (factor 2).

The reliability was studied by calculating Cronbach's alpha for each of the two factors. The coefficients are 0.71 and 0.78 (Table no. 2) and because they are both higher than 0.70, we can state that reliability is acceptable (Nunally 1978: 245). The content validity is rather subjective and doesn't have a formal indicator; it means that "the items look right" (Churchill 1978: 69); for that, the pre-test step allowed an improvement of the questionnaire. The convergent validity should be proved by measuring the traits with two different methods (Churchill 1978: 70) but in this case, given the business to business context we limited the research to only one method.

Table no. 2: Rotated Factor Matrix

	Factor 1	Factor 2
V1		0.797
V2		0.420
V3		0.896
V4	0.848	
V5	0.412	
V6	0.753	
Cronbach's alpha	0.71	0.78
Mean	26.60	11.88

Made by the authors

In order to explore the link between the aforementioned variables we first calculated the composite scores in SPSS, and generated the scatter with regression line for the two variables that were obtained. The resulted graph (Fig. 1) points out a linear relation between satisfaction as dependent variable and perceived sacrifice as independent variable.

Fig. 1.The scatter with regression line
Made by the authors

Furthermore, the errors must have a normal distribution. The Jarque-Bera test with a probability exceeding 0.05 indicated that the null hypothesis of the normality of residual repartition should be accepted (Pecican, 2001: 94).

Through the OLS method, we then generated the estimation output for the simple linear regression (Table no. 3) and obtained that the probability for the t-statistic is 0.000 which means that we can reject the null hypothesis where the regression coefficient was zero. The estimated regression coefficient is positive showing that an improvement of perceived sacrifice will lead to a higher customer satisfaction. The calculated R^2 indicated that perceived sacrifice explained 25% of satisfaction's variation.

The Durbin-Watson test indicates the lack of autocorrelation because its value is close to 2. Another condition for the regression is the constant variance of the errors. The value of White's test was smaller than χ^2 for a probability of 5% and so we can accept the homoskedasticity hypothesis, which means that the errors have the same variance (Pecican 2001: 94).

Table no. 3: Estimation output for the simple linear regression

Dependent Variable: SATISFACTION					
Method: Least Squares					
Included observations: 85					
Variable	Coefficient	t-Statistic	R-quared	Durbin-Watson	F-statistic
C	1.66	3.81	0.25	1.82	28.07
Perceived Sacrifice	0.26	5.30			

Made by the authors

We followed the same steps for a multiple linear regression, where the independent variables are the thee items composing perceived sacrifice. The t-statistic indicates that effort doesn't have a significant influence on satisfaction, unlike time and price (Table no. 4).

Table no. 4: Estimation output for the multiple linear regression

Dependent Variable: SATISFACTION					
Method: Least Squares					
Included observations: 85					
Variable	Coefficient	t-Statistic	R-squared	Durbin-Watson	F-statistic
C	1.59	3.70	0.30	1.84	11.40
EFFORT	-0.006	-0.10			
PRICE	0.16	3.63			
TIME	0.11	1.69			

Made by the authors

V. Conclusions

The research results indicated that there is a positive linear relation between customer satisfaction and an acceptable perceived sacrifice. When analyzing in detail this link, we find that effort is not significant, unlike time and price for the business to business customers. One possible explanation is that generally, the insurance brokers assist their customers on every level: before signing a contract and after, therefore they expect to benefit from the service with minimal effort. Customers consider it a fundamental condition. Also, the monetary costs seem to be more important that the time spend with the insurance broker. However, further research is needed in order to confirm these results.

Understanding the way in which determinants of satisfaction influence this complex construct allows managers to make effective decisions in the service industry, and particularly in the insurance business.

Starting from the specific features of bricolage retail trade (which is part of the 'Do It Yourself' – DYI commercial format), this study aims to clarify the concept and structure of innovation in this field, and to present how innovation is perceived and communicated by sellers to customers. The initial literature review is followed by the design of a three-stage research, which consists of a variety of methods, techniques and tools of selective market research. The objectives are to establish the main forms of innovation in DIY trade, the perception and communication of innovation to the customer, and the internal marketing techniques which could deliver higher marketing advantages to the seller. This paper covers only the results of a pilot research conducted via qualitative exploratory research among 13 managers of the bricolage stores in Bucharest. Five hypotheses were tested and confirmed through research. All premises are ready for the scientific construction of research tools for the second and third stages of the study.
Keywords: perception, retail trade of DYI products, qualitative exploratory research, in-depth interview.
JEL Classification: M31, O31.

Introduction

Innovation and knowledge have always been the engine of progress. Our present and future society relies more and more on these two progress factors, illustrated by bold projects of the scientists. Self-propelling islands, teleportation, cloning, nanobots, vaccines designed to stop the spread of diseases with high mortality, flying cars, interstellar travels, these are all products and services that marketing people have to bring to the market and ensure their success among consumers. Communication in general and marketing communication in particular have undergone significant changes. In trade marketing, changes were determined by modifications in the sales staff's behaviour (who becomes more empathetic and cultivated) as well as by modifications in the customers' behaviour (who become more informed, and consequently, more selective). These 'physiognomic' changes were also due to the new communication directions in the strategies of sales marketing, on the background of generalised electronic communication technologies. Non-verbal communication, for example, wins - in this context - more ground. As mutations undergone by the marketing communication mechanism, it is necessary to report that marketing communication has intensified its interactive character and has gained an integrative feature (Brătianu et al 2011:105-108), both triggered by the modification of the seller-buyer relationship. The latter exceeds his role of recipient of products and services, and rises to the position of partner in the process of valuing the goods which meet his demand.

What is innovation and how it reflects in retail trade

Innovation is defined, broadly, '*... as the work of a specialist or a team and its result, which ensures the improvement of technology, a production process, products and services, organisational arrangements which get a new look*' (Florescu, Malcomete şi Pop 2003: 309). The implementation of innovations leads to increased productivity, reduced costs, higher quality, safer working conditions in general, and economic development, it generates transformations at the micro level, modifies the character and nature of work, and is an important basis for competition; to narrow this definition down, innovation is reflected in all new solutions (design, technological, organisational solutions), usually perceived as improvements and without raising any claims of uniqueness or priority. Many definitions tried to capture the essence of the term 'innovation' over time: '*... the introduction of something new*' (The American Heritage Dictionary), '*... a change which gives performance a new dimension*' (Peter Drucker), '*... the introduction of new products (...), new methods of production (...), creation of new markets (...), discovery of new resources*' (Joseph Schumpeter), '*... the ability to create increased value for customers*'(Jose Campos) (http://innovationzen.com/blog/2006/11/17/the-definition-of-innovation/). Peter Drucker tackles the concept of innovation in terms of entrepreneurship, defining it as: specific instrument of entrepreneurs, '*... their means of exploiting change as an opportunity for different business or services*' (Drucker 1993: 19). It can be considered a field of study or a specific activity. Entrepreneurs should identify with precision the sources of innovation, its changes, and manifestations, which indicate favourable conditions for its successful implementation [ibid]. Constant innovation (understood as a state of mind) is the defence 'weapon' of the leader against competition, through the development of new products/services meant to increase efficiency and reduce distribution costs, and thus to increase the leader's competitive strength and his customer value (Kotler, Keller 2012: 611). Implementing the innovation becomes a mental process that buyers undertake, involving several stages, from learning about innovation to adopting it, which materialises in the practical use of innovation (Kotler, Armstrong, 2012: 180-182). In retail trade - defined as the sale of goods to final consumers (Nufer, Wurmer 2008: 7) – the dimensions of innovation include: *sale type* (store type), *brands* (especially privately held ones), which make up the product category, *process innovation*, *customer experience*, *information technology*, *new communication media, payment options* and *order fulfilment* (Reinartz et. al 2011: 54). Being a field where interaction with the customer is at the core of all activities, the degree of novelty of products, services, processes or business model depends on the extent to which they are considered innovative by consumers, on the first hand, and by company representatives, on the other hand (Hauser, Urban 1977: 614-616). As a consequence, many companies have acknowledged the need of involving consumers in the innovation process (Verhoef, Reinartz and Krafft 2010: 247-52) as well as their employees by assigning them (especially to those with operational positions) the role of introducing innovative products and services to potential customers and providing counselling for innovation adoption. Another dimension of innovation in retail trade is the form of the commercial area. If the arrival of the supermarket–in 1930 in the U.S. (http://en.wikipedia.org/wiki/Supermarket) - was considered as the first novelty in this sector, today the sales form is a promising source for the development of innovations (Reinartz et. al 2011: 56). Ailawadi and Keller perceive the strategic decision to sell one or more proprietary brands, their positioning and differentiation in various media as another dimension of innovation in retail trade (Ailawadi, Keller 2004: 331-342). A relatively recent paper on innovation in 'shopper marketing' (Shankar et. al 2011: 32) brings into discussion the digital innovations, the atmosphere inside the store, merchandising, organisation of the marketing activity and the collaboration manufacturer-trader. Offer customisation was a major innovation. Nowadays the use of smartphones for product presentation is another major step. It is extremely interesting how technological breakthrough - smartphones, social networks, etc. - can lead to innovative ways of approaching and delivering service to consumers. Baker's

studies in 2002 revealed that innovations of the store atmosphere are a positive incentive for customers (Baker et. al 2002: 120–141). Among innovations at the sales point, with high impact on the purchase decision, the following are worth the attention: RFID (radio frequency identification), mobile technology, television networks, holograms (Kalyanam, Lal and Wolfram 2008). A regular opportunity to reflect on human creativity in the service of innovation is offered by the International Exhibition of Inventions in Geneva (held this year between 18-22 April). The event brought together more than 1,000 inventions and new products from 765 exhibitors. 'Paradoxically, affirms Jean-Luc Vincent - President of the Jury, economic and financial crises give rise to new ideas, determining investors to forget about the stock market problems and invest in products with high commercial potential' (http://www.inventions-geneva.ch/cgi-bin/gb-visiteurs.php).

The Internet plays an increasingly important role for the dissemination of innovations in retail trade because consumers use this medium to inform themselves before making purchase decisions. To influence the behaviour of potential customers, the innovation phenomenon must be also present in this environment. The retail expands rapidly, more and more companies being interested in becoming a global player, which implies new challenges. As a result, innovations are a must in order to seize opportunities and to successfully meet the requirements of an increasingly competitive market. On this background, the need arises to develop a study about the retail traders' behaviour towards innovation, as they play an important role in its dissemination inside the store.

Perception and communication in the service of innovation

A practical problem is the perception of innovation and its communication by the two parties involved in the act of exchange in retail trade: the seller and the buyer. If innovation is not perceived as such by one or both sides, it is no longer an essential element of discrimination in the act of choice of the common offer. Perception is understood as a psychological process through which objects, phenomena and processes from the objective world of human senses reflect themselves as a whole, with all their properties, in the human mind. A certain image of the surrounding reality emerges from this reflection, with subjective meanings which vary from one person to another [http://dex.infoportal.rtv.net/ ~ word-perceptie.htm]. Perception has two important functions: informational and of regulatory adaptation. Man interacts with the environment via these two functions. Communication is essential as it

'shads light' on innovation, both in the case of the sales staff's awareness and in 'spreading' it among customers. Marketing communication involves all the elements of the mix to convey messages between the organisation and its target audience (Popescu 2002: 20). The main role of any type of marketing communication is its ability to influence the customer's purchase decision as well as all other factors triggered by the purchase decision (manufacturers, retailers, civil society, groups of interest, etc.). The integrated character which defines marketing communication throughout the last decades - as mentioned - summarises all organisational efforts made to send and receive messages both to its external environment and its internal one. It is also part of the internal marketing of the organisation. Internal marketing requires managers to show empathy, to think and act towards their employees just as these ones are required to treat their customers. This way, employees become 'internal customers of the company' (Bruhn 2007: 231et seq.). The correct perception of innovation by all stakeholders, along with its communication methods, represents important leverages in any business which performs an innovative act (goods, services or ideas). Although often risky, new products and services give a major competitive advantage to companies trading them. The *determination of the seller* during the promotion of the merchandise is essential for its success to the public. The seller's attitude towards the extra effort required for promotion depends on how he perceives innovation himself. A study on the theory of planned behaviour (Ajzen 1991: 179-211) explains the crystallisation of

the seller's intention to act by measuring how subjective standards imposed by the sales process are perceived as managerial, organisational and social pressure to sell the new product (Fu et. al 2010: 61-76). This approach favours the assessment of the relation between the behavioural control of the seller and his performance in selling new products.

Research objectives and methodology

This research has chosen as reference the large stores and sales areas from the bricolage (Do It Yourself) field. In scientific literature, this commercial concept (commercial format) falls under the specialised markets category (Dabija, Pop 2008: 43-60). Such a format option justifies itself through its characteristics and peculiarities, which ensures a higher degree of buyers' involvement in the purchase decision and thus a greater effort on their side to understand and appreciate innovation. Moreover, the selected commercial format is also called, in everyday language, 'Do It Yourself' (DIY) store. On the one hand, the variety of products and services for home and garden design, but also for other types of environments invites the customer to fulfil his needs at the highest degree (arrangement of his habitat, maintenance of his living space, development of DIY objects, etc.). This high level of involvement is a prerequisite for a broad field of innovation in the sale-purchase process. On the other hand, Romania is spread out with a large number of bricolage stores of important European retail chains, such as German brands (Praktiker, OBI, Hornbach), Austrian brands (bauMax), French brands (Bricostore, Mr. Bricolage, Leroy Merlin), Turkish brands (Tekzen) and even local brands (Dedeman - market leader, Ambient, Arabesque). This phenomenon emphasises competition as well as competitors' innovative requirements. The authors' option for the DIY network was also determined by the fact that, besides the final customer (natural or legal person), an important role is also played by an intermediary who 'prescribes' the final customer what goods to purchase. This major customer segment is the consultant craftsman, always engaged in repairs, renovation, expansion, etc. of all classes of property under the management of the final beneficiary of the goods offered by the DIY networks. A specialist in commodities, the craftsman can be an important factor in demand multiplication and marketing of new products and services, to the benefit of the commercial organisation and its turnover.

The *objectives of the research* focus on the following aspects:

a) which are the main forms of innovation in DIY trade?

b) how is innovation perceived and communicated in DYI retail by the seller, respectively by the buyer?

c) what are the main forms of internal marketing, which should be 'activated' in order to empower the seller with even more effective innovation marketing techniques?

The research consists of several *steps* and uses various *methods*, *techniques* and *tools* of investigation.

It starts with a *pilot study* applied to senior managers of store networks from the DYI commercial format. This study - which is the *subject of this paper* - analyses how innovation as understood and evaluated by these decision-makers. The pilot study takes the form of a *qualitative exploratory research*, based on: 1) a *semi-conducted in-depth interview*, which uses a *conversation guide* for decision-makers, 2) a *screening test* based on words or image completion, applied to the operational management of the store. The *second stage* provides a *quantitative descriptive research*, whose object is to determine the views and perceptions [Cătoiu (coord.) 2009: 78] of the managers from the DIY networks in Bucharest. The subject of this study is the *perception of innovation* in their business and how they communicate with their operational staff in order to raise 'innovation awareness' regarding the new products and services. The subjects of the *third stage* of the research are customers of DIY stores in Bucharest. Two different methods of investigation are applied at this stage: 1) *observation*, by monitoring their response to different categories of innovations from the DIY stores, selected from the categories of innovations

defined apriori (in the first stage of the research) and validated through the descriptive research among decision-makers, 2) organising a *marketing experiment* in one of the DIY networks for testing the optimal showcase position of new arrivals and signalling innovative products and services through different means (visual, acoustic, combined), 3) conducting a *qualitative causal research*, by means of a simulated market test [Cătoiu (coord.) 2009: 85-86], to determine experimentally the customers' reaction to a given number of innovative services, present for the first time on the Romanian market. In this paper, the authors refer exclusively to the *pilot research* carried out among *decision-makers at store network level*. 13 specialised managers from the bricolage stores in Bucharest were interviewed. Although such an approach does not provide representative results, it makes place to interesting conclusions based on which future research instruments can be built (questionnaires, projective tests, observation sheets, experimental schemes). The research based on the conversation guide was conducted during two weeks, from the end of March until early April 2012. Dialogue with each party lasted between 30 and 40 minutes, being recorded - with the interlocutor's consent - on electronic media. Efforts were made to ensure a relaxed atmosphere and a constructive dialogue, avoiding, as much as possible, the 'Yes/No' dichotomous answers. The interlocutors were head of service and marketing managers, trade managers or acquisition managers from leading bricolage companies present on the Bucharest market. Semi-conducted in-depth interview was chosen as investigation method because of its capacity to clarify the main concepts, which are next interpreted as *operational data* (transformed in measurable or evaluative indicators) in the following stages of this study. The *conversation guide* (Pop, Petrescu 2008: 190) is not a questionnaire with closed questions, but an arguable reference meant to guide the discussion in case the interlocutor does not take the lead in tackling the proposed topics.

The five hypotheses formulated for the pilot research were:

H1 Interlocutors are able to make the difference between innovation of new products and other forms of innovation;

H2 The interlocutors' perception of innovation in bricolage (DIY) retail is *diffuse* in the absence of a well-structured definition of the types of innovation, depending on *involvement, responsibility and control;*

H3 Exploratory research based on semi-conducted interview may lead to a classification of the innovation sources by *types, technological criteria, responsibility* and *involvement*;

H4 *Local initiative* as source of innovation is poorly represented in all possibilities of innovation;

H5 *Customer* as *source of innovative proposals* is considered a secondary solution in marketing novelties.

Results of the research

Interlocutors' availability to dialogue was an essential factor of the pilot research. Asked to formulate their own opinion on the concept of innovation in their field of activity, interlocutors have formulated a wide range of solutions. The most frequently mentioned solution was *new product* launch, which was treated separately. The discussion on product innovation went further, answers varying widely - from brand new products on the global market (e.g. roof elements including a solar energy recovery system) to new products for the retail company. The main sources of product innovation also proved themselves diverse (from brand new materials for the construction industry up to pricing variations – either 'prestige' pricing or 'popularity' pricing in relation to pricing of similar products sold by competitors). As the subject of this research was not the innovation of product offers, the authors concluded that interlocutors succeeded to clearly set it apart from other forms of innovation and thus **H1 is confirmed**. Interlocutors mostly focused on the technological side of innovation (from discussions resulting ideas such as: '... based on the display from the flooring showroom, the customer calculates his necessary of parquet and accessories with a few clicks.'), two thirds of them also reported innovations related

to the sale process ('... recently, our company opened a store in Transylvania, which has a testing centre for new electric tools, the customer having the possibility to try the equipment before purchasing it - something which has a positive impact on his buying decision and also brings something new which attracts the buyer'). A small number of interlocutors tried to classify innovation based on certain criteria, such as in-store presentation, additional customer services, product range and price configuration, loyalty programs, construction type of the store, without specifying exactly the persons responsible for such initiatives (store management, bidders - producers, stores network management, third parties). Although an important number of innovative services were registered, a direct connection could not be identified between these services and customers' requirements, including their desire to receive an optimal service quality-price report. These facts, along with some aspects which will be reported by the other hypotheses, prove that there was no clear customer-orientation among the interlocutors. All these factors have led the authors to the conclusion that hypothesis **H2 is confirmed**. Through dialogue, the authors could establish a typological structure of innovations in DIY retail criteria based on *involvement*, *responsibility* and *control*. Table no. 1 brings these aspects together and serve as a basis for designing other techniques and tools for the second and third stages of the general research on innovation perception and communication in bricolage trade.

Innovation type	Concrete forms of innovation
a. Genesis of innovation in triangle: *manufacturer - distributor - customer*	- manufacturer – innovative products; - distributor – sales of innovative products and innovative trade methods; - consumer – provides the best innovative solutions (mostly conveyed by needs), but these can be unrealistic in terms of development costs.
b. Innovations at the point of sales (store)	- constructive; - functional; - esthetical.
c. Innovations in presentation/display and offer 'activation' at the point of sales	- merchandising aspects of the sales process; - informing customers (smartphone applications, information terminals); - special in-store attractions (new arrivals, 'premium' products, etc.).
d. Innovations in the selling process	- mobile shopping assistant (on various gadgets); - testing and creativity room; - innovative payment and settlement systems; - buy-back and customer incentives to recycling.
e. Complex customer loyalty programs - to the store brand and its offer	- addressing intermediaries with a role in products and services prescription, (craftsmen who performs various works at the customer's location); - addressing organizational customers (construction companies); - addressing the end consumer.
f. Innovations along the supply chain	- in the supply process - in the transport process - in the storage process - in the inventory management at the store

Table no. 1 – Typology of innovations in bricolage trading
Source: realised by the authors of this research

Interlocutors have expressed their availability to classify innovations by categories they considered related to the applied field of the research (DIY retail trade). This approach presents applicative valences not only for the other investigations of this research, but also for delimiting responsibilities in *promoting* and *communicating* innovation in this context. Consequently, hypothesis **H3 is validated**. The authors observed the interlocutors' focus on innovative aspects generated at the 'mother' company level, as a result of the influence exercised in the commercial concept by the 'centre'. Paradoxically, in Romanian companies (Dedeman, Ambient, Arabesque) availability to innovation was less declarative and more strongly emphasised in practice. All interlocutors are open to specific training activities that involve customers directly in various practical activities, using products purchased from the store (e.g. cultivation of garden or indoor plants, installing tiles at home, painting the domestic environment, planning the bathroom in 3D, etc.). DIY store chains with foreign capital are more likely to invest in innovation because, on the

one hand, access to the latest technology is easier on the developed markets and, on the other hand, financial power of international groups is higher than that of the local ones. In addition, employees can be trained in stores abroad - where the brand is already present – this making possible the accumulation of knowledge that may lead to the creation of innovative solutions on the local market. Moreover, the concern of the vast majority of the interlocutors to highlight the innovative character of the brand they represent was highly appreciated. These considerations led the authors to **accept hypothesis H4**. Interlocutors noticed a change of conduct in the act of purchase. The customer first searches for the product on the Internet and then visits the store to purchase the product. Interlocutors state that it would be useful to place fast-speed Internet access points in the store, allowing quick visualisation of the entire product range. Customised treatment becomes also necessary - including customer loyalty programs - for intermediaries represented by craftsmen from different areas, who purchase goods for their customers. Interesting statements stood out, like: '... earlier this year we started a pilot project to test craftsmen's reaction to a new loyalty program - if the craftsman makes a purchase for himself, he receives a direct discount on the products value; in exchange, if he brings his own customer in, he is rewarded with a percentage from the value of his customer's purchase, the cash bonus being transferred directly to his account. The pilot program has been successful, which encouraged us to extend it to country level,' declared a DIY store manager; '... I have recently visited a retailer, where I saw a very useful customer loyalty device. It scans the customer's access card and discounts are then offered based on the information stored in the database about that customer's purchase history,' said a marketing director of one of the analysed networks. It could be observed that the DYI market is characterised by a minor concern for customer loyalty. Loyalty initiatives via the card are more punctual measures than a coherent plan to increase customer attachment to the products. The discussions showed quite clearly the *lack of a systematic approach* of the brand attachment process. Such a system would start from a *customer database* (based on classification criteria such as the nature and destination of the purchases, the average purchase amount, etc.), which is a prerequisite to *strategies of personalised customer treatment*, in terms of attachment/loyalty. Such a concept would be complete through a permanent marketing-controlling frame (Pelău 2009: 43-50). Buyers are more informed and, as a result, when they visit a store, especially a DIY one, they expect to find a wide range of products, of a high novelty level. One of the interlocutors stated: '... We had cases of customers who came and asked us if we had product X or Y, about which they had read in a specialised magazine. We often expanded our range of products and services based on customers' proposals'. However, the research showed that there was no systematic concern for the registration of innovative proposals coming from customers, and even much less for their consistent processing. All these elements lead to the **validation of hypothesis H5**.

Conclusions

The exploratory pilot research proved itself very useful for the authors, in terms of assessing the situation in the bricolage networks from Bucharest, but also for the subjects of the investigation, in terms of a series of conceptual clarifications, with operational implications. The study will be followed, at this stage, by a *projective test* conducted on operational store managers. This form of non-verbal communication is recommended in situations where people want to discover 'hidden' motivational elements, that verbal communication could not accurately stress (e.g. the attitudes of operational staff towards an extra effort required 'to highlight innovation' or to learn new marketing and customer guidance techniques). We strongly believe that the second and third stages of the planned research will allow a much clearer delineation of how innovation is perceived and communicated by all company stakeholders in the retail trade of bricolage products.

ROMANIAN CUSTOMER-BASED EMPIRICAL RESEARCH ON AMBIANCE IN RETAILING

Pop Ciprian-Marcel
Babeş-Bolyai University
Faculty of Economics and Business Administration

Dabija Dan Cristian[1]
Babeş-Bolyai University
Faculty of Economics and Business Administration

A special role in increasing customer satisfaction and contentment with any retail store is played by ambiance or in-store management. Store ambiance is closely related to all decisions taken concerning the manner in which the management can organise the store, arrange gondolas and shelves, resort to lighting and specific scents (smells) or set temperature in different departments. For consumers, ambiance also means enjoying pleasant atmosphere during shopping, conveying a sense of adventure, arousing positive feelings which make the customer return to the store, increase the volume of purchase and even recommend the unit to other people.
 The present study attempts to highlight the methods whereby a retailer manages to influence the customer by means on in-store management tools with a view to creating a favourable image in his/her mind. The research conducted on about 1800 customers in the Romanian food and non-food retailing reveals, through pertinent interpretation, the management strategies and actions that the enterprises of different retail formats should adopt in order to approach customers with beneficial results.
Keywords: in-store-management, ambiance, retail formats, physical evidence, food and non-food retailing
JEL Classification: M3, M31

Introduction

The policy of physical evidence as material part of a service corresponds in retailing to interior design policy also called ambiance policy or in-store management policy. Physical evidence includes the space inside the store, the arrangement of shelves and gondolas, the manner in which items are exhibited and the unit's working hours (Oehme, 2001: 122). Ambience policy is concerned not only with standardizing the building and its interior but also with spatial layout, arrangement of gondolas, systematization of decoration, ensuring a constant and pleasant music or using lighting (play of light). Delicate scents or attractive colours also make an essential contribution as they create a convivial shopping atmosphere, bring customers enjoyment or convey them a sense of adventure and ensure a secure and relaxing purchasing environment. Furthermore, through the elements of the ambience policy, the retailer will seek to extend the customer's pleasant stay in the store. At the same time, ambiance policy will seek to strengthen the retailer's image in the public's mind, increase the retailer's chances of development and achieve comparative competitive advantages (Severin & Louvière & Finn, 2001: 185-202).

Objectives of ambiance policy

Creating a pleasant shopping atmosphere and conveying a feeling of pleasant spending of time seem to be one of the most important objectives of ambiance policy (Liebmann & Zentes & Swoboda, 2008: 596). These objectives stand as grounds for recording higher turnover per area unit as well as custom increase and higher expenditure per customer. A pleasant atmosphere favours purchases made in the heat of the moment, ensures ease of purchase and prolongs the time spent by the customer in the store. This may thus lead to an increase in customer loyalty toward the retailer or the entire chain which, in turn, allows a better consolidation of the unit's image in the consumer's mind (Diller & Kusterer, 1987: 105-123).

The conveyance of feelings of pleasant spending of time during shopping or the sense of adventure or novelty is made through the assortment as well as the communication or service policies. A very attractive package, a unique design or just a simple board trying to stimulate consumption through emotional appeal, all these are nothing else but subtle ways of influencing consumer behaviour and improving some economic indicators.

Characteristics of ambiance policy

For the purpose of ensuring a proper in-store management the retailer has the possibility to choose from a vast array of methods, techniques and tools whereby the customer is determined to spend a longer period of time in the store, being surrounded by a pleasant, enticing atmosphere, perfectly fit for making purchases. Thus, the retailer's decision-makers will first and foremost a careful and clear delineation of the floor space into areas for merchandise display, areas for personal advising, for traffic flow (stairs, aisles), checkouts or fitting rooms. Additionally, the retailer will seek to make a proper arrangement of gondolas and aisles between them to ensure a smooth flow of customers, a logic display of assortment and items on shelves and gondolas so that they may be visible and facilitate the access of customers. This will further contribute to creating synergies and positive effects which will prompt customers to remain in the store for a longer time and increase their trust in it (Birker & Voss, 2000: 58; Kroeber-Riel & Weinberg, 2003: 437).

In-store arrangement will have to be made by likewise taking into account items display. Items display is usually done depending on how useful it is to potential customers, on the satisfied need (organic food products), a special event (Christmas or Easter items), the provenance of articles (from the X or Y manufacturer, items from Germany etc.) and the height of gondolas. Gondolas are generally divided into four height levels according to which items are exhibited. The space between the ground level and 80 centimeters above it shall be filled with heavier items that do not sell very well and items that make a smaller contribution to the store's turnover. The items sold at discount prices are also placed in this space as a means to promote sales. Whereas the first level is thought of as a „bend down" space, the next level, between 81 and 120 centimeters, is thought of as a „grasping" space. This level is designed for items of average price, specialties and items that generate massive sales as well as other marketable items. The space between 120 and 160 centimeters above the ground represents the "aiming" level where premium and impulse items are exhibited along with items that generate increased sales. The "stretching out" level, from 160 centimeters upwards, mainly contains light and very light items up to 1.5 kg and attention-drawing items (Liebmann & Zentes & Swoboda, 2008, p.603).

Another aspect of in-store management is the proper and attractive decoration of departments, equipping the sales area with adequate lighting and the use of visual communication. Whereas yellow is used to convey appeal or enjoyment, red may be used to stimulate consumers and capture their attention. Green may evoke quietness and blue may convey relaxation. By resorting to different colours, the retailer will seek to emphasize the psychological effects they produce and thus better influence consumers (Birker & Voss, 2000: 58; Chebat & Morrin, 2007: 189-196, Alt, 2009: 5-20).

In order that consumers may enjoy a more pleasant stay in the store, retailers may resort to acoustic communication by playing ambient music or broadcasting advertisements, promotions and various special offers by the store's radio. One may also appeal to the senses, particularly the scents (fresh bread at the bakery), fragrance (different combinations at the beverage departments, detergents, fruits), breezes (mountain-like cold wind in the milk sector) or set some temperatures peculiar to certain departments (low temperature for meat, vegetables and fruits and high temperature for recreation areas) (Theiß, 2007: 683).

Due consideration will certainly be given to the manner of organizing the storefront to ensure proper in-store arrangement. The competent, clean and informative display of items in storefronts contributes to capturing the consumer's attention and to evoking pleasant feelings (care exercised by the retailer for each person). Last but not least, storefront display contributes to the presentation of present and future offers and helps customers to take buying decisions. Other significant elements that the retailer's management should include in the organization of the sales area are: information kiosks and screens, barcode scanners for indicating the correct price, terminals where commands are sent, machines for collecting returnable or reusale packaging, film-developing stands or computers with access to internet, various promotional spots, softwares or music tracks (Liebmann & Zentes & Swoboda, 2008: 598-605; Kroeber-Riel & Weinberg, 2003: 437; Birker & Voss, 2000: 58; Chebat & Morrin, 2007: 189-196).

It is compulsory that in-store management should be customer-oriented. For the customer it is very important that his/her purchases should be made within a reasonable time period without long searches for the needed goods. Whenever s/he wishes to feel the complete satisfaction of a pleasant purchase, s/he will likely expect that the store's ambience should be different from that of competitors, should motivate and prompt him/her to action, please him/her and suit his/her lifestyle (Gröppel-Klein, 2006: 676).

Research operationalisation

In order to establish the extent to which consumers in food and non-food retailing manage to perceive the Romanian retailers' in-store management policy, we have operationalised the above-mentioned concepts using similar studies. Proper store management/arrangement makes a full contribution to influencing customers and attracting them to the retail unit. Every time the customer enjoys the store, s/he will be eager to return, purchase again, increase his/her purchase frequency and the amount of goods bought and will recommend the store to friends, acquaintances, relatives or any other persons (Dabholkar, 2000: 139-173).

Various empirical studies highlight the facets by means of which retail in-store management policy may be perceived and assessed by the consumer. No matter what elements are taken into account (the overall in-store ambiance, the customers' easy orientation toward the needed sections/departments, the pleasant and carefully maintained atmosphere or the unit's cleanness and orderliness), the sales area management policy features significant elements that fully contribute to building the customer's image about a particular retail store, chain or brand. Table 1 shows the dimensions whereby the in-store management policy has been measured with the aid of the statements included in a field research that was conducted by the authors in the food and non-food retailing.

Table 1—Indicators used to quantify in-store management from the customer's perspective

The analysed store...	Quantified dimension
… has created a relaxing ambiance.	General ambiance
…has divided the floor space in a way that allows easy orientation.	Simplicity of orientation
… provides simple and comfortable purchases.	Purchasing comfort/ease
… has created a pleasant shopping atmosphere.	Pleasant atmosphere

| … is always clean, neat and tidy. | Cleanness of the unit |

Research methodology

In order to check in a suitable way the theoretical concepts previously described, the method employed was the survey. The questionnaire referred to Romanian consumers' perception of food and non food retail units present in one of the most important and relevant economic regions of the country. The data collection phase took place in 2011 under the coordination of one of the authors (Dabija). More than one hundred interview operators have been used and the number of collected questionnaires has reached almost 2.000.

The specific and original research undertook was carried on 732 randomly selected Romanian consumers in non-food retailing, and on 1.048 randomly selected Romanian consumers in food retailing. A quota sampling on age and sex was utilized, according to demographic data from the Annual Romanian Statistics Report (2010). The face-to-face interviews were conducted in the second largest city in Romania, were the majority of the 30 identified food retailers, respectively more than 100 non-food retailers are subsidiaries of Western Europe large retailers. These have penetrated the Romanian market 16 years ago, due to the growth opportunity in this sector.

Two pieces of research were actually conducted simultaneously, similar questionnaires being used and customized both for the food and non-food retailing. It was not our intention to focus on a specific retail format, thus the number of questionnaires varied among the formats (hypermarket, supermarket, DIY...). Classification on retail formats (hypermarket, supermarket, discount, etc.) has not been introduced to respondents, but it has been carried out by the authors (Barth, 1999: 88; Dabija, 2010: 77; Liebmann & Zentes & Swoboda, 2008: 394-419).

Of the 1048 questionnaires administered in the food retailing, 41 dealt with the cash & carry units (Metro and Selgros) which operate to a great extent on the Romanian market as retail units despite the fact that they should operate solely as wholesale units. 152 questionnaires dealt with discounters (Lidl, Penny), 345 with hypermarkets (Auchan, Carrefour), 112 with proximity stores (mic.ro, CBA), 200 with supermarkets (Carrefour Express, Unicarm) and 198 with the "category killers". Only Kaufland was included in the last category because the unit markets items at low prices (a characteristic of discounters) on large areas (characteristic of super and hypermarkets). According to the literature, "the category killers" will most likely lead in time to the disappearance of discounters, hyper and supermarkets (Gilbert, 2003: 248).

In non-food retailing the research focused on the following retail formats: 43 retail centers and markets (Iulius Center, Piaţa Mărăşti), 54 DIY units (Praktiker, Hornbach), 16 furniture stores (Mobexpert, Obi), 79 electrical and household appliances units (Altex, Domo, Media Galaxy), 14 computer stores (Intend, Intel), 248 clothes stores (Bershka, Zara, H&M), 44 sports stores (Hervis, Decathlon), 74 shoe stores (Leonardo, Deichmann), 39 bookstores (Diverta, Humanitas), jewelry and watches stores (Meli Melo, Mango touch), 9 cosmetics and perfume stores (Douglas, L'Occitante), 27 interior decoration stores (Bam Boo, King Art), 10 units marketing mobile phones and accessories (Germanos, Cosmote) and 34 pharmacies and drugstores (Catena, Sensiblu, DM).

In order to test the trustworthiness and correctness of the operationalised statements, the research resorted to Cronbach's alpha coefficient and the "item-to-total" correlation (Hälsig, 2008: 120). Cronbach's α quantifies the internal consistency of the analysed variables and takes on the average value of all possible correlations established between any combination of two items. In order that the variables to which Cronbach's α is applied should be trustworthy, the value of alpha must be as close to 1 as possible. The "item-to-total" correlation measures the degree to which an item belonging to a particular model is (in)consistent with the average behaviour of the

items belonging to the same model. This actually helps to discard those variables which lead to higher values of Cronbach's alpha (Peterson, 1994: 381-391).

The application of the two tests to all variables of a retailer's ambiance policy revealed an alpha coefficient of 0.902 (a relatively great trust). Moreover, it has been ascertained that by discarding any of the variables, Cronbach's α does not take on a greater value.

Average findings

Overall, the research conducted both in food and non-food retailing revealed that, regardless of the retail format, ambiance is perceived in a positive light. On average, all variables indicated relatively favourable appreciations (the assessment was made on scale from 1 to 7).

However, as Table 2 indicates, slight differences were noticed between the two types of retailing in terms of consumers' perception of ambiance. From the respondents' perspective, non-food retailing scored higher than food retailing in terms of ambiance. This was particularly so for the cleanliness variable which was more carefully monitored in the case of non-food stores.

Table 2 – Respondents' average answers for the overall sample as well as for the two sub-samples

Characteristic No. of stores	Non-food retailing 732	Food retailing 1.048	Total Sample 1.780
General ambiance	5,34	5,24	5,28
Simplicity of orientation	5,52	5,56	5,54
Purchasing comfort/ease	5,48	5,52	5,50
Pleasant atmosphere	5,47	5,41	5,44
Cleanness of the unit	5,59	5,41	5,49

Source: own research.

With regard to the perception of ambience in units marketing universal products, we have to pinpoint, although not unsurprisingly, the very good image, far above the average, of the big units belonging to international retail chains, despite the fact that one would expect in this case, at least theoretically, possible problems related to the unit's appearance. A very weak perception of ambiance was recorded in the case of proximity stores and some local supermarket chains, the most likely reason being the lack of performance in displaying merchandise and organizing departments which, in the case of bigger units, are more visible and more spaced out. It is crystal clear that respondents approved of the tendency exhibited by the managers of these bigger units to "surpass themselves" and display merchandise in a way that makes visitors feel relaxed.

Table 3 – Average answers according to food retail formats

Characteristic	Retail format					
	Cash & carry	Discounter	Hiper-market	Proximi-ty	Super-market	Category Killer
General ambiance	5,71	5,40	5,38	5,05	4,85	5,28
Simplicity of orientation	6,20	5,72	5,63	5,31	5,20	5,70
Purchasing comfort/ease	5,85	5,74	5,57	5,28	5,20	5,66
Pleasant atmosphere	5,80	5,58	5,51	5,29	5,08	5,43
Cleanness of the unit	5,59	5,55	5,50	5,34	5,11	5,46

Source: own research.

Table 4 – Average answers according to non-food retail formats

Caracteristică	... store							
	Clothes	Sports	Shoes	DIY	Electrical	Pharmacy	Interior decoration	Book
General ambiance	5,43	5,34	5,38	5,35	5,03	5,00	5,67	5,71
Simplicity of orientation	5,58	5,52	5,64	5,57	5,34	5,09	5,48	5,74
Purchasing comfort/ease	5,61	5,48	5,38	5,54	5,22	4,91	5,56	5,63
Pleasant atmosphere	5,60	5,45	5,31	5,43	5,23	4,82	5,85	5,79
Cleanness of the unit	5,67	5,66	5,57	5,54	5,35	5,32	5,78	6,03

Source: own research.

The respondents' attitude in non-food retailing seems to be closely related to the store's profile, their perception taking on surprisingly low values for electrical stores, retail centres and pharmacies/drugstores. A possible explanation to this phenomenon could be the heterogeneity of the current design of these retail formats, both in terms of their organization and the offer provided to visitors. To a certain extent, this phenomenon mirrors the attitude of supermarket managers who focus excessively on exploiting each square metre to the full.

Conclusions, perspectives and research limits

Naturally, some of the stores under examination were not sufficiently represented in the research. Being aware of this major limit which may lead to erroneous interpretations, we propose to conduct a follow-up empirical study in order to obtain a larger number of answers from the customers of cosmetics, pharmacies and computer stores, particularly because in these stores some negative perceptions were confirmed.

Another limit is, in our opinion, the result of the Romanian consumer's lack of experience with modern retailing, cross-selling and the much more extended and complex self-service process in the current retailing.

Mention must be made, however, of the visible progress made by the current customer and the fact that s/he has become increasingly demanding over the quality of in-store performance and physical evidence of the retail units.

SMALL FARMERS FROM RURAL AREAS ATTITUDE ON ORGANIC FOOD

Roşca Mihai Ioan

Morar Mihai Gelu
The Bucharest Academy of Economic Studies
Marketing Faculty

This paper is one of the few marketing research done in rural areas of attitudes towards green products. Even if the subject is generally treated at the international level, Romania has an important specific is to be taken into account in the European area. Size of agricultural holdings and their degree of technology do not have the desired agricultural economic efficiency of modern economies. But by applying marketing techniques and by approaching customer needs, the agricultural sector in Romania can develop in another direction no longer going through the business model of major West European farmers. We are referring here to transition to a agriculture on small areas, intensively exploited and ecology and a system of distributed in the markets with a big search for such products. But he must know how people in rural areas see these green products and how they are trained to understand the concepts of green marketing and marketing organic products. These issues have been dealt with in the first part of the work. The second part of this paper aims to describe the attitude of small agricultural producers towards organic products and the degree in which they are willing to go to such a production. Research is based on a survey an explorer in two rural areas of Romania one at the mountain and the other in lowlands and shows the degree of adaptation for small producers to new market requirements. Results have been contradictory. Some of them have confirmed the assumptions, namely the opening to such a grown for, and others have shown a much greater degree of the use of chemical compounds in agriculture than expected. Also the degree of taking the initiative in rural areas was an issue that came out at a level lower than expected. This is a worrying conclusion but worth being taken into account. This research gives the image concept in rural areas being the starting point for further research and strategies which to propose turning Romania into a net exporter of organic production.
Key words: green marketing, bio food,, rural market
JEL Classification: M31

I. Introduction

In the recent years people began to be interested in protecting health and the environment by using earth resources rationally and making agriculture a reinvention of a conventional organic one. Several companies have emerged to support these ideas and even promotes environmental or selling such products. In big cities have appeared numerous companies and products certified organic. There is an ecological market peasant products formed parallel but nobody ever made an analysis of the perception of these small producers of organic products. There are several programs that encourage this type of production but, the interest is to see what the perception of this concept in this area is. Developing this type of production and introducing the modern retail system would bring huge benefits to both small producers and the entire national economic system.

In the current consumer market has become more demanding and began to consider the decision to purchase several aspects of environmental quality of products, type of packaging (biodegradable or not), their effects techniques production and environmental technologies and social behaviour of companies. It makes the transition from traditional consumer to consumer "green" - social responsibility. Ecological concerns not only reflect the final product, but the entire field of production of product from producer to consumer. Modern consumers want guarantees that the products purchased in greening their meaning. This is why governments and supra-state institutions attempted to regulate the problem. If you really want to support the development of organic food production as a way of getting the profit, must not only respect the legal rules, but to be one step ahead by studying small producers, consumers and understanding their perception of these issues. And so it meets a real need for research and economic adaptation of scientific research these real problems lead to an improvement of our system of socio-economic life.

II. Literature review/ previous research

"Green marketing, from traditional marketing is directed toward community interests and environmental protection, the environment is changing. In other words it is directed towards environmental protection and quality of life ". (Danciu 2006: 25)

Green marketing should push for the use of clean technologies oriented toward saving resources and other sectors, such as production, which should be considered ecological qualities and packaging of "eco". (Stoian 2003: 16)

Eco-product is defined in terms of American professor Philip Kotler in the book "Ecomarketing" written by M. Stoian as "a service vehicle". "Eco-product is the product that consumers demand and at the same time harmonize their interests, the short, medium and long term. As long as eco product demand is steadily increasing adaptation to market needs is a simple way to increase profit entrepreneurs.

Organic products are included in the ecological products. The European Commission's view, organic products are those products derived from organic agriculture (including both plants and animals), aimed at "getting fresh and authentic processes designed to respect nature and its systems." (European Commission)

"Organic Production, consumption is an interesting option because it satisfies three needs at once. Are perceived by most consumers as compared to conventional tastes much better and healthier and the production process is less harmful to the natural environment. "(Garcia and Magistris, 2008: 386)

"The interest in organic food is seen to increasingly higher among consumers around the world, because agriculture" organic "Assurance of quality organic products that help consumers to take care of their health and families." (Roitner-Schobesberger et all 2008: 112)

Numerous studies in Europe and the United States have shown that the choice to purchase organic products is strongly motivated by the desire of a state of good health and taste much better than these organic products than conventional products taste and the belief that organic products are grown on healthy principles and protect the environment and animal welfare in their growth process. (Arvola 2008: 443)

On the Romanian market can be bought organic food from organic specialty stores, shops and organic products are on offer as are the supermarkets and online stores would have to offer organic products. Another option is to purchase products directly from manufacturers. Their list - the address, telephone and even e-mail - can be found on the website of the Ministry of Agriculture, Organic Agriculture section. Although not all large retail chains have highlighted green products on their shelves in many hypermarket chains emerged districts bio spaces. Unfortunately most of them are important products especially from Austria and Germany. Based on this observation our work was designed to see what is missing from the Romanian system to

make our own organic products get easier on the market environment. Emergence of big retail chains and changing consumer preferences to products sorted, packed and labeled to meet quality and food safety principles tend to reduce the percentage of production sold at the farm gate for organized markets. This percentage is declining as a result of increasing trade through intermediaries.

III. Research methodology

Aim of this study is to determine perception of ecological products in rural areas.

The objectives are:

1. Existence of ecological education in rural areas.

2. Awareness of ecological products in rural areas.

3. Analysis of rural respondents' perception of ecological products.

Right from the beginning we state that this study is not conclusive but an exploratory research. As a research method a survey was realized. 150 questionnaires were applied in rural areas. 90 were applied in Harghita County, Toplita area and 60 were applied in the Old Kingdom, the County the area Titu. The two areas chosen have no statistical significance they were chosen primarily because of ease of authors to collect data from these regions and secondly as a means of checking to see if there are common views in the two rural areas so different. Data collection took place in summer 2011.

Sampling was done by the "snowball". (Cătoiu et.al 2009: 534) The questionnaire was initially applied to residents of the areas studied and through them was applied on to their friends and acquaintances. The target group consists of individuals residing in rural areas, does not apply other demographic restrictions.

Because livestock and agricultural production are the basics of their own subsistence respondents were asked to exemplify that livestock are the main crops household and area exceeding 500sqm.

IV. Results

The analysis of responses shows that 87% of respondents see their production of the household as a green, and only 10% do not perceive farming. Of knowledge and experience so far this is not necessarily true because many of those who say that their organic production uses chemical fertilizers and chemicals for pest removal.

Through the media over half of respondents first learned the concept of ecological, 15% have heard from friends and almost 10% of magazines. Interestingly, although the research took place in rural areas 8% of respondents have heard about organic products through the Internet. Although we expect the mayor to have increased activity in familiarizing people with the concept of ecological still below 1% of respondents indicated it as the place where they learned about the existence of such products.

Wishing to find out if there is a tendency to adapt behavior to the market, respondents were asked whether the last five years have started to grow or cultivate a new assortment of breeds of animals or plants. 67% of respondents respond negatively and only 32% responded positively.

Reasons for trying a new plant variety or a new breed of animals refers mainly to an increase in output or productivity 12% and 6%.

Because in recent years discussions about accessing pre or post-accession funds have monopolized the interest of small producers, we asked a question regarding the wearing of discussions or attending lectures or meetings held with the format farming subject. The answer is disappointing only 6% of respondents stating that they have taken part in such events. Of the seven respondents who participated in such meetings in June admitted thinking of going to transform the mode of production. Directions of change have been dictated by obtaining more green products, to increase the quantity or remove products such as chemical fertilizers, herbicides or pesticides in production activity.

Although he saw some interest in organic products however request information from specialized institutions is very low, only 12% of respondents resorting to this method of information. Most of them have turned to existing information from the Ministry of Agriculture, a respondent turned to information provided by the institutions that manage European funds, one to the media, and one by the information could be provided by the municipality.

Most common place to search for information has emerged to be the Internet more than 50% indicating it as the main source of information.

The media is another important source of information 40%, along with magazines 27%. Only 23% of respondents would call the specialized agencies to obtain information, while 20% would turn to information held by friends. In last place are municipalities with 17% of respondents indicating it, as a potential site for information collection.

The vast majority of respondents use their own production for own consumption only a little over 35% of them sold part of their output. Unfortunately the majority of respondents over 60% of them use chemicals for fertilization and removal of pests or unwanted plants. (Fig. no. 1)

Fig. no. 1 Behavior of agricultural production
Realized by e author

A 12% apply different treatment products for own use from those for marketing, however over 87% do not apply differentiated treatment. Over 80% of respondents would be open to doing away with the use of chemicals in the production process and would return to traditional methods.

However, this transition would be made provided that the price of organic products to be slightly higher than the other products. Thus 29% of respondents believe that organic products should have a price 25-50% higher than other products, 27% would like a price 10-25% higher and 20% of respondents would be satisfied and with a 5-10% higher price. In other words 65% of potential producers would charge a price up to 25% higher than today.

In a battery of 5-scale Likert questions response we analyzed respondents' on various aspects of agricultural production. Thus the statement on chemicals such as fertilizers, herbicides, pesticides or insecticides tends to be relatively respondents agree that they are a necessary evil. There is a clear tendency to focus on the attitude towards them is neutral. Respondents recognize that there is adequate information on organic foods or steps that will be made to obtain environmental certification. Agree that more could and should do more to get this certification, and feel very

strongly need help from City Hall. Place primary responsibility for obtaining these types of certificates to the government.

In view of respondents townspeople rarely buy organic products because they are more expensive 37%, 17% are not found or cannot afford. Western Europe prefer not to buy the Romanian origin because they trust not our products 18%, 14% are low quality, are not promoted enough 12% or have some better 9%. 4% of respondents see as the main reason lack "commercial aspect" that is not provided easy access to our products or because they are more expensive.

The main fault that things go as they should in Romanian agriculture is the government 52%, management 10%, 9% State, or Ministry of Agriculture 5% in other words not to blame but producers are still awaited from the State "to keep our hand as we cross the street ".

As the bivariate analysis, we examined several questions in terms of demographics. Unfortunately due to the relatively small number of questionnaires, many of these correlations have not emerged statistically significant or have given too large calculation errors due to insufficient data. Yet few have emerged statistically relevant.

The area Topliţa declares a higher percentage overwhelming that they have changed their production in recent years from 46.3% in Transylvania to 8.7% in Wallachia. This shows a greater power of adaptation in Transylvania. They also have been more interested in attending lectures, meetings, discussions about agricultural production, as well as organic food production. Although the hypothesis was that we left the mountain agricultural production is cleaner in terms of chemical treatment products, we noticed that all those from states Topliţa a higher percentage (68.7% vs. 50%) that use chemicals to protect from diseases, pests and unwanted plants.

V. Conclusions

Upon completion of this work we can say that rural population has a slightly wrong perception of what organic means. As we showed the beginning of this article, ecological means not only organic products that are not chemically treated but also those that are certified. Unfortunately, no one respondent of those surveyed in this research didn't made such a statement. This gives a poor training to both small producers and the authorities. Unfortunately due to this lack of knowledge we cannot exploit the potential that we have.

Even though more respondents in an overwhelming number said that their products are organic, they also said a 60 percent share of their products are chemically treated. This lack of knowledge has made in recent years much of our potential to lose its organic produce. Chemicals used without respecting quantities make some products to exceed concentrations and production considered as organic by the small farmer actually to be more toxic than those distributed through department stores.

Another conclusion we can draw on the degree of entrepreneurship of rural population. Most expect the state to do various things to increase the profitability of agricultural production. Guilty are always those in power, but training courses attended, associations of small producers, local government initiatives are not choices made by respondents. Trust that the things may change starting from low to the top is not an existing one among the respondents. All are waiting for a solution to come up from the politics and government.

Confidence in their own products or those of farmers like them is lower than industry products. In this case it is very difficult to build a functional business idea.

As recommendations made after doing this research would be the attendance to courses done in order to bring education among the rural population of what organic products, the ecologic way of production, administrative steps to be followed for organic certification, marketing and entrepreneurship means. These courses made for as part of nearly 40% of the Romanians population, the rural one, can become added value in the economy. These courses can be made both by local authorities as well as central initiative and with the help of EU funds. In order to

give an alternative to the rural population in order not have to emigrate in foreign countries to survive.

MARKETING ACTIVITY IN
ROMANIAN MICROCREDIT ORGANIZATIONS

Săvescu Roxana Florenţa
„Lucian Blaga" University in Sibiu
„Hermann Oberth"Faculty of Engineering

Microfinance is the solution that ensures the provision of loans and other basic financial services to those entrepreneurs who have limited access to the banking sector. These financial services provided by microfinance institutions allow small business owners to take advantage of their entrepreneurship skills by developing small businesses capable of generating additional income. As they mature, Romanian microcredit organizations become gradually aware of the importance of marketing in their current activities. The paper presents the results of a qualitative research on the experience and marketing practices in major microfinance institutions in Romania, highlighting at the same time the factors influencing decisions to invest resources in this area. The conclusions of the research reveal that microcredit organizations have a limited institutional capacity to develop complex marketing programs that drive marketing activities and resources to achieve the objectives of the organization. The approach here is one of a reactive management, the situations that pushes microcredit organizations into engaging in some marketing activities and using various instruments being determined by changes in the structure and level of market development and competition or by the availability of funds for current activity. Although marketing interventions should be considered important on all markets, the truth is that different types of markets (emerging, developing, mature markets) require certain marketing activities. The proposed marketing mix contains 8 elements ("8 P") that ought to be optimally combined within the marketing strategy, in order to get the expected response from the target group: product, price, placement, promotion, processes, procedures, personnel, partnership.
The topic chosen for this paper answers a need for know-how in the Romanian microcredit organizations, in terms of their marketing activity. From a scientific point of view, the paper has a pioneering role, representing the first steps taken in Romania towards the in-depth study of the field of microfinance and of marketing in the microcredit industry.
Key Words: marketing, microfinance, microcredit organizations, marketing mix, market.

I. Introduction

Microfinance is the solution that ensures the provision of loans and other basic financial services to those entrepreneurs who have a limited access to the banking sector. These financial services provided by microfinance institutions allow small business owners to take advantage of their entrepreneurship skills by developing small businesses capable of generating additional income. The formal microcredit activity in Romania is carried out by credit institutions (commercial banks which have the microcredits part of their loan portfolio, a specialized bank - ProCredit Bank and a network of credit unions - Credit Coop) or non-bank financial institutions (NBFIs). Since the subject of this paper is related to microcredit organizations, the following lines will refer only to the NBFIs specialized in micro-lending.

II. Literature Review

In 1999, The United States Agency for International Development (USAID) sponsored a global study, *Marketing in Microfinance: the State of the Practice*, regarding the marketing activities practiced by various types of microfinance institutions. This study is apparently the only one of this kind that has ever been done and made available to the public. It provides information on the stage of the practice of marketing in various microfinance institutions worldwide.

On the national level, scientific concerns about the microfinance in Romania in general and about marketing in the field of microfinance, in particular, are almost non-existent. This paper is an extract of the author's PhD thesis.

III. Research Methodology

The paper presents the results of an exploratory marketing research about the marketing activity performed by Romanian microfinance institutions within 2008-2009. The specific objectives of this research have been: a) to identify the characteristics of marketing programs run by Romanian microfinance institutions; b) to identify the determinants (internal and external) of marketing practices.

As the research goal was to obtain accurate and abundant information about the marketing activity practiced by microfinance institutions, the research methodology consisted of a primary-source research - qualitative research - in the form of in-depth interviews conducted with persons involved in marketing from the 8 "traditional" Romanian microcredit organizations (1).

IV. Research Results

The Romanian microfinance institutions are becoming involved in various marketing activities and use different tools, depending on the characteristics of the external environment and on the maturity degree of the institution.

The decision to invest in marketing depends on the access of microcredit institutions to sources of funds for the lending activity.

The activity of microcredit institutions is highly dependent on foreign funds attracted (2). In these circumstances, attracting the funds necessary for running the business is a priority in the microcredit organization's development strategy. As long as this issue is not solved, the management's interest in the marketing activity is minimal. The financial performance is critical to the success of the institution's fundraising strategy. To achieve positive financial results, the microcredit organization must have appropriate products and methodology to ensure a good quality of the loan portfolio.

Romanian microfinance institutions have a limited capacity to develop marketing programs.

Currently, the institutional capacity of microfinance companies in Romania to develop marketing programs is at an intermediate level. The following facts resulted from the conducted research care coming to support this statement:

- the financial ratios reflecting the sustainability and profitability of microfinance institutions are revealing their current priorities: reducing costs by developing methodologies to improve the quality of the loan portfolio;

- the microcredit organizations have begun to develop an organizational culture that supports future investments in marketing. But both customer service and internal communication are developed in an informal, unsystematic way; the systems that are transmitting and processing the information are not very much used in marketing;

- the human resources involved in marketing are usually the loan officers and general manager / credit manager, who are performing this activity along with the lending activity. There is no marketing department and no well-defined marketing strategy.

The development level of the microfinance market has a significant impact on the level of development of a marketing program in a microcredit organization.

Depending on its dynamics in time, the microcredit market in Romania can be divided into three segments: emerging markets (new markets or underdeveloped markets), developing markets (growing markets) and mature markets (developed markets). As the participation in the

microfinance sector increases, both from the demand side (more customers, more diversified needs) and the supply side (several microfinance programs, many microcredit products), the markets evolve from one level to another.

Emerging markets (new markets or underdeveloped markets)

This category includes those geographical areas where there have been no microcredit programs or where, although they existed, they have not obtained favourable results. In these markets, potential customers have limited knowledge (even no knowledge at all) about financial services in general, as these products and services either have never been available or they were not fit to their real needs and possibilities. These emerging markets can be found both in rural areas (in small communes and villages) and in urban areas (various market niches among disadvantaged groups – unemployed, Roma population etc.). In many cases, these areas are isolated communities where the access and communicational infrastructure is underdeveloped. The economic opportunities often have an impact on the initial demand for financial services and on the speed with which the population adopts them.

The challenge for the microfinance institution wishing to enter such a market is to accurately assess the potential demand and then to develop a sustainable model to transform this potential demand into effective demand. This takes time and energy to understand customer needs and to develop (or improve) an appropriate lending methodology. Undeveloped markets are areas of interest for the international donors involved in social development projects. In these circumstances, microfinance companies accessing funds from the international market must develop innovative lending models to ensure the long-term sustainability of the program. In this case, the elements of the marketing mix that require special attention are those related to: distribution (what distribution systems are optimal in approaching these markets?, where must the local office be placed?); promotion (what communication channels must be chosen to inform potential consumers about the availability of products on the market?); personal (can current employees be used or should additional staff be hired to serve a new market?); processes (what changes are internal processes suffering by extending the work on a new market?); partnerships (how should the client be "educated" about the financial behaviour he/she must adopt and the financial discipline he/she must obey to). The other marketing mix elements relating to products, pricing and procedures can be reproduced from the experience already accumulated on other markets.

Developing markets (growing markets)

Developing markets can be found in rural areas (bigger communes) and small towns (<50,000 inhabitants) that have economic potential for development. These markets are characterized by an increasing demand for microcredit, which is and will be met by existing or future microfinance programs. This demand comes from existing customers and potential customers who have heard of the available microcredit products and see their effect on customers who have accessed them. In many cases, there is only one microcredit supplier operating in the area. The challenge in this situation is to develop appropriate internal systems to manage growth. Attracting customers is relatively easy and the lack of competitive environment offers these customers few options, so the microcredit organization has a high retention rate. As a developing market proves to be profitable, it gradually attracts the attention of other microfinance and credit institutions (banks). The introduction of a microcredit program in a growing market is relatively easy. The stages of market research and product development - which are difficult and expensive components - have already been made. The awareness of the products among customers is high, so new microfinance institutions would only have to simply reproduce the existing experience. The size of the population and the economic potential of the area play an important role in the market growth rate. As the market matures and there is more competition between microcredit organizations, the clients portfolio growth rate decreases and customer retention becomes more difficult. On a developing market, the elements of the marketing mix that require attention are

(3): promotion (on what elements must the communicational strategy be built and what communication channels should be used?); staff (what incentive must be used so that the staff is motivated to manage a growing demand?); processes (how can the internal processes be optimized, in particular those related to documents and information flow?); procedures (what are elements that can be optimized so that the customers are served very fast?); partnerships (is there a maximum customer satisfaction?). On developing markets, the microcredit organizations are not investing resources in developing new products, but in diversifying the existing range of products by improving the some attributes of existing products, often as a response to competitors' actions.

Mature markets (developed markets)
Mature markets (developed markets) are usually found in bigger cities (> 50,000 inhabitants). In a developed market, a higher percentage of potential demand has been transformed into effective demand, customers already being extensively using various financial services. Microfinance institution's efforts are focused now on keeping the clients and increasing the productive loan portfolio (disbursing bigger loans), taking care that this is done by keeping a high quality of the lending activity. Increased competition is a characteristic of mature markets. Many suppliers mean that customers have more options to choose from. At the same time, competitive forces put pressure on the price to be charged to customers (effective interest rate). In these conditions microfinance institutions must improve their operational efficiency. The marketing mix elements that deserve attention in this case are: product (what new products have to be developed to meet the customers' increasingly diversified needs?); price (what price strategy should be applied to ensure the maintenance of customer relationships?); promotion (what promotion techniques must be developed?; does the real image of the institution correspond to the desired one?); procedures (what procedures should accompany the new products?); personnel (how must the sales force be managed so as to avoid "downtime" in work and to motivate of employees?); partnerships (how to optimized customer service?).

The challenge to invest in marketing is given by an increasing competition on the market.
The development of the competitive environment often takes place in parallel with the market development. On emerging markets, competition is very low, often nonexistent. It increases on developing markets and is very strong on mature markets. Once competition becomes more intense, microcredit organizations feel the threatened that they might lose the market share they have, and they start to invest resources in marketing activities to help them maintain their market position. In urban areas (cities), the main competitors are other microfinance institutions. Also banks, with the consumer loans are major competitors. The rural market (small cities and towns/villages) is relatively divided geographically between microcredit organizations. Here, banks have just started to open small local offices.

In the effort to craft an effective marketing program, particular attention should be paid to develop a marketing information system and to manage the sales force.
Microcredit organizations that started to develop marketing programs have realized that they need financial, human and information resources to make them work. Loan officers being the first line contact with customers, their activity is critical for the success of the institution. However, as the organization develops, it feels more acutely the need to develop internal systems to streamline the flow of information throughout the institution. Small institutions are able to closely monitor customer behaviour through informal meetings or occasional discussions between management and loan officers. Larger institutions with multiple branches in the territory and large portfolio of clients need formal information systems and a marketing department.

Most microfinance institutions in Romania haven't developed complex marketing programs to guide the marketing activities and resources in order to achieve the goals of the organization. The dominant practice is the reactive management.

So far, the marketing effort in microfinance institutions was a spin-off of specific market problems to which the institution has sought solutions (increased competition, pressure from customers etc.). There was no organized effort, able to anticipate problems that may later prove to be opportunities or threats to the institution. None of the institutions started its activity with an advanced marketing program, some of them have just entered into this phase, learning from experience.

V. Conclusions and Implications

In conclusion, it can be said that, having a limited institutional capacity, Romanian microcredit organizations began to develop marketing strategies and practices that other industries have been applying for a long time. The first step to design successful strategies is to realize and understand the value and strategic role that marketing is playing in developing the institution. Then, the challenge is to develop internal capabilities to successfully apply these techniques. Although marketing interventions should be considered important in all types of markets, the reality is that different types of markets require certain marketing activities. Table 1 shows the characteristics of the marketing mix elements, depending on the level of market development.

Table no. 1 Characteristics of marketing mix, depending on the degree of market development

Marketing mix	Emerging markets	Developing markets	Mature markets
Product	• Copying the products from on similar markets	• Improving existing products	• Developing new products
Price	• High price, in terms of a risk management policy (loans in small amounts)	• Maintaining the price	• Decreasing the price for repeated loans, as a strategy of customer relationship
Placement	• Developing innovative distribution systems	• Keeping the existing distribution systems	• Optimizing the distribution systems
Promotion	• Commercial promotion techniques with the purpose of informing	• Commercial promotion techniques with the purpose of persuading • Corporative promotion techniques with the purpose of defining the organization's image	• Commercial promotion techniques with the purpose of reminding • Corporative promotion techniques with the purpose of consolidating the organization's image
Personnel	• Recruiting and training the new and old staff / training the old staff	• Stimulating and training	• Stimulating and training
Procedures	• Coping the procedures existing on similar markets	• Improving existing procedures	• Keeping existing procedures / developing new procedures
Processes	• Developing the processes	• Optimizing the processes	• Keeping the processes
Partnerships	• Initiating the relationship and educating the client	• Developing the relationship with the client	• Improving the relationship with the client

Source: developed by author

It is obvious that most marketing interventions are required on new markets and mature markets compared with developing markets. The type of marketing instruments needed by microfinance institutions in each of these types of markets depends on the maturity (level of development) of the institution, the importance that management is paying to a customer-oriented strategy and the availability of funds for lending.

VI. Notes
(1) Romanian microfinance institutions subjects of these marketing research are: ROMCOM IFN S.A. – Oradea, INTEGRA IFN S.A. – Oradea, Capa Finance IFN S.A. – Cluj Napoca, Opportunity Microcredit România IFN S.A. – Târgu Mureş, Centrul pentru Dezvoltare Economică – Bucureşti, FAER IFN S.A. – Reghin, LAM IFN S.A. – Ilieni, MicroImo IFN S.A. – Cluj Napoca.
(2) National legislation does not allow microfinance companies to mobilize savings or other repayable funds from the public (except public "microcredit" funds provided by government agencies). In these circumstances, the financial resources of a microcredit organization consist of internal resources (own resources) and external resources (loans from the various national or international donors). Between 75% and 90% of total assets of mature Romanian microfinance institutions are financed with external resources – loans from international donors.
(3) The marketing mix proposed by the author in the field of microfinance services is adding particular elements (partnerships, procedures, processes, people) to the classical "4 P" elements of the marketing mix (product, price, placement, promotion).

RECOMMENDATIONS REGARDING THE INSTITUTIONALIZATION OF MARKETING RESEARCH ACTIVITY IN ROMANIAN MICROCREDIT ORGANIZATIONS

Săvescu Roxana Florenţa
"Lucian Blaga" University in Sibiu
„Hermann Oberth" Faculty of Engineering

As they mature, microcredit organizations in Romania are becoming aware of the importance of marketing in their current activities. Although marketing interventions should be considered important on all types of markets, the reality is that micro-credit companies in Romania have a limited institutional capacity to develop and implement marketing programs. This implies that marketing efforts should be focused and marketing needs should be prioritized, according to the appropriate level of market development (developing markets, growth markets and mature markets). The paper presents the results of an exploratory marketing research study regarding the marketing activity performed by microfinance institutions in Romania. The purpose of the research was to identify courses of action to institutionalize marketing research in the current activity of the subjects analyzed. It has been our intention to give a very practical dimension to the recommendations regarding the marketing information useful for microcredit organizations and categories of marketing research needing to be conducted regularly, making them applicable within the specific Romanian environment.

Given the fact that on a national level scientific concerns about microfinance in Romania, in general or about marketing in the field of microfinance in particular are almost nonexistent, this thesis can be regarded as an innovation. This conclusion comes both from the investigation of existing literature and from the author's interviews with managers of microfinance institutions who have argued that this was the first time when Romanian academic institutions got interested in this sector. Potential beneficiaries of the results of this study are: managers of microcredit organizations interested in the development and sustainability of the institutions they manage; various national and international organizations interested in designing technical assistance programs in the areas identified as being necessary; academic institutions, interested in improving the offer of educational services in the field of microfinance; researchers, interested in developing practical tools for the development of the microfinance sector, in general; the general public, who comes in contact with an area less or not at all known until now.

Key words: marketing, marketing research, microfinance, microcredit organizations, market.
JEL Codes – M31

I. Introduction

Microfinance is the solution that ensures the provision of loans and other basic financial services to entrepreneurs who have limited access to banking sector. These services allow them to take advantage of their entrepreneurship abilities by supporting the development of small businesses that generate additional income. Microfinance institutions are organized under various legal forms (microcredit organizations, non-governmental organizations, commercial banks, non-bank financial institutions, credit unions, microfinance programs etc.) and act almost similar to banks. They differ from banks through quick service and simplified lending procedures, working closely with the client and the community to which he/she belongs, focusing less on collateral and more on the potential of the business, the entrepreneur's character and his/her image in the community. While developing their activity, microcredit organizations become aware of the importance of marketing in their current activities. The next challenge is to institutionalize the process of marketing research inside the organization, in order to develop strategies in line with the market conditions and institutional characteristics.

II. Literature Review

In 1999, The United States Agency for International Development (USAID) sponsored a global study, *Marketing in Microfinance: the State of the Practice*, regarding the marketing activities practiced by various types of microfinance institutions. This study is apparently the only one of this kind that has ever been done and was made available to the public. It provides information on the state of the practice of marketing in various microfinance institutions worldwide.

On the national level, scientific concerns about the microfinance in Romania, in general or marketing in the field of microfinance, in particular, are almost non-existent. This conclusion comes both from the investigation of existing literature and from the author's interviews with managers of microfinance institutions who have argued that this was the first time when Romanian academic institutions got interested in this economic sector. This paper is an extract of the author's PhD thesis entitled *Enhancing Competitiveness in Romanian Microfinance Institutions through the Direct Use of Marketing Research Techniques.*

III. Research Methodology

The paper presents the results of an exploratory marketing research about the marketing activity performed by Romanian microfinance institutions within 2008-2009. The purpose of this research was to identify the types of marketing studies that can assist Romanian microcredit organizations in their marketing plans. The specific objectives have been:

- to identify the characteristics of marketing programs run by Romanian microfinance institutions;
- to identify the determinants (internal and external) of marketing practices.

As the research goal was to obtain accurate and plentiful information about the marketing activity practiced by microfinance institutions, the research methodology consisted of a primary source research - qualitative research - in the form of in-depth interviews conducted with persons involved in marketing from the 8 "traditional" Romanian microcredit organizations (1).

IV. Results of the Research

In outlining the categories of marketing research recommended to Romanian microfinance institutions, the following aspects have been taken into account:

- external environmental factors, characterized by frequent fluctuations, may favor or hinder the development of microfinance industry in a specific period of time. Therefore it is difficult to craft a long-term strategy;
- microcredit organizations have a limited institutional capacity to design and implement marketing strategies and programs (limited human, financial and information resources);
- the national microfinance market is characterized by the existence of specific regional markets in terms of stages of development: emerging markets, developing markets and mature markets. Thus, the required marketing information varies depending on the level of market development.

Marketing research for emerging markets

Emerging markets are geographical regions where microcredit programs have never existed or, if they existed, they have not obtained favorable results. In these markets, potential customers have limited knowledge (or no knowledge at all) about financial services in general, because these products and services have either never been available or, although available, have not met their real needs and possibilities. These emerging markets can be found both in rural areas (in small communes and villages) and in urban areas (various market niches among disadvantaged groups – unemployed, Roma population etc.). In many cases, these areas are isolated communities where access and communicational infrastructure is underdeveloped. The marketing objective on emerging markets is to create a market for the products. Because of their limited institutional

capacity, microcredit organizations should address the new emerging markets that have features similar to those currently underserved. The scope of marketing research in this situation is:

- external environment analysis (macro-environment and local external environment) in order to identify the factors with a positive / negative influence on the microcredit program;
- demand analysis, market segmentation, assessment of the market segments and profiling the microcredit consumer; studying the characteristics of the local consumer's financial behavior in terms of income, expenses, savings and loans;
- analysis of the microcredit product supply existing in the local environment, particularly the informal microfinance systems.

Marketing research for developing markets

Developing markets can be found in rural areas (bigger communes) and small towns (<50,000 inhabitants) that have economic potential for development. These markets are characterized by an increasing demand for microcredits, demand that is and will be met by existing or future microfinance programs. This demand comes from existing customers and potential customers who have heard of the available microcredit products and see their effect on customers who have accessed them. In many cases, there is only one microcredit supplier operating in the area. On a developing market, the microcredit organization is investing in the development of the internal systems in order to manage the demand growth. At the same time, on a growing market, the need for cash to meet the increased demand is acute. In these conditions, the purposes of the market research studies that a microcredit organization should conduct are:

- external environment analysis (macro-environment and local external environment) in order to identify the factors with a positive / negative influence on the microcredit program;
- competitive analysis and competitor monitoring in order to identify strengths and weaknesses;
- identification of the criteria used by the consumers in their choices of microfinance products and microcredit providers;
- identification of customers' perceptions on products and services offered by microfinance institution and its competitors (perceived image);
- consumers' satisfaction level concerning the products and services offered;
- identification of the reasons why some clients have delays in reimbursements;
- identification of the reasons why some customers leave the microfinance program after a while;
- social performance assessment by analyzing the impact of microcredit program on its clients, their businesses, their families and community, in general.

Marketing research for mature markets

Mature markets (developed markets) are usually found in bigger cities (> 50,000 inhabitants). In a developed market, a higher percentage of potential demand has been transformed into effective demand, the customers already using various financial services extensively. On a mature market, the microcredit organization's marketing investments are directed mainly to maintaining as much as possible the relationship with the customer. Market research studies that should be carried out by microcredit organizations operating in mature markets are:

- external environment analysis (macro-environment and local external environment) in order to identify the factors with a positive / negative influence on the microcredit program;
- competitive analysis and competitor monitoring in order to identify strengths and weaknesses;
- microfinance products' usage (the way clients use the products);
- customers' perceptions on products and services offered by microfinance institution and its competitors (perceived image);
- level of consumers' satisfaction regarding the products and services offered;
- identification of the reasons why some clients have delays in reimbursements;
- identification of the reasons why some customers leave the microfinance program after a while;

- social performance assessment by analyzing the impact of microcredit program on its clients, their businesses, their families and community, in general.

V. Conclusions and Implications

Table 1 presents the marketing information needed by Romanian microcredit organizations, according to the nature of the market in which they operate. It can be noticed that there are four areas of investigation where marketing research can be applied: macro-environment, competition, potential market and effective market (current customers and ex-customers). In addition, microcredit organizations must carry out some ad-hoc market studies in order to meet occasional needs (eg donors' needs).

Table no. 1 - Marketing information needed by Romanian microcredit organizations, according to the nature of the market in which they operate

| Emerging Markets	Developing (growing) markets	Developed (mature) markets
• Macro-environment Potential market: market segments and local demand for microcredits • Potential market: local supply of microcredits (especially informal supply)	• Macro-environment • Competitive environment • Clients: profile and segments • Clients: criteria used in selection of products / suppliers • Clients: perceptions on products and services offered by institution and competitors • Clients: level of satisfaction for products and services • Clients: reasons of delays in reimbursements • Ex-clients: profile and reasons of leaving the program • Effective market (clients) and potential markets: social performance and impact of the program	• Macro-environment • Competitive environment • Clients: profile and segments • Clients: usage of microcredits • Clients: criteria used in selection of products / suppliers • Clients: perceptions on products and services offered by institution and competitors • Clients: level of satisfaction for products and services • Clients: reasons of delays in reimbursements • Ex-clients: profile and reasons of leaving the program • Effective market (clients) and potential markets: social performance and impact of the program

Source: developed by author

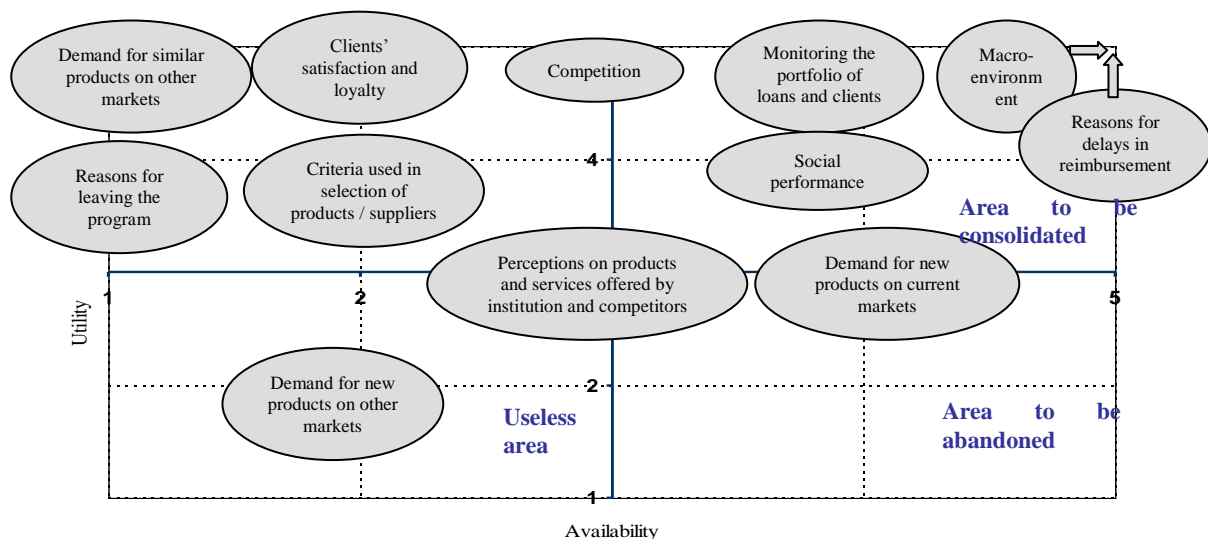
The analysis of the marketing information identified as necessary and its positioning according to its availability in the institution as well as its usefulness to the organization provides an overview of the priorities in terms of market research studies to be implemented. Table 2 presents a general model of an **availability-utility analysis** for microfinance institutions, noting that this analysis should be customized from institution to institution and from branch to branch.

Table no. 2 – Marketing information, according to its availability and utility

Areas of investigation	Information needed	Availability (2)	Utility (3)
Macro-environment	State and evolution of macro-environment factors	5	5
Competition	Analysis and monitoring of formal and informal competition	3	5
Potential market	Demand for similar products on other markets	1	5
	Demand for new products on other markets	2	2
Effective market (clients and ex-clients)	Monitoring the loan portfolio and portfolio of clients	4	5
	Demand for new products on current markets	3	4
	Clients' satisfaction and loyalty	2	5
	Reasons for delays in reimbursements	5	5
	Reasons for leaving the program	1	4
	Criteria used in selection of products / suppliers	2	4
	Perceptions on products and services offered by institution and competitors	3	3
Ad-hoc studies	Social performance and impact of the microcredit program	4	4

Source: developed by author

The types of market research studies needed by microcredit organizations can be prioritized by placing on a chart the information presented in the above table (Figure 1).



Area to be developed
Fig. no. 1 - Prioritization of market research studies required by Romanian microfinance companies, according to their utility and availability of marketing information (source: developed by author)

Thus, four areas corresponding to the four quadrants of Figure 1 can be seen:

- **area to be developed**: includes the category of information that is not available, but is important for achieving short and medium term goals. To obtain this information, microcredit organizations can perform various market research studies: Demand assessment for similar products on other markets, customers' satisfaction and loyalty studies, competitive analysis, identification of reasons why clients are leaving the program, analysis of criteria used by customers when selecting the products and suppliers, research on perception of micro products and micro-credit providers;

- area to be consolidated: includes the category of information that are useful to the microcredit organizations and are largely available. In this case, marketing research activity should be strengthened, in terms of: continuous monitoring of clients and loan portfolio, monitoring of macro-environment factors, monitoring of loan repayment behavior, ongoing assessment of social performance and generating ideas for new products on existing markets;

- **area to be abandoned**: the marketing research area in which the microcredit organization should stop investing, as the information already exists but is not useful for achieving short and medium term goals;

- **useless area**: includes the category of information that do not deserve any attention, being both unavailable and unnecessary for the microcredit organizations (demand for new products in other markets).

Prioritizing the marketing information useful and market research studies needed to be conducted is absolutely necessary, due to limited institutional capacity of most microfinance institutions (especially in terms of financial and human resources). In conclusion, using marketing research in order to understand the external environment, the markets and the customers and developing products and services that meet consumer demand, has an undeniable benefit on the microfinance institution. Depending on its institutional capacity and characteristics of the market, each microcredit organization should identify the appropriate techniques, the situations in which they can be used, their level of complexity and the sources of information that can be used in marketing research.

VI. Notes

(1) Romanian microfinance institutions subjects of these marketing research are: ROMCOM IFN S.A. – Oradea, INTEGRA IFN S.A. – Oradea, Capa Finance IFN S.A. – Cluj Napoca, Opportunity Microcredit România IFN S.A. – Târgu Mureş, Centrul pentru Dezvoltare Economică – Bucureşti, FAER IFN S.A. – Reghin, LAM IFN S.A. – Ilieni, MicroImo IFN S.A. – Cluj Napoca.

(2) Availability refers to the existence of complex information of high quality. Measurement scale is from 1 to 5, where 1 = information not available, 2 = few information available, 3 = information partially available, 4 = much information available, 5 = fully available information.

(3) Utility refers to the way information supports the short and medium term strategy and interests of the microcredit organization. Measurement scale is from 1 to 5, where 1 = useless information, 2 = information less useful, 3 = average utility information, 4 = useful information, 5 = extremely useful information.

THE PERCEPTION ON ECOLOGICAL PRODUCTS – A RESEARCH ON THE URBAN CONSUMER

Tanase Laura Daniela
Marketer Club

Roşca Mihai Ioan
The Bucharest Academy of Economic Studies, Marketing Faculty

Jurcoane Alexandra
University Of Agronomic Sciences And Veterinary Medicine Bucharest

This paper is about the consumers of organic products. The work is important because in Romania, although consumption data show a small percentage consumption of organic products, in words it is still high. The difference consists between the definition and the perception of the concept of ecological products in respondents' eye.

This work aims to study the consumer perception of such niche products from a narrow perspective and that of products certified or not. Trying to prove that there are differences in behaviour between the two groups.

Problem arising in this field is that there are many concepts of period of environmentally-friendly. Marketing and criterion by which to do all the market report shows green products from the point of view as they are legal certificates. Only that in Romania, there are two different segments of shoppers. Those who buy green products certified and those who buy green products certified. These latter, which many call the peasant market supplies, are an interesting group of future investigation for this type of sale. This paper comes as a complete research done in this market and brings attention to a new variable of analysis for motivational research.

This research is an exploratory research that proposed method is very common in research of this kind. We held three focus group meetings divided by a selection questionnaire.

The first group of 7 persons included only persons who have declared that they have bought certified products and the second group of 9 persons included only people who bought uncertified products. The third group also of 9 persons included people in both categories. So we could identify what some say about others when they are face to face and also when they are not.

The results are as expected. We can say says there difference between the two groups in terms of motivation choosing those types of products, the same reasons are for buyers and their family, taste and the appearance of a child in the family. However there are differences in what way those products are defined. If some consider as only those who are eco-certified, having confidence in the certification scheme more tightly, the other group has more confidence in their long term relationships with suppliers-manufacturers, and also in the taste of the products.

This research was necessary as part of a wider analysis that aims to build a model of purchase and consumption of organic products.

I. Introduction

Green Products form a market more and more interesting for scientific community. Started from mere observation as the man came in conflict with nature in the early 1970s, the theme was working till today many specialty studies, law and social movements. But the concept of eco-

label is hard to catch with a single study. (Bahn and Wright 2001: 51-55), (Roberts 1996:217-231)

First of all, the answer to the question what is an organic product? It is very difficult to give. There are many works to define environmental performance, durable products green, ecological services and not least for organic food. (Magdoff 2007: 109), (Ottman 1993), (Polonsky and Mintu 1995)

All these products also started as a niche market, some markets such as the food have developed representing true market segments more than 5% of the market in certain countries. But to be able to ease the development of these markets requires research methods unit. But researchers define the term differently law and her interviews with a number of restrictions and consumers understand anything by this term. This work comes from this third perspective, that of consumers. Designed on a qualitative study, research aims to analyze two types of consumer perception of organic products certified and the uncertified ones. Because marketing puts its spotlight the consumers need not the legislation, in this study we'll consider as ecological those products that consumers consider them environmental friendly and not only if there are certified as such. This paper aims to fine out the perception of the consumers, both of certified and uncertified products, have on the issue of the legal labeling, and also if there are any differences between the two opinions.

II. Literature review / previous research

In view of marketing, organic products have been defined by many authors from different perspectives. At first she appeared in the 70 marketing term ecological products were seen as products that accompanied the ecological behavior. They were simple consumer products and the way the consumer does not affect the environment. Direction of study is human behavior and ecological behavior of people. The first definition of green marketing has been made to the AMA seminar, "Ecological Marketing" in 1975 and emphasized the study of positive and negative aspects of marketing activities in terms of pollution and depletion of energy resources as well as the non-energy. This approach to analyze the degree of damage to the environment by marketing activities quickly turned into a concept that was very well defined by Mintu and Lozada as "Green marketing is the application of marketing tools to facilitate the exchange to satisfy the needs organizations and individuals, so that the environment to be protected and preserved"(Mintu and Lozada 1993:18). In this view any type of product could be green as long as the design, manufacture, distributor, use and then remove its use is taken into consideration the natural environment. This concept is defined as organic food if the product does not replace another product grown better environment in place. It cannot be considered organic grain, if it is grown in place of a piece of forest that was deforestation, or if during transportation to the consumer market for that product was consumed too much energy as fossil fuels. This concept is suitable for all categories of products from consumer goods to the durable. The concept was expanded including green buildings, green cars and other durable products.

If we talk about scientific terms should be noted and the view of some authors who say they cannot talk about green product but about greener products. (Smith 1998: XX) Any human activity affects the environment so that eventually every product is itself a part of non-organic production. Other authors have opened the front for organic food products of ecological agriculture. Chemical-free products or products provided local dispute the term of organic. The unconventional farming without plowing the earth (the polluting factor considered here is the energy necessary for plowing and excessive fragmentation of land resulting from damage while lifting texture and excessive amounts of dust.) Or biological treatment methods based on plant and crop insects that are working better then chemicals. Note that the term of organic product is multifaceted also for the scientific community. Being an important issue both for market and for consumers the authorities tried to clarify the issue. (European Commision) So they came up with

a new approach to the term. This work comes from a customer perspective as we came from the very beginning with a description of organic products as seen by them.

III. Research method

We have talked to a total of 25 people divided into three groups. Selection questionnaire included only information related to: sex, age, occupation, education level, family structure and income and if they bought in the last month any labeled organic products or eco or green as they presumed. A key objective of the study was to understand the Romanian consumer perception of organic food and their associations, including attitudes and buying motivations. Another objective of this study was to evaluate and acquire knowledge about consumer attitudes and perceptions in order to explore Romanian market opportunities for organic food and use of qualitative approaches such as focus group was considered as suitable for data collection. The three focus groups included 25 participants, grouped in buyers of: certified organic, uncertified organic products and the third group consist of people who have bought both certified and uncertified organic products.

Were considered as certified products those labeled products or certified available for sale in big chain stores, hypermarkets, supermarkets, specialized stores. Uncertified food products were "unintentional ecological" products, produced by people in rural areas. Most participants believe that demand for these products is high in most urban centers in Romania and that are more favorable than those certified. All consumers have been buyers of food products, over 18 years old, with permanent residence in Bucharest.

In the purpose of this study, buyers of organic products were defined as those who bought at least one believed organic product in the last month and depending on the type of organic product were divided into 3 categories.

Four major themes were explored:

i) general knowledge and awareness of organic food,

ii) associations of organic products,

iii) the major barriers to purchasing organic food,

iv) sources of information and the role of different stakeholders in promoting organic food.

Within these themes a number of topics were discussed such as: What is meant by the term "organic", price and willingness to pay a higher price for organic products, taste, healthy eating issues, selection of organic products confidence, the home, labeling, availability of green products, environmental concerns.

IV. Results

Participants were defined similarly organic food, especially focusing on the lack of chemicals (fertilizers or pesticides like) and the absence of artificial ingredients (such as preservatives, food additives "E's" modified organisms genetically).

Word officially designated and used by the Ministry of Agriculture is "ecologic". However, during discussions, the participants used different terms to describe them, namely "eco", "biological", "bio" and "natural". Since most organic products sold in Romania are imported, the existence of various labels explains the participants' confusion.

Examples of are products manufactured and handled using defined means of certification bodies:

"Foods that are not genetically modified"

"Grown without chemical fertilizers"

"Quality food with 100% natural ingredients"

"Farmed animal grown with bio-food"

In addition, participants have linked organic food with small scale farming systems, small traditional peasant farms. Thus this method was considered more of a "natural" food production, with lower productivity and thus with less impact on the environment.

Thus this method was considered more of a "natural" food production, with lower productivity and thus with less impact on the environment.

"From what I understand, there are certified products. I like natural foods "

"I am convinced that there uncertified organic food in the market, for example"

"My parents raise chickens and their eggs are safe to be organic because they do not give anything artificial, outside the grain"

"Why pay a high price for a product you can buy cheaply at all?"

The main benefits and barriers to buying organic food were identified.

They can be represented as positive and negative consumer associations on organic food. A joint award was recurrent consumption of organic products with a healthy diet. Some buyers of green purchasing organic products perceived as a potential way to prevent diseases such as cancer or cardiovascular disease. Encouraging children to consume ecological products was seen as an attractive opportunity to increase hope and quality of life.

"Because environmental means health ";

"I am much healthier";

"If you are really green and healthy are clear";

"Grandpas' ... environmental diet extended his life";

"Are ideal for children"

Physical defects of organic food are perceived as evidence of their authenticity, as a trusted source for organic buyers.

"I avoid products that look unnaturally good; may look for a wormy apple or a dirty carrot"

"I went and bought the ugliest leeks available there"

Discussion groups also commented about the taste and organic food.

Some have made it clear that organic products taste better and have more natural. Others could not identify any difference. Extracted significant idea was that organic products are more filling.

"Taste it shows if bio or not";

"There is not difference in taste but what you put in you"

"Eat less. Two bites you get filled."

All participants bend organic products of tradition, and in some cases of childhood nostalgia.

Participants recognized, however, that the traditional diet is not necessarily healthier.

"When you think of how much fat you eat ..."

"You lick your fingers but your cholesterol is over your head."

It was discussed in the group also the possible link between the consumption of organic products and the effect of consumer snobbery. In the group that consumed organic certified products it didn't sow such a connection: "In Romanian culture, snobbery is something else, is a strong car and a mountain villa with swimming pool. It doesn't mean a healthy diet."

Ask what they think there is a difference between those who buy organic products from stores and from fairs; they felt that there is such link. "To give so much for these products means you snob. Buy them to feel well and to have something to discuss".

Higher prices and lack of confidence in what you write on the label are the main barriers to consumption.

Organic food truly certificated as label and taste seems to be perceived as a luxury only for a narrow segment dedicated of consumers, thus creating a niche market.

"There are too expensive";

"There will always be luxury items for only part of the population";

"The problem is price. Nothing we know what we buy, if we have no money to them and give. "

"I'm not sure if I could have confidence in products labeled"

Another barrier to use would be limited diversity of products with limited distribution. These things characterize organic products market in Romania because of low demand nationwide.

"I found only some labeled products on the market, that I care for";

"There are fruits and vegetables labeled";

"You cannot find them in any store";

Were praised "locals shops" those little stores that distribute local traditional products from Sibiu. Selling what they industrialize and blend without cargo.

"There wasn't always have the same taste but that's why I trust they are natural" In terms of information sources, there were clear differences between buyers for certified and uncertified products. This is mainly due to the different degrees of awareness of participants.

"We see ads all crap, cigarettes, alcohol, but any good products"

"Green culture should be taught in schools";

"Even if the government's task should be to worry about the health of the population, that doesn't happen to us";

"I think we are not sufficiently informed about the benefits of natural products and about what we lose by all methods of production".

The main sources of information identified were the media, some specialty publications, the Internet and major sale points such as hypermarkets.

However, all participants agreed that it feels the need for information campaigns and greater involvement on behalf of the government.

When asked about buyer profile of ecological products in Romania, buyers tended to talk about themselves and their own experiences.

Participants in all three groups have defined the green consumer in positive terms: people informed, with above average income and who can afford the money and also the time, to seek to buy such products.

Those who do not buy products labeled clearly identified two types of organic consumers: (i) urban consumers who buy certified organic products from hypermarkets, and (ii) the consumer area, which produces "unintended ecological" products for self-consume.

In their view you cannot buy in town truly organic products you buy them because there are certified and because you don't know what you buy, only the peasant for his only use produces truly organic products.

In their view "eco consumer is a woman, highly educated, concerned with health and with an income above average".

"You go and buy organic food in the store because you are educated enough to believe everything that seller tells you in the market"

"After me, the organic consumer is primarily because he has the time for this"

"Clearly there are two kinds of eco-consumers. Most are those from the country that produce only for own consumption"

Low involvement in decisions related to food has been attributed to young consumers themselves, who do not buy organic products.

"Just by accident I happened to buy bio"

Was noticed a link between greater involvement in food choices and buying organic products. This was attributed to increased involvement of self-care behavior of some health problems or small children in this household.

"In my case, I changed a lot after I was born"

"I'm selfish. I eat this food because I like to take care of me"

"Keep and age, when you get older you start to think twice about what you eat"

This research is part of a broader research that aims to build a model of buying behavior of organic products. Research tries to conceptualize and crystallize the main study variables and to examine whether the main factor segmentation consumption of certified organic and uncertified imply different behaviors in the two groups.

V. Conclusions

In conclusion we can say that both groups mainly buy organic products for their own health or the family. The consumption is being enhanced by special programs and doctors but also the appearance of a child in the family.

There is one significant difference regarding the two groups. Among those who buy certified products are considered more educated and do not trust the sellers while the second group focuses more on the direct relationship they develop with the seller – producer, having not confidence in the present certification label. These last ones focus more on product taste. They tried certified products and didn't repeat the buy because of the flavor. "I ate certified cereal tasting like wood chips".

We could say that the second group cook more, this is a conclusion extracted from the research analysis and not a variable that was followed by early research. This is a new research direction.

A THEORETICAL SPOTLIGHT OVER THE ROMANIAN AGRICULTURAL PRODUCTS

Tarcza Teodora Mihaela
Faculty of Economic Sciences
University of Oradea

This paper aims at identifying and classifying new types of agricultural products, especially in Romania, but not only. As we well know, all the countries all over the world have their own history, traditions, economic structure, and a certain type of agriculture, adapted to their soil, climate, and nevertheless to theirs people needs. So, we know that certain countries used to cultivate certain agricultural products, while others are wellknown for others. Usually, we associate Spain with great wines, Belgium with delicious chocolate, Turkey with coffee, India with rice, Romania with grain, Russia with cereals, SUA – tobacco, etc.

There are new researches in the agribusines sector, the worlwide commerce is spreading and growing very fast, peoples' needs are continuously changing and therefore consumers behaviour is a new, different one. Every country, as well as every small or medium sized agrocompany has to focus itself on a new type of Marketing strategy, in order to be a succesfull one. Agricultural and food products are the most important ones in a persons life, and that's why we have to give them the right attention, starting with their production, pricing and selling, and nevertheless communicating and promoting their benefits.

The paper is a short literature review of defining and classifing agricultural and food products in Romania, underlying the attention given by the European Union to the promotion of products bearing a protected designation of origin (PDO), Protected Geographical Indication (PGI) or traditional specialty guaranteed (TSG), organic farming products.

Cuvinte cheie: agricultural and food marketing, basic needs, organic food, healthy products
Cod JEL: M31, Q13

1. Introduction

People's needs and preferences have changed a lot during the last years. Looking back to the ancient times, the mankind was struggling for food and a place to sleep. They were struggling for satisfying their most important needs – food and safety, needs that nowadays are perceived as **basic needs.** So, people's needs are changing; the needs are varied and unlimited, while the resources for satisfying them are limited. Therefore, mankind had to search and find different solutions for their problems. The commerce has developed, the science has evolved, and the climate has changed. Many years ago, every country was associated with certain goods it used to produce or to commercialize. And most probably, that specific product could have been obtained (cultivated or produced) at great standards only in that specific country or region. Usually, we associate Spain with great wines, Belgium with delicious chocolate, Turkey with coffee, India with rice, Romania with grain, Russia with cereals, SUA – tobacco, etc.

Due to commerce development and to the new researches in the Agribusiness sector, nowadays almost every country can vary the crops it cultivates and commercializes. Moreover, the world's climate is continuously changing, and that affords some crops to be cultivated in more different soils/ countries than many years ago.

During the Great Discoveries Period, Europeans introduced and adapted several types of crops found in the countries they conquered. So, for example, the eggplant, originary from India, (1500 years ago) is grown in Europe since Middle Ages only, and in Romania after the First World War (http://www.horticultorul.ro/legume/vinetele-sau-patlagelele-vinete/); the potatoes where brought in Europe, in France during the Reign of King Ludovic the XVI-th (Valnet, 1991), and so on.

Nowadays, we buy and eat fruits and vegetables from Asia and South America or even Africa, products like goji, peanuts, pistachio, mango, avocado, cranberries, bananas; we try to find and develop different new products to achieve new sources of energy, fuels, etc. If not possible, we try to use old, traditional products to meet new needs, or to find opportunities to diversify the use of a product (rapeseed oil used for biodiesel, myscanthus for getting heating energy, paulownia to obtain high quality timber, chocolate taste tomatoes, watermelon flavored brandy) (revista Profitul agricol, nr. 12/ 28 martie 2012).

Because of this new trend of diversity, variability and need to identify new solutions for old problems, every country has to reconsider its own strategy towards agriculture and agricultural foods at a macroeconomic level as well as microeconomic level. In other words, small farmers and national governments have to turn their spotlight on a new Marketing strategy, in order to survive and develop themselves on a fast moving market.

The starting point in reconsidering the marketing strategy of this domain is a good knowledge of the products/ services offered. For these new offered products one can establish all the others policies: pricing, selling and promoting strategies. First of all, in order to create, establish and implement a good promoting strategy, the strategic planner has to know very well the products (the subject of the promotion action) and nevertheless to identify to whom they might be addressed - the target market. So, in this paper we will consider the right definition and classification of agricultural and food products as subjects of a future promotion strategy.

2. The actual context of agricultural domain

It is considered that a country is a developed one if the Services Sector has a great percentage in its economical structure and contributes highly to its GDP; on the other hand, a country with an economy based on the Agriculture Sector is considered to be an underdeveloped or developing country. But, let's think a bit! A country can evolve only if it has a well settled Agricultural sector. Each country, whether developed or developing, has to put the importance of the agriculture at the right place. (We can see that, taking a look to SIC, or CAEN code in Romania). And Romania too! As LAPAR (The League of Agricultural Producers Association of Romania) said in its motto showed at the National Conference of Farmers, "mankind began with agriculture and would end in its absence" (revista Profitul agricol, nr. 12/ 28 martie 2012).

Considering Romania, agriculture is a very important domain, because our country was blessed with a great agricultural area and great climate conditions. It's up to us to create the appropriate legislative and strategic conditions to obtain the best from what we have! Romanian economy can overpass the crisis period investing and sustaining its "Cinderella" – agriculture. Contrary to the latest 20 years' trend of globalization, people tend to return to their origins, to their traditions and ways of being, turning their back to the new ideas of modernization and globalization. This idea of united states, free trade mark all over the world, the expansion of multinational companies sustains the development of junk food, a bad style of alimentation, the emergence of untreatable diseases. That's why now, we are looking back for our old style of life and eating, trying to find our original, healthy products.

In his new book, "Marketing 3.0", Kotler talks about a new level of satisfaction of needs, the spiritual needs (Kotler, 2010), considering that all the rest of mankind needs were satisfied by now. But, can we agree to this statement? It's true, almost all over the world basic needs are satisfied, but it has no importance the way they are satisfied? Yes, we have plenty of choices regarding food products, but we have to take care if they are healthy too. For example, Europe leads with the number of new yogurt products (1,234) introduced in 2003, and the number of cheese products introduced in 2003 with 979 launches. (Berry, 2004).

3. Perspectives of defining agricultural products

What are agricultural products? To try their definition, we define two separate words "agricultural" and "products".

What is a product? From an economic perspective, a product is a "physical good or service", material good for final consumption or use of individual or collective. After Ph. Kotler, "a product is anything that can be offered on the market to satisfy a desire or need. Products that are offered on the market are: physical goods, services, experiences, events, people, places, properties, organizations, information and ideas ". (Kotler, 2007)

On the other hand, "agricultural" is seen as something that "keeps on agriculture", which "refers to agriculture" or "is used in agriculture". For example, Explanatory Dictionary of Romanian association offers "agricultural year" defined as "period of time between the beginning of autumn agricultural works, concerning next year's harvest, and harvest of this year", and the association of countries or regions with agricultural term: "What supports its economy especially on agriculture."

So, by joining the two words, agricultural and products, we could say that "agricultural products" are goods obtained as results of processes working on soil or biological transformation and results of natural phenomena caused by dependence on weather conditions.

Diaconescu, M. in his work "Agro-Food Marketing", has another perspective: "food for final consumption, or for human consumption, is the result of an organization system, consisting of production companies, distribution and promotion belonging to different economic sectors." (Diaconescu, 2005)

So, food is "a product in its natural state or processed food, which serves as food for the maintenance of vital activity of the body." (Manole, V., 2010) Here we come back to its importance for our healthy body and mind!

In order to understand what agro - food products are, we have to make a short review of their characteristics. Here are some of them:

1. **Seasonality -** the process of producing agricultural products is long, often well defined, which depends largely on factors such as soil quality, weather, climate conditions, applied technology, etc. Agricultural products are produced only at certain times (short) of the calendar year, but there is demand for them throughout the year. Marketing has the task of finding solutions to meet demand regardless of season or growing cycle of the product. Planning and organization of marketing activities must be "so that supply and consumption of products to be relatively balanced, at least basic food." (Manole, V.)

2. **Perishability** - agricultural products are consumed in a short time after getting them, most often fresh. Consumers always look for these products to be top quality, to provide nutritional values, intake of calories, vitamins highest, but especially to be fresh. Often, consumers find that the processes in which the products to be kept for longer, for easy transport or storage adversely affects their quality. Following this "urgent transformation and distribution of these products," agricultural marketing takes the size of promptitude." (Manole, V.)

3. Agricultural production is done / achieved only in **certain geographical areas** (country) - most often in rural areas, while consumption of these products takes place throughout the country (especially urban agglomerations). Marketing specialist has to find optimal solutions in terms of distribution to meet the demand of any area it would be.

4. **Agricultural products can be harvested at different time interval**s depending on geographical area, but consumption is achieved in the whole country. The harvest is influenced by time of sowing, soil conditions, climatic conditions and cultivation technology used by the manufacturer. In periods of "high season" supplying markets must be done daily, regardless of the geographical area where the supply is made. This requires additional effort and expense distribution. (Constantin and Alecu, 2009)

5. Agricultural production (especially plant) is characterized by **high volume and low sales value**. Because of this, and highly perishable, high volume of work is required, the need for long distance transportation of agricultural products (from rural areas into urban areas), transport costs / unit of product are higher than in other sectors. To mitigate this shortcoming, it is recommended that much of the processing steps and processing of these products to take place as close to the place of production and not consumption.

6. As a result of more aggressive industrialization and urbanization, expressed mainly in economically developed countries, there is a tendency for consumers to invest more money in **processed foods** (downstream agriculture). Therefore, the amounts allocated to unprocessed agricultural products are increasingly reduced, which leads to the idea that agricultural products are becoming increasingly perceived as raw materials. This trend is denied by the new orientation towards a healthy diet, trying to avoid using chemical treatments, to bring the food processing stages, an orientation towards what is natural and healthy! (organic farming and organic food)

7. In the food domain we can't talk about **after – sales services**. A product once purchased and consumed, buyer shall meet all requirements as in this case there is the possibility of returning or replacement with another product properly. Therefore, many organizations, both national and international endeavor to develop rules, criteria and rules regarding the production and marketing of food products. Thus, FAO (Food and Agriculture Organization of the United Nations) and WHO / WHO (World Health Organization - World Health Organization) have developed a "code" of food, which provides standards and codes of good practice in food, Codex Alimentarius. (www.codexalimentarius.net) Therefore, marketer's activity will be to consider compliance with these rules and adapt products to consumer's demands.

4. New approaches to classification of agricultural products

In the field of agricultural markets for the capitalization of agricultural products we can distinguish several classification criteria, among which mention the following (Chiran and Gîndu 2003):

1. After **the origin** of the product can be distinguished:
• Production of grain crops, Horticultural, Animal products
• Agricultural products side (straw, stalks, haulm, manure).

2. In terms **of degree of perishability**, products are grouped into four categories specified in STAS no. 6952/64, as follows:
• highly perishable products (e.g. strawberries, blackberries, some vegetables and some animal products like meat and milk)
• easy perishable products (e.g. fruit: peaches, apricots, grapes, cherries and vegetables: peppers, cabbage summer)
• perishable products (example: apples, melons, and vegetables such as tomatoes, eggplant, potatoes)
• durable products (e.g. cereals, nuts and some fruits like nuts, some vegetables like onions).

3. Classification of agricultural products in commercial practice in the market derives from the fact that different categories of agricultural products are no longer sold in special shops yet, but are sold together with other vegetable or animal products. This classification, most often used, grouped them considering the **origin, composition, properties and degree of processing technology merchandise.** With respect to this criterion, agricultural products fall into the following main groups:
I. Goods grain pasta, flour derived from grains
II. Fresh and canned vegetables and fruit
III. Sugar, honey and confectionery
IV. Alcohol, alcoholic and nonalcoholic drinks
V. Digestive products (stimulants, spices, seasonings, herbs)

VI. Edible fats
VII. Milk and milk products
VIII. Eggs
IX. Meat and meat products
X. Fish and fish products

The document issued in Bucharest, by the MARD (Ministry of Agriculture and Rural Development) and APIA (Agency for Payments and Intervention in Agriculture), "Measures to promote agricultural products domestically and in third countries", in 2011, eligible products which may be subject to programs / projects and promotion, are differentiated on the two markets which they are addressed (www.apia.org.ro). Products subject to information and promotion on third country markets are especially products intended for direct consumption or for processing, for which there can be exported or the possibility of opening new markets in third countries, especially where no refunds, as well as typical or quality products with high added value:

 beef or pork, fresh, chilled or frozen, food preparations based on these products,

• poultry meat quality

• dairy products

• olive and olive oil consumption

• wines with protected designation of origin or geographical indication, wines with wine grape varieties,

• drinks with geographical indication,

• Fresh and processed fruit and vegetables,

• Products processed from cereals and rice

• in textile

• Live trees and ornamental horticulture,

• products bearing a protected designation of origin (PDO), Protected Geographical Indication (PGI) or are recognized as traditional specialty guaranteed (TSG) in accordance with Regulation (EC) no. 509/2006 or Regulation (EC) no. 510/2006,

• Organic farming products under Regulation (EC) no. 834/2007 on organic production and labeling of organic products and repealing Reg. (EEC) no. 2092/91.

(http://www.apia.org.ro/materiale%20promovare/promovare_prod_agr_piata_UE_terte_piete_09 112010.pdf)

A special attention is now granted by the European Union to products like PDO, PGI, TSG, medicinal herbs and organic farming products. These products definitions are established by the European Union in the REGULATION (EC) NO. 509/2006 THE COUNCIL of March 20, 2006 on agricultural products and foodstuffs guaranteed.

 (http://www.madr.ro/pages/industrie_alimentara/r_509_2006_ro.pdf) Therefore, "traditional product" that is used on the Community market for a period, showing transmission between generations that has been proven. Traditional specialty guaranteed (TSG) means a traditional agricultural product or foodstuff whose specificity was recognized by the Community through its registration under this Regulation.

In Romania, there are 147 products PDO and PGI registered. Most of them are included in the Dairy Products category (70 products), while the fewest are included in the Bakery products category (5), Meat and Meat Products (2 – Sibiu Sausage and Pleşcoi sausages) and only one product in Processed Fruits category (Topoloveni Plum jam). We can notice also a great number of registered products in the Alcoholic Drinks category (39) and Wines (31). (*www.portaldecomert.ro/DocumentDownload.aspx?parametru1=477*)

Organic farming has a large impact on consumers, especially in developed countries, where "to eat well is similar to maintaining health", not making excess for celebrations, special events, etc. Biological products meet the new requirements relating to: Food quality, Food security, Respect and care for nature (eliminates the use of synthetic chemicals, but relies on natural organic matter recycling and crop rotation).

Consumers say they choose these organic products for several reasons:
- Can avoid the risks of disease versus: ecoli bacteria in cucumber (milk bacteria) the influence of chemical factors can limit the negative effects of bacteria / viruses, etc.
- Respect the natural environment
- Retrieving natural products tastes versus: about 20 years ago in Romania, we were dissatisfied with the consumption of bread, rye bread, soy sausage, that our products taste, appearance not that great, and now we are willing to pay prices up to 100% higher for organic products, to return to the natural taste!

French Agency for Sanitary Security of Food (AFSSA), argues that differences in the contribution of organic food and conventional farming are insignificant.

Regarding organic farming there are many voices arguing. One of the most persistent questions is: "Can organic farming feed countries like India?"
(http://www.researchgate.net/publictopics.PublicTopicRewriteHandler.html?params=%2FAgriculture%2Fpost%2FCan_organic_farming_feed_countries_like_India)

5. Conclusions and further concerns

In conclusion, we have thrown a short overview on the agricultural products, their characteristics, and the new concerns of European Union regarding the information and promotion of the PDO, PGI, TSG, medical herbs and organic farming domestically and in foreign countries. Starting with the thought that agricultural and food products are the most important ones in mankind's existence, underlying the attention that must be given to the quality of these products, considering the new environmental changes, as well the fast moving people's needs we took a short lesson of health!

It is considered that nowadays almost every person around the world can afford to satisfy his basic needs and struggles to achieve the necessary goods for needs positioned on the last stages of Maslow's pyramid. Trying to get a job, or a better job, trying to impress his boss, or to gain a lot of money, to afford to buy expensive clothes, cars and luxurious things, man forgets about his regular alimentation and gets sick. Therefore, he starts turning his face to nature: taking a short rest in a mountain resort, eating fruits and vegetables, taking medical herbs, or supplements. So, let's remember that its' highly important to satisfy the basic needs in a healthy way!

ATTITUDES OF THE CONSUMERS REGARDING THEIR PERSONAL DATA: WHAT HAS CHANGED UNDER THE RECENT YEARS?

The historical roots of the debates regarding the privacy are to be found in the conclusion issued, at the end of the 19th century, by the Pacific Railway Commission (1887), on the essential, for the citizen's peace and happiness, "right of personal security", and the individual's "right to be left alone", approached and explained by Louis Brandies (1890). Since then, many definitions have been given aiming to explain the content of privacy from different angles but all these attempts were rather difficult and succeeded to clarify things only partially, due to the various perspectives considered. The information age has made even more difficult not only the definition of privacy, but its defense in front of the many invading ways based mainly on the internet employment.

From a marketing perspective, the definition of privacy should focus on the personal data regarding the consumers, the extent to what this data is communicated to or is collected by others, and the subsequent data treatment, in terms of the processing and employment, by the entities managing this information. In this context, the privacy should be considered in connection with its particular area of application – the consumer's private space – described by the amount of information regarding the demographics, psychographics and behavioral characteristics of the individuals, and the rights they should have to disclose or not their personal data, and to have this data protected through the appropriate laws and means.

The paper aims to assess, in a longitudinal approach, the attitudes of the consumers, and the specific differences, regarding their personal data in terms of their disclosure, the previous consent the consumers should express to the companies or public entities collecting them, and capturing, processing, and further employment by the companies, based on the primary data collected in two surveys conducted in January 2010 and 2012.

Keywords: privacy, consumer private space, personal data
JEL Classification: M31

Introduction

The end of the 19th century has brought the first formal attempts to conceptualize privacy. In 1887, the Pacific Railway Commission has found that "of all the rights of the citizen, few are of greater importance or more essential to his peace and happiness than the right of personal security, and that involves, not merely protection of his person from assault, but exemption of his private affairs, books, and papers, from the inspection and scrutiny of others" (Langenderfer and Cook, 2007). Three years later, Louis Brandies, in the article "The Right to Privacy", has approached and explained the individual's "right to be left alone" as a response to the loss of privacy experienced during that times (Wirtz, Lwin and Williams, 2007).

In spite of their historical roots, the attempts to define privacy were rather difficult due to the wide number of related interests such as the personal information control, reproductive autonomy, access to places and bodies, secrecy, and personal development (Kemp and Moore, 2007). Many definitions given have tried to explain the content of privacy considering the right to be let alone, limited access to the self, secrecy, control of personal information, personhood and intimacy (Solove, 2002), but misspecifications, cultural and historical biases, and their value-driven appearance altered more or less all of these (Kasper, 2005). Considering the information perspective, and the context of the information age, privacy appears as an ambiguous term and consumers may have different privacy thresholds depending mainly on the factors associated to the data collection (Long et al., 1999), and as a luxury to maintain, due to the many invading ways, mainly through the internet (Pan and Zinkhan, 2006).

From a marketing perspective, definition of privacy should focus on the personal data and information regarding the consumers. Westin (1968) sees privacy as the claim of individuals, groups or institutions to determine for themselves when, how, and to what extent information about them is communicated to others. Schoeman adapted the content of privacy at individual level presenting it as a claim, entitlement or right of an individual to determine what information about himself (or herself) may be communicated to others; the measure of control an individual has over information about himself, intimacies of personal identity, or who has sensory access to him; and a state or condition of limited access to a person, information about him, intimacies of personal identity (Jóri, 2007). Privacy must be seen in connection with the particular area where its content is applied. The above definitions imply the existence of a consumer's private space defined through and including an amount of information referring to the demographic, psychographic and behavioral characteristics of the individuals (personal data), and the rights the consumer should have to disclose or not, respectively to have this information protected through the appropriate laws and means (Veghes, 2009).

Analyzing the evolution of the definitions given to the personal data in the 1998-2008 decade, Grant (2009) has concluded that the content of the personal data, representing the central issue in the data protection, is still under debate. Still, there is a strong need for identification and definition of this data as consumers are more and more approached through direct marketing campaigns by the different companies and public entities. Although most of the consumers have realized that participating in direct marketing is a necessary part of being in a consumer society, they are concerned about the unauthorized use or the misuse of their personal data and information, mainly in the forms of sale of their data without permission, unsolicited contact by businesses, the feeling that businesses know too much about their personal information, and the accuracy of data retained in databases (Pope and Lowen, 2009).

Methodological Notes

The analysis of the variations in the consumers' attitudes regarding the processing and employment of their personal data has been conducted based on the data obtained through the research approaches conducted in January 2010, respectively January 2012. The research sample used in 2010 has included 78 Romanian consumers from the Capital and other cities, aged 21 to 30, with higher education, and holding a professional status of full-time employees, freelancers, entrepreneurs, managers, and students, while the research sample used two years later included 153 respondents, only from the Capital city, aged 23 to 34, with a similar status in terms of the education and professional status. The respondents have provided answers, among other aspects concerning their exposure, experiences, current and future behavior in connection with the direct marketing efforts of the organizations, corresponding to the following objectives and hypothesis of the research:

1) the attitude toward communicating their personal data to the companies or public entities the consumers are getting in touch with; the related research hypothesis states that there is no

significant difference between the specific attitudes measures in 2010 and 2012, i.e. the majority of the consumers does not agree to disclose their personal data to companies or public entities;

2) the previous consent the companies or public institutions and/or authorities should obtain from the consumers before asking them to disclose their personal data; the related research hypothesis states that there is no significant difference between the specific attitudes measures in 2010 and 2012, i.e. the majority of the consumers would like to express their consent before disclosing their personal data to companies or public entities; and,

3) the attitudes regarding the employment, registration and processing of the personal data by the companies providing different products and services; the related research hypotheses state that there is no significant difference between the specific attitudes measures in 2010 and 2012, i.e. the majority of the consumers does not agree to have their personal data collected when buying products and/or services; the majority of the respondents does not agree to have their personal data processed after buying products and/or services; and the majority of the consumers does not agree to have their personal data further employed in the promotion of the companies' products and services.

Main Findings

As in 2010, the consumers have significant reserves toward disclosing their personal data to the companies, but a little bit more relaxed in communicating this data to the public institutions and authorities when getting in touch with them. As the results obtained indicate (see Table 1), the consumers maintain their reserves in disclosing their personal data to the companies approaching them in a direct and interactive manner, in spite of the slightly decrease in the weight of the respondents that would not, or rather not, communicate their personal data to the companies, from 60.2 to 58.1 %. The slightly decreasing weight of the respondents agreeing or rather agreeing to provide their personal data to the soliciting companies, from 39.8 to 39.2 %, supports the conclusion stating that the majority of the respondents adopt a defensive attitude and tend to treat with caution the companies' attempts to capture their personal data.

Instead, the attitude of the consumers toward communicating their personal data to the public institutions and authorities has registered quite an improvement in the last two years: the percentage of respondents willing to provide their personal data to these entities has increased, from 52.6 to 56.8 %, while the percentage of the respondents having reserves in this respect has decreased, from 46.2 % to 41.2 %. This apparently increased confidence in the public institutions and authorities may be seen as an effect of the unfavorable macro-economic context over the consumers' behavior, an important part of them seeking for a certain level of protection from or having more trust in these entities in what regards their personal data collecting, processing, and further employment.

Table 1. Attitudes of the respondents toward disclosing personal data to the companies and public entities ($n_{2010}=78$; $n_{2012}=153$; percentages)

Disclosing personal data to:	Agree		Rather agree		Rather not agree		Not agree		Don't know / Don't answer	
	2010	*2012*	*2010*	*2012*	*2010*	*2012*	*2010*	*2012*	*2010*	*2012*
Companies	9.0	15.7	30.8	23.5	39.7	33.3	20.5	24.8	-	2.6
Public entities	9.0	26.1	43.6	30.7	35.9	30.1	10.3	11.1	1.3	2.0

These differences between the companies and public institutions and authorities in terms of the attitudes toward disclosing the personal data is related to the way consumers seem to perceive the employment of this data. Apparently, the consumers believe that companies could employ the collected personal data in a more threatening manner for their private space and privacy, and, consequently, they have to face increased risks associated with this inappropriate employment –

potential abuses, and frauds they may suffer as buyers, consumers, and/or users of the different goods and services. The consumers' trust in the appropriate employment of this data by the public entities is significantly higher as they do not expect, at least not to the same extent, to experience abuses or any other threats from the part of these institutions and/or authorities.

The right to agree or disagree in disclosing the personal data to the companies and/or public institutions or authorities is one of the most important tools the consumers may use to defend their privacy and private space. Results obtained indicate (see Table 2) that, overall, consumers consider this agreement they should be asked for and could express as mandatory before any attempt of the companies and public entities to obtain their personal data is conducted.

Table 2. Attitudes of the respondents toward having the right to express their consent before disclosing their personal data to companies and public entities ($n_{2010}=78$; $n_{2012}=153$; percentages)

Consent given before disclosing personal data to:	Agree		Rather agree		Rather not agree		Not agree		Don't know / Don't answer	
	2010	2012	2010	2012	2010	2012	2010	2012	2010	2012
Companies	82.1	79.1	17.9	16.3	-	2.6	-	-	-	2.0
Public entities	67.9	72.5	26.9	18.3	3.8	5.9	-	2.0	1.3	1.3

The attitude of the respondents regarding the agreement they should be asked before disclosing the personal data to the companies and public institutions and/or authorities reconfirms the higher confidence the consumers have in the public entities: the percentages of the respondents demanding for this agreement from the part of these entities were slightly lower, both in 2010 and 2012, by comparison to the similar percentages associated to the companies. In spite of the slight decrease (from 100.0 to 95.4 %, in the case of the companies, respectively from 94.8 to 90.8 %, in the case of the public entities), these percentages remain higher which supports the conclusion that consumers tend to perceive the mechanism of expressing their previous consent before any collection and processing of the personal data takes part as an extremely important instrument in defending their private space and privacy. A possible explanation for the apparent relaxation of the consumers in soliciting the companies and/or public entities to demand for their previous consent may be the consequence of the decrease in the frequency and intensity of the direct marketing companies conducted in the last two years. Moreover, the migration of the marketing communication to the Internet has partially solved the problem: according to the current legal provisions, organizations should ask for the consumer's consent before sending any marketing messages when these have an obvious commercial character, the previous agreement being not compulsory in the case of the communication aiming to inform the consumer.

What happens with the personal data after being collected by the companies represents a significant concern for the consumers. The lack of trust in the good intentions of the companies in terms of the personal data capturing, processing, and further employment already proven made the majority of the respondents to rather not agree to have this data collected, processed after buying different products and/or services, respectively employed in marketing communication campaigns promoting products and services in the market. As the results obtained (see Table 3) indicate, the evolutions in the last two years did not changed significantly the attitude of the respondents: both in 2010 and 2012, the majority did not agree to have their data captured (57.7 % in 2010, respectively 54.3 % in 2012), processed (56.4 % in 2010, respectively 60.2 % in 2012), and further employed (73.1 % in 2010, respectively 71.2 % in 2012).

Table 3. Attitudes of the respondents towards capturing, processing, and employment of their personal data by the companies ($n_{2010}=78$; $n_{2012}=153$; percentages)

Companies should not:	Agree		Rather agree		Rather not agree		Not agree		Don't know / Don't answer	
	2010	2012	2010	2012	2010	2012	2010	2012	2010	2012

... capture personal data	26.9	32.7	30.8	21.6	24.4	26.1	12.8	15.7	5.1	3.9
... process personal data	28.2	38.6	28.2	21.6	24.4	21.6	16.7	13.1	2.6	5.2
... employ personal data	56.4	54.9	16.7	16.3	14.1	13.1	11.5	11.1	1.3	4.6

Capturing and processing of the consumers' personal data were and still are perceived in a reserved manner by the investigated respondents: the majority agrees or tend to agree that companies should not process this data although is rather improbable even to imagine a situation in which a company will be content only to capture and store the personal data of its customers and prospects without conducting any processing allowing them to know better their consumers' demographics, psychographics and behavioral characteristics, to profile them, and to use this insight in planning more effective direct marketing campaigns. A possible interpretation of the respondents' attitude in this respect may refer to a certain expectation that their personal data will be processed in a way that will not affect their private space or do not expose their private lives.

Further employment of the consumers' personal data by the companies to promote their products and/or services through direct marketing campaigns is perceived in a rather unfavorable and reserved manner by the respondents: the majority agrees or tends to agree that companies should not employ this data in marketing communication campaigns. The percentages associated to the consumers not (or rather not) having a problem in disclosing their personal data (as obtained in 2010 and 2012) support the overall reserved attitude of the respondents regarding the processing of their personal data. These reserves are not necessarily determined only by the worries consumers may have regarding the risks associated with an inappropriate processing and further employment of their personal data, but also by the unclear definition of the personal data and the relative low consumers' knowledge on how this data should and could be protected.

As on overall conclusion that can be stated based on the results obtained in 2010 and 2012, the reserves of the consumers in terms of their personal data collection, processing, and further employment may suggest that this data should be used mainly in the database marketing activities, and less in direct marketing campaigns. The results also reveal the importance of educating consumers for a better understanding of the content of their personal data, the appropriate manner of collecting, processing and employment of this data, and the rights they are entitled as providers of personal data.

Conclusions, limits of the research, and main implications

Findings of the research approaches conducted in 2010 and 2012 show that the attitude of the consumers toward the processing their personal data was and remains a rather reserved one: consumers are not so willing to disclose personal data and are concerned for the risks they should face when this data is employed in an inappropriate manner. The consumers have significant reserves toward disclosing their personal data to the companies, but a little bit more relaxed in communicating this data to the public institutions and authorities, the increased confidence in the public entities could being an effect of the unfavorable macro-economic context over the consumers' behavior of seeking for a certain level of protection from or having more trust in these entities.

The research results indicated that, in spite of an apparent relaxation and in the context created by the recent migration to the Internet of the marketing communication, the consumers tend to perceive the mechanism of expressing their previous consent before any collection and processing of the personal data as an extremely important instrument in defending their private space and privacy. This attitude may be associated with a behavior that avoids an engagement in direct and interactive relationships with the organizations and aims to create a safety distance allowing the effective defense of the consumers' private space and privacy.

Finally, the reserves consumers have regarding their personal data collection, processing, and further employment may suggest that this data should be collected and processed only with the

previously expressed consent of the consumers, mainly in database marketing activities, and less in direct marketing campaigns. Educating consumers for a better understanding of their personal data content, collecting, processing and further employment, and the rights they have as data providers could generate significant improvements of the related consumers' attitudes.

Both the research approaches have been conducted in the context created by the existence of the limits related to the set of the variables considered to define and measure the attitude of the consumers regarding the processing of their personal data: obviously, these variables should be redefined in order to allow further research to be conducted. Other important limits are derived from the sample and the sampling procedures used: the differences between the samples, mainly in terms of the size and the demographic profile of the respondents (age and residence) have produced variations between the results obtained; further research should be conducted using a sample covering also the rural areas and having a representative structure in terms of demographics such as education and income.

The main implications of the results provided by the research approaches conducted in 2010 and 2012 are related to: (1) the significant difference in terms of the attitudes of the consumers toward disclosing their personal data to the companies, respectively the public entities, and (2) the reserves of the consumers regarding their personal data collection, processing, and further employment. Improving the attitude of the consumers, in fact, increasing their trust in the companies' and public entities' good intentions concerning the capturing, processing, and employment of their personal data should represent a priority for all the data processors and controllers that should action aiming to safeguard the consumers' private space and privacy. Clarification of the definition given to the personal data, and a better delimitation of the private space of the consumer, will create a better legal environment for the capturing, processing, and employment of this data, increase the confidence of consumers, as well as their openness toward the direct, interactive and personalized communication attempts of the organizations.

RISK MANAGEMENT IN THE CONTEXT OF SUSTAINABLE DEVELOPMENT

Gheorghe Mirela
The Bucharest University of Economic Studies,
Faculty Accounting and Management Information Systems

The objective of the present paper is to present the singularities of risk management in the context of the new requirements and strategies adopted by the European Union in order to ensure sustainable development at organizational level. The paper wishes to approach the complex problem of risk management, given the premise that risk needs to be tackled as a conscious and calculated assumption of reality. The motivation for this research originates from the necessity of having a holistic approach for the risk management process, which will allow risk analysis and evaluation at a strategic, operational, financial, environmental and social level. This integrating approach, the continuous and systematic analysis and evaluation of all risks will constitute a real fundament for the sustainable development of all organizations, generating an efficient management system for all possible risks and opportunities resulting from these risks.

The present research is based on the analysis of specialized literature, identifying the characteristics of the risk management process at conceptual level, in order to ensure the organization's sustainable development, the managers' perception regarding the importance of this process and the necessity for integration in the leading structures of the organization. The adopted research methodology is based on activities specific for descriptive research.

Modern management needs to be risk-sensitive, to follow the implementation and utilization of reliable and efficient systems, to elaborate action plans and security schemes which include ranking the objectives on operational levels, adaptable to the permanent changes. An efficient management system does not limit itself to a ,short time horizon', also but considers further perspectives. In these situations, proactive management turns into prospective management, its purpose being to identify the risks that might arise as a consequence of strategy or environment modifications. Today's organizations need to fully absorb the concept of sustainable development and risk management into their strategy, not only to minimize potential losses but also to exploit new business opportunities which result from the principles of sustainable economic development.

Keywords: risk management, sustenability, strategic risk, social risk, environmental risk.
JEL classification: M21, M15

INTRODUCTION

Organizations today need to fully integrate the concept of sustainable development and risk management into their strategy, not only to minimize potential losses, but to also fructify the new business opportunities which derive from the principles of sustainable development. These can include new products and services that can favor sustainable development, new technologies that can support and improve an organization's sustainability and financial performance, or new business models in order to develop emerging markets and support the creation of sustainable communities.

The bankruptcies recorded in the past years (Long-Term Capital Management (1998), Enron (2002), Societe Generale (2008), etc), the present world economical crisis brought profound mutations at manager mentality level, regarding the importance which the risk management system must have within the organizations' strategic preoccupations, regardless of their nature. The integration of this process needs to be an objective necessity, dictated by the complexity of the business environment and the multitude of interdependent risk factors.

The research conducted for the present paper attempts to deliver an answer for the following questions: What is sustainable development and what are the dimensions of this concept? What is the role of risk management in ensuring the sustainable development of the ‚new economy'? What is the content of the risk management process within the frame of sustainable development? In an attempt to answer these questions, the structure of this paper is the following: chapter 1 – analyzes the specialized literature concerning the concept of sustainable development, chapter 2 – offers a description of the risk management process for ensuring a sustainable development. The final section, conclusions, presents a few general observations regarding the research.

1. CONSIDERATIONS REGARDING SUSTAINABLE DEVELOPMENT

The relationship between humans and the natural environment is a problem that now concerns the internation community, starting from the first UNO environment Conference (Stockholm, 1972) and was materialized in the works of the World Comussion for the Environment and Development, established in 1985. This Comission's report, presented in 1987 by G. H. Bruntdland and named *Our common future* offered the first definition of the concept of **sustainable development** as being a type of ‚development which satisfies the actual generation's needs without compromising the future generation's chances to satisfy their own needs'. Although, initially, sustainable development was meant to be a solution for the ecological crisis determined by the intense exploitation of resources and continuous degradation of the environment, the concept was extended to the economical and social fields (figure 1).

Figure nr.1 The three pillars of sustainability development
(source: Zetterlund (2011)

Sustainable development has become a political objective of the European Union, starting 1997, through its inclusion in the Maastricht Treaty. In 2001, The European Council in Goteborg has adopted the European Union's Strategy for Sustainable Development, to which an external dimension was added in Barcelona, 2002.

In 2005, the European Commission has initiated the process of revising the Strategy, by publishing a critical evaluation of the progress registered after 2001. The document also highlighted a number of unsustainable tendencies, with negative effects on the environment, which could affect the future development of the European Union, the climatic changes, threats towards public health, poverty and social exclusion, the exhaustion the natural resources and the erosion of the biodiversity.

In 2006, the EU council adopted the renewed Sustainable Development Strategy for an extended Europe. In this strategy's vision, the object of sustainable development is represented by ‚continuously improving the quality of life for present and future generations by creating sustainable communities, able to efficiently manage and use resources and fructify the ecological and social innovation potential of the economy, in order to ensure prosperity, protection of the

environment and social cohesion.' In order to accomplish this, four **key dimensions** are identified within the strategy:

> **-*Environment protection***, by measures that allow the dissociation of the economical growth from the negative impact on the environment;
>
> **-*Social equity and cohesion***, by respecting fundamental rights, the cultural diversity, the equality of chances and fighting discrimination in all its forms;
>
> **-*Economical prosperity***, by promoting knowledge, innovation and competitivity in order to ensure elevated living standards;
>
> **-*Fulfilling international responsibilities*** of the EU by employing democratic institutions in the fight for peace, security and freedom, of the principles and practices of sustainable development worldwide.

In conclusion, the concept of sustainable development represents an attempt to fuse environment protection and economical development, while respecting social responsibility. This is not a doctrine, nor a theory, or a synergy between economy and ecology; it is an actual necessity to employ economical instruments for the responsible management of this planet's resources, its purpose being the continuous improvement of the quality of life, for present as well as future generations.

In the last years, the authorities' efforts to regulate the field of sustainable development have intensified, and the result can be seen in the number of methodologies and standards associated with this field (ISO published a brochure *"Rio+20. Forging action from agreement – How ISO standards translate good intentions about sustainability into concrete results"* that specifies the standards which allow a sustainable development):

The environment

The family of standards ISO 14000 certify that the organization's environment management system is aligned with the good practice standard.

Economical

The standard ISO 9001 refers to the quality management system, its purpose being to ensure customer satisfaction and to obtain compliant services and products.

The family of standards ISO 22000 concerns a food safety management system.

The standard ISO 27001 concerning information security.

The standard ISO 50001 concerning energy management.

The standard ISO 28000 specifies the requirements that concern the supply chain security management systems.

The standard ISO 31000 concerning risk management, although it is not considered as a standard management system, is considered to be an important instrument for ensuring a sustainable economy.

Social

The standard ISO 26000 concerning social responsibility.

2. RISK MANAGEMENT – the basis of a sustainable development for organizations

Today's organizations need to completely absorb the concept of sustainable development and risk management into their strategy, not only to minimize potential losses but also to exploit new business opportunities which result from the principles of a sustainable economical development. These can include new products and services that favor sustainable development, new technologies that will sustain and improve the risk management process' sustainability and performance, or new business models for developing emergent markets and supporting the creation of a durable community.

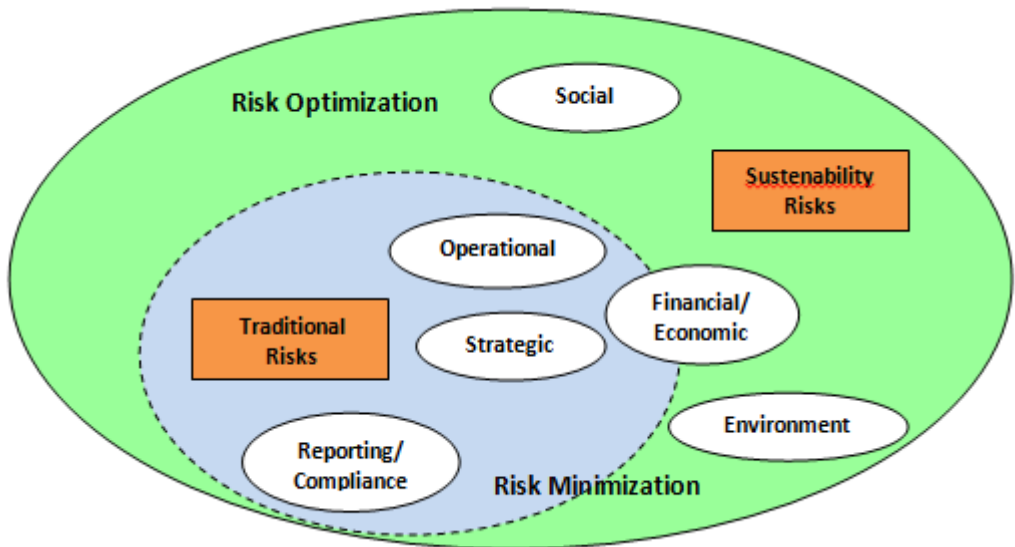
Figure 2 illustrates how risk management, in the context of sustainable development, includes social and environmental factors and extends economical problems that are broader than in the case of the traditional risk management.


Figure nr.2 Risk management in the context of sustainable development
(source: AON (2007)

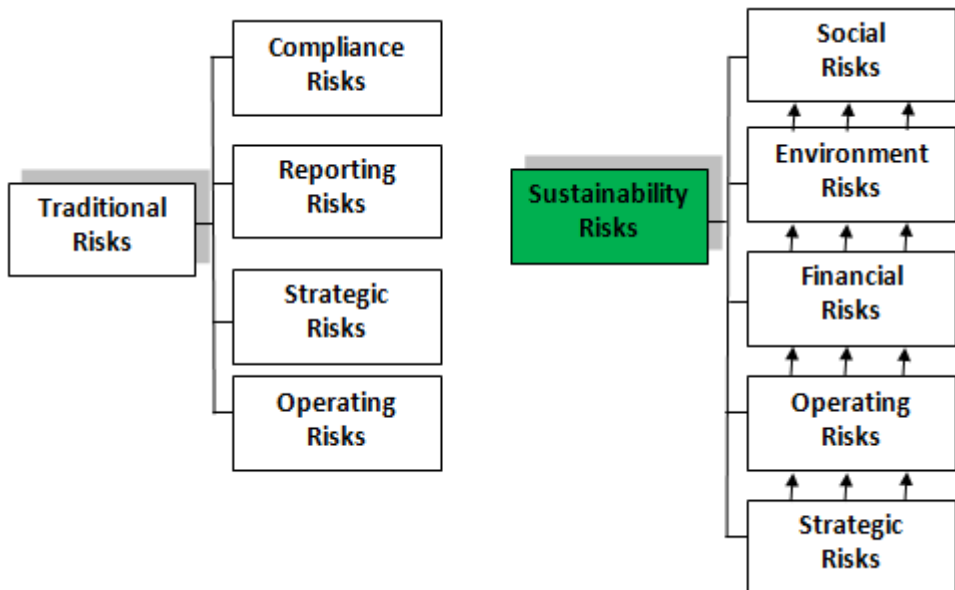
In the vision of the work frame elaborated by COSO (eng."Committee of Sponsoring Organizations of the Treadway Commission"), the objectives of the risk management process at organizational level are centered on the following fields: strategic, operational, financier reporting and conformity to standards, the law in force. In the context of sustainable development, the risk management process will analyze and evaluate risks at organizational level from the following points of view: strategic, operational, financial, environmental and social (figure 3).


Figure nr. 3 Traditional risks versus risks in the context of sustainable development
(Source: AON (2007)

Total risk= Σ Rstrategic+ Σ Rfinancial + Σ Roperational+ Σ Rsocial + Σ Renvironment

The risk management is considered to be an integrating part of the management of any organization, whose objective is represented by the identification, the analysis and the evaluation of the risks in an organization, having the goal of implementing additional measures of control which will lead to their decrease. Otherwise said, risk management has the goal of reducing the vulnerabilities of an organization confronting the adverse changes in its environment, and intends to reach the pre-targeted goals with maximum efficiency.

Risk management is a cyclic process and implies going through five stages, which in reality blend harmoniously in order to create a whole (ISO 31000, 2009):

-Organizational environment and risk factors analysis;

-Risk identification;

-Risk hierarchy and assessment;

-Establishing risk response strategies;

-Risk monitoring and control.

The risk management process starts with the internal and external **organizational environment analysis** of the relationships established between the organization and its existence environment, of the opportunities and threats specific to its environment. This analysis will allow the identification of the risk factors (political, social, economic, financial, technical, operational, and legislative) at which the organization is exposed.

Risk identification starts with the preceding stage's results (knowing the organization, the market in which it operates, the legal, social, political, economic and cultural environment in which its activities take place, as well as its organizational objectives) and it will identify the threats and vulnerabilities that affect the activity or reaching the organization's goals, the consequences associated with these possible events.

Risk hierarchy and assessment. After the risks have been identified we go on to evaluating them, or otherwise said, to the estimation of the probability of achieving the risk and its impact. In practice, the specialists use different methods: quantitative, qualitative, or semi quantitative.

Starting from the $Risk = Probability * Impact$ equation, the evaluation of all the risks is made using the same method (quantitative, qualitative) to assess the probability and the impact.

Establishing risk response strategies. Not all risks will be treated, only those that exceed the risk margin taken on by the organization. For each critical risk a response strategy will be chosen:

-Risk avoiding – eliminating the uncertainty by not initiating the activity considered as being hazardous;

-Risk transfer (risk externalization) – consists of giving property over the risk to a 3rd party (through bonds, insurances, contractual clauses);

-Risk decrease – through reduction of the probability of appearance of the risk or the impact. Otherwise said, through the implementing of additional control measures;

-Risk acceptance – this type of risk response consists in not taking any measures of risk control and it is adequate for inherent risks whose exposure is smaller than the risk margin. This strategy can be adopted in the situation in which no other response strategy can be put into action.

Risk monitoring and control. Monitoring and controlling the risks represents the final stage of the risk management process and certifies the efficiency of the management system and of the technicians, of the instruments used during the whole process. The stage will allow the revision and continuous enhancement of the risk management process, by identifying new risks or observing possible threats.

In conclusion, there is a significant recognition of the increasing number of risks, their variety and interactions with the organization. The progress of technology, the dynamics specific to new business models, globalization, the deeper complexity of the business world contributes to an increase in the number and complexity of the risks. The new requirements of sustainable development, the strategies adopted by the European Union in this direction require that the organizations use a holistic approach of the risk management process, which will allow risk

analysis and evaluation at strategic, operational, financial, environmental and social level. This integrating approach, the continuous and systematic analysis and evaluation of all risks shall represent a real fundament for the sustainable development of the management of any organization, thus generating an efficient management of all possible risks as well as the opportunities that may result.

CONCLUSIONS

Risk management grows more and more important as the decision factors realize its multiple applications with supporting the organization's sustainable development in an increasingly pressing competitive environment. The specter of the advantages which result from this process extend to concrete financial aspects, which consist of the elevated degree of predictability of cash-in and payment flows, the reduced costs in case of unpredicted events, disasters, up to the construction of a favorable image among all actors who interact with the organization in its environment (shareholders, employees, clients, authorities, society in a broad sense).

At large corporation level, risk management has become a process integrated within all other processes inside the organization, which allow the identification and evaluation of all the risks which result from its activity, including the ones determined by the outside, political, social and cultural environments. Compared to the traditional risk management, according to which specific instruments and techniques are developed for each and every identified risk, the actual risk management accomplishes a continuous and systematic risk analysis and evaluation. Given its continuous character, this process consists in identifying, analyzing and evaluating risks, as well as elaborating and implementing control measures which address to individual risks and risks caused by the interactions and interdependencies between themselves, thus creating a systemic perspective for the organization's management. In this context, risk management must not be regarded as a panacea, but only as an elaborated process for reducing the uncertainties and occurrence probabilities of certain events which affect the organization's financial performance.

THE COMMUNICATIONS INFRASTRUCTURE OF THE INFORMATION SOCIETY

Nicula Adrian
University ofOradea
Faculty of Economics

This paper aims to briefly present the term of „information society", term used since the beginning of the 90's, which implies the usage of new information technology both to the individual and organizational level with high ease, in all spheres of activities with a significant economic and social impact, making changes in social, cultural, educational, economic, environmental, political, administrative and judicial dimensions, changes that influence the work, study and life conditions of all citizens.
The more and more widely usage of ICT makes any economy become more efficient, more transparent, ensuring increased competitiveness and sustainable development. In terms of how ICT influences economic growth, Romania ranks 47 of the 70 countries analyzed in the Digital economy rankings 2010: Beyond e-readiness. Based on a synthetic indicator, defined by 24 variables in four categories, in order to determine the status of the information society, proposed by Marius Guran, and using the statistical data provided by ANCOM, the paper analyzes the current situation in Romania, answering the question: How digital is Romania in terms of communication infrastructure? Thus the paper presents the communication infrastructure from the point of view of: fixed telephony and its penetration rate per 100 inhabitants and per 100 households, a stagnant rate in the last few years; mobile telephony which reached saturation in recent years; cable TV which shows us that the penetration rate is quite low in Romanian households, mainly due to the low number of subscribers in rural areas, and also that the usage of DTH technology is growing.
Keywords: Information society, communications, telecommunications ICT, measuring
JEL: L96

Introduction

"The information society is the communication society based on ICT" (Dascălu 2001). The information society is based on the main activity of production and consumption of information using ICT. "Essentially the information society is based on the Internet" (Drăgănescu 2002) using the information technology in a creative and productive way, "in all spheres of human existence and activities, with a significant economic and social impact" (Stoica 2000), "the information society brought the Internet market. The new role of information in terms of the Internet opened an era of a more transparent and efficient economy" (Drăgănescu 2002).

"One of the current requirements for the information society to develop, in the context of globalization of the processes and contemporary phenomenon, is the access to information of citizens" (ADR Vest 2012). The development of the information society, through the convergence of the three key factors: information technology, communications technology and multimedia production (Stoica 2000), creates the necessary conditions for ensuring citizens with the access to information that concern them or that influence their work, study or life conditions.

The term of information society refers to a society and an economy where creating, accessing, acquiring, storing, processing, transmitting, distributing and using knowledge and information plays a decisive role (Ghilic 2002). The machine tools of the Information Society are computers and telecommunications, rather than lathes or ploughs. From an economic point of view, the most significant aspect of this new society is a shift in the majority of the labor force from agricultural and manufacturing sectors to the information sector.

The information society is characterized by an explosive growth of digital information, "which has a central economic and social value, value that can profoundly affect both companies and human life" (Ivan 2001), available through ICT products. For the public administrations, both local and central, but also for the governments, this means public services which are more efficient, transparent, faster, closer to the citizens needs and less expensive.

"Businesses are transforming their supply and demand chains, as well as their internal organization to fully exploit ICT. Governments are restructuring their internal functions and the way they deliver services and generally interact with citizens and businesses. People are modifying their consumption and spending patterns, as well as their behavior. In the process, nearly every economic variable of interest is affected" (OECD 2011).

Knowledge based information society means more than the progress of information and communication technology and applications, integrating also the following dimensions: *social* (with impact on the health care, solidarity and social protection, employment and labor market, education and continuous training etc. – *telemedicine, teleactivities, teleworking, teleelections, teleensurance),* ***environmental*** (with impact on the resource utilization and environmental protection), ***cultural*** (with impact on the preservation and development of the national and international cultural heritage, promoting cultural pluralism, the need for child protection, the development of the multimedia industry and the production of information content – *museums, art galleries on the internet, digitizing information: digitized manuals, national and international heritage digitization*), ***educational*** – (*develops the competence of conception and work under computerized conditions, the intelligent process management, education and distance learning, virtual libraries, e-Teaching, e-Learning),* ***economic*** (with the development of new digital economy paradigms and of new knowledge based economy, innovation, entrepreneurial and management culture, citizen and consumer education - *e-Comerţ, e-Banking, e-Learning, e-Money, e-Trading, internet online payment, internet businesses*), ***political and administrative*** (concerning electronic government – *e-Government, virtual desk, online car licenses, e-Auction, online tax returns),* ***Legal*** (with impact on current legislation regarding the security of transactions, intellectual property rights, protection of Internet competition, computer crime resulting in specific legislation, information society law) (Romanian Academy).

Measuring the Information Society

From a statistical point of view, there is no agreed comprehensive statistical framework of the information society. One possible conceptual model is presented by the OECD and encompasses the widely agreed elements of ICT supply, ICT demand, ICT infrastructure, ICT products and "content" based on the International Standard Industrial Classification (ISIC) Rev. 4.

Digital economy rankings 2010: Beyond e-readiness realized by The Economist Intelligence Unit, is an annual benchmarking directory which reflects the influence of ICT growth in the economy, comprising 70 countries, with over 100 qualitative and quantitative criteria, designed to help the governments of the studied countries to see the differences between them and to take the appropriate measures, but also to present to the interested companies which would be the most promising location for investing in ITC.

The 100 or more criteria are grouped into 39 indicators and 82 sub-indicators, consisting of 6 categories, the score being calculated as a weighted average, as follows: **1. Connectivity and technology infrastructure** (representing 20% of the score); **2. Business environment** (15%); **3. Social and cultural environment** (15%); **4. Legal environment** (10%); **5. Government policy and vision** (15%); **6. Consumer and business adoption** (25%). In this ranking, the first place is occupied by Sweden, with a 8.49 score, which beat Denmark, Romania being on the 47th place (last of the 27 European Union countries), with a 5.04 score, behind Bulgaria (45th, score 5.05), Hungary (35th, score 6.06) or Slovakia (38th, score 5.78) (Economist Intelligence Unit 2010).

Based on a synthetic indicator that defines the state of the information society in a country, proposed by Marius Guran, defined by 24 variables, grouped into four categories: Socio-educational category; ***Informational category*** (informational infrastructure: telephony, radio, TV); Computer category (automated data, information and knowledge processing and storage infrastructure: PCs, Software/hardware, Internet service providers – ISP, "Host computers" Internet); Economic category (Guran 2002), and also based on the 10 core indicators on ICT

infrastructure, we will briefly present the ***informational infrastructure*** trying to grasp the current situation in Romania.

The informational infrastructure facilitates the revolution of human communications, making it to be more and more cheaper and at more and more greater distances, the realization of the condition for the production of new products, services and even entirely new markets for a sustainable economic development, "the support for the development of new trends and technologies which allow the evolution of society by ensuring digital services (anywhere, at any time), an intelligent environment (at home, at work etc.), making knowledge an asset used in decision and innovation process, as a condition for development" (Guran 2002).

**The communications Infrastructure**

1. Fixed telephony

The number of electronic communication services and network providers in Romania increased from January 1st, 2003 when the monopoly held by Romtelecom, company owned initially by the Romanian government, ended.

The most important providers of fixed telephony services are, according to a report made by Gallup for The National Authority for Management and Regulation in Communications (ANCOM) in April 2010: Romtelecom with 87% of the fixed telephony market, still remaining the leader for the *legal persons* segment of the market, followed by RCS&RDS 21%, Vodafone 4%, UPC 3%, Orange 1%, other providers 2%. However we can notice a decreasing trend of the number of fixed telephony subscriptions for Romtelecom provider, starting with 2003 when Romtelecom had 100%, to 2005-2006 when they only had 57% of the market and then 2009-2010, to 37%. 61% of the households of Romania have fixed telephone services, 72% in urban areas, while in rural areas only 47% of the households have and use a fixed telephone, of whom 66% use Romtelecom, 33% RCS&RDS, 4% UPS, of the above mentioned, 94% use a single separate phone line.

Similar to the case of corporate or legal persons subscribers, also for the households, the number of fixed telephony subscriptions acquired in the last few years from the Romtelecom provider is decreasing from 100% in 2003, to 39% in 2005-2006, 18% in 2009-2010, the highest share being held by the competitor RCS&RDS with 65%.

Fig. nr. 1. The dynamics of the number of access lines / subscribers to fixed telephone services and the fixed telephone penetration rate in the 30.06.2009 – 30.06.2011 period, millions.

Source: http://www.ancom.org.ro/

One of the most important indicators of the telecommunication infrastructure is the fixed telephony penetration rate per 100 inhabitants and also the penetration rate per 100 households, rate that in our country did not increase significantly in recent years, being much lower than the rate for mobile telephony. *The low penetration rate is due to the high costs of fixed telephony*

compared to the average population income, and also to the reduced investments in rural telephony infrastructure.

2. Mobile telephony

The main authorized mobile telephony providers in Romania are: Cosmote, Orange România, RCS & RDS, Vodafone România, Telemobil - Zapp. The number of the mobile telephony users *Similar to the case of the fixed telephony, the most relevant indicator is the penetration rate for the mobile telephony services per 100 inhabitants, rate that is calculated as the ratio between the number of the mobile users and the total country population * 100.*

More and more users prefer a package / an integrated solution to pay only one bill for, the bill not being broken down per services, fixed/mobile telephony, fixe/mobile internet, TV services, data transmission, due to lower costs of packed services, and also due to a much easier use of the services, cost control and contract terms.

Fig. nr. 2. *The total number of mobile users and the mobile penetration rate in the 30.06.2009 – 30.06.2011 period, millions*

Source: http://www.ancom.org.ro/
3. Cable television

Unlike the television broadcasts that use electromagnetic waves, cable television represents the distribution of TV channels to the final consumer through an optical or coaxial cable.

Fig. nr. 3. *The dynamics of the number of subscriptions to services providing retransmission of television broadcasts received via cable networks in the 30.06.2009 – 30.06.2011 period*
The total number of subscribers has not increased significantly in recent years, the penetration rate being relatively low mainly due to the small number of subscribers in rural area, with a penetration rate of only 23,1% in 30.06.2011.

Since 2005 new technologies have emerged such as IP technology and digital satellite television (DTH) used especially for hard to reach locations where cable installation costs would be very high, so the number of subscribers receiving digital programs is constantly growing. At the beginning of 2006 cable networks had 91% of the subscribers and DTH had only 9%, while in 2011, cable networks had 60,7% of the subscribers and DTH raised to 38,6%.

IPTV services means not only online television, but it represents transmitting high image and sound quality programs, through IP internet protocols, offering the user a higher level of control over TV programs, enabling the users to select, record and watch their favorite programs anytime they want. Currently, Romtelecom offers this type of service in 21 counties, being available in three packages: iMaxim, iExtra şi iVariat (Romtelecom).

Fig. nr. 4. *The structure of the number of subscribers to services providing retransmission of television broadcasts on 30.06.2011, according to the type of networks*
Conclusions

As the report "Measuring the Information Society ITU" shows us, fixed telephony continues to decline from 2005, when market saturation was taken over by mobile telephony, not only in developed but in developing countries to. In Romania mobile-cellular telephony has reached saturation level, penetration rates is over 100% with 10%, from 2009 we are noticing a slight decrease. According to a Digital Agenda study, Europeans prefer complete packages of internet, telephony and television (European Commission).

The fixed and mobile telephony providers offer more and more minutes included in the subscription in order to attract a higher number of customers, including minutes/reductions in the subscription or as an extra feature for calls made, in the same fixed network, or to other fixed networks, in the same mobile network or to other mobile networks, or minutes to make international calls.

For countries to obtain maximum economic and social benefits from using digital technology, they have to make sure that the population has access and can afford fixed and mobile phone connections, that there are investments in infrastructure made to increase the penetration rate for fixed telephony especially in the rural area.

Digital Agenda for Europe is one of the seven flagship initiatives of Europe 2020 Strategy and aims to define the role that using the communication and information technology will have to play in achieving the objectives of Europe 2020 Strategy.

In the context of the Digital Agenda, *Action 101. Roaming,* in order to increase the competition on the roaming services market they made a preliminary agreement for a sustainable solution for the mobile telephony users, Bruxelles, March 28th 2012, so roaming services would be cheaper due to competition, the consumers having the opportunity to choose the network before they leave or when they are already abroad, they would also be informed about the roaming charges when travelling to countries outside EU (European Commission). It is intended that the difference between domestic and roaming charges to approach zero by 2015.

Telecoms networks and services are the backbone of Europe's developing information Society and the digital economy. To improve innovation, investment and competition and increase efficiency in the telecommunications sector, the European Union promotes increased competition and protect user rights in order to ensure a choice of high-quality broadcast services for consumers (European Commission). Regarding broadcasts, EU encourages rapid switchover to digital television. The rollout of digital television across Europe further expands consumer choice, giving people access to more programmes of higher picture and sound quality as well as the possibility to benefit from interactive services (European Commission).

INFORMATION TECHNOLOGIES IN INSURANCE SALES SUPPORT

Stofor Ovidiu
"Alexandru Ioan Cuza" University of Iasi
Faculty of Economics and Business Administration

Insurance system in Romania is carried out with a constant natural activity, evolving quite honorably these times. This is largely due to the difficulty with which insurance is sold in normal economic conditions when it comes to prosperity. Although psychologists, led by Maslow believes that the protection needs are basic needs, along with the physiological one, on the priority list regarding procurement, insurance needs are for some Romanians, of minimum or no importance, so that they are either pushed to the bottom of the list, or even, as it most often happens, they are non existent. Current economic conditions and climate, urges caution on most fields, especially in terms of individual properties, including, how somewhat forced, life and physical integrity which are still considered property, if this aspect is not debated in terms of Christian or other religious dogma. In other words, many Romanians see insurance as a product that "is not up their alley" including it in the luxury category. Furthermore, the media shows, sometimes amplify certain cases of doubt in relations between insurance company - customer. Appropriate marketing, allied with the information technology can improve the complete relationship between the two entities - the offeror and the consumer.
Through this study we aim to identify important issues that facilitate the sale of insurance, using information technology, given that the sales of these financial products through the "ancestral" methods are effective but not very efficient.
We will follow, by anchoring to the current reality, the insurance utility and how to use information technologies in support of marketing (sales). The study itself was done by observing the results in practical work, from an insurance agency, but also related to what the literature offers. Because this study is currently underway, there are certainly some limitations of accuracy of results, which are adjusted "on the fly". Realizing a practical application to accompany the insurance consultant, manager and sales team, can increase business efficiency, while being able to better control the forecast, an aspect so painful to the sales man.
Keywords: insurance, insurance marketing, sales, informational technologies, Internet
JEL Codes: M15, M31

I. Introduction

The research field, in which the study takes place, involves the application of marketing concepts in insurance, also conjugation informational technologies. The importance of this study is based on usefulness it has in a person's life, given that this financial product is not approved by Romanians; people's reluctance often reaching a level of hostility, when the approach is done by agents with modest skills. So the question is: how to achieve quality sales, and increase the sales' quantity, in a relatively short amount of time?

Many people work until old age in order to enjoy an abundant enough pensions that would help them to survive. However, the risk for many that after a lifetime of work, to go bankrupt in their old age (Schloss 2007: 88). In Romania, there is no need to conduct studies as these situations are very obvious, just by observing those who are on the streets, standing in long lines at pharmacies for discounted drugs or in second-hand stores. It is true that current retirees have long been deprived of their active life of usefulness of information on savings plans that complement or compensate a meager pension. During the communist period, companies that offer such products were non existent; the insurance was only a monopoly. After the revolution, Romanians temptation was to invest money in securities that provide income right away, so many were fooled and instead of earning profits, lost, perhaps their entire lifetime savings. It is known that

the Caritas era, but also the FNI's, brought people in a position to sell their homes or cars to have the money "invested". And these companies are just two examples of the temptations of quick profit Romanians faced. And even if we have a proverb saying that "who burns himself with hot soup, later blows into yogurt" the desire for a rapid profit, it would determine Romanian, in a case of a new emergence of such "business", to stand in line again, again. An analogy can be the televised bingo games, which have had great success in the late '90s; two years ago they have resumed such games, it is true, far fewer followers.

II. Insurance Usefulness

Life insurance plays a key role in managing Risks in modern societies. It can provide income to beneficiaries on year income earner's untimely death or loss of ability to work (SigmaRe 2012: 31). The immense destruction that fire (Realitatea.net) has caused to a local shopping center on small business, caused the small business owners to directly or indirectly realize, how good it would have been if they would have gotten insurance for their business. Their last tardy remark how they couldn't have afforded to buy insurance has no foundation when they watched helplessly as what constituted their daily livelihood was destroyed by a huge fire. Certainly, little effort (but still an effort) that they would have made by insuring their business would been offset by the beneficial effects of compensation. That is why once again, it justifies the claim that people purchase insurance for a future that due to unpredictability generates uncertainty. There is that saying as "we are too poor to afford us cheap stuff. As for many years insurance was seen as a luxury item, which is not exactly true, this "daring" to afford a "small luxury" would have provided a substantial financial reserve.

In a TV program Ion Oncescu, Skandenberg, multiple world champion, said: "I subscribe to the civilized people category, because I am insured" (Antena2.ro). He even mentions how he used his insurance for an operation. Certainly, many other public figures have insurance and even refer to them, all from the perspective of the educated man with a financially sound situation, so that sometimes an insurance holding slides on the slope of snobbery. Indeed, it seems that insurance has become "bargaining chips" in the campaign, yet unstarted; so insurance has been used as a way to determine Sălaj priests to give signatures for a candidate for the post of County Council. He made a substantial donation, making insurance payments of 65 parish houses (stirileprotv.ro).

Worldwide, after a temporary set-back in 2011, life insurance premiums will resume their upward trend in 2012 (SigmaRe 2011: 32). Interestingly, during the recession, people spend more time analyzing a decision about costs. Among the things that help them decide and trust are fundamental processes of a company (Bate 2008: 81). The current crisis and potential future crises can cause humans to think about translating some of the current financial situation, small but still existing, in the future it is likely to be even more difficult.

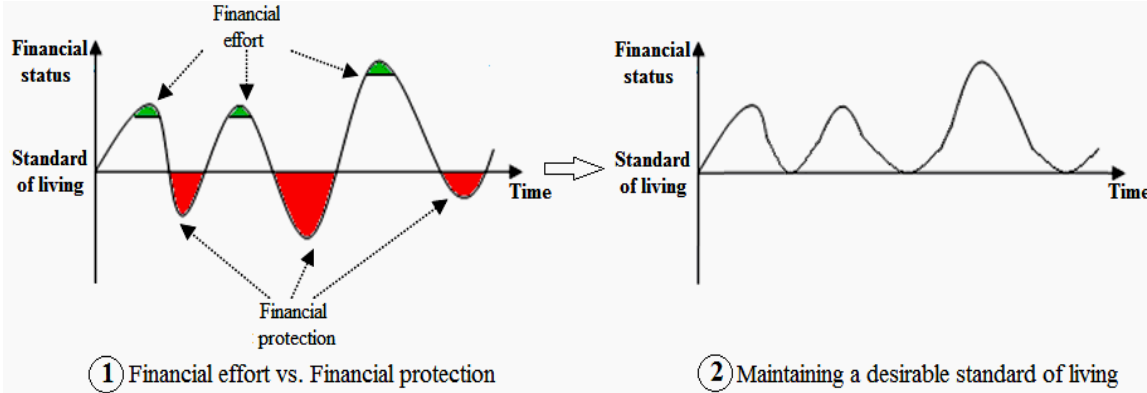

Fig. nr.1 Financial evolution depending on possession / lack of life insurance

This is a simple working principle of life insurance, given in the Fig. nr. 1.

III. The Internet as insurance sales support
Particularly for general insurance products, online insurance begins to gain ground (1asig.ro).
The distribution of insurance products has evolved significantly. Technological developments, such as the internet and mobile phones, have opened up new distribution channels and insurers are increasingly developing multi-channel strategies. (CEA 2011: 12). Adaptation sale steps, of course difficult to accurately achieve, can increase the chances of efficient distribution.
Prediction made in 1995 by Metcalfe, that the Internet will grow dramatically and in 1996 will catastrophically collapse was not achieved either in 1996, nor today, and is very unlikely that they will do in the near future. Although, when considering the warnings cautions in working with the Internet, given even by those from the FBI (Capital.ro)…
If warnings or prophecies more or less apocalyptic will happen, remains to be seen; until then, the Internet has a major role in people's lives, more important than hardware and software on which they are based. Rumbauskas Jr. (2012: 95-97) is convincing when he says the Internet is both extremely powerful sales tool and a generator of advertising, noting that one of the biggest mistakes made by sales people is a failure to accept the Internet and recognize and use its enormous capacity to identify potential customers. He recommended each salesperson to make a site for two purposes, in regards to the visit of a customer on his website:
- providing information to the customer, to design and consolidate credibility;
- retaining the name and email address of potential client.
Electronic communications allow the Internet to build relationships personally with potential clients and the real ones and the guidance of messages to individual users based on information on geographical features, content, buying behaviors and demographic or firmographic characteristics (Stone and Jacobs 2004: 275).
Making of orders and purchases via the Internet is becoming more attractive as consumers can be offered significant advantages due (Militaru 2004: 197) to: lower prices, showing the range of goods/service, convenience, entertainment.
E-mail has developed a reputation as less formal than other written communication in business and the level of formality continues to decline. In fact, it even became a substitute for speech (Sherman 2005: 151). People seem to no longer worry about spelling, thus abbreviations abound. Grammar is also affected, not to mention capitalization. We can consider that e-mail is somewhere between a substitute for speech and a substitute composition of letters. It's important to remember that e-mails without grammar or spelling mistakes are easier to read and allow quick understanding. Good writing depends on four factors (Grisham and Lee 2000: 61): thinking (that aims to write), legibility (clarity of writing), accuracy (spelling and grammar) and tone (how to choose the writing style, adapting it to the person to whom we are writing).
Prospecting using e-mail offers certain advantages: low cost, no shipping delays, the ability to track messages (whether or not read), provides extensive creative possibilities (Aguilar 2008: 74). Some people see in this modern technology, one of the greatest inventions of man but also one of the biggest sources of wasted time, if not used rationally. Richard Denny (2002: 56), one of the experts in sales, explained the situation to a customer who returned from vacation a week, 468 messages found for reading that, it took 22 hours, after which he realized that only three have been helpful. Another disadvantage of email is that companies without a good security policy, without judicious planning of its use has generated lawsuits challenging the discrimination to sexual abuse of trust, e-mail can even be easily faked or forged (Lilley 2008: 126).

IV. Technological "accessories" - modern weapon for insurance agents

Information technology supports all types of organizations to increase efficiency and effectiveness of business processes, performance in making decisions and cooperation in working groups, resulting in strengthening their competitive position in a highly volatile market (Hurbean 2008: 11).

In the hands of an expert having proper monitoring and support with "relevant" SQL can become a "weapon" of very useful network administration, from the creation of users, through the monitoring and logging to that of reporting to leading authorities (Munteanu, Greavu-Ştefan and Cristescu 2004: 239).

Despite the use of increasingly frequent electronic communication and the Internet, few experts foresee giving up traditional telephone services (Timm 2008: 67). Contacting a person can be done quite well through communication tools like instant messenger (Yahoo Messenger, MSN Messenger, Google Talk), but also on-line telephone systems (Yahoo Messenger, Skype), where costs are lower. Social networking sites, like Facebook and Twitter allow access to millions of customers and potential customers (Enderle 2009: 1). It may even make a segmentation of their constituency groups on demographic features.

Taking into account the usefulness of an applications to increase the chances of successful sales, the question is how useful it could be something passing through the filter of a relationship between the cost of developing, if a personal application or one of acquisition, if it buys the added value that it brings.

Widespread economic information systems are usually built around a powerful database server, whether the data managed in this way are available in client/server environment or on the web.

Information systems can be approached holistically, which keeps the prerogatives of systems specialist or a combination of interdependent and interrelated elements. Viewed through the prism of the two approaches, management information systems for sales is a component of marketing information systems, which, in turn, are a component of management information systems (Fig. nr. 2) (Donaldson 2001: 116).

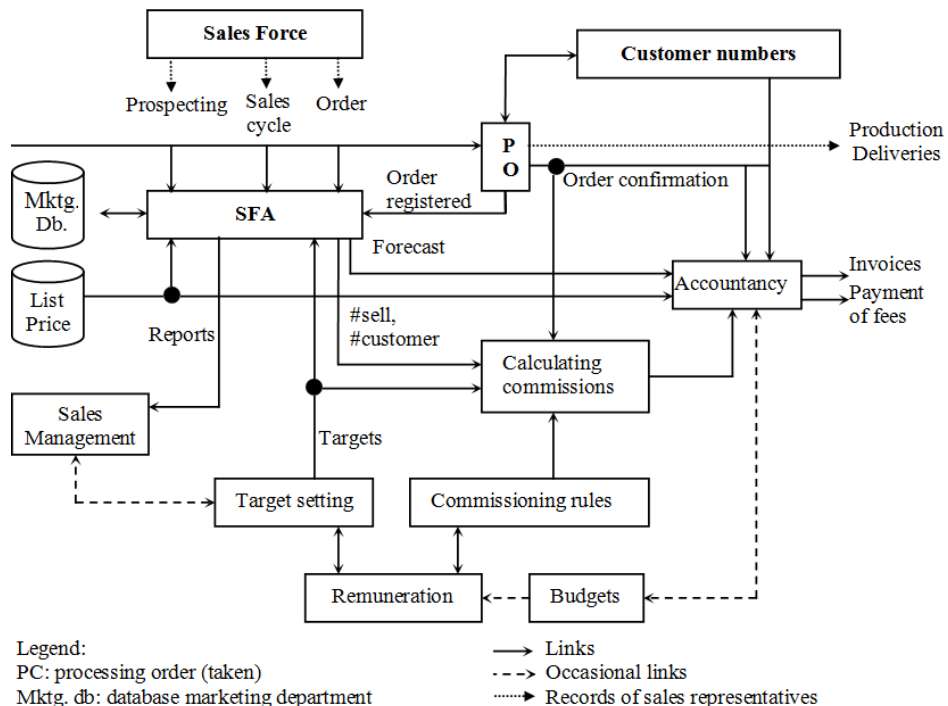
The diagram below (Fig. nr. 3), extracted from one software implementation, in case of a company that pays commissions based on orders takeovers, shows how to organize the various elements that will allow monitoring of sales cycles, sales forecasts, calculate commissions, tracking results of each salesperson, their ability to make offers in this application and, finally, linking sales activities with the marketing (De Preville 2010: 213).


Fig. nr. 3: Example of implementing a management program to sales force.
Source: De Preville 2010: 214

This synopsis presents all the elements to be correlated with program sales force automation (SFA) to obtain relevant reports on sales cycles, sales forecasting and automatic calculation of commission sales representatives.

V. Conclusion

Insurance sales are a daily challenge for those working in this field both in terms of their financial advantages, especially in terms of utility they have on customers.

These types of sales can be achieved and certainly they will be achieved, many years from now, in a classic form, through strict human interaction. But man is subject to both error and oblivion, much more than a computer, which when well programmed will "do the job". The observations I have undertaken, tapping into all sorts of small computer accessories, over time, gave me the opportunity to see an increase in the quality of sales. Still, far from what is intended as the project itself, this article has captured only a small part of the "troubles" involving the development, ultimately natural, given the thought that we live in the 21st century, or as otherwise referred to, the society of knowledge.

Information technologies are more than necessary, although many consultants are still "old school" based strictly on their flair. However using modern technology increases efficiency, especially in the early career of consultant time, the difficulty of this activity, leads many to step back. Customer is given the feeling of greater certainty in regards to his investment, with real-time access to information.

Faculty of Management, Finance and Accounting, Bucharest

In this paper is presented a survey of companies' websites in Bihor county. The study aims at local companies whose scope of activity allows them to interact with the end-users – individuals and whose presence in the virtual environment is ensured by websites. Companies that own a website use it for different purposes: to communicate to the users information about the company, to promote its products and services offered, to offer potential clients the opportunity to purchase these products online, to interact with their clients. The website of a company ensure its constant presence and can be used as an instrument in the marketing strategy, as a meaning of identity development or growth of the brand exposure, as a support for relationships with potential buyers or as a way of achieving market research. But for the website to fulfill the purpose for which it was made it must give the needed importance to certain aspects. Research carried out reveals an intensified concern of the companies for creating their own websites, for communicating with potential clients from the virtual environment, but they do not give importance to issues related to updating the information, structure, appearance, purpose sites. Most companies use the website mainly for information. They give little importance to promotion, yet not realizing the benefits they might have. Less than one third of the websites analyzed offers the possibility of online orders.
Keywords: websites, Internet users, virtual environment, company's promotion, loyal clients
JEL codes: L81, C85

1. Introduction

The accelerated development of the Romanian technological environment led companies to an increasing concern about entering the virtual environment, communicating with potential clients in this environment.

A growing number of Internet users use it in order to search information by gvisiting websites and blogs. Therefore there is a growing trend of increased buyers to approach virtual environment at the expense of the traditional. In these circumstances, companies are forced to use online environment in order to initiate a dialogue with them, to be able to communicate the informational message, promotional or the intention of initiating a commercial exchange.

Enhancing virtual environment use by Romanian companies is the result of the influence exerted by companies that have tapped the domestic market from abroad and whose marketing practices include the use of this environment. Marketing strategies of the latter are successfully implemented, which has motivated domestic companies to take the risk of the online approach.

The website of a company ensure its constant presence and can be used as an instrument in the marketing strategy, as a meaning of identity development or growth of the brand exposure, as a support for relationships with potential buyers or as a way of achieving market research. Offers to

its visitors information about the company, about its traded products, about providers, or about the financial situation.

But for the website to fulfill the purpose for which it was made it must give the needed importance to certain aspects. Thus, the homepage of the website influences in a large way the visitors' response to the entire website. The consistency of positioning the information presented - text, images or animations - it's absolutely or relative positioning –in the page, also the forms the positioning of information take, relative to each other - determines the user's range of how he considers the website relevant to its interests. The relationship created between the types of information can make the page attractive or can generate an overall inconsistency. The contextual factors also include technical aspects such as speed of loading and inclusion on the first page of items that require installation of new programs in order to be viewed by users, issues that, superficially treated, can determine users to stop viewing the website after a few seconds. The most common types of content are text, images, sounds and video. In order to achieve an attractive page, you must find the balance between them, because although the use of as many different elements as form on the content may attract the users attention, their excessive use generates a cluster of information. The information must be updated periodically to attract visitors, to make them return.

2. The premises of the research

In the research that I performed i started from the fact that:

1. There are companies that continue to be present in the virtual environment, even after their dissolution.
2. For many sites there are some problems related to the information updating.
3. There is a similarity of sites structure, of their appearance.
4. Most sites are intended mainly for information.
5. Most sites have elements of interaction with users

3. The research methodology

The sites analyzed in the research conducted were selected from a database composed at national level. The database used has a search engine that allows searches based on criteria such as name, location and domain, advanced searches based on the number of employees, turnover, profit, filtering of results based on: phone number or fax, e-mail, website, etc.

From the database, which can be accessed online at the www.listafirme.ro I extracted data in the table below. The data refer to the years 2007 and 2011, a range of five years, in order to see what changes have been in the concerns of companies from Bihor county to be visible on the web.

As observed in Table1, the completeness of general data about the companies is extremely high.

Table1 reveals a 7626 decrease in the number of active companies in 2011 in Bihor county, compared to 2007. The number of companies that have a website however is increasing, from 880 in 2007(3% of all companies) to 1.530 in 2011(8% of all companies). There has been a near doubling of their number, which shows increasing concerns of companies to be present in the virtual environment.

Table1: Total number of active companies in Bihor county between 2007 - 2011 and the completeness of the information for these

	Year 2007		Year 2011	
Number of companies in Bihor county	26.964		19.328	
Completeness of the information for companies				

Company data	No.	Percentage	No.	Percentage
Name	26.954	100%	19.328	100%
Address	25.394	94%	19.328	100%
Registry number	26.954	100%	19.328	100%
Fiscal code	26.954	99%	19.328	100%

I have selected from the database used, using the search engine available, all the companies from Bihor County that have a website (1.530 companies). By checking the existence of these companies, in the year 2011, it was found that 6 of these websites were of dissolved companies, which haven't announced that they have dissolved nor withdrew their website. Therefore the selection of websites is represented by 1.524 companies.

Out of the 1.524 companies from Bihor county that have websites were selected 450. The selection of the 450 companies submitted to the research was made as follow:

1. There were grouped all the companies from Bihor county, whether they have or they don't have a website, in the following categories: manufacturing, services, trade and other.

Table2: Number of companies according to the type of activity

Activity	Number of companies	Percentage
Manufacturing	2.126	11%
Trade	1.933	10%
Services	15.076	78%
Other	193	1%
TOTAL	**19.328**	**100%**

2. Were selected companies that have websites taking into account the structure of the previous paragraph, as shown in the table below (Table3):

Tabel 3: Number of websites of the companies selected according to the type of activity

Activity	Number of websites	Percentage
Manufacturing	49	11%
Trade	45	10%
Services	351	78%
Other	5	1%
TOTAL	**450**	**100%**

4. Data analysis and interpretation
The results are summarized in the tables below:

No. companies registered in the database listed that have websites	No. existing Websites for dissolved companies	No. existing companies that have websites
1.530	6	1.524

Websites	Web sites that don't have updated the information	Web sites with similar structures	Purpose of the website			Sites that contain elements of interaction with users				
			Only for information	Only for promotion	Of information and promotion	total	a	b	c	d
450	324	401	81	63	306	320	86	45	89	51

a	The existence of contact forms as unique elements of interaction with users
b	Possibility of obtaining current information via newsletters (newsletters) and blogs
c	Possibility of making online orders
d	Possibility for users to interact both with company and to each other

The data collected revealed that:

-4% of the websites are of dossilved comapnies. They continue to exist because withdrawal of the website is omitted when they decide to withdrawal from the market. These circumstances affect negatively the consumer's perception, not so much on the company, that is not affected of this case since they ceased to exist as legal entities, but on the whole virtual representation of business organizations. Consumers adopt an attitude characterized by lack of generalized trust to the information provided by companies through their websites.

-72% of websites fail to periodically update the information. The offer submitted by the company on the website is different from the real one, meaning that, with the change of product offer details is omitted the transposition of these changes in their website, risulting in a lack of trust of potential customers. It is also affected consumer perception on the companies' professionalism and diminished their confidence in the whole information of the virtual environment. Updating the websites offer visitors reasons to return and show him the company's willingness to communicate to the public. A possible cause of this situation is the attitude of local companies towards the virtual environment, an withheld attitude due to the minimized importance given to online marketing.

-89% of websites have a similar structure. On the one hand, this similarity allows visitors to familiarize with presentation websites, which makes internet surfing easy where the internet user is visiting for the first time such a website. On the other hand, it creates problems when a company wants to differentiate itself in the virtual environment from its direct competitiors or from the whole virtual community of companies. The main role of a presentation website is to draw attention, to arouse interest and to trigger the desire to buy the product. From this perspective the presentation website is a form of promotion, and therefore must exhibit a distinctive identity of the company. Similarity between the websites of different companies is influenced also by the strategy they adopted. The copying strategy of some companies already present in the market, whose design has proven to be a recipe for success, is really attractive especially for start-ups.

-18% of the websites are for informational purpose only. 14% of the websites are only for promotion. 68% of the websites have both informational and promotional content, in most cases is primarily informational content (83%). Therefore, for most companies the informative function is of major importance. Conpanies consider that this influences utmost the confidence that visitors give to the company, and the perception they form regarding to the seriousness of the company.

-71% of sites contain elements of interaction with users. Among these:

-26.9% of the websites have contact forms on the first page, these being the only element of interaction with users

-14.06% of the websites provide current information via informative bulletins (newsletters) and blogs

-27.8% of the websites enable online ordering

-15.9% of the websites can be found in public virtual spaces such as social networking and instant messaging programs. These sites allow both the exchange of information between the firm and users, and the development of virtual communities composed of visitors of those sites.

5. Conclusions

The consumers interest in the virtual environment is constantly growing, as evidenced by the rapid growth of internet use in the last years. But the pace at which companies approach the online environment is inferior to the one of the public. From 2007 till 2011 the percentage of the companies from Bihor county who have a website has changed from 3% to 8%.

Companies that own a website use it for different purposes: to communicate to the users information about the company, to promote its products and services offered, to offer potential clients the opportunity to purchase these products online. But a large number of companies don't give enough importance to regular updating of information, leading to a loss of confidence of their potential customers.

Most companies use the website mainly for information. They give little importance to promotion, yet not realizing the benefits they might have.

Less than one third of the websites analysed offers the possibility of online orders.
