The need for experienced physicians in management is growing, taking into account the dynamic nature of the competitive environment. Experienced physicians cure patients, but also accumulate direct expertise regarding how things should be done within the organization. Hospitals should value their input, if they want to increase their profitability in such a competitive and complex type of organization (McAlearney et al, 2005). Researchers have also studied the increasing turnover rates for hospital personnel in recent years, which have been found the result of increasing pressure on medical staff from higher productivity expectations in a managed care environment (Gifford and Zammuto, 2002).

## **2. Literature analysis**

Edgar Schein (1985) defines culture in terms of basic assumptions, shared beliefs or values. He considers that culture exists at three levels: basic assumptions, values, and artifacts and creations. Organizational culture consists of a set of social norms that define which behaviors are appropriate and which aren't within an organization. Nevertheless, organization culture is not necessary homogenous across all departments of the organization, as some norms might be embraced by all members of the organization, while different groups within the organization might develop their own sub-cultures. There were many studies and research that has been conducted about organizational culture recently. This interest was generated by the acknowledgement that an organization's culture could influence its short and long term performance.

Organizational culture is "the set of shared, taken-for-granted implicit assumptions that a group holds and that determines how it perceives, thinks about and reacts to its various environments" (Schein, 2004). According to this definition, there are three main characteristics of organizational culture. Firstly, organizational culture is passed on to new members of the organization through socialization. Secondly, the definition highlights that our behavior at work is influenced by organizational culture. Last but not least, organizational culture operates at different levels.

Organizational culture has three essential layers: artifacts, espoused values and basic assumptions. Each level varies in terms of visibility and resistance to change and each layer influences another layer (Dorothy and Leidner, 2008). The most

visible level is represented by artifacts. Artifacts are the physical manifestation of an organization's culture and include acronyms, myths, stories about the organization, observable rituals, decorations, office layout, awards or dress codes. This layer also consists of the visible behaviors exhibited by individuals or groups. One important characteristic of artifacts is that they are easier to change, as compared to the less visible levels of organizational culture.

The next layer of organizational culture is represented by espoused values. Values are concepts and beliefs that refer to desirable end states or behaviors, guide selection or evaluation of behavior and events and are ordered by their relative importance. Espoused values are the explicitly stated values and norms that are preferred by an organization. Nevertheless, there are cases in which aspirations do not have a direct result in employee behavior, as individuals are guided by enacted values. Therefore, enacted values represent the values and norms that actually influence and shape employee behavior. It is essential to reduce the gaps between espoused and enacted values, as this discrepancy can significantly influence employee behavior and organizational performance, in a negative manner (Schwartz, 1992).

The third level of organizational culture is represented by basic assumptions, which are unobservable and represent the core of organizational culture. These values become so important over time, that they will become assumptions that guide employee behavior. Organizations are likely to attain their goals when there is an inconsistency between espoused values and the behavior needed to accomplish the goals. Moreover, it is hard to promote and implement organizational change, if it is based on values that are not consistent with employees' own values (Reinter and Kinaki, 2009).

## **2.1. Manifestations of organizational culture**

In addition to the physical artifacts of organizational culture, cultural assumptions are passed down to new employees through socialization, subculture clashes and top management behavior. For example, a new member of the organization will not come late again, if someone tells him a story about a former employee that was fired because of a similar behavior. Similarly, top management can enhance product quality through the implementation of administrative and reward systems, as well as through the behavior they model. According to Sathe (2000), there are four general manifestations of organizational culture: shared things (objects), shared sayings (talk), shared doings (behavior) and shared feelings (emotion). Cultural information can be collected within an organization by asking, observing, reading and feeling.

Organizational culture fulfills four functions. First, organizational culture gives its members an organizational identity. Secondly, organizational culture facilitates collective commitment. In other words, organization's culture should create an environment that stimulates its members to be committed to the organization's mission. Thirdly, it promotes social system stability, which means it improves the positive and reinforcing perception of the environment by the employees and it manages conflict and change in an effective manner. For example, emphasizing on performance-based awards and celebrating success is a good technique to lower employee turnover. Fourthly, organizational culture shapes employee behavior by helping members make sense of their surroundings. Therefore, this function of

organizational culture helps employees understand its mission and how it will attain its goals (Kotter, 1992).

## **2.2. Types of organizational culture**

Researchers have conducted numerous studies regarding the relationship between types of culture and organizational performance, motivated by the possibility that certain cultures might be more effective than others. Nevertheless, researchers haven't reached a consensus regarding a universal typology of cultural styles.

Generally speaking rather than presenting a definitive conclusion about the existing types of organizational culture, most of the scientific literature talks about three types of organizational culture: constructive, passive-defensive and aggressive-defensive, each having its own set of normative beliefs. Normative beliefs reflect individual's thoughts and beliefs about how members of a specific group or organization should approach their work tasks and interact with others. In a constructive culture members are encouraged to interact with others and to work in projects that will satisfy their needs to grow and develop professionally. Therefore, this type of culture promotes normative beliefs that are associated with achievement, self-actualization and so on. Oppositely, passive-defensive cultures promote the belief that employees must interact with others in ways that do not threaten their job security. Therefore, this type of culture promotes normative beliefs associated with approval, conventional, dependant and avoidance. Last but not least, organizations with aggressive-defensive cultures encourage employees to have a competitive approach when it comes to protect their status and job security. These cultures promote normative beliefs associated with power, competitively, perfectionism or opposition.

Assessing an organization's culture is not an easy task, as the actual values and norms in an organization do not necessary correspond with the officially espoused ones. Several methods have been developed to conceptualize and assess organizational culture. In a study, Hofstede et al. (1990) assessed the values and perceptions of daily practices of employees from 10 different organizations from Denmark and Netherlands and revealed six main dimensions of cross-organizational variability: process versus orientation, employee versus job orientation, parochial versus professional identity, open versus closed systems, loose versus tight control and normative versus pragmatic mentality.

Process vs. result orientation reflects whether the organization is more concerned with the procedures that must be carried out or with the goals of the organization. Process-orientation is typical to bureaucratic organizations, while results orientation is characteristic to risk-taking organizations that value innovation and tolerate mistakes. The employee vs. job orientation reflects if the organization is concerned with the well-being of its employees or it focuses on getting the job done. In employee-oriented cultures decisions are taken by groups, while in job-oriented cultures decision-making is individual and implements from top to bottom. The parochial vs. professional dimensions reflects the weight that is given to the occupational cultures of the organization's members. On one hand, in parochial organizations employees identify with the organization, whereas in professional cultures employee identify with their profession. When hiring new employees parochial organizations take into account the social background, whereas professional cultures hire on the basis of job competences. An open vs. closed system refers to the communication climate within an organization. In open system

cultures information flows through the organization, whereas this doesn't happen in closed cultures. In tightly controlled cultures, there is a strict control over individuals, while loose-control organizations are permissive with individual's behavior. Lastly, pragmatic cultures are market-driven and open to innovation and fast solutions, whereas normative cultures focus on institutional rules.

### **3. Research methodology**

The main objective of my scientific endeavor concerns the analysis of the cultural differences between the public and the privately owned hospitals in Romania. This research is based on non-probabilistic sampling, more specifically on rational theoretical guided sampling. I have selected medical personnel from public and private hospitals located in Bucharest and used primary data collection, such as questionnaire and face-to-face interviewing, for this empirical study. The studied population is represented by medical personnel from public and private hospitals located in Bucharest. As far as the application of the questionnaire is concerned, I used a mixed strategy. On one hand, I sent questionnaires by email to 90 persons working in the medical field, of which only 32 have been returned, 31 being valid. On the other hand, I went to the Romanian College of Physicians headquarter and managed to fill 32 questionnaires. All the questionnaires were checked for validity, before numbering and loading them in a SPSS 17, data processing software. The graphs and the frequency were generating using this software. Taking into account the objectives of the research and the nature of the variables, the main analysis used were frequencies, Chi Square Test and the Correlation Coefficient.

### **4. The results of the research**

After analyzing the answers given by the participating medical personnel, there were noticed significant organizational culture differences between the persons working in the public hospitals and the ones working in private clinics. At the most visible level of culture, represented by artifacts, there are significant differences between the two groups. When testing the links between the ownership of the institutions and the perception of the medical staff about the facilities, the equipment and the layout of the work environment, it was observed a relationship of high intensity (Correlation coefficient=0.815, Sig.=0.012) and statistically valid (Chi-Square statistics revealed that none of the expected frequencies are less than 5, so these results are statistically valid). Moreover, 63% of the persons working in public hospitals responded that they are dissatisfied with facilities offered, whereas 68% of the persons working in private hospitals consider they have access to proper equipment. On the other hand, there is a small correlation between the number of years spent in the organization and the perception regarding the quality and efficiency of the technical equipment (Correlation coefficient=0.248, Sig.=0.05). Similarly, the position in the organization has no influence on their perception regarding the visible artifacts (Correlation coefficient=0.03, Sig.=0.982), which gives more weight to the relationship between the institution type (public or private) and the perception regarding the offered facilities.

When testing if the work climate is pleasant or not, there were differences in perception between the two groups. Therefore, the relationship between the work climate and the type of the organization is strong (Correlation coefficient=0.79, Sig=0.00) and show that 91% medical staff working for private hospitals are satisfied

with the work environment, as compared to only 10% of the persons from public hospitals.

The analysis of the data also revealed that there is a weak but not statistically valid correlation between the government and private funded hospitals, in terms of how clear the mission is for its members (Correlation coefficient=0.23, Sig=0.84). This result can be interpreted through the occupational culture perspective, as the core values and the mission of the medical personnel are acquired through schooling and through norms that are learned in the workplace. Nevertheless, there is a relationship of medium intensity (Correlation coefficient=0.49, Sig=0.00) and statistically valid (Chi-Square statistics revealed that none of the expected frequencies are less than 5) between the organization's type of funding and the perception of how well the institution fulfills its mission. Thus, 91.8% of the persons working in private hospitals consider their organization fulfills its mission efficiently, as compared to 44.7% of the medical staff from public hospitals.

Has been found a medium intensity relationship (Correlation coefficient=0.44, Sig.=0.00) between the two groups and the diplomatic leadership style. Thus, 92.8% of the persons working in private hospitals consider that all the operational aspects are tackled in a diplomatic manner, as compared to 51.4% from the public hospitals. Similarly the control test question revealed a relationship of medium intensity (Correlation coefficient=0.477, Sig.=0.00) between the type of the organization and an autocratic style of leadership (60.7% of the persons working in private hospitals and 28.8% of those who work in public clinics reject the assertion regarding the autocratic style of management).

According to the data analysis, there are weak relationships between perception of the persons working in public and private hospitals and the variables "my opinions are valued" (Correlation coefficient=0.209, Sig.=0.10), "communication with the organization's members" (Correlation coefficient=0.204, Sig.=0.208) and "access to information" (Correlation coefficient=0.09, Sig.=0.48). Both types of organizations allow the access to relevant information, communicate in an efficient manner and value the opinions of its members. One possible explanation to these results is the nature of the medical activity and the high professional expertise held by the members, which overcome the cultural differences between the organizations.

Have been identified a weak relationship between the two groups and the perception about how the organization acknowledges and rewards the success of its members (Correlation coefficient=0.241, Sig.=0.057). In addition, there isn't any relationship (Correlation coefficient=0.024, Sig.=0.851) between the perception of the groups regarding the celebrations and the events organized by the institutions, as almost all persons participate and have a good opinion about them.

The data analysis revealed a medium intensity relationship (Correlation coefficient=0.323, Sig.=0.01, Chi-Square statistics revealed that none of the expected frequencies are less than 5), that is statistically valid, between the two groups when it comes to their opinions regarding the manner in which hiring is made. Therefore, 82.1% of the persons working in private clinics consider the hiring is made according to the meritocracy principles, as opposed to only 48.5% from the public hospitals. There is a weak relationship between the perception regarding the job security and the affiliation to one of the groups (Correlation coefficient=0.104, Sig.=0.419, Chi-Square statistics revealed that none of the expected frequencies are

less than 5), 69% of the respondents from the private sector consider their jobs are secure, as compared to 82.8% of the persons from the public sector. Has been found a low intensity relationship between the funding type of the organizations and “the training programs” (Correlation coefficient=0.201, Sig.=0.115, Chi-Square statistics revealed that none of the expected frequencies are less than 5), “relationship with superiors” (Correlation coefficient=0.36, Sig.=0.781, Chi-Square statistics revealed that none of the expected frequencies are less than 5) and “professional evolution since being part of the organization” (Correlation coefficient=0.296, Sig.=0.0185, Chi-Square statistics revealed that none of the expected frequencies are less than 5). The respondents are satisfied with the training programs (60.7% in private sector, 45.7% in public sector), consider they have evolved professionally (96.5% in private sector, 82.8% in public sector) and have a good relationship with their superiors (85.7% in private sector, 77.1% in public sector). Moreover, there is a relationship of medium intensity between the affiliation of the respondents and their perception about the level of remuneration, compared to their responsibilities and the work done (Correlation coefficient=0.401, Sig.=0.01, Chi-Square statistics revealed that none of the expected frequencies are less than 5). Therefore, 75% of the members from private sector are satisfied with the level of their remuneration, whereas only 45.7% from the public sector make the same claim. On the other hand, both groups have similar opinions regarding the relative importance of financial reward compared to professional satisfaction (Correlation coefficient=0.201, Sig.=0.115, Chi-Square statistics revealed that none of the expected frequencies are less than 5).

#### 4.1 Organizational culture in public and private hospitals

The respondents were asked to choose the myths they have encountered within the organization, from a list of ten options (*bad boss myth, historical efficiency myth, superior remuneration for extra-hours myth, nepotism myth, management decentralization myth, new technology myth, model employee myth, western models myth, opportunistic employee myth and reduced chances of promotion myth*). As it can be seen in Table 1, the employees from private sector mainly chose: the myth of the reduced chances of promotion, the myth of new technologies, historical efficiency and the nepotism myths. The members from public clinics chose: reduced chances of promotion, bad superior, historical efficiency and the perfect employee myth.

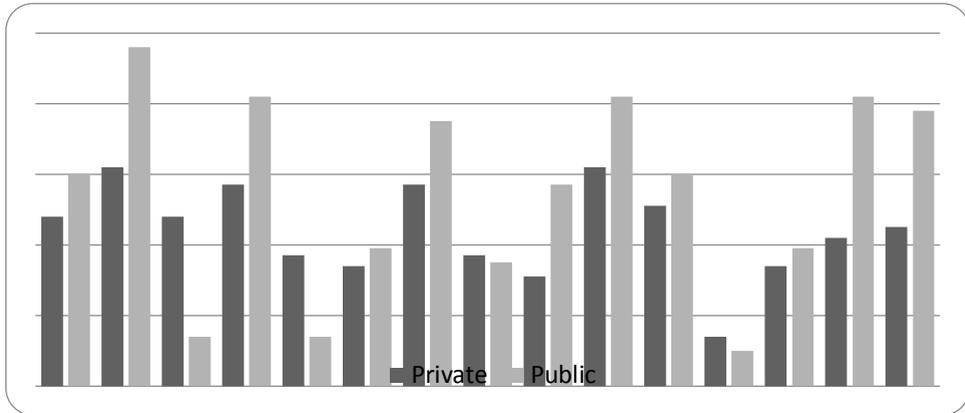

**Table 1:** Myths encountered within the organizations

Sector	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10
Private (%)	22	31	11	25	8.5	34	14	25	20	34
Public (%)	32	32	21	14	14	25	28	21	25	46

Source: made by author

The respondents were also asked to select at least five values they believe in from a list of 15 possible options, (*work-V1, correctness-V2, autonomy-V3, pleasant work environment-V4, customer satisfaction-V5, perseverance-V6, continuous development-V7, innovation-V8, punctuality-V9, quality-V10, team work-V11, coordination-V12, loyalty-V13, respect-V14, and integrity-V15*). Figure 1 shows in percents, how many persons from each group chose the values mentioned above.

Therefore, the values chosen by most people working in private sector were: correctness, quality, pleasant work environment and continuous development. The respondents from public sector preponderantly selected the following values: correctness, respect, integrity, team work and quality.

**Figure 1:** Values in which the respondents believe  
Source: made by author

Taking into account the values and the myths found in these institutions, I can say there are important differences in terms of culture between public and private hospitals, even if the occupational culture has the most significant impact on medical staff. On one hand, in public hospitals the centralized decision making, the perception regarding the leadership style (autocratic), the myths selected (bad superior, historical efficiency) and the values chosen by the medical staff suggest the existence of a passive-defensive culture. Employees value job security and they interact with colleagues in ways that don't threaten their job security. Moreover, the public organizations are more concerned with the procedures and the internal rules rather than focusing on the end result. This approach is typical to bureaucratic organizations, as compared to private hospitals that encourage innovation, which can be seen in the values chosen by their medical staff (continuous development, innovation and quality). Public hospitals are job-oriented, as decision making is individual and implemented from the top of the institution to the bottom. In contrast, private hospitals are concerned with the well-being of their employees, as they are involved in the decision making and satisfy their needs to develop professionally, aspects with sustain the existence of a constructive culture in these institutions. Both organizations focus on the professional dimension, as hiring is made taking into account the qualification of individuals, rather than if they would socially fit within the organization. Given the field of activity, the employees identify mainly with their profession, rather than with the organization, as the values and shared practices acquired trough schooling have a powerful impact on medical staff. Public hospitals tend to be closed systems as the communication is not efficient throughout the organizations, while private hospitals score better in this respect. Last but not least, both types of hospitals are tightly-controlled cultures, as they put an emphasis on punctuality, rigor and no mistakes are accepted.

## 5. Conclusions

Turnover rates for hospital personnel (nurses, doctors and auxiliary staff) have been increasing in recent years, especially in the public sector, being the result of several factors. Dated facilities, unpleasant work environment and lack of personnel contribute to low job satisfaction, motivation and involvement. The research also reveals the existence of a strong occupational culture that is explained through the values and shared practices acquired through schooling and training. Nevertheless, there are still significant differences between the state-owned and private-owned hospitals.

A significant extent of the medical personnel working in the public sector are dissatisfied with the equipment and facilities offered by the institution. In addition, the study revealed differences in terms of the management styles used, as managers in public hospitals tend to tackle things autocratically, whereas managers in private clinics are more diplomatic and value more the opinions of the organization's members. Nevertheless, due to the dynamic environment of hospitals, the need for experienced medical professionals in management is growing. Physicians are the ones who cure patients, but they also influence the speed and extent to which changes are made in the organization. Therefore, hospitals should use their expertise and perspectives, in order to survive in such a competitive and complex type of organization. Only 45% of the personnel from public hospitals consider that their remuneration reflects the amount of the work done, as compared to 75% in the private organizations. These results should also be seen through the following perspective: all respondents have similar opinions regarding the importance of job satisfaction compared to financial remuneration. Therefore, even though the financial aspect is not defining for their activity, the level of the remuneration is so low that it influences negatively the job satisfaction and the work climate. Better remuneration would improve the effectiveness levels, as the impossibility of fulfilling the basic needs of the employees (the so-called hygiene factors) has a significant negative impact on performance. Moreover, implementing performance-based awards and celebrating success are techniques that will reduce employee turnover in public hospitals and stimulate the personnel to acquire new competencies and learn continuously.

Taking into account the strength and the major differences in terms of occupational culture compared to other fields of activity, medical personnel from both public and private sector share common values and myths. Therefore, both groups value team work, as every member of the organization must contribute when a task is given. Medical institutions should focus on quality services, customer satisfaction, as in hospitals patients need to be given the prime priority, and innovation, as advancements and innovations in medical technology make a difference.

As compared to the private sector, in the public hospitals there is a perception that hiring doesn't follow the meritocracy principles. The management should focus on hiring and developing the best people in order to improve the quality of the services and the organizational performance. Training is necessary not only to keep up with the latest technological breakthroughs, but also to reinforce the importance of a respectful treatment for the patient, as disrespectful manners are inherently poor service. In public hospitals can be identified elements of a passive-defensive culture, as in these institutions employee complain about the centralized and top-down

decision making, as well as reduced promotion opportunities. Medical personnel's opinions should be more valued, not only to increase their motivation, but also to get quality information from people that work directly with patients. On the other hand, private hospitals have a constructive culture, as employees value team work and the management is more decentralized, leaving the employees enough freedom to take decisions when necessary, without having to ask their superiors.

The limitations of this research refer to the number of respondents and their location, as the primary data were collected from medical personnel working in several hospitals located in Bucharest. I intend to extend my future researches to investigating medical personnel from other hospitals, as well regions of Romania. In addition, this study doesn't establish ways in which the cultural differences between organizations from public and private sector can be minimized. Taking into account these limitations, I will focus my future work towards eliminating these aspects.

# COST OF QUALITY AND TAGUCHI LOSS FUNCTION

**Dobrin Cosmin, Stănciuc Ana-Maria**

*The Bucharest University of Economic Studies, Romania*

*cosmin.dobrin@man.ase.ro*

*ana\_mstanciuc@yahoo.com*

**Abstract:** *An organization must take into account the costs associated with achieving quality because one of the important objective of continuous improvement programs is to meet customer requirements at the lowest possible cost. Hence, an organization needs to adopt framework to classify costs and to focus on existing cost of quality (CoQ) models. The objective of this paper is to give a survey of research literature and models on the topic of CoQ and to provide a basic understanding of quality costs.*

**Keywords:** *Quality Costs , Cost of Poor Quality, Cot of Good Quality, The Taguchi Quality Loss Function.*

**Jel classification:** *M11*

## 1. Introduction

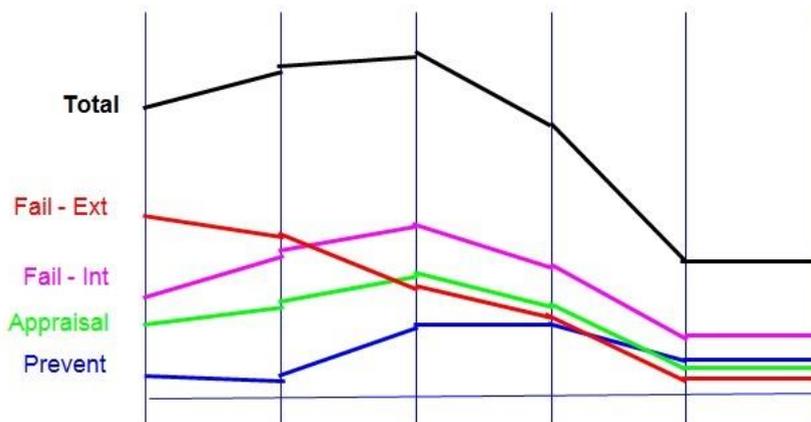

Many organizations consider improving quality as the best way to enhance customer satisfaction, to reduce manufacturing costs and to increase productivity. For this, the CoQ must be reduced. All quality management consultants tend to have quality cost programs as an integral part of their repertoire ( Suhansa Rodchua, 2006). Monitoring and controlling CoQ are becoming critical activities of quality improvement programs. Manufacturing companies tend to measure visible costs and ignore significant hidden costs that are difficult to measure such as opportunity costs. An approach for quantifying the opportunity costs is presented here.

## 2. Literature review

Three noted authors on quality management, Deming, Crosby and Juran each have a different attitude to cost of quality (CoQ). Deming's view is that cost analysis for quality is a misguided waste of time and measuring quality costs to seek optimum defect levels is evidence of failure to understand the problem. Crosby argues that quality costs need to be measured, not for management control, but for the development of "quality" thinking within the organization. The more popular approach is that of Juran who advocates the measurement of costs on a periodic basis as a management control tool.

To collect quality costs a firm needs to adopt a framework to classify costs. The Feigenbaum classification system is almost universally accepted (Plunkett & Dale, 1988). Feigenbaum(1974) identified three cost categories : prevention , appraisal and failure. Juran divided the failure costs into two categories: internal failure and external failure ( Juran & Gryna, 1970). Many writers such as Morse and Roth (1983), Ponemon (1990), Youde (1992), Ross(1993) have used Juran's classification system in their research.

To further facilitate understanding of cost of quality trends over time, the four cost categories are analyzed and presented in Figure 1.

**Figure 1:** Hypothetical Quality Costs Trends over Time

### 2.1. The COQ Models

In general, COQ models are classified into four groups:

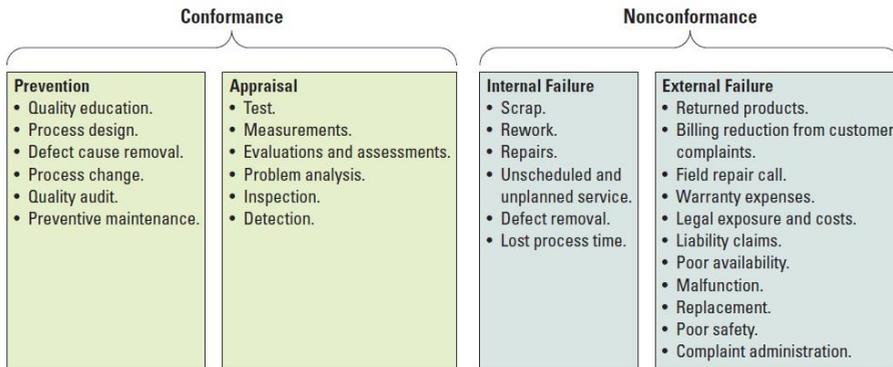

1. P-A-F models: Prevention costs+ Appraisal costs+ Failure costs
2. Crosby's model: Cost of conformance+ Cost of non-conformance
3. Opportunity or intangible cost models: [Prevention costs+ Appraisal costs + Failure costs + Opportunity costs] / [Cost of conformance+ Cost of non-conformance+ Opportunity costs] / [Tangibles + intangibles] / [P-A-F (failure costs includes opportunity costs)]
4. Process cost models: Cost of conformance + Cost of non-conformance

### 2.2. Cost of Quality categories

The cost of quality can be separated into three categories , namely:

- the cost of conformance to customer requirements;
- the cost of non-conformance to customer requirements;
- basic operational costs.

Defining each element in turn, the cost of conformance is the cost an organization incurs in meeting the requirements of its customer. A strong element of this cost is the money a company spends on preventing products or services going wrong or checking that they are right before they reach the customer. The costs of non-conformance are failure costs , the costs incurred by a company in repairing what has gone wrong. The third category basic operational costs are the costs an organization cannot avoid encountering during the normal performance of its business. Those categories are represented in Figure 2.

**Figure 2:** Cost of quality categories

### 2.3. Cost of Poor Quality and Cost of Good Quality

There are two main elements to focus on : the Cost of Good Quality (CoGQ) and the Cost of Poor Quality (CoPQ). The CoGQ relates to costs incurred to assure the quality of products and prevent poor quality. The CoGQ should be viewed as an investment in reducing the CoPQ, whereas the CoPQ can be viewed as a direct measurement of the failure costs incurred in producing a product. Together, these two variables make up the cost of quality.

$$\text{CoQ} = \text{CoGQ} + \text{CoPQ}$$

The CoPQ measures internal and external failure costs and the CoGQ measures appraisal and prevention costs.

The CoPQ quantifies traditional quality costs companies measure and includes rework, returned materials, scrap, and originate both internally and externally. Hence, the CoPQ variable is divided into two sub-variables: Internal Failure Costs (IFC) and External Failure Costs (EFC).

$$\text{CoPQ} = \text{IFC} + \text{EFC}$$

On the other end of the spectrum, the Cost of Good Quality (CoGQ) measures costs related to areas such as people and technology involved in the production of high quality products.

These costs are much less likely to be accounted for by executives and plant managers in respect to the cost of quality equation. They are often measured disparately rather than in a standardized way that can facilitate enterprise-wide comparison. The CoGQ has two central components: Appraisal Costs (AC) and Prevention Costs (PC).

$$\text{CoGQ} = \text{AC} + \text{PC}$$

### 2.3. The Taguchi Quality Loss Function (QLF) and the Hidden Costs of quality

Taguchi Methods was developed by Dr Genichi Taguchi. It combined engineering and statistical methods that achieve rapid improvements in cost and quality by optimizing product design and manufacturing processes. There are three statements that apply for the methods:

- we cannot reduce cost without affecting quality;
- we can improve quality without increasing cost;

- we can reduce cost by reducing variation or by improving quality. Therefore, when we do so, performance and quality will automatically improve.

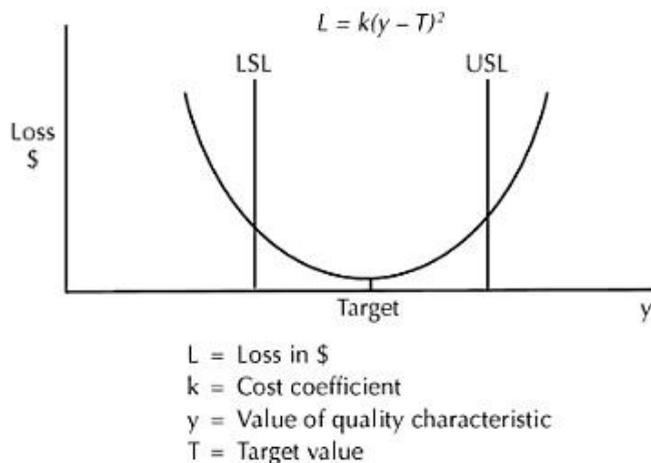

Taguchi defined quality as “the loss imparted to society from the time the product is shipped.” Fundamental to this approach to quality engineering is this concept of loss. He associated loss with every product that meets the customer’s hand. This loss include, among other things , consumer dissatisfaction, added warranty costs to the producer, and loss due to a company’s bad reputation , which leads to eventual loss of market share.

Quality costs or poor quality costs are usually quantified in terms of scrap and rework, warranty, or other tangible costs.

What about the hidden costs or long-term losses related to engineering, management time, inventory, customer dissatisfaction, and lost market share? Can we quantify these? Perhaps, but not accurately. Indeed we must find a way to approximate these hidden and long-term losses, because they are the largest contributors to total quality loss. Taguchi Methods uses the Quality Loss Function (QLF) for this purpose. QLF depends on the type of quality characteristic involved like:

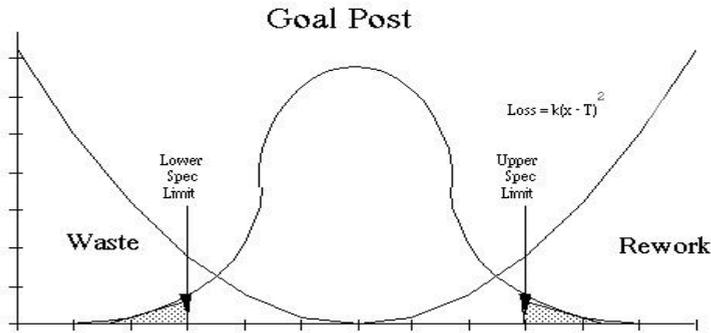

- Nominal-the-best (achieving a desired target value with minima variation: dimension and output voltage)
- Smaller-the-better (minimizing a response: shrinkage and wear)
- Larger-the-better (maximizing a response: pull-off force and tensile strength)
- Attribute (classifying and/or counting data: appearance)
- Dynamic (response varies depending on input: speed of a fan drive should vary depending on the engine temperature)

Loss can occur not only when a product is outside the specifications, but also when a product falls with specifications. Further, it is reasonable to believe that loss continually increases as a product deviates further from the target value, as the parabola (QLF) as shown in Figure 3.

**Figure 3:** The Taguchi Quality Loss Function (QLF)

The loss isn't linear. Taguchi theorized that the loss is proportional to the square of the distance from the target value.

### 3. Research methodology

We present the modeling approach used to define customer waiting time improvement model for evaluating service quality.

By using the Taguchi Loss Function, we can determine the cost of quality caused by customer dissatisfaction from waiting in queue. In this research, the model combines the

Taguchi loss function with the components of waiting time and customer dissatisfaction.

The model is derived for a single channel single server for M/M/1, Ek/M/1 and M/G/1 queuing model. We assume the queuing line has single channel single server and customers are selected from the line in a first come, first served fashion.

Waiting time from each queuing model is defined by its probability density function. The function is combined with Taguchi Loss Function to define quality loss of customer waiting and learning curve.

The Taguchi loss function for customer waiting time can be expressed in (1) which taken from Fink and Gillett (2006).

$$QC = \int_0^{\infty} f(t)Kt^2 dt \quad (1)$$

Where

$f(t)$  = probability density function of customer waiting

$K$  = penalty cost per unit time waiting

$t$  = time

In above equation, the value of  $K$  represents the cost of customers to wait in queue.

By direct integration of (1), expressions for the Taguchi loss of customer waiting time for M/M/1, Ek/M/1 and M/G/1 queuing model can be obtained. The Taguchi cost for M/M/1 queuing model (Fink and Gillett, 2006) is expressed in (2).

$$QC = \int_0^{\infty} \lambda(1 - \rho)e^{-\mu(1-\rho)t} Kt^2 dt(2)$$

In the equation,  $\rho$  denotes the utilization which can be expressed by (3).

$$\rho = \frac{\lambda}{\mu}$$

where  $\lambda$  and  $\mu$  denote arrival and service rate respectively.

A numerical example is given to illustrate the implementation of the model. We assume the time horizon is  $t= 2$ , the arrival rate is  $\lambda= 12$  customer/hour, the service rate  $\mu$  is 16 customer/ hour. Hence, the server utilization is  $\rho= 0.75$ . The model will find the least total cost. Let  $t$  equal to the time horizon for a continuous improvement program to reduce customer waiting time.

#### 4. Findings and discussions

We investigate customers waiting time improvement using Taguchi Loss Function. The cost incurred in this research includes quality loss. The decision variable of this research is learning rate which describe the level of learning that must be performed by a company to improve their service quality in term of waiting time.

#### 5. Conclusions

In recent years organizations have been focusing much attention on quality management. Also, manufacturing environments have changed enormously so today's consumers are becoming more and more complex and they require high quality and diversified products. Therefore, companies should produced new, innovative and high quality, yet cheap products that today's customers want to buy. To maximize the profits of an organization it is necessary to monitor quality costs. Quality costs are important considerations for information management and information technology. In global world, the most important way to survive in the competitive environment for firms is using quality as a core strategy. All successful companies have a strong quality strategy in order to survive in the competitive world. Now, many successful companies promote quality as the central customer value and consider it to be a critical success factor for achieving competitiveness. The successes of multinational corporation depend on their successes in using quality cost systems

**Abstract:** *This article presents a stage of the implementation process of the EFQM Model in a higher education institution, namely at the German study line within the Faculty of Economics and Business Administration, “Babeş - Bolyai” University, Cluj–Napoca. Actually, designing this model for the higher education sector means highlighting the basis for the implementation of a Total Quality Management model, seen as a holistic dimension for the perception of quality in an organization. By means of the EFQM method, the authors try to identify the performance degree of the criterion „Customer Results”, related to the students’ satisfaction level. The students are seen as primary customers of the higher education sector and have an essential role in defining the quality dimensions. On the one hand, the customers of the higher education sector can surface the status quo of the quality in the institution and on the other hand they can improve the quality. Actually, the continuous improvement of quality is highly linked to performance. From this point of view, the European Foundation for Quality Management model is a practical tool in order to support the analysis of the opportunities within higher education institutions. Therefore, this model offers a customer focused approach, because many higher education institutions consider the students to be the heart of teaching and researching. Further, the fundamental concepts are defined and the focus is pointed in the direction of customer approach, which highlight the idea that excellence is creating added value for customers. Anticipating and identifying the current and the future needs of the students by developing a balanced range of relevant dimensions and indicators means taking an appropriate action based on the holistic view of quality in an organization. Focusing and understanding students’ and other customers’ requirements, their needs and expectations, follows the idea that performance can be achieved by involving people in the continuous development of the process, they work in.*

**JEL classification:** *I23.*

## 1. Introduction

The higher education sector is perceived as a centre of opportunities and the global change requires a continuous improvement of teaching, learning and research. For this reason, it is vital to develop an excellence model in order to identify the status quo of the quality dimensions within a certain institution, but also to deduct viable strategies for its future development.

According to ENQA Report (2005) the higher education institutions should have policies and procedures to quality assurance in order to achieve performance. In the same time, the higher education institutions should also commit themselves to the development of a culture, which provides and recognises the importance of quality and implements strategies for the continuous enhancement of quality.

Further, the ENQA Report suggests, that it is not sufficient to define these developments in terms of new trends in higher education, since there are relevant factors that contribute to this. Facing the pressure from a range of stakeholders, the higher education sector is linked with the challenge of reorienting its approaches to more customer focused activities (Hides, Danes and Jackson, 2004).

Moreover, the Sheffield Hallam University Report (2003) highlights that the European Foundation for Quality Management has been tested and applied within higher education by using the customer – focused approach. This situation is congruent with the objectives of many education institutions, which put the students in the centre of learning and teaching.

Sallis (2005) admits that education is defined as a provider of services and concerning this matter, the customers are a very diverse group. Because quality means meeting the customers' needs, it is important to be clear whose needs should be satisfied. The author makes a distinction between:

- primary customers: who directly receive the service;
- secondary customers: such as government, employers or parents;
- tertiary customers: who have a less direct, but crucial stakeholding in education;
- internal customers: employees of the institution.

By using this structure, the primary customers are seen in this paper as paramount, namely the students.

Actually, the performance of an institution depends on its capacity to ensure the resources in order to achieve the main objective, which refers to the providing of knowledge and skills embodied in people and technologies. The value of this knowledge is defined by the customers of the institution in term of quality, relevance and utility (Spaapen et al. 2007; Marginson 2007, Benneworth & Jongbloed, 2010).

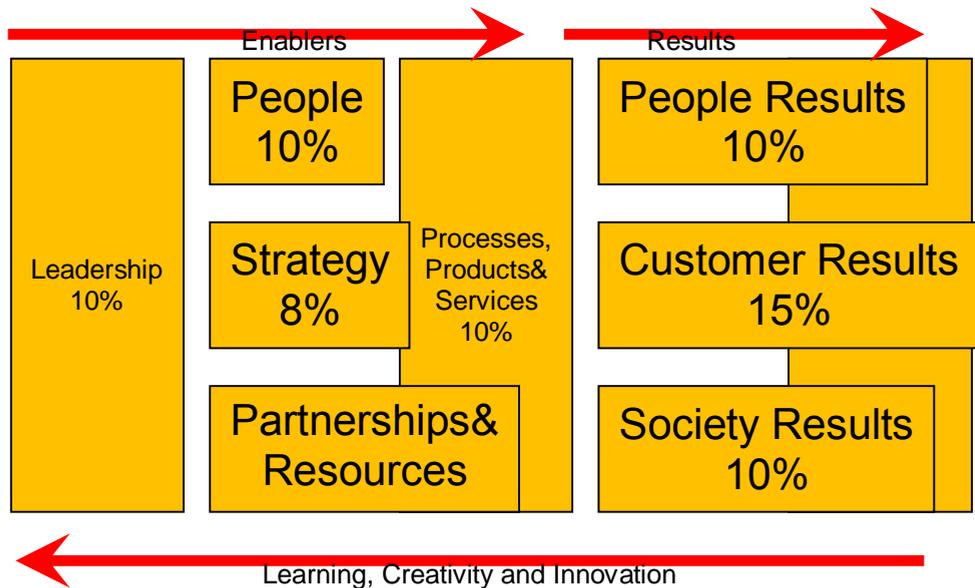

## 2. Objective

This paper aims to present the methodology and the importance of implementing the European Foundation for Quality Management model in the higher education sector, because regardless the culture, size or tradition the higher education needs to develop excellence in order to be successful.

### The EFQM Excellence Model

The „European Foundation for Quality Management (EFQM)“, founded 1988, resulted as part of an initiative assumed by managers of large European companies,

offering a possibility in adopting a Total Quality Management Model. (The European Foundation for Quality Management, Introducing excellence, 2009) Within this paper we will focus on the current used version of the model, namely the 2010 version. Figure 1 represents the graphic structure of this model.

**Figure 1:** The new weighting of criteria within the EFQM model, version 2010

Source: Introducing the EFQM Excellence Model 2010,

[http://www.efqm.org/en/PdfResources/EFQMModel\\_Presentation.pdf](http://www.efqm.org/en/PdfResources/EFQMModel_Presentation.pdf), p.21 and p.42

Five of the criteria are grouped within the category „Enablers”, and four of them are grouped within the category „Results”. Therefore, the category „Enablers” contains all efforts taken by the organization and necessary resources in order to achieve excellent results, and integrating the feed-back contained within the category „Results”, the organization may improve its enablers.

The criteria of the „Enablers” category would be (The European Foundation for Quality Management, Introducing excellence, 2009 and Introducing the EFQM Excellence Model 2010):

- Leadership: Referring to leader’s behaviour, manner of initiating, implementing and communicating change within the organization. Assuring good relationships to external partners, clients and suppliers would also be leader’s responsibilities;
- Strategy: The vision of the organization and the goals deriving from that vision ground on the future needs and expectations of the stakeholders, meaning that latter should be inserted into the strategy;
- People: Orientation towards human resources refers to the capability of the organization in using employees’ competencies in order to continuously improve the performances of the organization. Therefore, the evaluation within this criteria focuses on the way the organization plans its resources, the way the organization plans the needs regarding competences and abilities and the way the employees are involved in achieving the goals of the organization;

- Partnerships and resources: Issues addressed within this topic rely on the way partnerships and resources are used and managed so as to sustain the policy of the organization. The term „resources“ is used to gather both financial, material, technological, informational and other sorts of resources the organization uses. Therefore, this criterion deals with the way an organization establishes relationships with partners (suppliers, clients, sponsors, etc.)
- Processes, Products and Services: Addresses the design and management of processes. Measures that facilitate continuous improvement, creativity and innovation are greatly encouraged.

The criteria corresponding to the category „Results“ are (The European Foundation for Quality Management, Introducing excellence, 2009 and Introducing the EFQM Excellence Model 2010):

- Customer results: Has a greater weight within the model, compared to other criteria, because it is thought to be the best instrument in achieving the goals of the organization. Issues addressed within this topic deal with the initiatives taken in order to satisfy both internal and external clients. Also, it has to be clearly stated which kinds of measures are currently taken by the organization so as to determine and measure clients' satisfaction. In this respect, the organization should take into account new indicators in order to measure clients' satisfaction.
- People results: This criterion focuses on establishing the performance of the organization from employers' perspective, but also to evaluate organizations' results through the involvement of employees. Therefore, motivation and satisfaction are important issues.
- Society results: Within this criterion, public opinion is of great value. Self-assessment of the organization should underline if it is able to satisfy the needs of the society: responsibility towards the environment, quality of life, involvement in different social activities, etc.
- Key Results: The main goal is to maintain and improve the results of the organization. Hence, this criterion deals with organization's achievements in relation to their planned performance. Therefore, one can easily identify the link between the criterion "Processes, Products & Services and Key Results, because latter offers information about past data and "Processes, Products and Services" about the future, meaning that the success of an organization is only partially covered by Key Results, hence the source of improvements lies in the criterion "Processes, Products and Services".

Taking into account the goal of this paper, an important aspect is to be noted within this revised version of the model, namely the proposal in measuring the achievement of the criteria "Customer Results". As mentioned within (Introducing the EFQM Excellence Model 2010), the assessors should pay attention both to customer perceptions and performance indicators. According to prior cited publication, first issue to be measured, perception, could be measured using customer surveys, focus groups, customer complaints, generally direct contact to the customer. Second issue, performance indicators, focuses on external recognition, delivery of products and services, assessing the efficiency and effectiveness of an organization (Introducing the EFQM Excellence Model 2010). Presented in the Sheffield Hallam University Report (2003) the benefits of the implementation of an EFQM Model are:

- the model offers a holistic approach of the quality in the organization;
- the approach can be adapted to suit to all the requirements of the

- organization;
- the model is designed to suit to individual organizations;
- the method offers a way in which a common focus can provide a new way of working in the organization;
- it also provides a balanced set of results indicators;
- it has been tested in a range of sectors;
- it provides a framework through the kernel of a certain organizations' issues can be surfaced and improved.

It is also to be noted, that the academic culture plays an important role when implementing an EFQM model in the higher education institutions. Galler and Ghobadian (2004) state, that the successful adoption and practice of Quality Management requires probably modification to organizational culture. Davies (2007) admits that there is support for carrying out the cultural assessment before implementing a quality management model in order to identify potential barriers and help in designing the implementation program.

This article illustrates the results of the performance degree of the customer satisfaction; this dimension being integrated in the results section. Mainly, the section "customer results" is structured in the sub criterion customer perception and internal indicators. This research illustrates the results obtained by analyzing the Bachelor students' perception regarding the quality of the educational services at the German study line.

### 3. Methodology

The paper seeks to explore the performance degree of the criterion "customer results". The research question which emerged from the above literature review is, Which is the performance degree of the criterion "customer results?". In order to get a variety of perspectives, the authors designed a questionnaire with 27 items that focus on quality dimensions regarding the students' satisfaction. The first section is focused in the direction of teaching and learning process, the second section in the direction infrastructure and the last section reveals the dimension "opportunities and service provided". We also ask the survey respondents to give suggestions for improvement for the above mentioned dimensions. The questionnaire was given to the Bachelor students at the German study line at the Faculty of Economics and Business Administration and a response rate of 72% was registered.

For this study, the authors used as statistical method the mean in order to identify the students' degree of satisfaction for the provided educational service (Table 1).

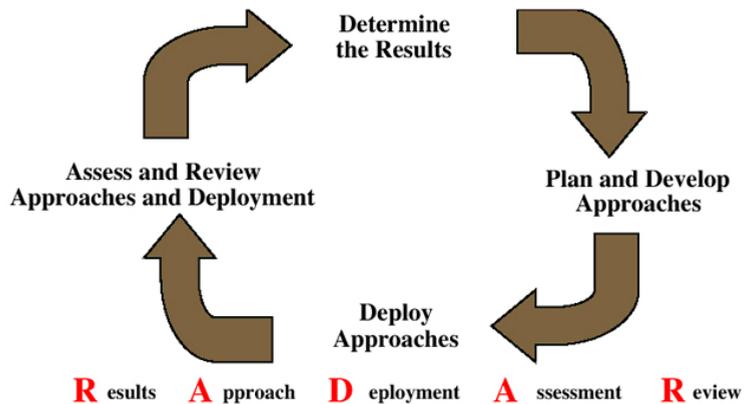

**Table 1:** Mean Values for the Bachelor students

Teaching and Learning Processes		Mean
1.	The curriculum of the specializations at the German study line presented on the web site of the faculty is useful and easy accessible	3.3210
2.	The knowledge gained within classes represent a good mix of theory and practice	3.0988
3.	The information about the elective courses are helpful, complete and available on time	3.2840
4.	The inclusion of both domestic and foreign teachers provide a successful mix of knowledge and skills	3.7099

5.	The teachers are available during tutorials whatever questions you may have	3.9753
6.	I also take the opportunity in visiting the teachers during the office hours within a semester	3.1790
7.	The tutors of all the specializations ensure adequate support during the academic year	3.3457
8.	During classes, soft-skills are also required (teamwork, communication skills, practical skills, etc.)	3.2531
9.	The presence at the course is a prerequisite for the acquisition of the specialized knowledge	3.2963
10.	A reasonable timetable contains 2-3 units daily	3.3951
11.	The knowledge acquired within all subjects in one semester are accessible, complete and appropriate	3.2222
12.	The language level at the courses meets my expectations	3.4568
13.	The difficulty of the taught material and the learning effort for the exam preparation are in balance	3.2963
14.	The rating system should be composed of several units (exam, homework, projects, attendance, etc.)	3.6235
15.	The final results of the tests are subject to the principle of fairness	3.5309
16.	The chances and opportunities to find a job as a graduate of the German study line provide a comparative advantage over other graduates	3.9630
Infrastructure		
17.	The premises have appropriate equipment (number of seats, heating, acoustics)	3.6049
18.	The technical equipment to carry out educational activities is in line with the expectations	3.7716
19.	I visit the "Robert-Bosch" library of the German study line at the during the semester and am aware of the current books fund	2.5185
20.	I am aware of the economic books fund at the Austrian library, the library of the German Cultural Centre and the German Institute	2.5926
Opportunities and Services provided		
21.	I am satisfied with the administration service ( secretary)	3.1296
22.	The referee at the German study line informs me fully and on time about all organizational news and events on course	3.4630
23.	There is a reasonable amount of information about scholarships and internship opportunities	3.4877
24.	The opportunities for the recognition of professional services with the scope of awards (Rehau, EBS, etc.) are meaningful	3.3889
25.	The representative of the students of the German Study Line within the Council of the Faculty is known to me	2.9630
26.	I am fully aware of his duties. I also feel that my sphere of interest are well represented	2.9259
27.	The existing student organizations act to strengthen the intercultural competencies. I am therefore ready to participate actively in such an organization.	3.1974

#### 4. Results

Further, in order to apply the EFQM Model at the German study line, the statistical values from the above table were integrated in the RADAR model. Supported by the Radar logic (Figure 2) the organization can systematically set goals (Results), develop actions ( Approach) in order to achieve these goals, implement a plan for these actions (Deployment) and finally analyse the action plan and its implementation ( Assessment and Review) (McCarthy, Gratbanks and Yang, 2002).

**Figure 2:** RADAR matrix cycle for the methodology of EFQM Excellence Model  
Source: adapted after McCarthy, Gratbanks and Yang (2002)

According to Sohovic, Pavletic and Kern Pipan (2010) the tool of RADAR Matrix is used for the assesment of organizational performance and applied within the EFQM Excellence Model. The matrix is structured in five columns, each of the column being responsible for the achievement of a certain degree of performance, namely between 0 % and 100 % for each subcriteria of the criterion „ customer results”. In this case, there exist 27 subcriteria afferent to each question regarding the degree of students’ satisfaction. The authors took into consideration the following structure (Table 2) for the implementation of the RADAR logic in accordance with the mean values.

**Table 2:** Correlation between performance degree and satisfaction level according to mean values

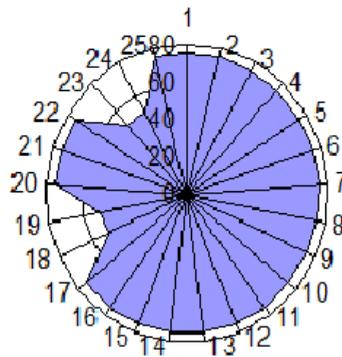

Performance Degree	0%	25%	50%	75%	100%
<b>Satisfaction Level (Likert –Skale): Mean Values</b>	<b>1-1,5</b>	<b>1,5-2</b>	<b>2-3</b>	<b>3-4</b>	<b>4-5</b>

Moreover, the RADAR matrix for the above mentioned results are illustrated in Table 3.

**Table 3:** RADAR Matrix for the performance degree of the Bachelor students' satisfaction

Performance Degree	0%	25%	50%	75%	100%
Satisfaction Level (Likert –Skale): Mean Values	1- 1,5	1,5-2	2-3	3-4	4-5
Number of reviews	0	0	4	23	0
Values	0	0	200 (4x50)	1725 (23x75)	0
Sum	200+1725=1925				
Performance Degree	1925: 27 = 71, 3%				

Further, Figure 3 illustrates the RADAR diagram, which reveals that the performance degree of the criterion „customer results” is 71, 3%.

**Figure 3:** RADAR Diagram for the performance degree of the Bachelor students' satisfaction

## 5. Conclusions

The performed research proposed the implementation of the EFQM model and explored the continuous improvement in the educational services. By implementing the model, a performance degree of 71, 3% was registered for the criterion “customer results”. This result illustrates actually the satisfaction level of the students, regarding the quality at the German study line. There are undoubtedly factors, that lead to an increasing satisfaction level, namely the chances and opportunities to find a job as a graduate of the German specializations and the inclusion of both domestic and foreign teachers in order to provide a successful mix of knowledge and skills. The dimensions scored with 50 % performance degree are related to the mediated information about the German libraries and about the duties, that the students' representative have in the Faculty Council. According to the performance degree, one could say that the organizational philosophy supports the quality within the educational processes.

A framework for the implementation of the EFQM model is proposed and a guideline is provided in order to calculate the performance degree of the sub criteria “students' perception”. This paper concludes that the successful implementation of a EFQM model is the starting point in designing a total quality management in the higher

education sector. According to Venkatraman (2007) the developing of quality management systems determine the organisations to be aware of the customer needs in order to react immediately to their needs and in the same time to use the students' feedback for making improvements in a systematic and continuous way.

**Abstract:** *This paper is intended to outline the importance of e-logistics programs, based on the new information technologies and successful e-business applications in the case of Romanian companies that activate in the production and services field, namely producers, suppliers or distributors. The redesigning of the logistic system and the reconfiguration of the supply chain management (SCM) challenge the firms, especially the small ones, to explore new e-business applications, on the basis of feasibility studies before getting implemented. For a long time, firms considered that commercial changes are the last solution to resolve SCM problems, however many supply chains have been a failure. The explanation resides in the fact that a number of companies that had integrated their supply chains noticed that there was little or no response to the existing requests in this field. Although commercial changes represent an important part of Business to Business programs, actually very few managers understand the way to deal with them, which is integrating them in e-business programs. This paper outlines the companies' need to develop e-business programs and the importance of these programs for the whole supply chain to obtain performances, taking into account that many firms that get integrated in the supply chain lack the technological capacity to implement electronic means for processing, transmitting and receiving data. One remedy might be their initiative to use Business to Business programs, with the purpose to offer easily configurable optimized networks and interactive solutions based on Web, at competitive prices. This system should have different assisting functions to help the partners of a supply chain, especially the small firms, to easily integrate up-to-date management and informational system refinement methods, in an efficient and effective way. As it has been pointed out in the paper, a major role for the enhancement of SCM performances is information technology such as Internet and ERP systems. Internet offers important opportunities to all partners from the supply chain to get information about consumption tendencies and changes in consumption request, virtual information about a product and the clients' requests regarding the logistic services. As for ERP systems, it can be said that they mostly influence the designing of business processes, in order to assure coherence between them and the effective integration of different firm components. Even though the internal integration is an important aspect, an approach to management at the supply chain level, in an efficient and effective way, cannot be done without external integration with suppliers and clients. That is why we consider that companies belonging to the business field must focus on structuring key processes, to collaborate with their clients and*

*suppliers and to integrate their internal systems, with the aim to support business operations.*

## **1. Introduction**

Firm competitiveness in the market is more and more contingent on the attempts to enhance supply chain management competitiveness. This is to be achieved by means of improving the integration level with providers and clients, taking into account the influence of raw material prices, materials and other aspects regarding the production costs on one hand, and the clients' requests dynamics of change on the other hand.

Firm management is more and more concerned to identify logistic problems, such as: keeping supply chain and logistic network control, obtaining and processing information from suppliers, sending them out to other departments and finding out ways to deal with them on the basis of analysis and options emerged from new situations and opportunities (i.e. stocks expiry date, changes in transportation technologies and ware handling, freight and reorientation of cargo, when necessary). Equally, the firm must be prepared for taking into account the threats that may come out (i.e. new technologies in the informational flux, new e-business applications, e-logistics) in the view of assuring the background for effectively and efficiently putting into practice the strategies and the logistic programs.

An important factor that has a major role for the enhancement of SCM performances is information technology (Internet, ERP systems). Internet offers important opportunities for suppliers to get information about consumption tendencies and changes in consumption request, while ERP systems enable a blending of managerial practices with information technology. By means of this blending, the business processes of a company get integrated into the informational system of the entire supply chain, aiming to meet some specific logistic objectives. It offers to the clients a new channel to obtain virtual information about a product and even to purchase. All these aspects influence the producers to become more sensitive towards their clients, by anticipating their needs and requests. (Ghiani, G., Laporte, G., Musmanno; 2004)

A major role in enhancing SCM performances is the employing of new information technology, more exactly the development of a management based on electronic solutions and appropriate organizational change, which allows the use of the most effective and efficient e-business applications and e-logistics.

In order to be sure that the clients are in control, a completely appropriate new set of management practices and tools must be put into practice. The initiatives in the field of e-business application development firms, in general, and e-logistics in particular, attempt to align functional processes of SCM with information technology, aiming to improve its effectiveness, efficiency and performances.

Redesigning the logistic system and reconfiguring SCM represent for the firms a challenge to explore, acquire and implement new e-business applications, on the basis of feasibility studies that are to be conducted before being implemented. For a

long time, firms considered that commercial changes are the last solution to resolve SCM problems, however many supply chains have been a failure. The explanation resides in the fact that a number of firms that had integrated their supply chains noticed that there was little or no response to the existing requests in this field. (Murphy,P.R., Wood, D.F., 2004)

## **2. Need and opportunity of using information technologies with SCM**

Although commercial changes represent an important part of Business to Business programs, actually very few managers understand the way to deal with them, which is integrating them in e-business programs. Despite the fact that e-business programs development is crucial, we have to point out that a lot of firms that get integrated into the supply chain, especially the small ones lack the technological capacity to implement electronic means of data processing, transmission and reception. One remedy might be their initiative to use Business to Business programs, with the purpose to offer easily configurable optimized networks and interactive solutions based on Web, at competitive prices. This system would have different assisting functions to help the partners of a supply chain, especially the small firms, to easily integrate up-to-date management and informational system refinement methods, in an efficient and effective way. A global logistic strategy and a strategy to use common tools for the logistic operations, activities and processes must be developed, taking into consideration the client and market typology. Companies must have at their disposal the necessary capacity to deliver products to clients in short and exact time and to reliably complete an order-to-delivery cycle. Therefore, firms must be willing to significantly transform their processes, business activities and IT system, their internal processes of SCM, even if this measure takes great investment efforts for changing the uncompetitive systems with systems based on new information technology.

Another concern for the improvement of SCM, using the help of e-business, is related to the producers' interest to assure an effective and efficient control of production and logistics, that outlines the importance of activities optimization and logistic processes. The effective control of production and logistics will improve the relationship with the suppliers and the clients, who, at their turn, will be in control of the logistic operations they perform. This is easy to achieve for the direct distributors and suppliers (level 1), but as one moves backwardly among the different levels of a supply chain, where materials and other components are delivered for the subassemblies producers, the stock level can increase significantly because of the incapacity of partners belonging to the same supply chain to correctly identify the request. The stock-out, considered as a "break" between request and offer, is to be assured by means of components, subassemblies and raw material availability, which is based on reliable information in real time. This can often cause last moment changes in the manufacturing programs and it consequentially amplifies the variability factor from inside the system. At the other end of the SCM, the distributors/retailers make up their sizeable stocks, in order to deal with the clients' request (Bowersox,D.J.,Closs,D.J.,Cooper,M.B,2002). There are moments when changes in manufacturing program bring about stock-outs at the distributors level (distribution chain). The suppliers react slower as they need longer terms to deliver a requested component therefore they increase the period of time needed for the order-to-delivery cycle, which, as a consequence, determines a stock growth. The

same risk of a stock growth is caused by the possibility that they undergo obsolescence, which generates additional costs to the system, but some clients are not willing to wait when dealing with a stock-out and they will choose competitors' products.

Firm management has to take into account that assuring the product availability, as an aspect of the service they offer, will contribute to clients' satisfaction, and therefore it will build consumers' loyalty, being a fact that considering a service competitive standard, for the most part, the costs to regain a client are up to 2-5 times higher than to retain a client. Therefore, the use of Internet and ERP systems facilitates the implementation of logistic and production control improvement actions, by means of transmitting information in real time. (Ballou, R.H, 2004).

Another action concerning SCM efficiency and effectiveness is related to the building up of a value generating system, which implies large changes in the organizational culture, inside each function and each firm belonging to the supply chain, starting with raw material suppliers and ending up with the final clients. The increase of the capacity to immediate reaction to the new final client requests must be an important goal, and this can come into being by means of interconnecting clients, distributors, producers and suppliers over Internet. This will allow logistics and production control improvement, and the suppliers will represent an important segment of this process. Information regarding request and offer must assure good visibility for partners with the use of logistics functions. For example, suppliers' communication site, also known as "*supply power*", will provide important information to: designing, supply, production control, internal logistic operations, production, external logistic operations, sales and services. This will enhance the client service level, by shortening the delivery deadlines and order-to-delivery cycle. SCM reconfiguration is facilitated, in a collaborative approach, by the assurance of good visibility of clients' requests during the whole supply chain. ( Ballou, R.H, 2004)

All these critical change factors in the field of logistics should be well assessed and taken into consideration as important opportunities in the view of the shift of industrial Romanian enterprises from traditional organizational model to a value generating integrated system that reacts to international and national market conditions, changing technologies and clients requests, which implies SCM redesigning. To solve these problems, an infrastructure must be created, that enables the use of the tools offered by the new information technologies, the assurance of the building up of a value generating integrated system and the optimizing the coordination of functions for partner firms in the supply chain, on the basis of a functional strategy aligned to the purpose of maximization of value offered to client.

Romanian enterprises, suppliers, producers and distributors have to act in the following directions, in order to compete with the fore mentioned changes and to successfully implement the new information technologies:

- putting forward professional development programs for managers to finely understand the system and particularities of SCM, to adopt e-business, e-logistics, SCM models and programs, with the purpose to get solutions to the really important problems that refer to large and non-functional procurement center, to freight networks and fragmented logistics, to tensioned client/supplier relationship, to communicational barriers;
- developing alignment and collaboration not only with first level clients and suppliers, but with the entire dimension and structure of SCM (level 2 and 3

clients and suppliers), in order to create a value generating integrated system. Currently, Romanian industrial enterprises possessing functional logistic systems have direct relations only with strategic clients and suppliers, which decreasing SCM efficiency and effectiveness. Managerial decisions within SCM must be based on performance assessment criteria, which are well defined for all participants (suppliers, producers, distributors, clients), in terms of quality, delivery deadlines, technology, without neglecting the financial impact upon the entire logistic chain. Key processes must be coordinated by inter-functional teams that should include: designers, engineers, marketing specialists, logistics specialists, etc., with the aim to determine client services standards; ( Handfield, R.B., Nichols, E.L).

- advocating some collaborative forms in the product designing, processes and services field, by developing informational systems, in the view of suppliers and clients active involvement in the optimization of activities and logistic processes; (Donath, B, 2002)
- long and continuous partners' performance improvement, their integration in the supply chain, by point of contact identification within the chain;
- assuring employees professional competences in the field of e-business applications and programs, by the means of a rigorous selective process and continuous development of these competences, starting with top management and continuing to the bottom of the managerial pyramid;
- implementing an integrated strategy for a SCM administration, based on the most appropriate e-business programs, aiming to improve collaborative planning and to maximize internal and external performances of the logistic chain.

The effectiveness of degree of internal integration activities and of logistic processes, as well as the extent to which they are externalized, depend on managers competences in the field of SCM and e-business applications, e-logistics and e-SCM, on company strategies, on partners within supply chain requests and standards and on intra-organizational and inter-organizational communicational development, facilitated by e-mail and Internet. (Stock, Lambert, 2001: p.587) Internet enables the practicing of outsourcing, as it assures visibility to logistic and manufacturing processes, offering to the firms the possibility to have a real control upon the supply chain even in situations when certain activities are entirely achieved outside the firm.

### **3. Use of Internet and ERP systems in supply chain management**

The main purpose of this paper is to identify the weaknesses and strengths of using Internet and ERP systems in supply chain management, exploiting in this sense the results of a study conducted by the authors, between 2010-2012, in 67 firms belonging to industrial production field (producers, suppliers, distributors) and to logistic services providers' field. The study was conducted on the basis of a complex logistic audit questioner and of 7 interviews with renowned professionals in the field of logistics, 3 managers and 4 specialists belonging to very performing companies in this field. We have to mention that we used a conducted sample, consisting of firms that have interests and achievements in logistics. A separate part of the questioner was dedicated to the problems rising in the development and enhancement of informational systems and logistic processes management, on the

basis of information technologies and e-business, e-logistics, e-SCM successful applications.

Our study conducted in the Romanian industrial milieu shows that, in order to enhance the logistic performances (limited stocks, quick and accurate delivery, low costs, high quality service, client service, etc.), many industrial firms (44,77%) are not prepared to integrate new digital technologies.

The large variability of request determines producers and distributors to use Internet, which is considered the most important Business to Business technology, and to create an informational line in the supply chain. This informational line enables rapid communication, rapid spread of ideas and concepts and facilitates innovation. The explosive growth of Internet makes the specialists affirm that there is no limit for the quantity of stocked and transmitted information over Internet, thus, a full collaboration of the logistic network being possible. (Ghiani, G., Laporte, G., Musmanno, R, 2004).

Firms can be successful on the Internet economy, by means of participation to the electronic business network, but it has been noticed that, in the case of many firms (35,82%), especially small end middle size, logistic management web sites are designed by non-experienced staff. The result is that the electronic business network implemented by these firms are lacking of consistency. Well-designed sites, created by logistic specialists, have a very important role in purchasing goods and services, offering the capacity to build up "one to one" networks, by means of assuring long-term relations that may accelerate electronic acquiring process. They also help to reinforce the favored client status assigned to some companies that buy great quantities of products. The study also shows that partner firms from the supply chain are preoccupied more with cost reduction (56,71%) than with accessing new successful applications in e-business, e-logistics and e-SCM field (20,89%).

Web offers the possibility to transmit information via e-mail, with a certain degree of message standardization. Economist Intelligence Unit and Meritas Consulting conducted a study which proves that 82 % of the senior managers from firms belonging to Fortune 500, that are in charge with supply chain, consider that Internet will crucially influence the supply chain performances. This proves that managing informational fluxes and logistic processes within the supply chain have taken a step to the digital era. (Donath, B, 2002 p. 758). A new trend has been observed in Business to Business commerce, buy means of firms integration in virtual logistics. There is an even larger number of electronic markets, an even larger number of Internet based supply chains that are meant to create communicational levels and dynamic interaction among participants. Access to virtual logistic networks can be realized using Wireless technologies (mobile phones, laptops, desktop units).

Another challenge for many Romanian firms belonging to industrial milieu and other fields consists of updating the technologies in use and older software, for a better exploiting of the opportunities offered by a modern Web based network. The study reveals that 32,83% of the enquired firms from the Romanian industry have encountered these problems. The cause for this resides in the fact that companies comprised in this segment don't have a coherent IT strategy, compatible with logistic management requirements and don't have very well trained staff. It is to be said that 71,64% of these firms have less than 250 employees, being small and medium sized companies. Taking into consideration that many Web sites allow the access of a large variety of information for free, this being not only an opportunity for Romanian

companies, but also a necessity, firms must adapt themselves to software standards compatible with the requirements of an effective and efficient supply chain.

As for the use of ERP systems, the study reveals that only 62,68% of Romanian industrial enterprises comprised in the sample use ERP systems, integrating production, logistics, stocks, transportation, orders and accounting. Many of the ERP systems applications are used for planning in advance, for system designing and delivery automation. For the most part of the enquired enterprises, ERP represents a back-office activity that does not directly involve clients. That is why front-office systems need to be implemented, to create interaction with clients and with e-Business, e-Commerce and SRM (Supplier Relationship Management). ERP system advantages refer to online visualization in real time of firms' activities and permanent monitoring of the most important business parameters, at the level of each enterprise and overall, for the entire supply chain. All these actions allow to easily identify the most important problems and opportunities, to ground decisions in real time and to efficiently control business in real time.

Except for the large size enquired enterprises, which represent 26,86% from the total amount of the enquired firms, the small and medium size enterprises managers declared that the acquisition of an ERP system is not a priority to them. There are manager who have purchased accounting-financial applications, improved them with some modules (human resources and material resources management), considering therefore that they own ERP systems, not taking into consideration the fact that these systems must comprise business management modules that assure the management of all organizational processes, such as accounting-financial processes, sales, delivery, acquisitions, logistic management, production management, human resources management, etc. The firms that don't implement ERP solutions lack in real time information, resorting only to accounting solutions, which causes difficulties in activity flux, time loss, human resources loss and lack of control over information. Therefore, there is no pertinent topic for firms and competitive supply chains without appropriate and competitive ERP.

Many production companies and distributors from the Romanian market lack well prepared staff, at the managerial level as well as at other levels comprising specialists in charge with executive functions, which leads them to opt for sophisticate ERP solutions, inappropriate to the type of business, or to the acquisition of cheap solutions that don't bring about profit. Because investments in ERP competitive systems are great, the enterprises that declare to have heavily invested for purchasing this kind of systems are to be found in the segment of large production and distribution companies.

The great providers for these systems, such as SAP and Oracle, which are well represented in Romania, help the companies to develop a system of integrated information management, that integrates not only organizational internal components, but clients and suppliers also, aiming to share data and information that will bring about important effects for the quality of decision in supply chain management. This ability of the system to get integrated represents a huge advantage for them, and even if they are at a high price, they offer to the users the possibility to reduce costs by means of efficiency and standardization of systems and procedures.

Despite the fact that there are many companies that have implemented ERP system, we can say that they focus especially on designing business processes, in order to

assure coherence between them and the effective integration among different parts of the company. Internal integration is one important aspect within supply chain management, but an approach to SCM cannot be done efficiently and effectively without external integration with suppliers and clients. In order to accomplish this, enterprises have to make efforts to structure their key processes, to collaborate with their clients and suppliers and to integrate their internal systems with the purpose to support business operations. (Rushton, A., Oxley, J., Croucher, P, 2004)

Specialists in the field have ascertained that there is a misunderstanding in ERP systems implementation, not only Romania, which started this process later, but also in countries that have notably achievements in this domain, such as USA. In this light, R.V. Delaney, executive vice-president at la Cass Information System (St. Louis), severely criticizes ERP systems, pointing out the fact that, in 40 years of logistic experience, there hasn't been ever so much confusion like it was when ERP systems were implemented. Even if ERP system implementation hasn't developed too much in the last 10 years, these sophisticated systems are not the only ones to be blamed, top managers engaging their part of responsibility. Many planning systems have been replaced by ERP systems, this change being undertaken without deeply knowing the business, so as it can offer an alternative support for planning to the logistics professionals. Despite this, Delaney admits that ERP systems providers have minimized obstacles regarding interface, by means of documentation and standardization, with the purpose to make these systems accessible to the supply chains. A significant obstruction in ERP systems is time of implementation (6-8 months) and the elapse of time in which they will display a positive impact over national productivity. (Donath, 2002: p.794)

#### **4. Conclusion**

The analysis of the logistic systems based on Internet and ERP urges us to affirm that a very important role for the success of these systems is represented by the degree of top management awareness and involvement. Top management is in charge with solving specific problems of these systems and with resorting to internal professionals and to consultancy, in the case of the small and medium firms that don't have at their disposal highly qualified staff in the field.

Of course, one could easily suggest implementation of technology, but it is more difficult to change organizational culture, in order to share these ideas both with external clients and with internal clients (the employees).

As there isn't such a thing like a culture of e-SCM in Romanian industrial enterprises, except for the top companies that represent 18.87% of the total amount of companies, one possible solution might be setting up a logistic council within the company, made up of logistic professionals and other professionals from the company, that should discuss with the managers about the impact of the new technologies, in order to understand the advantages and the extra value they bring about. If necessary, asking for outside firm consultancy is recommended, with the purpose of getting the managers and other employees aware of the advantages that result from the implementation of these solutions. Purchasing solutions based on information technologies within supply chain management will be a success if partners are informed about the last innovations in the field of IT tools and technologies, if human resources possess team work abilities and competences, if managers holistically understand the business culture. Regarding the acquisition of

ERP systems, the experience of the successful enterprises recommends solutions developed in Romania, that are adapted to the Romanian laws, with beneficial effects in implementation, that take less time and that are more effective. Of course, it is mandatory for the success of implementation that the software provider should have the *know-how* in this field and should assure professional support services.

Implementation of quality management system can assure proper ERP systems and Internet working, for highly qualitative services offered to clients. Assuring a service to clients at their level of demands and expectations asks not only for the assurance of the provided services quality and for long and medium term retention of loyal customers, but also for the ability to use the most appropriate e-business programs, the most effective systems and applications, e-logistics and e-SCM, with the aim to offer competitive advantage and higher profitability.

E-SCM is based on the certainty that competitiveness is unconceivable without logistic services development, without achieving comparable levels of effectiveness, efficiency and quality. For this, stress should be put on these aspects: product availability improvement, based on an efficient stock management and on market requests; coordination of production, distribution, stock levels and deliveries between the main loops (members or organizations) of the supply chain management, supported by integrated informational systems that provide sales in real time; programming and proceeding along information; setting up of alliances and strategic partnerships with clients, suppliers, stock administrators, with those in charge with the development of information technology and successful e-business and e-logistics applications; direct involvement of the client in defining the product and in specifying the requests regarding operation quality standards that make up physical fluxes of materials and products.

# ANALYSIS OF THE IMPACT OF THE SUPPLY CHAIN PERFORMANCE ON THE OVERALL ORGANIZATIONAL PERFORMANCE

**Laszlo Florian Gyula**

*Partium University, Department of Management and Marketing, Oradea, Romania  
gyulaflorian@yahoo.com*

**Abstract:** *One of the first questions which need to be addressed in empirical research on organizational performance is how to measure it. Different stakeholders might understand performance in their own terms so adequate measures of organizational performance have to balance different perspectives. Although financial measures of performance, in particular shareholders return, are recognized as most appropriate measures of firms' performance, the most employed measures of organizational performance are accounting indicators due to the availability of data. Drawing on existing empirical studies on organizational performance we have chosen to measure the organizational performance using one of the most prevalent accounting ratios – the return on sales (ROS). After presenting the multidimensionality of organizational performance and its specific in the context of a supply chain, this paper uses a Romanian dataset of firms to estimate the impact of different areas of performance in the context of a supply chain on the overall organizational performance. Analysis follows a balanced scorecards approach, identifying four areas of performances in the context of supply chains. Logistics costs and revenues measure the performance in a supply chain from a financial perspective. We have chosen customers' satisfaction, delivery dependability, speed and flexibility as the major coordinates of the marketing performance in the context of a supply chain. Standardization, simplification and structural adaptation define in our perspective the operational performance in the context of a supply chain and information management and internal communication accounts for the innovational performance, the last performance area defined by a balanced scorcard. Results show that financial, marketing and innovation do have a positive and statistically significant impact on the overall organizational performance. While all the estimated coefficients have the expected sign, not all the performance areas and metrics employed in the analysis are statistically significant. We appreciate that this research affords a better understanding of the performance areas that contribute to the increasing of organizational performance.*

**Keywords:** *supply chain management, supply chain performance*

**JEL classification:** *M10, C54*

## **1. Multidimensionality of organizational performance**

Richard, Devinney, Yip and Johnson (2009) wrote a comprehensive reviews of the empirical studies on organizational performance published between 2005 and 2007 in top 5 US management journals (Academy of Management Journal - AMJ, Administrative Science Quarterly – ASQ, Journal of International Business Studies – JIBS, Journal of Management – JOM and Strategic Management Journal - SMJ). The review shows that the most employed measures of organizational performance are accounting and financial indicators and ratios. The accounting measures have

been the traditional mainstay of proxies for organizational performance in empirical research (Roberts and Dowling, 2002). Their prevalence is attributable to a documented statistical relationship between accounting performance and organizational performance. Yet there is agreement in the management literature on performance that economic and not accounting performance reflects the true organizational performance. Financial measures of performance, in particular shareholders return, are recognized as most appropriate measures of firms' performance. That is because such measures better incorporate intangible assets that in the case of accounting measures. In addition accounting measures of firms' performance are limited by the fact that they reflect past performance and consequently using them for forecasting future performance is limited. Yet using financial indicators as proxies for performance has in its turn strong limitations. Relying on the assumption that shareholders are the sole beneficiary of firms' rents reduces the dimensionality of firms' performance. Then, as financial literature points out, market valuation reflects not present performance but expectations about future performance. In other words changes in market prices are determined by information and not by fundamentals. Under market efficiency hypothesis we have a random walk phenomenon. We cannot use past information to predict future performance. Momentum (Glenn, Pettengilla, Edwards and Schmitt, 2006) also contributes to the weak relationship between economic fundamentals and future organizational performance. Finally, financial indicators of firms' performance evaluate performance at organizational level as a whole, making impossible to disaggregate performance at product or strategic business unit's level due to synergies / cannibalization phenomena associated with interactions among units (Richard, Devinney, Yip and Johnson, 2009).

Mixed indicators (financial and accounting) are a third class of indicators used in measuring organizational performance. There is extensive literature on Economic Value Added (EVA). The key advantage of EVA is that this method accounts for the cost of capital, providing a better balance between risks and returns. Although considered a mixed indicator, EVA does targets solely the interests of shareholders. A better accounting for the multidimensionality of organizational performance is offered by the balanced scorecards. Most important BS is mapping not only financial performance and shareholders' outcomes but also marketing performance and innovation and consequently Balanced scorecards better account for the multidimensionality of firm's performance. Yet obviously employing Balanced Scorecards methodology to assess organizational performance is not appropriate in empirical estimation with one left hand side proxy variable for organizational performance. It follows that quantitative estimations of organizational performance cannot use balanced scorecards methodology – which is another reason for the prevalence of using accounting indicators as proxies for organizational performance.

## **2. Supply chain performance metrics**

Defining a performance metrics in a supply chain requires: (i) choosing the areas where we measure performance and (ii) choosing the most appropriate measures of performance (Constangioara, 2013).

Turning to the issue of defining a relevant conceptual framework of approaching the performance metrics in supply chain, to account for the multidimensionality of performance in supply chains, the literature on supply chains proposes three

approaches to defining performance metrics and sub-metrics: (a) balanced scorecards, (b) differentiating between strategic, operational and tactical levels of SCM and (c) considering more closely the four major supply chain activities / processes: plan, source, make/assemble and deliver. Gunasekaran, Patel and McGaughey (2003) in their proposed framework for supply chain performance's measurement even consider a combination of approaches (b) and (c).

Regarding the most appropriate supply chain performance measures, the existing supply chain literature agrees that in empirical studies, accounting and financial indicators such as ROI or price/earnings are most often employed in estimations of performance. Yet using solely accounting / financial indicators limits the dimensionality of performance in the context of a supply chain. These considerations are discussed in detail in the literature on organizational performance and briefly mentioned in what follows.

The literature on SCM extends the perspective of the literature on organizational performance towards supply chain context. All the considerations presented in the organizational performance literature are important in defining the areas where we measure performance and the most appropriate indicators that we choose to use.

### **3. Analysis of performance metrics in Romanian supply chains**

#### **3.1. Data**

For the analysis of performance metrics in SCM, I am using a Romanian sample of 100 firms which were subject to a supply chain survey in 2011. Respondents were asked to evaluate different areas of performances in the context of Romanian supply chains. The 100 mailed questionnaires returned 26 usable responses. The 26% response rate is similar to response rate reported in supply chain empirical studies. The working dataset comprises enterprises representative of the overall structure of Romanian economy. Most enterprises from the working dataset are from the manufacturing sector (11) followed by commerce (5) and other services (10). Final sample size is sufficient for adequate quantitative estimation.

#### **3.2. Methodology**

There are many empirical studies focusing on performance metrics in the context of a supply chain. The methodology proposed by them first checks for the dimensionality of the scales employed in the analysis, by means of a principal component analysis. The principal component is a mathematical procedure that uses an orthogonal transformation to convert a set of correlated variables into a set of values of uncorrelated variables called principal components. Thereby this analysis results in set independent principal components. However the assumption needed here is that the dataset is jointly normally distributed and results are very sensitive to relative scaling of original variables (Wagner and Neshat, 2012). For business analysis and management policies development, the principal component analysis is important because identifies how much each factor contributes to the total variability of data. After the preliminary analysis of the scales employed for collecting data, Gunasekaran, Patel and McGaughey (2003) propose an approach similar to Pareto analysis for analysing the performance metrics in the context of supply chains. They establish the importance of the performance measures used in the supply chain context by calculating the means of all responses and ranking them.

Ranks are then converted to relative percentages. Nevertheless, most of the empirical works use regression to estimate the partial effect of different performance measures on the overall performance.

Comparing the two, it is obvious that Gunasekaran, Patel and McGaughey (2003) approach is easier to interpret but lacks the statistical significance interpretation. The regression approach is grounded in quantitative methods employed in business but, although provides an ordering of factors, results are less intuitive than the relative percentages offered by the approach of Gunasekaran, Patel and McGaughey (2003).

For the purpose of my empirical research I propose using econometric estimation of impact of performance in the context of supply chain on the overall organizational performance. Furthermore, my analysis employs a balanced scorecards methodology for defining the performance areas in a supply chain context. Thus I had only four areas of performance. The variables used in the analysis and the corresponding area of supply chain performance are presented in table 1.

**Table 1:** Performance metrics used in the analysis

Variable	Label	Performance area
costs		Financial
Revenues		
Customers satisfaction		Marketing
Delivery dependability		
Delivery speed		
Delivery flexibility		
Standardization		Operations
Simplification		
Structural adaptation		
Information management		Innovation
Internal communication		

Table 1 show that we have employed two variables for measuring financial performance in the context of a supply chain (logistics costs and revenues), four variables to account for marketing performance ( customers satisfaction, delivery dependability, speed and flexibility), three for operational performance ( standardization, simplification and structural adaptation) and two for measuring the innovational performance ( information management and internal communication). The independent variables are all dichotomous, taking value one for improved performance and zero otherwise. The dependent variable is dichotomous, with value one corresponding to an increase in ROS over a two years period (2009 to 2010) and zero otherwise.

### 3.3. Results

SPSS statistical package was used for estimation purposes. Results are presented in table 2.

**Table 2:** Estimation results

Variable	Coefficient ( $\beta$ )	p-values
costs	0.21	<0.001
Revenues	0.06	0.08
Customers satisfaction	0.17	<0.001
Delivery dependability	0.15	<0.001
Delivery speed	0.19	<0.001
Delivery flexibility	0.17	<0.001
Standardization	0.04	0.065
Simplification	0.07	0.011
Structural adaptation	0.11	0.09
Information management	0.23	<0.001
Internal communication	0.15	0.24

Table 2 shows that all estimates have the expected sign. However not all of them are statistically significant. In particular indicators measuring marketing performance are all statistically significant, with p – values less than 0.001. This documents the important contribution that marketing performance in the context of a supply chains plays in achieving the overall organizational performance. We see that the odds of increased organizational performance are 21% higher for firms that have increased their delivery speed over the investigated period. In comparison the odds are lower for delivery flexibility (19%) and dependability (16%).

Financial performance also influences the overall organizational performance. We see that reducing costs over the investigated period has increased the odds of increasing organizational performance by 21%. Yet the contribution of sales to organizational performance is not statistically significant at p – values less the 5% (p=8%).

Operational performance contributes to organizational performance to a lesser degree. We see that none of the estimates corresponding to indicators measuring operational performance is statistically significant.

Finally we see that innovation is important for organizational performance. Information management has the greatest overall impact on organizational performance. Improving information management is found to increase the odds of greater organizational performance by 25%.

### Concluding remarks

Although it is generally accepted that there has been a shift from treating accounting and financial measures of performance as the 'foundation of performance to treating them as one among a broader set of measures' (Gunasekaran and McGaughey, 2003), in empirical studies published in the most prestigious management journals, financial indicators continue to remain the most prevalent measure of organizational performance (Richard, Devinney, Yip and Johnson, 2009). This is why we have

chosen to employ accounting indicators as dependent variables in our quantitative estimation of the impact of supply chain performance on organizational performance. Our results document the important contribution that marketing performance in the context of a supply chains plays in achieving the overall organizational performance. Results also show that financial and innovation performances are also positively impacting the overall organizational performance. Information management has the greatest overall impact on organizational performance. Nevertheless the structural adaptation and internal communication do not have a statistically significant impact on organizational performance. We appreciate that our findings contribute to a better understanding of the impact of different areas of performance in the supply chains have on the overall organizational performance. This study offers Romanian managers a guideline to focus their efforts on those performance areas in the supply chains with most important impact on organizational performance.

As a limitation of this research we mention that estimating the impact of supply chain management on organizational perspective could benefit from a more detailed analysis of the performance in supply chains. Consequently we propose that future research should employ performance metrics relevant for every logistics process in the context of a supply chain. Furthermore, we propose that future research should measure the impact of logistics performance on all supply chain participants.

[mabrudan@uoradea.ro](mailto:mabrudan@uoradea.ro)

**Abstract:** *For decades, the field of work motivation was moulded mainly by the cultural constraints. The present scientific paper is a theoretical research which aims at identifying various motivational patterns which might be used in the EU countries. In order to illustrate these differences, we will use three Hofstede's cultural dimensions: individualism, uncertainty avoidance and masculinity. Each of these cultural dimensions presents particularities which exert an influence on the way of thinking, on the abilities and behaviours of the individuals in a certain society, but we will refer only at the influence on the attitude towards work. For the identification of the motivational patterns, we will have as starting points, on one side, the particularities of the cultural differences and results of the relevant research performed so far; on the other hand there is Maslow's hierarchy of needs. Hence, we can consider that safety and security prevails upon other needs where uncertainty avoidance is strong (Greece, Romania and so on). The need of belongingness will prevail upon the need of esteem in the feminine cultures (such as Sweden, Latvia), but in the masculine cultures esteem need is stronger (such as in the case of Hungary). In masculine countries with an increased collectivism (Greece), the opportunities for improvement, recognition and extra incomes will have an increased importance, while in feminine countries (Holland, Sweden) personal time, freedom and need for belongingness will be more important. Without claiming to be an exhaustive presentation of the motivational patterns, the purpose of the present paper is to underline the necessity that the motivation theories are to be considered valid only in the cultural environment where they were conceived. The transfer and the application of the motivation theories and patterns from one culture to the other, implies the testing of their validity in the new context.*

**Keywords:** cultural dimensions, Hofstede, work motivation, EU

**JEL classification:** M12, M16

## 1. Introduction

The extension of the activities of the companies at International level implies the increase of the complexity of the activities they develop and at the same time, the development and diversification of the human resources management tools used for managing the cultural, economical and political values which influence the activity. For ages the field of the work motivation was mainly modelled by the

occidental theories, each theory being subject to cultural constraints, for which the cultural factor cannot be neglected.

The present scientific paper aims at identifying various motivational patterns which might be used in the EU countries. Because of the tensions of the past years in the EU, the cultural differences between the member states have been perceived significantly. In order to show these differences, we will use three of Hofstede's cultural dimensions: individualism, uncertainty avoidance and masculinity. Each of these cultural dimensions shows particularities which exert an influence on the way of thinking, the attitudes and the behaviour of the individuals in a certain society, but we will refer only to the influence of the attitude towards work.

In order to identify the motivation patterns, we will have as starting point the particularities of the cultural dimensions and the results of the relevant research performed so far.

## **2. The concept of culture and the study of cultural dimensions**

The concept of culture knows various definitions in the specialized literature. Therefore, Hofstede defines culture as: "mental collective programming which makes us accept something together with the members of the nation or the group that we are part of, but not with the components of other groups or nations (Hofstede, 1996, p.43). Another definition is the one given by House (House et al, 2002, in Alas Ruth, 2006) who considers that culture manifests in the shape of "motives, values, beliefs, identities and events shared which result from the common experience of the members of the groups and which are transmitted from one generation to the other". The analysis of the cultural differences can be realized only on the base of certain criteria, which make the comparison possible. These are called cultural dimensions and in the past few decades several studies have been conducted for the identification of those cultural dimensions which can be used for explaining the differences between the cultures. The most important studies belong to: Geert Hofstede, Edward T. Hall, Florence Kluckhohn and Fred Strodtbeck, Charles Hampden-Turner and Fons Trompenaars, Robert House (coordinator of the GLOBE project), Shalom Schwartz. A few of these studies will be presented briefly.

*Schwartz*: in an International study on high school students and teachers in 67 countries (1994) identified three cultural bipolar dimensions: conservatism versus autonomy, hierarchization versus equality and artistry / self achievement versus harmony, based on seven basic values (Ng, Sorensen, & Yim, 2009).

*Inglehart* (World Value Survey): proposes two cultural dimensions: well-being – survival, secular-rational authority – traditional authority (Ng, Sorensen, & Yim, 2009).

*House* (the coordinator of the GLOBE): The GLOBE study can be considered one of the largest studies on the national cultures. This is a project that involved over 170 researchers from 62 cultures in all the main regions of the world. From the GLOBE study new cultural dimensions resulted: uncertainty avoidance, orientation towards the future, distance towards power, institutional collectivism, orientation towards person, performance orientation, group collectivism, equality, assertion (Alas, 2006).

*Hofstede*: his approach consists in six cultural dimensions, that is: individualism versus collectivism, distance versus power, uncertainty avoidance, masculinity versus femininity, orientation towards time and permissibility versus austerity.

However, most studies which refer to National culture use Hofstede's cultural dimensions. A search in the Social Science Citation Index indicates the fact that between 1987 and 2004, Hofstede's works *Culture's Consequences* from 1980 and 2001 were quoted 2858 times, almost as frequently as Karl Marx' s *Capital* work (2873 quotations) (Bearden, Money, & Nevins, 2006).

Hofstede's model regarding the cultural dimensions has along the time both sustainers and critiques. One of them is McSweeney, which is in the article *Hofstede's Model of National Cultural Differences and their Consequences: A Triumph of Faith - a Failure of Analysis*, published in 2002, critiques both the research tool used by Hofstede and the data analysis pattern (McSweeney, 2002), and Bearden et. All (2006) question the validity of the tool used by Hofstede to capture the complex multidimensional nature of the culture at individual level, considering the tool used by Hofstede unidimensionally (Bearden, Money, & Nevins, 2006).

Due to the spread of use of Hofstede in the cultural studies and the replications and confirmation in multiple following research, in this scientific paper we will use Hofstede's approach.

### **3. The work motivation and the influence of the cultural factor**

The motivation is a force which is said to act in each individual making it choose an action or another one. Cultural values influence how an individual perceives and interprets a situation, and therefore exerts influence on his behavior and motivation (Erez, 2008). As a collective mental programming, the culture plays an important part in motivation. Culture influences not only our behaviours, but also the reasons for which we choose to behave in one way or the other (Hofstede, Hofstede, & Minkov, 2010, p. 315).

Different assumptions regarding motivation lead to various motivation theories, although classic motivation literates in the management context are American (Maslow, McClelland, Herzberg etc.). Therefore, one will discuss whether the motivational theories can be valid in cultures different from the ones they were realized in.

One of the motivational theories which reflect its American origin is the one of Frederick Herzberg based on the motivation-hygiene dichotomy. From the cultural point of view, Herzberg's theory corresponds to an environment in which the distance from the power is small and the avoidance of uncertainty is low. In the countries in which the distance from the power is big, "surveillance" must not be seen as a hygiene factor, because in this type of culture the dependence on stronger people is a fundamental need which must be a real motivator (Hofstede, Hofstede, & Minkov, 2010, p. 316).

Another example is the X and Y theory. The suppositions of this theory reflects the values of an individualist and masculine culture such as the one in which McGregor formed and the distinction between X and Y theory is not relevant in certain cultures, such as the ones in Asia (Hofstede, Hofstede, & Minkov, 2010, p. 318).

Numerous studies on work and attitude towards work in various cultural contexts underlines the importance of the cultural factor. For example, in the cultures in which masculinity is pronounced, there is a high need of accomplishment and the accomplishment is defined through acknowledgement and wealth. The strong masculine cultures appreciate material possessions and extra incomes, while the

feminine culture stress on the work conditions and the employees' participation (Greckhamer, 2011). This suggests the fact that the motivation practices in a feminine culture will be less efficient or completely inefficient in a masculine culture. Other authors (Rinne, Steel, & Fairweather, 2012) explore the connection between Hofstede's cultural dimensions and the innovation level expressed by the Global Innovation Index (GII) scores. They identified a strong negative correlation with power and the number of innovations expressed through the scores Global Innovation Index (GII) and a positive link between individualism and the GII scores (Rinne, Steel, & Fairweather, 2012). The connections between Hofstede's cultural dimensions were studied by Shane as well (1992). His research identified a positive correlation between the number of patents for inventions and individualism and a negative correlation between the distance compared to power and number of patents (Ng, Sorensen, & Yim, 2009).

Ng&all (2009) tested and confirmed the hypothesis according to which the relationship between the work satisfaction and work performance is stronger in individualist cultures, where the distance from the power is smaller and which are masculine. Since the employees in the cultures where the distance from the power is bigger expect to be told by the superiors what to do and how to do, it is probable that the work satisfaction exerts a smaller influence than in the cultures which stress on social equality. In the cultures which appreciate material possessions (masculine cultures) a positive attitude towards the work can generate performance, because satisfied employees will dedicate a lot time and energy for the activities with the purpose of obtaining money or climbing the hierarchic ladder. In contrast, in the cultures which appreciate harmony and human relationships (feminine cultures), satisfied employees may prefer to dedicate more time to social activities which do not necessarily exert influence on the performance (Ng, Sorensen, & Yim, 2009).

#### **4. Individualism, uncertainty avoidance, masculinity and motivation in the EU**

As stated in the official site, although EU is a unique political and economical partnership between 27 European countries (EU official site), as a consequence of the lately tensions inside the EU, the cultural differences between members states have been massively perceived. The purpose of this document is to bring attention on the cultural differences between the EU member states, showing various motivational models with the help of the cultural dimensions which might be used in the EU countries.

As stated before, due to the broad use of Hofstede's dimensions in the cultural studies in this paper we will use Hofstede's approach. More precisely we will use three of the six cultural dimensions: *individualism (IDV)*, *uncertainty avoidance (UAI)*, *masculinity (MAS)*.

Hence, a brief presentation of the three cultural dimensions is required. *Individualism* is characteristic of the societies in which the connections between individuals are weak: it is expected that each of them takes care of itself and the close family. On the other hand, *collectivism* belongs to the societies in which individuals are integrated since birth in strong and unite groups which keep on protecting it during its entire life (Hofstede, Hofstede, & Minkov, 2010, p. 92).

*Uncertainty avoidance* can be defined as the measure in which the members of a culture feel threatened by ambiguous situations or unknown situations. This feeling is expressed, amongst other, through nervous tensions and need of predictability –

the need for written and unwritten rules (Hofstede, Hofstede, & Minkov, 2010, p. 187).

A society is called *masculine* if the emotional gender roles are set apart clearly: men need to be authoritarian, tough and focused on the material success, while women must be modest, tender and focused on the quality of life. A society is called *feminine* if the gender emotional roles overlap: both men and women must prove modesty, tenderness and preoccupation for the quality of life (Hofstede, Hofstede, & Minkov, 2010, p. 141).

Each of these cultural dimensions has particularities which exert an influence on the way of thinking, the attitudes and the behaviours of individuals in a certain society, but we will refer only to the attitude towards work. For a better image we will take into consideration the cultural dimensions two by two (on one side uncertainty avoidance and masculinity and, on the other hand, individualism and masculinity) and we will represent graphically the way the UE countries are distributed in four quadrants.

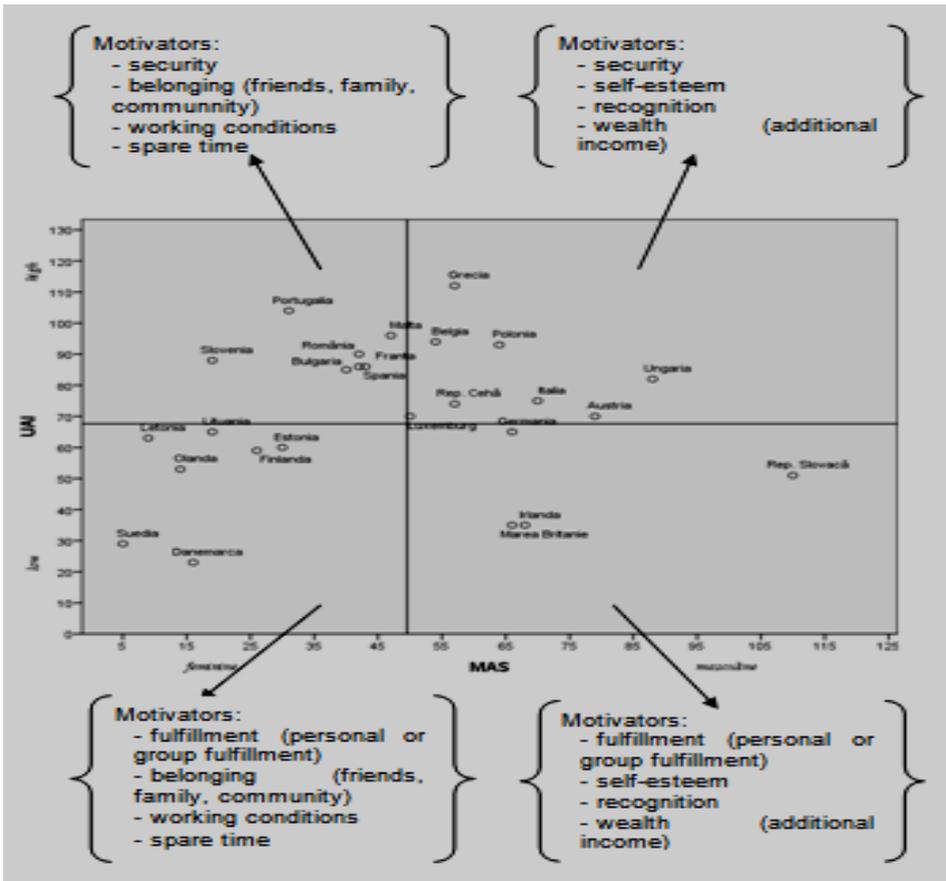

The particularities of the cultural dimension together with Maslow's needs pyramid will represent the starting point in the identification of the motivation needs.

Disposed as a pyramid, according to Maslow these needs are (from the base to the top): physiological needs, security needs, social and belongingness needs, esteem and accomplishment needs. Adler (1991) argues that the frame of references of an individual is what determines the importance of his needs, and that the frame of references is partly determined by culture (Geren, 2011). So, these needs require a reordering according to the cultural specific of a country. Hence, we can consider that safety and security prevails on other needs where the avoidance of uncertainty is strong. The need for belongingness (family relations, friends, etc.) will prevail on the need for esteem in feminine cultures, but in the masculine cultures the esteem need will be stronger.

As seen in figure 1, most of the countries are equally distributed in three quadrants (upper left, lower left and upper right). Romania is included in the upper-left quadrant, being feminine (but on the borderline with masculinity) and with a high level of uncertainty avoidance. The extremes are:

- reduced uncertainty avoidance: Denmark;
- intense uncertainty avoidance: Greece;
- masculinity: Slovak Republic;
- femininity: Sweden

Hence, in figure 1, the motivation factors will be (personal or group) satisfaction and esteem in the upper right corner; achievement and belongingness in the lower left corner; security and belongingness in the upper left corner. In some cultures there can be the need of adding new needs, such as: respect, harmony etc. (especially in the case of Asian cultures) (Hofstede, Hofstede, & Minkov, 2010, pg. 210-211).

**Figure 1.** Uncertainty avoidance, masculinity and work motivation in EU  
 Source: made by authors based on Hofstede's scores for the two cultural dimensions (available at <http://www.geerthofstede.nl/research--vsm>).

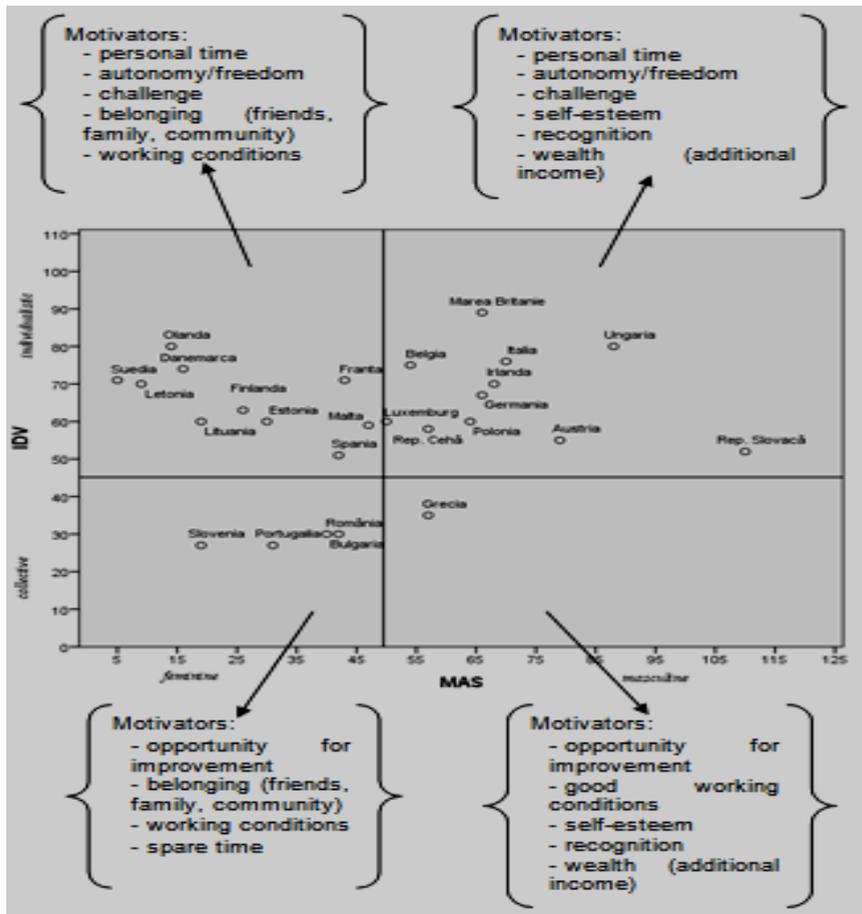

When taking into account individualism and masculinity, the distribution of countries across the four quadrants (figure 2) highlights again the need to adapt the motivational models to the cultural specificity of a country.

As shown in figure 2, most countries are distributed in two of the quadrants (upper left and upper right); Greece is alone in the lower right quadrant. Romania is included in the lower left quadrant, being feminine (but at the borderline with masculinity) and with a pronounced collectivism. The extremes are:

- collectivism: Slovenia and Portugal;
- individualism: Great Britain;
- masculinity: Slovak Republic;
- femininity: Sweden

Hence, in figure 2, personal time, freedom, challenge, belongingness and work conditions will have a special importance in the upper left quadrant; the personal time, freedom, challenge, esteem, recognition and wealth in the upper right corner; perfecting opportunities, belongingness, work conditions and free time in the lower

left quadrant; and the perfecting opportunities, work conditions, esteem, recognition and wealth in the lower right quadrant.

**Figure 2.** Individualism, masculinity and work motivation in EU

Source: made by authors based on Hofstede's scores for the two cultural dimensions (available at <http://www.geerthofstede.nl/research--vsm>).

It is not difficult to associate the importance of the personal time, the freedom and the personal challenge with individualism; all these underline the employee's independence from the organization. The work purposes associated with collectivism: perfecting, physical conditions and use of the abilities refer to things that the organization makes for the employee and hence it underlines the dependence of the employee towards the organization (Hofstede, Hofstede, & Minkov, 2010, p. 93).

## 5. Conclusions

We stand along side the researchers that support and promote the need to adapt and develop motivational theories that take into account the cultural specificity of a

country. Since the interactions (economical and not only) between the EU member states are unavoidable, the neglect of the cultural factor may lead any such interaction to failure.

Without the claim of an exhaustive presentation of the motivation models, we consider that the present action can represent a starting point for testing the validity of the motivation theory in other cultural context than the ones they were conceived in.

Since the observations in one culture are not mandatory applicable or valid in other cultures as well, we recommend that the motivation theories be implied to be valid only in the cultural environment they were conceived in. They overlap some cultural constraints and they reflect that culture in which the author / authors formed and performed the research (Hofstede, Hofstede, & Minkov, 2010, p. 317). In order to be applied in a different culture than the one they were conceived in, the motivation theories must be adapted and their validity must be verified. A testing example of the validity is given by Deci&all, who, in 2001 made a study for the verification of the possibility of generalizing the Self-determination theory to the level of other cultures. The analysis perceived offers proof that this theory can be valid also in cultures different than the one it was conceived in, but there are differences related to the intensity between needs and motivation, so that the cultural factor must be taken into consideration (Deci, Ryan, Gagné, Leone, Usunov, & Kornazheva, 2001).

The transfer and application of the results of a research from one culture to the other without testing their validity in the new context must be avoided. The organizations that extent to a multinational level must give special attention to cultural differences and to perform analysis before applying policies and procedures (Ng, Sorensen, & Yim, 2009).

# NEW APPROACHES OF THE CONCEPTS OF HUMAN RESOURCES, HUMAN RESOURCE MANAGEMENT AND STRATEGIC HUMAN RESOURCE MANAGEMENT

**Munteanu Anca - Ioana**

*Management Department, Faculty of Economics and Business Administration, West University of Timisoara, Timisoara, Romania*

[ank.ioana@yahoo.com](mailto:ank.ioana@yahoo.com)

**Abstract:** *This paper presents the most representative approaches to concepts of human resources, human resource management and strategic human resource management in the last two decades, based on purely theoretical analysis of the concepts mentioned above.*

*The purpose of this paper is to demonstrate through a critical analysis of concepts, that in this era of change and uncertainty, attention to human resources of an organization has changed radically. It can be seen by analyzing the definitions, evolving concepts of human resources, human resource management, strategic human resource management over time. Analyzing the authors approaches regarding the concept of "human resource" it is observed that is no longer assign the term "cost element", present authors define it as a strategic component of organizations.*

*In turn, human resources management has evolved considerably.*

*The period during which the department deals with purely administrative activities, preparing various documents, payroll is no longer valid. Note, by analyzing the literature, a strategic approach to human resource management, focusing on strategic human resource planning, selective recruitment and selection, training, motivation of employees, involving them in decision making, teamwork, reward performance based, creating a working environment, with particular emphasis on organizational climate.*

*Organizations have realized the role of human resources, human resources management in the survival and development.*

*Through this article we want to conclude that at the moment it is absolutely necessary strategic approach to human resource management to allow straightening organization to obtain a competitive advantage over other competitors in the field.*

*Competitive advantage has a critical role in the survival of organizations and is managed by Human Resources Management. This may be reflected in better financial performance (higher sales, increased profit), but also by non-financial performance (organizational reputation with customers and potential employees).*

*M. Porter highlights the important role of human resources within an organization, considering that in any business there are potential sources for obtaining competitive advantage. It comes from the ability of firms to master better than its rivals competitive forces. Any subdivision organizational structure and any employee of the organization, no matter how far away lies the strategy development process, contributing to gaining and maintaining competitive advantage.*

**Keyword:** *human resources, human resource management, strategic human resource management, competitive advantage*

**JEL classification:** *J24, M10, M12*

## **Introduction**

Nowadays there are many more risks and uncertainties than at any other time in the past, as a result of disruptive innovations and unexpected shocks coming. This is the new normal, an era of constant turmoil and chaos increased. (Kotler & Caslione, 2009)

This new normal led strategic behavior among new managers to minimize vulnerabilities and help them exploit the opportunities in the new normal.

Organizations often arrive at certain strategic points of inflection, when the old strategy does not give the desired results and should be quickly replaced with a new one.

In terms of data security can guarantee the success of any business that extensively cultivated or not, can be the most powerful obstacle to success. (Roger Martin, 2010) Period in which managers and other decision makers in organizations were focused and gave a critical role only tangible assets, quantifiable, and financial resources, has long faded.

In this "new era" was aware of the importance of human resources within an organization, human resource management role evolved considerably in recent years. Now, managers talk about the importance of "human" in the success of the organization, often using the term "human capital".

I noticed, looking at the literature, that this change in business mentality has occurred since the 1990s, significantly increasing the role of human resources with the advent of the "new economy" (Porter, 1998).

"New economy" has culminated in the development of important innovations, the most significant being computers and the Internet. Is the period in which they arise and develop emerging industry sectors like IT information technology, telecommunications, financial institutions.

There is a similarity between the two periods, the "new economy" and the present, in terms of innovation. At present, the most reliable source to obtain competitive advantage by organizations is innovation.

A awareness the importance of human resources in the organization, which proved to be vital, and currently occurred.

Now, investment in human resources is seen as a strategic approach to be constantly optimized and not as an element of costs to be minimized and kept as low a level.

Practice has proved what sets professionals in their work, namely that the success of an organization lies in its people. Organization's objectives can be met only if it has the necessary human resources and competencies, as required in this respect a rigorous strategic planning of human resources requirements. This process can be considered but a challenge for HR managers under this era of change, because "what was the future a year ago is now gone." (Roger Martin)

It is not difficult to formulate objectives for an organization; much more difficult it is to establish and to personally ensure that these objectives are realistic. (Mathis, R., Nica, P., Rusu, C., 1997)

In the same vein, J. Naisbitt and P. Aberdene (1985) states: "... human capital has replaced dollar capital as a strategic resource".

## **2. Human Resource Management**

Currently there are different concepts and approaches of modern human resource management in organizations.

In this paper I want to present some recent approaches of the concept, which I discovered by reading various books in the field. I want to conclude with a critical analysis, referring me to the similarities and differences between them.

Boselie (2010) addressed human resource management by focusing on sharing relationship that exists between employees and the organization. Thus, in his view, work report includes four types of contracts:

- Contract law - usually encompasses stipulated in a contract establishes the rights and obligations that arise between employees and the organization (eg, number of holidays, terms and conditions relating to confidentiality)
- Economic and trade agreement (employer and employee determine employee work effort, reflected in the number of working days and how much the employer pays for the submission of this work, within salary)
- Psychological contract (contains all those elements that are not directly stated but are expected by the two actors - the employee and the organization. Example, employees are willing to invest additional time in a project because it can promote them in next.)
- Sociological contract (relations and networks that employees have with the organization - eg teamwork)

In another approach, consider that "Human resources management operates in an environment where there is a continuous tension between value added and moral values." (Paauwe, 2004).

Paauwe defined as value added economic dimension of work organization, the role that HR plays in creating economic value and increase financial performance in an organization.

Moral values reflect the notion of employees in terms of human beings with feelings, emotions, opinions, norms and values.

A study of Paauwe and Boselie in 2004 concluded that:

- Human resources are more than just "resources";
- Human resource management is focused not only on getting financial performance;
- Human resource management is focused on transfer relationship between employees and the organization;
- Employee relations gained importance in an era of continuous tension between adding value and moral values.

In his acceptance Boxall and Purcell (2003):

- Human resource management refers to all labor groups, including employees basic peripheral employees and contingent workers;
- Human resources management involves line managers and specialist staff is not only;
- Human resource management managing work and people, both collectively and individually;
- Human resource management is incorporated both in industry and society.

Legge (1995) distinguish between human resource management focused on achieving material results (HR hard) and one who is interested in the creation of conditions necessary to obtain these results (HR software).

So, Legge's opinion there:

- Human Resources Management "hard" - focused on economic outcomes (dominant in organizations)
- Human resources management "soft" - focused on the human side of work organization human resources

Several authors in the literature have made reference to human resource management featuring two models:

- The Anglo-Saxon or Anglo-American - focused on creating shareholder value, in terms of profit and market value, with little attention, if any, to other stakeholders
- The Rhineland - is focused on the interests of all stakeholders (not just shareholder) is given importance and interest of employees

Analyzing approaches to human resources management concept presented above, it is easily seen that all authors wanted to reveal the crucial role that human resources department within an organization it is. The purpose of this department is not only to achieve by harnessing the potential of human resources, material and financial results as large, but to create an environment for their fulfillment.

Therefore, human resource management is to shape people and their activities so as to achieve maximum performance. Purpose of human resource management activities is to make employees want their organization as well as organization make employees want, so the organization to achieve its goals.

As mentioned Novac E. (2008), "Human resource management is one that provides a systematic check on a set of interrelated processes affecting and involving all members of an organization, processes that include human resource planning, recruitment, selection and evaluation employee training and human resources development, motivating and rewarding employees. "

### **3. Strategic Human Resource Management**

Strategic Human Resource Management has developed rapidly in recent years, especially because of the impact that human resources have had on the competitiveness of organizations. (Lefter, Marincas, Puia, 2007)

So there was an awareness that, at present, an organization cannot survive or develop without obtaining a competitive advantage over other competitors.

Manageability instrumental in obtaining the competitive advantage it has human resource management.

The fundamental objective of strategic human resource management is to generate strategic capability to ensure that the organization has highly qualified, highly motivated employees to achieve competitive advantage. (Popescu, Marincas, Puia, 2007)

According to Lefter, Marincas, Puia (2007), Strategic Human Resource Management must take into account several aspects:

- Predictions about the economic progress of the industry in which the company operates and customers
- Position competitors (technology they use, sale price, market share)
- Policy selling short, medium and long
- The uncertain evolution of sales
- Investment Policy and technologies to be implemented in future
- Production policy that will take the company into the future
- Consequences of certain factors that contribute to the emergence of new qualifications and changes in work organization management or planning

Strategic human resource management involves a collection of practices, programs and policies that facilitate the strategic objectives of the organization (Mello, J., A., 2006). It proved, however, that there is the best way to lead people, human

resources practices vary from one organization to another. In any organization, however, the essential condition for success is that human resource management system to support and sustain a clear mission and strategy.

Is focused on aligning human resources management at general business strategy, creating high-performance work systems and adding value through better management of people so that they sustain competitive advantage. (Delery & Doty, 1996)

In conclusion, strategic approach to human resources management is very much focused in the moment, manageability human effort to obtain competitive advantage.

#### **4. Conclusions**

Under current conditions, the authors of the literature finds it necessary heady a strategic approach to human resource management, which means abandoning old thinking and practices and focus more on strategic than operational side of the organization.

In the authors opinion, the focus should be on transforming human resources function a priority for the organization. It is very important to integrate all human resources policies and programs in the organization's overall strategy.

Therefore, businesses need a strategic approach to human resource management, human resource strategy must be integrated into the overall strategy of the organization.

This requires a certain degree, that those in charge of the organization to learn more about HR issues and activities and human resources managers to acquire some knowledge about economic transactions, business contracts, the company's products, market outlets, financial situation of the organization.

In strategic human resource management, human resources department plays a key role and has a strong influence in strategic decisions at the organizational level.

In our opinion, human resource management at the micro level (HR policies and practices) is necessary but not sufficient for organizations to gain a competitive advantage, especially sustainable. To face competition from others, organizations should move to a strategic approach to human resource management.

Success or failure of an organization probably not entirely due to his practice of strategic human resource management, but these practices are likely to be critical.

## DEFINING ASPECTS OF HUMAN RESOURCE MANAGEMENT STRATEGY WITHIN THE GENERAL STRATEGY OF THE MODERN ORGANIZATION

**Muscalu Emanoil, Muntean Silvana Nicoleta**

Faculty of Economics, „Lucian Blaga” University of Sibiu, Romania

emanoil.muscalu@ulbsibiu.ro

silvana.muntean@yahoo.com

**Abstract:** *The field of human resources requires the presence and action of several categories of persons and managerial structures interested in the quality of human resources and the activities developed by them. Besides managers and employees there are also the shareholders, the unions, the customers, the different national or local agencies, the local community, etc., with major interests regarding decisions in the human resources area. In order to harmonize their activities and achieve an optimal perspective within the evolution of Human Resource Management, special attention is paid to the strategy of human resources management. According to many specialists, strategies in the field of Human Resource Management show, in the first place, that personnel function adopts a broader perspective and a more dynamic view of human resources, which enables its full integration within the other functions of the organization. In the second place, strategies in the field of Human Resource Management designate the assembly of long term objectives concerning human resources, the main modalities of achieving them and the necessary resources which guarantee that the organization's structure, value and culture as well as the utilization of its personnel contribute to fulfilling the general objectives of the organization. Therefore, we approached in this paper the problems of grounding and elaborating the Human Resource Management strategy, and we outlined their specific traits, as these are necessary aspects in order to emphasise at the end of our paper the correlation between the strategy in the field of Human Resource Management and the general strategy of the organization. Taking into account specialists and practitioners' increased interest in knowing, substantiating and implementing strategies in the area of Human Resource Management, we consider that the aspects presented in this paper are modern issues and a starting pointing in solving the great problems of organizations nowadays. Thus, contemporary economic thinking is invited to solve the numerous challenges that society faces in general, aspects that can be solved, we believe, only if a strategic Human Resource Management is achieved with great professionalism. Therefore, Human Resource Management strategies constitute a continuous challenge for organizations' researchers and a real possibility to attain performance within organizations, be they present in a national or international area.*

**Keywords:** *strategy; Human Resource Management strategy; the general strategy of the organization; organization; implementation; substantiation.*

**JEL classification:** M12

## 1. Introduction

When conceiving and substantiating organizations' activities, an important role is played by strategies, especially Human Resource Management strategies, elaborated and implemented by managerial organisms. The essential concretization of the prevision, the strategies of Human Resource Management contour the development of each organization in the field of human resources, and their content often decides the efficiency of the interface with the subsystems to which it belongs, the extent to which they maintain and amplify the efficiency and effectiveness of the activities developed.

In managerial practice there is a certain scepticism regarding the necessity and opportunity of Human Resource Management strategy, considering that the environment where the activity of the organization takes place is unstable, submitted to some irregular fluctuations, hence its uselessness, on the one hand; on the other hand it is considered that a plan is profitable only if it is respected, which does no longer ensure flexibility as an imperative trait that conditions the survival and development of an organization.

In this respect, the objectives of Human Resource Management define and express synthetically the aims envisaged and the criteria to evaluate the future activity in the field of Human Resource Management, and the Human Resource Management strategy describes – explicitly and implicitly – the directions to follow, the modalities or ways to attain specific purposes under the form of the objectives formulated for a 3-5 year span. Only under the circumstances of knowing the specific traits, of grounding and implementing Human Resource Management strategy, are the objectives of the organization fulfilled and its competitiveness increased.

## 2. Concept and specific traits of Human Resource Management strategy

The history of the word 'strategy' began many millenniums ago. In this respect, the remarks made by American Brian Quinn are interesting: "At first, during early Greek antiquity, the word «strategos» referred to the role of a general in charge of an army. Then, it acquired the sense of «a general's art», referring to the psychological and behavioural abilities that enabled a general to fulfill his role. In Pericles' time (450 B. C.) strategy was perceived as a managerial quality (administrative, leadership, oratory, power), and during the reign of Alexander the Great (330 B. C.), strategy referred to the ability to unfold forces in order to overwhelm opposition (the enemy) and create a unitary system of global government. This sense was used for centuries in most military approaches, expanding in other fields as well in the 20<sup>th</sup> century" (Nicolescu and Verboncu, 2008:130).

The idea of strategy appeared in social sciences around the '40's, with the game theory, designating the moves thought or played by one of the players.

During the '60's the term was used in order to define some of the most important decisions within companies. The fundamental work in the field is Igor Ansoff's *Corporale Strategy* (1965, original ed.), which had a great influence and was the first in a series of works that envisaged the foundation, clarification and application of managerial strategies (Gazier, 2003:30).

Since then, things have moved very fast and starting with the '80's everything or almost everything became strategy in economy, sociology, psychology, anthropology. Whether they speak about groups' or individuals' interests, economic, sentimental, esthetic options – more or less reasonable and elaborated – or even

about sequences and attitudes, more and more authors have started to think in strategic terms.

Referring strictly to the economic field, the results of the research made by one of the greatest specialists in management, Henry Mintzberg, signaled the presence of 10 schools of managerial thinking as far as strategy is concerned, after examining 1495 works dedicated to strategy. In table no. 1, authors Nicolescu O. and Verboncu I. (2008) present synthetically which these schools are and their defining traits concerning strategy elaboration – the most important element from the point of view of managerial practice.

In this respect, there are more and more numerous hints and analyses that show that human resources have a strategic potential and make the difference in the long run, changing an organization's future.

**Table no. 1** Strategy schools

<b>No.</b>	<b>Strategic name</b>	<b>Strategic elaboration seen as a process</b>
1.	Designing	Conceptualized
2.	Planning	Formalized
3.	Positioning	Analytic
4.	Entrepreneurial	Visionary
5.	Cognitive	Mental
6.	Learning	Emergent (contoured across time)
7.	Political	Based on power
8.	Cultural	Ideological
9.	Environmental	Passive
10.	Configurative	Sequential

Also, in many authors' opinion, like for instance Michael Armstrong, personnel strategies define the intentions of the organization regarding the human resources development directions, as well as the necessities or requirements that have to be met in this area in order to facilitate the fulfillment of organizational objectives (Manolescu, 1998:105).

Consequently, Human Resource Management strategies are to start from both operational objectives and human resources peculiarities and use an adequate investigation methodology which should provide a reasonable direction of the efforts in this field (Manolescu, 1998:105).

At the same time, Galbraith and Nathanson, famous specialists in the explicit approach of Human Resource Management strategies, researching the role of human resources in the implementation of organizational strategy, outlined the following basic fields of Human Resource Management, where adequate strategies can be developed (Feris and Buckley, 1996: 9): selecting personnel; evaluating performances; rewarding employees; training employees.

In our opinion, starting from the definitions given to strategy, to Human Resource Management, namely to the place and role of Human Resource Management within the general strategy of the organization, the Human Resource Management strategy can be defined as:

- the assembly of major objectives and modalities of attaining them, of Human Resource Management concerning the optimal utilization of human resources in the

long run, in order to ensure the efficiency of the organization and of the benefits of each of its members;

- the assembly of the objectives, policies, programs and fundamental decisions through which it is possible to determine, for a long period of time, the general direction of the evolution and viability of Human Resource Management through the harmonization of the relations between employers and employees, meant to guarantee productivity and efficiency increase within the organization;

- a mixture of significant activities, substantiated and elaborated by Human Resource Management in the long run, directed to the effective utilization of human resources, in order to attain the goals of the organization and to satisfy the needs of the employees;

- a distinct field of the strategy of the organization's management through which Human Resource Management strategy envisages in the long run recruiting, selecting, training and developing the employees' performances, their motivation and responsibility in order to efficiently attain the goals of the organization;

- the mission, namely the long term commitment aims and modalities of Human Resource Management through the specific involvement of the other resources of the organization in order to attain its objectives.

Obviously, we could continue with the presentation of other significant definitions connected to Human Resource Management strategy, but we believe that they would not contain further remarkable elements.

By analyzing the content of the definitions given by different authors and of those suggested by us, the following characteristic traits of Human Resource Management strategy can be outlined:

- Human Resource Management strategy always envisages – explicitly and implicitly – attaining some well-established goals, specified as mission, aims and objectives;

- strategy envisages future spans in the field of Human Resource Management, usually 3-5 years long. Hence, a certain degree of risk and uncertainty associated with it, with some consequences in the operation process;

- the area is specific to Human Resource Management and to the general problems of the organization;

- the content of the strategy envisages essential elements, focusing on the major aspects of human resources evolution in order to support the organization so as to survive and develop;

- strategy takes into account and is influenced by the interests of the organization's owner, managers and especially by the interests of those who administrate human resources, namely the employees. The better this reality is known and respected, the greater the chances to apply the strategy successfully;

- strategy means improving a competitive type of behaviour with managers and employees in the long run, taking into account the culture of the organization;

We consider that the definitions given by us in this part of the paper and our view of the foundation of Human Resource Management strategy are an attempt to explain and clarify some important aspects of this reality which is so necessary for the present, and especially for the future efficient and effective functioning of national and multinational organizations.

### **3. Substantiating, elaborating and implementing strategy in the field of Human Resource Management**

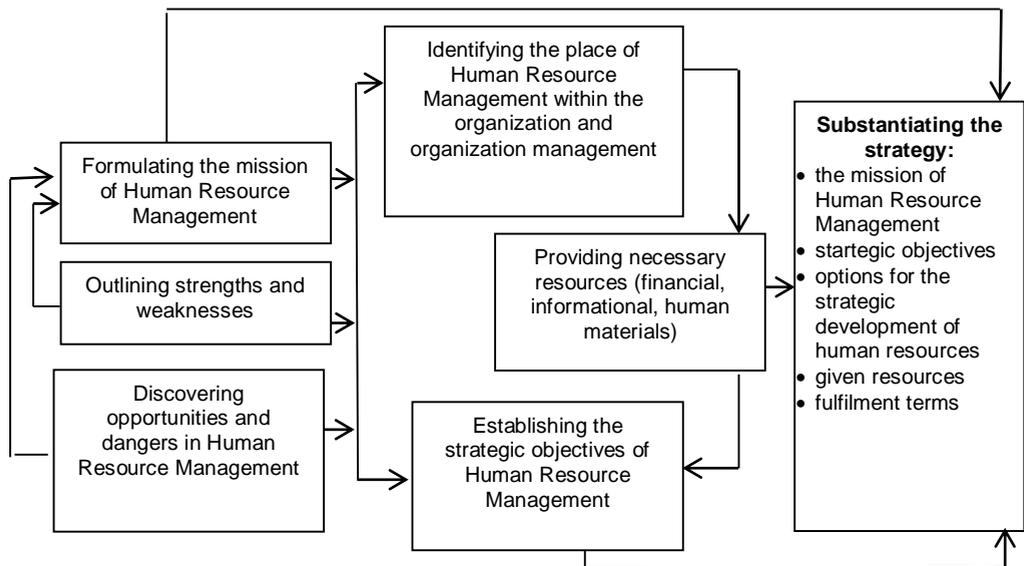

When valuing the human resources potential of the organization in the long run, through efficient Human Resource Management strategies an important role is played by the substantiation of Human Resource Management strategy. This basically means identifying and taking into account the scientific programs which envisage the future activities of the organization and hence the formulation of some prognoses characterizing Human Resource Management to maintain them.

Prognoses, as tools of knowing and investigating the future processes of the organization in general, in the field of its human resources in particular, constitute the logic, realistic and objective support of the substantiation of the necessities and possibilities of the future evolution of human resources.

Considering some appreciations formulated as far as human resources strategy is concerned (Armstrong, 1996: 171), we estimate that the following problems with an impact on the substantiation of Human Resource Management strategy become very important:

- the intentions and possibilities of increasing, integrating, diversifying or concentrating the activity of the organization by taking into account the environmental national and international factors, especially those concerning market / production;
- the appreciations regarding the new perspectives about the selection, formation and promotion of human resources in accordance with the new transformations at the level of the organization;
- the evaluation regarding the efficiency and effectiveness in the long run of Human Resource Management in order to ensure an increased performance of the organization;
- the necessity to develop an organizational culture directed towards performance;
- other environmental factors (opportunities or threats) which can influence Human Resource Management, as for instance: governmental interference, European legislation, competition or pressures on the workforce market, the quality of personnel training, the diminution of the interest in academic training with high school pupils, demographic reduction, etc.

On the whole, the process of substantiating Human Resource Management strategy is presented in figure no.1.

**Fig. no. 1** – the process of substantiating Human Resource Management strategy

As shown in figure no. 1, the substantiation of Human Resource Management is finalised by elaborating and formulating it. In order to elaborate Human Resource Management strategy, the fundamental problem, as Rolf Bühner opines is the analysis of the human resources the organization has at a certain moment, as well as of the opportunities and specific risks that exist or may appear in the field of human resources when there is competition with other organizations. (Bühner, 1994: 43).

Human Resource Management will impose easier the envisaged measures and cross faster the process of elaborating human resources strategy if it involves the organization's staff in this process. Thus, the organization's members will be encouraged and motivated to have the same opinion about the strengths and weaknesses of the organization, as well as about the environment where it functions. To do so, special attention will be paid to the communication process, so as to make the members of the organization trust and be interested enough in establishing the organization's perspective.

Strategy implementation is achieved in connection with the elements that define the general organizational context and the one specific to the field of human resources, namely: the seriousness of the firm's strategic difficulties; the type of implemented strategy; the available financial resources; the configuration of the personnel's mentality; the organizational relations; the urgency of getting performance in the short run.

Human Resources Management went through significant evolution. The newly conceived idea of strategic management in human resources is the consequence of past and coming changes (Karaszewska, 2010)

From this point of view, the success of Human Resource Management strategy depends on a good internal organization and on the existence of competent personnel. We suggest that internal organization involves: elaborating a Human Resource structure compatible with the strategic necessities of the organization and the necessary human resources in order to develop it and promote some adequate management relations; the identification of distinct aims and competences, envisaging managerial aptitudes, the know-how and the other necessary resources; selecting people for key functions. Ensuring the motivational support for the employees plays an essential role in the success of a strategy.

Considering these conditionings, managers often have to fulfil very different roles. They have to act as undertakers, administrators, people in charge with solving problems in crisis situations, negotiators, motivators, mentors and so on. Only thus can managers in the Human Resource field support the missions and actions required by the implementation of Human Resource Management strategy.

The aspects analyzed concerning the content, substantiation, elaboration and implementation of Human Resource Management strategy were correlated with certain ideas that envisage the organization's global strategy. From the perspective of the possibility of identifying the contribution of Human Resource Management strategy through its increased efficiency and effectiveness to the maintenance and consolidation of the national and multinational performance, we consider that outlining some correlative aspects of the two strategies is both useful from a theoretical and practical point of view and necessary in order to fulfil the organization's objectives.

#### **4. Correlating strategy in the field of Human Resource Management with the general strategy of the organization**

Strategies in the field of management are fundamental, formulated and implemented at different levels of an organization's management.

From this point of view, we can identify general strategies (Nica, 2008: 104) or corporative ones and functional strategies (Gazier, 2003: 32).

*General strategy* as a strategy developed at the level of the organization has the strategy of the organization's management as distinct field, and *functional strategy* envisages the specialised compartments and the autonomous fields of strategy, namely Human Resource strategy, with its important vector Human Resource Management.

Through the specialised activities which it prefigures, Human Resource Management Strategy within the organization's general strategy ensures the conditions of its adequate implementation through human resources' availability and capacity.

Taking into account the importance of human resources for the performance level and the competitiveness of the organization's activity, no other field of functional strategies is as vital as the one referring to the organization's employees.

The relation between Human Resource Management strategy and the general strategy of the organization is that from one part to the whole, and the interdependencies between them can be identified under the form of some influence factors in both senses.

- General strategy influences the management strategy of human resources by establishing the general objectives of the organization, for a well-established future

period, a part of them being made up of objectives that envisage the organization's personnel directly.

- In turn, Human Resource Management strategy influences the general strategy of the organization, by the fact that the objectives of the former are formulated in such a way as to allow , through aggregation, the achievement of the integrated ones, either directly or indirectly, with the help of other objectives ; the success of Human Resource Management strategy leads to the strategic general success of the fundamental objectives.

Human Resource Management strategies are established after the global or general strategy of the organization is known, taking into account competition's conditions or contextual evolutions.

In this respect, the model of personnel strategy, conceived by Armstrong M. (1996) (fig. no. 2) suggests that the elaboration of personnel strategies should take into account the most relevant organizational or environmental aspects, as well as those belonging to the field of human resources.

**Fig. no. 2** – The personnel strategy model (after M. Armstrong)

Elaborating strategies in the field of human resources is in fact the result of a continuous process of analysis or diagnostic of all the activities within the organization, as well as of the directions the organization is heading towards.

Consequently, Human Resource Management strategy has a derived character, it is a partial strategy which refers only to certain activities within the organization, namely to those that belong to the Human Resource function. Human Resource Management strategies are usually concretized in policies and programs in the field of human resources, and the objectives, strategic options and resources that are to be involved have smaller dimensions.

From this point of view, numerous outstanding papers in the field frequently mention the great importance of the accord between the general objectives of the

organization and the objectives in the field of Human Resource Management, between the general strategy and the Human Resource Management strategy, which involves:

- providing the necessary human resources in order to ensure the organization's strategy;
- developing human resources to allow further strategies within the organization.

In this context, we also mention the fact that more and more specialists in the area are for establishing a full accord between general strategies and strategies in the field of Human Resource Management, which finally led to the emergence of new concepts, like, for instance, "*strategic integration*", "*strategic accord*" or "*strategic Human Resource Management*"

If within general strategy, establishing or building some stable market/ product relations is in the foreground, then Human Resource Management strategy has to be directed towards:

- the intensive development of the personnel in order to ensure their qualification, as well as the improvement of the activity in relation with the clients;
- the long term personnel planning in order to ensure the necessary human resources in the future too;
- the intensification of internal personnel advancement in order to use their potential as efficiently and long as possible.

The examination of the mentioned aspects shows that there are major differences between the general strategy of the organization and the strategy in the field of Human Resource Management. If general strategy refers to the organization as a whole and usually covers the entire organization, affecting all its activities directly or indirectly, Human Resource Management strategy envisages a distinct component, the most important one, and considers correlating results and actions with other compartments and subsystems, starting from the general objectives of global strategy.

The content of the aspects presented so far demonstrates clearly that, in order to fulfil their objectives, organizations in general, irrespective of their nature and size, have been forced to deal with some challenges meant to try their *capacity of ensuring and maintaining success in competition by anticipating contextual evolutions*.

## **5. Conclusions**

Organizations exist because people have limited mental and physical capabilities, and the ability to have and develop organizations. All organizations need their human resources, regardless of how many people will experience some aspects of management as limiting their individual freedom of action.

In this regard, human resources is one of the most important investments of an organization, whose results become more obvious over time.

When conceiving and substantiating activities in the field of human resources, a very important role is played by strategies, which do not represent an aim in themselves, but impose themselves more and more as essential components of Human Resource Management and major managerial modalities of professionalizing it.

Thus, Human Resource Management strategy can have shocking results only when there is a tight cooperation between the top management of the organization and Human Resource Management.

Because of the economic crisis, the dynamic action of internal and international factors, the change in the coming physiognomy of the organization, elaborating a prognosis in the field of Human Resource Management which should emphasize the complex and difficult process of the organization's efficiency in a national and international environment, becomes a condition of the organization's economic and managerial success in the long run, with most important consequences for the future of the organization, irrespective of its size and national or international character. Nowadays, and even more in the future, the role and place of strategies in the field of Human Resource Management will increase from the point of view of its importance and significance, and their implementation requires a cumulus of quality activities, which is a fundamental condition in order.

## INTEGRATED DOCUMENT MANAGEMENT SOLUTION FOR THE LOCAL GOVERNMENT

**Nistor Răzvan Liviu, Mureșan Ioana, Moca Mircea**

*Management dept., Business Information Systems dept., Faculty of Economics and Business Administration, Babeș-Bolyai University, Cluj-Napoca, Romania*

*razvan.nistor@econ.ubbcluj.ro*

*ioana.muresan@econ.ubbcluj.ro*

*mircea.moca@econ.ubbcluj.ro*

**Abstract:** *In this paper we present system analysis and design elements for the integrated document management solution at local governing authorities in the rural areas. While specifically dealing with the actual management of the Agricultural Register, an important primary unitary evidence document, we also keep a general character of the discussion, in order to argue for the generality of the proposed solution. Hence, for the identified and described problem space we propose an administrative and software infrastructure solution. This work is an empirical research in which our aim is primarily to identify key problems within the local governing authorities from several perspectives concerning the management of the Agricultural Register then to address those problems with an integrated document management system. For the proposed solution we give and argue the general system architecture and describe the key-mechanisms that support quality requirements. The relevance of this research concern is given by the impact of the actual Agricultural Register management on important stakeholders. This can be measured as the satisfaction felt by taxpayers and the performance of the local governing authorities, the Financial Administration, the Agency of Payments and Intervention in Agriculture and the Ministry of Agriculture and Rural Development. This work is also intended as a start-point for a new, modern thinking of the governing authorities, in their pursue to improve public services. For this, in our work we highlight the importance of complete system analysis at all administrative levels as a main priority concern for all public managers. Our aim is the improvement of the public service by raising the awareness of the decision makers on the necessity of using integrated document management solutions for the provided services. Also, our work aims at increasing the efficiency with which nowadays, governing authorities invest public funds in various IT projects for the management of their services. For this, we highlight the importance of documenting quality requirements during system analysis.*

**Keywords:** *Local government; integrated system; decision making; document management; Agricultural Register.*

**JEL classification:** *M15, H11*

## Introduction

Improving the public service offered to citizens through integrated software systems should be a permanent concern of the public managers (West, 2005). More, the concern for integrating software systems running at different government bodies within the European Union is an actual concern of the European Commission (EC, 2011).

To modernize means adapting to requirements, to the exigencies of the present, renewing, updating, moving from a static organization characterized by inertia to a dynamic one, adapted to a changing environment in fast transformation. To modernize also means adopting modern behaviors considered innovative in comparison with the previous ones. Therefore, knowledge policies such as research, innovation, education and training are very important for the future of the Romanian public administration.

The administrative reform should be always a current topic on the public agenda. There are several problems that the local government in Romania is facing, leading to the appearance of significant disparities in socioeconomic development:

- territorial excessive fragmentation and inadequate dimensioning of administrative - territorial units, with negative effects on adapting the provided services according to European standards of quality and efficiency;
- high operating costs for administrative territorial units, especially in rural areas and small towns leading to a low investment level at this level;
- low absorption rates of structural and cohesion funds by many villages – development regions with a preponderant statistical role, lead to their incapacity to really play the role that the European Union is projecting for the regional level in the planning for 2014 - 2020.

An efficient local public management involves means of organizing such as: the main organizing directions, implementation of a complex IT program, developing and implementing the Code of Conduct for clerks, relationships with civil society institutions, organizing and conducting environment related activities.

According to article 3 of Romanian Law no. 544/2001 regarding free access to information of public interest, providing access to public information by authorities and institutions is made ex officio or upon request, through the public relations department or the person designated for this purpose.

In Romania, as in most European countries, the practice shows an increasing involvement level of citizens, under at least two aspects:

- information procedures, more and more diversified: motivation of administrative documents, access to administrative documents, reducing the application field of the "administrative secrecy";
- participation procedures, also increasingly frequent: not only consultancy, but also techniques involving a more active role for recipients of administrative action, public inquiries, developing non contentious administrative procedure laws etc.

The progress of IT and of derived methods facilitates this type of relationships, which involves a different form of government, less authoritarian and less rigid.

Nowadays, in many Romanian public administration agencies one can easily note the bureaucracy. Some general causes for this phenomenon can be the maintaining of complicated administrative procedures, the failure to comply with set time-limits

for processing requests, documents flow fragmentation, the presence of offices without IT equipment and technologies, inability to generalize processes, at least when dealing with taxes and the "single window" system.

The consistency of the public administrative management improvement can increase the efficiency of the relationship between central and local government, between the public authorities at national level and those from rural areas and cities. Nowadays we cannot identify an integrated information system of central and local government to support all social policy decisions.

Reorganizing and restructuring the central and local administration requires an increased level of efficiency in document management and decision making.

A frequently required document by citizens in the rural areas is based on information included in the Agricultural Register. This is an official document of primary unitary evidence, containing sections like: the composition of the household/ agricultural holding, owned land identified by parcels, forests in public/ private ownership, the use of agricultural areas regarding the arable area cultivated with the main crops, orchards areas and the number of trees, vineyards, grapevine nurseries, irrigated areas and livestock.

In this work we present system analysis and design elements for the integrated management of the Agricultural Register at local governing authorities in the rural areas. For the proposed solution we give and argue the general system architecture and describe the key-mechanisms that support the identified quality requirements.

The remaining of this paper is organized as follows. In Section 1 we present the background of our work, in Section 2 we describe the problem space, in Section 3 we argue the proposed solution. In Section 4 we present related work and we conclude in Section 5.

## **1. Background**

The research work that aims an efficient public administration assumes interdisciplinary work where the research team address IT, managerial and legal issues under a variety of approaches (Wright, 2011).

The public administration can be seen as a system of institutions or various administrative structures organizing and implementing the central state laws.

Although the characteristics of public administration mechanisms are different from country to country within the European Union, increasing their efficiency requires their harmonization. The values that define the European administrative field are: transparency, predictability, responsibility, adaptability and efficiency (Androniceanu, 2007). Romania is one of the European Union's member states that still deals with the process of adopting and implementing these values.

Improving the management of public institutions in Romania towards alignment with the European standards is a necessity for the contemporary public management system, in a context of major changes which need to be faced both by each public institution, and by the entire system as a whole.

Public institutions cannot be isolated from the general social system. Therefore the relationship between these institutions and the citizens should be a matter of great interest for the public managers. The main objective when improving the management of public institutions is increasing the level of satisfaction of the citizens (Androniceanu, 2007).

The relationship between public institutions and citizens can be improved by:

- increasing rigor in reasoning and replying as well as shortening the response time to requests submitted by citizens;
- reducing bureaucracy of the central and local government agencies;
- strengthening and enlarging the participation of civil society in decision-making;
- ensuring transparency of administrative documents and communicating operatively with citizens.

## **2. Description of the problem space**

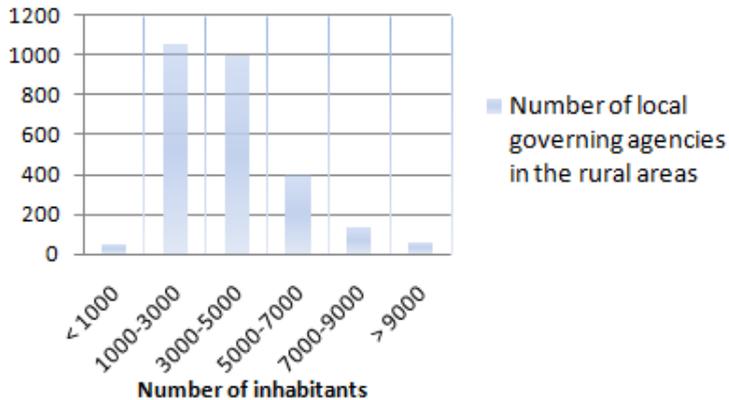

In this section we provide a description of the problem space from two main perspectives. One is represented by the public institutions responsible with local governance and the other is determined by the taxpayers. In our discussion we firstly identify and describe the stakeholders from each perspective by highlighting their needs then we present the relationships among them as components of a whole information system.

Within the governance perspective we consider three types of key state institution: local governing authorities in the rural areas, the Financial Administration, the Agency of Payment and Intervention in Agriculture (APIA).

In our context the local governing authority represents a functional structure with permanent activity, consisting of mayor, deputy mayor, secretary of the administrative-territorial unit and the special unit of the mayor. The aim of the local governing authority is to solve current problems of the local community (Romanian Law 286/2006, article 4). In this work we consider the rural areas where the local governing authorities offer services to a small set of surrounding villages. The average administrative territorial area is 9000 hectares (INS, 2013). Also, in average, a district manages the activity of 70 local governing authorities in the rural areas.

In figure 1 we present the distribution of the local governing authority's size (in number of citizens) in the rural areas according to the Romanian Statistical Yearbook (INS, 2013). In this graph we observe that most of the local governing authorities have a small number of citizens. Obviously, this aspect raise challenges in terms of public management efficiency.

In our discussion the fiscal body operating within the local governing authorities have the responsibility of collecting taxes from the taxpayers. Hence, it operates as a speciality compartment within the local governing authority but its activity is subordinated to the central fiscal body, to which it reports the evolution of the tax collection process.

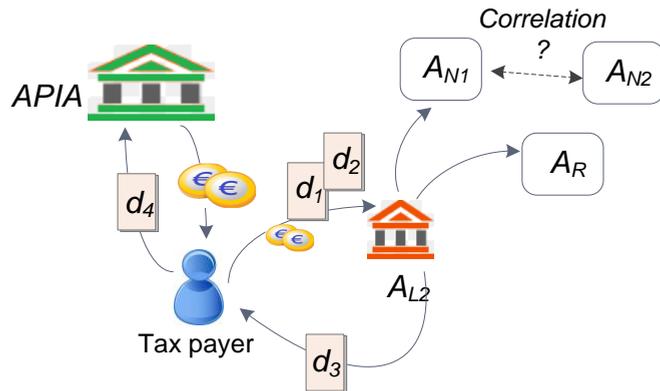

**Figure 1:** The distribution of the local governing administration size.  
Source: Authors' contribution

The Agency for Payments and Intervention in Agriculture (APIA) operates under the Ministry of Agriculture and Rural Development according to the Romanian Law 1/2004 with subsequent amendments. The institution has the following organization: central unit, 42 district centres and 210 local centres. Hence, this body has a nationally spread structure which can be characterized as a tree with three administrative levels.

Since January 2007, APIA is in charge for carrying European funds to implement support measures financed by the European Agricultural Guarantee Fund (EAGF). The subventions are awarded to farmers as direct payments per hectare, managed by the Integrated Administration and Control System (IACS) according to the market measures for the implementation of trade mechanisms under the Common Agricultural Policy (CAP). Regarding the management of the European funds granted to farmers, APIA has the following main responsibilities:

- Provides verification of payment requests received from beneficiaries;
- Authorize the payments to beneficiaries after verifying their payment requests;
- Notifies the beneficiaries of any irregularities noticed in order to resolve them;
- Runs authorized payments to beneficiaries;
- Tracks the framing within the funds allocated for the activities mentioned above;
- Ensure that the requirements regarding public information on its activities.

In figure 2 we present the interactions of a taxpayer with the local governing authority and APIA. In this context the taxpayer is either an individual or a legal representative of a company that owns or rents a given surface of land within the administrative territorial area of a local governing authority, denoted with AL2. The taxpayer has a yearly obligation of tax payment to the local governing authority according to Romanian Laws 273/2006, 215/2001 and the 28/2008 Government Ordinance, all with subsequent modifications.

**Figure 2:** Overview of the problem space at local level.  
Source: Authors' contribution

In relationship with APiA, the taxpayer that has a position opened in the Agricultural Register is called farmer. Yearly, a farmer that is registered at APiA receives an invitation to declare her land, culture types and livestock for the current year. For this, the farmer has to obtain a certificate with the content of her position in the Agricultural Register. This document is issued by the local governing authority and we denote it with  $d_3$ . Forward, the farmer goes to the local APiA centre on the scheduled date and submits a request for payment, denoted with  $d_4$ . After a while, for the valid requests for payment, APiA orders the bank transfers for the calculated amounts, to the farmers' bank accounts.

For the previously discussed context we identify a set of main issues, which we forward describe. The taxpayer declares the land surfaces, buildings and other taxable properties to the tax office within the local governing authority. This is one of the bases for calculating the annual tax for a contributor. Yearly, the same taxpayer declares to the Agricultural Register office values for the same list as to the tax office. At different key-moments like the end of the financial year, the local governing authorities are facing problems when confronting synthetic data from the two offices. They sometimes find substantial differences between the two amounts, leading to confusion and lack of governance control.

Some local governing authorities have developed applications for the tax collection management. Even these agencies could find sooner the previously described issue due to various process and document flow defects. In this case, other taxpayers may have to spend significant time intervals waiting in line to access the service. Hence, we note a loss of time for both the clerk and the concerned citizens.

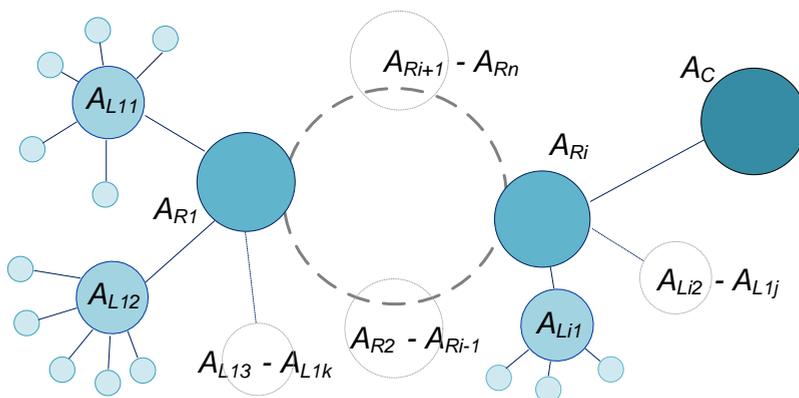

At national public management level, the lack of an integrated system for the public services can lead to lack of data correlation, decisions and actions between different state institutions, denoted with  $A_{N1}$  and  $A_{N2}$  in figure 2.

A real understanding of the scale impact caused by the before mentioned issues can be obtained if we multiply the defects with the number of local governing authorities at national level.

### 3. Proposed solution

In this section we present the solution proposed to address the problems identified in section 2. Hence for two distinct perspectives – governance and infrastructure we give the details of a collaborative integrated system, highlighting important system requirements. We consider that this discussion could start interesting research challenges in the fields, leading to a better social welfare.

We consider that software and hardware infrastructures of quality should be major concerns of the governing authorities at all levels. In this context we define quality as realistic standards created and imposed by public governing authorities to partners developing their software and hardware infrastructures in order to obtain maximum satisfaction. Through satisfaction we refer to a guaranteed system behavior, according to valid quality system requirements professionally documented, and accordingly felt by all types of stakeholder.

**Figure 3:** General architecture of the proposed system.  
Source: Authors' contribution

Forward in this section we present the vision for a software solution that addresses the problems identified and described in section 2. We propose a general system architecture, we describe coordination and integration mechanisms for the solution, we document the system features and finally discuss the benefits for stakeholders. In figure 3 we depict the solution proposed for the Agricultural Register management. This is a hybrid system architecture, using the client-server model for the document management at local and regional levels and a peer-to-peer model for the integration of all regional governing authorities at national level. Consequently, we can state that the system is a super-peer network.

We propose a client-server communication model for the regional (at district level) management of the Agricultural Register. The rationale for this approach is that a regional administrative entity is motivated to provide the necessary infrastructure for the subordinate local authorities. As we discussed in section 2, a local governing authority would provide service (i.e. store backup data) for an average of 70 local governing authorities. Another reason for this architecture choice is that the client component running at local governing authorities are independent, managing data from the local context. The advantage is their functional independence from a permanent Internet connection, which could be a real issue for some rural areas. In

general, the communication between AL and AR should comprise periodical saving of backup data, exceptionally obtain recovery data and access data from other regional governing agencies.

The client component running at AL should have local backup mechanisms. Since some of the local authorities have unstable, poor or no Internet connection, the system should provide for the server component running at AR manual update mechanisms. This would function as follows: a user creates a dump file at AL, and then uploads the respective file from a computer connected to the Internet (which can be geographically located outside the local governing agency). By this, the server component can keep more accurate data for subordinate authorities even with no or poor Internet connection with them. Consequently, governing stakeholders from upper levels (AR, AC) will have more up-to-date information regarding the Agricultural Register.

In figure 3, for a clearer presentation of the system architecture we omitted to represent all local and regional governing entities. Hence, AR1 is also connected to the remaining local authorities AL13 – AL1k.

A server component is running at each regional governing authority, which for the current national administrative organization is considered at district level. A server component has also knowledge (i.e. is connected to) of some of the other servers running at regional governing authorities. For this, we propose the employment of the Chord protocol (Stoica et al., 2001, 2003). The advantages of such a distributed solution at national level would imply:

- High fault tolerance of the system due to distribution of data and functionality over the structure at regional level: the server components would communicate in a peer-to-peer fashion among them.
- Insignificant or no down-times for the server components: due to the distribution mechanisms, the role played by a particular server running at AR could be rapidly taken over by another server in the system in case of unexpected failure. This also provides the means for an easy planned maintenance of servers.
- Prevent the system from malfunctioning due to local or regional hazards.
- Reduce the costs with maintenance and local data backup at any AR since data is replicated across the system.

A distinct component that runs at the central governing authority (AC) would provide to stakeholders means for generating various reports on data from all regional governing authorities. The proposed distributed architecture at regional level allows the central authority to access data from any AR.

Another important advantage of the overall proposed system architecture is the capability of integrating any other services that nowadays run on different independent systems at local and regional governing authorities. This solution is capable of supporting other similar services, since it relies on abstract, elastic and adaptive communication mechanisms fitting to the governing organizational structure.

The presented architecture supports the collaboration of the components, allowing the development of a system with integrated functionalities. More, the architecture takes into account the users from different governing levels, which is essential for obtaining an integrated system (Danaiata et al., 2008).

An integrated document management solution for the local governing authorities

would provide through collaboration and communication mechanisms means of integration with other systems employed by other governmental bodies.

More, when designing such a collaborative system with super-peer architecture, the system designer can easily add new levels of abstraction, or build new overlaying functional layers. In the context of regionalization, new functionality can be easily added to the system, which, for instance, would provide service for certain groups of governing authorities at district level. In this way, we insure the maintainability of the system.

The impact of the system on different types of stakeholder from local, regional and central governing authorities is significant, since it leads to a better control over the administrative processes due to availability of more accurate data compared to the traditional informational system. Also, stakeholders can be more reactive to context changes due to the availability of synthetic information reported by the system shortly after data registration in territory, at local level.

#### **4. Related work**

Kunis et al. (2007) propose a model for document management in e-government systems based on hierarchical process folders, providing security mechanisms that are tailored to the processing of distributed government processes within and between authorities.

In Viscusi et al. (2010) we find the pursue of studying the importance of the knowledge in information systems for all public administrators. Their findings show strong correlations of information systems background of the public administrators and the quality of the provided services and related processes. More, the authors present methodological frameworks for developing optimal e-government plans while considering technological, economic, organizational and legal aspects. The methodology relies on the quality of the provided services and related processes, as well as the quality of the data managed in the administrative services and processes.

The research group of the United Nations Department of Economic and Social Affairs showed in a recent study (Qian et al., 2012) the benefits of public investments in IT infrastructures made by local governing authorities in rural areas from different countries. Also, the authors present the pursuit of many UN Member States to move from a decentralized single-purpose organization model to an integrated whole-of-government model in order to increase the effectiveness and efficiency of the administrative processes. More, the study argue for the interconnection of different state individual agencies in order to deliver services that successfully deal with the complex economic and social challenges.

#### **5. Conclusion and future work**

In this work we presented system analysis and design elements for the management of the Agricultural Register issue at local governing authorities in the rural areas. For the proposed solution we gave and argued the general system architecture, describing the key-mechanisms that support the identified quality requirements. We showed the importance of the integration of services while designing a system and highlighted the impact of the quality requirements on the satisfaction and efficiency of the stakeholders.

As future work we propose to develop this analysis by documenting and validating

functional and quality requirements for the proposed solution in the discussed context. We also intend to continue this work with a detailed economic analysis for the proposed system in order to identify the resources needed for its development.

# THE IMPACT OF THE WORK ENVIRONMENT ON THE ACTIVITY OF THE EMPLOYEES WITH LOW QUALITY RELATIONSHIPS

**Pastor Ioan**

*Management - Economics Department, Faculty of Economics, Law and Administrative Sciences, Tîrgu – Mureş, „Petru Maior” University of Tîrgu – Mureş, România*

*ioan\_pastor@yahoo.com*

**Abstract:** *The paper tries to identify the contextual factors that influence positively the level of work effort made by the employees who have low quality relationships with their hierarchical superiors. According to the control theory regarding the leader-employee relationship we can state that a higher work effort than the expected one is due to the fact that in certain working environments can offer control to those who normally do not have it, thus serving as substitute of the high quality leader-employee relationships. Studies have proven that for the employees that report low quality relationships with their superior, low competence of their superior, decentralized decision making and low perceptions of policies, high levels of the individual work effort are recorded. The paper highlights the theoretical and practical implications of these discoveries and offers directions for further research in this field.*

**Keywords:** work effort, competence, leader, control, contextual factors.

**JEL classification:** M12, M20, M21

## 1. Introduction

Many times leaders favour some employees to the detriment of the others or create advantages for the ones they favour (K.M.Kacman et al, 2007). The favoured employees generally benefit of more attention, support and guidance from their superiors, have easier access to key resources and important task allocation and get better performance scores than their less favoured colleagues (Graen,Novac 1982). Due to the important impact of the condition of favoured employee on career, researchers in the field of management have studied this dynamic for a long time (Liden, Sparrowe, Wayne,1997).

The theory of the leader-employee exchange is at the centre of this research field. This theory states that leadership is based on exchange relationships with subordinates. The central premise of this theory is that leaders develop individual relationships with employees, relationships that vary as far as their quality is concerned. Research studies have investigated the effects of these relationships quality on the work results. High quality relationships are characterized by allocating challenging tasks, emotional support both for decision making and resources exchange. The low quality exchange relationships are limited to the exchange of those resources that are essential for performing tasks (Taylor,Pierce, 1999).

A high quality relationship consists in the feeling of the employee that he belongs to a group. The employee has more responsibilities, more influence on decisions, satisfaction and access to resources. A low quality relationship emerges when the employee does not feel included in a group. The leader offers little support to the

employee, and this has less responsibilities and less capacity of influencing decisions.

So far, the theory of the leader-employee exchange has focused on understanding the antecedents and benefits associated with the high quality exchange relationships. Despite the importance of maximizing all employees' effort, research on the leader-employee exchange showed little interest to the understanding of the variables regarding the level of effort made by employees with a low quality exchange. Therefore, the goal of our research was to contest this generalized research line by concentrating on the contextual conditions in which employees involved in low quality exchanges will make efforts, despite the relatively poor relationships with their superiors. We use the control theory in order to explain the way in which three contextual variables – the perception on the superior's competence, centralization and organizational policies – have an impact on the perceptions of control and the wish to make an effort at the workplace of the employees with low quality exchange relationships.

## **2. The control theory and the contextual variables**

Research in the field of control (Spector, 1987) at the workplace suggests that high levels of perceived control are related to a combination of variables with important results, including high levels of job satisfaction, employment, involvement, performance and motivation and low levels of physical symptoms, emotional suffering, stress, absenteeism intention of leaving the workplace and staff turnover. Although a number of empirical studies have not succeeded in obtaining substantial effects of control interventions, perceived control is theoretically an important anticipator of a variety of work results, including motivation. Moreover, the expectancy theory of motivation (Vroom, 1964) suggests that, control at the workplace is an important anticipator of the employees' motivation and of the corresponding effort made by employees.

The expectancy theory of motivation (Vroom, 1964) suggests that individuals will not make an effort for a task related to something they do not expect to get success or rewards from. It is possible for employees in a low quality relationship with their superior to perceive with difficulty the occasions of acknowledgement of their performances or those of receiving rewards for the performance they achieve, because of the low quality relationship with their superior. Integrating the control theory and the expectancy theory, it results that the employees having high quality exchange relationships with their superior will perceive that they have access to resources, feed-back, support and the necessary communication in order to be successful and be rewarded with a high quality exchange relationship with their superior, so they will be motivated to make an effort. However, the perception of the lack of a quality relationship with the superior and the corresponding perception of losing control can lead to a diminished effort of those involved in low quality relationships.

A number of key environment variables can influence the perception of control that employees with low quality exchanges have on the environment and can, therefore, play a role in the level of effort that they are willing to make at work. Our arguments are in accord with the substitutes of the leadership theory which state that there is a variety of contextual and environment variables that can substitute or neutralize the effects of the various leader behaviours. Based on the control and leader-employee

exchange theories, we have selected three contextual variables of the work environment in order to analyse them in this study, variables that could substitute and/or neutralize the effect that a high quality exchange with the superior has on the effort made by the employee. More precisely, we analyse to what extent the environment characteristics of the superior's competence, decentralization and work policies have an impact on the degree to which an employee with low quality relationships finds reasons to make an effort at work.

Using the control theory as a theoretical framework, we anticipate that, when managers are competent, they are aware of everything that is going on in their environment and its proximity. This fact will limit the control that those with low quality relationships perceive, as they know that the superior is attentive and knows everything that is happening and that should happen. On the other hand, individuals that have an incompetent manager may consider that they have more control on their work, as their manager is not aware of everything that is going on. This reasoning suggests that individuals with low quality exchange relationships and that work for an incompetent superior might be willing to work more if they worked for a competent manager, as their efforts are not monitored or questioned, fact that gives them a feeling of control over their work in the work environment.

Similarly, the decentralized structures, which disseminate the power of making decisions to those who are directly affected by the decision, can be associated with the level of effort made by the employees with low quality exchange relationships. Individuals with low quality relationships that work in a highly centralized environment have to ask for permission before they act. Unfortunately, those with low quality relationships have limited access to their superior, thing that makes the task of getting permission extremely difficult. The combination of the two conditions, the need to ask for permission and the lack of the possibility of asking for it, may determine employees that work in such an environment to perceive a low control or not to find reasons for working harder. On the contrary, those with low quality relationships working in a decentralized environment are able to make decisions regarding the way and moment for achieving their tasks, having control and a reason in order to make an effort.

Individuals with low quality exchange relationships that work in a highly political environment may find few reasons to make an effort. Political environments are full of uncertainty and limit perceptions of control. For example, it is rarely clear for those who are outside the coalition having the power how and why crucial decisions are made, how rewards are given and how tasks are allocated. Working in an environment where there are no clear connections between effort and rewards limits the reasons a person has in order to make an effort. Thus, individuals that work in political environments and have a low quality relationship with their superior will not have the motivation to make an effort at work. However, the same individuals who have a low quality relationship with their superior, when they are in a transparent and apolitical work environment will perceive the connection between effort and rewards and will notice that they have more control over their work and the results they get. Such an environment will motivate employees having low quality relationships with their superiors to make an effort.

*The superiors' competence:* The superiors' competence has been studied under various aspects, including their skill, ability, managerial skills and managers' competence. Moreover, some researchers have studied the results of the superiors'

competence, including the organization's performance. Little is known about the effect of the superiors' competence on the work effort of the employees. Since one of the main tasks of the superior is managing the work effort of the employees, there is an urgent need for analysing this relationship empirically.

Moreover, the leader-employee exchange theory supports studying the effect that the superiors' competence has on the work effort of the employees. The leader-employee exchange suggests that the work effort of the employee is influenced by the relationship with the superior; employees that have high quality relationships get better results and performance than the employees with low quality relationships. If a superior has very good managerial abilities, he will probably be accustomed with organizing the workflow, delegating, communicating and encouraging participation, monitoring the progress made for achieving goals and offering feed-back. These things are good especially for the employees with high quality exchange relationships that enjoy the benefits of their superior's ability. The superior's increased competence may lead to an increase in effort of those having good exchange relationships with their superior, by increasing the perceptions of those employees that they are likely to receive rewards for their efforts.

However, for the employees with low quality exchange relationships the superior's competence may have opposite effects. We put forward the hypothesis that an individual that does not have a good exchange relationship will work more when he perceives that his superior is less competent. We suspect that if an employee considers his superior as being less competent, others will do the same. Less is expected from superiors with such a reputation. If from the field of an incompetent manager good things emerge, this fact is attributed to somebody else than the manager. Therefore, an individual, having low quality relationships with an incompetent superior, has better chances of being attributed the merits of his work, so he is motivated to work harder. The other way around, if an employee with low quality relationships works for a competent manager, harder work might not bring him the expected reward, because positive results will be attributed to the competent manager.

Our reasoning is also supported from the point of view of the control theory. More precisely, if a manager is competent he will be aware of everything going on. This fact will limit the control perceived by those with low quality relationships, because they know the superior is attentive and knows what is going on or what should be going on. The other way around, individuals who report to an incompetent manager may feel that they have more control over their work, because the superior is not aware of everything going on and the employees do whatever they wish to do whenever they wish to do. Again, this fact would suggest that individuals with low quality exchange relationships working for an incompetent superior would be willing to work more if they worked for a competent superior, as their efforts are not attentively monitored and questioned, thing which gives them a feeling of control over their work environment. For these reasons, we suspect that, the superiors' competence moderates the relationships between the quality of the exchange relationships between the leader and employees and the work effort.

In this context, ( K.M.Kcmar et al , 2007) we appreciate that *a perceived competence of the superior will moderate the relationship between the quality of the exchange relationships and the work effort, so that employees that report low quality exchange*

*relationships will evaluate the work effort as being higher when the superior's competence is lower.*

*The decentralized decision making:* Centralization refers to the extent to which the power of making decisions comes from the top of the organizational structure. A decentralized structure empowers its employees to make decisions regarding the work goals, the work structure and problem solving. In the highly centralized organizational structures, employees having good quality relationships with their superior will have an advantage due to the increased power of the superior of making decisions and due to the indirect power that they have as a result of the relationship that they have with the superior. However, for the employees that have low quality relationships with the superior, a centralized structure highlights their lack of control. Not only are they discouraged to make decisions, but they also have limited access to the superior who should decide what they have to do. Under highly centralized work circumstances, we suspect that employees with low quality relationships will make little effort.

On the other hand, we cannot make the same statement as far as the employees with low quality relationships working in decentralized environments are concerned. We would rather expect the same employees to make bigger efforts, since the freedom they enjoy by making their own decisions brings them a certain level of control over their life. This theory is supported by the leadership theory, which states that there are a variety of contextual and environment variables that can actually substitute or neutralize the effects of the leader behaviours. Leadership's neutralizers are characteristics that really make it impossible for relational leadership and/or task-oriented leadership to act. Therefore, decentralized structures may serve as neutralizers of leadership. As the leader's direct authority of making decisions is reduced, those having low quality relationships with the leader will be more motivated to make an effort at work, due to the perception that they have control over their environment. As a result, we put forward the hypothesis that for the individuals having low quality exchange relationships, a decentralized decision making structure will increase the efforts made at work.

In this context ( M.M.Kacman et al. , 2007), we can state that *centralization will moderate the relationship between the quality of exchange relationships and effort at work, so that employees that report exchange relationships of a reduced quality will evaluate the level of effort made as being higher in a decentralized environment.*

*The perceptions of work policies:* Organizational policies are actions that are directed toward the goal of promoting the interests of one person, without considering the well-being of others or the organization (Kacman – Baron, 1999). The specific tactics used for committing to a policy and the distinct purposes towards which behaviours are directed vary very much, reflecting, partially, the various reasons from which these behaviours emerge. Examples of the various reasons include pursuing their own interests, not forgiving others for previous injustice or the struggle for getting appreciated rewards. Political behaviours often include activities that are outside the sphere of the job's normal requirements and may involve actions that are not officially approved by the organization. Moreover, the real reasons for committing to these policies are often hidden. Finally, political behaviours regularly emerge when there is competition for limited resources and a lack of clear rules regarding the way of

allocating resources. The final result is the lack of clear reasoning regarding the way of giving rewards.

The lack of clear rules involves ambiguity, inequity and lack of control at the workplace. As it has been shown above, this type of environments can be acceptable and lacking threat for those that enjoy good quality exchange relationships with their superiors, as they are generally protected from negative consequences that emerge in the political work environments. However, not the same can be stated about the employees with low quality relationships. These individuals that are not protected by their superiors may be target of political tactics (e.g. the resources they need are not accessible to them) or may be affected by the consequences of these tactics (e.g. decisions on how they have to perform their tasks may be made, thing that might make these tasks much more difficult). Therefore, we expect the work effort of the individuals with low quality relationships and who work in political environments to be reduced. However, apolitical work environments are characterized by highly popularized and strictly followed rules and regulations, thing that brings order and control at the workplace (Kacman,1991). Employees that work in such environments will have a feeling of control and through this they will see the connection between effort and rewards, so they will increase their work efforts struggling to get favourable results. This reasoning suggests that the political perceptions moderate the relationships between the quality of the exchange relationships and the work effort. Starting from this thing we ( K.M.Kacman et al., 2007) consider that *policies at the workplace will moderate the relationship between the quality of exchange relationships and the work effort of the employee, so that employees that report low quality exchange relationships will evaluate the level of effort as being higher in the less political work environments.*

### **3. Conclusions**

The interest for exchanges between leader and employee continues to increase. Employees having low quality exchange relationships have a distinct disadvantage, both regarding career development and their potential of contributing to the organization's results. It is extremely important to understand how an environment can be created, one in which individuals with low quality relationships are willing to make an effort at work, but still the aspect has rarely been studied.

The results of our study show that the superior's competence, the centralized decision making and the perceptions of a political work environment moderate the relationship between the quality of the exchange relationship between leader and employee and the work effort of the employee. The form of these relationships indicates the fact that all of them serve as substitutes for a leader-employee exchange relationship of a low quality. Specifically, these variables, when they are present, can create a work environment that motivates individuals in leader-employee exchange relationships of a low quality to make more effort at work than the leader-employee exchange theory anticipated.

When employees with low quality exchange relationships understand that their superior is less than competent, they could have more control over their work, as the superior is not aware of everything going on and employees could do everything they wanted, as their superior's supervision capacity is low. The freedom of doing what you are asked to at the workplace without any interference from your superior may encourage the employee to make a bigger effort who would otherwise make a

minimum effort. Similarly, individuals with low quality leader-employee exchange relationships that work in a decentralized environment feel that they have more control over their work and, as they can make decisions on what and how to do, are willing to make a bigger effort at work than individuals in a similar situation, but in a centralized environment. In the end, if the work environment lacks policy, the work effort made by employees with low quality relationships may be bigger than that of the individuals in similar situations, but in a political environment. Again, using the control theory as explanation suggests that apolitical environments induce control feelings, that strengthen an individual's willingness to make an effort, because praises and rewards generated by his efforts are more likely to appear here than in a work environment.

The results of this study could be improved by including an estimation of the work effort of another person than the one who makes an effort. Collecting data on the effort made by the analysed employees by superiors and colleagues could lead to a more accurate evaluation.

Despite the limitations, this study may bring some contributions to the specialist literature and can have implications on the human resource departments. Our results indicate the fact that environment factors, the perceived competence of the superior, the centralized decision making and the low level of politics are positively related to the auto-estimated work effort of the employees that have low quality exchange relationships with their superior. These results suggest that efforts made by management to increase employees' control perceptions that do not have a good quality exchange relationship with their superior will be beneficial for the efforts these employees make at work. In order to achieve that, managers have to minimize policy behaviours at the workplace by implementing and adhering to work policies. Making these decisions will help employees to convince themselves that their performance will be rewarded, thus motivating them to maximize their efforts. Moreover, we discovered that it is important for the management to make sure that employees with low quality relationships have the autonomy to make decisions, in such a way that they should feel a certain control over their work environment. Therefore, managers ought to think at creating some operating motivation systems, which would support decentralized decision making. Such an action would bring an enormous contribution to the performance of employees with low quality exchange relationships, without diminishing the good performance of their colleagues with high quality exchange relationships.

Our results indicate that further investigation on the methods of maximizing the work efforts of the employees with low quality exchange relationships constitutes a promising research area. If our study is an initial viable analysis of this phenomenon, the next step would be carrying out a more sophisticated study in order to test key relationships. Some variations in data collecting and analysis could offer interesting results. Further studies could compare results using evaluations of the independent performance and self-evaluations. Moreover, the quality of the relationships could be independently evaluated by the hierarchical superior or collectively, using the leader-employee interaction. Finally, the moderators could be treated as group variables in the analysis. Although some researchers could sentence employees to stagnant careers and low evaluations of performance, our discoveries suggest that not everything is lost for these employees. Creating a work environment that would compensate the lack of leadership in their low quality exchange relationships is

possible by offering control over the work environment and by motivating them to make an effort at the workplace.

# THE INTERDEPENDENCE BETWEEN MANAGEMENT, COMMUNICATION, ORGANIZATIONAL BEHAVIOR AND PERFORMANCE

**Pipaș Maria Daniela**

*Department of Management-Marketing, Faculty of Economics, "Bogdan Vodă" University of Cluj-Napoca, Cluj-Napoca, Romania  
dpipas@yahoo.com*

**Abstract:** *The approach of this paper is based on the concepts of management, communication and organizational behavior that by implementing the appropriate strategies, by taking and prevention of organizational risk that creates a favorable organizational climate that can improve, in time, the image of the organization, leading ultimately to making a synergic organization and to increase the organizational performance. An effective communication, followed by an efficient management provides safety in any domain of activity. Organizational communication cannot be seen outside of the management, and represents a fundamental component of it. The lack of communication or poor management of this process leads to alterations in key components of organizational management on one hand, and on the other, the lack of skills and organizational culture regarding these components invalidates the communication process. Today, communication has become increasingly important and more nuanced. At work, employees are faced with an overload of information, but with insufficient or even no communication. Information and communication are two different concepts, but that are interrelated, so information puts people in connection with certain information while communicating puts people in relation with others. Any communication process takes place in a context, which means that it takes place in a specific social, cultural, psychological, physical or temporal space, which is in close interdependence. Any behavioral attitude that we have in this space communicates something about us and determines, consciously or unconsciously, a reaction of positive or negative response from others and may be a factor in sustaining the process of social evolution. In an organizational context, attitudes, behavior can be found as organizational behavior, covering, in turn, a wide range of activities: knowledge and employee satisfaction, understanding group dynamics, accepting and respecting differences between people and of different cultural values that they come with, in the organization and many other skills, activities and management practices. Functionality and performances of an organization, regardless of the national context depend largely on how managers manage to create modern and flexible management systems, integrating in their structure many intra and extra organizational variables.*

**Keywords:** management, communication, organizational behavior, attitude, motivation, job satisfaction, performance.

**JEL classification:** M12

## **1. Introduction**

Organizational management has experienced an accelerated evolution in recent years due to changes on the labor market and socio-economic structures. This has resulted in a series of changes at the microeconomic level imposed by the need to adapt to new conditions in order to obtain maximum performance and impact (Novac, 2007:4). Thus, from the perspective of modern methods, organizational management and implicitly human resource management fall within the overall policy of the organization, the major objective being the overlap of individual interests with those of the organization. In this context, the new human resources management systems aim to clarify the place, role and duties of employees, to stimulate creativity and to establish an effective communication system that meets the participation needs of employee but, at the same time, they create premises to motivate employees and recognize their merits and achievements.

Today, communication is the main dimension of existence each of us, becoming so present, that is not even seen as a separate activity, its role being to put people in connection with each other, in the environment around them, by the content of transmitting and receiving messages aiming to achieve certain goals and passing on certain significances.

One of the important tasks of the manager is to motivate subordinates and creating an ambience of psychosocial leadership style, attitude towards daily problems of people, climate, cohesion, moods, to current interpersonal relationships and the whole preparation and living arrangements, to generate self-motivation, the strongest form of motivation (Pânzaru, 2009:36).

Knowledge of organizational behavior helps to better understand oneself and other people in a context mainly related to work. It can also extend personal potential for success in careers while the jobs are becoming more dynamic, complex and interesting.

To be an effective manager requires a combination of knowledge and experience. The study of organizational behavior produces no guiding principles but rather a series of statements whose explanation depends on the situation (Schermerhorn et al., 2002:42).

## **2. Organizational behavior - theoretical approach**

The founder of organizational behavior concept was Fritz Roethlisberger that together with Elton Mayo proceeded to identifying the relationship between individual and group behavior of labor productivity. Their first observation (Hawthorne study) was related to the importance of social relationships (informal), which proved to be more important even than the salary system (Stanciu and Ionescu, 2007:3).

A formal definition for organizational behavior can be: the study of individuals and groups in organizations. It involves understanding, predicting and controlling of human behavior. The most popular definitions follow a certain line: the study and understanding of individual and group behavior, of models and structures to improve performance and efficiency of the organization (Schermerhorn et al., 2002:3).

Although widely used in the organizational environment, the term "organizational behavior" is used improperly, because very rarely all members of an organization behave in a manner that represents the organization as a whole. In practice we should refer to the behavior of individuals and groups of people within an organization. The combination of "organizational behavior" has become common

and is widely used to refer to a large number of discipleship, influences, attitudes, and behavior patterns of people in organizations.

### **2.1. Field study of organizational behavior**

Interpersonal relationships between people take place through contextual communication in an environment where attitudes and behavior cannot be studied in isolation. From this point of view, it is important to understand human relationships in context with other variables that are included throughout the organization. The study of organizational behavior involves understanding the most important organizational factors:

- the type of management and management style;
- the organizational context environment;
- organizational processes and development of work;
- attitudinal and communication types of people;
- employee interactions with internal and external environment of the organization.

Organizations are composed of individuals. In turn, the individual is the most important component of the organizational behavior and is a necessary part of any attitude or behavioral situation, whether acting individually or as part of a group in response to the expectations of the organization to achieve organizational goals, or as a result of the influence of personal background or where they work. Each individual is a unique entity with unique personality which brings to the organization a new culture, a host of attitudes, values and past experiences. Where individual needs are not compatible with the organization's requirements situations of dissatisfaction, frustration and conflict may occur. It is the task of managers to create an organizational environment that allows individuals' needs satisfaction, adopting a positive organizational behavior and disappearance of conflicts to favorably achieve organizational goals and performance in work.

### **2.2. Characteristics of organizational behavior**

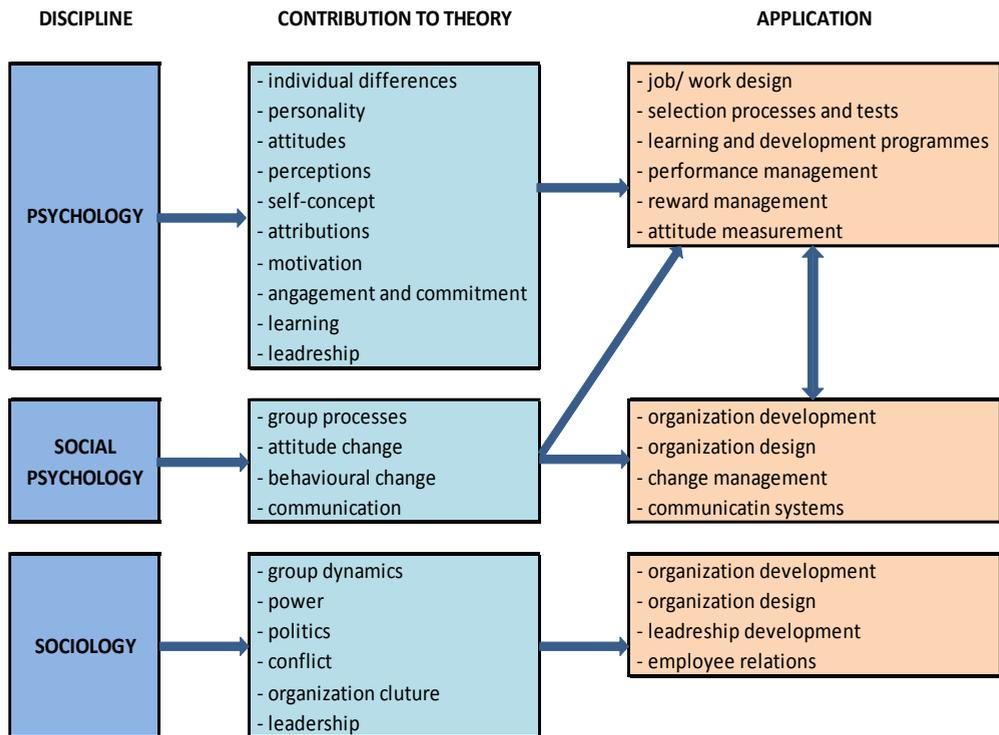

Ivancevich and collaborators (Ivancevich et al., 2008:82) identified the following characteristics of organizational behavior:

- it is a way of thinking about individuals, groups and organizations;
- is multidisciplinary - uses principles, models, theories and methods from other disciplines;
- it has a distinctly humanistic orientation - people and their attitudes, perceptions, learning abilities, feelings and goals are of a paramount importance;
- it is geared towards performance - studying factors affecting the performance and how it can be improved;
- the use of the scientific method is important in the study of variables and relations;
- it is oriented on the applied part of things in that it can provide answers when questions arise regarding the management of organizations.

Armstrong (Armstrong, 2009:295) argues that there are few factors affecting organizational behavior like the actions, reactions and interactions of people that constitute organizational behavior are influenced by the following factors:

- the characteristics of people at work – individual differences, attitudes, personality, attributions, orientation and the roles they play;
- how people are motivated;
- the process of employee engagement;
- the process of organizational commitment;
- how organizations function;
- organizational culture.

Figure 1 summarizes how each of the main organization behavior disciplines contribute, first to different aspects of organization behavior theory, which in turn influence HR practices.

**Figure 1** – The sources and application of organization behavior theory.  
Source: (Armstrong, 2009:295).

In conclusion, sources of organizational behavior include disciplines of psychology, social psychology and sociology. Contributions are based on an understanding of individual differences, those of managers, group processes and concepts such as motivation, engagement and commitment. Applications cover all aspects of human resources management and organizational development. All managers and HR specialists are influenced in the organizational management by the organizational behavior in ways that meet organizational needs, understanding of communication

types, organizational processes and skills of employees which means that the analysis and diagnosis of organizational behavior is important.

### **2.3. Management and organizational behavior**

Management (Pânzaru, 2009:2) is defined as the art of getting things done in organizations. Managers obtain, allocate and use physical and human resources to achieve goals. The definition does not include a provision on how to realize these goals. Each management style is effective in certain situations. The modern world is characterized by an increase in the diversity of values, behaviors and lifestyles. To the extent that managers will be able to understand more deeply the people, they will be able to make better decisions in areas such as recruitment, assignment of tasks, job performance evaluation, training and qualification, compensation and promotion of staff, coordinating and motivating employees, teamwork, communication within the organization, etc. To the extent that behavior can be predicted or explained, it can be controlled or managed. If they are understood by those managed, the reasons that lead to a service of high quality, of ethical behavior, they can be corrected and consciously accept the managerial act. If providing and explaining constitutes the analysis, the management is action.

Most experts in management, tried to find the right way to lead an organization in order to achieve organizational goals. Organizational behavior management systematically studies attitudes and behaviors of employees and provides the ability to understand how to manage them efficiently and effectively and how they can be changed.

The manager can have full confidence in a subordinate without the certainty that, in turn, that subordinate has the same feeling for him as leader, with his qualities and capacities. "Trust is the highest form of human motivation. It brings out all that is best in people". (Covey, 2004:56).

One of the important tasks of the manager is to motivate subordinates and to create an ambience of psychosocial leadership style, an attitude towards daily problems of people, climate, cohesion, moods up to current interpersonal relationships and the whole preparation and living arrangements , that will generate self-motivation, the strongest form of motivation (Pânzaru, 2009:36).

Knowledge of the organizational behavior help to better understand oneself and other people in a context mainly related to work. It can also extend personal potential for success in the career while the jobs becoming more dynamic, complex and interesting. To be an effective manager requires a combination of knowledge and experience. The study of organizational behavior does not produce guiding principles but rather a series of statements whose explanation depends on the situation (Schermerhorn et al., 2002:42).

### **3. Job satisfaction prerequisite for organizational performance**

Formally defined, job satisfaction is the degree to which individuals have positive or negative feelings related to the assigned work station. Job satisfaction is an attitude, an organizational behavior or an emotional response to the work tasks and at the same time to the physical and social conditions at work. At first glance, from the perspective of Herzberg's theory, some aspects of satisfaction should be motivational and lead to positive employment relations and individual performance.

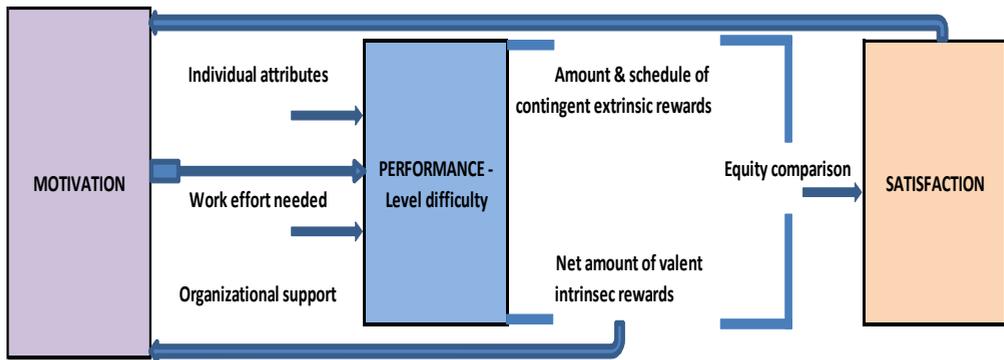

Based on daily activities managers must be able to deduct employee job satisfaction through careful observation and interpretation of what they say and do about the positions they occupy. Sometimes it is useful for levels of satisfaction of employee groups to be formally observed through interviews and questionnaires (Wymer and Carsten, 1992:71-78).

The importance of job satisfaction can be seen in the context of two decisions that people make in relation to their work. The first is the decision of belonging - to join and to stay within an organization. The second is the decision to be performing - to work to achieve high levels of performance, but not all who are part of an organization are performing.

The relationship between performance and satisfaction is still the subject of many disputes. The views are alternative: 1. satisfaction generates performance; 2. performance generates satisfaction; 3. reward generates performance and satisfaction (Greene, 1972:31):

1. **Satisfaction generates performance.** If job satisfaction causes high performance the message that managers should understand is simple: to increase work performance of employees they need to be made happy. Research shows that the relationship between individual satisfaction and performance at a time or another is not exactly straightforward and simple. There is some evidence that the relationship works better for those with high qualifications and occupy higher positions in the hierarchy. Job satisfaction alone is not considered a predictor for performance.
2. **Performance generates satisfaction.** If high levels of performance cause satisfaction the message is different. Rather than focusing attention on employee satisfaction the effort should be directed to offer them help to achieve such performance and satisfaction will follow. Research shows an empirical relationship between individual performance measured at a time and job satisfaction.
3. **Reward generates performance and satisfaction.** This last argument is the most convincing. It suggests that an appropriate allocation of rewards can positively influence the performance and the satisfaction. The key word is "appropriate". Research has shown that people who receive high rewards report high satisfaction. But at the same time it was shown that performance related rewards affect work performance of the individual. In this case the size and amount of reward varies depending on the accomplishments. As long as small rewards offered to a poorly performing employee will lead to dissatisfaction, the expectation is that he will make efforts to improve his performance to achieve greater rewards in the future. The idea is that managers must consider satisfaction and performance as two separate results but related to labor that are influenced by the allocation of rewards. Because alone, job satisfaction is not a predictor for performance, well-managed rewards can have a positive influence on satisfaction and performance.

There is an integrated model of motivation as represented in the figure below.

**Figure 2 – An integrated model of individual motivation to work.**

Source: (Schermmerhorn,2002:164)

In the figure, job performance and satisfaction are separate, but potentially interdependent with work results. Performance is influenced most directly by individual attributes such as ability and experience, organizational support such as resources and technology, and work effort—the point at which an individual’s level of motivation comes directly to bear. Individual motivation directly determines work effort, and the key to motivation is the ability to create a work setting that positively responds to individual needs and goals (Schermmerhorn,2002:165).

On organizational interdependencies that lead to obtaining work performance Sirbu said: "The human factor has always been particularly important for the activity of an enterprise" (Sirbu, 2004:1).

Individual motivation directly determines work effort and the key to this motivation is to create a work environment that responds to individual needs and goals. Regardless of the work environment motivation will depend on rewards and their perceived value. Contingent and immediate rewards are significant. Rewards that individuals deemed attractive are those perceived to have a high valence. Among them - job satisfaction as conceptual equivalent of valence that is the very activity they perform (Cole, 2002:107).

Motivation can occur when satisfaction results from extrinsic or intrinsic rewards that allocated equitably, we can specify that when inequity is resulting, satisfaction will decrease and motivation will be reduced.

Successfully motivating employees is based more on a philosophy than a management technique. Actually, it is important the kind of attitude and communication the manager has with people he leads and their reaction to those two factors.

A manager who leads by motivation needs to create conditions where people feel inspired to work hard. Clearly, a motivated workforce is essential to performance which results are particularly beneficial to the organization (Jaradat, 2007:195).

People have a common nature and basic needs that are alike, which simplifies things: members of an organization have, generally similar aspirations, desires,

hopes and goals, differing quantitatively rather than qualitatively and it's up to managers to lead them to achieve organizational goals in an efficient way. The manager of the third millennium, no longer forms subordinates but a team of fully autonomous personalities and skills that express their personality, that want to take on new responsibilities and will and can make decisions (Pintea, 2011:329).

#### **4. Research methodology**

This research is part of an applied, extensive scientific research, related to my PhD thesis which aims as an overall objective to analyze the interdependence of management, communication and organizational behavior and how internal communication in organizations influences the organizational effectiveness and efficiency or organizational performance.

The problem of personality and organizational behavior is of particular importance in modern organizations, being acclaimed on an empirical level as essential for social and professional performance of an individual. The methods of collecting and analyzing data and information were based on direct observation of organizational processes behavior and phenomena that characterize the organization as well as document analysis.

In the empirical investigation process there were analyzed and interpreted data and information already available, which were selected from a variety of bibliographic sources and are subject to a process of constant comparison and conceptual framing in order to justify the importance of the realized of this empirical study.

#### **5. Conclusions**

Communication is one of the most important activities in an organization (Harris and Nelson, 2009:67). Fundamentally, relationships grow out of communication, and operation and survival of organizations is based on effective relationships between individuals and groups.

Internal organizational communication, seen as a set of procedures and organized communication exchanges, participates in the construction of numerous definitions of problematic situations underlying the understanding and behavior of employees. Communication does not take place in a sterile and isolated environment therefore it is directly influenced by the personality of the individual / individuals that make up the organizational internal environment, in this case, the organizational behavior.

Related to the organizational behavior, we are interested, in particular, in the attitude toward work, respectively employee satisfaction and the link between it and organizational performance. Thus, through the attitude at the work place we can see how an individual reacts to typical situations described by a work task. Personality as a whole rarely offer clues about potential of performance, however proactive attitude towards work causes high levels of performance. It is not always easy to change a person's attitude about work. Attitudes towards work are only a component of the attitudes of a person. These attitudes may be linked and correlated with several other attitudes, which makes difficult for managers to change the feelings and actions of employees. However, attitudes / behavior and job satisfaction may change and sometimes that happens fairly quickly, with the events.

The organizational behavior covers a wide range of activities: knowledge and satisfaction of employee needs, understanding group dynamics, accepting and respecting the differences between people of different cultural values with which they

come into the organization and many other skills, activities and management practices.

To the extent that organizational behavior can be predicted or explained, it can be controlled or managed. Knowledge about organizational behavior helps to better understand oneself and other people in a context mainly related to work. They can also extend the personal potential for success in careers while the jobs are becoming more dynamic, complex and interesting. The study of organizational behavior doesn't produce guiding principles but rather a series of statements whose explanation depends on the situation.

In conclusion, we can state the following: knowledge of personality traits involved in work activities is necessary to determine the agreement between the person and work, how far individuals respond to the work activity, and the consequences of their deviations from rules have on work process. In the professional success there are involved a number of individual personality traits, communication styles, types of interaction and the type of organizational behavior approached, all of this putting their mark on the efficiency and productivity at work.

The success, performance and competitiveness of any organization depend largely on the content and quality of management, on the type of organizational communication / management because, as stated by many experts, the competitive advantage of an organization lies in its people.

# THE MEASUREMENT AND EVALUATION OF THE INTERNAL COMMUNICATION PROCESS IN PROJECT MANAGEMENT

**Pop Alexandra-Mihaela, Dumitrascu D. Danut**

*“Lucian Blaga” University department of Industrial Engineering and Management, Sibiu, Romania*

*alexandrapop\_6@yahoo.com*

*dumitrascud@asconet.ro*

**Abstract:** *Internal communication is among one of the most important factors for success in project management. It helps the project managers take correct decisions, implement the right strategies and finish a project on time and within budget. Measuring internal communication and keeping track of its development is a crucial asset that a manager should possess so that the project deliverables are handed out correctly. In this paper our goals are to illustrate how important internal communication is in a project and also to create an analysis model of internal communication in projects based on characteristics of communication. We developed the ICAM model based on a systemic approach with inputs – a processing box – outputs. For the inputs we used the communication characteristics data that we obtained from the questionnaires and the interviews which were later structured in a communication instance relationship. Each communication instance reflects through its attributes the characteristics of internal communication in a project. Processing this information is done by using the data mining tool called Weka. In the data processing stage classification, decision tree classification algorithms were used and also algorithms from the Naïve Bayes belief networks. Applying these algorithms in the model facilitates the interpreting and analysis of the communication characteristics in a project. The outputs of the model consist of summarized representations of the communication characteristics such as: texts, diagrams graphics, tables. These outputs of the model, as a result of the processing helps us in obtaining practical conclusions related to the improvement of project communication, for the successful completion of projects.*

*The model is a useful tool for improving the internal communication process of a project and help the project raise its efficiency. It has been created based on the characteristics of the information flow within a project. Also the Internal Communication Analysis Model – ICAM – helps improve the projects’ deliverables by making sure that everyone in the project understood their roles correctly.*

**Keywords:** project management, internal communication, modelling.

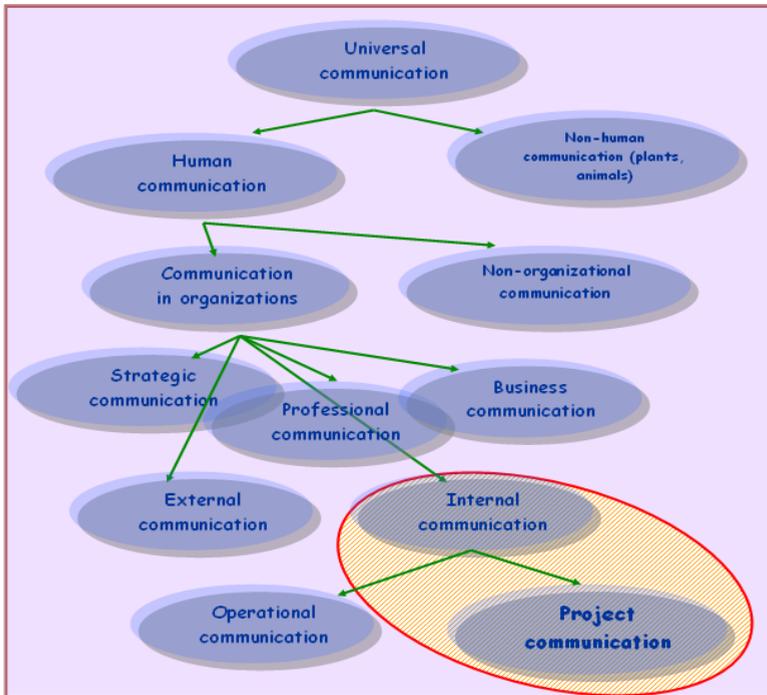

**JEL classification:** C11, C15, M14.

## **1. The communication process as a part of project management**

Communication is a central feature of the human endeavours. Being a good communicator as a project manager assures, in the end, the successful completion of the project. If the communication process is a poor one, it can lead to differences in expectations, meaning in terms of what needs to be delivered at the end of the project, people being unprepared when changes occur, not knowing in-depth information about the status of the project and team members not knowing what is

expected from them. Because the project climate is an ever-changing one, the project manager must always be up-to-date with everything that is involved in the project. Communication is the common thread that holds the project together and keeps it from falling apart. (Kliem 2008)

If attention is paid on the outcome quality of the project then a well glued together communication process must be established. Since the project manager is the leader, he is responsible for maintaining the communication flow going. The manager is the main link between the project team and the exterior of the project. So his role should be the one of a facilitator in the internal communication process. Internal communication lays the foundation of proper functioning for the entire project by promoting its identity. Also internal communication is a way to solve the need of the project members of belonging to a group and also a way of implementing managerial strategy. Studying internal communication in a project means establishing methods and techniques of organizing the communication flow in the process of project management to achieve optimal results from its activities and tasks. The inheritance of the communication characteristics is illustrated by the conceptual hierarchy in figure 1.

**Figure 1:** Communication paradigm: conceptual hierarchy.

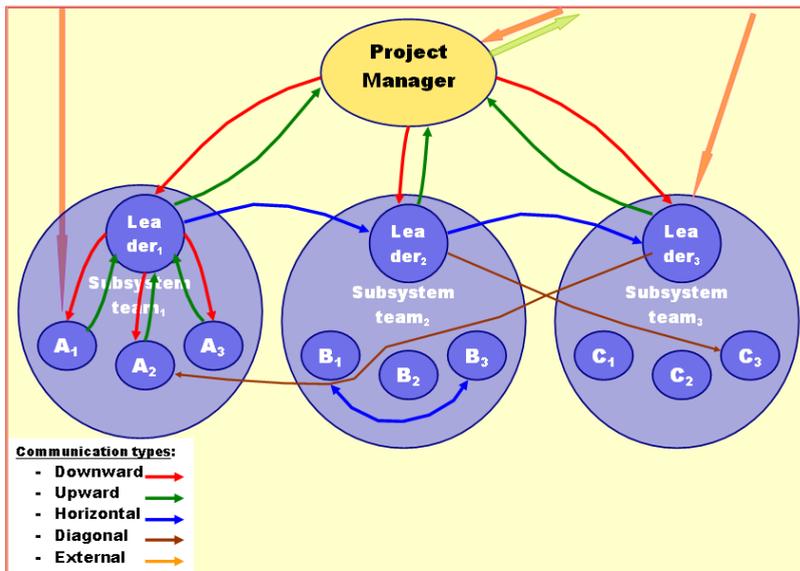

Source : Pop A-M (2013) An analysis model of the communication features in research project management.

By analyzing the work breakdown structure of the project we can determine the direction of the communication flow among the components of the project. Usually there are five ways in which information can flow in a project: top-down, down-top, horizontal, on diagonal and with the exterior. (Kerzner 2010)

Information flowing from top to bottom is part of the communication that takes place between management (the manager) to team members. This communication flow is used by managers to convey information to the team member about work. Team members need this information in order to complete their tasks successfully. The down-top flow of communication serves the following purposes:

- Gives feedback on performance from team members.
- Provides instructions for correctly performing the project tasks.
- It communicates the mission and the vision of the project to the team members.

It provides detailed and complete information about the team members' job description.

**Figure 2.** Information flow in a project

Source: Pop A-M. (2012) 2-th Report of Doctoral theses Contributions towards communication management in projects, Sibiu, Romania, November, 2012.

The communication flow from team members to managers is called „down-top” communication. This flow provides feedback on how well the project is evolving and also through this type of flow, members can express their own views and report their performances to their managers. A „down-top” communication that works well allows the team members to participate in the decision-making process and can create much better communication channels between the two parties.

Internal communication analysis is also directly influenced by the development model of the project. There are several approaches to the development model of a project. Figure 3 illustrates the main approaches used most often in project management.

The approach based on the life cycle phases includes project tracking and communication in this type of model is maintained at an average level. As the models become more and more complex, the internal communication process becomes increasingly more pronounced because their steps requires closer collaboration

between project members. The highest level in internal communication is achieved in the agile model. This is because the very essence of this model is the existence of a strong communication process between team members.

For a very thorough analysis of internal communication we can establish different classifications based on criteria chosen in relation with the characteristics of internal communication. (Stoica 2011)

This classification of internal communication in project management provides a relevant ranking of its characteristics, which will be analysed using a model presented in section three of this paper.

	<i>Phased</i>	<i>Iterative</i>	<i>Incremental</i>	<i>Agile</i>
<i>Methodological characteristics</i>	A traditional phased approach identifies a sequence of steps. Typical development phases: initiation, planning and design, execution and construction, monitoring and controlling systems, completion. Some projects do not follow a structured planning and/or monitoring process, and some projects will go steps 2, 3 and 4 multiple times.	Is a repeatable, practical and proactive methodology that ensures project success while decreasing an organization's negative environmental impact. The methodology encompasses the management, control and organization of a project with consideration and emphasis beyond the project life-cycle and on the five aspects of sustainability.	Is a methodology of planning and managing project execution designed to deal with uncertainties inherent in managing projects, while taking into consideration limited availability of resources (physical, human skills, as well as management & support capacity) needed to execute projects. In multi-project environments, resource should be performed across projects.	Agile project management approaches based on the principles of human interaction management are founded on a process view of human collaboration and a strong communication.

## 2. Methods of measuring internal communication in projects

Finding the right methods for project communication is a challenge for the project manager. Project metrics have the role of informing both the stakeholders and the project members on the status of the project throughout its development. Also based on metrics, the project manager may determine the validity or invalidity of an action that must be undertaken (Kerzner 2011). Measuring communication is a fairly new concept with which managers increase efficiency in a project and cause a positive result. The complexity of the communication process in a project cannot be fully understood unless the process is measured one way or another. Therefore, if there are ways to measure communication in a project this confirms that an active communication process exists in that project. Metrics can be used for tracking performance even related to the organization's objectives, as shown in figure 4.

One method of measuring the communication process is the chosen by Angela Sinickas. As far as communication within organisations is concerned, one of the most used methods of evaluating communication performance is calculating the Return of Investment (ROI). The formula used for this is the ratio between gain minus cost and cost:

$$ROI = \frac{Gain - Cost}{Cost} \quad (1)$$

Sinickas argues that the Return of Investment method (1) can also be used in projects for measuring the communication process. In order to receive an accurate information about the ROI in communication we must divide the communication cost to the net value and the result is an approximation of the ROI. With the help of surveys, the project manager, who is the communication facilitator, can track down what impact different communications has on project members decisions with a cost impact on the project itself. When calculating the ROI in communication, the difficult part is finding out what is the role of communication in helping the project to reach the desired outcome (Sinickas, 2007).

**Figure 4.** The debriefing pyramid.  
Source: Kerzner, 2011.

To prepare the questionnaires and interviews we used the classification summaries of the communication characteristics presented in the first section. Formulating the questions from the interviews and questionnaires was based on several rules to ensure that the answers are directly related to the problem in question. We formulated the questions based on two principles enunciated by the communications expert Angela Sinickas (Sinickas, 2007):

- Questions must be raised to the point and ambiguous questions are to be avoided.
- We must use questions whose answers are more detailed so that the questionnaire is relevant to the sample studied.

In gathering the information that best describes the communication features in project we took into account the Likert scale with five gradations to express the intensity of the staff's agreement.(Jamieson 2004). In order to capture the information as faithfully as possible we determined that the five nominal graded responses on the Likert scale will be: Never, Seldom, Sometimes, Often, Always.

These nominal values that we obtained will be discretized on a numeric scale from 1 to 5. A reliable interpretation of the data accuracy will be done by using the Weka analysis tool and several classification and clustering algorithms from Machine Learning. In order to process the information at a performance level several abstract models will be created which will serve for efficient analyzes and interpretations in communications management within projects. In this paper we present a model designed for the analysis and interpretation of the communication characteristics based on the criteria called „communication flow in a project”.

The data collection methods used were the questionnaires and the interviews. Then data is entered on spreadsheets which will be later summarized on communication characteristic categories and coded so that they can be pre-processed with the Weka tool (Weka-3.7.8 2013).

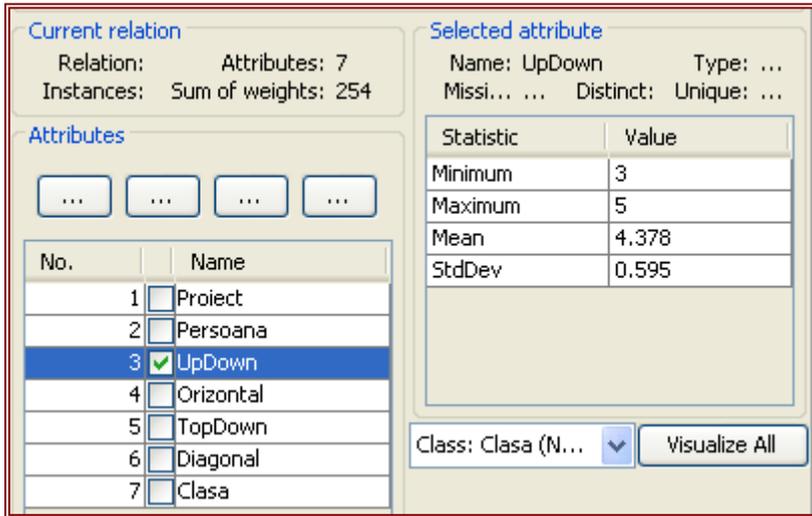

### 3. A model of analysing internal communication in projects

The Internal Communication Analysis Model (ICAM - Internal Communication Analysis Model) was created with the help of the data mining development tool Weka from Waikato University in Prinston, New Zeland. Once the data measured in internal communication was collected from all the 96 projects, it was structured as input data for the ICAM model in a communication relation which includes 254 communication instances. In the structure of this relation, 7 attributes of communication were selected for the analysis which express the same number of communication features from the research project surveyed in universities and research organizations. The criteria followed in analysing internal communication in projects was the one that expresses „the communication flow in projects”. Table 1 presents these features together with the values that were surveyed.

**Table 1.** Communication stream characteristics.

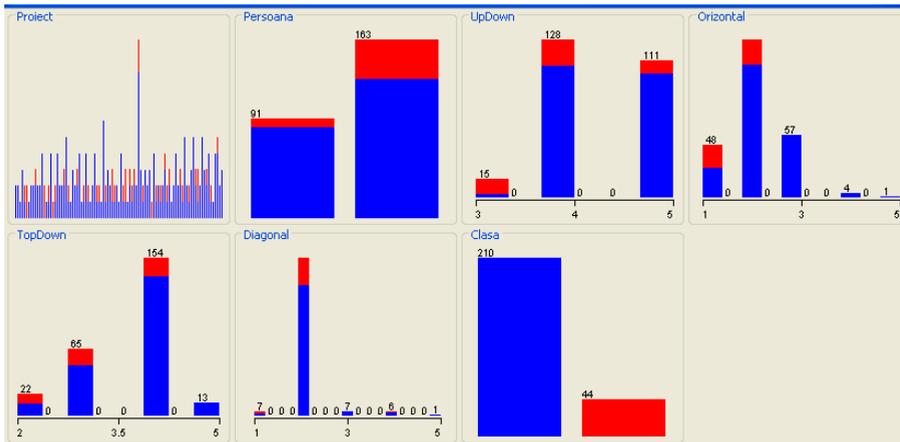

Code	Characteritics	Probabilistic Values
<b>Fl</b>	Communication stream	Likert Scale: Nominal = (Always, Frequently, Sometimes, Rarely, Never) Numeric = (5, 4, 3, 2, 1)
<b>Flsj</b>	TopDown	
<b>Fljs</b>	UpDown	
<b>Flo</b>	Horizontal	
<b>Flt</b>	Transversal	

The seven input attributes for the ICAM model are presented in figure 5. Here we have an attribute that identifies the project investigated „Pnn”, where nn=number of the project. The attribute „Person” has two nominal values: Manager and Member (team member or stakeholder or an expert). The TopDown, UpDown, Horizontal and Transversal attributes express the direction and the way of the communication process in a project and their values were numerically discretized to the {1, 2, 3, 4, 5} set. The last communication attribute is called Class and its role is to help the model clarify internal communication. It has the nominal values {yes, no} where the yes values is assigned to an instance if the average number of communication numeric values is more than 3. If not the value of the class is no. Figure 5 illustrates statistical values for the 7 communication attributes (minimum, maximum, average, standard deviation).

**Figure 5.** Statistical values for 7 communication attributes  
 Source: MIFC Application in Weka-3.7.8 (2013).

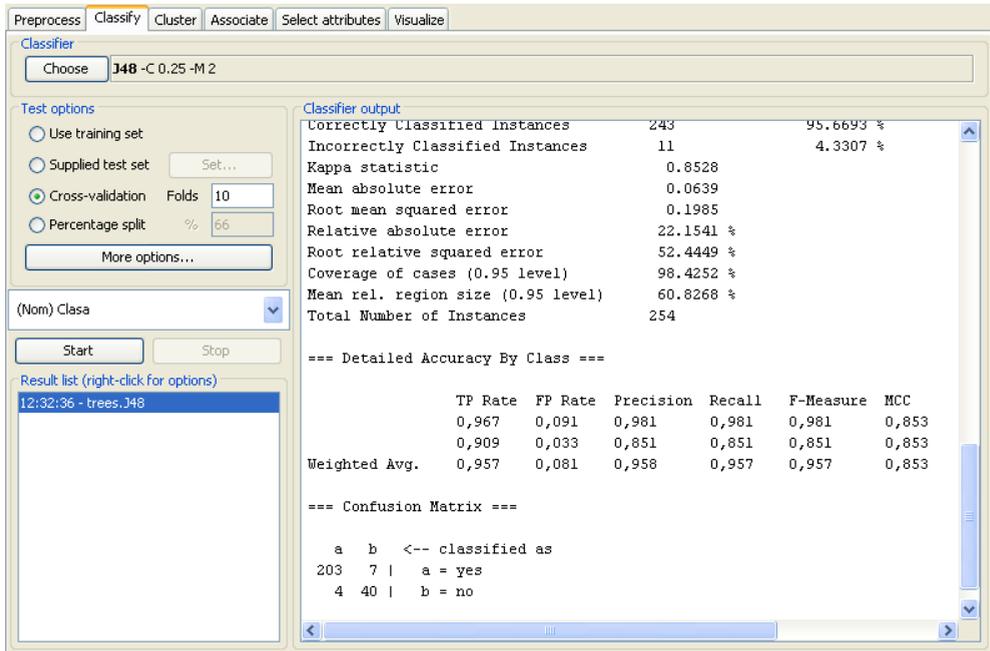

Figure 6 presents graphically the pre-processed statistics of the communication instances from ICAM input relation.

**Figure 6.** Statistic graphics of the internal communication.  
 Source: MIFC Application in Weka-3.7.8 (2013).

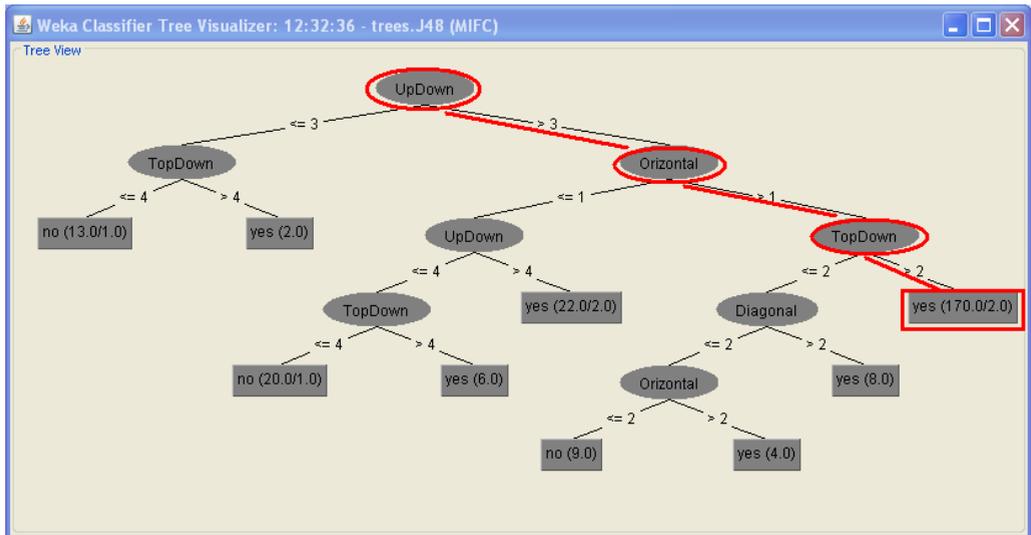

The ICAM model has various classifications for the communication characteristics which are applied by various algorithmic methods in Machine Learning. For example in figure 7 we have a textual result of a classification instance after using the J48 „Decision Tree” method. In the text resulting from this classification we presented some statistics regarding the correctness and the accuracy of the communication characteristics classification. Also, here, we presented the „Confusion Matrix” with numerical elements which indicates the number of THRU communication instances

on diagonal (for example, an instance is „a” and it was predicted as being „a”). The other elements are false.

**Figure 7.** The textual result of the J48 classification  
Source: MIFC Application in Weka-3.7.8 (2013)

Figure 8 illustrates the decision diagram resulting from the communication instances classification with the help of the J48 algorithm. From this classification tree we can highlight several decision rules in the communication flow. The most powerful classification rule of the communication characteristics is marked with red in the diagram from figure 8. This route has as a starting point the attribute node „UpDown” and follows the decision test „Valoare comunicare” > 3, which leads to the Horizontal attribute node, then passes through the decision test „Valoare comunicare” > 1 which leads to the attribute node TopDown. Further, passing through the „Valoare comunicare” > 2 test we reach a final communication characteristics class with 170 classified instances, from which 2 are incorrectly classified here. By interpreting this route in classifying communication instances we can say that this rule is the most efficient way in which we can use the communication characteristics of project management. The other routes from the classification tree are less important for this model, but maybe in another context we can identify other relevant routes for the characteristics of internal communication.

**Figure 8.** The decision tree diagram in the J48 classification of the communication characteristics.

#### 4 Conclusions

Measuring internal communication helps in quantifying, analysing and evaluating its value for a more efficient management of the project's tasks. Also by analysing the communication process project managers and project portfolio managers can effectively manage the projects' resources.

The ICAM model is a useful tool for performing retrospective analyses of the characteristics of internal communication. With the help of this model we can obtain several interpretations of the characteristics of project communications which help improve the communication process and also the project management process.

The model has the possibility to provide a consistent series of communication analysis tools through different classifications and clustering of the communication instances. The deliverables obtained after applying the model on the questioned data can be presented as graphics, diagrams and statistic summaries that establish the accuracy and efficiency of internal communication in projects.

**Abstract:** *For developing economies the development of enterprises should be a strategic goal, this way of thinking may become viable only as a result of a combination of judicious analysis based on specific local economic aspects and a set of actions to correct any slippage or amplify existing development trends taken by the managers. A better leadership would unequivocally lead to a better strategy but sometimes the lack of information, first about the external environment, continuously undergoing quick and radical changes, the political problems and the complexity of the implementation of the strategy or the costs that it implies are not taken into consideration. Therefore managers have two options: to establish strategies, which would lead to the achievement of the objectives; evaluate them on the basis of economic efficiency or to identify an already existent strategy and to adapt it to the environment changes in which the enterprise carries on its activity. This paper aims at discussing and explaining from a theoretical perspective, the evolution and the advantages and disadvantages of the strategic management process, in order to convey the managers a modality to achieve competitiveness and evaluate the position of the firm. In the first section, we explain the the necessity of strategic management process. In the second section we present the different evolution stages. The third section presents our conclusions regarding the advantages and disadvantages of the strategic management process, fundamental for the strategy success. The financial crisis did affect the Romanian economy and Romanian enterprises early in 2009 registering an impact of the crisis identified in the need of the managers to rethink their strategies, to improve their management skills and perspectives on the role of the employees after the crisis. In this paper we try to underline the evolution stages of the strategic management process with its own characteristics by which both Romanian or foreign managers can evaluate the position of their enterprise and can take improvement measures, which may help sustain or gain competitiveness that has been affected by the crisis.*

## 1. Introduction

With the works of Meyer and Heppard, McGrath and MacMillan, in 2000 began the integration of two research fields and namely that of entrepreneurship and strategic management. This integration appears as a necessity because the entrepreneurs needed a more rigorous perspective over their strategic planning for the purpose of profiting well from market opportunities under conditions of uncertainty (Kraus, Kauranen & Reschke, 2011:59). Just at the beginning of 80s two prolific authors in the field, Schendel and Hofer argued that strategic management can be seen as a process. It is interesting that this process relied on the entrepreneurial work which is in any enterprise and it is aiming to adapt the enterprise` s operations with the necessity of its development and renewal; but we will discuss these in the next chapter. That is why we will observe the use of strategic management concepts at entrepreneurship level in the specialized literature (Covin & Slevin, 1991).

## 2. The evolution of strategic management

Paitsch condenses this evolutionary process into four phases. Phase 1 contains financial planning which was focused on the enterprise budgets achieved annually. The operative control was aiming to improve the economic result by combining efficiently the production factors (Peitsch, 2005:48). Grant positions this phase between 50s and 60s. Wheelen and Hunger consider this phase contains a basic financial planning, in which information focuses on the ideas provided by the sales department requiring sometimes much time on gathering useful information, and the planning horizon is usually 1 year (Wheelen and Hunger, 2010:5).

Passing to a new phase, the second one, is called forecast-based planning (Istocescu, 2005:66), the managers relied on the budgets from different years and on the environment analysis to achieve allotting the resources. The economic forecast from the 60s was on short-term, the planning within the enterprise being formal; it desired diversification and synergy achievement by creating special departments for planning (Grant, 2010:17). The planning horizon is this time longer, namely from three to five years because the managers already take into consideration projects that last more than a year (Wheelen & Hunger, 2010:5).

**Figure 1:** The evolution of strategic management

Source: Grant, 2010:17

In the third phase the planning is the outcome of more careful analysis of competitive environment and was as a response to the speed-up in technical changes and different circumstantial cycles, the implementation and control being considered as subsidiary activities (Peitsch, 2005:48). At the same time the different strategic alternatives are taken into consideration, they were emphasized by the achievement of strategic portfolio, of PIMS analysis that was aimed at evaluating the changes that appeared in competitive position of the enterprise or introducing market segmentation strategies. Being dissatisfied with what they have done so far with the achieved planning, the managers call on consultants; they can offer sophisticated and innovative techniques (Wheelen & Hunger, 2010:5). It can be understood why in this period appears two specialized magazines as: "Strategic management Journal" and "Journal of Business Strategy".

In the 1990s the strategic management triggers a search for the achievement of a competitive advantage by using the resources and competencies, the maximization of the shareholders' s value, reorganization and alliances. The managers' suggestions and engagement from the lowest level is invaluable even if it is not aiming to forecast in the future but especially to achieve urgent strategies for probable scenarios (Wheelen & Hunger, 2010:6). Strategic innovation, new business models and destructive technologies introduced as a notion by Clayton M. Christensen, professor from Harvard Business School to emphasize the new innovations, are defining elements of the strategy for the New Economics considered as being the third industrial revolution. The new millennium which marks the fourth phase is characterized by a strategic management which relies on CSR and ethics in business, the achievement of standards and the application of global strategies (Grant, 2010:17). Thus the new directions of strategic management can be summed-up beginning with the year 2000, period in which only a certitude remained namely that some economies even thriving, have a quite raised indebted level for a peace period (Grant, 2010:457). General Electric can be regarded as an enterprise which fulfilled successfully the pioneer role of strategic management passing through all these phases in the 80s (Wheelen & Hunger, 2010:6).

The main stages of strategic management process are the formulation, implementation and evaluation of the strategy (Barney, Hesterly & Hesterly, 2010:6). Understood as a process, the strategic management is thus a series of stages which do not necessarily present a linear sequence but it rather points out certain interdependences between stages and according to Japanese models they overlap (Raps, 2008:24). These stages start from the formulation of strategy, then contain all the concrete actions to achieve it and they develop until the final evaluation. Although in the case in which the outcome of this process is excellent, it is important that the companies are not satisfied with (David, 2011:288).

The evaluation phase is the end of the strategy process and at the same time it is also the basis for the next stages (Barney, Hesterly & Hesterly, 2010:6). The distinction between them is made more in didactic and analytical aim (Raps, 2008:15). The evaluation consists of a process to question all decisions at all the levels within the enterprise. It can be extremely risky to wait to the end of the year to achieve this stage (David, 2011:290). The stages proposed by Barney, Hesterly and Hesterly will be discussed further on.

An alternative to this classification presented above is offered for example by Welge and Al-lea Laham (2008: 185-187) and by Borza et al. (2009). These authors consider

that the next phases represent the basic components of the strategic management process: the planning of strategic objectives, the strategic analysis of external environment and of the enterprise and prognosis, strategy elaboration and its evaluation, the implementation of the strategy and its control.

Strategy formulation, according to Popa must be rigorous, (Popa, 2004: 60) contains first the development of a vision and mission. It is equally important to identify the opportunities or the dangers from the enterprise external environment as well as to establish the strong and weak internal points (Barney, Hesterly & Hesterly, 2010:6). We identify a similitude with the SWOT analysis. Although, according to Grant this model is very widespread, the classification in four determinant factors of an enterprise strategy is not quite correct. The first two categories characterize the external environment and the other the internal environment (Ilieş et al., 2005:99). Grant questions the division of internal factors in strong and weak points giving Steve Jobs as example, the founder of Apple who suffers pancreas cancer. Taking these aspects into consideration, the question that can be put is how Steve Jobs can be viewed as a strong point of the company or a weak one? Another example would be the effects that global warming has over the auto industry. It can encourage the states government to raise taxes supporting public transport and disadvantaging private transport but on the other hand enabling the apparition of new types of car (Grant, 2010:12). The central elements would be fixing the enterprise long-term objectives and also offering alternative strategies from which the enterprise benefits a lot. The concepts about strategy start from the presupposition that the formulation of strategy is ambiguous, it must be changed into a precise idea about how to redirect the organizational conduct (Jäger, & Beye, 2010:97).

The formulation of strategy as a starting point for strategic management (Kaplan & Norton, 2004:5) approaches problems as to enter the international market, to allocate favourably the limited resources, to analyze the potential mergers or formation of joint venture and sometimes even to avoid an hostile taking- over. Having the best perspective over the enterprise, the manager is the only one who has the authority and capacity to evaluate the consequences and the major ramifications that any strategic decision might have.

According to Hart there are five typologies for the formulation of strategy identifying different models used at many management levels. Within the authoritative model, the formulation is made by a strong leader supported by a few from his top managers. The others within the enterprise are only good "soldiers", merely executors. The enterprise environment is not complicated and the organizational structure must be simple to enable keeping an efficient control (Brown, 2004:213).

There are three kinds of programmes for strategy implementation (Lynch, 2009:492). The complex implementation programmes are used when the enterprise must achieve major changes in the strategic direction that must be followed. A tight coordination is essential to succeed in leading by new strategies, because surely they will confront with a serious resistance. If for example the environment in which the enterprise carries its activity is uncertain or the research results are doubtful, then the gradual implementation programmes will be used. In this case the strategic approach is flexible, the calendars, tasks and even the objectives can be changed in compliance with the current events; it may be even the possibility of leaving aside some strategic fields. In case in which after an analysis it reaches to the conclusion that none of the two types of implementation mentioned above is the best way to

follow, then programmes for selective implementation will be applied in which only a major programme is elaborated but only in certain fields.

According to the traditional approach of strategic management the formulation of strategy relies exclusively on situational analysis of external and internal environment (Grant, 2010:26) being in our view rather a consequence of this. Resources-based vision implies a careful analysis of the enterprises resources and abilities. In contrast, according to stakeholders vision the formulation of strategy must be achieved in compliance with those rights and expectancies (Bordean, 2010:14).

The next stage approaches the way in which the strategy is implemented and includes the development of organizational cultures and it is aiming to support the strategy by organizational structure, redirecting marketing efforts, the preparation of the budgets, the development and use of informatics systems and the correlation of compensation system with the organizational performance (Barney, Hesterly & Hesterly, 2010:6). According to Popa the implementation must be systematic and effective (Popa, 2004:60) because it is aiming to change an already existent stage in a desired one (Raps, 2008:27). Two distinct models emerge in the specialized literature to examine the implementation of strategy: descriptive models which only present the process and activities-based models namely how the process of implementation ought to be proceeded (Tapinos, Dyson, & Meadows, 2008:3).

The dynamics renders well the main feature of this stage because the employees mobilization is needed to implement an already established strategy and discipline, engagement, sacrifice is also needed. Thus, in our view strategies that cannot be implemented is not viable and according to Lynch not even the paper in which it was written values (Lynch, 2009:13). The difficulty of this stage is the attempt to implement, to put into practice a new idea in a system which already is within the enterprise (Raps, 2008:27). Thus the specialized literature concerns more to discover why the implementation was successful in one organization and in the other was not.

In Germany the implementation stage fell into place at the same time with the evolution of information systems simultaneously emphasizing the necessity to introduce new rules within the enterprise (Raps, 2008:27). Implementing the strategy could be more important than selecting it to explain the effect over the performance (Leitner & Güldeberg, 2010:176).

Concerning the importance of the link between strategy and its implementation, this was synthesized by Raps after studying many authors from the field in the following table. If for example the quality of strategy implementation is as inferior as the strategy then the outcome will be unequivocally a completely failure. If the strategy is very good and its implementation leaves much to be desired, then for the enterprise will be unfortunately a failed chance.

**Table 1:** The importance of link between strategy and its implementation

Strategy	of inferior quality	of superior quality
the implementation of an inferior quality strategy	failure	a failed chance
The implementation of a superior quality strategy	preventable danger	successful

Source: Raps, 2008:27

The final stage of the strategic management process is the evaluation of the strategy by which the validity of a strategy is tested and then modified due to the ongoing changes of the enterprise environment. There are three elementary strategies of evaluation: the re-evaluation of internal and external factors which were the basis for the present strategies, the measuring of the performances and taking corrective actions. The re-evaluation is necessary because a strategy which now is successful, it may not be successful in the future. All the three stages of the strategic management process will be implemented on all the enterprise hierarchical levels. In this way the communication and interaction of all those implied has a vital role (Lynch, 2009:13). Pettigrew and Whipp` researches pointed out the formulation and implementation of strategy must not be viewed as two distinct stages and rather as being part of an ongoing experimental and repetitive process (Lynch, 2009:493). Although this should be the tendency towards the managers ought to turn their attention many times there are major differences between what have been formulated and what was really implemented. Norton and Russel identified a solution to this problem by introducing "a strategic management office", three primary functions of this would be the achievement of strategic management framework that will contain the leadership convention and the proper process. The second function is to appoint the responsible person for this whole strategic and essential process of reference to the stage of its implementation. The third function is that of coordinator or consultant together with other departments such as the IT assuring the operation (Norton & Russel, 2011:8). The process of strategy revision must be redefined annually, Norton being one of the prolific authors in this field. Norton proposed six stages of strategic management process. The first stage contains the development of strategy; it contains a clear formulation of the enterprise vision. In the second stage the strategy is expressed from a more general form to specific objectives, initiatives and budgets and the quantification passes from strategy to action (Norton, 2010:3).

An alignment of the organization is in the third stage. By this it can be understood the achievement of an ongoing adjustment between strategy and objectives at department level. This alignment must take place not only internally but also externally with the enterprise partners and clients. The fourth stage links strategy and operations. If, for example, the next strategic objective establishes a diminution of the cycle of a product development by 50%, it cannot be achieved if someone does not realize how to reorganize the product development process. The strategic management process is increasingly decentralized, it is recognized the fact that the planning must be at the lowest levels. So did Dusney, allotting this process to the division. It must be emphasized this process is one of learning, helping, educating and supporting and it truly has positive effects over the enterprise performance (David, 2011:16). We could not affirm that in reality within the enterprises this strategic management process is as clearly divided and its development takes place in the arrangement proposed by diverse authors. Many enterprises organize formal meetings to discuss again the vision, mission, strategies, performance, objectives and the politics encouraging the creativity of its own employees because without communication and appropriate feedback this process cannot work at optimum parameters (David, 2011: 16).

### 3. Conclusions

The advantages of the strategic management application within the enterprises are summed up offering new clearer visions over the enterprise and a clearer focus over what it is important from a strategic point of view (Wheelen & Hunger, 2010:6). But David offers new perspectives. In his opinion the communication is improved by an ongoing dialogue and a participation of the employees at taking decisions. By profound understanding he refers to both the opinions of the others and the enterprise situation and also to the reason for which it is planned. A bigger engagement is absolutely necessary to achieve the objectives, to implement the strategies and an assiduous work. The expected outcome is that both the managers and employees have as a task the enterprise success (David, 2011:16) receiving an award for this. It must also be mentioned the positive psychological impact by reducing the conflicts from the enterprise interior due to satisfy the need of stability of each individual by planning of the future (Popa, 2002:45).

Other advantages would sum up to a systematization of the most important decisions that would facilitate the managers attempt to improve developing them simultaneously the thinking regarding the management and the development of managerial attitudes (Popa, 2002:46).

The disadvantages of strategic management can be reflected by an obvious feature, according to our opinion, and namely that it is an expensive process either we measure it from a financial point of view by using market analyses, special software programs or the need of appellation at a consulting firm; from the work force point of view because the specialization in different fields and its reallocation will have to take place, sometimes even its excessive solicitation; from the time allotted point of view (Istocescu, 2005:48) because for example an owner will have to look after not only the daily activities but also the strategic ones; from human or psychological point of view because the strategy formulation, implementation and control does not sum up only to follow some steps and to know the enterprise internal and external resources but also to admit your own limitations or drawbacks and to know when it is the moment to withdraw or to delegate or to ask help of a third person.

A consensus within the strategic management hardly can be reached (Nag, Hambrick & Chen, 2007:935), because it includes fields such as the sociology, psychology and economics (Mazzarol & Reboud, 2009:150). We can however affirm the academic environment had a serious contribution in providing many ways of thinking over the strategy and implicitly over strategic management. But we think that the collaboration with the business environment was extremely profitable, more than in any other field, the contribution being unquestionable because it led to the evolution of methods to implement the strategy.

# CLUSTER POLICIES IN THE EUROPEAN UNION – ENGINES FOR SUSTAINABLE ECONOMIC DEVELOPMENT AND COMPETITIVENESS

**Popa Ion, Vlășceanu Cristina**

*The Bucharest University of Economic Studies, Romania*

*iipopa@yahoo.com*

*crysthina2003@yahoo.com*

**Abstract:** *The present article wishes to present the topic of clusters and cluster policies, to highlight their status and role in the European Union and to underline their significant purpose in obtaining a sustainable economic development, and in making a more competitive and well oiled Europe. The research for this article is part of a greater goal – that of getting the answer to the question: What are clusters what and how can “they” better the performance of the regions that are part of the member states of the European Union? To do that, an inquiry into the issue was necessary, by analyzing information from multiple data sources and by drawing some conclusions, based on those informations. The conducted research was empirical, and in order to better highlight the relationship between clusters, cluster policies and economic development, a synthesis of different case studies and statistical data were used. The conclusion that was found was that strong cluster portfolios are related to (and thrive in) developed countries, but interestingly enough, relationship can also be reversed (meaning that clusters cause the region they exist in to increase its performance). Also, clusters are highly prevalent from a geographical point of view, the existence of which can be seen globally, of course in different stages of development. And last, but not least, from the standpoint of national cluster policies, although all countries have programs for clusters either at national or regional level, which varies from country to country is the number and type of ministries that are responsible for implementing cluster policies. Also another factor that varies is the importance given to cluster policies. However an issue that is becoming increasingly clear is that the cluster policy is becoming more important and relevant. Therefore, the hypothesis was confirmed, there is a direct correlation between clusters, cluster policies and sustainable economic development and competitiveness.*

**Keywords:** *clusters, cluster policies, economic development, European Community instruments*

**JEL classification:** *F63, O1, I15*

## **1. Introduction**

In recent years the clusters based concepts have been used increasingly more often as a tool to strengthen regional economies.

Many Europeans are concerned that their levels of prosperity, productivity and innovation can not keep up with those from the U.S., but also with competitors from other parts of the world, including Asia. The fact that the European regions have clusters and cluster portfolios weaker than other regions outside Europe, could be an important factor that will pull Europe back when it comes to global competition.

European regions have seen an improvement in overall economic performance, due to the presence of strong portfolio of clusters and this is accentuated in some regions by supporting cluster development policies by the European Commission in the European Member States, but also at national and regional level within individual countries.

### **1.1. Background**

As the current EU countries were integrated, they tried to develop plans and strategies that have the common interest issues related to globalization of trade, sustainable regional and social development, interests in areas such as research, innovation, economic growth and of jobs, heavily tested by the economic and financial crisis.

All of the EU legal frameworks aimed at facilitating a social and economic environment favorable to the requirements of its citizens in order to transition well over imminent challenges of the present context - as well as the main objective being sustainable economic development, and competitiveness.

Through the global crisis, economic and industrial zones have been relocated and consequently jobs were disrupted. Although Europe concentrates on her vital area, it is also facing many of the effects of globalization (outside areas of military conflict, epidemics, outbreaks of riots, famine, the dynamic economy of the Asian market), taking into consideration the essentiality of improving its competitiveness. A real challenge is really the adaptation of Member States - especially of the latest ones, on the go to these challenges. To these, also contributes sustainable economic development plans for individual countries; supporting and developing clusters being able to assist in this regard.

Through the integration of as many countries of the European continent, in the European Union began to appear new challenges in many areas. The complexity of these new challenges is amplified by a large and diverse range of economic, social and political issues that EU economies have been based on. By establishing joint strategies at all levels, the EU must take into account a bonding and a versatile strategic partnership both with Russia, China, USA and other countries around the world, this having an important role on the global stage.

### **1.2. Theoretical framework**

Clusters are part of a broader conceptual framework of understanding, respectively as influencing factors (stimulus) of regional and national competitiveness. This framework was developed by Michael E. Porter (1990) in his book "The Competitive Advantage of Nations". According to M. Porter environments for growing and innovative clusters are usually led by a strong "diamond", which includes:

- intense local rivalry - including famous battles that stimulates continuous improvement that creates a more advanced and diverse base of suppliers;
- Dynamic Competition - arising from the entry of new firms;
- intense cooperation - collaboration organized by various institutions, such as professional organizations, chambers of commerce, cluster initiatives; (Solvell et. al., 2003)
- Access to more specialized and advanced production factors (human capital, financial capital, infrastructure) and for more clusters, links with

- universities and public and private research institutions;
- Links to related industries, sharing talents and new common technological advances;
- Proximity to sophisticated customers and with needs.

Among the important terms related to the support and help of clusters are to be found:

- Politics - strategic intentions of a government, listed in a certain document, must set the political objectives and provide reasons why these activities are important in that direction.
- Schedule - switching from intention to action, involving allocation of funds, creating organizational responsibilities and defining the specific conditions under which funding is available.
- Implementing Agency (government agency or ministry) - is responsible for the program implementation

There are 3 types of cluster policies. Cluster development policy - directed towards the creation, mobilization and empowerment (strengthening) of a given cluster (e.g. national funding competition for the best strategies for "life science" clusters). These are actual cluster policies. Policies for clusters influencing - use a cluster to increase the efficiency of a particular instrument (traditional) (OECD, 2007). These are represented by industrial policies, SME policies, innovation and research policies or regional policies.

## **2. Cluster development strategies, projects and policies in the European Union**

EU-10 - the countries which joined on 1 May 2004 - differs in a large proportion from the EU-15 and EU-27 in terms of multiple factors related to business conditions. Instead, all were affected by barriers at the efficient geographic allocation of economic activities.

„To improve the innovative capacity of Europe, in particular, will not be sufficient for more resources for science and for research and development; there is a need to focus on the microeconomic capacity of European regions: the quality and specialization of factor conditions, demand sophistication, quality corporate strategies and entrepreneurship, and the presence and depth of clusters. These qualities of the business environment enable the transformation of specific knowledge into products and services and competitive companies.” (European Communities, 2006)

Most EU Member States have specific measures of clusters or cluster programs developed at national and / or regional level, which are essential elements of national and regional strategies to support innovation.

„Examples of successful clusters such as Silicon Valley, raised political interest regarding clusters and accelerated the desire to replicate in other regions (to stimulate economic growth, foster innovation and make the region more internationally competitive)” (European Commission, 2008).

The European Commission embraces the development of clusters and cluster policy as the main factor to improve clusters competitiveness in Europe. The objectives of the European Commission:

- A better design for cluster policies at national / European level
- Strengthening cluster initiatives more effectively and exchange of

knowledge

- Better access of knowledge through cooperation at trans-national cluster level.

European Cluster Alliance (ECA) is an open platform that protects trans-national cooperation between policy makers for improving cluster policies for the benefit of companies and other stakeholders connect. This is managed by TACTICS INNO-Net Project.

„Europe INNOVA Initiative” – under the „Competitiveness and Innovation Programme” – CIP – Europe INNOVA initiative of the Competitiveness and Innovation Programme is focused mainly on the joint development, of better and new tools, that can be used by cluster organizations to support innovative SMEs, and therefore to improve the Service Support of clusters in Europe. This initiative has helped to increase business ties between clusters in Europe by organizing cluster visiting schemes and "coupling" events and preparing partnership agreements for creating sectoral platforms for business opened to cluster. (I „Europe INNOVA Innovation and Clusters: The experience of Networks”, available at: [www.europe-innova.org/index.jsp?type=page&cid=10337&lg=en](http://www.europe-innova.org/index.jsp?type=page&cid=10337&lg=en))

Policy makers at all levels should be concentrated on providing the best framework conditions by nourishing innovation, excellence and cooperation across the EU. To support this approach, common efforts are needed to achieve more synergies and complementarities between different policies, programs and initiatives.

”To promote the free transfer of knowledge produced in public research institutions and technological organizations, the basic construction of clusters should be supported by policies and programs for public networks and cluster. The purpose of these programs cluster is to promote the construction of clusters and networking in society to overcome market imperfections and improve structures to allow free movement of knowledge” (Thomas Alslec Christensen, Ger Meier Zu Kocker, Thomas Lammer-Gamp, Morten Solgaard Thomsen, Kresten Olesen, 2011).

### **3. Clusters - driver of sustainable economic development and the competitiveness promoter - analysis**

Interest in the research in the field of clusters has become increasingly larger in recent years, given the fact that they make their presence felt in large numbers in developed economies and in smaller numbers, but increasing, in developing countries.

For the analysis several data sources were used. One of them presents data on the employment rate in clusters and regions (the basis of the analysis), which shows the presence and strength of clusters per country. The other four data sources are divided into three categories: case studies, data on exports by type of cluster (additional perspective on the economic success of regional clusters identified) and data on national business environments.

The analysis was realized at cluster level (where relevant statistical information is provided by mapping of clusters - which leads to a better understanding of the present economic profile and performance of clusters). As the main advantage of cluster-level analysis is the comparability between regions and the main disadvantage is the inherent limitations of the data (the definition of cluster treats the dimension specific to the region of a cluster, reliance on data on employment rather than wages or productivity creates a fostering of industries with an intensive

labor occupancy). The power of regional clusters has also been evaluated, following a three star rating:

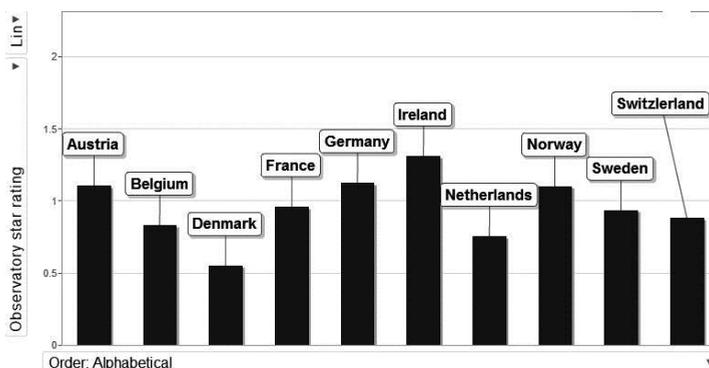

- Size (size - over 15000 employees)
- Specialization (specialization - over 1.75)
- Dominance (dominant - over 7%) (according to the European Cluster Observatory, available at: [www.clusterobservatory.eu](http://www.clusterobservatory.eu)).

“The first Human Development Report introduced a new way of measuring development by combining indicators of life expectancy, educational attainment and income into a composite human development index, the HDI. The breakthrough for the HDI was the creation of a single statistic which was to serve as a frame of reference for both social and economic development. The HDI sets a minimum and a maximum for each dimension, called goalposts, and then shows where each country stands in relation to these goalposts, expressed as a value between 0 and 1” (Human Development Reports, available at: [hdr.undp.org/en/](http://hdr.undp.org/en/)).

**Table 1: Top 10 European Union Member States to HDI ranking 2013 (Human Development Index)**

No.	Global Ranking	Country	HDI value - 2012
1	1	Norway	0.955
2	4	Netherlands	0.921
3	5	Germany	0.920
4	7	Ireland	0.916
5	7	Sweden	0.916
6	9	Switzerland	0.913
7	15	Denmark	0.901
8	17	Belgium	0.897
9	18	Austria	0.895
10	20	France	0.893

Source: adapted from UN Development Programme, Human Development Report, 2013

**Figure 1: Observatory Star Rating cluster from the top 10 European Union Member States, ranked according to HDI ranking 2013 (Human Development Index)**

Source: adapted from European Cluster Observatory, available at <http://www.clusterobservatory.eu/index.html>

Above in the table and figure, in the table mentioned the top 10 European Union countries are mentioned, according to the Human Development Index value from 2012, and then the graph which follows shows the European Cluster Observatory star rating, of these 10 countries. The purpose is to highlight the correlation between the level of development of a country and the cluster portfolio strength in that country.

#### **4. Conclusions**

Case studies show that although there are differences between countries in terms of policies and institutions that affect the development of regional clusters and cluster portfolios, the challenges faced by cluster organizations in their efforts to improve competitiveness are similar in many countries:

- regional clusters must overcome the barriers of collective action, especially the lack of trust between the public and private sector
- regional clusters should identify strengths / weaknesses of their location, decide on a positioning strategy for the regional cluster within the network of locations, in the category of clusters which is feasible and attractive, and create and execute an agenda of action that to help them achieve that position

Assessing the information made several observations and proposals emerge that will be presented below.

Emphasizing geographical specialization - European institutions must develop data, tools and methodologies to enable initiatives in member countries to be more effective.

Provides a process to support for initiatives of regional development clusters - the EU should focus its policies on increasing (improving) microeconomic capacity of Member States and their regional economies.

Improving the efficiency / effectiveness of EU competition policy

Increasing of regional specialization and the efficient allocation of economic activity across the area must be a main element of the European competitiveness effort.

Where there are regional clusters, cluster initiatives, organized efforts of companies, government agencies and regional research and education institutions, the economic benefits may increase.

In most EU countries, national cluster policies are implemented by agencies organized under the authority of various ministries. Across the 31 countries were identified 75 national agencies or at the state level. Most countries have 1-3 agencies.

Efforts to develop and support clusters are based on national programs and projects. The government has a strong role in initiating these efforts. To support clusters appropriately with their needs, cluster programs should take into account the technological field in which the cluster operates.

From the observations results low levels of regional specialization and correlation of regional specialization and economic performance, given that the policies pursued by the European institutions should focus the process of increasing geographical specialization of industries in Europe.

## HIGHLY IMPORTANT OBJECTIVES FOR INNOVATION IN ROMANIA WITHIN THE EUROPEAN CONTEXT

**Popa Ion, Lavric Victor**

*<sup>1</sup>Management Department, Faculty of Management, The Bucharest University of Economic Studies, Bucharest, Romania*

*iipopa@yahoo.com*

*lavricvictor@yahoo.com*

**Abstract:** *Romania, as a country with a low R&D level, in order to converge to the living standards of western economies, is doomed to foster private investments in applied research and experimental development. Thus, it is critical to study what are the main objectives for innovation at organizational level. This paper investigates the most important objectives for innovation in Romania and in the European Union, aiming to find out what are the main challenges innovative enterprises have to face. The general approach is focused on the analysis of the frequency with which these objectives occur, both at general and structural levels. Therefore we have extracted the most important three highly important objectives for innovation, both in Romania and EU: improving the quality of goods or services, the need to increase the range of goods or services and the entering new markets or increase the market share. All these three are positively correlated with the size (number of employees) of the organization. One of our findings underlines that there are fewer objectives in EU than in Romania, both at general and structural levels. Such a situation suggesting that the differences derive from two main sources: Romania has more needs, thus the enterprises target more goals, and there is a lack of managerial know-how that leads to non-prioritized objectives for innovation. Also, we identified an asymmetry, consisting in the fact that in EU, medium sized enterprises are more likely to act as the small ones, as opposed to the Romanian context. R&D and innovation component should be in the center of the Romanian strategy for convergence and competitiveness strengthening, treating differently the SMEs in order to foster innovation in a sustainable manner, through the encouragement of private enterprises to engage in partnerships for R&D an innovation. Also there is a critical need for governmental intervention in building facilities for the modern business infrastructures (business incubators, industrial parks, clusters, and competitive poles), creating a viable VC market for innovative projects, stimulating the creation of new SMEs and fostering internationalization of the local enterprises.*

**Keywords:** *Innovation; R&D; Objectives; SMEs; European Union*

**JEL classification:** *L29, M14, O32, O52*

## 1. Introduction

Romania presents itself as a country with low R&D level, thus being simultaneously subject to a wide gap in the economic development as compared with the EU average, but also to a great growth potential. The growth perspectives derive primarily from the following characteristics of the Romanian economy: the need for administrative and institutional structural reforms, generous fiscal space, good macroeconomic statistics, competitive labour costs, geographical position and existing natural resources. The administrative and institutional structural reforms can act as development boosting instruments on short and medium term, as their main effects (raising the quality of the governmental act, better law enforcement, greater efficiency of governmental spending, the narrowing of the gap between the nominal and the implicit tax rates etc.) would be rapidly converted in higher confidence in the economy, better positioning in terms of international capital flows and a decrease of the risk associated to Romania (the level of CDS). The existing fiscal space is a great opportunity, as it gives the possibility to allocate governmental funds to the development of the economy. In this sense, the resources could be directed as marginal contributions in order to raise the efficiency of the spending (co-financing the EU funded projects, participating in PPPs, partnerships with the international financial institutions), and should address with priority the following needs of the Romanian economy: creating modern business infrastructure (business incubators, industrial parks, clusters, competitive poles), creating a viable VC market for innovative projects, stimulating the creation of new SMEs and fostering internationalization of the local enterprises. All these sources of growth converge to the idea that developing the competitiveness of the Romanian economy is the number one objective in the medium and long run, and besides the structural and institutional aspects, the enterprises are the ones that can, or cannot, capitalize this potential. In order to make enterprises, an especially SMEs, more competitive on the global market, there should be consistent efforts for innovation, and thus, for internal and external R&D.

## 2. Theoretical framework

The theoretical literature regarding R&D underlines the growing importance of the R&D activities performed in networks as a result of collaborative approaches (Kesavayuth, 2012). The amount of the resources allocated for R&D is a good proxy for forecasting the success rate of the project, being registered a positive correlation between these two elements (Schwartz, 2012). This is why there is a pragmatic need for stimulating collaboration in order to generate the critical mass in order to ensure a risk – reward ratio of the projects that is bearable. There was an intense theoretical debate over the assumption that *“public R&D subsidies crowd out private R&D investment”*, but the empirical findings suggest that *“funded firms are significantly more R&D active than non-funded firms”* (Aerts, 2008).

Great energy was put into studying of the connections between the quality of the corporate governance and the tendency to conduct internal and external R&D. Although it is quite intuitive, the theoretical literature records results that point out that in order to *“enhance companies' innovation and R&D capabilities, need to improve their corporate governance”* (Dong, 2010). In one of the baseline studies focusing on the interconnection of general management and R&D projects underlines the following: *“(1) the presence of CEO incentive schemes increases both*

*corporate innovation effort and innovation performance; (2) sales-based performance measure in the incentive scheme, as compared with profit-based performance measure, is more conducive to firm innovation; and (3) CEO education level, professional background and political connection are positively associated with firm's innovation efforts*" (Lin, 2011). There are works that overcame the analysis phase, and formulated/proposed measures needed for developing the R&D component: (1) improving the management quality in SMEs and (2) incentivizing collaboration and cooperation (Martinez-Roman, 2011). Some authors approached the evolution of the R&D management, emphasizing that *"the perspective on managing R&D processes has changed over the years, moving from a technology-centered model to a more interaction-focused view"* (Nobelius, 2004).

A recent study of ours (Lavric, 2012) is underlying that at EU level, there are three groups of states, that differ one from another in terms of structure and intensity of R&D: (1) high R&D level (Finland, Sweden, Denmark, Germany and Austria); (2) medium R&D level (France, Slovenia, Belgium, Netherlands, Ireland, Great Britain, Estonia, Portugal, Czech Republic, Spain and Italy); and (3) low R&D level (Hungary, Lithuania, Poland, Malta, Slovakia, Bulgaria, Latvia, Cyprus and Romania). In this context, Romania, as a country with a low R&D level, in order to converge to the living standards of western economies, is doomed to foster private investments in applied research and experimental development. Thus, it is critical to study what are the main objectives for innovation at organizational level.

### **3. Methodology**

In this study we use the Eurostat data regarding the "Community Innovation Survey 2010" for Romania and the rest of the EU states. Because of the data availability, there were included the following countries: Belgium, Bulgaria, Czech Republic, Estonia, Ireland, Spain, France, Italy, Cyprus, Latvia, Lithuania, Luxembourg, Hungary, Malta, Austria, Poland, Portugal, Romania, Slovenia, Slovakia and Sweden. We also excluded from the analysis the United Kingdom, although it appears in the statistics, the data is fundamentally inconsistent and out of the normal variability around the rest of the countries.

The data set from Eurostat refers to the highly important objectives for innovation in 2010, including the study of product and/or process innovative enterprises, regardless of organisational or marketing innovation (including enterprises with abandoned/suspended or on-going innovation activities). So, our study will focus on the identification of the most relevant tendencies regarding the objectives for innovation in Romania and in the European Union, focusing the analysis in the following directions: (1) structural analysis in terms of enterprise size, (2) Romania's specificity in the European context and (3) correlation testing between different components.

### **4. Results**

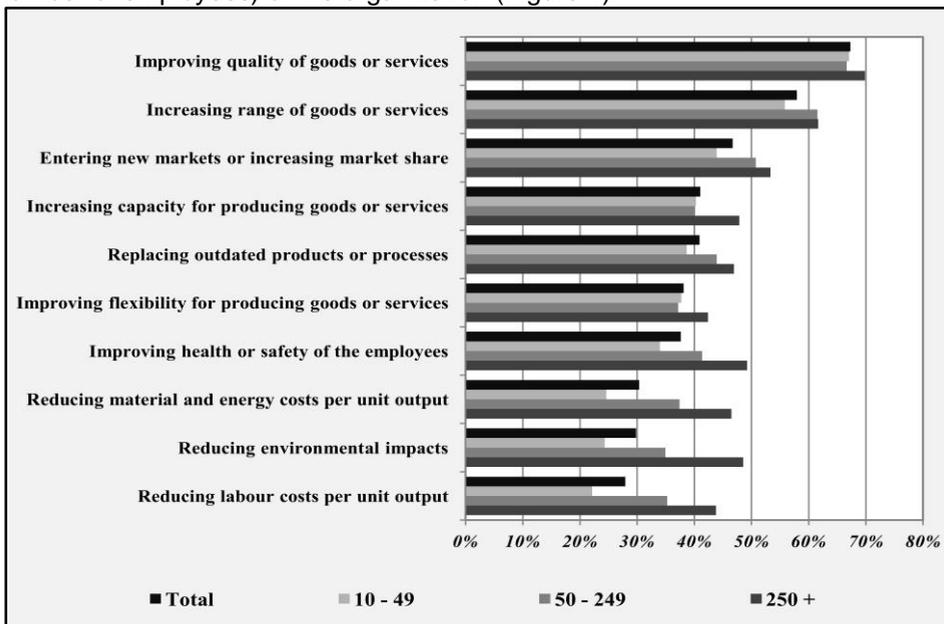

#### **4.1. Highly important objectives for innovation in Romania**

At micro level, it is important to analyze the specifics of product and/or process innovative enterprises, regardless of organisational or marketing innovation (including enterprises with abandoned/suspended or on-going innovation activities). In order to do so, we will focus our attention on the main innovation objectives in the

Romanian enterprises as compared to the EU situation. In this sense, the Community Innovation Survey is delivering data at EU level regarding the highly important objectives for innovation: (1) increasing range of goods or services, (2) replacing outdated products or processes, (3) improving quality of goods or services, (4) improving flexibility for producing goods or services, (5) increasing capacity for producing goods or services, (6) reducing labour costs per unit output, (7) improving health or safety of the employees, (8) entering new markets or increasing market share, (9) reducing environmental impacts, (10) reducing material and energy costs per unit output. As we see, these objectives can be classified at least by two main criteria: by types of resources and by level in a production system flow. By types of resources, we have financial, material, human and informational, and, in a systemic approach, there are inputs, processes and outputs. As we are talking about highly important objectives for innovation, it is clear that through R&D or know-how transfer, the organization is actually fostering primarily the informational resources, that transcend the classical paradigm and materialize in knowledge resources (some authors place it as a fifth type). If we look at the enterprises as open systems, it is obvious that innovation, and especially R&D, are strongly associated to the internal processes, but the objectives we investigate could be easily characterized by the type of the challenges those innovations are aiming to answer. Therefore, increasing the range of goods or services relates more to external pressures (local and external markets, changing consumer behavior, and technological progress), and implies primarily informational, material and financial resources. Replacing outdated products or processes is highly connected to sphere of internal processes in comparison with the technological edge and markets development (that covers such notions as life cycle of products and technology and comparative advantage). Improving the quality is a much more general objective, as there is large space and complexity in defining, in clear, specific and comprehensive terms, what the quality really is. The approach that dominates the debate on quality management, combining wisely the theoretical and the pragmatic aspects, states that quality represents the measure in which a product is responding to/satisfying the consumers needs in both its objective (value adding elements) and subjective (expectations, perceptions, emotions) dimensions. Improving flexibility for producing goods or services is obviously concerning the internal processes (that transform the inputs in order to deliver the output) and primarily the informational and human types of resources. Although flexibility proved to be a constant (for at least two decades) preoccupation of the theoreticians and practitioners in manufacturing, it is critical now as it was back then, because the processes that brought the paradigm shift, not only did not disappear, but got more intense and complex. Increasing the capacity of producing goods or services involves simultaneously, at high intensity, material, financial, human and informational resources. From a systemic point of view, it is more focused on internal processes and inputs. Such an objective it is more likely to appear in a market where there is a supply deficit, that could be generated by the scarcity of resources (natural or human), technological limitations or market asymmetries. This objective for process and/or product innovation it is actually congruence between stimulating productivity and efficiency growth. Reducing labour costs per unit, as well as reducing material and energy costs per unit output, are also related to the above mentioned elements (productivity and efficiency). Improving health or safety of the employees and reducing the environmental impacts, are two

objectives that are related both to the corporate social responsibility of the organizations and to the standards and requirement enforced by national and international laws. Maybe one of the most complex and difficult to fulfill objectives regarding innovation is to develop their capacity to enter new markets or increase the market share. It is mainly because for delivering on this one, there is an inherent need to accomplish at a considerable level the other 9 ones. As we see, there is quite a diverse range of preoccupation regarding R&D and innovation, therefore it is critical to measure and analyze these objectives in order to extract useful conclusions for the governmental authorities, entrepreneurs and managers that could be used in order to develop competitiveness, foster internationalization and raise private participation to R&D activities.

Romanian innovative enterprises record on average 4,18 objectives per organization, this indicator being positively correlated with the size of the enterprise (3,88 – small enterprises, 4,49 – medium enterprises, 5,10 in large ones). At general level, the most frequent objective is improving the quality of goods or services (67,29%), being followed by the need to increase the range of goods or services (57,93%) and the desire to enter new markets or increase the market share (46,72%). There are also enterprises for which increasing capacity for producing goods or services (41,06%), replacing outdated products or processes (40,92%), improving flexibility for producing goods or services (38,13%), improving health or safety of the employees (37,60%), reducing material and energy costs per unit output (30,35%), reducing environmental impacts (29,79%) and reducing labour costs per unit output (27,93%) are highly important objectives. Taking a closer look in terms of structure, we find out that there are 6 out of 10 analyzed objectives that maintain the positive correlation between the specific intensity of an objective and the size (number of employees) of the organization (Figure 1).

**Figure 1:** Highly important objectives for innovation in Romania by enterprise size  
 Source: Community Innovation Survey, Eurostat, own calculations

As a matter of fact, these 6 objectives can be divided into two main groups: objectives whose nominal growth rates are correlated with enterprise size (1) positively (convex profile), (2) negatively (concave profile) or (3) almost non-correlated (linear profile). In the third group there are the most ones: entering new markets or increasing market share; replacing outdated products or processes; reducing material and energy costs per unit output, and reducing labour costs per unit output. Each of second and first categories contains only one objective – reducing environmental impacts, respectively improving health or safety of the employees. In this context, we can argue that in the case of those objectives whose nominal growth rates form a convex rate, small and medium sized enterprises differ consistently from the large ones. On the other side, a concave profile suggests that the medium enterprises are more like large companies, thus small enterprises are characterized as more vulnerable.

#### **4.2. Highly important objectives for innovation in the European Union**

The innovative enterprises from the European Union record on average 3,14 objectives per organization, this indicator being positively correlated with the size of the enterprise (2,98 – small enterprises, 3,37 – medium enterprises, 4,02 in large ones). As we see, there are fewer objectives in EU then in Romania, both at general and structural levels. Such a situation suggests that the differences could occur from two main sources: (1) Romania has more needs, thus the enterprises target more goals, or (2) there is a lack of managerial know-how that leads to non-prioritized objectives for innovation. Even if the first hypothesis is true, in order to catch up the developmental gap, there should be established priorities, as the resources used are not endless. At general level, the most frequent objective is improving the quality of goods or services (49,84%), being followed by the need to increase the range of goods or services (46,58%) and the desire to enter new markets or increase the market share (41,97%). There are also enterprises for which replacing outdated products or processes (32,12%), increasing capacity for producing goods or services (28,72%), improving flexibility for producing goods or services (28,33%), improving health or safety of the employees (24,52%), reducing labour costs per unit output (22,52%), reducing environmental impacts (19,92%) and reducing material and energy costs per unit output (19,20%) are highly important objectives. It is obvious that the main hierarchy of the objectives is kept almost the same in Romania compared to the EU average, thus emphasizing that there are core challenges that all the EU states are facing and are pursuing to overcome through R&D and innovation.

Another two findings are that, in the EU context, (1) the frequency of all the analyzed objectives is positively correlated with the size (number of employees) of the organization, and (2) only one objective has a concave profile, while the others are characterized by a clear convex profile.

#### **5. Conclusions**

The underdevelopment of the Romanian economy and the growth rates that are below the potential, underline the need for a coherent strategy for convergence and competitiveness strengthening. So, the R&D and innovation component should be in the center of this catch-up process, and in order to do so, we have to start from

identifying the real needs of the enterprises, i.e. their objectives for innovation. Also, in order to foster innovation in a long term paradigm, SMEs should be encouraged to engage in R&D activities jointly with other organizations (other enterprises, universities, public and private research institutes, NGOs etc.).

In our study we identified, from a list of ten, three highly important objectives for innovation, both in Romania and EU: improving the quality of goods or services, the need to increase the range of goods or services and the entering new markets or increase the market share. All these three are positively correlated with the size (number of employees) of the organization. Also, it is quite obvious that they express the enterprises response to the globalization processes, underlining the importance of R&D and innovation in the in the global economy.

**Abstract:** *At the heart of any workplace behavior (and not only), there are always one or more emotions (pleasant/unpleasant, partially controllable/uncontrollable, aware/unconscious, useful/useless/harmful, intense/less intense, predictable/unpredictable, expressed/ repressed, observable/ unobservable, explained/ unexplained, rational/irrational, and so on). Emotions are the foundation of a complex and mysterious mechanism of action and behavior. Emotions are triggered by certain things, people, events, situations, processes, results, interactions and so on, and are informed by a variety of endogenous (biological) and exogenous factors, and also by the intellectual potential of each individual. Emotions lie at the intersection of mind (rationality), body (physical) and soul (spirit), thought, reason, logic, compassion, autonomy and action/behavior, individual and environment. This article undertakes to define emotions and identify their impact on the organizational environment, with emphasis on emotional climate and managing emotions. Moreover, we will focus on human behavior/action, rather than on the evolution of the nervous system or the cortex in particular. Work itself should not be a source of suffering. It is obvious that certain emotions cause bad moods, unnecessary and even harmful ones, conditions that should be considered, even if they have a situational and subjective character. Some managers think that the decision-maker fulfills his/her duties by strictly conforming to the law and to the agreement clauses and by meeting his/her obligations in a timely and exacting manner. Others believe that a good leader, in addition to observing the applicable rules and regulation, must be honest also to his colleagues and collaborators and sympathetic to the needs, ideas and emotions of those who are interested in the optimal operation of the company. Managers must remain alert to events, people and behaviors that can trigger harmful emotions within the organization. Employees should be encouraged to express their emotions in order to avoid tense situations. Even though tensions may occur, they must be managed effectively because, as we all know, avoiding a war does not mean peace, just as avoiding unnecessary inconveniences does not always equal pleasure. The improvement of emotional behavior represents a competitive edge in business activities for any organization. The main target of this undertaking is to provide a certain perspective on emotion; to be more specific, we are concerned with discovering the circumstances and causes that trigger off emotions in organizational environments. Theoretical approaches conveyed in this article may be perceived as a call to mindfulness and to the managers' awareness as to the importance of improving the emotional climate of the workplace.*

**Keywords:** emotions; organizational environment; emotional climate.

**JEL classification:** D21, D83, J28, M12, M14.

## 1. General Introduction

As Rimé (2005) suggests, humanity has no other means to safeguard and preserve its constructs than *individual emotions*. The idea that the individual is hard-wired to have affects, possessing an emotionally viable organism, was proposed by Darwin. He also proposed that affects are useful, because they help the organism adapt to various vital situations.

We are aware that the discussion on the basic meaning of the concept of “emotion” as a trigger of human behavior might go on forever, given the multitude of scientific fields that operate with this concept (psychoanalysis, medical science, psychobiology, psychology, psychophysiology, organizational theory, philosophy, anthropology, sociology, etc.).

Turner (2010: 169) argues that sociology cannot fully understand human cognition, behavior, interaction, and social organization without a theory of emotions that drive all social processes. Workplace communication is not entirely rational, but influenced by an array of experiences/logical information pertaining to previous interactions (with the same individual or concerning a similar problem/situation etc.) and also by emotional memory (i.e. memories related to experienced emotional states, remembered states of affect).

## 2. A sneak peek into defining and characterizing emotions

In Rimé’s opinion (2005), the term “emotion” is recent and its early significance was basically related to collective behavior (for instance, “a certain emotion seized the crowds”). However, in Larousse’s definition of emotion (1870), the concept of “excitation, disturbance of animal economy” gained pre-eminence over the concept of “commotion that moves masses into action”. The Oxford dictionary (1933) traced back several key historical occurrences of the concept: in 1579, signifying “social commotion”, in 1600, denoting a “commotion or disturbance of the spirit”, in 1603, signifying a “migration, a transfer from place to place” and finally, in 1690, signifying “physical movement, commotion or disturbance” in John Locke’s writings (Rimé, 2005).

From a cognitive point of view, the concept of emotion includes an instigating/generating event, an interpretation of the latter and a consequent evaluation of this interpretation that determines a physiological change in the organism and a state of preparedness for action (Power and Dalgleish, 1998). The following aspects must be therefore taken into account: the occurrence of an event, the perception of its consequences, the consequent interpretation and assessment, the occurrence of a physiological change within the organism and the preparedness for action.

The definition proposed by Keltner and Gross (1999) integrates previous conceptions regarding the biological and social determinism of emotions, that are regarded as biologically based episodic patterns of perception, experience, physiology, action and communication of relatively short duration, that occur as a response to specific challenges and opportunities of physical and social nature.

As Cosnier (1994) shows, emotions, defined as states of preparedness and activation of largely innate behavior systems, that are also influenced by learning and training, belong to the category of *major motivational states* that generate orientated states of tension (tendencies to act, defined by their purposes and results). Emotions are primed response structures that intervene automatically

during the process of adaptation (Rimé, 2005).

In specialist literature, emotional response structures are defined in terms of vernacular language: fear, sadness, anger, disgust/contempt, amazement, shame, guilt, joy, surprise.

In Rimé's opinion (2005), states of affect include, apart from *emotions* (marked by quick induction, transience and discontinuity within the individual-environment relationship), a series of *non-emotional* manifestations of affect (that are less intense, less differentiated and more diffuse), such as:

- ↳ *Moods*: that may last from a few minutes to several weeks.
- ↳ *Temperament*: highly stable features of affect, that tends to persist for one's whole life.
- ↳ *Emotional disturbances*: syndromes that may last for several weeks or several years (depression, anger, phobias, Obsessive-Compulsive Disorders, panic attacks).
- ↳ *Preferences*: positive or negative manifestations of affect that constantly accompany one's dealings with objects, situations and people (attraction and rejection).
- ↳ *Affects*: diffuse incipient emotional manifestations, *positive* (hope, exhilaration, exaltation) or *negative* surges of affect (anguish, sadness, grudge) that do not qualify as emotions, as they lack discontinuity (unlike emotions).

Scholars recognize that emotions are distinct from attitudes (Perugini and Bagozzi, 2004) and suggest that emotions influence attitudes (Steenhaut and Kenhove, 2006) (in Agnihotri et al., 2012: 246).

Moreover, for Cosnier (1994), daily affective manifestations are interactional micro-emotions, conversational (phasic) affects, if they do not leave lasting (medium or long-term) impressions in the memory or have a lower intensity.

In his work, Ekman (1992) lists 9 features of basic emotions: (1) *the universality of emotional signals*: the expression of basic emotions is universally recognized (there are, however, certain subtleties that depend on culture and on the specific type of emotion); (2) the presence of *comparable expressions* between man and other primates (for instance, fear, anger, sadness and joy); (3) each emotion is based on *a specific physiological context*: it seems that there are certain specific schemes that describe the actuation of the autonomous nervous system, that have been verified at least for anger, fear, disgust and sadness; (4) *the universality of triggering events*: the generating situations share commonalities, i.e. a certain type of vital situations and challenges elicits specific reactions; (5) *the coherence of emotional reactions*: generally speaking, there is a congruence between the emotional experience and its expression; (6) *quick triggering*: physiological reactions may occur in a fraction of a second and mimic, within milliseconds; (7) *limited duration*; (8) *automatic perception mechanism*: emotions occur out of a sudden – they are neither voluntary, nor logical; (9) *spontaneous occurrence*: an emotional experience is not a deliberate choice, and that's because of the quick succession, the automatic perception and the involuntary expressive reactions.

For a large number of contemporary authors, only the "basic" or "primary" emotions (fear, happiness, sadness, anger, disgust, distress, shame, etc., whose number ranges between 4 to 10, according to each expert's own opinion) and the derivatives that result from combining the former count as emotions.

In Turner's view (2010: 176) there are at least four primary emotions: satisfaction-happiness, aversion-fear, assertion-anger, and disappointment-sadness. More than that, the author explains the variations in these primary emotions from their low-intensity to their high-intensity manifestations.

Clark (2013) distinguishes two classes of emotions, namely:

1. *Basic emotions* (such as fear, joy, and anger): these are seen to be evolutionarily old sets of responses involving stereotypical neural, physiological, and behavioral profiles that have evolved in response to recurrent evolutionary challenges (capable of being activated by unconditioned stimuli and leading to unconditioned, involuntary responses that cannot be easily modified by higher cognition).
2. *Higher cognitive emotions* (such as pride, shame, and guilt): these are held to necessarily involve sophisticated cognitive inputs by their very nature (such as means-end, causal, and counterfactual reasoning, long-term planning, social cognition, etc.), and to lack simple noncognitive elicitors; these emotions do not involve involuntary, stereotypical physiological, expressive, or behavioral responses, but rather involve responses that are learned or prescribed by the social environment.

Many, if not all emotions have both basic and higher cognitive forms that share all of the paradigmatic features of emotions according to Clark (2013: 74): while higher cognitive and basic forms do indeed differ in important ways, they can nevertheless be placed in a common evolutionary and developmental framework.

### **3. Emotions' impact in the organizational environment**

As far as the organizational environment is concerned, Brief and Weiss (2002) showed that the 30s set the foundation of the studies concerning the emotional life of employees, with work satisfaction as a pre-eminent object of research. According to Weiss and Brief (2001), one particularly influential study on the emotions of employees was conducted in 1932 by Hersey, who came to the following conclusions: there is a clear relationship between daily emotional experience and work performance; the daily emotional experience (although variable over time) shows well-defined cycles; the effects of negative emotional states are more pronounced than the positive effects of positive emotional states; both work-related and external factors (e.g., family life) have an impact and are relevant in enabling the employee's emotional adjustment to the work environment. Therefore, employees do not interpret and evaluate the situations in an abstract manner, isolated from the social, organizational and relational context in which they are experienced.

Riotti (2009) examines some reasons why moral, social, and political philosophers should be concerned about emotion-work and what it tells us about the nature of emotions and their moral, social, and political significance, and especially, their significance for agency and the relationships and interactions between agents. Emotion-work has fundamental impact both on agency and on well-being, both for those who do the work and for those around them: and for that reason alone, value theorists would do well to pay attention (Riotti, 2009: 57).

People have been shown to use feelings as information. The ease with which information comes to mind – i.e. how accessible it is - guides people's inferences about their moods, emotions, metacognitive experiences, and bodily sensations (Schwarz, 2012).

Emotions are aroused under two general conditions: (1) expectations and (2) sanctions. In all encounters embedded within mesostructures and macrostructures, individuals have expectations about what should and will transpire (Turner, 2010: 186):

- ↳ When these expectations are realized, individuals will experience satisfaction and more intense degrees of happiness, when they are exceeded.
- ↳ When individuals receive positive sanctions for their actions, they will feel satisfaction or perhaps a more intense form of happiness.
- ↳ If individuals fail to realize expectations and/or receive negative sanctions, they will experience negative emotions.

The distinguishing feature of emotional versus non-emotional states (passions, feelings, affects, preferences, moods, sensations etc.) is the discontinuity within the interaction between employee and organizational environment. The virtually infinite number of conditions that facilitate such discontinuities is clustered around two poles:

1. *Variations that pertain to the organizational environment*: the impact of strategies, plans, targets, tasks, events, phenomena, processes, physical or social circumstances etc.
2. *Variations that pertain to the employee*: the dynamics of needs, wants, reasons, ideals, dreams, goals, individual objectives, interests, concepts, beliefs, certainties, values, desires etc.

In order to avoid shocks, any variation that occurs at one pole must find adequate supporting resources at the opposite pole. To be more specific, when the management is about to implement certain changes, it should make sure that the employees will find the personal internal resources needed to handle such changes successfully. If such resources are insufficient, the continuity is endangered. In this case, the individual should reorganize his priorities in terms of motives (needs, expectations etc.), by resorting to cognitive-symbolic means.

As noticed above, the individual is the one who has to either find the resources needed to adapt to the changes in his environment or abandon his new needs, wants, intentions etc. in order to continue his relation with the environment (if he chooses to). In our opinion, however, emotions are not mere responses of individuals to unexpected variations/situations in the external environment, but transitory states by means of which a positive relationship between individual and environment is constantly adjusted/ rebalanced.

Just like any other resources distributed by institutions, emotions have a tendency to compound their effects: positive emotions provide the energy to gather resources in many domains, whereas negative emotions in one domain will often work against securing resources in others (Turner, 2010: 175).

*The positive effects of encouraging the expression of emotion at the workplace are: enabling self-understanding; stimulating feed-back; improvement of both intellectual (cognitive) and emotional skills; developing and maintaining optimal relationships within the organizational environment, with a positive impact on enthusiasm, loyalty, attachment, involvement etc.*

In Huy's opinion (2011: 1406), many executives continue to believe that affective neutrality and focus on tasks are the best ways to deal with emotional situations. So, they avoid discussing emotions at work and understanding their causes.

*The possible negative effects* of the failure to express emotions (of those unpleasant ones, that generate stress, in particular) are: a counterproductive (tense, stressful) work climate; the impairment of the employees' mental skills; the impairment of the employees' social and emotional capacity; the discouragement of immediate feedback; the dehumanization of the organizational communication process; the decline of workplace creativity etc.

All this negative aspects may determine reactions that any organization tries to avoid: physical/verbal aggression at the workplace, hostility, threats, negative feelings towards the organization, resistance to change, sabotage, revenge, decline of trust, negative self-perception, negative perception of the others, escalation of interpersonal conflicts, the decline of labor quality and quantity, the increase of personnel fluctuation, labor union actions that may lead to violence etc.

As far as the relationship between workplace, the experienced emotions and the associated behaviors are concerned, Van Katwyk et al. (2000) have discovered significant correlations between negative emotions experienced within the organization and a series of factors with stress potential (the volume of work, interpersonal conflicts, organizational constraints). Judge et al. (2006) have examined the correlation between hostility, workplace attitudes and deviance in the context of a dynamic approach to the role of emotions, such as the one provided by the theory of emotional events and discovered that interpersonal justice and hostility are significant predictive factors of deviant conduct within the organization. Tepper et al. (2006) remind us that people perceive a state of procedural injustice when they are denied the right to opinion or when the representatives of the organization behave disrespectfully during resource allocation. Tepper et al. (2007) show that victims of management abuse experience a high level of stress that indicates disturbances involving dysfunctional thoughts and emotions (anxiety, anger, depression, emotional exhaustion).

In a recent study, Kammeyer-Mueller et al. (2013: 47) explain that the results of their analyses were consistent with the perspective that surface acting emotion regulation strategies show a pattern of negative relationships with labor outcomes such as job satisfaction and stress/exhaustion (but not with job performance itself), whereas deep acting emotion regulation strategies show a pattern of positive relationships with all of these work outcomes.

### **3. Emotional climate and managing emotions**

As there is a growing pressure on employees to display their loyalty, commitment or even their identification with their employers, the emotional "climate" of workplaces has come under enhanced scrutiny lately (Kunda and Van Maanen, 1999).

The concept of climate has been used extensively in organizational psychology in an attempt to capture important differences in organizational environments. While an emotional climate may often be labeled by using names for emotions, such as joy and fear, we may also use labels that directly refer to the emotional relationships that are involved, such as hostility or solidarity (de Rivera, 1992).

The emotional climate is part of the organizational culture that affects everyone in the organization and refers to the quality of the organizational environment and the dominant relations and behaviors (how the employees emotionally relate to one another). Concentrating on the emotional climate of the nation-state, de Rivera (1992) referred to some of the different climates that have been reported in past

investigations: a climate of fear; a climate of security; a climate of instability; a climate of confidence or optimism (and their opposites, lack of confidence, pessimism, or "depression"); a climate of dissatisfaction; a climate of hostility; a climate of solidarity; a climate of hope.

Workplace emotional climate includes the whole of the employees' purely emotional reactions in relation to the organizational environment and culture: management style, labor conditions, relations between employees, communication climate, organization targets, work climate, change processes, external relations etc.

Emotions determine (even in the organizational environment) emotional/subjective experiences, cognitive alterations, psychological changes with an impact on the neurovegetative system, behavioral changes (verbal, non-verbal, paraverbal) and specific action drives (flight/escape, rejection, aggression etc.).

Every organization management should be concerned with encouraging the expression of emotion that strengthen and maintain a favorable/efficient emotional climate (for instance, a climate of security (trust, openness), stability, confidence, optimism, satisfaction, hope, solidarity). An unfavorable/inefficient emotional climate within the organizational environment (depression, instability, pessimism, fear, dissatisfaction, hostility, despair) shouldn't be ignored, because it may bring about both short-term and long-term harm. However, this doesn't imply that the repression of unpleasant emotions that lead to the instauration of the hostile climate should be encouraged.

Negative emotions are painful and, hence, will be often repressed. And, once defense mechanisms are activated, the repressed emotion will often transmute into a new emotion or set of emotions (they also become more intense) that change people's perceptions and propensities for action (Turner, 2010: 176).

Riitti (2009) explains why we seek to regulate emotions (our own/other people's emotions):

- ↳ Emotions convey information, both to oneself and to others, and as such, they can - and typically do - act as communications.
- ↳ Emotions act as incentives and disincentives - given the fact that emotions are perceived or even recalled as either pleasant or unpleasant, they also have more directly hedonic experiential aspects.
- ↳ Both the communicative and the hedonic aspects are subject to norms over which individuals have different degrees of control - and emotional labor conditions do not need to favor all equally.

Communication by means of emotions is faster and more subtle than verbal communication and, although its inner workings remain elusive, it can be highly beneficial in business or organizations (Goleman, 2002). In the process of communication, the message is conveyed together with the emotions of the sender. It is however true that there may be differences between intended and unintended emotions, and also between the intended and the received message.

It would be unwise for managers to simply presume that employees will always be genuine in their emotions while also displaying the appropriate mood. Instead, employee training for high emotional labor jobs should probably encourage deep acting over surface acting, and managers themselves should be trained to anticipate and proactively prevent episodes where employees may "break character" (Kammeyer-Mueller et al., 2013: 80).

Managing emotions is most often presented in studies concerning emotional intelligence. For instances, Mayer and Salovey (1997) have designed a four branch model of emotional intelligence: (1) perception, assessment and expression of emotions; (2) emotional enablement of thinking; (3) understanding and analysis of emotion and the use of emotional knowledge; (4) managing emotions for emotional and intellectual development. In the authors' opinion, managing emotions requires the following abilities: being equally open to pleasant and unpleasant emotions; deliberate engagement with or detachment from a specific emotion, depending of its value; conscious monitoring of emotions towards oneself and the others; the ability to manage emotions by attenuating negative emotions and intensifying positive ones.

Analyzing the organizational domain of emotions, Fineman (2001) believes that, while this doesn't necessarily qualify as actual full-fledged "control", organizations tend to incorporate emotion control schemes and that the process itself involves emotional experiences. The authors also shows that the desirable or undesirable character of emotional expression is regulated by means of explicit rules issued and enforced by authority agents or in an informal, discrete manner, through socialization and organizational "rituals".

Beyer and Niño (2001) make reference to 5 ways in which organizational culture shapes the emotional experiences of the employees: (1) through the management of the anxiety generated by the uncertainty inherent to the dynamics of social, economic, organizational life; (2) by providing opportunities and ways (spaces, codes of conduct) to express emotions; (3) by encouraging and discouraging the expression of emotion; (4) by instilling identification and commitment; (5) by inculcating ethnocentrism.

Seo and Barrett (2007) suggested an alternative approach organizations could adopt towards feelings: fostering the freedom of managers/employees to experience and express their emotions to maximize the positive outcomes of those feelings, while simultaneously helping them minimize the emotions' potential negative impacts (in Huy, 2011: 1406).

In Huy's opinion (2011: 1406), managers can also increase their emotional self-awareness by acquiring a richer vocabulary of emotions, by understanding the causes and consequences of various emotions such as shame, guilt, anger, pride and joy so they can recognize/regulate them, and express them to others in an articulated way.

## **5. Conclusion**

With the acknowledgment of the emotions' role at the workplace, specialist literature produced an impressive amount of studies and research on the negative or positive nature of the emotion's impact on attitudes and behavior within an organization.

Just as we people manage more or less successfully to repress/eliminate/ignore emotions/consequences we deem unpleasant/inefficient and to be open to emotions that are pleasant and bolster our performance effectively, on the other hand, so should organizations concern themselves with securing an emotionally intelligent environment. As Goleman et al. (2002) show, research has revealed three useful key ideas for creating a resonant, emotionally intelligent and effective culture: (1) the discovery of emotional reality, (2) the visualization of ideal and (3) the fostering of emotional intelligence.

Unfortunately, some organizations are not alien to various forms of physical (physical violence, exposure to situations that may endanger one's life etc.) and emotional abuse (verbal aggression, insult, offence, blame, instilment of guilt, inequitable treatment, withdrawal of support or threats with withdrawal of support for an individual in a relevant situation, various forms of justified or unjustified penalty, immoral conduct, abusive/ambiguous conduct of managers and supervisors, lack of respect, public humiliation etc.). In order to eliminate such dehumanizing behaviors it is important to accept and encourage the expression of unpleasant emotions felt by those who were afflicted by these treatments, in spite of any risk or costs that might be involved. Due to space limitations, in this article we did not consider thoroughly the risks and costs associated with the emotions' excessive manifestation in the organizational environment. This will be the focus of our further research.

The perception of emotion by the employees at the workplace cannot be prevented or averted. On the other hand, the employees can learn how to adjust their emotional reactions to achieve good communication within the organization.

People that experience unpleasant emotions may receive social support in the form of *emotional* (listening, positive affects, attachment, patience, availability, respect, consideration, appreciation, care, empathy, etc.), *informational* (messages, advice, opinions, reassuring information, solutions, indications, etc.) and *instrumental* support (material aid/services for relief, rest and mood improvement). Employees are able to learn the emotion expression regulation/codes (accepted/endorsed expressions), if the organization culture is one that allows and encourages the expression of emotions and stress reactions by the employees. They will be able to make better use of those emotions or emotional expressions that best ensure their security and the achievement of their targets.

Emotional workplace behavior encouragement and assessment schemes may include a set of implicit and/or explicit, written and/or spoken rules for an adequate emotional conduct, designed and implemented in way that helps people guide their conduct, enabling or inhibiting certain emotional expressions.

Perhaps the most important takeaway is that future studies should not neglect the role of dispositional affect in the emotional labor process (Kammeyer-Mueller et al., 2013: 72).

**Abstract:** *This paper is part of change management. The extent to which managers succeed to reduce the resistance to change from the part of the affected employees contributes greatly to the achievement of the targeted objectives that follow a change process. This paper aims to present a number of forces located both inside and outside the organization, forces that through their manner of expression may exert a direct influence on the increase or decrease of the opposition's intensity of those affected by the change.*

*The identification and analysis of these forces give to the involved managers in coordinating changes the possibility to reduce efficiently and effectively employees resistance to change.*

**Keywords:** *change, resistance to change, change in organizations, reduce resistance to change.*

**JEL classification:** *O30, O39*

### ***Introduction***

The complexity of the world in which we live makes the pace at which changes invade our life to be more accelerated. Everything around us is accelerating. The pace of technical innovations, technological discoveries abound all fields of science and technology, but also in the social area, generating a need for extensive changes in organizations. However, regardless of their knowledge, intelligence or quantity of data acquired over the life by people, they still remain social beings who do not like frequent changes. As Alvin Toffler stated in 1970 "the most disturbing thing is that most people, including the educated and refined ones, consider the idea of change so threatening that they try to deny its existence".

### ***Resistance to change***

Psychologists (Claes Janssen, 1982, Conner, 1998) explain that human resistance to change is a perfectly natural process. It is human nature to exercise opposition to a process laden with uncertainties and anxieties that generate discomfort and doubts.

Kurt Lewin (1951) explains in a logical manner correlated with the laws of physics that a change does not occur if the factors of a force that generates change are met with similar oncoming factors of a force that generates resistance to change. The force field analysis is the tool proposed by Kurt Lewin that allows us to identify and analyze the two major categories of forces that act as opposites.

An important ingredient that can greatly contribute to the lack or failure of a change is resistance to change. Employees opposition towards manager's proposed changes occur in any change process. We consider that the intensity of this force varies from one change to another, depending on a set of factors.

In the existing literature many experts present that resistance to change can be reduced by using some specific methods or techniques. To do this, first must be assessed the level of commitment to change. Representative methods proposed by specialists to assess commitment to change are:

- Chart commitment proposed by R. Beckhard and R. Harris;
- Curve commitment proposed by Michael Ward.

Kotter and Schlesinger (1979) propose several ways to reduce resistance to change:

- Training and communication;
- Participation and involvement;
- Facilitation and support;
- Negotiation and agreement;
- Manipulation and cooperation;
- Coercion.

The role of the reducing resistance to change methods alongside managers knowledge and skills are essential for a successful implementation. Managers who have the responsibility to coordinate a change must have the ability to choose and then use the appropriate method for each employee in direct correlation with the reasons underlying its opposition. Our belief is that the intensity with which an employee opposes a proposed change is influenced by a number of factors and this intensity can vary from one change to another, from one period to another, from one employee to another, from one organization to another and even from one country to another, depending on the manner of expression of certain forces, deemed by us responsible for increasing or reducing employee resistance towards change.

### ***Forces that enhances or reduces employee resistance to change***

The great diversity of forces identified as exercising influence on the acceptance or rejection of the change ideas in an organization has imposed their grouping into categories. In relation to the place from which it generates action, we can speak of internal forces, within the organization, and external forces, specific to the environment in which the organization operates.

We believe that internal forces exert more influence and their better understanding might be achieved if the subsystems that generate them are analyzed (change, employee, manager, organization).

#### ***Internal forces***

In the vast category of the internal forces we can include:

- Forces that relate with the particularities of the decided change to be implemented;
- Forces connected with employees;
- Forces which are related to the managers that coordinate the change;
- Forces connected with the organization features and processes that take place within it.

Certainly, the greatest influence on the manner in which employees respond to a change is change itself. The manner in which it enhances or reduces employee resistance to change is correlated with several dimensions of change: amplitude (the vertical size of change) that reflects the gap between the old and the new state;

stretch (the horizontal size of change) that reflects the number of employees affected by the change; the frequency with which the change is made; the way in which it keeps or not certain elements of continuity from the past; the way in which the announcement of the change has been prepared; the urgency of the change and the speed of its implementation required by managers; and last but not least, the extent to which the proposed change amends the way in which employees achieve their tasks.

Briefly, the influence of the change on employee resistance to change is also reflected in Table 1.

**Tab.1. The influence of the change on the intensity of the resistance to change manifested by employees**

C H A N G E	Forces that influence	Resistance to change	
		Small	Big
	Amplitude	small	big
	Stretch	local	general
	Frequency	repeated	singular
	Continuity	connected to the past	discontinuous
	Surprise	expected change	unexpected change
	Urgency	small	big
	Implementation speed	small	big
Changes the way things are done	to a small extent	to a large extent	

The manner in which each employee assesses change can generate a bigger or small opposition from employee's part. In this category we can also include as influence factors the following: the nature of employees activity, their trust in the manager who coordinates the change, the extent to which they agree or disagree with company's strategy and policy, qualification and how quickly they can find a similar job in another organization, job security, their potential for leadership, thinking style, age, temperament, their position in the organization's hierarchy as well as their seniority.

Shortly, employee's influence on the intensity of resistance to change is also reflected in Table 2.

**Tab.2. Employee influence on the intensity of resistance to change**

E M P L O	Forces that influence	Resistance to change	
		Small	Big
	Their perception	positive	negative
	The nature of their activities	innovative	routine
	Trust in the change agent	big	small
	Attitude towards company's policy and strategy	agreement	disagreement
	Level of training	big	relatively low
	Possibility of reintegration into the labor market	small	big

<b>Y E E S</b>	Thinking style	creative- innovative	conservative
	Leadership potential	small	big
	Job security	small	big
	Temperament	melancholic	choleric
	Age	young	old
	Position in the organization	important	insignificant
	Seniority	big	small

The intensity of employee opposition may be correlated with certain qualities and skills that the manager responsible for coordinating the changes have. Insofar as they have specific knowledge and apply change management principles, certain characteristics of their personality and management style can help reduce or increase employee resistance to change.

Briefly, manager's influence on the intensity of employee resistance to change is also reflected in Table 3.

**Tab.3. Manager's influence on the intensity of employee resistance to change**

	<b>Forces that influence</b>	<b>Resistance to change</b>	
		<b>Small</b>	<b>Big</b>
<b>M A N A G E R I</b>	Management style	participatory	authoritative
	Managerial abilities	excellent	satisfactory
	Holds and applies knowledge of change management	yes	no
	Holds and applies specific methods to reduce efficiently resistance to change	yes	no
	Communication and negotiation abilities	excellent	relatively low
	The degree of trust inspired to employees	small	big
	Leadership potential	big	small
	Position in the organization	top manager	bottom line manager
	Age	maturity	very young
	Experience	big	small
	Personality and charisma	strong	weak
	Innovative creative potential	big	small

Just as there are huge differences between the characteristics of the changes decided to be implemented in organizations, there are also huge differences between the attitudes of employees and managers, differences at the training level, commitment to organizational values and even their own personality. We find that there are a number of specific elements and processes that take place in organizations and they might contribute to a higher or reduced level of resistance to change from employees part.

We include in this category: organization's size, characteristics of the production processes (mass production, small production or series only), how much delegation of authority is used, characteristics of the organizational structure (a mechanistic structure where there are written policies and procedures to be strictly observed or an organic structure, where the goal is the achievement of the individual objectives), the way in which the payment and motivational systems are designed to work, the quality of the information system, characteristics of the organizational culture and the existence of trade unions in the company. Shortly, the influence of organization's peculiarities on employee resistance to change is also reflected in Table 4.

**Tab.4. The influence of organization's peculiarities on employee resistance to change**

O R G A N I Z A T I O N	Forces that influence	Resistance to change	
		Small	Big
	Complexity of the activity	big (high tech)	small (routine activities)
	Degree of centralization	small	big
	Production characteristics	small production and unique products	mass production
	Type of the organizational structure	organic	mechanistic
	The use of motivational systems for employees	yes	no
	A fair payment system aligned with the market labor	yes	no
	The quality of the information system	big	small
	The hierarchy distance	small	big
Organizational culture	pro change	conservative	
The pace of change in the organization	big	reduced	
Organization's market position	high	low	
The average age of stuff	low	high	
The existence of strong trade unions	No	yes	

**External forces**

Over the years it was found that a set of an increasingly complex and dynamic environmental forces exert a more powerful action over organizations. Even though we are tempted to believe that only internal forces exert an influence on employee's resistance to change, the reality is different. People react to a change also in terms of the specific characteristics of the business environment. We include in the category of external forces the following: the pace of the national economy development, the purchasing power of citizens, the unemployment level in the region, the professional reintegration opportunities, national culture characteristics, the dependence of an area or locality, as well as living standards.

Briefly, the influence of the external forces on the intensity of employee resistance to change is reflected in Table 5.

**Tab.5. The influence of the external forces on the intensity of employee resistance to change**

	Forces that influence	Resistance to change	
		Small	Big
EXTERNAL FORCES	The pace of the national economy development	small	big
	The purchasing power of citizens	small	big
	The economy is in crisis or recession	yes	no
	The unemployment level in the national economy	big	small
	Opportunities to change job	small	big
	Retraining opportunities	small	big
	Social instability	big	small
	National culture	pro change	conservative
	Dependence on a certain area	big	small
	The existence of some strategies and policies to promote the entrepreneurial phenomenon	no	yes
	Banking and insurance	weak	strong
	Wage dependence	high	low
	Standard of living	reduced	acceptable

### Conclusions:

Reducing resistance to change is a well defined and crucial phase in a process of change implementation in organizations. Successfully reducing employee's resistance to change creates preconditions for achieving a greater measure of objectives. For a successful completion of the reducing resistance to change phase important resources are needed. These resources are: necessary expertise in the field of change management, action coordination by competent change agents, time resources that will allow employees to accept the change as well as financial resources, necessary for motivating the affected by the change employees. By knowing the forces that can increase or reduce employees strength of opposition to the new ideas for change, managers can better coordinate the process, reducing the resources required to achieve the necessary commitment from those affected by the change, so that the implemented change is not reversible.

### Aknowledgments

**Abstract:** *There are many situations in professional life when for various reasons we are employed in jobs that do not meet our emotional expectations our professional capabilities, our passions and therefore performance on that job will not be high. Analysis of the causes of under-utilization of human potential and adoption of appropriate strategies according to employee needs help reduce staff turnover costs. The main objective of the present paper consists in identifying managerial strategies which contribute to the improvement of the employees' performances by stimulating their motivation, and the extent to which they are used in the managerial practice. Based on literature review we realized an integrated model and developed a classification, that present our own vision regarding performance improvement strategies. Our classification divides strategies for improving employees' performances into four main groups: by employees' development, by rewarding employees, by modifying the job description, by employee involvement in the organization. Starting from this model, through two types of questionnaires we have made an empirical research among managers as well as among office personnel, in order to capture both perspectives regarding the pursued objectives. For the present paper we will present only research results obtained for performance improvement strategies by employees' development because support a higher degree of generality and do not depend on the organization characteristics. A quantitative data analyze from the two samples show that there are differences between managers and employees perception when it comes to strategies used in their organizations and also manager did not know which determines employees to strive in order to improve their performance and obtain better results. The strategies to improve the employee's performances, proposed within this article have the role to show the fact that managers cannot determine every employee to be competitive by using the same methods, and therefore treating each differently person with the aim of creating for that person a favorable context for the development of the performance brings benefits at individual as well as at organizational level.*

Key words: performance improvement; motivational strategies; employee development; performance feedback; career planning; mentoring.

Jel clasification: M12; M51; M53.

## **1. Introduction**

As well as it may be forecasted, the evolution of economic conjuncture is accompanied by frequent restructurings, which affect the employees of a company in respect of quantity as well as in respect of quality. Knowledge of the employees' potential, performances and motivations and the ways in which these can be maintained represents one of the basic activities of the human resources management in an organization.

The first condition for improving the individual performance and reaching excellence in business is to recognize the role of human resources and to adopt appropriate strategies to determine the employees to fructify as much as possible the own professional potential. According to the opinion of some authors (Boswell and Boudreau, 2000: 283), in order to insure success, a company must know how to turn into account its employees' potential. Of course, we all can do more than we believe and the role of management in every organization is to turn into account the qualities and potential of its employees and to make their weaknesses (flaws) imperceptible. Considering that this study is part of a boarder research regarding the process of performance appraisal we defined the following objectives for the present article:

- identify motivational strategies used by managers in order to improve the performance of their employees;
- identify the differences between the perception of the managers and the perception of the employees regarding the ways to improve the performances;
- identify motivational strategies that would cause employees to achieve better performance.

The reason we chose to address performance and ways to improve it, from a strategic perspective is the fact that the management of organization must have a vision of efficient use of human resources. The need for a strategic thinking stems from environmental characteristics, found in a changing shift that is seen as a condition of progress.

## **2. Literature review**

The organizations' possibility of progress may only be achieved if these pursue continuous performance and therefore it represents one of the main objectives at the level of the organizations' management. Many of the studies approach only the organizational performance (Koning, 2004), but for instance 98% of the subjects of a study consisting in executive managers of average and big companies have stated that improved performance of the employees would lead to an increased performance of the company.

Numerous studies and statistical indicators (Campbell et al, 1998; Chen and Kuo, 2004) demonstrates that the success and competitiveness of organizations depend largely on the professional performance of employees, and the ways to improve it should become a pressing and permanent concern, in a competitive market.

Current concerns and organizational practice did not reach sufficiently convincing results in this area, recognizing the need for new searches and involvement of additional forces to identify as acceptable solutions. In addition, Romania studies (or their results) on strategies to improve employee performance are limited or are not sufficiently comprehensive.

Over time, management staff was asked what methods to improve the performance of work for their employees are more appropriate. We consider the issue of motivation as essential to human activity, for understanding and explaining behavior in general and especially those within organizations and therefore we can not talk about strategies to improve performance without implicitly bring into question the concept of motivation.

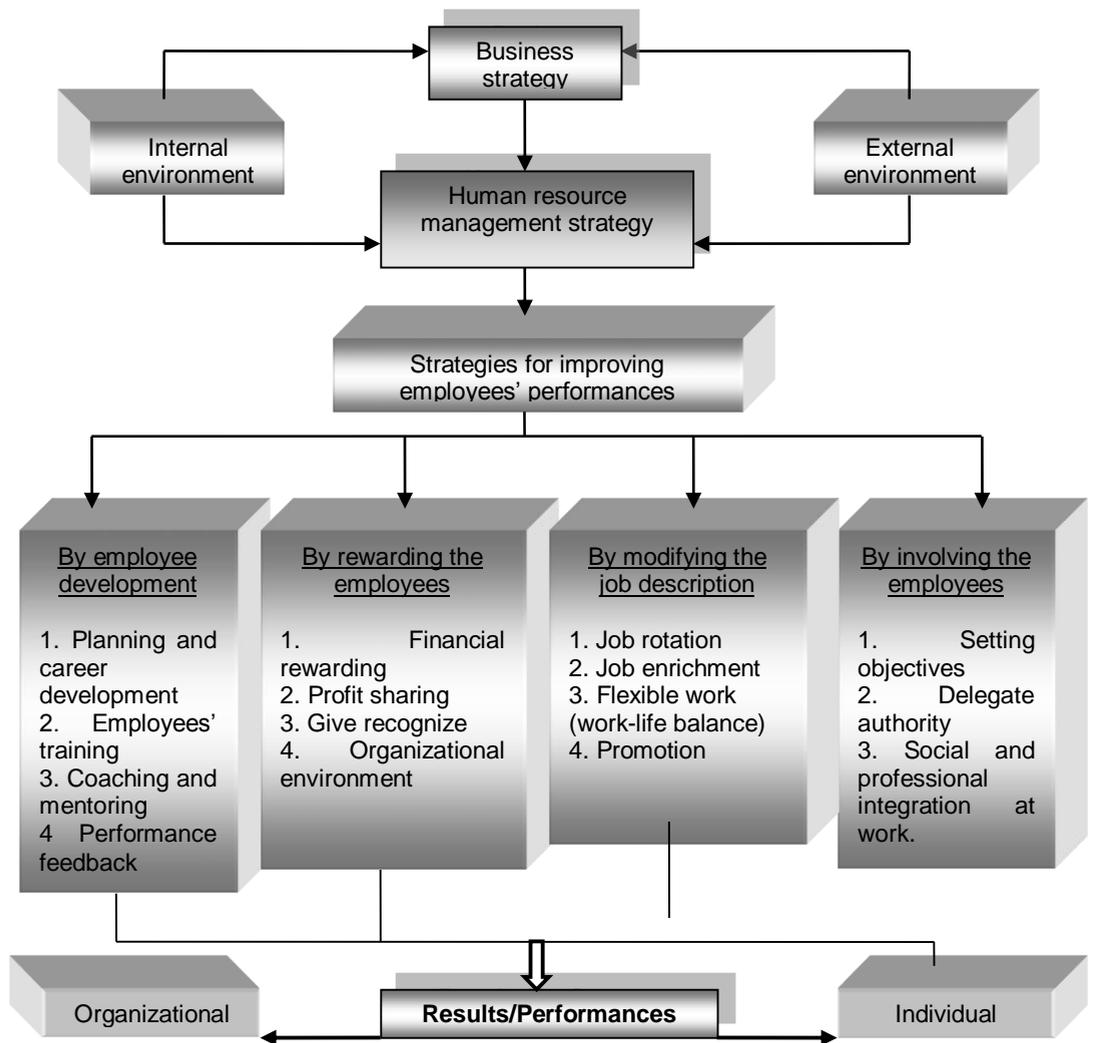

Studies (Ielics, 2001: 151) show that many managers believe that addressing behavior in terms of motivation is particularly difficult, while the problems that arise can take the following form: „how to persuade employees to do what you want?“ or „how can you be sure that employees will be working without direct and constant control?“

According to a study ([www.managementtoday.com.uk](http://www.managementtoday.com.uk)), conducted by Investors in People, a non-profit organization 30% of employees in the UK suffer from a lack of motivation at work, which is why 43% of them want to change jobs in the next 12 months.

Regarding the reasons for which they did not find motivators in work, 28% of employees who participated in the research said that a major reason is that do not receive support from superiors. Also 18% complained of the large amount of work, another 18% believe they are underpaid, while 17% of them believe that the main reason of demotivation is the lack of directions in career planning and development. This latter percentage increases to 24% for those already working two years in the same position.

If the goal for what people working is to live a decent and comfortable life, then their motivation is achieved through salaries, bonuses, or other organization facilities that provide comfort. There are also people who have provided this comfort for several generations and still continue to work. For some that they, we understand that work is a challenge, and part of their lives, giving them the opportunity of socializing and interacting with other people. These people can not be motivated by money or other financial incentives and therefore managers should know that their motivation for performance consist in providing a varied and challenging work or social rewards (eg, public recognition of the value of work performed).

For a better visualization of the classification strategies to improve employee performance, we designed an integrated model from detailed study of the literature, without pretending to be an exhaustive classification, given that human resource activities are interdependent and show intense linked. We took into account the need to estimate influences that may arise from internal and external environment of the organization. In order to obtain individual performance and organizational effectiveness, human resource strategies is a prerequisite, which is interposed directly in the process, as seen in figure 1

**Figure 1:** A model concerning the strategies for improving employees' performances  
 Source: author's conception

After analyzing articles in the field we shared motivational strategies to improve employee performance in four categories as: strategies to improve performance by employees' development, by rewarding employees (financial and non-financial), by modifying the job description and by employee involvement in the organization. Of these we choose to present only research results obtained for first group, performance improvement strategies by employees' development because support a higher degree of generality and do not depend on the organization characteristics. Another reason is that the most of the studies and specialty items made correlation between employee motivation and their development needs and that is why we tried to realize a comparison with results found in literature.

An important part of the theoretical and empirical research in this field aim to show that human resource strategies is a differentiating factor in business activity, but also provides a competitive advantage in the market (Grund and Sliwka, 2009: 2050; Koning, 2004: 3). In contrast, the number of articles and studies that establish a clear link between human resource strategies and performance improvement at the individual level (among employees) are lower, especially in Romania.

The continuous development of human resources involves identifying and capitalizing opportunities of lifelong learning to form a stock of valuable and competitive human capital and better use workforce. (Oniciuc, 2005: 37).

Human resource development should be a coherent process oriented to facilitate personal and professional development of employees, enhancing creatively the results of their work. This leads on the one hand to improve the performance of human resources, thus having an effect on growth company's performance, and secondly to increase workforce capacity to adapt to the requirements/needs of the market, thereby increasing the chances of finding a new job in terms of restructuring or changes in the organization.

### **3. Research methodology**

The target group of the study is represented by general managers, human resource managers and office personnel. The study was conducted on a sample of 40 organizations in production and services from private sector, in north-west of Romania. In order to achieve the objectives of the study, data was collected through two questionnaires, self-administered that were designed separately for the two target groups to capture both managers and employees' perspective on the most used ways to improve performance at workplace. Regarding questions we used mainly closed questions, with choice. Some of the used variables were built as Likert items with a scale from 1 to 5 (In a small extent; In a very large extent). Data was collected through a quantitative tool, a questionnaire, which took into consideration the following questions: „What made you get better performance at work?“, „What methods are used to improve performance by your manager?“ (for employees), „In order to improve the performance of your employees what are the most commonly used methods?“ (for managers).

Once you have applied the two types of questionnaires were obtained responses from 40 managers (general managers and human resource managers) and 80 employees, belonging to the executive sphere. Anonymity was ensured during the whole process of data gathering and analysis, no names or personal details being requested from respondents.

### **4. Results and discussions**

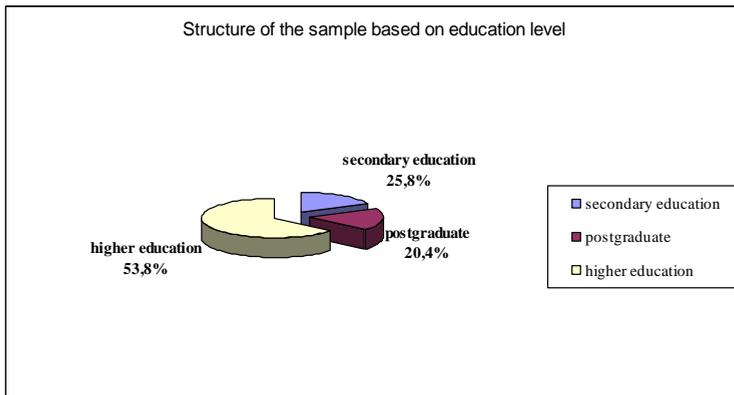

#### **4.1. Respondent's demographic characteristics**

In the following we present the structure of the two samples according to some socio-demographic characteristics: size of company, respondents' age, seniority in the company and on the job, level studies. Most respondents work in large firms (62.1%), followed by those working in medium-sized firms (17.6%) and small firms (12.4%); the rest work in micro firms.

The average age of managers-respondents is 43 years old and the post length within the organization is 8 years and a half, on average. In this way we made sure that

people who answer the questions have experience and service seniority in the organization (average 11 years), so that they can provide relevant answers regarding the study objectives. In terms of vocational training of respondents dominated by those with higher education (58.3%), but only one third of them attended postgraduate (31.7%), which shows that the majority were not conditioned by completion of a master's program to be promoted and are not concerned with its own development and lifelong learning.

Next we analyze the sample consists of employees in executive positions, so that their average age is 35 years, seniority in the firm is on average 7 years and 5 years in current position, which we can indicate a low staff fluctuation. Age of respondents is a variable that must be taken into account in the processing and interpretation of data, being a factor of influence in matters related to motivation and job satisfaction. Given the sample distribution by level of education of respondents we can observe in figure 2 that 53.8% of them are graduates of institutions of higher education, followed by those with secondary education (25.8%), while the percentage of respondents registered postgraduate (masters) is 20.4% We believe that the vocational training of employees is an important variable that influences their motivation for performance, and strategies to improve performance used by managers. Therefore in our research we aimed to test the following hypothesis: "There is a direct, positive correlation between educational level and employees' preference for strategies to improve performance through development " .

**Figure 2:** The structure of the employees respondents based on education level

To highlight the main aspects and elements, a descriptive statistics analysis has been used. Since the variables are ordinal ones, we have analyzed the values of the median.

In order to notice if there are significant differences between the respondents' answers, managers respective employees, in the interpretation of the results we will use the values of the t test on the two pair samples. Independent samples t test is used to test the difference between the averages of the same dependent variables measured in two groups consisting of different subjects. The reason for choosing such analyze solutions was based on the fact that in the case of this research subject, in order to obtain wider and more relevant results it is necessary to have the managers' opinions as well as the employees' perspective.

#### 4.2. Planning and career development.

One of the best ways to ensure long-term commitment and loyalty of employees to the organization is to transform a job of some into a career for that employee (Harrington, 2001: 234). Indeed the best way to keep employees is to make them understand that they have a future in the organization and thus will devote personal time to prepare for the opportunities for promotion that might occur.

Although in literature career planning is considered a key element in the human resources strategy and an essential component of career management, practice shows that managers do not give due importance considering it's a pointless waste of time and resources. For example the study conducted by Marinas (2010: 329) on a sample of 150 organizations in various fields show that frequency of use of career plans in the promotion of employees of Romanian companies is quite low. This is evidenced by low mean score (3.62) obtained from the processing of responses (using 7-step scale). The same study show that among the types of companies investigated, large companies are using in the lowest proportion career plan as a tool for career planning (21.43%). Promoting employees, iniquitously, on the needs of the moment impulse is evident expression of short-term orientation, the main value of culture in Romania.

Our research results show that for employee career planning and development is one of the strategies that would most determinate to improve their performance at work (mean 4.08). Analyzing the responses from managers we can notice that planning and career development of employees is not a motivational strategy often used by them (average 3.28), and results on sample of employees confirms this (average sample consists of employees was 2.52). Because the questions were the same, for both managers and employees we use statistical analysis. T-test indicate that is a significant difference between the opinions of the two groups and between the scores recorded in this variable (t-test value is 4,650,  $p < 0.01$ ).

We believe that managers consider employee career planning as a difficult activity difficult, devoted exclusively to the interests of employees and actually can not see the benefits at the organizational level. In exchange for the employees it represents guarantee of a job in the company they belong. Therefore further we present some advantages of career plans both for individuals and for the organization.

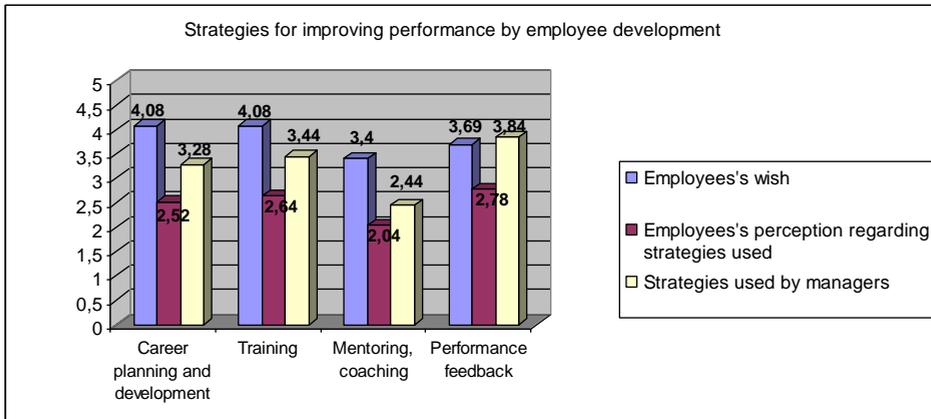

**Table 1:** Advantages of career plans

<b>Organization</b>	<b>Employee</b>
• reducing the costs of employee turnover	• development potential to promote the organization's hierarchy
• attracting and retaining performing employees	• increased autonomy and responsibility
• employee loyalty	• increase employee satisfaction
• increase employee performance	• achieving knowledge and experience

Source: adapted after Chişu, 2002: 315

Other authors (Harrington, 2001: 238) argue that without career planning, there is a risk that the organization have a workforce underused, disappointed, error-prone and migrating towards other organizations. We believe that in terms of organization, career planning can reduce the costs of labor movements, but also will benefit from

greater loyalty from them. Internal environmental changes are imposed by the new strategy determined by the appearance of new products, markets change, new technological requirements, the changes in the organization. Just these mutations whose pace is fast determined the need for career planning and practicing its management.

**Figure 3:** Different perspectives regarding using of performance improvement strategies in Romanian companies

### 4.3. Employees training

Training related to professional development is one of the main ways in which organizations can enhance employee performance (Bocean, 2009: 27). Between training and development must establish a certain distinction, at least in principle. Giscard (in Russu, 2004: 156) says that the training is to develop new capabilities, while developing involves improving existing capacities.

Total expenditure per employee of Romanian companies for training, make that Romania ranks last, while participating in professional training programs remains low. Thus in 2005 only 1.1% of the population in the age range 25-64 years participated in training as against the EU average of 9%. The situation was a serious concern because place at a significant distance Romania to the European target of 12.5% for 2011. (<http://www.mmssf.ro>).

From our research results (figure 3) it can be notice that participation to training and development is seen by employees a way that stimulates them to improve their performance (average 4.08), but their perception is that the organizations they belong to, is not really a strategy used by managers (average 2.64).

One reason may be the cost of such training (only 1.5% of the total human resources costs at company-wide are allocated for training activities) and also the fact that not always training needs are correctly identified among employees.

Responses received from the manager show that training programs are ranked 2 among performance improvement strategies they use in organizations to which they belong, and statistically there is a significant difference between the opinions of two groups (t-test value is 2.905,  $p < 0.01$ ).

The study conducted by Society for Human Resource Management revealed that 40% of managers consider employee training as the most important activity of human resource management (Knorad and Deckop, 2001: 270).

The explanation of such guidelines is that potential employees' work and thus their ability to obtain performance is limited time, not only in terms of age employees, but especially in terms of their migration to other companies. According to American managers, employees must be oriented to improve their performance so as to generate added value to the company. In conclusion we believe that training of employees, even if it involves some investment is a source of profit for the company able to guarantee its survival and stability of employees who are better trained and better paid. Also we believe that in case of major technological leaps, training all staff is definitely a supporting measure. In our opinion it is not enough for companies to provide employee training programs; more importantly, they should develop specific practices that seek the human potential (knowledge, experience, skills) new acquired in these programs to be capitalized in order to improve employee performance.

#### **4.4 Coaching and mentoring**

Coaching is "an interactive process through which managers and supervisors seek to resolve performance issues or to develop staff capacity through collaboration and based on three components: technical support, personal support and individual challenge" (Luecke, 2004: 2). The aim of the coaching is to improve professional performance, correct inappropriate behaviors and unlock a person's potential to maximize their own performance. Both results obtained on the sample consists of managers and those obtained on the sample consists of employees shows that mentoring and coaching are not ways to persuade employees to strive for better results (it was recorded the lowest average 3.4), nor strategies used by managers to motivate their actions for performance (average 2.44). This was the only variable for which we obtained agreement between the answers to the three questions. T-test statistical analysis indicates that no significant differences between scores compared are recorded ( $p > 0.05$ ), averages being very close (2.44 on managers' sample and 2.04 on employees' sample).

We believe that involving the employee in a personal process of exploration and discovery, setting goals and implementing a specific action plan, followed by appropriate feedback, coaching leads in time to obtain good results. Through coaching activity employee understand what are his limitations, which is the source of its failures and are supported in discovering the causes which prevent progress in a particular area or time (Bocean, 2009: 29).

Unlike coaching, mentoring initiative is the one who wants to develop, taking responsibility for this (Wanberg, et al, 2003). According to Luecke (2004: 78), the final difference between the two activities could be summarized as follows: coaching refers to the current job and current work, while mentoring concerns the career in general. Indeed these activities require effort, involvement and interaction daily workplace managers with subordinates, and from the results of our research we can conclude that there is actually no availability for developing coaching and mentoring programs to guide and orient employees.

#### **4.5 Performance feedback**

Through several studies that had examined the effects of feedback on performance concluded that that generally, people who receive immediate and frequently feedback achieve better performance than those who are not receiving (Stewart and Brown, 2011: 314). Other studies show that intake of feedback to enhance

professional performance of employees is significantly, recorded an improvement in results between 8-26% in average. According to Aubrey (2007: 174) in many cases performance even doubled shortly after the introduction of feedback.

The purpose of feedback is to determine the necessary actions to improve performance, corrective actions can be, but it is desirable to be preventive. Deficiencies in providing feedback contribute greatly to the problems of poor performance, yet most organizations do not have an effective system for providing performance feedback to their employees. Even companies that communicates to employees twice a year production figures and quality indicators actually gives them information, no feedback that have little impact on improving workplace activity. Feedback is a vital part of an individual's performance and development and therefore an organization needs to decide above all if the purpose of the feedback is developmental only, or if it will be evaluative and linked to promotion and reward (Rațiu et al, 2011: 344).

As you can see in figure 3, in order to improve the performance of their employees, managers surveyed say they use most often feedback (mean 3.84). This result is confirmed by more than half of the employees who responded to the question: What methods are used to improve performance by your manager? (mean 2.78).

Between the two samples pairs were obtained significant differences in responses, that was indicated by t-test values ( $t = 4,650$ , for  $p < 0.01$ ). Instead, performance feedback is not the preferred way to employees when it comes to what cause them to improve their work (mean 3.69), because they are afraid of receiving negative feedback.

Initial reaction of employees who receive negative feedback can be to make a greater effort, unless they are confident that they will experience success in terms of future results (optimistic perception of their own abilities). Otherwise, employees whose results are below expectations will become demotivated, will become defensive or conflicts with other employees. Therefore, an important aspect to consider to ensure that negative feedback leads to improved performance is confidence and helping employees, for them to realize that however have the necessary skills to improve future performance.

Unfortunately, many managers find it difficult to discuss the negative aspects of assessment and therefore try to avoid interview feedback. But, this is not the most appropriate solution, because an employee may not always be aware of his weaknesses and their consequences; therefore these can not be removed if the employee is not connected to the feedback. We believe that one of the manager's skills is the communication of a poor outcome of the assessment, along with discussions about ways to improve employee work without causing strong resentment along employees.

Another objective in our research was to test the following hypothesis: "There is a direct, positive correlation between educational level and employees' preference for strategies to improve performance through development".

In order to check the existence of a statistical link between these variables we have tested this assumption by correlating the level of education variable and the variable "I am determined to improve my performance in the following ways": career planning, performance feedback, training, mentoring (Pearson correlation). A single positive correlation was found between these variables, namely, the level of education correlate with career planning (the sig 2-tailed = 0.035,  $p < 0.05$ ; Pearson's

correlation coefficient is 0.384). One explanation, in our opinion, could be related to the fact that not everyone is interested about professional development and career planning; these are often an intrinsic motivation, only for those ambitious, for those, who needs esteem and achievement are important, so that their satisfaction will lead to progress on Maslow's pyramid. This conclusion is particularly important for companies' management, while the possibilities and opportunities for promotion and career development is an important way to boost employee performance.

## 5. Conclusions

Human resource strategies are increasingly necessary as essential components of human resource management conditioning the development and rational use of personnel of an organization. Strategies to improve performance costs are much lower than the losses caused by fluctuation of employees and their dissatisfaction. Conflicts, sabotage, defensive behavior, intensive fluctuation are just some of the forms of employee dissatisfaction. Fluctuation is costly and deeply dysfunctional and employee's departure affected good work in an organization, because on the one hand, a certain amount of time, colleges must take the burden off, on the other hand need to find a person in place, mean time to integrate in relation to current tasks and team work.

The result of this study bring into attention the fact that the perspectives of managers and employees from surveyed companies are quite different in terms of performance improvement strategies. Besides one variable (mentoring and coaching) for all other were recorded significant differences between the two groups. Therefore managers should pay more attention when chose strategies for improving their employees' performance, because not all of them react in the same way, due to different education levels, needs and motivational structure.

Concerning our hypothesis, one could say that it is partially validated since employee preference for certain strategies vary by level of educational attainment. Employees with higher education levels are determined to achieve better performance if their superiors are concerned about giving opportunities to plan and develop their career, for designing a clear pattern against which they can report their expectations and to direct their efforts.

In our opinion, one of the main measures that could to be taken in order to increase employees' performance, refers to fact that managers cannot determine every employee to be competitive by using the same methods, and therefore treating each person differently with the aim of creating for that person a favorable context for the development of the performance, brings benefits at individual as well as at organizational level. But, to perform this role, full understanding human behaviour and appropriate use of these strategies is required.

# FACTORS AND REASONS THAT CAN MAKE USERS TO INCREASE THE USAGE OF SMARTPHONE SERVICES

**Roman Teodora, Vasilache Silviu**

*Department of Management, Marketing and Business Administration*

*Faculty of Economics and Business Administration*

*„AL. I. CUZA” University of Iasi, Romania*

*throman@uaic.ro*

*silviu.vasilache@gmail.com*

**Abstract:** *The purpose of this paper is to identify and analyze factors that influence the users of the telecommunications smartphone services for increasing the usage of such services. The first approach adopted was to study the literature review related to the technology acceptance models and the second, to test the hypotheses by using SPSS regression analysis. The research was performed in three multinational companies operating in Romania, collecting data from 307 respondents via a web questionnaire survey between 11th – 24th of February 2013. Since many companies have been used in their business the new technology, it is important to link the users' motivations with the specific of telecommunications services, in order to improve, in the end, the job performance.*

*The findings suggests that the users of smartphone services are very much influenced by practical reasons of getting access to the smartphone services, so that the telecommunications operators should consider the factors in the model to promote and increase the usage.*

*In this paper the conclusions related to the reasons and direction that can make users to increase the usage of smartphone services are coming both, from multiple factor regression analysis, as well as from the analysis of the sample research profile.*

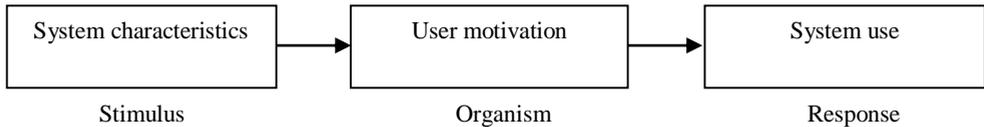

**Keywords:** *high technology, smartphone services, technology acceptance model, “national globalization”, remote management.*

**JEL classification:** *M31*

## **1. Generally Introduction**

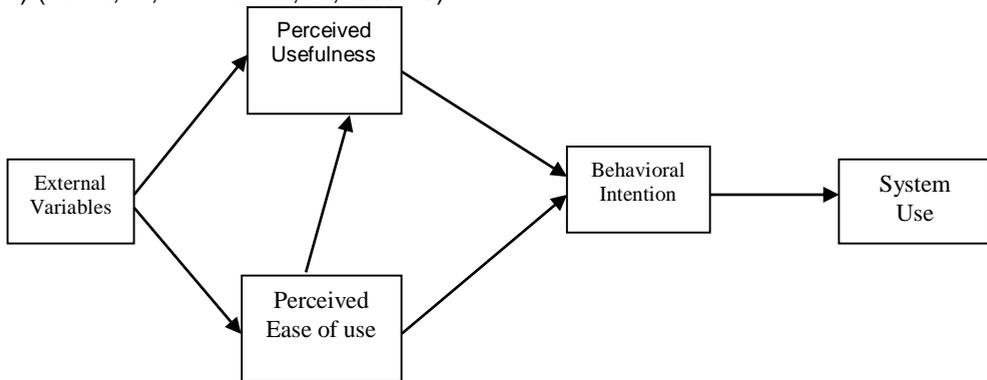

“Technological innovation is one of the causes of economic growth. Inventions drawn from new technologies and their rapid commercialization are bringing about a material richness in the lives of people” (Ishikawa, A., Tsujimoto, A., 2006:23). The progresses made in technology areas brought major changes in the last century at the level of producers, consumers and markets. The new wave of digital technology enables people to express themselves and collaborate regardless of different geographical areas they are living in. What they need to know, under these circumstances, is how to benefit efficiently by the technological advantages that are all around them becoming more common they thought in the early days. Many researchers were concerned about the reasons people accept and adopt new technologies and, in this respect, developed different models out of what the most popular remained the technology acceptance model.

The Technology Acceptance Model, proposed by Fred Davis in 1985 in his doctoral thesis at MIT Sloan School of Management, Cambridge, Massachusetts, USA is one of the most popular and used theory benefiting from most attention that explains the acceptance reasons of new technologies by users (Bagozzi, R.P., 2007: 22). In his initial theory Davis suggested that the use of a technological and information system is a response and could be explained and anticipated depending on the level of users' motivation which, at its turn, is directly influenced by external stimuli consisting of characteristics, parameters and technical data of that system (Figure 1) (Davis, F. D., 1993:487).

**Figure 1:** Conceptual model of technology acceptance  
Source: Davis, 1985

Based on the importance of Davis theory, this was developed during the years by different researchers getting a final version in 1996 by Venkatesh and Davis (Figure 2) (Davis, F., Venkatesh, V.,1996:45).

**Figure 2:** The final version of technology acceptance model  
Source: Venkatesh and Davis, 1996

The telecommunications sector is, by definition, one the most exposed to the technological progress and innovation due to the following aspects: imply high technology devices, the means to transform the capabilities of equipments into services are related to a reliable network implying high technology too and the terminology and language is close to IT and technical domain again. One of the very well known theory that describes the influence of innovations on the users' behavior and decision to accept high technology is the Diffusion of innovations developed by E. Rogers starting with 1962. The diffusion of innovation refers to the spread of an abstract idea, concept, technical information and actual practices within a social system using communication and influencing (Rogers, E.M., 2003). The decision-

making process would be influenced by the characteristics of innovations that determine an individual's behavior to adopt or reject an innovation.

The innovation characteristics are highly important in determining the diffusion of that innovation through the members of a social system increasing or not the adoption rate. The spread of a new idea is basically influenced by four main elements: the innovation itself, communication channels, time and a social system. During this communication flow, the idea is rarely evaluated from a scientific standpoint; rather subjective perceptions of the innovation influence diffusion and then the adoption decision (Wejnert, B., 2002:326).

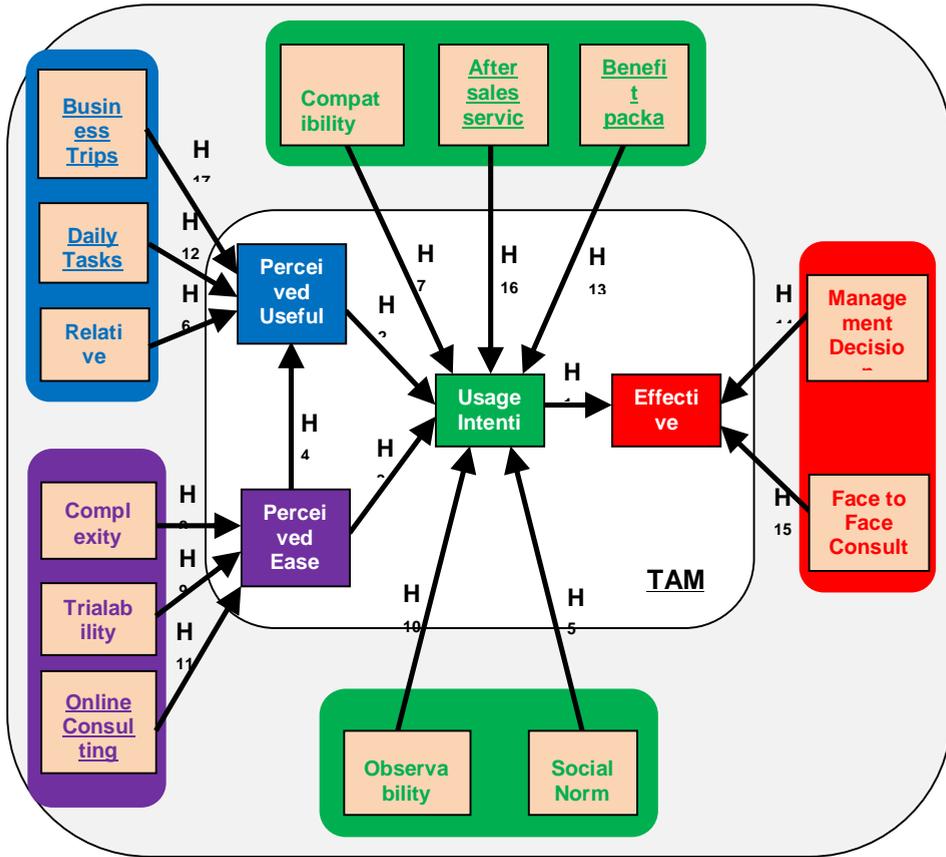

## **2. The research model and hypotheses development**

As a result of studying different theories related to high technology acceptance, the focus in designing proposed research model considered as the background the Technology Acceptance Model (TAM) and it was developed by attaching the variables coming from the specifics of the smartphone services sector within the multinational companies context. What was considered as external variables in the final version of TAM get shape by specifying them in the proposed research model (Figure 3), on the one side, using the attributes of the innovation and on the other side, using the variables coming from the researchers' experience and specialization.

Taking into account the fast progress of technology, the new products and characteristics developed within the telecommunications industry, the others becoming obsolete and useless, the review of the literature and the experience in the field of more than seven years, the smartphone would be described as a mobile phone equipped with an operating system such as: Android (Google), IOS (Apple), Windows Phone (Microsoft), Blackberry OS (RIM) etc. on which can be run multiple applications capable to perform different actions: internet access, document office package, email, messenger, multimedia, agenda, etc., making it very close to a pocket personal computer.

Independently, the smartphone represents just a complex device with huge potential, but without final purpose. Making a parallel thinking with the definition Bouwman et al. (2008) gave to the internet services as being an activity or series of activities that happen when consumers are travelling, the services being delivered by a mobile operator that ensures the connectivity (Bouwman, H., Carlsson, C., Walden, P., Molina-Castillo, F.J. & al., 2008:93), smartphone services could be defined as being those activities and services that can be performed in real time due to the proper integration of the smartphone characteristics and the capacity of the telecommunications operators to value them anytime and anywhere.

The TAM was found as a very usable one with a very important emphasis on the usefulness, ease of use and external variables that are different from business to business (Yousafzai, S.Y., Foxall, G.R., Palliester, J.G., 2007:280).

**Figure 3: Proposed research model**

Telecommunications services have three impacting parts:

- the continuous need of communication between people, especially in a globalization era when the information is required to circulate very fast between people, people and companies, between companies etc.
- the complexity coming from the intrinsic nature of the products that contributes to perform them: user device, technology network and the software included in the device in order to make possible the connectivity
- the level of knowledge that the users should have to perform them effectively. In the digital era, the product development exceeds the speed at which the user can understand and adopt new technologies and, as a consequence, the product performance is far in advance to the consumers' needs (Kotler, P., Caslione, J.A., 2009).

Accordingly, we hypothesize that:

*H<sub>1</sub>: The intention of use (IU) will have a positive influence on the effective usage of smartphone services (EU)*

*H<sub>2</sub>: The perceived usefulness (PU) of smartphone services will have a positive influence on the intention of use*

*H<sub>3</sub>: The perceived ease of use (PEU) of smartphone services will have a positive influence on the intention of use*

*H<sub>4</sub>: The perceived ease of use (PEU) of smartphone services will have a positive influence on the perceived usefulness*

*H<sub>5</sub>: The social norm(SN) will have a positive influence on the intention of use*

As explained in the diffusion of innovation theory the attributes of the innovation could significantly contribute to the decision of adopting or rejecting the new idea or system, in our case the smartphone services. In the mobile telecommunications services it can be seen a range of reasons people use them and a survey made with the students at the University of Ibadan, Nigeria in 2005 showed that: 42% use them because is the latest technology, 75% considers that facilitates the communications on the move, 52% appreciates the access to the information in real time, 50% of the students use them because ensure the communications with friends and colleagues and other reasons refer to the fact that they are used by many people and indicate a certain level of social status (Olatokun, M.W., Bodunwa, I.O., 2006:547).

Considering the high level of technology used together with these services, the day by day need of them and the high speed progress made in this business area when an innovation is replaced by the other in just six months (Omekwu, CO., 2006:863) we hypothesize that:

*H<sub>6</sub>: The relative advantage (RA) of smartphone services will influence the perceived usefulness*

*H<sub>7</sub>: Compatibility (CMP) with smartphone services will influence the usage intention*

*H<sub>8</sub>: Complexity (CPX) of smartphone services will influence the perceived ease of use*

*H<sub>9</sub>: Trialability (TLB) of smartphone services will influence the perceived ease of use*

*H<sub>10</sub>: Observability (OBS) of smartphone services will influence the usage intention*

The information technology (IT) is one of the major factors of the globalization process in both, commercial sectors and geopolitical area. The progresses made from early 1990 to our days in software development, telecommunications and digital technology led to a rapid transfer of data and knowledge in the entire world (Kotler, P., Caslione, J.A., 2009). Starting with 2000 in Romania started the process of centralizing the legal entities of the big companies in only one, as a headquarters in one location, keeping in the territory only points of sales, branches or, at best, the subsidiaries. In this way they moved, in fact, the strategic thinking at a national level, while the execution remained at the local level, naming, in this way, in our view, the "national globalization" of businesses where the scale economy and other administrative advantages could be better exploited. Therefore, the management of the whole company consisting of one legal entity – headquarters - and point of sales, branches in territory, changed consequently, moving mainly from face to face management to "remote management" when telecommunications and travelling became very necessary. Moreover, the management of the company related to human resources considers more and more in the benefit package the allocation of telecommunications devices and services making possible the connection anytime and anywhere. Thus, the context of smartphone adoption is influenced both, by individual factors that could be: age, education, experience and personal traits and

organizational factors that include: top management support, size, user involvement and product champion (Park, Y., Chen, J.V., 2007:1365).

The complexity of telecommunications services, as a cumulated consequence of the equipments and technologies complexity associated with specific notions and language lead to the idea that the access and the usage of the related services could not be anymore the result of using by chance, of simple intuition, repetitive attempts, feelings or luck (Ishikawa, A., Tsujimoto, A., 2006). Based on the above reasons and the experience in field of the researchers, we hypothesize that:

*H<sub>11</sub>: Online consulting (OLC) offered to the users will influence the perceived ease of use*

*H<sub>12</sub>: The daily tasks performed by employees (DTP) will influence the perceived usefulness*

*H<sub>13</sub>: The benefit package supplemented (BPS) with smartphone services and devices will influence the usage intention*

*H<sub>14</sub>: The top management decision of the company (TMD) will influence the effective usage of smartphone services*

*H<sub>15</sub>: The face to face consulting (FFC) will influence the effective usage of smartphone services*

*H<sub>16</sub>: The after sales services (AFS) related to smartphone will influence the usage intention*

*H<sub>17</sub>: The business trips (BT) will influence the perceived usefulness of the smartphone services*

Kotler, Kartajaya and Setiawan (2010) mentioned in their book Marketing 3.0 (p.85): "(...) that there are two distinct ways to convince people. The first one is to base your ideas on a set of facts and numbers and engage people in intellectual arguments. An alternative, which he thinks is much more effective, is to write compelling stories around the ideas and engage with people emotions instead". Based on this, the study of beliefs and virtual relationships between people that influences behavior becomes more and more important and it is the top priority when new products and services appear on the market.

### **3. Research methodology**

The instrument of this research was a web questionnaire composed of three sections. The first section included terms, definitions, estimated time to complete and some clues about the completion. The second section included the 48 items for measuring the independent variables and multi-items were used to measure each. A five-point Likert scale was used to measure the items from strongly disagree to strongly agree. Most of the items, related to H1-H10, were found in the previous researches related to technology acceptance and the items related to H11-H17 were based on the experience in the field and the specialisation of the researchers. The third section included the demographic data about the respondents.

#### **3.1. Sample and measurement**

The research population was coming from the employees of the three multinational companies covering the whole Romanian territory. There was emailed 617 web questionnaires and of those, 589 were received and 28 were returned undeliverable. From a total of 344 questionnaires accessed between 11th-24th February only 307 were finalized, 37 remaining incomplete. The population of smartphone services

users was at a level of 289 which shows a response rate of 46%, while 18 respondents were non smartphone users.

The internal reliability of the multi-items scale was measured using the Cronbach alpha analysis in SPSS 20. Results indicated higher value than 0.7 (Table 1) which is considered acceptable , except the Complexity that due to its low value of 0.245 was removed from further analysis.

**Table 1: Mean, Std Deviation and Cronbach alpha of factors**

<b>Factors</b>	<b>Mean</b>	<b>Std. Deviation</b>	<b>N</b>	<b>Cronbach alpha</b>
Effective usage	4.11	0.537	289	<b>0.897</b>
Usage intention	4.58	0.584	289	<b>0.850</b>
Perceived Usefulness	4.29	0.625	289	<b>0.887</b>
Perceived Ease of Use	4.19	0.547	289	<b>0.732</b>
Relative Advantage	4.01	0.724	289	<b>0.865</b>
Compatibilitz	3.97	0.688	289	<b>0.847</b>
<b>Complexity</b>	3.77	0.561	289	<b>0.245</b>
Trialability	4.11	0.600	289	<b>0.732</b>
Observability	3.82	0.696	289	<b>0.695</b>
Social Norm	3.34	0.783	289	<b>0.763</b>
Management Decision	3.54	0.956	289	<b>0.924</b>
Benefit Package	3.41	1.005	289	<b>0.892</b>
After Sales Services	4.03	0.739	289	<b>0.819</b>
Online Consulting	3.74	0.819	289	<b>0.812</b>
Face to face Consulting	3.78	0.739	289	<b>0.853</b>
Business trips	4.27	0.719	289	<b>0.891</b>
Daily Tasks	3.73	0.847	289	<b>0.838</b>

### **3.2. Hypothesis testing**

Considering the big number of variables, independent as well as dependent, the hypothesis testing was performed using the regression analysis in SPSS 20. The first approach was to demonstrate Technology Acceptance Model (TAM) with H1-H4. In summary, this research confirms the results of TAM with IU having a positive significant influence on Effective Usage (Beta=0.598, Sig.=0 ), then PU and PEoU had a positive impact on IU (Beta=0.626 and Sig.=0 and Beta=0.547 and Sig.=0.02) and finally USP having a positive significant influence on UTP ( Beta=0.422 and Sig.=0). The other two variables considered by researchers as having influence on EU namely, MD and FFC showed as follows: MD positive significant impact (Beta=0.587 and Sig.=0) supporting H14 while FFC was demonstrated not to be significant (Beta=0.075 and Sig.=0.06) and thus not supporting H15. This could

come from the fact that in the tested population 62% of respondents have been used smartphone services for more than two years.

The second approach was to test the other hypotheses related to IU, UTP and USP constructed based on literature and the experience of researchers. Out of seven hypotheses related to IU it was showed that two of them (PU and PEOU) were part of TAM and significantly impacting IU and from the other five only one, CMP, (Beta=0.738 and Sig.=0) demonstrated strong positive impact to IU supporting H7, while the other four showed not significant influence on IU as follows: AFS, negative and insignificant influence (Beta=-0.094 and Sig.=0.13), BT as well negative and very insignificant (Beta=-0.041 and Sig.=0.45), the SN was found not influencing IU with Beta=0.075 and Sig.=0.15 and OBS not being significant as well (Beta=0.059 and Sig.=0.37) finally not supporting H16, H13, H5 and H10. The hypotheses related to PU, H17, H12, H6 and H4 proved to be true with significant impact as follows: the strongest positive impact had AR (Beta=0.556 and Sig.=0), then BT with Beta=0.301 and Sig.=0) while the DT showed negative significant impact (Beta=-0.183 and Sig.=0). PEOU as part of TAM had a positive significant impact on PU with Beta=0.422 and Sig.=0.

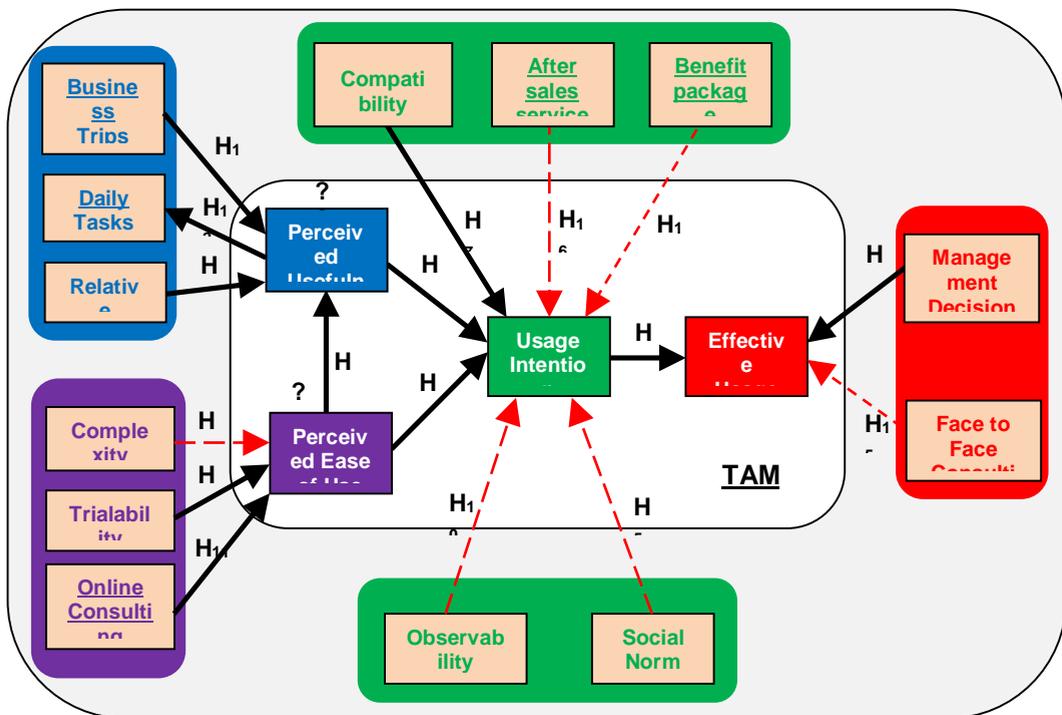

Figure 3: Proposed research model with the entire sample

.....> it was mentioned with dotted arrows the not supported hypothesis  
 In the end, of the three hypotheses related to PEOU, H8, H9 and H11, CPX not being reliable as factor after reliability analysis, OLC and TLB were found with positive and

significant impact on PEOU (Beta=0.504 and Sig.=0.002, respectively, Beta=0.422 and Sig.=0) supporting H9 and H11.

#### **4. Conclusions and implications**

The influencing of technology users today, when they are very well informed and can easily compare similar offers on the market, should make the practitioners use the studies and results in a smart manner to be able to create attraction and interest much more than the users can do. The people shouldn't be treated as simple consumers, who takes the ads and commercials as such, but they should be considered as human being as a whole with brain, heart and spirit (Kotler, P., Kartajaya, H., Setiawan, I., 2010). Based on the results published by Nielsen Global Survey, fewer consumers take seriously the commercials issued by companies and 90% pay much more attention to the recommendations and advices coming from the people they know or friends from social networks (Ishikawa, A., Tsujimoto, A., 2006). The results of this research and the proposed model could serve as a clue to identify manners of how to increase the usage of the smartphone services as the employees have granted access to them. From the model and the regression analysis it results that TAM keeps its reliability applicable in the smartphone services area too, but clearly with some nuances. In order to explain them it is important to understand the profile of the research sample: first, the respondents were smartphone users in proportion of 94% out of that 64% are experienced ones with more than two years of using the related services. Related to the age, 49% are younger than 40 years and 60% males and 40% females having a large professional experience with 60% between 6 and 20 years. In terms of education they had 33% technical background, 38% economic and the difference with other specialties. In our view, this sample profile contributed very much to the results of the research versus what was thought initially. The very obvious one is that in this context of smartphone users, H15 related to face to face consulting and H10 related to trialability are redundant as long as the users are very experienced, that's why, complementary, it is supported H15, the online consulting, the respondents being used with IT devices and services. On the same path H7, the compatibility with their lifestyle is supported. Having an overview at the model we could conclude that, again due to the sample of smartphone users achieved, it would not worth very much in the whole model to stimulate the intention first and then, based on theory of reasoned action (Davis, F. D., 1989), to stimulate the effective usage of the services. It appears clear that for the smartphone services users the model should be totally different from the non users. In order to support this, even if the sample of nonusers was small, it shows completely opposite result for face to face consulting that shows a very strong and positive correlation with effective usage of services.

As long as the sample was mainly composed of the smartphone services users the model should be adjusted considering all the related insights and for the model fit should be performed a structural equation analysis due to large number of dependent variables and the correlations between them.

Finally, knowing the details and having a reference base in this model used for different businesses, the researchers in telecommunications services could perform a specific approach and consistent analysis, finding the applicability of the results in the business field, rather than remaining a theoretical study. Moreover, when the field study is a company or many with national coverage, there could happen to have

even more useful results capturing the needs of those companies from the study phase and making them active part in the research, and thus, improving the gap between theory and practice.

The limitation of the study could come from the fact that the users were high level users coming from the big multinational companies that have used smartphone for a long time, the benefits include these services in the package, so that there is no service limitation and the coverage of the operators was at a high level in the regions where the study was performed.

**Abstract:** Successful designing and implementation of the quality management system in an organization requires taking into account the requirements of all categories of natural persons or legal entities which have direct or indirect interests towards it. Efficiency and effectiveness of the actions carried out to meet the expectations of stakeholders shall be assessed by periodic measurements and analyses accomplished with appropriate tools for each category.

Obtaining favourable results following the measurement of contentment does not put an end to the process of relationships with the customers and stakeholders. Implementation of the process will reveal new expectations and requirements that, in conjunction with the ones existing in the Organization and in order to improve the activity will lead to strategies and policies that are intended to contribute to the continuous improvement of the relations with stakeholders.

Thus, based on previous researches undertaken internationally and nationally, we carried out two investigations which aimed to identify the employers` needs and requirements related to the quality of skills provided by universities to the higher education graduates, and measurement of their degree of adjustment to the specified or implied requirements.

In our country, the studies on employers' requirements have permanently concerned the universities. The problems identified are almost similar with those abroad, and the solutions offered by many studies have not provided the solving key but only at most an improvement of the situation.

The labour market in Romania is not structured, and there is no nationwide program for its development, but nevertheless the universities must provide the workforce for the next 3, 4 or 5 years.

The researches carried out for this purpose show that work experience is considered by employers as a main criterion, stronger than the grade of graduation or than the reputation of the university where they graduated from.

A first research - the exploratory type – has aimed through investigation to identify the following issues: the importance placed by employers on the staff selection criteria; areas in which employers have difficulties in finding staff with higher qualifications; skills that the employers would like the University to focus on, preparing additionally the graduates in this respect, and the general level of contentment in terms of the educational services quality.

A second research – both the descriptive and explanatory type – has provided information on: identifying the skills required from the higher education graduates; measuring the importance placed by employers on several groups of skills and competencies; estimating the levels of the skills achieved in some Romanian

universities; contentment survey related to other services provided by the higher education institutions in Romania.

**Keywords:** quality, higher education, contentment, requirements, employers

**JEL classification:** I25

## 1. General Introduction

Successful designing and implementation of the quality management system in an organization requires taking into account the requirements of all categories of natural persons or legal entities which have direct or indirect interests toward it.

In the latest edition of ISO 9000 these individuals or interest groups are referred to as „*interested parties*“, and in the management literature *stakeholders*. They exist both inside and outside the organization, may have personal or collective interests, may be individuals or formal and informal organizations.

Orientation of organisations towards all types of stakeholders becomes a dominant of the philosophy of total quality management as a result of the fact that their requirements and expectations are met mainly through quality.

In order to meet the demands of stakeholders, the universities should design and implement efficient and effective systems of quality management to ensure the conditions for achieving success through TQM. Efficiency and effectiveness of the actions carried out to meet the expectations of stakeholders shall be assessed by periodic measurements and analyses accomplished with appropriate tools for each category.

Obtaining favourable results following the measurement of contentment does not put an end to the process of relationships with the customers and stakeholders.

Implementation of the process will reveal new expectations and requirements that, in conjunction with the ones existing in the Organization will lead to strategies and policies that are intended to contribute to the continuous improvement of the relations with stakeholders.

Conducting surveys on employers` opinion should be a common practice of all Governments and institutions directly concerned. Thus, in the United States it was made one of the most extensive survey, *Educational Quality of the Workforce, National Employer Survey*, conducted in 1994 (Zemsky, Iannozzi, 1995). The sample included 4,000 companies with at least 20 employees (so that the respondents have the experience of the hiring process) from the private sector (the state companies and non-profit organisations have been excluded). Among other things the survey aimed to analyze the stages and criteria that the employers make use of, in the occupational selection. Respondents were asked to indicate the degree of importance of various selection criteria: professional experience, level of education, school results, reputation of the educational institution, attitude and communication skills.

In the United States other surveys have also been initiated and conducted through collaboration between higher education institutions in different states and central agencies, such as the State Departments of Education, the State Commission for Higher Education, the National Center on the Educational Quality of the Workforce, the Commission for achieving the skills required on the labor market (Secretary's Commission on Achieving Necessary skills - SCANS).

Another representative research (Clarke et al., 1996) aimed to develop an instrument by means of which employers' requirements and the necessary workforce can be analysed. The purpose of this tool was to identify the fields of activity where employers need workforce with higher education, and the level of training required by vacancies. The results showed that for about 60% of the jobs that the companies declare as vacancies, it is required workforce with higher education. Among the most requested jobs by employers there are the managerial positions, the medical field and banking-finance jobs.

## **2. Researches conducted internationally and nationally at institutional level**

At institutional level, the universities run surveys through which they try to identify: selection practices for graduates, education-related information, and candidates skills desired on the labor market. The main purpose of the surveys conducted by the educational institutions aims at analyzing employers' opinion on their own graduates. Most of the educational institutions which are concerned to ensure and provide high quality education have developed a customer-oriented policy (especially towards employers). To be more specific, we will show some of these surveys conducted by universities and then we will briefly present the most important results.

Such a survey has been conducted by the University of Sussex (*Report to HEFCE by the University of Sussex School of Education, 2006*). There have been forty-one (41) interviews, three (3) focus groups and one hundred (100) questionnaires. The work experience of candidates is the main selection criterion used by employers. As regards the importance of quality in general, namely the quality standards of educational institutions, the employers do not consider this aspect as very important, only 20% of them are turning to the information provided by the universities.

Another study conducted at institutional level includes regular surveys performed by the Palomar College in California, aiming at identifying the employers' attitudes towards graduates.

Even if the employers have declared themselves satisfied with the technical knowledge specific to the workplace, there are still several dimensions that require improvements, namely, the problem solving skills and critical thinking. In terms of behaviour, punctuality of graduates is the most favourably assessed, while the initiative is rated as the most unfavourably. Analyzing the employers' assessments for these three dimensions at the level of the surveys conducted by the educational institutions, we will note that the dimensions that need to be improved are just the general skills pertaining to attitude, pro-activity and initiative (Hodges & Burchell, 2003).

To conclude, we note that investigation-type studies aiming at the employers' opinion differ through both the coverage level (application of questionnaires to companies at local, national or international level) and the objectives which they pursue.

In our country, the studies on employers' requirements have permanently concerned the universities. The problems identified are almost similar with those abroad, and the solutions offered have not provided the key to their solving but, at most, an improvement.

The labour market in Romania is not structured, and there is no nationwide program for its development, but nevertheless the universities must provide the workforce for the next 3, 4 or 5 years.

The researches carried out for this purpose (Quality Barometer 2009) show that work experience is considered by employers as a main criterion, stronger than the grade of graduation or than the reputation of the university where they graduated from. Most employers prefer graduates who have worked either part-time (40%) or full-time (26%) in college; only 7% of the employees would prefer those who have not had a job during college. On the other hand, employers prefer Master's graduates, and if talking about the graduates with Bachelor' Degree, they prefer the pre-Bologna graduates (prevailing in both cases the duration of studies).

The Technical University of Cluj-Napoca has conducted a survey on 34 companies with the following outcomes: 48% of the participating companies require knowledge of English, 15% of them insist on experience in the workplace, while the other requirements focus on communication skills, team spirit and a willingness to learn.

A study at the University of Oradea conducted in 2011 on 39 companies with 3,700 employees (many of them being graduates of the University), had as objectives:

- assessment of the employers` degree of contentment regarding the graduates of the University of Oradea,
- identification of shortcomings in the study programmes (curriculum) of the University of Oradea, and making recommendations to remedy them

The outcomes show that employers are definitely pleased with the theoretical knowledge of the graduates from the University of Oradea, Romania. With regard to the poor skills and abilities of those who own diplomas issued by the University of Oradea, the employers bring most often a charge to low practice in the field (29% insufficient and satisfactory) and to the lack of resistance to stress and pressure (28.2% insufficient and satisfactory).

In the context of launching the National Framework of Qualifications in Higher Education, we have had the opportunity to present the outcomes of the study "Recent Graduates of Higher Education and Their Integration in the Labour Market", an achievement of the UECNCFPA. The sample under investigation includes 5576 graduates from over the past five years, a number resulting from a fruitful collaboration with the employers who have previously sent us a list with the graduates from our university employed by their companies; in turn, these graduates have facilitated the access to other graduates. Also, we have obtained 4,000 of responses from the employers and other workforce recruiters have been inquired on the topic. One of the study's findings is that "both employers and graduates consider that, at the moment, the higher education system provides graduates with the theoretical knowledge they need, but fails to provide practical skills. There is a difference between what the universities are able to provide and the workplace requirements".

Prioritizing the curricula based solely on research-centered indicators has led to penalization of the knowledge-oriented universities education, underfunding them. However, the number of students will still remain an important element of survival. Prisoners of the certification culture, the student is still concerned with completing a degree, and less with the accumulation of knowledge and acquisition of skills.

### 3. Research regarding awareness on employers` requirements in terms of the skills provided by universities

The research problem aims at identifying the employers` needs and requirements related to the quality of skills provided by universities to the higher education graduates, and measurement of their degree of adjustment to the specified or implied requirements. The following issues have been taken into account:

- the criteria used by employers in the recruitment process;
- employers` requirements concerning the skills to be formed upon graduates through educational services;
- fields and specializations in which employers are experiencing difficulties;
- ranking made by the employers for the core skills that graduates must have;
- available jobs for the young graduates

In our country the employers' perception is that there is a significant gap between the graduates` skills required and current level.

Most scholars credit the University system with much or very much confidence in terms of its ability to provide high-quality graduates on the labour market

A first research - the exploratory type – has aimed through investigation to identify the following issues:

- the importance placed by employers on the staff selection criteria;
- areas in which employers have difficulties in finding staff with higher qualifications;
- skills that the employers would like the University to focus on, preparing additionally the graduates in this respect;
- the general level of contentment in terms of the educational services quality.

The analysis sample is composed of 220 companies represented by the senior staff involved in the recruitment and selection of personnel.

In a first stage we have aimed to identify the main criteria for the selection of staff that employers take into account in the selection process, regardless of the origin of candidates (fresh graduates or people who already have a previous practical experience). For this purpose, we have made available to employers a list of criteria, asking them to specify how important in the selection process such criteria are, on a scale from 1 to 5.

**Table 1: Assessing importance of the criteria used in the selection process (grades on a scale from 1 to 5) (average grades)**

Position	Selection Criteria	Grade
I	Candidate`s motivation, attitude towards work	4,61
I	Motivation and interest in the work	4,61
I	Conscientiousness, reliability	4,60
I	The honesty and trust the candidate inspires	4,60
I	Willingness to learn new things, openness to change	4,55
I	Practical skills (what he can do)	4,47
I	Candidate optimism, positive attitude	4,44

Position	Selection Criteria	Grade
I	General Skills and Competences (communication, teamwork)	4,43
I	Pro-active, solution-oriented	4,40
I	Matching the nature of the candidate with the job	4,39
II	Promptness, organization and efficient use of time	4,34
II	Computer Skills	4,30
II	Candidate's enthusiasm, his dynamism	4,28
II	Self-control, calm, patient nature	4,26
II	Personality traits, character	4,23
II	Matching the nature of the candidate with the organization	4,22
II	Strength and ability to work under pressure	4,19
II	Results from tests / applications / practical tests / interview questions during the selection process	4,15
II	Desire to have a career, to promote	4,14
II	The general level of intelligence	4,12
III	Mature and professional attitude	4,02
III	Job specific knowledge	4,00
III	Language skills (knowledge of foreign languages)	4
III	Interview overall performance of the candidate	3,87
III	Graduated specialization (matching the field of study with the job)	3,84
III	Candidate's job expectations	3,84
III	Specialized theoretical knowledge of the candidate	3,82
III	Quality of the educational institution graduated	3,80
III	Knowledge specific to the company's field of activity	3,80
III	Professional results obtained in the previous place of work	3,80
III	Management skills, leadership	3,79
III	Candidate's level of higher education (Bachelor Degree)	3,78
III	Negotiation skills	3,77
IV	Neat appearance of the candidate	3,67
IV	Recommendations you received about the candidate from people you know	3,64
IV	Work experience in the business of job	3,55
IV	Results obtained in college (grades, general average, Olympics)	3,49
IV	Training and extracurricular activities, volunteer activities	3,49
IV	Recommendations from teachers	3,47
IV	Letters of recommendation from former employees	3,38
IV	Elective courses you attended during college	3,35

Position	Selection Criteria	Grade
IV	Willingness to work overtime	3,35
IV	Degree of selectivity at admission of the university graduated	3,34
V	Salary solicited by candidate	3,31
V	Master diploma	3,15
VI	Work experience, but for unskilled positions / unrelated with the job	2,59
VII	Appearance of the candidate (how attractive he is)	2,29

A second research – both the descriptive and explanatory type – has provided information on:

- identifying the skills required from the higher education graduates;
- measuring the importance placed by employers on several groups of skills and competencies;
- estimating the levels of the skills achieved in some Romanian universities;
- contentment survey related to other services provided by the higher education institutions in Romania.

The analysis sample is composed of 268 companies represented by the senior staff involved in the recruitment and selection of personnel.

The difference between the number of respondents who have filled in the first questionnaire and those who have filled in the second is explained by the fact that the two questionnaires have been distributed at different times and the number of participants has been fluctuating.

Firstly, after assessing the importance of skills and the degree of meeting the requirements for each skill and skill group we can appreciate the degree of adjustment of the educational services quality to the employers' needs. Based on the importance placed on each group of skills we can achieve a ranking of the skills from the employers' point of view. We find that the average level of contentment regarding the adjustment of educational services to the demands and expectations of employers is less than 75% for all the skills, ranking at a very low level within the group "involved in the execution of their tasks" (such group being on the 2nd place in terms of importance).

**Table 2: Degree of Meeting Requirements, in terms of Graduates Skills**

Place	Groups of Skills	Importance factor	Degree of meeting	Degree of not meeting
1	Interpersonal relationships	0,0938	62,34	37,66
2	Involvement in fulfilment of tasks	0,0897	36,4	63,6
3	Communication	0,0889	60,72	39,28
4	Other skills	0,0885	74,22	25,78
5	Teamwork	0,0862	67,46	32,54
6	Adaptability	0,0859	53,96	46,04
7	Systemising skills	0,0857	37,2	62,8

Place	Groups of Skills	Importance factor	Degree of meeting	Degree of not meeting
8	Initiative	0,0839	49,92	50,08
9	Mode of work	0,0815	64,28	35,72
10	Foreign Languages	0,0776	59,66	40,34
11	Results Presentation	0,0692	67,58	32,42
12	Knowledge	0,069	58,02	41,98

In order to adjust skills to the employers` needs, it is necessary to:

- a) analyse the skills in order of importance or in order of increasing the degree of contentment provided to employers. For instance, in the skills group "involved in the execution of their tasks" have been included:
  - identifying new methods for achieving goals
  - finding solutions to reduce costs
  - finding solutions for reducing the time for reaching a goal
  - finding solutions to improve quality
- b) if we consider the skills included in this group, afterwards we have to see, separately per fields and specializations, which are disciplines that contribute to the achievement of the respective skills and what improvements should be made to such disciplines in order to meet employers' expectations.

Secondly, following a survey among employers it has been revealed that there are several fields of activity and specialization for which they face difficulties in finding higher education workforce, namely:

- Technical
- IT Programming
- Business
- Management
- Finance
- Trade – Sales
- Administrative
- Communication – Public Relations
- Marketing
- Accountancy

Thirdly, we have identified the core skills which the University has to focus on in the educational process of its graduates, namely: communication, practical skills, management, IT, teamwork, analytical thinking, etc.

Distinctly, one has also to consider the improvement of collaboration of universities with the business environment by involving specialists in consulting activities.

The second part of the research aimed to identify the employers' contentment with the quality of graduates from several universities, reflected by the extent to which graduates meet the requirements specified above. The following universities are under study:

- "Gh. Asachi" Technical University of Iași
- "A.I.Cuza" University of Iași
- "Gr. T. Popa" Iași University of Medicine

- West University of Timișoara
  - Academy of Economic Studies București
- Employers' contentment reflects, in fact, the degree of adjustment of educational services provided by universities to the needs and requirements of employers.

**Table 3: Summary of the assessments on ensuring the graduates' skills**

Skills	Importance factor	Percentage of the employers who consider the group of skills as being very important and important (%)	Degree of ensuring the required skills (%)				
			Technical University "Gh. Asachi" Iasi	"A.I.Cuza" University of Iasi	Iasi University of Medicine	West University of Timisoara	AES Bucharest
<b>Knowledge</b>	0,069	42,7	72	46	83	80,8	8,3
<b>Systemising skills</b>	0,0857	53	50	51,2	0	73	11,8
<b>Mode of work</b>	0,0815	50,4	60,8	56,5	100	90,1	14
<b>Involvement in fulfilment of tasks</b>	0,0897	55,5	50	38,7	0	83,3	10
<b>Initiative</b>	0,0839	51,9	50	35	100	58,1	6,5
<b>Adaptability</b>	0,0859	53,1	50	38,1	100	71,7	10
<b>Communication</b>	0,0889	55	25,3	65	100	83,3	30
<b>Interpersonal relationships</b>	0,0938	58	50	51,9	100	83,3	26,5
<b>Teamwork</b>	0,0862	53,3	50	47	100	83,3	57
<b>Results Presentation</b>	0,0692	42,8	50	53,6	100	80,2	54,1
<b>Foreign Languages</b>	0,0776	48	50	55	100	83,3	10
<b>Other Skills</b>	0,0885	54,7	82	68,7	100	91,7	28,7
			53,03	50,92	72,9	82,33	22,5

#### 4. Conclusions

General appreciation of the quality of higher education in Romania is above average at the universities that provide a general or technical education, but the appreciation is different for public and private education, at the expense of the latter.

Regarding the importance placed on the staff selection criteria, motivation ranks the first, followed by the criteria that reflect the quality of the person and then the work engagement.

Although 54,55% of the respondents say that their company offers jobs for fresh graduates, many companies have difficulties in finding personnel with higher education in the following areas: technical (30,77%), IT programming (30,77%) and Business (25,64%).

When selecting graduates, it is placed great and very great emphasis on: candidate's behaviour at the interview, quality of the educational institution attended, grades during studying years, knowledge, skills and experience. It is placed less importance on the diploma of master.

More than half of the respondents (51,11%) consider that in the selection process, the salary required by the candidate is an important and very important criterion.

There are also very important: conscientiousness and reliability, self-control, candidate's optimism, honesty and confidence, willingness to learn new things, openness to change, and communication and negotiation skills.

We have also identified the core skills which the University has to focus on in the educational process of its graduates, namely: communication, practical skills, management, IT, teamwork, analytical thinking, etc.

The academic world stays still concerned with its own financial survival, in a continuous search for ways and milestones related to the orientation of graduates

# MARAMUREȘ WORKFORCE COMPARED TO THE REST OF THE NORTH-WEST REGION

**Sabou Simona**

*Economic Sciences and Physics Department, Faculty of Science, North University Center of Baia Mare, Technical University of Cluj-Napoca, Romania*

[simona.sabou@gmail.com](mailto:simona.sabou@gmail.com)

**Abstract:** *This paper presents aspects regarding population and workforce in Maramureș County, compared with the situation recorded in the region to which it belongs, i.e. North - West, at the end of 2010. The paper is aimed at all those interested in these issues. Besides Maramureș County, the North - West Region also includes the counties of Bihor (BH), Bistrița-Năsăud (BN), Cluj (CJ), Satu Mare (SM) and Sălaj (SJ). Maramureș is known for its wooden churches, its rural architecture, its old traditions - preserved until today - its craftsmen and its impressive landscapes. This paper is based on statistical information provided by the National Institute of Statistics, Department of Statistics in Cluj. In March 2013, the latest data available are those relating to the end of 2010. Thus, based on this information, it pinpoints the fields in which the people in Maramureș are employed at this date, compared to other counties in the region, the wages they get, and the contribution to the county and regional GDP. It also compares labor resource, active civil population and employed civil population, unemployed. After 1989, Maramureș County, as well as the entire North - West Region, underwent major changes. Population decreased from year to year, however the lack of jobs has become a constant reality. The mining of ore, the processing of metals other than iron and the auto industry, which used to cover most of the jobs in Maramureș, entered into a continuous decline, which culminated in the closure of all mines in the county. In this situation, adapting to the new conditions, the current economic reality, is a daily problem for the people of this county. We will try to determine in which fields the people of Maramureș are currently working in, compared to the residents of the other counties in the region, which are their wages and what the contribution to the regional and county GDP is. We will also see the state of the labor resource, the active civil population, the employed population and the unemployed.*

**Keywords:** *workforce, employed population, unemployed, Maramureș.*

## 1. Introduction

In order to establish itineraries, you must know where you are and only then where you are going. To establish development strategies you must know exactly where the studied area lies from an economic, social and cultural point of view. Only a correct localization ensures an appropriate strategy. Thus, we shall try to establish the position of Maramureș County in terms of population and labor force in the year 2010.

Maramureș County (statistically classified in NUTS 3) is part of the North - West Region (NUTS 2), which in turn is part of Macro-region 1 (NUTS 1).

Maramureş is known for its wooden churches, its rural architecture, its old traditions - preserved until today - its craftsmen and its impressive landscapes.

After 1989, Maramureş County, as well as the entire North - West Region, underwent major changes. Population decreased from year to year, however the lack of jobs has become a constant reality. The mining of ore, the processing of metals other than iron and the auto industry, which used to cover most of the jobs in Maramureş, entered into a continuous decline, which culminated in the closure of all mines in the county. In this situation, adapting to the new conditions, the current economic reality, is a daily problem for the people of this county.

Much of the county remained non-industrialized in the communist period, so that traditional agriculture is at home in this part of the world.

The county seat is the city of Baia Mare, around which the ore mining industry developed before 1989. This greatly polluted the city in the past, but now, due to the decline of the industry, the area is much less affected.

Besides Maramureş County (MM), the North – West (NW) Region also includes the counties of Bihor (BH), Bistriţa-Năsăud (BN), Cluj (CJ), Satu Mare (SM) and Sălaj (SJ).

We will try to determine in which fields the people of Maramureş are currently working in, compared to the residents of the other counties in the region, which are their wages and what the contribution to the regional and county GDP is. We will also see the state of the labor resource, the active civil population, the employed population and the unemployed.

## 2. Maramureş workforce, compared to the rest of the North-West Region, in 2010

The area occupied by Maramureş County is 6674 km<sup>2</sup>, as can be seen in Table 1.

**Table 1:** The area of the counties in the NW Region

Indicator	NW Region	BH	BN	CJ	MM	SM	SJ
Area - km <sup>2</sup>	34159	7544	5355	6674	6304	4418	3864
Percentage of the area in the total area of the Region - %	100	22.08	15.68	19.54	18.46	12.93	11.31

Source: *Wikipedia The Free Encyclopedia, Nord – West Development Region*, [Online]. Available: [http://en.wikipedia.org/wiki/Nord-Vest\\_\(development\\_region\)](http://en.wikipedia.org/wiki/Nord-Vest_(development_region)) [March 15, 2013]

The county is in 3rd place when it comes to its area within the Region, the first two being Bihor and Cluj.

In terms of population, Maramureş takes the 3rd place, both in terms of number of inhabitants (being surpassed by Cluj and Bihor) and in terms of density (being surpassed by Cluj and Satu Mare), as can be seen in Table 2.

**Table 2:** Population and density of the counties in the NW Region

Indicator	NW Region	BH	BN	CJ	MM	SM	SJ
Population –no. of inhabitants	2716456	592561	317247	691048	510482	364104	241014
Percentage of the population in the total population of the Region - %	100	21.81	11.68	25.44	18.80	13.40	8.87
Density (inhabitants/km <sup>2</sup> )	79.52	78.55	59.24	103.54	80.98	82.41	62.37

Source: Cluj Regional Department of Statistics (2013), *Regional statistics*, [Online], Available: <http://www.cluj.insse.ro/cmscluj/rw/pages/statReg.ro.do> [March 15, 2013]

According to data provided by the National Institute of Statistics on July 1, 2010, the share of urban population in Maramureş County is 58.82%, atypical for an area known for its ancient traditions preserved until today especially in rural areas. In the NW Region, the percentage is 53.26%, and so Maramureş ranks 2nd after Cluj with 66.42%. The reason for this is related to the period before 1989, when the development of the mining industry led many county residents to move to urban areas in the hope of a better life. Thus, they created settlements around mines which have since become towns. Such towns are Baia Sprie Cavnice, Borşa, Tăuţii Măgherauşi, Vişeu de Sus. In addition, the county has the highest number of cities - 13 (of which 2 municipalities) - followed by Bihor with 10 cities (including 4 municipalities), Cluj and Satu Mare with 6 cities each. The large number of cities in the county explains the relatively high share of urban population compared to the regional average.

According to the same information, in the Region, the population over 60 has a share of 19.44%. In Maramureş, the degree of aging of the population is below the regional average, people over 60 representing 18.125% of the total population. The county ranks 2nd after Satu Mare, which has a share of 17.44%. An explanation for this situation could be related to life expectancy, which in 2008-2010 was 72.93 years, ranking Maramureş in 3rd position after Cluj and Bistriţa-Năsăud and below the region average which is 73. In addition, except for Bistriţa-Năsăud, the other counties of the Region have a negative natural growth, so that aging will increase in the future. With regards to workforce, the situation is presented in Table 3.

**Table 3:** Average number of employees at end of 2010

Indicator	NW Region	BH	BN	CJ	MM	SM	SJ
Average no. of employees – no. of people	573728	146551	51823	178649	86256	71056	39393
Percentage of employees in the total population - %	21.12	24.73	16.33	25.85	16.90	19.52	16.34

Source: Cluj Regional Department of Statistics (2013), *Regional statistics*, [Online], Available: <http://www.cluj.insse.ro/cmscluj/rw/pages/statReg.ro.do> [March 15, 2013]

The number of employees in Maramureş County is 86256 people (Cluj Regional Department of Statistics, 2013), at the end of 2010, ranking in the 3rd position in the Region, after Cluj and Bihor. But in terms of the percentage of employees in the total population, the county recorded a value of 16.90%, well below the regional average of 21.12%. From this point of view, the county ranks 4th, but at a rather small distance from the last two (Sălaj and Bistriţa-Năsăud). Reasons for this could be related to unregistered employment, subsistence economy, work abroad or smuggling (alcohol, tobacco, wood).

The average number of employees, by activity, in the national economy in 2010 is shown in Table 4.

**Table 4:** Percentage of employees, by activity, in the national economy in 2010

- % -

Field	NW Region	MM
Economy as a whole	100	100
Agriculture, forestry and fishing	1.53	1.55
Industry	32.24	37.12
of which:		
▪ Mining	0.72	0.41
▪ Manufacturing	28.37	34.14
▪ Production and supply of electricity, gas, hot water and air conditioning	1.11	0.76
▪ Water supply, sanitation, waste management and decontamination activities	2.04	1.80
Construction	7.12	7.11
Wholesale and retail trade, repair of motor vehicles and motorcycles	17.34	14.55
Transport and storage	5.44	4.37
Hotels and restaurants	2.40	2.37
Information and communication	1.72	0.92

Administrative services and support services	2.53	2.05
Public administration and defense, social security	3.95	4.33
Education	9.96	10.57
Health and social care	8.85	9.29
Arts, entertainment and recreation	1.12	0.93
Other services	1.13	1.65

Source: Cluj Regional Department of Statistics (2013), *Regional statistics*, [Online], Available: <http://www.cluj.insse.ro/cmscluj/rw/pages/statReg.ro.do> [March 15, 2013]

Most employees in Maramureş are working in industry, namely 37.12%, above the average for the region which is 32.24%. The county occupies first place in the Region from this point of view. Most of these employees work in manufacturing. In 2010, the mining industry, which dominated the landscape before 1989, has only 0.41% of the total number of employees of the county.

In public administration, education and health, Maramureş also has more employees than the regional average. Agriculture and construction lie approximately at the average of the NW Region. In other areas, Maramureş is below the regional average. Thus, we consider that there is potential for development in tourism, transport and trade.

Regarding the future, projections show that by 2013 the demand for labor will be oriented towards (Maramureş County Agency for Employment, 2011):

- services;
- construction;
- trade;
- transport - storage - communications;
- hotels and restaurants.

Services will be, in the next period, the main generator of gross added value in the national economy. With an average annual growth rate of 6% in 2007-2013, the third sector will be, after construction, the most dynamic sector. With a share that is around 50% of the GDP and a constant growth rate, the services sector will, in the next period, be the largest contributor to a true GDP growth (Zima, 2008: 568).

The number of registered unemployed in Maramureş at the end of 2010 was 12490 persons (Cluj Regional Department of Statistics, 2013). Of these, 56.07% are men. Among them, the unemployment rate in late 2010 was 6.3%, below the average regional rate which was 6.5%. Among women, the unemployment rate was 5.7% at the end of 2010, a percentage that is above the regional average of 5.3%.

So, we consider that unemployment affects women in the county more than it does men. But the overall unemployment rate in Maramureş in late 2010 was 6%, above the regional average rate of 5.9%. The percentage of unemployed is increasing from year to year, especially among young people. One of the reasons for this is the poor correlation between the educational system and labor market demands.

At the end of 2010, from the total county population of 510500 inhabitants, according to the labor balance published by the National Institute of Statistics, the labor resource was 331.7 thousand persons and civilian labor force 200.3 thousand, as shown in Table 5.

**Table 5:** Workforce at the end of 2010

- Thousand people -

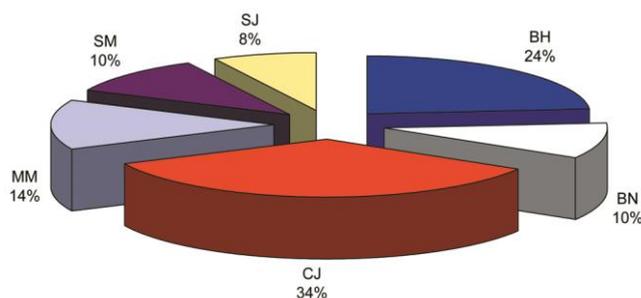

Indicator	NW Region	MM
Total population	2716.5	510.5
Labor resources	1764.4	331.7
Employed population	1109.0	187.4
▪ of which employees	573.7	86.3
Unemployed	78.6	12.9
Civilian labor force	1187.6	200.3
Population in training and other population categories	576.8	131.4

Source: National Institute of Statistics (2011), *Labor balance on January 1, 2011*, [Online], Available: <http://www.emplonet.ro/wp-content/uploads/2012/03/Balanta-fortei-de-munca.pdf> [March 24, 2013], ISSN: 2067-0311, ISSN-L: 1584-7837, pp. 43, 51

Of the total employed population of 187400 people, only 86300 were employees, i.e. 46.05%. The regional average was 51.73%, while the percentage in Cluj County was 58.10%. Thus, the county ranks 4th after Cluj, Bihor and Satu Mare. Last class is Sălaj with a percentage of 41.91%. In Maramureș the difference between the employed population and actual employees is 101100 people. They either work in subsistence agriculture or on their own.

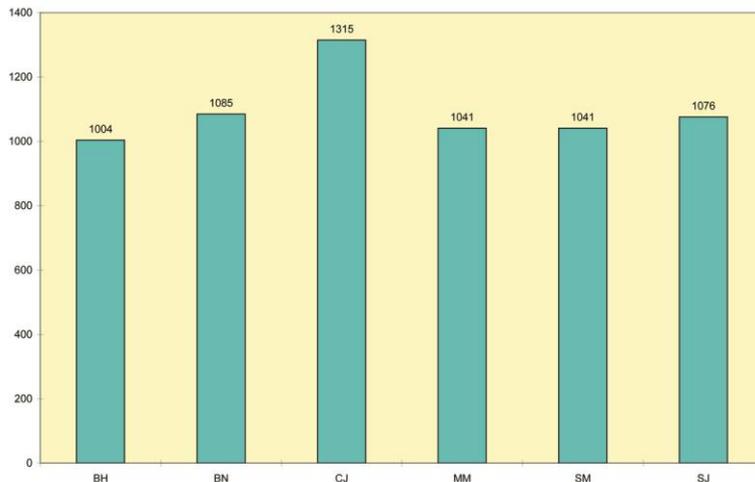

Under these circumstances we can conclude that most of the inhabitants of the county, of those employed, are working in agriculture, a field with the lowest income. The employment rate of labor resources in Maramureș is 56.50%, well below the regional average of 62.85%. Regarding the activity rate of labor resources in Maramureș, it was 60.39%, well below the regional average of 67.31%.

To date, on the website of the Cluj Regional Department of Statistics, only data on the GDP for 2008 have been published. Thus, Maramureș made in 2008 a GDP of 7998.5 million lei current prices. In the same year, the Region's GDP was 57937.1 million lei current prices. In Figure 1 we can see the contribution of each county in the Region to the GDP.

**Figure 1:** The contribution of each county to form Regional GDP in 2008

Source: Cluj Regional Department of Statistics (2013), *Regional statistics*, [Online], Available: <http://www.cluj.insse.ro/cmscluj/rw/pages/statReg.ro.do> [March 15, 2013]

The greatest contribution is brought in by Cluj County, mainly due to the presence of Nokia and MOL Romania on the Romanian market. The economy of this county is over 4 times more powerful than the lowest ranked county, Sălaj. Bihor came in second place, followed by Maramureş. Compared to Cluj, Maramureş economy is 2.5 times weaker. In this area, the main business is Eaton Electro Romania, producing low voltage electrical equipment and automation solutions. Thus, within the Region, there are major economic development discrepancies between the counties (Cluj and Bihor are more stable, economically, compared to the other), discrepancies highlighted by the level of participation of each to the regional GDP. In terms of the monthly net average nominal wage for the total economy, the situation in the Region in 2008 is shown by Figure 2.

**Figure 2:** The monthly net average nominal wage for the total economy in each county in the Region in 2008

Source: Cluj Regional Department of Statistics (2013), *Regional statistics*, [Online], Available: <http://www.cluj.insse.ro/cmscluj/rw/pages/statReg.ro.do> [March 15, 2013]

Maramureş occupies the first place in terms of monthly net average nominal wage only in agriculture, hunting and forestry, with 890 lei/employee, the Regional average being 847 lei/employee. However, less than 2% of the employees in Maramureş work in this field. In industry, where the county has the most employees, the wage is 843 lei/employee. With this value, it is ranked last, the regional average being 987 lei/employee. When it comes to trade and health, the county ranks 2nd in this regard. In other fields the county has intermediate ranks - 3, 4 and 5 - compared with other counties in the Region, according to information provided by the Cluj Regional Department of Statistics.

### 3. Conclusions

Maramureş County ranks 3rd in the Region both in terms of area and number of inhabitants. It has a majority urban population, explained by the large number of existing cities (13), compared to other counties.

Maramureş generally takes the 3rd or 4th place in most indicators studied, so that

in the North - West Region it is located approximately in the middle.

Before 1989, mining, the processing of metals other than iron and the auto industry recorded most employees, the labor resource in the county being mostly engaged in these fields.

In 2010, most of the people in Maramureș were employed in manufacturing, while mining only had 0.42% of all employees.

However, the average nominal monthly net wage for the total economy is quite low in this region.

The number of employees is low relative to civilian employed population.

There are over 100000 people working in subsistence agriculture, on their own, unregistered employees or are working abroad.

Also, from the analysis of the number of employees in the national economic activity, it was found that in the county there is potential for development in tourism, transport and trade. Workforce training should be therefore linked to these perspectives. Moreover, the poor correlation between the educational system and the labor market demands is considered one of the main problems. But correlating the educational system with the requests on the labor market is a very complex issue. From the moment the labor market calls for a particular qualification a certain period of time is necessary (which is all the greater as the job has a higher degree of specialization) until the education system is able to provide specialists in that field.

Nevertheless, we believe that the biggest problem is the lack of a broad culture on professional orientation.

There is also a high degree of subjectivity regarding the professional future imposed by the need to make decisions at the age of 15, when choosing a high-school.

Under these circumstances, a solution for the labor market would be thinking like an American employee, who is more willing, regardless of his age, to change his job or career.

Yet another solution is continuous training, which must be part of the daily life of any employee.

**Abstract:** *In the current economic context, quality has become a source of competitive advantage and organizations must perceive quality as something natural and human in order to achieve excellence. The proper question for the context of the internationalisation of the economy is whether the culture of the regions, states or nations affects the development in the quality management field and the quality approach. The present study tries to give a theoretical approach of how culture influences the quality approach at the European level. The study deals only with the European quality approach, because at European level one could meet a great variety of models and methodologies. In the U.S.A. and Japan one could identify a specific cultural approach regarding quality. At the European level, we cannot discuss in the same terms, because each country has a different cultural specifics in terms of quality. In order to determine the cultural specificity of the countries surveyed, the study has used the most popular analysis tool of cultural dimensions, namely the Dutch Professor Geert Hofstede's model. The model illustrates according to a survey, the organizational behavior of several countries and was able to identify a set of variables and fundamental dimensions, that differentiates one culture from another. An attempt was made to see if there are connections between the values of Hofstede's cultural dimensions and the quality characteristics in the analysed countries. The study, describes on the one hand, the quality evolution from quality control to Total Quality Management and on the other hand, focuses on the quality approach modalities at European level. The second part of the paper is structured into two parts, addressing on the one hand the quality in countries of Western Europe, such as United Kingdom, France and Germany, because these three countries are considered to be the exponents of quality development in Western Europe. In the same time, the paper seeks to explore the quality approach in Eastern Europe, with a brief analysis of cultural context and quality development in Romania.*

**Keywords:** *quality, total quality management, quality culture, quality and cultural dimensions, European quality, Hofstede's model and quality*

**JEL classification:** M14; P52

## 1. Introduction

According to Tito Conti, the quality is first a cultural aspect and then a technical aspect, which means that in terms of cultural diversity the quality makes no exception. The same author argued that one cannot speak of a "European or American quality" (Conti, 1993). However, the reality confirms that there are major differences between nations, states, regions and even between organizations in the same area. These differences are the result of patterns of thoughts, feelings and potential events that tend to develop in general groups of individuals. These patterns of manifestations specific to certain groups of individuals, are called culture, seen from the viewpoint of social anthropology. Geert Hofstede defined culture as "the collective programming of the thought, which distinguishes the members of a certain group of members of another group." (Hofstede, 2010: 16).

The culture influences the entire social life, being decisive for the economy, for the management and for the quality approach.

In this context, we can say that the quality dimensions in certain nations varies greatly, for example, Germany is a great authority with regard to the production of high quality goods, France has a reputation for the wines' quality, the Northern European countries are known for the very high standards of offered services and Norway for the high level for the quality of life, according to a study by the Organisation for Economic Co-operation and Development (OECD, 2012). The examples may be continued with reference to Switzerland, which is recognized for its high quality of banking services and Italy for the quality of fashion and luxury products.

One can emphasize that Europe, particularly Western Europe, has made and continues to make major breakthroughs in the field of quality excellence in the past 20 years. (Beckford, 1998). This is determined in large part by the competition pressure exercised by other world powers: the United States, Japan and the Republic of China. Regarding this specific fact Juran specifies that, until the end of the 1980s the major European corporations resorted to specialists outside Europe for planning strategies for the total quality management systems. The situation changed in the late 1990s when both the corporate sector and professionals are well positioned in this domain, in comparison with the United States and Japan (Juran, 1999).

## 2. From quality to Total Quality Management

In an attempt to answer the question "what is quality?", the experts have not agreed to provide a generally accepted answer, because each individual has a different opinion about what it should mean a product or a service.

In an attempt to define quality, one of the masters of quality, namely Juran offers two different meanings of the term as:

- "quality means those characteristics of the products which satisfy the customers' needs and ensure their satisfaction" (Juran, 1999)
- "quality means lack of deficiencies, i.e., the absence of errors that require reprocessing or are the results of accidents, customers' dissatisfaction, customers' complaints, etc." (Juran, 1999)

These two Juran approaches, highlight the idea that the quality goal is to provide greater customer satisfaction, and to avoid wastage of all kinds: financial, image, etc. The purpose is to increase competitiveness, which determines increased profits.

The quality attempts to answer the following question: why an organization, regardless of their field of activity, economic organization must be concerned to improve continuously the quality of the products and services they offered? One of the answers could be that due to an increasing competition at national and international level, quality is a source of sustained competitive advantage.

Another author, Sandholm (1996) identifies five phases of quality in the manufacturing companies:

The first phase, called "*drowsiness phase*", in which companies do not feel threatened, the competition is weak or even non-existent, and the company obtained an acceptable profit. In these circumstances, the quality has not received attention from the company.

In the second phase, called the "*wake-up stage*", the company's situation completely changes from the previous phase. The company start to lose the position on the market, which means lower profits. In this phase the company realize that lies in the midst of a crisis.

"*The wobble*" pahse, in which the company realizes that something needs to be changed. It's a phase of trials, of searching quality management tools in order to change something.

"*The Action Phase*", is a phase in which the company may notice that the used instruments make significant changes. It is the phase in which there is a change in organizational culture in order to improve the manufactured products.

"*The Maturity Phase*", is the phase in which the total satisfaction of the customer is obtained through the perfection of every level in the organization. Quality does not apply only to products but to all activities of the organization. A total quality approach, in which the company regards quality naturally.

### **3. Approaches to quality in Europe**

#### **3.1. Culture and quality**

It is generally accepted the opinion, that total quality management is a philosophy, a model of organizational culture, which aims to a client-orientation of all activities and processes in the organization and to their optimization in order to achieve long-term benefits (Dragan, 2012). The organizational culture determines the individuality of your organization and its' mode of operation. Every organization has different expectations in comparison with others. A simplistic organizational culture can be defined as "the way you do in the organization". McLean and Marshall (1993) defines organizational culture as "a set of values, traditions, procedures, concepts and attitudes that create the context of the work of the organization". Hofstede's cultural dimensions studied in over 70 countries, through the investigation of over 116000 employees local subsidiaries of IBM concluded that major cultural differences between companies can be described in terms of five dimensions:

- *power distance*: how relationships between people with different status are handled ;
- *individualism*: so far as relations between people are few and sensitive;
- *masculinity*: the extent to which the roles of women and men differs in a society;
- *uncertainty avoidance*: the extent to which the individual is afraid of what is different and act to avoid any unclear situations;

- *long-term orientation*: how is understandable and manageable time. (Lungescu, 2005)

### **3.2. Quality Approach in Western Europe**

During the 1950s-1970s in Western Europe the quality was considered a matter of priority due to high-tech sectors such as nuclear energy, space, defence, industry, etc. As evidence for the growing interest given to quality, and in particular to statistical control of quality, was the founding of national associations for quality in many European countries. In the field of consumer goods appeared certain brands, that have distinguished themselves through the high level of product quality, creating a rule, which says that higher quality means a higher price. (Tomusk, 2000)

A major step in the progress of the quality development in Western Europe, was moving from the evaluation of preventive inspection of the quality systems of suppliers, which was determined by the needs of the defence sector through the introduction of NATO standards. Thus, in the early 1980s the quality was perceived as conformity to standards, but in the late 1980s began to show a new concept based on continuous improvement, focus on customer needs and control of business processes. (Juran, 1993).

#### **3.2.1. Quality in United Kingdom**

Cultural characteristics of Great Britain determined on the basis of the values recorded by Hofstede's model are the following (Hofstede, 2010: 64, 99,142,188):

- a lower power distance with an index of 35
- strong individualism, with an index of 89
- emphasized masculinity, with an index of 66
- acceptance of uncertainty, with an index of 35

The British management principles are: respect and admiration for what has been good in the past, individualism of the human personality, where the middle class is a resource to promote the managerial functions.

Regarding the organisation, it is to observe decentralised, and flexible structures, with little control. The company produce and sell products under their own brands, there is a very strong specialization. There is also a clear differentiation of the categories of personnel from various hierarchical levels, managers coming mainly from the middle class. The focus is rather on personality, than on training and managers are coming from social fields and lately is given more attention to financial and marketing areas. The main feature of British managers, is the priority for interpersonal skills ability to influence others and to negotiate: charismatic leadership and hierarchical relationship is least authoritative in Europe (Warner, 1997).

From the viewpoint of organizational culture, British organisations resemble the American, with the observation that the British management has retained some elements of "managerial archaism" as well as the use of empiricism, of rudimentary instruments in order to motivate people and of short-term vision etc. As strengths, flexibility must be mentioned, as well as fairplay, competitive importance given to decentralisation and human personality. (Lawrence & Edwards, 2000).

The main feature of the quality approach in the United Kingdom, is the focus on standards and certification, but this issue should not be seen necessarily as having a negative impact, United Kingdom being among the first European countries to implement the total quality Management concepts for the companies in the most

competitive areas. However, Juran (1999) notes a remarkable fact with respect to the level of certification and standardization, namely standardization and certification were also a significant note of the image he cultivated in United Kingdom with regard to the quality of its products. In this sense, in the period 1970-1990 United Kingdom had more certifications than the rest of the European countries at one place. Thus, at the time when the total quality management philosophy appeared, it has created a major disconnection between these two types of approaches to quality assurance. However, there is a reason, that caused this deep focus on standards, namely, the policies imposed by the customers, a great example of this being the Ministry of defence. This dissension, has generated a situation in which the standards-based quality approach was focused on quality assurance and control, losing orientation for the consumer focus. The Total Quality Management approach was taken in the other extreme, focusing deeply on the consumer and thus losing control of the quality control. This significant divergence between ways of British quality approach was formalised at the time the British Quality Association, which have a total quality management approach was separated in 1992, from the Institute of Quality Assurance, which had a standards-based quality approach and which was considered to be since the symbol of quality in the United Kingdom. Formally, the separation was made on behalf of the Organization of the British Prize for quality, which was based on European quality award model oriented on the Total Quality Management. In reality the separation marked the approach differences between total quality management and the traditional British quality approach (Juran, 1999). It can be asserted that the principles that characterize the culture of British culture in general and the British management in particular, is respect and admiration for what proved to be good in the past. Further, the British culture characteristic dimensions influenced significantly the quality development in the United Kingdom. Cultural characteristics such as fairplay , Britain needs to be fair and dignified, could explain the need for the quality standardization approach and reluctance towards a new approach to total quality management.

### **3.2.2. Quality in France**

Cultural characteristics of France, determined on the basis of the values recorded by Hofstede's model are the following (Hofstede, 2010: 64, 99,142,188):

- power distance, with an index of 68
- individualism quite pronounced, with an index of 71
- balance between femininity and masculinity with an index of 43
- strong uncertainty avoidance with an index of 86

It can be inferred from the above mentioned idea, that French society is a conservative one, and some of these values have perpetuated at the level of organizations, so that the French management relies on a mix of bureaucratic and aristocratic elements. (Lawrence & Edwards, 2000).

The French management principles are: dirigisme of state, individualism and authoritarianism, based on a bureaucratic structure, the unconditional priority for technical and technological creativity (Warner, 1997).

French organizations are usually very complex and have a reduced dimension of supervision. The number of managers is very high, hierarchical levels are bounded and French managers are considered to be the most well educated managers in Europe. There is a strict separation of different categories of personnel: managers,

civil servants, technicians and workers, respectively, are making a clear distinction between top managers and middle managers. The driving style for managers is generally authoritarian, paternalist, with a manifestation to avoid legal liability, not to whole country scale, but explicable because of their distance from power. It is remarkable, that France have the highest value of this indicator in Western Europe, this hierarchical differentiation being matched by a very strong specialization of tasks and qualifications (Warner, 1997).

A feature of the French economy is nationalization, as since the postwar period and until the mid-1990s many companies have undergone this process. As a general rule, the nationalization process causes a decrease in quality, which was experienced by many European countries, however, this has not happened also in France. The vast majority of French companies led by the State, were leaders in the field of quality in Europe, the company Renault is very representative in this context. Juran (1999) put this feature to the French economy on account of the excellent training of managers. Essential elements in the French approach in the design of quality Juran's are the following (Juran, 1999: 38.7):

- the central role of the State in promoting quality, as a result of his dominant presence in the economy. Talking about nationalization, it has in this sense the most extreme form, the interventions seem to have a beneficial role, because of the superior quality of management, as quality of managers in the administration of the state is superior to that of other European countries;
- the deliberate concentration regarding region and in particular on small and medium enterprises has stimulated the local activity and created the progressive bottom up movement;
- the particular characteristics of the French Award for quality, which was introduced in 1993, is aimed for small and medium-sized enterprises, on the basis of a selection bottom up procedure, from the regional level to the national level. Companies that sign up for the prize, must be qualified for the regional phase, and only then, if they meet the criteria arrived the national phase. It should be noted that there is a high level of participation in this award on behalf of French companies. This bottom-up approach has been taken as the reference model in drawing up the plan for the European quality award.

In the general context of the quality development, the national power is relevant and meaningful in France not only at central level, but also at the regional level. It is in fact a national culture of France, which has generated a very favourable situation for the quality development.

### **3.2.3. Quality in Germany**

German cultural characteristics determined on the basis of the values recorded by Hofstede's model are the following (Hofstede, 2010: 64, 99, 142, 188):

- a lower power distance, with an index of 35
- individualism quite pronounced, with an index of 67
- masculinity quite pronounced, with an index of 66
- relatively strong uncertainty avoidance, with a rate of 65

The German management principles are: results-based management, competence and interpersonal relations. Value discipline, industry and creativity of the individual,

participatory management based on co-determination, individual and social well-being (Warner, 1997).

With regard to the Organization, one can identify the following: organizational structures on the functions or divisions and the management budgets. High importance is given to engineering and resources saving, and low importance is given to marketing. Managers at the pyramid of the hierarchy, i.e., the head of the team or the foreman, have a very important role. Workshop managers are responsible for the vocational training of their workers, which means that it focuses on discipleship at work. Very high importance is given to quality and innovation. The managerial control is relatively rigid, namely, delegation of authority is rarely encountered. (Lawrence & Edwards, 2000).

With regard to the quality development Juran (1999) believes that "mastery" of the German industry is rooted in the quality standards established by the guilds of German manufacture. The German standards were based on an internship of 3-4 years, which is fundamental to develop certain skills for the workers. Routine tasks are performed by the unskilled labour force, while highly skilled experts play an important role in thinking and producing quality. While large and medium-sized companies maintain a strong work crafted approach, the small organisations are strongly influenced by the legacy of guilds (Juran, 1979). Another key element for the success of the German system, which has brought considerable benefits, is the standardization, the German Standards Committee being established in 1926. The state intervention coincides with the interests of the private sector, generating great competitive advantages for the economic system. High quality of German products is linked to the other distinctive feature of the system, namely the trade marks and service marks. Using the trademark to ensure product quality has its origin in the guilds. Superior quality has been and is linked to a higher price, making German products to be niche products, offering quality and dependability similar to those of art. Another specific feature of German quality approach, is the importance of the Foundation, Stiftung Warentest founded in 1961, which carries out systematic testing of various products of competitors from the market, publishing the results in a magazine, which are used in advertising. Quality has been the main point of interest for German industry, but currently the risk of competition from other industries have great success in combining quality with efficiency and large-scale production. German industry has realized the importance of quality management more slowly, primarily at the level of quality assurance and quality management level. (Juran, 1979).

One can see the relationship of dependency between the cultural dimensions of Germany and how to address quality: focusing on the aspects of deep engineering, integration and training of workers within the companies; all these cultural aspects determine the evolution of the quality niche in order to achieve a globally and premium quality standard.

### **3.3. Quality Approach in Eastern Europe**

Eastern Europe has a tumultuous history, the countries in this part of Europe, such as Poland, the Czech Republic, Slovakia, Bulgaria, Romania, Hungary, Ukraine, Estonia, Latvia, Lithuania declared themselves or were incorporated into the Soviet bloc of the USSR along with the central core of Russia, which was a decisive

influence factor in all the fields of interest of the region, so therefore also in the approach and development of quality. (Milbank, 1994)

The Communist model characteristics have deeply affected the quality approach, this model is influencing today this part of Europe. In order to provide an overview of the Communist economy, punctuated briefly in the following traits (Juran, 1999: 39.2):

- *the economy was centrally planned*, which means that all decisions are made at the Center with the pressure "of the plan" and to protect themselves from failure. Managers across the economy were addressing unclear schemes either to carry out or plan, in order to ensure that the fault could be attributed to the failure of someone else, which work to unrealistic plans;
- *in effect, the state was the only customer* regarding the consumer goods, this meant that the huge central agencies represented the needs of the whole population, and there was no any direct input on the part of the consumer as regards the design of goods and services, i.e. There is no real feedback from the consumer, which meant that the consumer had to accept what is offered, which means to accept the quality provided by the state.
- *orientation was toward production volume*, and not the quality, the centralized plan required commitments for numerical quotas, and in order to achieve the fulfillment of the plan, most of the times there have been developed rebates to the quality.
- *most of the industrial production was destined for military purposes* thus, an elevated priority military system implies a low priority accorded to the rest of the economy
- *the plan committed the state to heavy-industrial development*, the objective of this policy was the transformation of the economy to one of industrial type, so the entire region to remains with factories, which were unable to react to the rapid changes of the market and of technology
- *there was little or no private ownership of property.*

The forces that influenced the development of the quality in Eastern Europe after the fall of Communist regimes are according to Juran (1999: 39.5):

- *local appearance of Japanese and Western goods*: Western created at the beginning of their local markets, a standard of comparison with products made by the old regime;
- *availability for purchase of Japanese and Western goods in the local market place*: the quality standards were determined by the market and not by the meetings held in the offices of standardization organizations;
- *the need and desire to compete at home against Western imports*, situation that awares Governments of the region that the long term local industry must achieve competitive products;
- *need and desire to sell high-value goods on the international market*: Governments are conscious that the key element for the long-term economic health is the participation in the world market and global competition requires high quality products;
- *joint venture with international corporations*, they are proving to be effective vehicles for technology transfer in the market-oriented management, which includes quality management.

With respect to the quality approach in terms of cultural influence in a country in Eastern Europe, it will be referred to Romania:

With regard to the cultural characteristics of Romania, estimated on the basis of the model of Hofstede are the following (Hofstede, 2010: 64, 99,142,188):

- power distance is very high, with an index of 90, "management has a discretionary character corresponding to an effective mechanism of preservation and highlights the status differences, characterised in particular by arbitrary and unconditional obedience leadership from hierarchical superiors" (Lungescu, 2005)
- individualism, with an index of 30, "characterized by the expectation of support from the community, lack of initiative, counterproductive vision of private property and, above all, nepotism and the primacy of the interests of the group" (Lungescu, 2005)
- masculinity, with an index of 42, "with a slight tendency to womanhood. Unfortunately, from this point of view the Romanian culture is not homogeneous, but includes a set of extremely masculine tendencies, pronounced differentiation between the behaviors of the two sexes, counterbalanced by a pronounced feminine tendencies of egalitarianism, the rich people's vision and convenience, etc." (Lungescu, 2005)
- very high degree of uncertainty avoidance, with an index of 90, "characterized by contrary trends: on the one hand to avoid strong elements in the social impact of religions, the need for supervisory authorities for more citizens, etc., on the other hand elements of uncertainty, indifference, lack of pathologic laxity rigour, etc." (Lungescu, 2005).

With regard to the development of quality, 24 years after the communist regime change, a significant step in changing the culture of quality, is the establishment of the Foundation "For Quality Award 1999 – J. M. Juran". Since 2000 is held the first edition of the prize for quality – J. M. Juran. The Mission of the Foundation as we find on the web page is: "the Foundation For Quality Award – J. M. Juran is the most important factor for progress through quality Romanian organisations" (PRC-JMJ). The basis of the Award criteria was the European model of excellence. The creation prize is approved by the European Commission for quality (EOQ), the European Foundation for quality management (EFQM) and is based on the following fundamental concepts: customer-orientation; partnership "supplier-client"; development and involvement of personnel; continuous development and innovation; the leadership and consistency of objectives; responsibility; results orientation. To win the prize of quality Romanian – j. m. JURAN, candidates must furnish proof that they are on the path to excellence in business practice, over a number of years, and have met the expectations of stakeholders. These stakeholders are: customers; employees; service providers; shareholders; (the owners) and at the same time, the company in which the organization operates (Ilies, 2003).

#### **4. Conclusions**

It can be seen that there are close links between the cultural specificities of a country and the way they approach to quality. The characteristics of cultural dimensions Hofstede explains the evolution of the quality of the country concerned. For example, in the United Kingdom, the cultural characteristics as fairplay and fairness can

explain the need for a quality standardization approach and reluctance towards a new approach to quality and total quality management. In France, the official dirigisme both at central level and at the regional level, due on the one hand, to the high power distance has generated a very favorable situation for the quality development, unmatched in any other European country. In Germany, the deep concentration on engineering, integration and trainings for the workers, the deep professionalism are leading to the realization of a standard of premium quality, namely niche quality. In Eastern Europe, thanks to the four decades of the totalitarian regime, the evolution of the quality journey steps until reaching the total quality management philosophy approach.

# ORGANIZATIONAL DEVELOPMENT IN THE FIELD OF POSTAL SERVICES

**Sîrbu Janetta**

*Department of Management-Economy, Faculty of Economics, "Bogdan Vodă" University, Cluj-Napoca, România*

[sjanetta2002@yahoo.com](mailto:sjanetta2002@yahoo.com)

**Abstract:** *In the current competitive context organizational development of enterprises determine radical changes in order to cope with an environment dominated by deep uncertainty and creates the ability to renew its own knowledge assets in order to gain competitive advantage in a market more and more complex and diverse. A detailed analysis has been made of the organizational development at the County Postal Office in Cluj according to Greiner's model in the five phases of development: creativity, leadership, delegation, coordination and collaboration, the five types of crisis being defined for each stage/phase, respectively: leadership crisis, autonomy crisis, control crisis, staff crisis and unknown crisis. By delegating responsibilities a special attention is required with regard to the way of acting, the availability of managers to give up power, the "reaction" of top managers, etc. With the new development phase, that is the phase of delegation, there are found some objectives with respect to use of delegation as a tool to facilitate organizational development, the creation of an organizational culture favorable to development, the improvement of the motivational system or the development of interpersonal relationships.*

*The evaluation of organizational development at the County Postal Office in Cluj was made by applying a questionnaire on organizational development that consists of 60 descriptive statements, answered by four of the organization's management and 56 employees with executive positions. Following the results obtained from the questionnaires there has been showed that the organization is in phase two of development that is leadership development. The applied management style starts to be on odds with reality and triggers the crisis of autonomy, which requires delegation of authority and responsibilities to as many employees as possible, involvement and encouragement of initiatives of the staff. After analyzing the questionnaire responses, it was revealed that the organization is in the second phase of development, respectively development through leadership, requiring an authorized leader to streamline the activity and to create major necessary budgeting systems of reward and communication.*

**Keywords:** organizational development, assessment, questionnaire

**JEL classification:** O43

## 1. Introduction

Organizational development promotes targeting goals by harmonizing them with the aims of people working in the organization, by changing the organizational culture and optimizing organizational communication on the basis of principles of openness, trust, information sharing, productivity, organization and work group dynamics, etc. For this reason "the development of organizations is a planned effort, depending on the size of the organization, managed from above, aimed to improve the health and

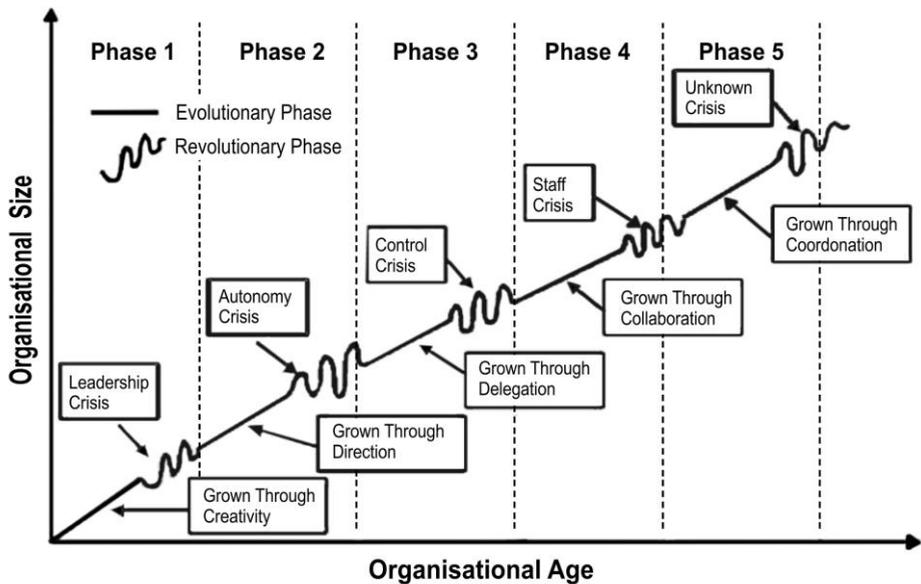

effectiveness of the organization through planned interventions on the organization's processes, using behavioral science knowledge in the field" (Burduş, Căprescu and Androniceanu, 2008). However, "organizational development is an intervention at the level of the human component of the organization, which aims to increase the overall organizational performance and employee efficiency" (Vlad, 2010:142).

For these goals, an important role is played by the manager and, in particular, the managerial ethical behavior, "which manifests itself not only in accordance with the law, but also with a broad set of moral principles common to all societies. Managers that act ethically have a huge positive impact on social outcomes of the activity undertaken by the organizations they lead" (Abrudan, Deaconu and Lukacs, coordinators, 2010). In addition to appropriate ethical behavior, managers must have different roles: interpersonal roles, informational roles and decisional roles (after Henry Mintzberg and Rosemary Stewart in *The Nature of Managerial Work*, 1980). The combination or "mix of roles for each manager depends on the level that the manager occupies within the organization, the nature of the tasks and the stage in his career" (Pintea, 2011:120). Hence the management philosophy aimed at people that "does not only mean that people are representing the organization, but also the respect for people to compete with other people" (Purdea and Macra-Oşorhean, 2010: 255)

For each company to operate at the optimum parameters, we need effective communication and managerial communication that „is increasingly important at the interpersonal level for positive interaction among all levels of management. It is essential for managers to interact with internal employees and external stakeholders to accomplish managerial objectives and develop positive team relationship” (Pipaş and Jaradat, 2012: 82). Another important aspect is planning/forecasting of staff, besides an adequate and appropriate selection recruitment of potential employees, along with a process of on-boarding and training that "represents a necessity from the desire of the individual to plan his career, but also from the needs of the organization" (Gârbo, 2008:113).

## **2. The Greiner model and organizational development**

According to Greiner, all organizations follow the same predictable development stages: developing through creativity, development through leadership, development under delegation, development through coordination, collaborative development. Thus, it highlights some of the characteristics and problems of each stage of development and some of the matters that may be included in the transformation of an organization (Fig. 1).

**Figure 1:** The organizational development by Greiner  
 (Source: Clarke L., 2002, pg. 20 apud. E. L. Greiner, *Evolution and revolution as organization grow*, 1980)

"The Greiner model has proven true for many companies and has a logical organizational development" (Câmpeanu Sonea and Sonea, 2006). As the company matures and its size increases, it passes through the five stages of development representing cycles of evolution and revolution. Greiner proposes an analysis of the changes that the structure has to suffer, the strategy and behavior of an organization if it relates to transition to the next stage of development. His study shows that most businesses do not learn to adapt, at least not in time. In the best case, they seem trapped in a "time loop", being unable to exceed a certain size. The Greiner model highlights the characteristics of each stage of development and proposes a scheme useful for successfully passing a crisis.

The Greiner model is particularly useful for any management team facing change through the following:

- provides a common language, common terminology needed for discussion about change and sharing experiences related to the process of transformation;
- John Leppard questionnaire can be used to determine where the firm stands in the growth curve, allowing "finding" of problems that can be anticipated in the future;
- it demonstrates the need for change at different stages of development of the business (because what worked in the past will no longer be applicable in the future).

### **3. Predictable crises of development of postal services (on the example of County Postal Office in Cluj)**

Currently, mail services go through significant changes that bring with them challenges for organizations, members and partners. Globalization, market liberalization, increased competition and development of information and communication technology is changing the way postal administrations do business. The decreased of volume of referrals, the emergence of electronic alternatives and changing in the consumer needs, require innovative measures, which will lead to the creation of new services, in order to maintain postal administrations competitive and generating revenue.

Following Greiner's model there was made a detailed analysis of the County Post Office in Cluj (it used to be the Regional Directorate of Postal Cluj) on the five stages of development (Table 1): Creativity, Leadership, Delegation, Coordination and Collaboration, being defined the five of crisis types for each stage / phase, respectively:

Stage 1: Leadership crisis

Stage 2: Autonomy crisis

Stage 3: Control crisis

Stage 4: Staff crisis

Stage 5: Unknown crisis

For each stage there were analyzed aspects referring to structures, systems, styles/people and advantages, at the weaknesses being presented items refereeing to above mentioned crises. Each stage of development has its specifics, with some advantages and some drawbacks, which actually would trigger those moments of crisis that would bring further improvements in the development of postal services.

Creativity - is characterizes by an informal structure with an immediate response to customer reaction and styles such individualistic, creative and initiative, and the benefits are attractiveness and responsiveness, triggering the crisis of management. For this reason there was developed the second stage - Leadership - which has a top-down structure and directive leadership, standards-based, cost centers, budget and wage with advantages of efficiency and effectiveness, favoring the triggering of the autonomy crisis.

The third stage is characterized by delegation, with a form of structure that is the opposite of the creativity structure, respectively bottom-up, with applied central systems on tax and management by exception. Full delegation is applied and autonomy with strong motivation from management, which subsequently triggered the crisis of control. The fourth stage, called coordination was characterized by strategic business units operating under product groups based on methods of planning and investment centers with severe spending controls and close supervision of the activities. Thus, the crisis of bureaucracy was triggered which determined the apparition of phase 5 - collaboration, based on a matrix structure with streamlined and integrated information systems with a focus on economics, expertise and innovation that created advantages with high spontaneity, flexible and behavioral approach. All these advantages can lead to a psychological saturation, that will trigger another crisis for new openings and opportunities.

**Table 1:** Predictable crises of development of postal services

Specificati on	Phase 1 Creativity	Phase 2 Leadersh ip	Phase 3 Delegatio n	Phase 4 Coordinati on	Phase 5 Collaborati on
Structure	Casual	Functional Central Hierarchica l From top to bottom	Decentraliz ed From bottom to top	Staff functions Strategic business units Units operating according to product groups	Matrix structure
Systems	Immediate response to customer reaction	Standards Cost centers Budget Wage systems	Profit centers Pay bonus Managemen t by exceptions	Formal planning methods Investment centers Severe controls of spending	Streamlined and integrated information systems
Styles / People	Individualistic Creative Leadership spirit	Impairment leadership (ordering)	Full delegation and autonomy	Supervision	Focus on economy Importance given to relational skills Innovation
Advantage s	Attractivenes s Responsiven ess to market demands	Efficiency	Strong motivation of the managemen t	More efficient allocation of corporate and local resources	High degree of spontaneity Flexible and behavioral approach
<b>Crisis point</b>	<b>Leadership crisis</b>	<b>Autonom y crisis</b>	<b>Control crisis</b>	<b>Staff crisis</b>	<b>Unknown crisis</b>
Weaknesse s	The founder has often a temperament inadequate to management activity	Inadequate to diversificati on Hierarchica l Do not form their people	Senior managers lose control as freedom cultivate liberal attitudes	Bureaucratic divisions between hierarchical / functional structures, headquarter s, field	Psychologica l saturation

#### 4. Evaluation of organizational development at the County Postal Office in Cluj

To outline directions for organizational development is useful to evaluate on what level of development is the County Postal Office in Cluj. For this purpose we used a questionnaire on organizational development that consists of 60 descriptive statements (Appendix 1). The questionnaire was completed by 4 decision makers and 56 employees. From the list

there were chosen the allegations that the firm is deemed fit. Whenever a statement that fits the company is encountered it is ticked. Once all 60 statements were completed, we transfer the check marks on the score sheet (Table 2) and are ticked in the box with the same number. At the end of the questionnaire the check marks are added up. Depending on the column that score approaches, the diagnosis of stage development of the company can be established. Through this list are selected the statements which are deemed fit to the postal organization.

**Table 2:** Questionnaire scoring sheet on the organizational development

Phase 1	1. Crisis	Phase 2	2. Crisis	Phase 3	3. Crisis	Phase 4	4. Crisis	Phase 5	5. Crisis
1	2	3	4	5	6	7	8	9	10
11	12	13	14	15	16	17	18	19	20
21	22	23	24	25	26	27	28	29	30
31	32	33	34	35	36	37	38	39	40
41	42	43	44	45	46	47	48	49	50
51	52	53	54	55	56	57	58	59	60

Where:

Phase 1 Development through creativity: 1 Leadership crisis

Phase 2 Development through leadership: 2 Autonomy crisis

Phase 3 Development through delegation: 3 Control crisis

Phase 4 Development through coordination: 4 Staff crisis

Phase 5 Development through collaboration: 5 Unknown Crisis

From the data analysis there is shown that the organization is in phase 2 of development through leadership. At this stage there is the need of an authorized leader to guide the activities and establish the main budgeting system of reward and communication necessary for the firm to be effective.

The directive management style "from top to bottom" begins to be inconsistent with professional managers that lead activities in which they are specialized. Generally these managers are involved in conflicts of interest in order to be heard or will lose motivation and leave. Thus, autonomy crisis is triggered. The solution to solve the autonomy crisis is to admit that the authority must be delegated to a greater number of company's employees.

The next stage of development of the County Postal Office in Cluj is development through delegation. The organization needs a team and it must assign authority to more people. Devolution of decision in order to create a strong sense of employee involvement, inevitably involves control issues, senior managers are panic-stricken and attempt to seize power. Everywhere managers encourage their employees to

take initiative. In fact, once we begin to understand what delegating responsibility really means, it becomes obvious that there are many issues that require attention, such as:

- What is the "action space"?
- To what extent managers are willing to give up power?
- When the context is unfavorable, senior managers panic and take back the power?

In the stages of development through delegation, the structure is decentralized, centers of profit are created, salary and bonus system is rethought, management by exception develops and the leadership team is highly motivated. Knowing the new development stage that the organization must follow, we can establish several strategic development objectives:

- the use delegation as a tool for facilitating organizational development;
- creating an organizational culture conducive to development;
- improving the motivation system;
- development of interpersonal relationships.

## **5. Conclusions**

Organizational development is necessary to change attitudes of managers and employees within organizations, covering the entire organization and aims to improve organizations' capacity to solve problems, to improve organizational climate through direct involvement of people in order to increase flexibility, capacity of adaptation to environmental changes and more effective use of resources. Organizational development uses methods and knowledge of behavioral sciences in order to improve human performance, focusing on the full exploitation of human potential in the field of organizational change.

Using the evaluation questionnaire and adopting Greiner's model on predictable stages of development of the organization, it was established that the County Postal Office in Cluj is at the level of development through leadership, after which the autonomy crisis will follow and the next level of development will be development through delegation. For this reason we can define several strategic development objectives with respect to:

- use of delegation;
- development of management by exception;
- creating an organizational culture favorable to development;
- development of interpersonal relationships;
- improving the motivational system.

Also there can be used successfully some of the methods of organizational development, including: formation of team spirit, surveys feedback, total quality management and reengineering. By the training of team spirit is sought the increase of work efficiency by focusing on interpersonal processes, clarifying objectives and wages. Feedback of survey requires organization members to suggest data that are then administered as a basis for change. Total quality management aims to achieve a continuous improvement in the quality of products or services. Reengineering means a radical redesign of organizational processes to achieve major improvements in time, cost, quality of products or customer service.

## Appendix 1

### Evaluation questionnaire on organizational development

1. The organizational structure is informal.
2. Senior management is burdened by numerous unwanted management responsibilities.
3. Management focuses mainly on activity efficiency.
4. Staff at lower levels of the organization knows the markets, products, trends and so on better than senior management.
5. The main concern of management is to expand markets.
6. Senior managers feel they are losing control of the company.
7. Management focuses primarily on coordination and consolidation.
8. The trust is missing between staff in administrative roles and specialist staff, between headquarters and subsidiaries.
9. Management focuses mainly on problem solving and innovation.
10. Teamwork has a huge importance.
11. Top management adopts an individualistic and personal initiative oriented style.
12. Top management needs too much time to answer questions and requests.
13. The organizational structure is centralized and functional, based on specialization.
14. There is not given sufficient scope to those able to do so.
15. The organizational structure is decentralized and affiliates and different departments enjoy a high degree of autonomy.
16. Many employees at lower levels have too much freedom to act on their own.
17. Decentralized units were grouped into categories of products.

18. Managers at middle and lower levels think that the senior management authority is exaggerated.
19. The organization is a matrix of tasks or project teams.
20. Dependence on the decisions in groups is so large that some managers lose confidence on individual decisions.
21. The main control system is to determine whether or not the sales goals were met.
22. Senior management does not provide sufficient guidance.
23. Senior management tends authoritatively exert their duties and could easily delegate authority.
24. Senior management resorts to delegation of authority.
25. It may be possible that the organization is too decentralized, cultivating liberal attitudes.
26. Senior management resorts to delegation of authority.
27. Top management prefers to supervise rather than to direct.
28. It seems that we have lost the ability to react to new situations or to solve problems quickly.
29. Senior management adopts an advisory style, often organizing meetings to debate issues.
30. We spend too much energy on internal teams and we tend to neglect what is happening in the external environment.
31. Long hours of work are rewarded by modest salaries, but there is the promise of future benefits.
32. Senior management is not involved as it should.
33. The main control systems aim standards and costs.
34. Flexibility is impaired as a result that those who could make decisions must await management approval.
35. Control is exercised mainly through profit centers.
36. Senior management seems to not have the authority.
37. Each product category is an investment center subject to detailed scrutiny.
38. Everyone criticizes the bureaucratic system created.
39. The main control system is in the evaluation of the work teams of their own performance with help of real-time information systems, integrated in daily work.
40. There is already a very strong individual feedback on behavior in meetings.
41. Management focuses mainly on production and sale.
42. Senior management is very tense, conflicts between its members being intense.
43. The main way to reward managers is the salary, plus bonuses.
44. Employees lost their motivation, even quit, because of the lack of sufficient personal autonomy in the functions they perform.
45. The way managers are compensated is the individual premiums.
46. We need a better coordination of activities.
47. The way managers are compensated is the share of profit and granting shares.
48. Good humor and enthusiasm seem to be missing from the company.
49. Especially team performance is rewarded and in a lesser extent the individual success.

50. Permanent creative requirements create tension.
51. Senior management maintains close relationships with clients and is informed regarding to market requirements.
52. Senior management does not seem to be able to introduce new business techniques required.
53. To be appreciated in the company, managers at lower management levels do not question the decisions of their superiors.
54. The performances are evaluated by managers who have little knowledge about their subordinate's work and working problems.
55. The personnel is communicated what is expected of them and then allowed to perform their work as they see fit. It is management by exception.
56. Experienced managers make regular checks to ensure that the work was done - they tend to exaggerate in this regard.
57. Many employees at headquarters develop work programs to verify the work of local managers.
58. Too many employees work "by norms".
59. Conflicts between employees are manifested openly and are usually solved in a constructive way.
60. The constant struggle to be spontaneous and open in business relationships proves to be tiring.

# HOW TO DEAL WITH CORPORATE SOCIAL RESPONSIBILITY RELATED TO EMPLOYEES

**Stoian Ciprian-Dumitru**

*Department of Management, Faculty of Economics and Business Administration, "Babes-Bolyai" University, Cluj-Napoca, Romania  
ciprianst@yahoo.com*

**Abstract:** *The aim of the paper is to examine an area which was not thoroughly researched until present. We refer on how Corporate Social Responsibility (CSR) practices are nowadays reflecting its actions to employees / labor force. This paper represents a theoretical research related to the latest developments in this field. We had documented our paper based on actual references on this matter. In order to make correct assessments, this material seeks firstly to examine the level of understanding in respect of internal CSR actions related to employees. It is very important to understand and to briefly describe how previous studies described the link between CSR actions assigned to own employees. Secondly, this paper focuses on presenting and commenting an idea prescribing that pyramids (i.e. the pyramid of Maslow's hierarchy of human needs and the pyramid of Carroll's corporate social responsibility) put together generate a clear feedback related to companies' reactions in respect of CSR for their employees. In a practical manner, it is assumed that each level on the pyramid of Maslow has a correspondent in the pyramid of Carroll and vice-versa. This model is then precisely reflected when looking at the employees and their needs reflected through CSR actions. Thirdly, this paper also emphasizes the importance of the labor unions for employees' CSR. We discuss about an out-of-the-box role for the labor unions, which should be engaged more and more in the employees updated wishes, one of them being about various CSR actions that need to be focused on employees. We assume that CSR efforts directed in the field of employees would make them more responsible, more eager to work and more productive in their day-to-day work.*

**JEL classification:** *M14*

## **1. Introduction**

Financial crisis had spread around the world and many systems had to suffer. Thus, one of the consequences of the financial crisis was that occurred delays in paying wages and unreasonable disorders. Wages represent nowadays a method to maintain basic survival needs for employees and their families (Wei, 2013). In this respect, we consider that it should be more careful understood the way in which companies are capable to create an internal CSR practice behavior related to their employees. We may argue that until now this internal CSR component was not so much researched.

However, recent studies argue that a thoughtful relation should exist between the pyramid of Maslow's hierarchy of needs and the pyramid of Carroll's CSR. This relation is called as "double pyramid" thought and was considered to help creating a

better society derived from a good management of corporations' social responsibility for their employees. (Brammer, S., Williams, J., 2007 and Wei, 2013).

Another factor that may influence companies' attitude related to CSR for employees is the active presence of the labor unions in the market. In the past, it was believed that unions only responsibility was to mediate better working conditions of their members. In present times, we consider that it is important to observe the actual versus desired involvement of unionized labor to the so-called their social responsibility.

## **2. Internal CSR actions related to employees**

Internal CSR actions related to employees are not very researched and the level of understanding and its importance are not at an optimum level. We consider that it is important for each company to manage its business in order to show interest to its employees' wishes. It is true that nowadays crisis made a lot of companies to think twice before spending money.

However, it is well known that each company bears profit and loss and that profit is the motive power of business management. In many situations, companies are not interested in social responsibility for their employees. It is clear that generally speaking CSR actions are seen as external activities, even though specialists consider that own employees are part of the CSR stakeholders.

When we discuss about small and medium-sized enterprises and even about multinational corporations, there are generally two ways (Wei, 2013) to approach profit maximization:

- to save internal management cost, by speeding up the assembly line, lowering the piece-rate wage, increase daily workload and
- to reduce social spending as much as possible. Most of private companies only pay attention to corporate interests, neglect employee's benefits (i.e. endowment insurance, medical insurance, injury insurance, etc.) and do not carry out on the labor rights (i.e. extension of the working hours, etc.)

This attitude may not be helpful for companies because of the feedback received from employees and from the other stakeholders. We may only take the example of a company who intends to contract a loan from banks – this company may incur problems (i.e. refuse or higher interest rates) because of its internal issues (i.e. even CSR policy) with employees.

A correct approach would be that businesses to be managed by professional managers who understand that profits are not only belonging to owners, but also to all investors. Companies' interests and social interests are imparted and have influences on each other. Every company needs to have a common understanding related to a better treatment for employees, which may be seen by all the stakeholders as a positive CSR activity.

## **3. “Double Pyramid” thought**

As Wei (2013) have mentioned in his paper, each enterprise should not only realize the profit maximization, but also to meet the individual needs of employees. All enterprises should not only undertake financial responsibility, but also undertake social responsibility. In a word, those enterprises that their employees' personal needs and social welfare are all brought into the enterprises' agenda, can have the favorable development, and will grow much bigger and stronger (Wei, 2013). Thus,

as a strong argument, the design of Maslow and Carroll pyramids was to offer an idea on how to positively cope to the success of employees' CSR.

### 3.1. The Pyramid of Maslow's Hierarchy of Human Needs

Maslow's hierarchy of needs was mentioned for the first time in the field of psychology and was created by Abraham Maslow, in his paper "A Theory of Human Motivation (Maslow, 1943: pg370)." After initial issue of the paper, Abraham Maslow extended the idea to include his observations of humans' innate curiosity. His theories parallel many other theories of human developmental psychology, all of which focus on describing the stages of growth in humans. He had used the terms such as physiological needs, safety needs, love and belongings, esteem, and self-actualization needs, as his objectives were to describe the pattern that human motivations generally move through (Wei, 2013). The physiological needs are the largest and most fundamental level of needs at the pyramid bottom of Maslow's hierarchy needs. The self-actualization needs are at the pyramid top of Maslow's hierarchy needs (Maslow, 1943).

**Figure 1:** The pyramid of Maslow's hierarchy of human needs  
Source: (Maslow, 1943)

As a short notice on the content of the pyramid, *Physiological needs* are obvious - they are required for human life, as the human body simply cannot continue to function well. *Physical needs* are active when individual's safety needs take precedence and dominate behavior. *Safety* needs include personal security, financial security, health and well-being, safety net against accidents and their adverse impacts. After physiological and safety needs are fulfilled, the third level of human needs which is interpersonal and involves feelings is *belonging*.

All human have a need to be respected, and they have *self-esteem and self-respect*. *Esteem* presents the normal human desire to be accepted and valued by others. *Self-actualization* is the level of need pertains to what a person's full potential is and realizing that potential. Maslow describes this desire as the desire to become more and more what one is, to become everything that one is capable of becoming. This is a broad definition of the need for self-actualization, but when applied to individuals the need is specific.

### 3.2. The Pyramid of Carroll's Corporate Social Responsibility

Carroll studied the responsibilities of enterprises and finally managed to create a pyramid of corporate society responsibility (Carroll, 1991).

**Figure 2:** The pyramid of Carroll's corporate  
Source: (Carroll, 1991)

Carroll considers that *economic responsibilities* are the base of the CSR pyramid, the beginning of a fair and just social responsibility while *legal responsibilities* are the next layer of the CSR pyramid and it merges with the economic responsibilities. The third layer of the CSR pyramid is *ethical responsibilities* in respect of standards, expectations and norms that are seen as fair by all entities involved, such as the community, consumers, shareholders and employees. These are the agreed-upon moral obligations of the business. The top of the CSR pyramid is *philanthropic responsibilities*, which reflect the expectations of corporate citizens, encouraging the promotion of concern and well-being of the community.

### 3.3. "Double Pyramid" concept – instrument for managing CSR related to employees

"Double Pyramid" concept derives from the pyramids described above. The essence of the concept relates to the fact that employees' needs should follow Maslow's hierarchy of needs while corporate management should follow Carroll's CSR pyramid.

There are important arguments that present the pyramids relations. First argument is that contractual obligations are relationships of labor and capital. The basic economic responsibility and legal liability are ethical bottom lines for getting labor resources (Cianci, R., Gambrel, P.A., 2003).

Another argument would be that companies not only pursuit profit maximization, but also meet their employees' physical and security needs. Labor is one of the key elements of business development. Only with safe working environment companies may retain and expand its business (Tang, T. L. P., Ibrahim, A. H. S., & West, W. B., 2002).

Business owners should respect and meet employees' social needs and right (e.g. holidays, vacation, birth and maternity leave, etc.) and grant employees' the right of insurance, welfare, education and training.

These can make them wholeheartedly work for the enterprises without any trouble back at home. All those can also arouse employees' work enthusiasm. They will contribute their ideas and efforts to firms' future development.

By taking into consideration Maslow's hierarchy of needs and Carroll's CSR, the essence of the "two pyramids" concept is that business owners and their employees should be harmoniously coexistent, mutually beneficial to each other while developing. In a market economy, every company with its specific operations needs labor production elements for its uninterrupted development. On the other side, employees are in position to be remunerated for work rendered by the employer. Even though in a financial crisis period the employees may find difficult to find easier new jobs, it is known that companies should still meet basic survival requirement and improve employees' rights for the long-term development. Only in the harmonious environment the employees would offer maximum potential of their capabilities. In modern society, different people do different things because of division of labor. People devote themselves to all kinds of affairs, and they undertake different responsibilities. Although employees work for enterprises in order to gain wages, enterprises should also offer safe working environment to ensure their lives (Wei, 2013).

Each business enterprise should provide equal promotion and education opportunities for his employees. Every employee should not be discriminated due to gender, age, race, color or faith. The enterprise should also create favorable working conditions for employees, and improve their scientific and cultural levels at the same time, which will promote the employees' development and perfection. In addition, the enterprise should respect employees' needs and pay attention to employees' opinions and demands. Therefore, the "double pyramid" concept may be accomplished through employees' self-worth and companies that achieve the enterprise's economic benefits at a maximum level.

#### **4. Labor Unions – supporting institutions for CSR related to employees**

Starting from the history, labor unions had the objective of securing the best possible working conditions for their members. However, unions may be defining working conditions too narrowly. Since union members usually live in the community in which they work, concern for the welfare of the workers should not stop at the end of the work shift. Local unions need to be involved in their local communities to insure that the non-working environment provides the best living conditions possible for their members. Such unions may give a helping hand to the employees by promoting their interests in order to be better served through CSR actions organized by their employers.

The national or international unions, of which the local is an affiliate, should also be involved in the broader state and national communities to insure that the cultural, physical, educational, and political environments do not negatively impact the members' living conditions. Since unions are not part of a political party they are in a position to lobby both sides of the aisle for meaningful legislation for the welfare of their members and hence, the common good (Carroll, 2010). Labor is more sensitive

to social responsibility issues as corporations expand their scope of stakeholders to the social sector (Marchand, R. (1997).

Social responsibility is a dynamic concept. What is considered socially responsible depends on the expectations of society and this evolves over time in response to changing circumstances. In respect of the labor unions in both the private sector and the public sector, it is probably advisable that unions may also have their social responsibilities and may help to promote the employees' wishes. Some of the union areas of responsibility are in contributing to full-employment, preparing members for other work, contributing to the quality of education in the community, supporting issues that involve improving life in the local and national communities, and supporting members in meeting the new social contract. (Carroll, 2008).

To be effective, the union has to represent a significant percentage of the labor force because this makes it possible for the union to have a strong bargaining position and may have better impact on companies. Unions, whether strong or weak, could emphasize the competitive advantage of undertaking social responsibility initiatives, encouraging their employers to see these as an element in their corporate competitive strategy. Unions could partner with other social groups, national unions could partner with international unions and Non-Government Organizations to work for better global labor practices. The local unions could work with local and state school boards to raise the general educational and skill level of the population (Carroll, 2010).

Labor union may represent an institution that can serve as a promoter for CSR related to employees.

## 5. Conclusions

It is important for each company to manage its business in a way in which to be able to also show interest to its employees' wishes. Even though the financial crisis made a lot of companies to think twice before spending money, the approach and interest of companies should increase when referring to internal CSR actions related to their employees.

When an interest for CSR actions related to employees was generated, we observed that we have in front of us a double win situation, according to the idea prescribing that pyramids (i.e. the pyramid of Maslow's hierarchy of human needs and the pyramid of Carroll's corporate social responsibility) put together generate mutual and positive feedback related to companies' and employees reactions in respect of CSR. We may also conclude that companies' attitude related to CSR for employees may be "affected" by the active presence of the labor unions in the market. Such labor unions may trigger better mediation that may improve the impact on employees' social responsibility.

# HUMAN RESOURCE MANAGEMENT - FROM FUNCTION TO STRATEGIC PARTNER

**Todericiu Ramona, Șerban Anca**

*Faculty of Economics, "Lucian Blaga" University of Sibiu, Romania*

*ramona.todericiu@ulbsibiu.ro*

[anca.serban@ulbsibiu.ro](mailto:anca.serban@ulbsibiu.ro)

**Abstract:** *In most of the organizations, people are now recognized as the vital asset. Their knowledge, skills and abilities must be deployed to the maximum effect if the organization is to become successful. The intangible value of an organization relating to the people it employs and its human resource strategies is gaining recognition and it is generally accepted that this has implications for long-term sustained performance.*

*The recent changes in the economy and the development of new technologies are creating the proper set for a series of other changes regarding the human resource management.*

*The first one refers to the need to respond to the challenges raised by the knowledge workers and the second one refers to the increasing role of human resource management in the strategic moves of the organizations.*

*Lately, because of the recent mentioned developments, strategic human resource management became a subject of ongoing discussion for academics. Its definition and relationships with other aspects of business planning and strategy vary, but the common agreement is that strategic human resource management is a complex process that is constantly evolving and that there is a need of understanding its usefulness. Having quality professional practices is a must, but this shouldn't be the only focus of the best human resource practitioners. They need to be able to combine their attention to basic administration with also making important strategic inputs that have a positive impact on the organization.*

*The purpose of this article is to present the current research state in the field of strategic human resource management. In order to achieve this, the factors that underline the importance of human resource management are assessed. The study has been accomplished using the methodology of bibliographic study and qualitative research.*

**Key words:** *human resource management, knowledge society, chief executive officers, partnership*

**JEL classification:** *M12*

## **1. Introduction**

Nowadays, the Human Resource (HR) function in the corporate world is going through two main changes. The first one relates to the rapid growth of the knowledge economy and the second one with the struggle of being more than just a function and becoming a strategic partner.

These two trends are reshaping the role of HR in the corporate world.

The first changes are generated by the new context of the knowledge society when a committed, appropriately skilled and prudently deployed workforce is critical in order to develop a competitive advantage.

The second change comes as an opportunity since many administrative functions that were formerly handled by HR departments, such as payroll and pensions, have now been outsourced, and specialists, unburdened by some of their former responsibilities, have a chance to transform their role, exploiting their image as experts in people to place themselves at the heart of the debate on a organization's strategic direction.

## **2. Human Resource Management in the knowledge society**

Changing knowledge management practices and global convergence of technology has redefined the nature of work (Horwitz F., 2003). This statement is true when we think about the actual work of any employee and also when referring to the work done by human resource specialists. Knowledge as the main resource of the century poses a large series of changes, from the way the economy and its' forces work, to the need of developing new management systems, to the way in which a worker thinks. The new era could be far more productive than the previous one, but in the same time can lead to certain confusion in respect with the changes that need to take place in order to get to the necessary performance level that guarantees survival and success.

Peter Drucker considers the knowledge-based company as the organizational model of the XXIst century and draws its main characteristics: *composition dominated by professionals, small number of intermediate levels of hierarchical leadership and coordination ensured by means of non-authoritative style (standards, procedures, rules of cooperation and so on)*.

This new type of organization forces specialists to change the traditional personnel management by creating different strategies for the most important resources.

Also, the 2008 global recession and demands for sustainable performance have forced corporate leaders to examine and re-evaluate how they manage and operate. They are utilizing new technologies, changing their organizations' structures, redesigning work, relocating workforces and improving work processes. These changes have significant implications for how their human capital should be managed and how their HR functions should operate (Lawler E., Boudreau J. W., 2012). Now, more than ever, the effectiveness of an organization depends on its ability to address talent management issues such as knowledge management and change management.

Due to the immense importance of knowledge workers as the main resource of the modern society, the organizations must not only be designed to accept the knowledge worker but, more radically, be designed with the worker as the consideration around which the rest of the organization must fit (Paton S., 2013). Also, the processes of the organization must focus on communication and coordination rather than command and control because direct supervision of knowledge workers is difficult, so implementing an organizational design that relies upon a vertical hierarchy is impractical.

The acknowledgement of the importance of a proper human resource management for knowledge workers is imperative for any organization that aspires progress. A successful management in this sense is a big challenge for organizations, and

human resource experts need to channel their abilities in order to attract, motivate and retain the most important resources of the century.

### **3. Strategic Human Resource Management (SHRM)**

The importance of the human resource department in an organization has been noticed ever since the early 1990s, at which time specialists developed a series of definition for strategic human resource management. SHRM was defined as “*the undertaking of all those activities affecting the behaviour of individuals in their efforts to formulate and implement the strategic needs of business*” (Schuler, R.S., 1992) and as “*the pattern of planned human resource deployments and activities intended to enable the organization to achieve its goals*” (Wright, P.M. and McMaha, G.C.,1992).

More recent, the Chartered Institute of Personnel and Development (CIPD) defines SHRM as *an approach to the management of human resources that provides a strategic framework to support long-term business goals and outcomes*. The approach is concerned with longer-term people issues and macro-concerns about structure, quality, culture, values, commitment and matching resources to future need (Armstrong M., Baron A., 2002).

Lately, because of the recent mentioned developments, strategic human resource management became a subject of ongoing discussion for academics. Its definition and relationships with other aspects of business planning and strategy vary, but the common agreement is that SHRM is a complex process that is constantly evolving and that there is a need of understanding its usefulness.

HR department always had strategies like *to deliver fair and equitable rewards, to improve employee performance* or *to streamline organizational structure*, but these strategies are not testimonies of SHRM. Rather, SHRM is the overall framework that determines the shape and delivery of the individual strategies (Armstrong M., Baron A., 2002). A clear view over the difference between human resource strategy and SHRM is offered by Boxall and Purcell which assert that strategic HRM is concerned with explaining how HRM influences organizational performance. They also argue that strategy is not the same as strategic planning because: *strategic planning* is the formal process that takes place, usually in larger organizations, defining how things will be done, and, by contrast, *strategy* exists in all organizations - even though it may not be written down and articulated - and defines the organization’s behavior and how it attempts to cope with its environment.

John Sullivan points out that human resources professionals often think they are being strategic when they are actually being tactical. He states that being strategic means having a business impact on the organization's corporate goals and objectives and that a certain program is strategic only if it meets the following criteria:

- It has a broad impact.
- It focuses on future needs.
- It has the potential to provide a sustainable competitive advantage.
- It has the potential to generate at least 1 percent of revenue or profits.
- It has a direct impact on long-term corporate goals.

The academics from at the Aston Centre for Human Resources in association with CIPD recently concluded that SHRM is about the integration of human resource management strategies into the corporate strategies and more specifically it means linking people with the organization.

In the new context, human resource management is not a concern just for the human resource department, rather it should be a main focus for the top management. The HR people are accountable to management for excellent human resource management processes, tools and coaching that work. They are responsible to energetically influence managers to effectively use the tools that have been designed.

HR Folks International has depicted a contrast between human resource management and the human resource department that explicitly shows areas of responsibility for managers and human resource professionals (figure no.1).

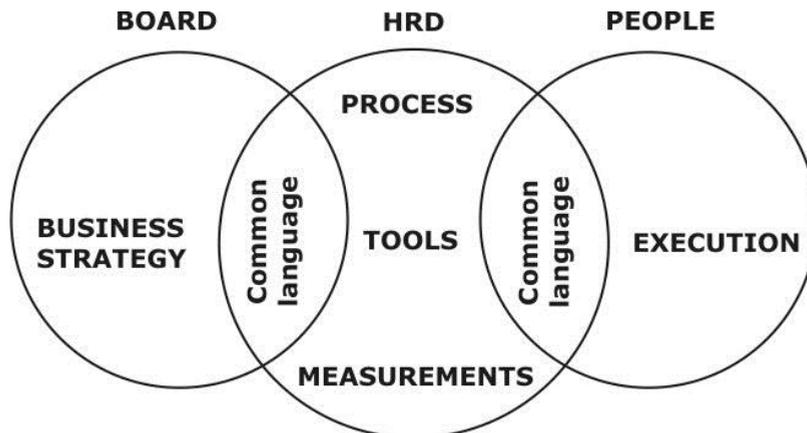

A good business strategy, one that is likely to succeed, is informed by people factors. This is one of the main reasons why human resource management should be strategic. So, if human resource management is a coherent approach to the management of people, SHRM implies that this is done in a planned way that integrates organizational goals with policies and action sequences (Armstrong M., Baron A., 2002).

**Table 1:** The contrast between human resource management and the human resource department

	<b>Human Resource Management</b>	<b>Human Resource Department</b>
<b>Focus</b>	Implementation of HR tools and practices	Development of HR tools and practices
<b>Owner</b>	Top management	HR department
<b>Outcome</b>	Creation of value through effective management of competencies	Effective HRM practice

Source: HR Folks International

It would be very simplistic to suggest that strategic human resource management just derives from the organization's business strategy. The relationship between the two should be mutually informative (Armstrong M., Baron A., 2002). Business strategy is also shaped by the way in which people are managed, motivated and deployed, and by their availability of sharing their skills and knowledge. In the new context, it should be impossible to find an organization that does not take into account the human resources, since they are the main asset. Individual human resource strategies are also shaped by the business strategy. For example, if the business strategy is about improving customer service this may be translated into discrete human resource strategies involving the use of training plans or performance improvement plans. In this case, the purpose of the human resource department is one of active partner for the board because only by being part of the design of the strategy, it will be later able to create the perfect tools and to translate the strategy in objectives that can be easily understood and completed by the employees (figure no.2).

**Figure 1:** The complex role of the Human Resource Department  
**Source:** own

Human resource strategy must be anchored to the business strategy and for this, HR professionals must understand the strategy and economic realities of the business it supports. HR people must “speak” the language of business and their activities must reflect the priorities of the business.

#### **4. The HR manager –a new seat at the executive table**

A global survey conducted in May 2012 on 235 executives by the Economist Intelligence Unit, Oracle and IBM, confirmed that chief executives are very concerned about the potential negative impact of certain human resource issues in the near future. A significant proportion of CEOs polled believe in the ability of their head of human resources to help the company to overcome these challenges.

Although the human resource function is believed to perform well within its own parameters, some doubts remain about its commercial understanding of the wider business. This indicates that heads of HR have not completed their transition from administrator to strategic partner although there is clearly a need for human resource professionals to assist in the vital people dimension of corporate strategy.

However, a significantly proportion (70%) of CEOs want the head of HR to be a key player in future corporate strategy, but things have to change since many respondents believe that their heads of HR are overly preoccupied with a narrow HR agenda and 37% say that human resource people don’t “understand the business well enough”.

These findings suggest that top executive expect their HR managers to demonstrate business pragmatism and efficiency. Therefore, it is important for the HR department to deploy both HR specialists as well as managers who possess a business background.

HR professionals could become drivers of organizational effectiveness and business strategy, the key question is whether they will rise to the occasion.

HR professionals can add value by (Lawler E.,Boudreau J. W., 2012):

- Providing administrative support services.
- Serving as business partners who help to implement business systems and practices.

- Becoming strategic partners who help corporate leaders develop business strategy.
- Measuring their performance against qualitative, quantitative and financial metrics

The last aspect is of extreme importance, especially when thinking about the need to attract bigger budgets for the human resource management. If HR professionals measure whether their programs are having a strategic impact and produce the desired results, they have more leverage when negotiating. The measurement can be either a detailed HR audit or a snapshot assessment that can be completed in a few days based on readily accessible data, such as financial performance measures, retention measures and recruiting measures (Sullivan J., ). Two of the most well-known methods of measuring performance are benchmarking and the Balanced Scorecard.

Benchmarking is a systematic process of measuring an organization's products, services, and practices against those of an organization that is a recognized as a leader in the studied area.

The Balanced Scorecard represents a set of indicators that assures a unitary presentation of the management vision regarding the performance control and supposes the relational approach on four dimensions: financial perspective, customers' perspective, internal business processes and organizational learning and growth perspective. A very useful improvement of the balanced scorecard is the total performance scorecard. The latter is defined as the systematic process of continuous, gradual, and routine improvement, development and learning, focused on a sustainable increase of personal and organizational performances. This framework tries to mark the common road of an individual's goals and the company's goals, in order to obtain maximum satisfaction for both parts involved. The Total performance Scorecard combines two separate balanced scorecards: the personal one (PBSC) and the organizational one (OBSC). Correlating the two of them is the perfect framework for improving the entire organization, as well as for the development of human potential.

Since these areas are critical determinants of organizational performance, HR leaders are missing a great opportunity to add value if they do not develop much better metrics and analytics. In high-performing HR departments they rely on data-driven practices and the organizations' business strategies. This allows them to make rigorous data-based decisions about human capital management and to engage in discussions with senior executives based on business strategy and data (Armstrong M., Baron A., 2002).

The human resource management is an integral part of how an organization is going to achieve its mission and only by integrating it into the organization's strategic plan one can keep people aligned with the objectives of the organization.

Human resources management alignment means to integrate decisions about people with decisions about the results an organization is trying to obtain and represents the last level in the Hierarchy of Accountability (figure no.2).

**Figure 2:** The Hierarchy of Accountability

Having quality professional practices and services is a must, but this shouldn't be the only focus of the best HR practitioners. They are able to combine their attention to basic administration while also making important strategic inputs that have a positive impact on the future of the organization. This is obviously not an easy balance to maintain, but is definitely not impossible either.

## 5. Further research

The strategic human resource management is a very interesting subject that could be the source of many studies, but one of the most interesting is the relationship between CEOs and the heads of the human resource departments. This type of research conducted in Romanian organizations would help understand how human resource management is perceived in national organizations and could provide us with the necessary information for the steps needed in order to achieve better results when it comes to fulfilling strategic goals.

## 6. Conclusions

While individualization of employment practices and team-based work may provide personal and organizational flexibilities, aligning HR and organizational strategies for competitive advantage has become more prominent (Horwitz F., et al., 2003) and the perception of human resources management is changing, more and more organizations considering it a value-added business partner. SHRM can be regarded as a general approach to the strategic management of human resources in accordance with the intentions of the organization on the future direction it wants pursue.

The human resource management literature makes clear that HR is always involved in execution of an overall strategic plan, but infrequently involved in the initial development of that plan and this needs to change in the new economic context. CEOs recognize that human resource professionals have a role to play in supporting and promoting the value of HR within the company, but are also looking for senior HR executives themselves to be more assertive in demonstrating their value.

Alignment between executives, the human resource department and employees is critical to ensuring that the HR team is designing and developing initiatives that drive business performance and enable people to achieve results.

# ORGANIZATIONAL CULTURE AND STRATEGY. HOW DOES IT WORK? AN EMPIRICAL RESEARCH

**Vele Cristian-Liviu**

*Department of Economics, Faculty of Science, "Technical" University, Cluj Napoca,  
North University Centre Baia Mare, Romania  
cristian\_vele@yahoo.com*

**Abstract:** *Why do some companies fail in their efforts to implement competitive strategies? Why do others win in implementing competitive strategies? Of course the reasons behind every fail and every win are numerous and can be related to insufficient resources, lack of information, changes in the external environment, etc. But let's say that two companies, trying to implement a competitive strategy, have the necessary resources, information and the environment is relatively calm. Although the two companies have the same opportunity in implementing the strategy, only one is successful in its efforts, while the other fails. Why? One possible answer and one of the most plausible causes behind this fail is the resistance to change. Strategies are designed to increase the company's overall performance by strengthening its capabilities and core competencies and by eliminating the inefficient activities and processes. But, this phenomenon will change the way in which things are done inside the company. This, in term, will change the culture which defines that organization. Facing this threat, employees will try to maintain things as they were, while managers are trying to implement the new strategy to gain competitive advantages. As a consequence of this conflict, the new strategy will most likely fail in its implementation, causing negative effects on the company. This article wishes to provide a theoretical and empirical view on the importance of having a dynamic organizational culture designed to sustain new strategic initiatives. To underline this importance, an empirical study was conducted on several Romanian construction companies with the intent of revealing the correlations between a supportive culture and strategy. In conducting this study the main objective was to reveal if companies characterized by a supportive and dynamic organizational culture are more likely to have a strategy formulated and implemented.*

**Keywords:** *organizational culture, strategy, strategic management, construction industry*

**JEL classification:** *M14, L74, L20*

## **1. Introduction**

The business environment today is forcing the companies to focus their efforts onto gaining more clients and increasing the overall level of efficiency and performance. Thus, the quest to identify sustainable competitive advantages has become more important than ever before. According to Michael Porter (Porter, 1985, p. 1) competition is the most important element which influences the companies' success or fail, by dictating the action which must be taken regarding performance and innovation, organizational culture and efficient implementation of competitive strategies designed to position the company in a more favorable location on the

market.

## 2. Organizational culture

Organizational culture, according to Dess, Lumpkin and Eisner (Dess *et al.*, 2007, p. 323) can be defined as a system of shared values, representing the company's most important elements, and beliefs, representing the way in which things are done inside the company, that shape the employees, the organizational structure and control systems, in order to produce commonly accepted behavioural norms. Moreover the way in which people behave is influenced by the ideologies, symbols and core values shared throughout the company (Hitt *et al.*, 2006, p. 377). Thus, organizational culture consists of the way in which a group of people can be defined as a model of shared assumptions assimilated by all of its members as a consequence of solving the problems related to external adaptations and internal integration, and which has functioned well enough in order to be considered valid, and thus transmitted to new group members as the correct manner to perceive, judge and feel different problems (Schein, 2004, p. 17).

One of the biggest challenges faced by managers, in trying to fit the new strategy into the cultural context present inside the company, is how to analyze an intangible element like organizational culture. To overcome this problem, Tony Morden (Morden, 2007, p. 381) set up an analysis based on five main variables: *value judgement, vision, value system, behavioural standards and norms* and *perceptions regarding needs, priorities and wishes*.

*Value judgement.* Different behaviours are actively influenced by the employees' individual and shared judgements which are related to the company's mission, objectives and sets of values. These judgements are based on certain values, like focusing on the interests of clients, shareholders or stakeholders. These values and judgement values define and shape the priorities of the entire strategy formulation and implementation process.

*Vision.* Vision represents the main elements which connects and integrates the company's judgement values and ideologies. It is imperative for the vision to be formulated in such a manner in which to ensure a proper alignment between strategy and organizational culture.

*Value system.* The value system is comprised of the company's vision and value judgements, and represents the foundation onto which the company's mission, strategy and behaviours are defined and implemented inside the company.

*Behavioural standards and norms.* The norms and standards shape the employees' behaviour and their attitude, also influencing the manner in which they relate to their co-workers, their leadership style and the decision making process.

*Perceptions regarding needs, priorities and wishes.* By establishing the objectives related to sales, market share, quality, value chain management, risk management and ethics, the perceptions related to needs, priorities and wishes directly influence both the strategic formulation process and the decision making system.

According to Pearce and Robinson (Pearce & Robinson, 2007, p. 378-382) today's managers come across difficulties in understanding the relationship between organizational culture and the key factors which influence the success of the strategic actions taken by the company in order to gain competitive advantages. The core activities undertaken by the company are influenced by a series of key components, such as structure, employees, systems, managerial style, thus

implementing a new strategy requires managers to continuously adjust these components in order to meet the requirements set by the new strategy. Consequently, managing the organizational culture – strategy relationship requires a high level of attention in ensuring that the changes generated by the new strategic option are compatible with the existing organizational culture.

Although the need for change may be driven by a variety of reasons, which may include a downfall in financial results, government legislations, an increase in competition or the appearance of technological innovations, managers must, in all of these cases, alter the existing organizational culture in order to be able to implement the strategies required to increase the company's performance. One approach to changing the existing culture is a process of *unfreezing* and *refreezing* (Hannagan, 2007, p. 155). As a consequence of external pressure managers may feel that there is a need for change in the organization, in order to ensure its survival. The main issue, in this case, is how to convince everyone in the organization that change is needed and that the current culture needs *unfreezing*. At this stage the need for change is obvious, thus individuals should easily recognize and accept it. Unfortunately, there will be members in the organization who will refuse to accept and embrace the need for change, considering that the existing culture is the best way of conducting the day to day activities. In this situation, the leadership of the company must engage in a communication campaign design to foster the new values, attitudes and behavior. Also, the use of consultation and retraining can provide a useful mechanism in determining the personnel in accepting the necessary changes. Following this process, the new practices must be locked in place inside the organization as the new way of doing things. This is called *refreezing* and represents the final step in changing the organizational culture with a new one, designed to improve the company's performance and its competitive power.

In order to change the culture, in an efficient way, and ensure its total support for the new strategy, companies must undertake a series of main activities (McMillan & Tampoe, 2000, p. 234):

- ✓ Sell the new strategic intent.
- ✓ Interpret the existing organizational culture.
- ✓ Develop group decision-making skills.
- ✓ Introduce innovative mindsets that welcome change.
- ✓ Develop skills and knowledge base.
- ✓ Encourage staff to feel secure.
- ✓ Develop means of helping staff deliver consistent performance.
- ✓ Enable accessibility to management during periods of change.
- ✓ Encourage thinking that focuses on the outset world.

Due to the fact that organizational culture sets the behavior of employees, motivating them to achieve the company's strategic goals, it influences the effectiveness of the strategy formulation and implementation process. In order for the new strategy to gain sustainable competitive advantages, it must be implemented in an efficient manner and it has to be supported by all the members of the organization (Abass, 2003, p. 207). As a consequence, managers must link the strategy with the existing organizational culture, if it is possible, and also, they have to create and sustain a flexible and dynamic culture throughout the organization. This is necessary, in case the new strategy brings significant changes at a cultural level. Having a flexible culture ensures a more efficient adaptability of the entire personnel to the new goals

and activities. More, a dynamic culture will actively support the implementation of the new strategy and will encourage everyone not only to match the strategic goals, but to overpass them.

### 3. Strategy

Choosing the right strategy represents one of the key elements in strategic management, companies focusing solely on their own future and the means to cope with the numerous external influences and pressures. Also, it is very important for the new strategies to lead to sustainable competitive advantages. In order to achieve this, they have to be realistic in evaluating the external influences and, also, the internal capabilities and core competencies (Johnson & Scholes, 1999, p. 255, Dikmen *et al.*, 2009, p. 291). In order to be sustainable, Aras and Crowther (Aras & Crowther, 2010, p. 568) emphasize four main aspects which need to be recognized and analyzed: *social influence*, which shows the strategy's influence in terms of social contracts and other stakeholders, *impact on the environment*, consisting of the entire array of actions which mark the environment, in one way or another, *organizational culture*, which is described previously in this article and *finances*, represented by the actual and future financial result.

It is imperative for the new strategy to be chosen and formulated in an efficient way, especially by understanding very well the pros and cons of every strategic alternative. This is extremely important due to the fact that, as shown previously, the new strategy might bring significant changes in the organization. These changes need to be embraced by all the members of the organization in order to meet the strategic goals. Following this, the organizational culture needs to support the new strategy, and this support can be achieved by transforming the strategic process in a highly transparent one, offering detailed explications and ensuring the participation of all personnel (Karnani, 2008, p. 515).

Managers are responsible with choosing the best strategy and they must identify and explore all the consequences of the new strategy, externally and internally, in order to ensure its success (Finlay, 2000, p. 371). On the other hand, companies are forced to take into consideration certain elements, which actively determine the nature of the strategy, elements like the *structural conditions* in which the company conducts its business, its own *capabilities and core competencies* and, also, its *past experience* (Kim & Mauborgne, 2009, p. 74). Considering all of above, the new strategy consists of the company's decision related to (Finlay, 2000, p. 341) *its offers, strategic positioning, necessary resources, ways to access the resources and financing sources*.

Strategy formulation is not reserved only for top level managers. Mid-level and lower-level managers must be involved in the strategy making process, especially due to the fact that in large companies there are four levels of strategies: corporate, divisional, functional and operational. In case of small companies, there are only three levels of strategy: company, functional and operational (David, 2009, p. 180).

At a corporate level, strategies can be used in order to diversify the company, and its offer, whether this diversification is related to the main business and managers are seeking economies of scale, or unrelated, if the managers wish to go beyond its main business activity. In some cases, however, certain external and/or internal factors can cause negative effects on the company, forcing it to enter into a defensive mode. In this situation retrenchment can be used to minimize loses, and eliminate

all the redundant activities, in order to fortify the core competencies and strengthen the company. Unfortunately, this strategy will not offer a guarantee that the company will be able to comeback, and sometimes managers are faced with the necessity of selling divisions of the company, a strategy called divestiture, in order to raise money for future investments, or to sell all the company's tangible assets, a strategy called liquidation. However, companies can increase their performance by creating strategic alliances with other companies, in order to combine the efforts and to create innovative products and services, and also to gain competitive advantages.

At the business unit level, the best known and most widely used strategies are *differentiation*, *overall cost leadership* and *focus* (Porter, 1998, p. 35). These are also called Porter's generic strategies and are intended to be a source of competitive advantages. Differentiation consists of producing goods and/or offering services which are different, even unique, in comparison with the same products on the market, with the intent of building an individual image in the consumers' mind. Overall cost leadership emphasizes the importance of producing standardized goods, in relatively high volumes, in order to keep to a very low level the costs per unit. Companies implementing a focus strategy produce good or offer services to a very narrow group of customers. The aim of the strategy is to best satisfy the needs of these customers, by offering goods which are unique and offer high value for the customer and a high price, or to offer products and/or services to that small group of customers at the lowest price on the market.

We must emphasize the fact that no matter what strategy is chosen, it will generate changes, which will, in term, lead to an opposition of the employees, in the way of implementing this strategy.

#### **4. Empirical research**

Our research is focused on showing and understanding the relationships between a dynamic organizational culture, focused on supporting the strategic efforts, and the existence of a strategy in the construction companies in Romania. Although, from a theoretical perspective, as we have shown in the first two parts of this article, culture is a crucial determinant of the strategic process, I set out to analyze this relationship from an empirical point of view.

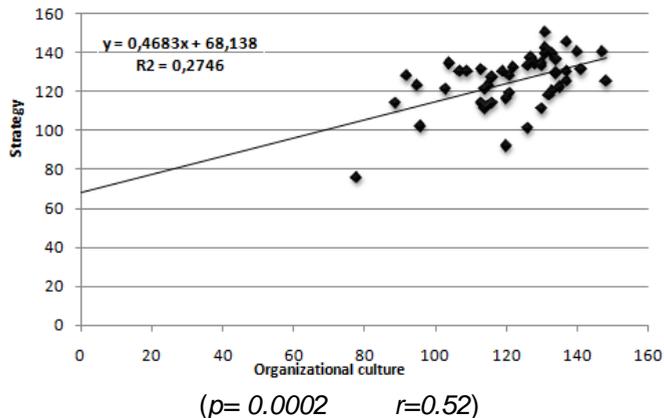

The research presented in this paper is part of a much wider research, focused on the Romanian construction industry, and it shows the correlations between organizational culture and strategy, based on the result obtained from a number of eight companies from the construction industry.

As a tool for research we used a number of two questionnaires, one focused on the organizational culture and the other one focused on the strategic efforts undertaken by the company. The organizational culture questionnaire is aimed in identifying the cultural particularities present inside the company, more specifically the degree in which the culture supports a strategy orientated view. From a strategy perspective, we sought out to evaluate the strategic efforts undertaken by the companies in their quest for competitive advantages.

We choose the questionnaire as a research tool first of all because of the high volume of information which can be obtained, and also because it is standardized, enabling researches to get relevant statistical data.

The eight companies involved in our study provided a total number of 23 valid questionnaires, which were statistically analyzed. The normality test's values which

were obtained showed that the data collected is very well modelled and has a normal distribution. Furthermore, the value of the Pearson's linear correlation coefficient ( $r$ ) which has to be above 0.29 and that of the significance of correlation coefficient ( $p$ ) which has to be below 0.05, revealed a powerful connexion between the existence of a dynamic organizational culture and a strategic process intended to gain competitive advantages.

**Figure 1:** The relationship and correlation between organizational culture and strategy

Due to the fact that this is only a preliminary research, which will be extended to a much numerous statistical population, the results of this research have certain limitations. First of all, only a number of eight companies have been analyzed so far, and second, the majority of these companies are based in the Northern part of Romania, leaving the other regions unanalyzed. But, looking beyond these limitations we can conclude that companies which have a dynamic and strategy supporting organizational culture are much likely to have a competitive strategy formulated and implemented in order to gain sustainable competitive advantages. In other words, an organizational culture in which the employees have a proactive attitude focused on responsibly and efficiently meeting the company's goals, in which managers offer their full support in solving the problems and where everyone is focused on constant professional developments and overcoming their own limits, is more likely to lead to a strategy focused view inside the company, in comparison to the companies in which all of the elements above are not present. Also, a culture, which is dynamic and adaptable, will allow companies to better overcome the problems which may occur both in the internal business processes and in the external environment.

## 5. Conclusion

Companies "fighting" in today's extremely competitive business environment are constantly seeking new ways to ensure an increase in performance and development, especially by gaining sustainable competitive advantages as a result of implementing new strategies. Having the perfect strategy will not guarantee success; companies need to be able to implement the strategy in an efficient manner. This means not only to have the necessary resources required to implement

the strategy, but also to ensure that the organizational climate is favourable towards the new strategy.

As we have stressed out previously in this paper changes will be generated by the new strategy, changes which will alter the way in which things are done inside the company. This may cause employees to oppose the new strategy, as they try to maintain things unchanged in their working environment. It is very important, in ensuring the success of the strategic process, for managers to adopt a high level of transparency and to communicate very efficiently the benefits of the new strategy, in order to show that it will influence, in a positive manner, the organisation and its members. Also, it is important that managers create a dynamic organizational culture. As we have shown in the research, presented in this article, a dynamic culture focused on supporting strategic initiatives will actively influence members to take initiatives in formulating and implementing strategies with the intent of gaining sustainable competitive advantages.

## MONTE CARLO SIMULATION: IMPORTANT MANAGEMENT TOOL IN EVALUATING DECISIONS UNDER RISK. CASE STUDY: LAUNCH A NEW PRODUCT OF SHOES

**Vereş Vincențiu, Mortan Maria**

*Management Department, Faculty of Economics and Business Administration, Babeş-Bolyai University, Cluj-Napoca, Romania*

*vincentiu.veres@econ.ubbcluj.ro*

*maria.mortan@econ.ubbcluj.ro*

**Abstract:** *Decisions are a result of choices made between several alternatives and will affect all participants in the decision-making process. In this paper we analyze the Monte Carlo simulation as an important management tool in evaluating decisions under risk. The method is particularly useful in simulating decision problems. For example, the profit that could be achieved if a company launches a new product may depend on a number of factors (market share, advertising, production costs, launch costs, the lifetime of the product, etc. The company manager should identify all factors that could affect profit and then to consider the large number of ways in which these factors may interrelate. In such situations it is recommended company manager to divide the problem into smaller parts, asking him to estimate the probability distribution for market share, for advertising, for the cost of launch. Once they were obtained it can be determined their combined effect in order to obtain the probability distribution of profit. Through computer can generate a large number of possible combinations of situations where you choose a particular course of action. Upon completion of the simulation possible combination will be generated mostly while the least possible combination will be generated less frequently. For exemplification we selected a company producing shoes in Cluj market who wants to launch a new model for autumn-winter 2013-2014. In the current period the company has limited production capacity, has a number of additional contracts honored and general economic crisis situation makes money availability to be extremely limited. Accordingly, the company will have to choose a single product to be launched next season. The company will have to decide which of the two new products to be launched on the market: a model of boots for men in business class or a new model of women's boots of the same class business. The company is not sure either production costs or sales level. Profit estimate involves going through several phases, and the first of these relates to the identification of factors that may or may influence the profit for both products.*

**Keywords:** *decision-making, simulation, Monte Carlo method, launch a new product.*

**JEL classification:** D81

## 1. Introduction

Because Monte Carlo simulation allows estimating the risk associated with a particular course of action often the studies in the field refer to this method as a method of risk analysis in the decision-making process.

Decisions are a result of choices made between several alternatives and will affect all participants in the decision-making process (Lazăr, Suciu, 2009).

In the opinion of specialists practicing and those in academia - U.S. Environmental Protection Agency (1997) and Vose, D. (2008) - Monte Carlo simulation method has a number of advantages over other methods of quantitative analysis of risk. In this sense, this paper focuses on explaining the Monte Carlo simulation method. By using this method, the distribution of all possible outcomes of an event is generated by analyzing a model several times, each time using input values selected by chance from the probability distributions of the components that make up the pattern.

The method is particularly useful in simulating decision problems. For example, the profit that could be achieved if a company launches a new product may depend on a number of factors (market share, advertising, production costs, launch costs, the lifetime of the product, etc. In this context, a decision maker will face a serious problem in making estimates of the profit that could be obtained. If the decision maker would be put in a position to answer the question "what is the probability that the launch of a new product record annual profit?", it would have great difficulty and would provide a relative response.

To answer this question, the company manager should identify all factors that could affect profit and then to consider the large number of ways in which these factors may interrelate.

In such situations it is recommended company manager to divide the problem into smaller parts, asking him to estimate the probability distribution for market share, for advertising, for the cost of launch. Once they were obtained it can be determined their combined effect in order to obtain the probability distribution of profit.

Due to the large number of factors and because many values that each of these factors can take, there could be an infinite number of possible combinations that may affect company profits (Ionescu and Cazan, 2007).

Such a problem can be solved successfully by using Monte Carlo simulation. The simulation assumes the existence of three main elements: real system (the real problem of decision maker), a computer system and conceptual model.

Through computer can generate a large number of possible combinations of situations where you choose a particular course of action. Upon completion of the simulation possible combination will be generated mostly while the least possible combination will be generated less frequently.

Using Microsoft Excel to perform simulations can be complemented with tools that can simulate in Excel, popular being @ Risk, an add-on program for Microsoft Excel and MS Project, developed by Palisade and available at [www.palisade.com](http://www.palisade.com) and Crystal Ball, that is available at <http://www.oracle.com/us/products/applications/crystalball/index.html>.

There are also available free tools that can be used to perform a Monte Carlo simulation, for example SimulAr is an add-on program for Microsoft Excel and is distributed as "emailware". The program was developed by Luciano Machine at the National University of Rosario, Argentina, and is available at [www.simularsoft.com.ar](http://www.simularsoft.com.ar). It adds probability distribution functions for performing

Monte Carlo simulation and risk analysis under uncertainty. It also provides the ability to correlate variables and adjust distributions to data.

So profit is calculated for each possible combination and then will quantify the frequency of profits that were generated, and finally the manager will determine the likelihood of profit expectation. To use the simulation in a decision problem it is necessary to go through the following steps:

- 1) Identify each factor that may influence the profit for each course of action;
- 2) Development of a model, noting how these factors relate;
- 3) Take a sensitivity analysis to identify factors that need to obtain probability distributions;
- 4) Establishment of probability distributions for the factors that were identified in the previous paragraph;
- 5) Making Simulation;
- 6) Application of sensitivity analysis of results obtained from simulation;
- 7) Comparison of results for various alternative courses of action and identify preferred course of action.

## **2. Case study: Using Monte Carlo simulation for the election of a new product that will be launched on the market.**

A risk decision situation is a company producing shoes in Cluj market who wants to launch a new model for autumn-winter 2013-2014.

In the current period the company has limited production capacity, has a number of additional contracts honored and general economic crisis situation makes money availability to be extremely limited. Accordingly, the company will have to choose a single product to be launched next season.

The company will have to decide which of the two new products to be launched on the market: a model of boots for men in business class or a new model of women's boots of the same class business.

Since the company has launched such products on the market and there are similar products on the market, means that information is available (which may be collected by the company) for making the decision. Consequently, decision-making situation is closer to risk than uncertainty. The company is not sure either production costs or sales level.

Profit estimate involves going through several phases, and the first of these relates to the identification of factors that may or may influence the profit for both products.

### **2.1. Identifying influencing factors**

Economic analysis conducted by the company's management led to the identification of the following factors which affecting profit:

- Estimated quantity of products sold (units);
- The estimated price for each product marketing (RON/ piece);
- The fixed costs of the company (their size is independent of actual production work and includes training costs of production, with utilities, salaries of management staff, to the service etc.).
- Variable costs (these costs depend directly on the size and production activities include: costs of raw materials, direct labor, etc.).

In any analysis of this type, variable costs are easier to estimate both per unit and overall, while fixed costs are more difficult to spread, as the company produces a

wide range of products and profitability analysis must take into account a fair allocation of these expenses. In this case fixed cost allocation is proportional to the value of production of each product compared to the total value of production for all products.

**2.2. Design a mathematical model that meets current needs**

In this case, taking into account the factors identified above will leave the relationship that highlights all items, profit formula.

$$P_r = (P - c_v) \times Q_{es} - C_f$$

Pr = expected profit,

P = estimated selling price;

c<sub>v</sub> = estimated unit variable cost;

Q<sub>es</sub>= Estimated quantity of products to be produced and sold;

C<sub>f</sub> = estimated fixed costs.

**2.3. Sensitivity analysis to identify factors required to obtain the probability distribution.**

Following our approach we perform a sensitivity analysis for each of the two products to see to what extent each factor influences the variable of interest – profit. If, after review finds that one of the factors has a significant influence on the variable of interest, will be decided using a single value, one that is most likely.

In sensitivity analysis will identify those factors that are required to assess the probability distributions. For each product that influence profit we identify three values: minimum value, maximum value and most likely value.

*Sensitivity analysis for "boots for men".* Among the influencing factors is considered that the price is known by the company and is set at 150 Euro / piece. The following table presents the values of each factor. These values were provided by the management company

**Table 1:** Estimate values for "boots for men"

<b>Factor</b>	<b>Symbol/ U.M.</b>	<b>Minimum value</b>	<b>The most likely value</b>	<b>Maximum value</b>
Estimated quantity of products to be produced and sold	Q <sub>es</sub> (units)	500	600	900
Fixed costs estimated	C <sub>f</sub> (RON)	20.000	25.000	30.000
Estimated unit variable cost	C <sub>v</sub> (RON/units)	70	80	110

Next we analyze the possible values of profit changes under the influence factors.

**Table 2:** Profit values while factors influencing change

	minimum	likely	maximum	% Variance
Price	150	150	150	
$Q_{es}$ (units)	10000	17000	38000	53,69863
$C_f$ (RON)	22000	17000	12000	6,849315
$C_v$ (RON/units)	23000	17000	-1000	39,45205
Total	-	-	-	100

Sensitivity analysis is presented through chart indicating to what extent a given factor is important in the analysis.

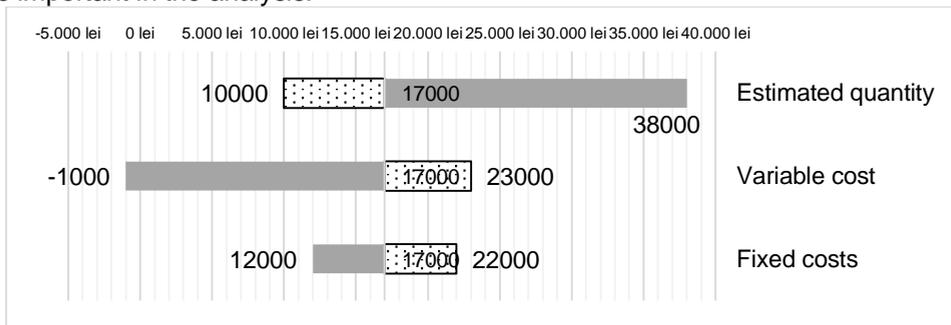

**Figure 1:** Tornado diagram - influence of the product "boots for men"

Figure 1 shows the Tornado diagram for the first product considered "men's boots". The analysis of this chart is noted that the factor, which influencing most the profit is amount of product estimated to be produced and sold, and at the opposite end fixed costs. Since fixed costs do not significantly influence the value of the variable of interest (profit) we still use a single value for the fixed costs, the most likely (25 000 RON).

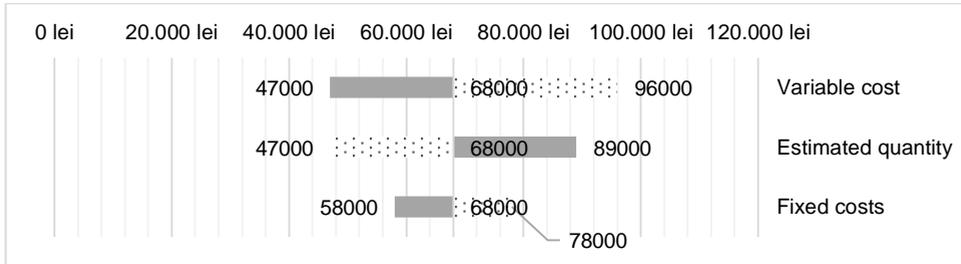

*Sensitivity analysis for the second product "ladies boots".* Among the influencing factors the price is known by the company and is set to a value of 290 RON/ piece. The following table presents the values of each factor. These values were provided by company's management.

**Table 3:** Estimate values for "ladies boots"

Factor	Symbol/ U.M.	Minimum value	The most likely value	Maximum value
Estimated quantity of products to be produced and sold	$Q_{es}$ (units)	550	700	850
Fixed costs estimated	$C_f$ (RON)	20.000	30.000	40.000
Estimated unit variable cost	$C_v$ (RON/units)	110	150	180

**Table 4:** Profit values while factors influencing change

	minimum	likely	maximum	% variance
Price	290	290	290	
Q <sub>es</sub> (units)	47000	68000	89000	38,64184
C <sub>f</sub> (RON)	78000	68000	58000	8,762322
c <sub>v</sub> (RON/units)	96000	68000	47000	52,59584
Total	-	-	-	100

**Figure 2 -** Tornado diagram- influence of the product "boots for women"

Figure 2 shows Tornado diagram for the second product analyzed 'boots women'. From the analysis of this chart it can be observed that the factor, which influencing most the profit are again variable costs (variation being 52.59%), then estimated quantity to be sold (with a variance of 38.64%) and the least influencing factor is, as with previous product, fixed costs, whose variation is 8.76%. Since fixed costs do not significantly influence the value of the variable of interest (profit) we still use a single value for the fixed costs, the most likely (30,000 RON).

#### 2.4. Establishment of probability distributions

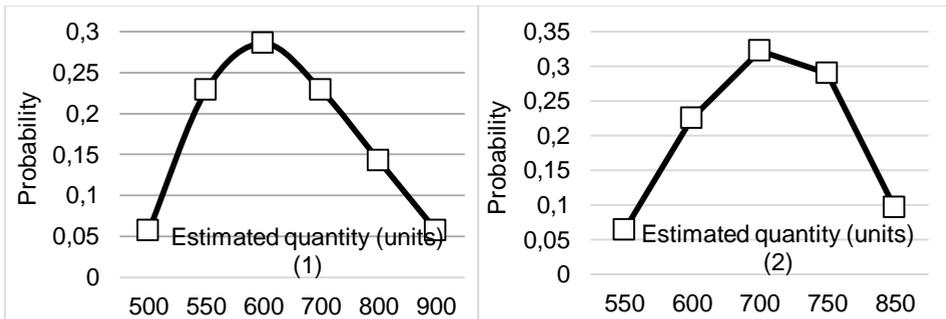

The next step in determining the profit for each item of footwear is to identify probability distributions for each factor. These were determined by the graphical method.

**Table 5:** Probability distributions for the two products analyzed

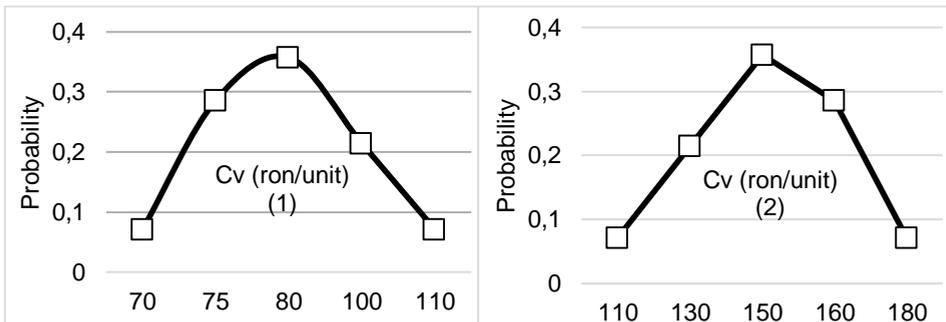

Boots for men			Boots for women		
Estimated quantity	The length of each line	Probability	Estimated quantity	The length of each line	Probability
500	2	0,057143	550	2	0,06451613
550	8	0,228571	600	7	0,22580645
600	10	0,285714	700	10	0,32258065
700	8	0,228571	750	9	0,29032258
800	5	0,142857	850	3	0,09677419
900	2	0,057143			
Total	35	1	Total	31	1

Boots for men			Boots for women		
Cv (ron/unit)	The length of each line	Probability	Cv (ron/unit)	The length of each line	Probability
70	2	0,071429	110	2	0,071429
75	8	0,285714	130	6	0,214286
80	10	0,357143	150	10	0,357143
100	6	0,214286	160	8	0,285714
110	2	0,071429	180	2	0,071429
Total	28	1	Total	28	1

The next step is to plot the probability distribution for the estimated amount to be sold 'boots men' (1) and "boots women" (2).

**Figure 3** – Probability distribution for the estimated amount to be sold 'boots men' (1) and "boots women" (2)

**Figure 4** – Probability distribution for the variable costs of products 'boots men' (1) and "boots women" (2)

## 2.5. Making simulation

After we obtained probability distributions for each factor, we realize simulation in order to obtain the probability distribution of profit. The first product for which we perform simulation is "boots for men". To achieve the simulation we used the Microsoft Office Excel. Program generated two random numbers the first representing the estimated quantity of products to be produced and marketed and the second number representing variable costs. For example for the first simulation we obtained:

$$\text{Profit} = 900 \text{ unit} \times (150 \text{ ron} - 80 \text{ ron}) - 25000 \text{ ron} = 38000 \text{ ron}$$

To obtain a probability distribution as close to reality we conducted 1000 simulations. In the following table we present profits from these simulations.

**Table 6:** Profit from 1000 simulations – "boots for men"

Simulation number	Estimated quantity of products to be produced and sold		Unit variable cost estimated (ron/unit)		Fixed costs	Profit
	Random number	Units	Random number	Ron		
1	93	900	42	80	25000	38000
2	0	500	79	100	25000	0
3	20	550	89	100	25000	2500
4	7	550	7	75	25000	16250
5	49	600	78	100	25000	5000
...	...	...	...	...	...	...
500	93	900	88	100	25000	20000
501	3	500	49	80	25000	10000
502	79	800	0	70	25000	39000
503	2	500	50	80	25000	10000
504	21	550	54	80	25000	13500
...	...	...	...	...	...	...
996	94	900	36	80	25000	38000
997	66	700	12	75	25000	27500
998	70	700	8	75	25000	27500
999	53	600	96	110	25000	-1000
1000	11	550	42	80	25000	13500

Average profit for "boots for men" obtained from the 1000 simulations is 17,647.25 RON

**Table 7:** Probability distribution of profits from the 1000 simulations for product "boots for men"

Profit	Number of simulations	Probability
de la -5000 la 0	66	0,066
de la 1 la 10000	209	0,209
de la 10001 la 20000	397	0,397
de la 20001 la 30000	179	0,179
de la 30001 la 40000	124	0,124
de la 40001 la 47000	25	0,025
<b>Total</b>	<b>1000</b>	<b>1</b>

From the above table it is observed that as a result of 1000 simulations profit recorded also negative values. Most of profit values were recorded between 10,001Ron and 20,000 Ron (397 simulations) representing a 39.7% probability of occurrence. Also there have been 209 cases in which profit ranged between Ron and 10,000 Ron, which is a probability of 20.9% and 179 cases in which profit ranged between 20001 Ron and 30.000 Ron with a probability of 17.9%.

The second product that we realized simulation is product "boots women".

For example for the first simulation we obtained:

$$Profit = 700 \text{ units} \times (290 - 130) - 30000 = 82000 \text{ Ron}$$

In the following table we present profits from these simulations.

**Table 8:** Profit from 1000 simulations – "boots for women"

Simulation number	Estimated quantity of products to be produced and sold		Estimated unit variable cost (Ron/unit)		Fixed costs	Profit
	Random number	Units	Random number	Ron		
1	43	700	17	130	30000	82000
2	80	750	68	160	30000	67500
3	33	700	43	150	30000	68000
4	33	700	94	180	30000	47000
5	41	700	58	150	30000	68000
...	...	...	...	...	...	...
500	46	700	36	150	30000	68000
501	1	550	61	150	30000	47000
502	44	700	60	150	30000	68000
503	68	750	64	160	30000	67500
504	94	850	28	150	30000	89000
...	...	...	...	...	...	...
996	83	750	96	180	30000	52500
997	34	700	79	160	30000	61000
998	14	600	77	160	30000	48000
999	39	700	80	160	30000	61000
1000	86	750	71	160	30000	67500

Average profit for "boots for women" obtained from the 1000 simulations is 67.725 RON

**Table 9:** Probability distribution of profits from the 1000 simulations for product "boots for women"

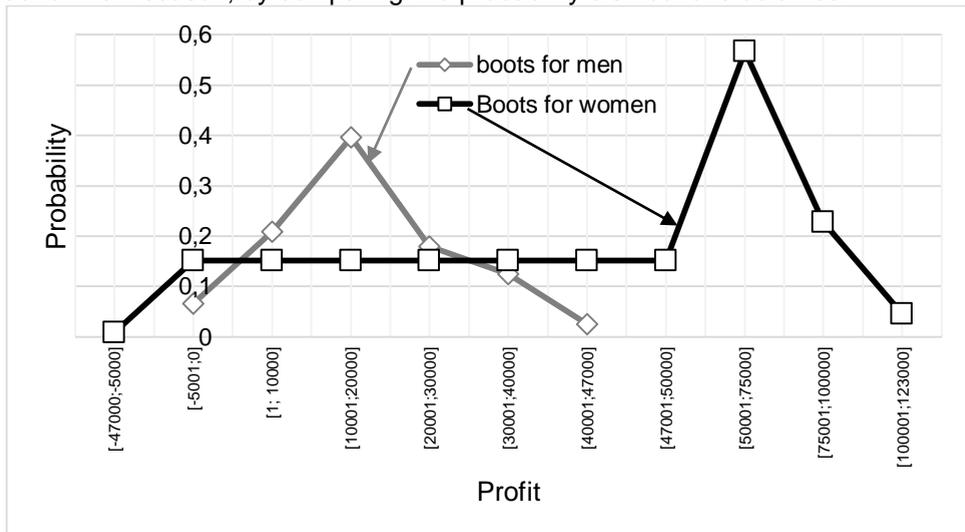

Profit	Number of simulations	Probability
de la -47000 la 0	8	0,008
de la 1 la 50000	151	0,151
de la 50001 la 75000	567	0,567
de la 75001 la 100000	228	0,228
de la 100001 la 123000	45	0,045
<b>Total</b>	<b>1000</b>	<b>1</b>

From the above table it is observed that as a result of 1000 simulations profit recorded also negative values. Most of profit values were recorded between 50,001Ron and 75,000 Ron (567 simulations) representing a 56.7% probability of occurrence.

Also there have been 228 cases in which profit ranged between 75,001 Ron and 100,000 Ron, which is a probability of 22.8% and 151 cases in which profit ranged between 1 Ron and 50,000 Ron with a probability of 15.1%.

### 2.6. Comparison of alternative courses of action

At this time the company manager must decide who will be the product that it will launch next season, by comparing two probability distributions obtained.

### 3. In conclusion

From both the graphics and the analysis presented in previous tables we observed that in both cases may occur losses. The first product "boots for men" these losses are likely to occur by 6.6% and range between -5000 and 0 Ron and in the case of the second product, 'boots women' probability is 0.8% and range between -47000 and 0 Ron.

Probability of profit for the first product to be located between 10001 Ron and 20000 Ron 39.7% being the highest value.

For the second product most likely (56.7%) is for profit ranged between 50001 Ron and 75000 Ron.

Given this analysis, company manager will decide, naturally, the launch of "boots ladies' autumn-winter season. Due to the uncertainty and risk involved in these decision problems, company management has encountered great difficulties in taking that decision that will maximize profit on the one hand, but that will minimize the likelihood of a loss on the other.

So now management of production companies in Romania may resort to various tools which can improve decision making, instruments known as decision trees, sensitivity analysis, charts, Tornado Monte Carlo simulations which can be useful for the management of the whole company.

Taking into account the fact that it is based on numerical data obtained by performing multiple simulations, add value to this technique. It also helps to eliminate any bias in the selection of alternatives when planning risk. Monte Carlo simulation provides many advantages, but its reliability of results depends on the accuracy of the values and patterns of correlation if they are specified during simulation. Therefore, a particular attention should be given when determining the value range and selection of appropriate distribution, because the results will not be accurate. In other words, the data provided by the manager are vital for the successful of simulation and the manager must have solid knowledge in the field of which take part the simulated situation.

# THE PUBLIC SERVANTS' PERCEPTIONS REGARDING THE COMMUNICATION PROCESS WITHIN LOCAL PUBLIC ADMINISTRATION – A QUALITATIVE APPROACH

**Bențe Florina Maria**

*The Faculty of Economics and Business Administration within "Alexandru Ioan Cuza" University of Iasi, Iasi, Romania*  
[florinaalb@yahoo.com](mailto:florinaalb@yahoo.com)

**Abstract:** *The goal of this paper was to assess the communication efficiency within local public administration in Crisana Region. It also aims to explore factors predicting employees satisfaction regarding communication process. Using qualitative research were investigated public servants' opinions on the communication in local public administration. As an exploratory study, it was performed a content analysis of information gathered from the interviews organized in the two most largest local public institutions in Crisana Region. The particularities of the internal and external communication are analyzed. In addition, it was taken into consideration the importance of citizen involvement in local government and the requirements for the citizen oriented applications. By analyzing data it was possible to highlight the aspects that please or discontent the clerks regarding the communication with their colleagues, their chiefs, the citizens they serve or other institutions. Therefore every participant in the study presented a positive and a negative critical incident on local communication. It was revealed the crucial role of the dispatch to obtain information by public servants on the one hand and citizens on the other hand. Measures for ensuring the institutions transparency and fairness are described. The public servants emphasized some aspects that are characteristic to the communication within large institution inference. This paper offers a view on the communication process seen from the inside. The collected data are used for verifying the hypotheses regarding the difference in the public servants' perception regarding internal and external communication within local public communication. The interviewed employees stated that authorities granted more importance to external communication than internal communication. Accordingly, is needed an improvement to the means and applications through which internal communication operates because the participants are less satisfied with it. The research findings, certainly reflected the genuine desire of public servants to find better ways to communicate with the public.*

**Keywords:** *public servants, external communication, internal communication, transparency, citizen involvement*

**JEL classification:** *M31*

## **1. Literature review**

For the public sector, communication represents an important but delicate part among its responsibilities. Modern public organizations have in the centre of the concerns aspects regarding efficient communication, citizen involvement in public decisions and increasing performance and quality.

Vos (2009: 362) stated that communication quality measurement can clarify the added value that communication has for governmental organizations, support accountability and help set priorities for the organization's communication policy.

In his work Zerfass (2008) proposes a framework for a corporate communication scorecard, including elements such as rising stock values and community programs using sponsorship that do not correspond to the activities of municipalities.

Upton (1954: 152) pleaded for the implication of the citizens in the act of governing. Despite the fact that politicians and administrators declared interest in increasing public involvement in public decisions, there is considerable evidence to suggest that these efforts are not effective (Crosby, Kelly, and Schaefer, 1986, Kathlene, Lyn and Martin, 1991, Kweit, and Kweit, 1981).

Potentially, all of a community's residents have an interest in the findings of the most effective solutions for their problems, yet clearly everyone cannot participate in public decision making, and not every interested group can sit at the table to discuss the issues regarding their community (Pearce, 2005: 6). Although not all citizens show interest in the governments' activity, in policymaking, public organizations have to be transparent and need to communicate responsibly about unfinished matters that are still under discussion (Gelders, Bouckaert and Ruler, 2007: 34-35).

Yusoff, Ismail and Ali (2010: 236) stated that internal and external customers are essential to be the main contributing factors of organizational success. Therefore, understanding the internal and external customer's satisfaction is relatively crucial in order to ensure that the employees are able to provide the quality service delivery system at all times.

Consideration of how clerks view the internal and external communication from their institution might help to explain the overall communication process within local public administration.

Pandey and Garnett (2006: 41-42) designed a construct model of communication within public administration. The construct model had three dimensions of communication performance- interpersonal communication, external communication and internal communication which are influenced by goal clarity, organizational culture, organizational size and red tape. In addition, Robbins (1998: 260) states that smaller groups are faster at completing tasks than are larger ones (which affects communication performance), however, he points out that large groups do better if engaged in problem solving.

## **2. Research Methodology**

The research project followed a series of key stages. To collect data were organized in depth interviews in the two most largest local public institutions in Crisana Region. This investigation was used as exploratory qualitative research.

Considering roles of external and internal communications for the effectiveness of the overall communication process, it was hypothesized that:

H : There is a difference in public servants' perception of satisfaction regarding external and internal communication.

Because were investigated only the communities with a total population exceeding 200,000 citizens and by taking into account the specific of the region respectively Hungarian minority is dominant at a rate of approx. 20-25% of the total population, the communities selection was summarized to the Bihor County. Consequently, the

only communities that meet the two conditions were Oradea City Hall and the Bihor County Council.

The selection of the participants for the in-depth interviews was conducted by the management of each institution. Following the writing request and verbal discussions with the institution managers of those institutions, were approved the number of people who will participate and the interviews schedule. 40 in-depth interviews were conducted (23 interviews - Bihor County Council and 17 interviews - Oradea City Hall).

The interviews had some features:

- the discussions were audio-recorded for later analysis,
- the interview guide,
- at the end of the interview participants also completed a demographics questionnaire (eg age, sex, education, household income, geographic location).

The analysis of the data collected in the survey constitutes the bulk of the material reported. Exploratory data analysis emphasizes analyzing and grouping the mentions into equivalence classes, so that each equivalence class contains exactly those mentions that refer to the same discourse entity. Textual data are typically explored inductively using content analysis to generate categories and rigorous and systematic explanations.

In the paper are quoted participants mentions in order to confirm the results and highlight the most consistent perspectives.

### 3. Results

**Table 1:** Key in-depth interview

Exemple : P1/ IPOr, Q3- participant number 1, interview City Hall Oradea, question number 3 IPCJ- in-depth interview Bihor County Council IPOr- in-depth interview Oradea City Hall [researcher's interpretations]
---

Source: Made by author

The overall appreciation of the internal communication has a predominantly positive orientation, but exploring in-depth the phenomenon we can note that the interviewees had different considerations regarding horizontal communication with colleagues beside vertical communication with management. In terms of horizontal communication- between colleagues within the institution were identified numerous references, most with positive orientation. Vertical communication with the heads was less nominated, but opinions were more obvious polarized than horizontal communication. Although internal communication is considered overwhelmingly positive, the vertical communication is predominantly negative oriented, but does not destabilize the general employee satisfaction. This phenomenon is due to the fact that the share of vertical communication across internal communication is lower, than horizontal communication.

Both Oradea City Hall and Bihor County Council are institutions with more than 100 employees and the communication process in these institutions involves a fairly long

communication channel. At Oradea City Hall five participants were dissatisfied but at Bihor County Council more than a half of the interviewees were dissatisfied with the internal communication. When the communication channel is longer there is the chance to appear blockages in the communication system.

P17/ IPOr, Q3 „... being a large institution we communicate quite arduous...”

P23/IPCJ, Q4 „... our organizational culture did not have the purpose of collaboration between colleagues, everyone keeps the information to himself...”

In order to function properly in both analyzed institutions internal communication needs improvement in terms of accessibility to the employees. In addition, the clerks who have direct contact with citizens considers appropriate the discussions with employees from the specialized departments to clarify certain issues that may leave room for interpretation.

P9/ IPOr, Q5 „...we have to know in advance what changes occur in the legislation, to be announced by the specialized department and we should have a discussion about it, in order to clarify certain aspects because one is to read the law and quite another to be explained, because not all of us are lawyers...”

Among the issues raised in discussion by the respondents regarding horizontal communication we can remember the following statements:

P10/ IPCJ, Q1 „... friendship and understanding between colleagues...”

The mentions of the employees participating in the in-depth interviews on the vertical communication were predominantly negative oriented:

P15/ IPCJ, Q5 „... the focus is on formal communication and yet the management of the institution obtain the required information on informal communication...”

The hypothesis was supported, the participants to the in depth interviews assed differently the external beside internal communication. External communication has received a special attention from the management of local authorities because it is the lever that allows relationships with most of its categories of public.

P10/ IPOr, Q4 „... Internal communication was ignored although it is often observed that the external depends on internal communication...”

Local councilors external communication was considered predominantly negative.

P23/IPCJ, Q3 „... One problem is that our county councilors are not involved in the external communication of the institution, you do not hear anything from them...”

The communication with other institutions predominantly neutral oriented. Among the issues raised in discussion by the interviewees it can remembered that there are certain unreliable institutions in responding to specific requests:

P4/ IPCJ, Q 5 „... when you are writing to the territorial administrative units and they are taken it seriously or not and you have to phone them, you must send an e-mail, you have to say exactly what they should do...”

Another aspect of the external communication is the communication with citizens. Public servants are dissatisfied with the citizens reticence and language.

External communication mediated by media is predominantly positive oriented, clerks are satisfied with the way institutions managed to inform the public through the press.

P5/ IPOr, Q4 „... we perceive the media as partners because through them we can simplify our work...”

It was identified a variable which was not initially considered - " the documents circuit " and is affecting local government communication within public institutions with a large number of employees.

P8/ IPCJ Q16 „[ responses dispatch] is delayed because of the gathering signatures so that a document could leave the institution...”

Regarding the variable "trust" several participants in the in-depth interviews stated that the politicization of local government structures is an important problem.

P7/ IPCJ Q5 „... it is experiencing the politicization of all organizational structures...”

The participants identified a number of human resource issues in local public administration:

- the inequitable division of tasks;

P6/ IPCJQ2 „... the work is not equally divided, one works more than another...”

- the respect towards the public servants;

P5/ IPOr, Q2 „... lately the public official is in the dust, being only an intermediate link between policy makers and citizens, is a buffer, and this is not quite correct...”

- the clerks` number is insufficient and the impossibility of employment;

P14/ IPOr, Q2 „... are some services where public servants are not enough...”

- high workload;

P16/ IPOr, Q2 „... often there are too many demands...”

- the lack of protection of employees against those who are beyond the counter;

P12/ IPOr, Q2 „... we are not protected as we should...”

- the appointments, employments and advancements in some cases are made on the political considerations;

P17/ IPOr, Q2 „... the appointments and often even the advancement are made on political considerations...”

- there are some problems regarding the rank advancement;

P22/ IPCJ, Q16 „... there are some problems regarding the rank advancement. For some of us is possible but for others no ...”

- the violence of language or on the institutions` property;

P15/ IPOr Q 16 „... two or three years ago a citizen came and told me that me - shit (...) although it was not ours fault...”

- the contact with the Rrom ethnic persons is difficult;

P5/ IPOr, Q5 „... Rrom ethnic persons are savages (...) they have urinated in the hallway...”

- the specific working characteristics are requesting;

P5/ IPOr, Q16 „... it is not the clerks` job here to make each persons` psychiatrist...”

- the lack of confidence in professional conduct of public servants.

P4/ IPOr, Q16 „... being here, having this job, giving hundreds of exams, without exaggerating, it can be considered that we are empowered to solve a problem...”

Regarding the activity of local government the civil servants participating in the interview noted that in the analyzed institutions citizen interest prevails. Most of the statements on this issue were mostly positive.

P5/ IPOr, Q6 „... a feature of local government is that it adapts very quickly to the citizens needs...”

The bureaucracy variable had a negative influence on local governments` communication.

P8/ IPCJ Q5 „... bureaucracy [is a problem] we have to do so many papers to get an answer...”

On one hand solving citizens` problem is considered by some interviewees as fulfilling his duties, and on the other hand is generating satisfaction when the citizen is satisfied with the answer and he is appreciating public servants` effort.

P9/ IPOr, Q16 „...when a citizen thanks after solving his problem, it is a satisfaction for having managed to relate with him, understanding the problem and helping the citizen in that matter ...”

Appreciated as important by the overwhelming majority of the participants in the in-depth interviews, citizen involvement is taken into account by local authorities depending on the institution managers attitude regarding this concern. The respondents mentioned that there are web site functions and services that facilitates public involvement.

P12/ IPCJ Q6 „... it is important [the citizen involvement] and even if they get involved their opinions are not taken into account...”

P8/ IPCJ Q6 „... citizen involvement is important and helps us because they give us many details that from the office we do not know...”

Citizens can get involved in local government activities in different ways with one common requisite: the desire to do something useful for the collectivity to which they belong to. Starting from desire, is necessary and the availability of time, sometimes physical presence, and in some cases citizen participation this may involve financial resources. Citizens can get involved with minimal effort by informing in the communities they live about local authoritys` projects on its new regulations or events that they organize. They may get involved by directing that 2% of income tax or even directly through participation in the public debates and events local authority derives.

P13/ IPOr, Q6 „... there are topics where the town halls` office where usually these debates are organized is full or sometimes just a few people are present. Depends on the importance of the topic...”

Overall positive appreciation on mayor`s activity or attitude was specified but none of the 23 participants in the in-depth interviews at Bihor County Council had no appreciation of the county council president.

P5/ IPOr, Q5 „... if you have coordinators, a mayor who understands these things and contributes to the welfare of city, things can be solved...”

Compared to written communication the assessment of the verbal communication was predominantly positive. The participants appreciated verbal communication for particularly rapid information transmission, but they mentioned a disadvantage of verbal communication between colleagues (when in the institution there is no team spirit and organizational culture in order to promote good relations between colleagues) is the misinformation or omission of some issues there because there is no "proof" of shared information, claims may or may not be challenged.

P19/IPCJ,Q16 „... it was requested a report data from a colleague who later denied the requested data and more recently we are working with internal memos to make sure we receive the necessary information...”

From civil servants point of view the local government response time was predominantly positive appreciated by most interviewees but there are perception differences between them regarding the legal duration for the responding a request, some participants said that legal period should be reduced, on the contrary, others considered that 30 days insufficient and would like an extension of the legal term.

P13/ IPCJ, Q5 „... the law allows too much time - 30 days or 15 days, It would be enough four or five days to communicate an answers, of course it depends on the subject of the request...”

P4/ IPOr, Q12 „... it should be extended this period because there are many requests, there are many cases, and we should invest more time to solve a case otherwise it is superficial...”

Among the issues that local public administration employees wish to be improved, internal communication and employees training is one of the most cited in this regard. Staff believes it would be appropriate to organize courses for employees development.

P8/ IPOr, Q5 „... communication with citizens could be improved (...) our way of expressing needs improvement ... ”

P4/ IPCJ, Q5 „... the way we communicate depends on each training, the approach, the seriousness, depends on your devotion to your profession...”

The employees attitude influences the communication process of local government in the sense that a positive, open, remarkable courtesy and attention to each citizen according to his specific needs facilitates contact between clerks and the public that they serve.

P1/ IPOr, Q2 „... A problem that should be solved is that every public servant should take responsibility for what he does and unfortunately this does not happen in all our departments...”

P8/ IPOr, Q5 „...It is true that is not always easy to smile and not always are moments to smile, it depends on citizens` problem. So, you must first identify the problem and then have a proper attitude...”

Adopting more and more specific elements provided by private service companies, local government assumes increasingly often customer orientation as more practical than just a established goal.

The communication materials available to citizens popularize certain achievements and inform on specific issues. Bihor County Council employees mentioned that inside the building there is a notice board where the public information is displayed. It is notable that Oradea City Hall has a particular concern regarding the efforts to improve the relationship with population, accordingly it can be seen the extra attention paid to the communication process. Oradea City Hall provides citizens informative flyers that have printed on the back the documents needed for different authorization or demands that citizens frequently required from City Hall.

P5/ IPOr, Q3 „... if you say the same thing ten times a day it is not sure that citizen understand you and you start to get bored, therefore we focused our attention on printing some flyers with the most requested information by citizens (...) thus we facilitate the communication and we would not bore each other...”

In order to communicate, citizens do not have to go to local government institution because the analyzed local public institutions had complied some of the citizens new requirements through adapted communication according to the citizens` needs.

P2/ IPOr, Q7 „...we are inviting them [citizens] to the meetings with citizens in the neighborhoods... and they can express their point of view, because if you want to make parking spaces at first you have go there and ask people there if they need those parking spaces...”

To facilitate citizens` contact with the institution, Oradea City Hall had created an one-stop counter /center for citizen service.

P1/ IPOr, Q3 „...our communication with citizens is better since last year [2011] was created a modern public relations center (...) and all departments are represented down there, citizens no longer have to walk through the institution...”

Internet communication has received special attention. On Oradea City Halls' website citizens can pay online their taxes, they can download forms and they can even schedule their wedding date.

P1/ IPOr, Q11 „... we are the only or one of the few halls in the country who send so many press releases, so we have activity as a newspaper...”

The institutions transparency, fairness was considered positive by most of the participants. The institutions transparency can be viewed from two angles:

- in terms of the employee who is properly and timely informed;
- from citizens' point of view whose authority should provide the necessary information.

P20/ IPCJ Q5 „... we should be informed when the organizational chart changes, so we should be informed before the change not to receive directly the disposal...”

As regards minority languages employees mentioned that there are some employees who speak Hungarian language.

P13/ IPOr, Q10 „... citizens of Hungarian minority who are addressing our institution in very small percentage use this possibility, maybe they do not know about this possibility...”

When participants were asked about the evolution of the communication process since 2010, the participants from Oradea City Hall positively appreciated the communication process of this institution but most participants in the interviews held in Bihor County Council considers communication to be constant or declining.

P2/ IPOr, Q15 „... the communication is improving every year because it was one of the main objectives of the new institution management...”

P13/ IPCJ, Q15 „...it is more difficult, worse...”

#### **4. Main findings and implications**

After coding the data collected during the interviews, it can be concluded that the majority opinions regarding communication process within local public administration had a positive orientation.

The interviewed employees stated that authorities granted more importance to external communication than internal communication. When the participants were asked about the aspects regarding the communication process that should be improved, most of them indicated internal communication. The hypothesis was supported, accordingly, is needed an improvement to the internal communication. The institution managers should set several objectives targeting the improvement of the internal communication.

The employees participating in the in-depth interviews mentioned that the documents circuit is affecting local government communication within public institutions with a large number of employees. The clerks stated that it takes about one week for a document to obtain the necessary signatures in order to be sent to the recipient.

The participants identified a number of human resource issues in local public administration: the inequitable division of tasks, the citizens' respect towards the public servants, the violence of language or on the institutions' property, the contact with the Rrom ethnic persons is difficult, the lack of protection of employees against those who are beyond the counter, the clerks' number is insufficient and the impossibility of employment, high workload, the appointments, employments and advancements in some cases are made on the political considerations, there are

some problems regarding the rank advancement, the specific working characteristics are requesting; the lack of confidence in professional conduct of public servants.

## **5. Conclusion**

The goal of this paper was to collect a series of essential events that can affect communication by facilitating it and increasing clerks satisfaction or on the contrary that disturb the communication process.

This study has limitations common to all qualitative research. It can be mentioned the following limitations:

- the short period for the data collection (16- 31 January 2012);
- employees participants were selected by institutions` management not randomly recruited;
- the denial of two employees from Bihor County Council and one from Oradea City Hall to be registered with the recorder during the in depth interview;
- interpretative research cannot be detached from the biases of researcher;
- using a single coder;
- due to the large amount of gathered information problems in classification have arisen.

Most of the statements in terms of local government communication were regarding the external and internal communication of these institutions and had a positive orientation.

In Oradea City Hall the evolution of communication in a positive way is the result of effective communication policies where the management of the institution has a special role: to establish standards and internal rules, in pursuing of their application and in motivating the staff. The employees motivation has an important role even more because in the current financial restrictions when managers of public institutions can not reward employees with increases in theirs salary, overtime pay or by offering holiday bonuses. For the other local public institution analyzed, an assessment instrument seems one of the few ways in which the communication performance can be measured and after that the institution managers can establish a number of objectives concerning the communication process.

The problem that the participants noticed is given by the difficulty of implication of the citizens in public affair problems. Citizens can get involved in local government activities in different ways with one common requisite: the desire to do something useful for the collectivity to which they belong to. A more important result is that public consultation and citizen involvement as means of legitimation can also be related to the managements` attitude regarding this concern.

The results supported Yusoff, Ismail and Ali (2010: 236) findings that there are ten critical success factors based on priority from the internal client`s point of views within local authorities: focus on both internal and external customers, coordination between departments, effective and efficient service delivery system, training for continuous improvement, top management as support system, good and reliable human resources, conducive job environment, application of latest technology and ICT, effective property and facility management, good management of office spaces. Further research is needed, however, to explicate the specific communication characteristics in terms of local government communication for the communities with a total population of more than 200,000 persons. Survey studies would seem an appropriate technique for obtaining data on local public communication process.

Further research require a more quantitative approach based on inquiry in order to investigate a larger sample of public servants. Under this conditions the survey could be used to validate the results found here.

*bianca.boitor@unitbv.ro*

*andreea.hertanu@unitbv.ro*

**Abstract:** *This paper presents the results of a marketing experiment done on the Romanian software market. The main purpose of this research is to determine how the marketing campaigns of software manufacturers can influence the decisions of software retailers. Through this marketing experimental research an evaluation and an analysis of the impact that marketing policies of software companies have on the retailers from all over the country is made. Three different marketing campaigns were proposed to three groups of software vendors from the most important cities of the country. The total number of software retailers included in this experiment is of 45, and the marketing campaigns proposed by the authors in this experiment refer to the Microsoft brand. Promotion strategies such as: sales promotion by encouraging sales force and promotional pricing or even the policy of partner relationship management have a great impact on three aspects regarding software retailers: loyalty, purchase and resale intention and attitude towards a brand. The results of the experiment show a high interest for the strategy of promotional pricing. The representatives of the software vendors have a positive orientation towards sales promotion by encouraging sales force. Regarding the influences of the manipulations used in the experiment, the greatest impact on the loyalty of the software vendors it has the strategy of promotional pricing. Also the policy of sales promotion by encouraging sales force has the biggest impact on the purchase and sale intention of the software retailers. All three manipulations have also an impact on the attitude towards a brand of the vendors, but the differences are too small to determine which of the proposed stimuli has a greater impact on this aspect. The results of the experiment may help and could have a great influence on the future marketing decisions of manufacturers regarding the strategies and marketing policies used on the Romanian software market. Also, this paper represents a solid foundation for future marketing research that can involve all the stakeholders' categories from the Romanian software market.*

**Keywords:** *experimental research, software, stimuli, loyalty, marketing campaigns, software retailer.*

**JEL classification:** *M31.*

## **1. Introduction**

The main results from carrying out a marketing experimental research are presented. Through this experiment we attempted to analyse and quantify the impact that different marketing stimuli could have over the loyalty, purchase intention and attitude toward a brand of the Romanian software retailers.

The paper aims at revealing if the software vendors from different parts of the country are influenced by marketing campaigns which involve marketing strategies

such as: promotional pricing, sales promotion or partner relationship management. This subject is approached mainly because of the changes that have occurred in the distribution channels of the international software manufacturers in Romania over the last years. In recent years, the reports of Revenue Architects (2012) show that with the increasing use of the Internet for eCommerce, many pundits have announced the death of the distribution channel for software. But now, more than ever, this channel serves an increasingly important role for the software industry, and, within just a few years, it will likely change more than any other channel in businesses globally.

It is very important now, more than ever, for marketers to better understand these changes and, most important, to understand their partners, the software retailers. Also in Romania, these changes have occurred and are affecting the distribution channels of international software manufactures.

Technology, software and IT industry in Romania has experienced significant growth in the last years. As Vuici (2012) presents, the total Romanian software and IT industry turnover exceeded EUR 9.2 billion in 2011.

## **2. Literature review**

The ideal way of measuring the impact of marketing programs is carrying out marketing experiments on territories or marketing segments homogeneous market segments. Today, many companies use different communication channels to send the desired message or their service offer to different groups to record the differences arising between them. (Kotler 2005: 110)

Information service and software marketing has similar but different aspects due to the so-called information economics. For example, to market a new software product, companies may provide customers with a test version having a three-month expiration date, a free version handling only a limited numbers of variables, or a guest account to use for a web-based system with limited functionalities. This study used a web-based system to evaluate the effects of system trial on consumers' beliefs and intentions regarding e-learning use. In particular, the following research questions guided the study: (1) Do the potential consumer groups with or without system trial experience have similar beliefs and use intentions regarding the software product? (2) Do the relationships between consumers' behavioral intentions to use an e-learning system and determinant factors differ for trial and non-trial groups? (Yao-kuei Lee, 2006: 222-244)

One of the largest experiments on the software product market was carried out in 1993, the year that, on the United States' market, agents of small software companies considered introducing a few independent variables in marketing campaigns, in order to test their impact upon the individual users' buying intent.

Therefor they introduced the following new elements in the marketing campaigns: author rights for software products were included in contracts, as well as author rights for books and media, very popular books among the young population were introduced in applications as interactive elements, educational television shows began presenting interactive computer games, the idea of nowadays artist in programming and web-design, etc. was promoted. This very high level experiment had the following effects: very good programmers succeeded to request higher tariffs for their services, the prices were maintained through increased production, programmers' agents obtained

a higher charge, the powerful expansion of using software products started to emerge. (Shea, 1983: 20)

Traditionally, marketers as agents of change attempt to find ways to influence consumers use or purchasing behavior. One of the employed methods is for consumers to experiment with the product on a limited basis and make evaluation before use or purchasing. For example, some of the common practices are: (1) giving out trial-size samples of consumer goods, (2) providing limited trial of durable goods, and (3) offering test-drive of the latest auto models. These practices are designed to make consumers aware of the new products and at the same time reduce the risk perceived by prospective buyers. (Yao-kuei Lee, 2006: 222-244)

The subjects were randomly chosen, not knowing the scenario they will take part in. The groups didn't communicate whatsoever and the scales used are the same as in the literature. (Youn, Kim, 2008:123-137, Quester, Lim, 2003: 22-38)

It must be noted that in a marketing experiment sources of internal or external validity can appear. (Aaker, Kumar, Day, 1998: 384)

### **3. Research methodology**

From the need to have control over various conditions, marketing experiments are difficult to carry out. Various companies, including those in the software domain developed testing markets. These are certain towns or geographic areas in which marketing experiments are implemented. These testing markets are selected because they reflect competitive characteristics and consumer characteristics that are important for the companies. (Burrow, 2011: 148)

The marketing experiment allows the organiser to control over some experiment factors and comparisons between groups that are exposed to different inputs. (Hoyle, Harris, et. al., 2002: 421)

Experiment is a research method by which the variation of one or more independent variables is operated by the researcher, after which its effect on the dependent variable is measured. (Cătoi, Bălan, 2002: 363)

The hypotheses from which this experiment started are as follows: the strategy of sales promotion has the highest influence on the purchase and resale intention of the software retailers, the strategy of promotional pricing has the biggest influence on the loyalty of the vendors and on the attitude towards a brand of the software retailers.

Microsoft is a relationship – motivated company. In the manner of the most loyal personnel, partners must work hard to demonstrate their loyalty, which is rewarded. (Dinsmore & O'Conner, 2005:73)

To confirm or infirm these assumptions, the authors have introduced three stimuli which refer to the Microsoft Certified Partner Program and marketing strategies of the company. The companies that took part at this experiment are all members of this program, but none of them has any Microsoft competences.

#### **3.1. Defining the community, the unit of observation and sample characteristics**

The researched community consists of 45 software retailers from the main important cities of Romania. The observation unit is represented by the company that sales software products and services on the local market, and the experiment includes only experimental units. For the experiment, the representatives (managers and so on) of the following retailers were interviewed: Unitech 3-Alba; Contact Infonet AG-

Argeş; Cybernet-Bacău; One IT, MultiNET-Baia Mare; Short Cut Computers 1, B2B Digital, Trendex Electronics, Zolitrone IT Solutions-Braşov; Short Cut Computers 2, Soft Expert, Multi Data Soft, Omni Tech, Convex Network, Everest Computers, Tech PC Data-Bucharest; Centrul de Calculatoare 3-Caransebeş; Centrul de Calculatoare 1-Caraş Severin, Intend Computer-Cluj Napoca; Intercriş, MicroNet Systems, Silva Systems, Top Systems-Constanţa; Centrul de Calculatoare 2-Covadar; Angelosoft Computers-Craiova; Unitech 6-Deva; Simms Computer Center-Galaţi; Unitech 5-Hunedoara; Avicena Computers, IQ Plus-Iaşi; Aibox Consult-Oradea; Unitech 2-Petroşani; Compware Systems-Râmnicu Vâlcea; Nolimits Technologies, Gerodar-Satu Mare; Unitech 1-Sebeş; Pro Info-Sfântu Gheorghe; Open Systems-Suceava; Unitech 4-Târgu Jiu; Digimax, Caro Comp-Târgu Mureş; Saratoga, M&M Medianet, Com Stas Computer-Timişoara.

### 3.2. Tools used for data collection and the accuracy of the scales

Collection of the data was made by using 4 questionnaires as follows:

- Questionnaire number 1 - before testing – all respondents answered - serves to highlight the structure of the sample and the homogeneity of testing units from each group. It contains questions regarding the trade of Microsoft software products, questions regarding the attitude of software retailers towards Microsoft brand, the loyalty of the retailers and also questions regarding the purchase and resale intention of these companies;
- Questionnaire number 2 - after testing for the first group (15 respondents) – partner relationship management strategy – the scenario used was: “Free access to Pinpoint Platform and to Silver Small Business Competences (Get the first Silver Small Business Competence by obtaining a minimum number of 150 unique visitors in the first month on the Pinpoint Platform through your new account that you can create free of charge in the next three months)”. The questionnaire contains topics such as the attitude towards Microsoft brand, purchase and resale intention but also questions regarding the option and view of the software retailers on the marketing campaign to which they were exposed and the other two campaigns;
- Questionnaire number 3 – after-testing for second group (15 respondents) – sales promotion by encouraging sales force strategy - scenario used was: “Participate, by purchasing minimum 150 Microsoft Windows 8 licences, to a 3-day training program in Bucharest, were your employees will be trained in the trading techniques of the new Microsoft product, the operating system Windows 8”. Contains the same batch of questions as questionnaire 2;
- Questionnaire number 4 – After-testing for third group (15 respondents) – promotional pricing strategy –scenario used was: “Get the first Silver Small Business Competence with a charge of only EUR. 300”. Contains the same batch of questions as questionnaire 2.

Accuracy of the scales used in the experiment (Likert with 5 levels) was rendered through the results of the Cronbach’s Alpha index test, the value of this test for each variable being greater than 0.60.

To highlight the stages and the process of the experiment, the following notations are used: (See Table 1)

**Table 1:** The notations used for the experimental research

<b>X</b>	The manipulated independent variable	X <sub>1</sub> , X <sub>2</sub> , X <sub>3</sub> - the independent variables used
<b>Y<sub>a</sub></b>	The dependent variable measured before the independent variable is manipulated, controlled or measured	Y1a, Y2a, Y3a - the dependent variables before exposure to experimental stimulus
<b>Y<sub>b</sub></b>	The dependent variable measured after the independent variable is manipulated, controlled or measured	Y1b, Y2b, Y3b - the dependent variables after exposure to experimental stimulus
<b>R</b>	The three random samples	R1, R2, R3 - random samples

The representatives of all three samples were asked to answer to the first questionnaire and after that, to the questionnaires that included the stimuli used in the experiment.

#### 4. Research findings

Regarding the impact of the proposed stimuli on the purchase and resale intention of the software retailers, the promotion of sales has the most important influence by encouraging the sales force strategy. Next, the values recorded before and after exposure to stimuli for the means and standard deviations of the variable used to define purchase and resale intention of the retailers are presented (See Table 2):

**Table 2:** Means and standard deviations before-testing and after-testing for the variable “purchase and resale intention”

Observed groups	Before-testing		After-testing		No.
	Mean	Std.Dv.	Mean	Std.Dv.	
Partner relationship management strategy	3,533	1,06	4,000	0,75	15
Promoting sales trough the stimulation of the work force	3,133	1,24	4,266	0,79	15
Promotional pricing policy	3,133	1,06	4,133	0,74	15

After the introduction of the manipulation, the dimension of the purchase and resale intention changed as follows: increased in the case of partner relationship management strategy, from a mean of 3.5333 to one of 4.000 (on a scale from 1 to 5), in case of promotion of sales by encouraging the sales force the variables' mean came from a value of 3.1333 to a value of 4.2666 and in the case of promotional pricing, the value of the variables' mean increased from 3.133 to 4.1333.

To see if the differences recorded for the values of the analysed variable for each group are significant, a T Paired test was applied and the results are shown in Tables 3 and 4:

**Table 3:** Paired Samples Statistics for the variable “purchase and resale intention”

Variable used to illustrate the purchase and resale intention of the software retailers	Mean	No.	Std. Deviation	Std. Error Mean
Among providers, we grant greater importance to Microsoft distributors post-testing	4,1333	45	,75679	,11282
<b>Pair1</b>				
Among providers, we grant greater importance to Microsoft distributors pre-testing	3,2667	45	1,11600	,16636

As can be seen bellow, from the test conducted, the probability, 0.00015 is less than the significance level of 0.05. So, the null hypothesis is rejected and the outcome is statistically significant. There are significant differences between the means and standard deviations before exposure to experimental stimuli and after exposure for this variable.

From the above data it can be seen that after exposure to stimuli, the mean for the analysed variable is higher for the group exposed to sales promotion policy (4.2666) compared to the values of the variable in case of the other two groups exposed (4000 and 4133).

**Table 4:** Paired samples Test for: “Among providers, we grant greater importance to Microsoft distributors”

Variable used to illustrate the purchase and resale intention of the software retailers	Paired Differences					t	df	Sig. (2-tailed)
	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
				Lower	Upper			
Pair 1 Among providers, we grant greater importance to Microsoft distributors before-testing / Among providers, we grant greater importance to Microsoft distributors after-testing	,86667	1,40777	,20986	,4437	1,2896	4,13	44	,00015

To see if the differences between the three observed groups are significant, One Way ANOVA test is used (See table 5):

**Table 5:** One way ANOVA Test for: Among providers, we grant greater importance to Microsoft distributors

	<b>Sum of Squares</b>	<b>Df</b>	<b>Mean Square</b>	<b>F</b>	<b>Sig.</b>
Between Groups	3,378	2	1,689	3,500	,039
Within Groups	20,267	42	,483		
Total	23,644	44			

The results of the ANOVA Test shows that the alternative hypotheses is accepted and that there are significant differences between the three observed groups after exposer to stimuli (Sig. = 0.039 < 0,05).

The research findings show that the impact of the promotion of sales strategy is higher than the impact of partner relationship management strategy or the impact of the promotional pricing strategy on the observation units.

Next, the results show how the promotional pricing strategy influences the dimension of software retailers' loyalty and in what measure this differs from the impact had by the other two stimuli over the observation units of the experiment.

As it can be seen in Table 6, after the exposer to stimuli, the dimensions of the retailers loyalty changed: for the group exposed to the promotional pricing strategy the mean of the analysed variable increased to 4.800, for the group exposed to the partner relationship management policy the value of the mean reached the value of 4.866 and for the group exposed to the promotion of sales, the value of the mean reached 4.8000. The most significant difference is recorded for the observed group exposed to the promotional pricing strategy.

**Table 6:** Means and standard deviations before-testing and after-testing for the variable "loyalty"

<b>Observed groups</b>	<b>Before-testing</b>		<b>After-testing</b>		<b>No.</b>
	<b>Mean</b>	<b>Std.Dv.</b>	<b>Mean</b>	<b>Std.Dv.</b>	
Partner relationship management strategy	4,800	0,41	4,866	0,35	15
Promoting sales trough the stimulation of the work force	4,533	0,51	4,800	0,41	15
Promotional pricing policy	4,466	0,51	4,800	0,41	15

To see if the differences recorded for the values of the analysed variable for each group are significant, a T Paired test was applied and the values obtained are shown in Table 7.

The results from the conducted test show that the probability, 0.017 is less than the significance level of 0.05. So, the null hypothesis is rejected and the outcome is statistically significant. There are significant differences between the means and

standard deviations before exposure to experimental stimuli and after exposure for this variable.

**Table 7:** Paired samples Test for: “We choose the brand Microsoft when we want to sell operating systems or office suites”

The tested variable	Paired Differences					t	df	Sig. (2-tailed)
	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
				Lower	Upper			
Pair 1 We choose the brand Microsoft when we want to sell operating systems or office suites before-testing/ We choose the Microsoft brand when we want to sell operating systems or office suites after-testing	2,2222	,59882	,08927	,0423	,40213	2,489	44	,017

To see if the differences between the three observed groups, after exposure to stimuli, are significant, One Way ANOVA test is used (See table 8):

**Table 8:** One way ANOVA test for: “We choose the brand Microsoft when we want to sell operating systems or office suites”

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	3,244	2	1,622	4,522	,017
Within Groups	15,067	42	,359		
Total	18,311	44			

The results of the ANOVA Test show that the alternative hypotheses is accepted and that there are significant differences between the three observed groups after exposure to stimuli (Sig. = 0.017 < 0,05).

The research findings show that the impact of the promotional pricing strategy over the dimension of the retailers’ loyalty is higher than the impact of partner relationship management strategy or the impact of the promotion of sales by encouraging the sales force strategy over the same dimension.

When it comes to the dimension of the attitude of the software retailers towards the Microsoft brand, the results of the analyse show that the differences, after the exposure to stimuli, between the three groups are not significant.

All three types of strategies have a positive influence over the attitude towards of a brand, but it can’t be said which of the stimuli has a greater influence on the

dimension of this variable. Instead, the promotional pricing strategy has the greatest influence over the retailers' orientation to a brand.

The differences between the observed groups, after the stimuli were introduced, are not significant and the One way ANOVA test confirms this hypotheses. The results of the one way ANOVA test are shown below, in table number 9.

**Table 9:** One way ANOVA test for: We recommend our clients Microsoft products

	<b>Sum of Squares</b>	<b>df</b>	<b>Mean Square</b>	<b>F</b>	<b>Sig.</b>
Between Groups	,133	2	,067	,396	,675
Within Groups	7,067	42	,168		
Total	7.200	44			

Of the three proposed strategies, the one that the software retailers were most receptive was the one of promotional pricing (See Table 10). After the manipulations were introduced, it can be seen that the mean for the group exposed to the promotional pricing strategy has a higher value (4.200) then the values recorded for the means of group exposed to partner relationship management strategy (4.133) and of group exposed to promotion through sales (4.066).

**Table 10:** Means and standard deviations after-testing: "attitude towards the brand"

<b>Observed groups</b>	<b>After-testing</b>		
	Mean	Std.Dv.	No.
Partner relationship management strategy	4,133	0,35	15
Promoting sales trough the stimulation of the work force	4,066	0,96	15
Promotional pricing policy	4,200	0,67	15

The One way ANOVA test results confirm that the difference between the values obtain for the analysed groups after exposure to the stimuli are significant (Sig. = 0,026 < 0,05) and that the highest receptivity of the software vendors is recorded for the promotional pricing strategy (See Table 11).

**Table 11:** One way ANOVA test for: "attitude towards the brand"

	<b>Sum of Squares</b>	<b>df</b>	<b>Mean Square</b>	<b>F</b>	<b>Sig.</b>
Between Groups	3,244	2	1,622	3,992	,026
Within Groups	17,067	42	,406		
Total	20,311	44			

After exposure to stimuli, all observation units were asked to give their opinion regarding the three marketing strategies proposed. 20 of the 45 representatives of the observation units have opted for promotional pricing strategy. Only 13 chosen the partner relationship management policy and 12 opted for sales promotion strategy.

## 5. Conclusions

After analysing the results we can conclude that the policy with the greatest influence of all 3 stimuli policies proposed (partner relationship management strategy; promoting sales through the stimulation of the work force; promotional pricing policy), was the promotional pricing policy, followed by the promoting sales strategy. The last, with the weakest influence was the partner relationship management strategy. Confirming the analysed hypothesis, the impact of the promotional pricing is more powerful regarding the retailers' loyalty in comparison with the impact that partnership relationship management and promoting sales had on the analysed variable. Loyalty in commercialising software products is a factor of great importance. This factor and the retailers' attitude towards different national and international software brands are strongly influenced by the promotional prices.

Regarding which of the marketing campaigns proposed in the experiment is the software retailers' favorite one, the results show that vendors are more receptive to the campaign that involves promotional pricing strategies.

The findings of this marketing experimental research represent a solid base for further research that can help the software products and services producers approach in a different and more constructive manner their relationship with their retailers.

**Abstract:** *Internet technology, as well as development of mobile phone was fast adopted by people for recreational, economical and business reasons. The web-based technology development and the new communication systems made marketers to orientate their promotional campaigns and efforts towards new ways of reaching their actual and potential client. They started to use new and innovative ways to get public's interest and to encourage purchase. In this context, Internet offered a complex environment to support the development of innovative brand strategies. One of the emerging new techniques in advertising is advergaming. Advergaming represent the use of video game interactive technology for delivering brand messages to public. They are electronic games accessible on companies own websites, on social media sites and on application which can be downloaded on mobile devices. For marketers is important to understand the way that advergaming work and what consumer's attitude towards this practice is. The formation of attitude depends on a series of factors which are common to all types of advertisements based on Internet technology. These factors responsible for consumers' attitude towards online advertising and implicit for attitude formation over advergaming are informative component, source credibility, entertainment, and irritation. Beside these four elements, there are additional criterions which consumers use for evaluating advertising in video games: the viral component, interactivity and telepresence. For marketers it is important to understand these factors and to find practical ways for using them for a better brand communication and for higher results of advertising campaigns which include the use of advergaming as part of the promotional strategy. The present paper is looking to make a description of the factors influencing consumer's attitude formation towards advergaming, in conjunction with the Internet environment and the specific features of this media channel. The presentation of the relevant factors is based on the fundamental elements defining consumer's attitude and it's particularities in online environment.*

**Keywords:** consumer's attitude, video games, advertising, advergaming, online

**JEL Classification:** M37

## **1. Introduction**

Today advertising is a complex business and with the improvement of Internet technology, the environment and landscape of business changed very much from what was like in the past. New techniques in communication and public targeting include studies for understanding consumers' behavioral characteristics and to help satisfying their needs. Among these studies, consumer's attitude has an important role.

More scholars and researchers become interested in understanding consumers set of actions, and become an aspect very large studied including development of efficient strategies used in influencing decisions made by consumers (Blackwell et al, 2001).

The Internet proved to be a good alternative to traditional media like television, radio and magazines for promoting products and services. The continuous increase of web traffic made advertisers orientate their advertising campaigns to online environment, and determined researchers to intensively investigate the online potential, for understanding and better use of the advantages offered by the Internet. Internet technology, as well as development of mobile phone was fast adopted by people for recreational, economical and business reasons. The latest models of communication offered companies new ways of reaching their clients and provided new ways for promoting their brands and products (Pelău and Zegreanu, 2010). The new online techniques received higher attention from the public, determining the change of the new media consumption patterns and making people to orientate to online environments (Drury, 2008).

Online advertising includes several forms, which could be understood in bigger classes as e-mail advertising, text, display advertising and online video advertising (Varnali, 2012). Among the last category, advergaming started to be a common practice in the new marketing context.

Advergaming represent the use of gaming interactive technology for delivering brand advertising messages to public. Advergaming is a technique of incorporating brands and product directly into the game environment. They are electronic games accessible on companies own websites, on social media sites and on application which can be downloaded on mobile devices. Some authors consider that under the generic name of advergence are "commercial messages embedded within the content of retail, accessible video games, online electronic games or apps" (Dahl et al, 2009). Advergaming are an efficient medium connected to Internet offering telepresence, immersion, accessibility and replaying ability.

## **2. Elements defining consumers' attitude**

Consumers' attitudinal structures were found to be similar both for traditional and Internet based advertising (Schlosser et al., 1999). The consistency of this structure is in accordance with other findings regarding the resemblance between traditional and Internet advertising with respect to entertainment and information value perceived by consumers. The studies about consumers' perception over advertising showed that factors specific for traditional media are also relevant for web based advertising (Chen and Wells, 1999).

Attitude can be defined as an emotional, rational and mental predisposition regarding a person, an object or a fact. In marketing, consumers' attitude studies are a part of

behavioral studies and imply the definition of reactions towards important attributes of brands, products, services and markets.

In literature, attitude was defined as “a learned predisposition of human beings” (Fishbein, 1967) or a “predisposition to respond in a favorable or unfavorable manner to a particular advertising stimulus during a particular exposure occasion” (Lutz, 1985).

More recent definitions considered attitude as a person’s position of being favorable or unfavorable, positive or negative, for or against a particular object (Loudon and Della Bitta, 1993). Kotler (2000) defined attitude based on the concept of human learned disposition. He developed this concept and considered attitude as being an expression of the individual personal evolution, an action tendency and an emotional feeling towards some objects or ideas. Some authors (Solomon et al, 2002) state that attitude is a long-lasting and common assessment of people, towards objects, oneself, other people, advertisement and any given problem. Other authors considered attitude as a predisposition to behave in a consistently favorable or unfavorable way with respect to a given object or a constant tendency to behave accordingly in a concrete situation, regarding a certain object or a group of objects (Schiffman and Kanuk, 2004).

The formation of attitude depends on a series of factors: knowledge, learning, information, education, thinking, experience, lifestyle, predisposition, belief, faith or communication. It could generally be translated in good or bad, positive or negative, optimistic or pessimistic, friendly or unfriendly. Attitudes could be consistent, could change due to external factors, could be influenced by some contextual elements, or could influence attitude of other persons.

Summarizing, attitude can be understood as a particular system of motivations, emotions, perceptual and cognitional processes, responding to certain environmental aspects, surrounding an individual.

Consumers’ attitude is a composite of consumers’ beliefs, feelings and behavioral intentions towards a certain brand, product or service. A consumer might have positive or negative beliefs about an object, as well as he could be neutral, depending on the context or the person. In some situations, the same person could have contradictory beliefs about a brand, being also positive about it in some situations, and negative in other situations. Starting from these beliefs, a consumer could develop certain feelings towards a brand or product. In accordance with these feelings, a consumer will manifest behavioral intention directed to a specific brand.

### **3. Elements specific for online advertising which influence consumers’ attitude over advergames**

Literature about advertising considers that there are several factors which are responsible for consumers’ attitude towards online advertising: informative component, source credibility, entertainment and irritation. Beside these four elements, there are additional criterions that consumers use when they evaluate advertising from video games: the viral component, interactivity and telepresence. Literature (Ducoffe, 1995; 1996) confirmed that attitude towards online advertisement is dependent on the perceived value of advertisement and the level of entertainment, information and intrusiveness. The author also described that these three factors determine consumers’ evaluation of the ad and the attitude towards it.

Researchers tried to explain the relation between the level of advertising persuasion and the consumer's reaction towards it, founding that this is directly related to consumer's preference for advertising in general, values of enjoyment and entertainment, the informational content value, the perception about the credibility and truthfulness of the source (James and Kover, 1992; Mehta, 2000).

### **3.1 The informative component**

Informative component of an advert refers to the quantity and quality of data relevant for the brand or product, which describes its particularities, properties, special characteristics and the way it could be used. This component has impact on consumers as it helps them in decision making process and purchase (Tsang et al., 2004). This factor is also important for determining the efficiency of an advertisement. It helps in making consumers be aware of a product, and informs them about the features that make it better and more attractive than competitors' offers (Saadeghvaziri and Hosseini, 2011).

Advergaming can incorporate interactive branded objects which can help users to understand the particular characteristics and the usage of a product or service during a game session. From this perspective, the information provided through an advergame can be more complete and relevant for consumers than watching a TV commercial or seeing an online banner.

The specific structure of a video game encourages players to repeat the game experience by replaying the game. This fact leads to minimal risk of forgetting the information and message about the products advertised in the game. From the cognitive perspective, replaying the game helps in bringing the brand or product in the preference set of the consumer and may increase loyalty.

### **3.2 Source credibility**

Some authors (Ducoffe, 1996) consider that the attitude towards an advertisement can be related to the attitude towards the environment that contains it and the consumers' perceived value of that advertising. As an example, authors said that adverts placed in a medium like newspapers are more trusted and perceived as more credible and informative, than those placed in a medium as television, considered less informative and reliable, (Bauer and Greyser, 1968; Becker et al., 1976; Larkin, 1979). For web-based advertisement, this means that a consumer may accept the web as a tool with multi-functional characteristics, but could have a different attitude towards the advertising in this medium.

There are multiple factors that influence the credibility of an advertisement, like the general credibility of the brand and company, as well as the context and the channels used for transmitting the brand message to public. Authors think that a higher credibility of the source leads to a higher value of the advertisements and higher impact of the message over consumers (Haghirian et al. 2005).

The original purpose of video games was to entertain and relax the public, and put them in a position less credible. Today instead, video games can be used for practical purposes, as they could employ practical benefits to their purpose of recreation. Compared to classic video games, there are new categories of games named serious games, which include, beside their basic purpose, a utilitarian purpose. These categories of video games include: educational games, training games, simulation games and advertising games. In other words, serious games are

characterized by a utilitarian and educational scenario, which exist in a combination with the entertainment scenario.

Serious games created for advertising, like advergames, have the purpose of promoting particular brands or products during game sessions. This approach differentiates advergames from normal video games, and can be perceived as more credible by consumers.

### **3.3 Entertainment**

The feelings of enjoyment connected to advertisement have an important role in determining consumers' attitude towards online adverts. It is considered that entertainment services brings an additional value for consumers and could lead to an increased loyalty, as well as a positive attitude (Saadeghvaziri and Hosseini, 2011). For online advertising, entertainment component helps in predicting online advertisements efficiency and is an important factor which determines the positive attitude in web based and mobile advertisements (Tsang et al., 2004; Bauer et al., 2005). These facts have great importance for advergames, which are design both for computer and mobile phones.

One of the most important features of advergames is the entertainment value offered. This can block the natural forgetfulness of a brand experience specific to advertisements. Players can see the billboard, the interactive branded objects or characters from the game while they play and reach game goals.

In today market, when audiences get easily distracted, loose interest, show indifference and are difficult to captivate, combining entertaining with advertising features seems to be an effective practice. While other Medias as television seem to fail in retaining publics' attention, advergames are a good way to gain consumer's interest and awareness.

Several authors consider that advergames are a unique way of branded entertainment because it is produced for a specific sponsoring brand and contains promotional messages directed towards the same product. Compared to other forms of advertising like product placements and insertions, the entire game is in fact a brand message (Chen and Ringel, 2001; Deal, 2005).

The possibility of creating advertising with entertaining content using an advergame is a form of branded entertainment which incorporates in its essence a hybrid brand message. In this way, advergames allow marketers to have control over the context they deliver the entertaining message and provide a very high level of conducting promotional campaigns. It can present a brand's message "in an engaging manner at a fraction of the cost of television advertising" (Bertrim, 2005). It can be said that advergames are a direct form of branded entertainment delivered more efficiently than other advertising methods.

The most recent study on this matter (Marti-Parreño et al., 2013) investigated if the entertainment of an advergame has positive influence over consumer's attitude towards a brand integrated in the advergame. For the investigation, the authors applied a questioner with 19 items to a sample of 100 students from a University in Spain. The answers were designed on a seven-point Likert scale, ranked from "strongly disagree" to "strongly agree".

The result showed that attitude towards advergames is positive connected to the consumers feeling of being entertained by the advergame. These findings also supported previous research, showing that attitude towards advertising follows

similar rules for advergaming as for other media as web-based technology (Lou, 2002; Chen and Wells, 1999), advertising in general (Ducoffe, 1996) and online computer games (Gao, 2004).

### **3.4 Irritation**

Many advertisers adopted intrusive tactics for getting consumers' interest and attention, but most of the time these tactics are perceived as being annoying (Zhang, 2000). Numerous studies revealed a negative attitude of consumers regarding advertising (Alwitt and Prabhaker, 1994). Authors (Ducoffe, 1996) pointed out that in the moment of exposure most of the messages are not related to consumers' immediate interests and needs. Therefore, they dismiss these messages. These facts made advertisers find new strategies that could help in reaching the targeted public, as well as adapting old practices used in traditional environments as television and billboards to interactive media as Internet.

When consumers face invasive and repetitive advertisements tend to react with negative feelings as irritation and annoyance. Compared to other media, advergaming are more consumer' friendly because advertisements are exposed in the background during certain games, a practice that is more accepted by consumers (Ipe, 2008). Authors (Kretchmer, 2004) think that advergaming are more effective than online banners because of the "growing cynicism about banner advertisements" while in advergaming the product is present in the background or as part of a character of the interactive game.

The same study mentioned above (Marti-Parreño et al., 2013) also investigated the connection between attitude towards advergaming and consumers irritation. Authors pointed out that irritation is a sensation produced by the brand abusive appearance in the advergaming content, which could trigger anxiety, poor game experience and disrupt player's attention from the game play. The study showed that if the presence of the brand is too intrusive and unsuitable or the role of the brand in the game is not justified by the game action, the attitude towards that brand will become negative. These facts support Gao's (2004) findings that "the design of a game that annoys, offends or insults the intelligence of the audience can cause irritation and can negatively affect attitude toward the brand".

## **4. Particular elements which influence consumers' attitude towards advergaming**

### **4.1 The viral component**

Many brands started to use viral marketing for promotional purposes, determining in this way an increased popularity of this method (Eckler and Bolls, 2011). Compared to conventional media, this method helps to better target people and to deliver personalized messages. It also offers potential for quantify the speed of message transmission and the consumers' reaction and response (Bampo et al., 2008).

A good impression and a positive attitude towards an advergaming will reflect in a positive evaluation of the brand or product advertised in the game. The repetitive nature of the game produces a higher remembering rate as the frequency will influence the chance of retaining the players' attention with the brand exposure and message deliverance.

Advergaming can be used as a viral marketing tool, their structure permitting players to share the game experience and talk about them with friends and family. Advergaming has a “tell-a-friend” viral component making players be more engaged with the game and more aware of the brand and product presented in the scenario. Besides remembering the brand, if the advergaming is popular and fun players will associate the game’s characteristics with the brand.

#### **4.2 Interactivity**

Traditional media is characterized by a one-way communication system which makes consumers to accept the message from the source without any possibility of control. Compared to this, advergaming allows people to voluntarily and constantly take action, by actively searching and choosing the game they want to play, to replay it and repeat the experience on the game and implicit with the product or service advertised within. Consequently, the non-linear structure of the interactive advergaming influences consumers’ experience with the brand.

Interactivity is considered the possibility to modify the form and content of a mediated environment in real time (Steuer, 1992). It was also defined as “an expression of the extent that, in a given series of communication exchanges, any third transmission is related to the degree to which previous exchanges referred to even earlier transmissions” (Rafaeli, 1997)

When a consumer interacts with an advertisement, the relevance of the ad, the importance of information, and current needs will influence the consumers’ general involvement with the ad.

The structure of the interactivity on new media includes a dimension defined by Liu (2001) as active control, freedom of choice, two-way communication and synchronicity. Internet technology enhances consumer’s interactive experience, allowing them more freedom in choosing the type of information they search and the moment when to receive it. The interactive communication through advergaming eliminates physical, temporal and spatial barriers in a way that traditional media is unable to do.

For video games, telepresence is a dimension given by interactivity and vividness of the virtual environment. Telepresence refers to consumers feeling of being mediated in the virtual environment. Players’ sensation of being present in the video game world is enhanced by the number of senses that are incorporated within the game, including visual and audio effects, and leads to a higher level of telepresence. Authors (Cook and Coupey, 1998) explained that environments with video, text and sound elements offer a good context for decision making, increasing consumers experience with the promoted brand. From an advergaming perspective, telepresence is important only if it helps the consumer to get involved in the game and to feel immersed in the virtual environment.

Vividness is considered to be the richness of the virtual environment and it depends on the game’s technical characteristics. Authors (Steuer 1992) first described the factors that best describe vividness as depending on the number of sensory dimensions presented in the game and the depth of these sensors, including visual and audio as the most important sensors.

An important study on interactivity and its most relevant attribute, telepresence, was conducted in 2010. The authors (Hussein et al., 2010) investigated the way that

video games which created the feeling of telepresence and the way that interactivity created product experience affected consumers' purchase intention.

The study was conducted over a sample of 250 undergraduate students from University Sains Malaysia who volunteered for the laboratory research. The experiment was designed to ensure the cause and effect relation between persuasive actions of the video game and the respondent manifested intentions. The respondents answered immediately after a game session to a questionnaire structured in three main sections, designed for collecting demographic data, telepresence data and purchase intention data. The answers were designed on a five-point Likert scale.

The results indicated that the relation between experience with the product induced by telepresence and purchase intention is significant. This fact has proved that attitudes formed in a mediated environment influence the behavioral intention in the real world, as purchase.

Authors pointed out that telepresence offers important contribution to understanding the perception of product presented in mediated environment and the game player's way of understanding the product experience and the particular persuasive messages, concluding that telepresence is an important driver of players purchase intention.

## **5. Conclusions**

This study presents the basic elements that describe the formation of attitude based on consumer's experience with a video game containing advertising elements. The product experience can be mediated through an advergame where advertisers have the possibility to control players' perception through advertising actions.

Marketers who plan to use advergames as part of their promotional strategy have to first understand the players' preferences and expectation from a video game. They have to design a game content that will engage consumers and will create positive feelings towards the brand or product presented in that particular game. They should integrate the brand in a way that would not distract player from the game play and avoid in this way players' irritation. Also, it is important to create content by using symbols, objects, characters and messages that makes the game space environment more fun and attractive.

When a firm uses advergames it should be careful to produce creative content, to engage consumer in the virtual space of the game and to increase entertainment possibilities of the advergame. As game players are subjective, advertisers should give special attention to consumers' expectation and preference.

## **6. Acknowledgment**

This work was possible with the financial support of the Sectorial Operational Programme for Human Resources Development 2007-2013, co-financed by the European Social Fund, under the project number POSDRU/107/1.5/S/77946 with the title „Doctorate: an Attractive Research Career”.

mariusdpop1@yahoo.fr*

**Abstract:** *The purpose of this paper is to provide a review of the main issues surrounding the concept of market orientation applied in the context of higher education. Considering the important changes taking place in this sector, a strong willingness of universities to adopt marketing concepts can be noticed. The paper seeks to provide a retrospect on this process, starting with the incorporation of marketing in higher education, and moving on to its implementation, which has come to be known as market orientation. Following a stream of the most relevant literature in the field, we present definitions of the main concepts, and integrate them in the education context, with the purpose of establishing the relevance and importance of market orientation for achieving a sustainable competitive advantage and higher institutional performance. The paper does not aim at providing an exhaustive literature review, but rather at presenting the main elements that define a market orientation, and at supporting its implementation, by outlining the significant benefits that could follow. While theoretical by nature, this research contributes to the body of literature in the field, through closely examining the conceptualization and operationalization of market orientation, and also providing the fundamental components that define the concept and help its implementation. Furthermore, the paper provides practitioners with a number of suggested research directions, which could potentially help improve educational institutions' activity, while also contributing to a better understanding of the concept, and to building richer theories in the field of marketing education. Given that the marketing literature in Romania has mostly overlooked market orientation, both this paper, and all following research in this area will prove to be significant for education managers and researchers alike, promoting the importance and significance of relevant knowledge, and encouraging a wider acceptance of market orientation throughout the education sector.*

**Keywords:** education marketing; market orientation; higher education; customer orientation.

**JEL classification:** M31, I23

## 1. Introduction

Change is not a new word for higher education institutions or the academic environment. The higher education literature widely acknowledges the fact that universities today are faced with great challenges, and that their survival depends mostly on the way in which they choose to respond to environmental threats. Among these threats, competition between universities both for students, and for resources is believed to be one of the most important elements that led to a growing interest in marketing, and to a shift in the institutions' focus towards customers and the educational marketplace (Newman, 2002; Oplatka, Foskett and Hemsley-Brown,

2002; Flavián and Lozano, 2007). The initial reaction of universities to these changes was to adopt marketing theories and concepts which have been effective in the business world, with the scope of increasing institutional performance and gaining a competitive edge (Hemsley-Brown and Oplatka, 2006). The student – customer – became the focal point, followed by the development of a customer-driven organizational culture.

Today most higher education institutions commonly acknowledge the need for the use of marketing, in order to survive and continue to face the challenges in the academic environment. Consequently, research on education marketing has been receiving increasing attention in recent years (Oplatka and Hemsley-Brown, 2007). For more than a decade, a primary area of research has been the study of market orientation (Flavián and Lozano, 2006), as a way for institutions to improve the student-university relationship. Basically, this construct reflects the degree to which the marketing concept has been implemented within an organization (Hammond, Webster and Harmon, 2006). Market orientation is believed to be linked to the opportunity of creating sustainable superior value for customers, in this way leading to a competitive advantage, and to higher institutional performance (Kohli and Jaworski, 1990; Narver and Slater, 1990). However, as shown by Hammond, Webster and Harmon (2006), levels of market orientation and levels of management emphasis on market orientation are alarmingly low within higher education institutions. Also, in spite of the extensive interest in this concept throughout the literature, education marketing literature in Romania seems to have overlooked market orientation. With few exceptions that apply a market orientation perspective to a university setting (Platis, 2009; Pitic and Drăgan, 2010), research fails to address the concept in terms of construct or ways in which it can be applied successfully as a strategy for educational institutions.

The purpose of this paper is to provide a short literature review on market orientation, its emergence and development in higher education, and also on potential benefits that could be obtained by embracing the concept. We begin our discussion with the incorporation of marketing in the education sector, and then move on to show and how it came to be implemented within higher education institutions. In the final section we also suggest future directions for education practitioners to better understand the concept and the ways in which it can be implemented successfully.

## **2. Marketing in Higher Education**

Literature on higher education marketing can be found to be rather extensive, focusing on various items that define the concept, starting with the educational marketplace and customer needs (Teixeira, Rosa and Amaral, 2004; Brown and Scott, 2006), and moving on to specific topics, such as the marketing mix and educational marketing strategies (Cowburn, 2005; Ho and Hung, 2008; Ivy, 2008), and even to controversial discussions over the current marketization of universities or over the function that students hold within the educational process (Bok, 2003; Molesworth, Scullion and Nixon, 2011). Nevertheless, the emergence and development of educational marketing were somewhat defined by an unclear start, as the concept was initially regarded with suspicion and doubt, both by academics, and by universities' management. Marketing was believed to be synonymous with sales and promotion, and these concepts did not belong to the values fostered by

the educational system.

One of the first supporters of educational marketing was Krachenberg (1972), who argued that universities are involved in marketing actions, even if they do not officially admit it. Starting with student recruitment and tax policy making, and on to putting together a research proposal, every action that the university undertakes, no matter who actually performs it or where exactly in the institution it is being done, is grounded on marketing components (Krachenberg, 1972). Litten (1980) further supports this idea, and argues that “marketing is a frame of mind in which questions are asked about the optimum relationship between an organization and its environment, or parts of its environment, and action is taken that is informed by the answers to those questions” (Litten, 1980: 41). The author proceeds on defining this concept, and discusses various aspects, which are specific to higher education:

- Marketing involves conventional activities, such as advertising, as well as an array of other actions, which he adds up under the label “institutional presentation”;
- Information generation through marketing research holds a key role;
- Marketing is concerned with the development and delivery of educational and auxiliary services for which there is desire or need, at a price and under financial circumstances that would permit the intended beneficiaries to take advantage of the services;
- The responsible feature needs to be fully integrated within marketing, so that institutions become concerned with providing students with educational programs that are both beneficial and rewarding;
- The concepts of “market segmentation”, “targeting” and “positioning” are major functions of marketing and market research, and if applied properly, could significantly contribute to the achievement of institutional goals.

Progressively, marketing has become an instrumental managerial function to the survival of a university in an increasing competitive environment, given that it is no longer enough for a higher education institution to be effective, it needs to also have an effective image for parents and other stakeholders (Oplatka, Foskett and Hemsley-Brown, 2002). As Kotler, Kartajaya and Setiawan (2010) show, marketing has witnessed a transition from a product-centric vertical view (Marketing 1.0) to being consumer-centric (Marketing 2.0), and is now entering a new stage of “human-centricity” (Marketing 3.0), trying to reach all stakeholders, by cultivating the values they consider to be important, like public service or sustainability.

The higher education literature promotes marketing as “the body of theory that holds practical tools to help tertiary educational institutions survive and even thrive in competitive environments” (Stachowski, 2011). But to be successful in this endeavor, higher education institutions must first focus their interest on consumers and stakeholders, and their respective needs and wants. As Kotler and Fox (1995: 5-6) so eloquently state, “marketing exists when people decide to satisfy their needs and wants through exchange”. Therefore, the very first step that higher education institutions must undertake is to become customer oriented, and let marketing be the means to ensure the exchanges between the institution and its publics, in response to their corresponding needs and wants (Motekaitienė and Juščius, 2008). The next section discusses the concept of market orientation, its construct and benefits, and also provides universities with the existing ways in which they can measure the degree of market orientation within their institutions.

### **3. Market Orientation – The Construct**

Many managers today recognise that the ability to succeed in the marketplace requires more than just sales techniques (Hemsley-Brown and Oplatka, 2010). By incorporating marketing into the school culture, higher education institutions are looking out for clever ways to adapt to their competitive environment and to overcome the challenges that it may present. The notion of market orientation derives from the marketing concept (Hampton et. al., 2009) and is defined as the implementation of the marketing concept within an organization (Kohli and Jaworski, 1990). It is widely adopted throughout the education literature by many authors, along with the terms “marketing orientation” or “customer orientation” (Siu and Wilson, 1998), to emphasize the shift in the institutions’ focus towards delivering value to their many constituents.

Kohli and Jaworski (1990) show that there has been a transition from the concept of “marketing orientation” to the one of “market orientation”, the latter appearing to be preferable in most writings. Presumably, according to the authors, this has happened based on the fact that the term “market orientation” focuses attention on “markets”, incorporating all the parties involved, including (but not limited to) customers and the forces affecting them, at the same time suggesting that embracing a market orientation is not exclusively a concern of the marketing function, but of the entire organization.

The marketing literature is replete with definitions and perspectives of market orientation (Hemsley-Brown and Oplatka, 2010), the most frequently cited being the ones offered by Narver and Slater (1990) and Kohli and Jaworski (1990). According to the first two authors, “market orientation is the organization culture that most effectively and efficiently creates the necessary behaviors for the creation of superior value for buyers, and, thus, continuous superior performance for the business” (Narver and Slater, 1990: 21). The authors believe that this concept consists of three behavioral components – customer orientation, competitor orientation, and inter-functional coordination, and two decision criteria – long-term focus and profitability. Kohli and Jaworski (1990) adopt an information-processing perspective (Ross, Grace and Shao, 2012), and argue that “market orientation is the organization-wide generation of marketing intelligence pertaining to current and future customer needs, dissemination of the intelligence across departments, and organization-wide responsiveness to it” (Kohli and Jaworski, 1990: 6).

These original attitudes towards market orientation went on to be integrated within the literature, giving shape to two different, but at the same time complementary perspectives of the concept. As shown by Avlonitis and Gounaris (1999), and Flavián and Lozano (2006), market orientation is defined on one hand from a philosophical point of view, as an organization’s “attitude”, and on the other hand, as a specific “behavior” of the organization. The complementary nature of these two perspectives comes from understanding that unless an institution has developed a certain attitude, the strategies intended to maximize its adaptation to the market cannot be designed. Also, the strategies designed to increase the degree of the institution’s adaptation to the market cannot be implemented, unless the preoccupation to do so is appreciated (Avlonitis and Gounaris, 1999: 1006). Therefore, the market orientation of a higher education institution is presented as a convergence of marketing and strategic management thinking (Binsardi and

Ekwulugo, 2003). It is a process that implies the analysis of external influences (competitors), generation of relevant information, coordination of the activity of all departments, but also the construction of a strategic answer to market opportunities, all with the intent of satisfying customers through continuous needs-assessment (Oplatka and Hemsley-Brown, 2007).

In conformity with the principles of marketing, market orientation emphasizes customers' interests, and therefore, aims at directing all the institution's activities towards meeting customers' needs (Voon, 2008; Hemsley-Brown and Oplatka, 2010; Webster, Hammond and Rothwell, 2010), with the purpose of obtaining a competitive advantage, while also measuring the degree to which all this is being accomplished within the institution. However, there is more to market orientation than just customer orientation (Oplatka and Hemsley-Brown, 2007). It is grounded upon other specific components, as reflected in the original definitions of the concept.

Based on the arguments developed by Narver and Slater (1990), Modi and Mishra (2010) examined market orientation in the nonprofit sector and defined the concept as "the coordinated outward focus of an organization on its key stakeholders" (Modi and Mishra, 2010: 553), thus suggesting the need to expand an organization's actions towards other participants in the marketplace. According to the authors, the concept is grounded upon four equally important components, derived from the ones initially suggested by Narver and Slater (1990): beneficiary orientation, donor orientation, peer orientation and inter-functional coordination. Following this idea and focusing on higher education, Rivera-Camino and Molero Ayala (2010) show the need for a distinctive definition of this concept in the education sector, and focus on the employees' perspective. The authors consider market orientation to be "a competitive strategy or an organizational model, which is maintained by the recurring behavior of workers or routines" (Rivera-Camino and Molero Ayala, 2010: 127). Moreover, they expand the range of market orientation to include the following six components: student orientation, worker orientation, competitor orientation, company-donor orientation, environment orientation, and inter-functional coordination. Also considering higher education, Voon (2008) adopts a services perspective and offers a comprehensive definition of market orientation. Labeled "service-driven market orientation", it is defined as "the set of beliefs, behaviors, and cross-functional processes that seriously focuses on continuous and comprehensive understanding, disseminating, as well as satisfying the current and future needs of the target customers for service excellence" (Voon, 2008: 219).

Research on market orientation applied to higher education generally starts with the three components initially described by Narver and Slater (1990) – customer orientation, competition orientation and, respectively, inter-functional coordination. Some of the identified studies consider solely the above-mentioned components (Oplatka and Hemsley-Brown, 2007; Hemsley-Brown and Oplatka, 2010; Ross, Grace and Shao, 2012), while others seek to expand the domain of market orientation, to also include long-term orientation, performance orientation (Voon, 2008) and employee orientation (Siu and Wilson, 2008; Voon, 2008). While there is no general agreement throughout the literature about a single definition of market orientation or its usefulness and reliability (Rivera-Camino and Molero Ayala, 2010; Ross, Grace and Shao, 2012), studies overall admit that adopting a market orientation can offer a number of benefits for a higher education institution, and seek

to determine specific benefits, their antecedents or the existent link between the measured degree of market orientation and the possibility of achieving a competitive advantage.

### **3.1 Benefits of Implementing a Market Orientation**

One of the most important benefits that comes with embracing a market orientation in higher education institutions is actually the one most emphasized by both Narver and Slater (1990) and Kohli, Jaworski and Kumar (1993), and that is increased performance for the institution. Studies by Caruana, Ramaseshan and Ewing (1998a, 1998b) and Hammond, Webster and Harmon (2006) show that a university's performance is indeed impacted by the degree of market orientation implemented within the institution. Their studies also reveal that applying the concept is, to a large extent, contingent on universities' management (Hammond, Webster and Harmon, 2006), but also that a higher degree of market orientation is positively correlated with the institution's ability to obtain non-government funding (Caruana, Ramaseshan and Ewing, 1998a,b).

Webster, Harmon and Rothwell (2010) suggest other significant benefits that could follow the implementation of a market orientation, by focusing the institution's marketing efforts towards students or potential employers. Among these improvement opportunities, they mention a potential increase in the enrollment within the institution, an increase in the retention rate of current students, an increase in future involvement from the alumni or establishing more partnerships with the business community. Concentrating on academics, Flavián and Lozano (2007) further show that market orientation can have a positive impact on teaching and research activities, and also on university extension activities – dissemination of knowledge and culture. A higher degree of market orientation has also been linked to customer-perceived service quality, customer satisfaction and customer loyalty (Voon, 2008).

However, higher education institutions still show relatively low levels of market orientation and low levels of management emphasis on market orientation (Hammond, Webster and Harmon, 2006). Siu and Wilson (1998) argue for the important role that university management plays in creating a marketing organizational culture, and support a greater and more active involvement in implementing a market orientation. Higher education institutions should take advantage and fully embrace market orientation, as they could be presented with significant opportunities to improve their activity and increase their performance.

### **3.2 Measuring Market Orientation in Higher Education Institutions**

In the following, we seek to provide higher education institutions and their management with ways in which they can assess the existent degree of market orientation, as presented throughout the literature. By evaluating their current position, and knowing where they stand, they can take measures to improve specific components, and gain advantages in certain directions.

Research reviewed in this paper measures market orientation using the MKTOR (Narver and Slater, 1990) and MARKOR (Kohli, Jaworski and Kumar, 1993) scales, which are based on the components of market orientation identified by the authors. Correspondingly, MKTOR applies customer orientation, competitor orientation and inter-functional coordination, and MKTOR encloses information generation,

information dissemination and organizational responsiveness. Voon (2008) suggests a service perspective on the concept, and develops the SERVMO scale, to measure market orientation within higher education institutions. He builds his instrument on six components that define market orientation, respectively customer orientation, competitor orientation, inter-functional coordination, performance orientation, long-term orientation and employee orientation. Furthermore, the author strongly emphasizes the importance of considering other dimensions of the concept than just customer orientation, arguing for the important function of competitor and employee orientation within institutions. Ross, Grace and Shao (2012) support the idea that customer orientation does not always appear to be the most significant component of market orientation. Focusing on international recruitment departments, the authors note that their performance is mostly influenced by inter-functional orientation, which could significantly enhance the outcomes, if implemented properly.

#### **4. Discussion and Future Research**

The purpose of this paper was to highlight the importance of market orientation for educational institutions, by reviewing the most relevant literature in the field, and also to make a contribution to the marketing literature in Romania, by bringing forward the concept of market orientation applied to higher education, and pointing out a number of potential future research areas.

While research on market orientation applied to higher education in Romania is still developing, the international studies reviewed thus far show significant opportunities for educational institutions to improve their activity and performance by embracing this concept. Throughout this paper, the authors have shown that great benefits could be obtained by incorporating and implementing a market orientation in the university setting, and therefore argue for a greater attention paid to this concept. Higher education managers must accept that this can indeed turn out to be a time-consuming process (Siu and Wilson, 1998), and be open to dedicate their time and allocate resources in this direction. Identifying their publics' needs is a significant first step for any higher education institution, followed by precise measures and actions that will lead to satisfying the identified needs. Meeting students' expectations, together with a student-centered approach can become part of the institutional mission (Hemsley-Brown and Oplatka, 2010), while communicating the institution's identity, its purpose and priorities to all stakeholders. The final objective should be the implementation of a marketing organizational culture within the institution, through engaged employees, through carefully analyzing environmental trends, and implementing coherent strategies, based on the fundamental principles of marketing. Considering the great impact and potential benefits that a market orientation could offer to higher education institutions, we argue for a better understanding of the concept in this sector. Future studies could focus on establishing the dominant components of market orientation or identifying new dimensions of the concept and their antecedents. We support the authors who looked beyond customer orientation as the major component of market orientation, and agree that in order to be completely market oriented, it is imperative to examine the entire educational marketplace. In this sense, we agree with Akonkwa (2009) who suggests operationalizing the "stakeholder orientation" concept, in place of customer orientation.

Furthermore, given that market orientation is closely linked to institutional performance and strategy, being considered “the heart of modern marketing management and strategy” (Narver and Slater, 1990: 20), we believe it could be useful to analyze the relationships between these concepts, and how they influence one another. Research could focus on what components of market orientation most influence institutional performance or the implementation of strategy, and ultimately develop a model for a better understanding of these relationships.

There are many other topics that could be explored in connection to market orientation, including the internal environment, service quality matters, funding issues, competition etc. Each of these topics could add great value to both higher education theory and practice, and therefore, they should not be disregarded by future studies.

**Acknowledgement:** This work was possible with the financial support of the Sectoral Operational Programme for Human Resources Development 2007-2013, co-financed by the European Social Fund, under the project number POSDRU/107/1.5/S/76841 with the title “Modern Doctoral Studies: Internationalization and Interdisciplinarity”.

**Abstract:** *Many researchers have outlined the specific importance of trust for service provider firms, on one hand, because the intangible nature of services increases the risk and the uncertainty of the buyer's selection process; on the other hand, because trust can represent the basis for the development of long-term, mutually beneficial, relationships between the service provider and the customer. From this perspective, a good understanding of the effect of trust on customer loyalty becomes paramount for designing and implementing effective marketing procedures, and for accurately predicting business results. The trust-loyalty link is, however, difficult to predict and explain, because of the multitude of factors that can influence consumer behaviour. This study attempts to analyse the relation between trust and customer loyalty in different service settings, and to identify the factors that can influence customers' behaviour towards trusted service providers. To answer the formulated research objectives, a combination of secondary and primary sources have been used to collect relevant data. In the first stage of the research process an extensive literature review was realised in order to identify and evaluate the existing theories regarding customer trust and its effect on customer loyalty, especially in the area of services. In the second stage of the research process, the research framework was refined, verified and validated through 5 face-to-face interviews realised with randomly selected people. The interviews lasted between 30 and 45 minutes and took place in the waiting area of one major supermarket, located in Edinburgh, Scotland. These interviews indicated the need to study the relation between trust and customer loyalty in various service settings, as well as helping to define the major elements that influence this relation at individual level. In the third stage of the research process, a total of 412 face-to-face interviews have been realised. These interviews lasted around 15-20 minutes, and the respondents being randomly selected from the waiting areas of five UK supermarkets. The collected data has been analysed with the SPSS software, using the Chi Square and Pearson's two-tailed correlation tests. The results indicate a complex relationship between various categories of factors and the level of customer loyalty, which varies in relation to specific service settings. The findings have been integrated into a synthetic model, developed for four different types of services.*

## **1. Introduction**

The intense competition in most areas of business activity has refocused the attention of researchers and practitioners on the concept of consumer trust. Trust represents a very complex phenomenon, which has been defined and interpreted from many various, and sometimes even contradictory, perspectives (Raimondi, 2000).

Many researchers have outlined the specific importance of trust for service provider firms, on one hand, because the intangible nature of services increases the risk and the uncertainty of the buyer's selection process; on the other hand, because trust can represent the basis for the development of long-term, mutually beneficial, relationships between the service provider and the customer (Mittal and Lassar, 1998; Ranaweera and Prabhu, 2003). From this perspective, a good understanding of the effect of trust on customer loyalty becomes paramount for designing and implementing effective marketing procedures, and for accurately predicting business results. The trust-loyalty link is, however, difficult to predict and explain, because of the multitude of factors that can influence consumer behaviour (Bendapudi and Berry, 1997).

This study attempts to analyse the relation between trust and customer loyalty in different service settings, and to identify the factors that can influence customers' behaviour towards trusted service providers. The research framework has been organised around three main research objectives:

1. To analyse the relation between trust and customer loyalty in various types of service settings (low versus high risk services; continuous versus discrete service situations).
2. To identify the main factors that influence the relation between trust and customer loyalty (service-related, customer-related, interaction-related, and circumstantial factors).
3. To develop a synthetic model of customer loyalty towards trusted service providers in various service settings.

After a critical evaluation of the trust-loyalty related research, the paper presents the research methodology applied to collect, and analyse primary and secondary data. The interpretation of results is made in direct relation to the formulated research objectives, and a synthetic model of trust-loyalty relation is developed on the basis of analytical research findings. The paper concludes with a summary of the main findings and with suggestions for future research.

## **2. A review of trust-related research**

Both trust and loyalty represent the focus of extensive research and analysis in the academic and professional environments.

Trust represents a research topic that was studied by psychology, sociology, economy and management sciences (Castaldo, 2003; Raimondi, 2000). In marketing, the concept of trust is strongly connected with the theories of customer relationship management (Grönroos, 1996), the main research being focused on the determinants of trust formation and on the various aspects/levels of company-customer trust (Auh, 2005; Garbarino and Johnson, 1999; Morgan and Hunt, 1994; Sirdeshmukh et al., 2002).

For the purpose of this research project, the mechanism of trust formation and the determinants of trust were not considered as research objectives. Instead, the

investigation has focused on the behaviour of customers in relation to already trusted service providers, which were defined as service firms that simultaneously fulfil three conditions:

- customer trust is based on direct experience (the customer has previously bought, or is presently buying, services from this firm);
- customer trust is based on satisfaction and perceived reliability;
- the customer has a clear intention to continue the relation with the firm in the future, through exclusive or occasional service acquisitions.

These three inter-related elements have been identified by most researchers as determinants and effects that can effectively describe a company-customer trust situation.

The relation between customer trust and loyalty has been analysed in many academic and professional studies (Gremler and Brown, 1996; Ranaweera and Prabhu, 2003; Sirdeshmukh et al., 2002). The benefits of customer loyalty are significant for business organisations: the loyal customers cost less and are less sensitive to price than opportunistic clients, providing a stable source of income for the firm and increasing the business profitability (Hallowell, 1996; Mittal and Lassar, 1998; Rust and Zahorik, 1993). In some cases, the concept of commitment was used to describe the loyal customer behaviour, understood as the intention to continue an existing relationship with the salesperson and the company (Crosby et al., 1990; Garbarino and Johnson, 1999; Hess and Story, 2005). The researchers have outlined the complex relationship between satisfaction, trust, commitment and loyalty. In general, it is argued (Dick and Basu, 1994; Liang and Wang, 2004; Sirdeshmukh et al., 2002) that consumer behaviour is influenced by a mix of positive (e.g. quality, satisfaction, trust, reliability) and negative elements (e.g. inertia, circumstantial promotions, limited information, monopolistic market conditions). On the other hand, satisfaction and trust do not automatically ensure customer commitment and loyalty (O'Malley, 1988).

In order to investigate the relation between customer trust and loyalty, the present study has attempted to identify the service-related, customer-related, interaction-related and circumstantial factors that can significantly influence the customer loyalty towards trusted service providers.

## **2.1. Service-related factors**

Some authors have outlined the differences between service settings, emphasising the need to study separately the loyalty in process-dominant services, such as phone banking, and in outcome dominant services, such as a restaurant dining service (Lu and Tang, 2001). Other researchers have adopted the distinction between continuous service settings – e.g. telephone line connection, and discrete service transactions (Ranaweera and Prabhu, 2003). In the present study, the distinction between continuous and discrete, on one hand, and the difference between low risk and high risk services, on the other hand, is considered essential to understand the effect of trust on customer loyalty in various service settings. The perceived risk of the service is directly related with the classical definition of trust, which considers trust as the willingness to assume the risk of an opportunistic behaviour from the other party in a relationship (Mayer et al., 1995, Raimondi, 2000).

This study will consider the relation between customer trust and loyalty in four different service settings, characterised by the cross-tabulation between the type of service, and the level of perceived risk.

## **2.2. Customer-related factors**

Some studies have questioned the existence of loyal customer behaviour. The postmodernist society based on perpetual change and forced obsolescence encourage customer to seek for novel products, or for improvements of existing offers (Rowley and Dawes, 2000). From this perspective, it is important to verify the effect of novelty seeking behaviour on the level of customer loyalty towards trusted service providers. Therefore, the following research hypothesis has been formulated:  
*H1: The customer's propensity towards novelty seeking is significantly influencing the level of customer loyalty towards trusted service providers.*

The novelty seeking behaviour must be, however, moderated by the customer's propensity to assume risk. A risk adverse person will probably use only trusted service providers, trying to fulfil his/her novelty needs by modulating the existing relationship or by exploring alternative offers of the same service firm. To verify this assumption, the following research hypothesis has been formulated:

*H2: The customer's propensity towards risk is significantly influencing the level of customer loyalty towards trusted service providers.*

Some authors have argued that loyal behaviour can exist only when choice is freely available on the market, since in conditions of monopoly the relationship with the single supplier is the only alternative for customers (Sharma and Patterson, 2000). In the present study, all the service settings investigated are characterised by a competitive environment, with multiple service providers. However, it can be assumed that, even in a free competitive market, loyalty can be strongly limited when the level of market knowledge of the customer is very low or superficial. In this situation, the customer is sufficiently satisfied with the present service provider and does not try to search, collect and process information about the alternative offers existent on the market. Considering this possibility, the following research hypothesis has been formulated:

*H3: The level of customer's market knowledge will significantly influence the level of customer loyalty towards trusted service providers.*

## **2.3. Interaction-related factors**

The role of the switching barriers or costs implemented by service companies was also considered as an important factor in determining the customer's level of loyalty (Hellier et al., 2003; Ranawena and Prabhu, 2003; Zeithaml, 1981). To this factor, the present study adds the specific benefits that are introduced by service providers to reward loyal customer behaviour. Considering these two elements, the following research hypotheses can be formulated:

*H4: The switching barriers introduced by service providers are significantly influencing the level of customer loyalty towards trusted service providers.*

*H5: The specific benefits introduced by service providers are significantly influencing the level of customer loyalty towards trusted service providers.*

Several researchers have made a distinction between the hard and the soft attributes of services (Auh, 2005). The hard element is represented by the functional/technical processes that compose the service, which are often standardised in the basic

service offer. The soft side includes the interpersonal relation between the service provider and the customer, which is often adapted to the profile of every customer in function of his/her needs and style of interaction. Many researchers (Foster and Cadogan, 2000; Guenzi and Pelloni, 2004; Mittal and Lassar, 1996) have identified the level of interpersonal contact between the customer and the service provider as an essential element in judging the quality level of a service, and Gwinner et al. (1998) discovered that social benefits have a direct positive effect on customer loyalty. In the context of our research it is relevant to verify what is the influence of the interpersonal relationship on the customer loyalty towards trusted service providers, using the following research hypothesis:

*H6: The level of interpersonal relationship between the service provider and the customer is significantly influencing the level of customer loyalty towards trusted service providers.*

#### **2.4. Circumstantial factors**

In their study of disloyal customers, Rowley and Dawes (2000) have identified the possibility of temporary disloyalty determined by circumstantial factors. In relation with a service provider, some of the most frequent circumstantial situations that can induce disloyal customer behaviour are the temporary unavailability of the trusted service provider, an attractive promotion launched by competitor firms, or the reduced accessibility of the trusted service provider. Considering these factors, three research hypotheses have been formulated:

*H7: The temporary unavailability of the trusted service provider is significantly influencing the level of customer loyalty.*

*H8: The attractiveness of promotions launched by competitor firms is significantly influencing the level of customer loyalty towards trusted service providers.*

*H9: The temporary inaccessibility of the trusted service provider is significantly influencing the level of customer loyalty.*

### **3. Research methodology**

In order to answer the formulated research objectives, a combination of secondary and primary sources have been used to collect relevant data. In the first stage of the research process an extensive literature review was realised in order to identify and evaluate the existing theories regarding customer trust and its effect on customer loyalty, especially in the area of services. The literature review has provided relevant information which permitted the further development of the research framework and the formulation of more specific research hypotheses.

**Table 1: Examples of various service settings provided by respondents**

Level of risk / Continuity	Discrete Service	Continuous service
Low risk service	Restaurant, grocery retailer services, newspaper sales	Fixed or mobile phone connection, cable television
High risk service	House repair services, car repair services	Bank services, insurance services

In the second stage of the research process, the research framework was refined, verified and validated through 5 face-to-face interviews realised with randomly selected people. The interviews lasted between 30 and 45 minutes and took place in the waiting area of one major supermarket, located in Edinburgh, Scotland. These interviews indicated the need to study the relation between trust and customer loyalty in various service settings, as well as helping to define the major elements that influence this relation at individual level.

Finally, in the third stage of the research process, a total of 412 face-to-face interviews have been realised. These interviews lasted around 15-20 minutes, and the respondents being randomly selected from the waiting areas of UK supermarkets (3 supermarkets located in Edinburgh and 2 located in London). From the 412 respondents 214 have been interviewed in Edinburgh and 198 in London.

The respondents have been firstly asked to name trusted providers from continuous and discrete service settings, and then to evaluate the perceived level of risk they associated with each particular type of service. The respondents were then required to consider in more detail a highly trusted service provider from four different service categories: high or low risk continuous services, and high or low risk discrete services, and to evaluate their loyalty toward these firms, based on their existing behaviour and the intensity of future re-purchase intention. Table 1 presents the most frequent services selected by respondents in order to represent a specific service setting. Finally, the respondents were asked to evaluate various relation-based and circumstantial factors, and to answer a series of questions on their personal characteristics, that could influence their behaviour towards trusted service providers. Since the interaction-related factors, the circumstantial factors and the market knowledge of respondents have specific effects for each type of service, data has been collected for each of the four type of investigated service settings.

The collected data has been analysed with the SPSS software, using the Chi Square and Pearson's two-tailed correlation tests to verify the influence of various factors on the customers' loyalty towards trusted service providers.

## **4. Presentation and analysis of data**

### **4.1. The effect of trust on customer loyalty**

The analysis of the collected data has indicated four different level of customer loyalty towards trusted service providers:

- a. exclusive loyalty: the customer buys services exclusively from the most trusted service provider;
- b. high loyalty: the customer buys frequently from the most trusted service provider, but there are occasional instances when the customer acquires services from competitors. Often this solution is applied when circumstantial problems reduce the availability of, or the access to, the trusted service provider;
- c. medium loyalty: the customer buys from the trusted service provider and from an equally trusted competitor. This situation can be defined as shared loyalty, which is based on the shared trust in a small number of service providers, a behaviour already identified by O'Malley (1988);
- d. low loyalty: the customer buys from a multitude of relatively similar service providers, adopting the model of a 'fragmented loyalty'.

**Table 2: The level of customers' loyalty in various service settings**

Service setting / Level of loyalty	Exclusive	High	Medium	Low	Total
Continuous / N	305	0	82	25	412
Low risk %	74	0	19.9	6.1	100
Continuous / N	315	0	89	8	412
High risk %	76.5	0	21.6	1.9	100
Discrete / N	155	106	85	66	412
Low risk %	37.6	25.7	20.6	16	100
Discrete / N	252	22	122	16	412
High risk %	61.2	5.3	29.6	3.9	100

The data presented in Table 2 demonstrates that the level of customer loyalty is very different depending on a specific service setting. The exclusive loyalty is used predominantly in high risk service settings (continuous and discrete) as well as for low risk / continuous services. However, for the situation of low risk / discrete services, a large percentage of respondents have also indicated a preference towards occasional disloyalty (25.7%), shared loyalty (20.6%) and fragmented loyalty (16%). It is interesting to note that in continuous service settings the occasional disloyalty is not practiced by any respondent. The interviewees have indicated as reasons for this behaviour the high switching costs and the very low benefits offered by a temporary disloyalty, combined with the risk of using an unknown service provider. On the other hand there is relatively large group of respondents who use shared loyalty in continuous service settings (19.9% for low risk and 21.6% for high risk services). The respondents have indicated that this method helps them to take advantage of complementary advantages/benefits offered by two competing service providers which they trust, and to reduce the risk of unpredictable market evolution.

#### 4.2. The factors influencing the trust-loyalty relation

In order to investigate the influence of the three main categories of factors defined in the research framework (customer-related, interaction-related, and circumstantial factors), the Pearson two-tailed correlation test was applied to the analysed variables. The data presented in Table 3 indicate a very complex interdependence between loyalty and the investigated factors, which varies according to specific service settings.

In a setting characterised by low risk and continuous service (e.g. mobile phone connection), the level of loyalty has a strong negative connection with the personal levels of novelty seeing and of risk acceptance, but is positively influenced by the market knowledge of customers – which helps them to evaluate the competing service providers and to reinforce their trust in a specific service firm. The development of a personal relation between the service provider and the customer represents a significant disincentive to switch suppliers. It is interesting to note that the switching costs and the special benefits implemented by the service provider have a very limited influence on loyalty, as it is also the case with circumstantial factors.

**Table 3: The Pearson (sig. two-tailed) correlation between the level of customer loyalty and various types of factors**

	Level of loyalty Continuous / Low risk	Level of loyalty Continuous / High risk	Level of loyalty Discrete / Low risk	Level of loyalty Discrete / High risk
Novelty seeking	-.244** .000	-.094 .057	-.189** .000	-.104* .034
Risk acceptance	-.134** .006	-.123* .013	-.097* .048	-.110* .026
Market knowledge	.158** .001	-.105* .034	-.112* .023	-.203** .000
Personal relation	.166** .001	.296** .000	.269** .000	.209** .000
Switching costs	.094 .055	.277** .000	.016 .743	.104* .036
Special benefits	.031 .527	.172** .000	.214** .000	.113* .021
Availability	-.015 .759	-.045 .367	-.164** .001	-.148** .003
Competitor promotions	-.002 .969	-.007 .880	-.179** .000	-.005 .918
Accessibility	-.018 .714	-.054 .276	-.135** .006	-.118* .017

Note: \* Correlation is significant at 0.05 level

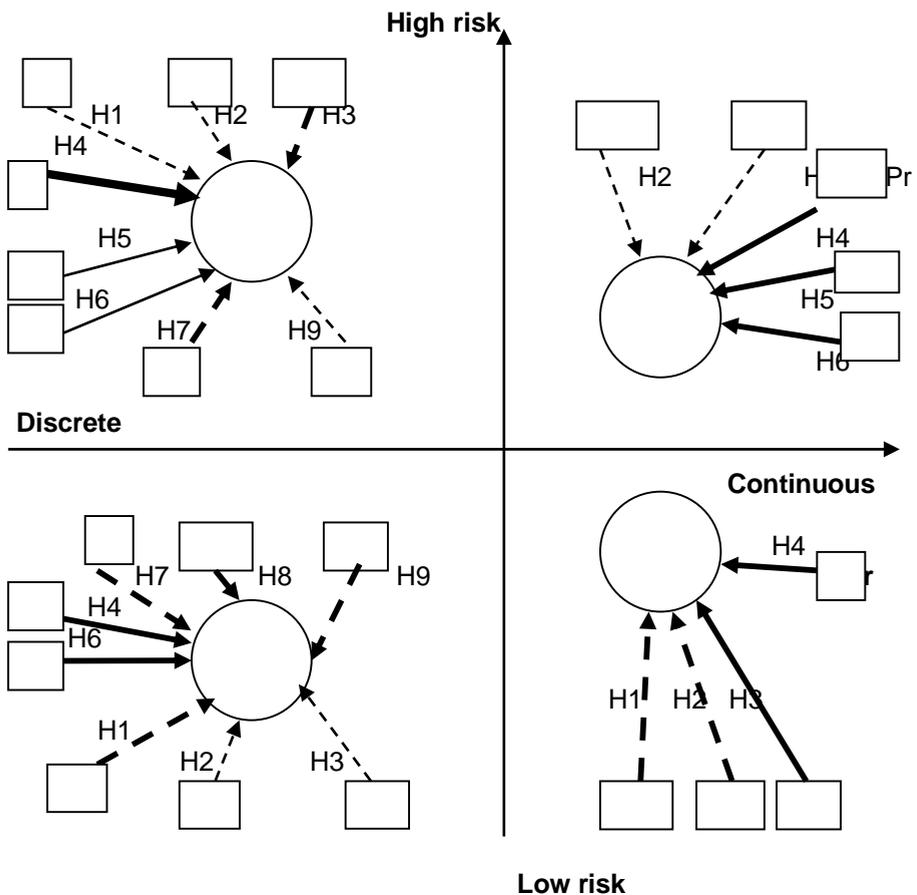

\*\* Correlation is significant at 0.01 level

For continuous services characterised by a high perceived risk, a high level of risk acceptance and of market knowledge can induce a disloyal behaviour. However, in this case the interaction-related factors can be effectively used by the service provider to discourage disloyal behaviour. As in the previous case, the circumstantial factors seem to have a very limited influence on the level of customer loyalty. The situation of discrete services provides the most complex range of influences. For discrete low risk services (e.g. restaurant launch), a high level of novelty seeing, risk acceptance and market knowledge will negatively influence customer loyalty towards trusted service providers. Paradoxically, many respondents have indicated that a trusted service provider can represent an incentive to explore other options, since the customer has always the possibility to return to the trusted firm. The development of personal relations and the application of special benefits can, however, strongly discourage a disloyal behaviour. The circumstantial factors have a strong negative relationship with the level of loyalty, which is explained by the highly competitive structure and the fragmented nature of this type of service setting. For discrete services characterised by a high level of perceived risk (e.g. house repair services), the market knowledge of customers can influence their level of loyalty – if the customer knows the name and the address of competing service providers, there is a higher possibility of disloyal behaviour. The customer's level of risk acceptance and novelty seeking present a significant negative correlation with the level of loyalty, although the link is weaker than for the level of market knowledge. The interaction-

related factors present a significant positive correlation with the evolution of customer loyalty, among them, the development of an interpersonal relation represent the strongest disincentive for disloyal behaviour. The temporary unavailability of the trusted service provider is strongly influencing the level of customer loyalty. It s interesting to note that the attractiveness of competitors' promotion does not induce a significant effect on customer loyalty, while the problems of access to the trusted service provider are negatively correlated with the level of customer loyalty.

### 5. Conclusion: A synthetic model of trust-loyalty relation

This study has investigated the influence of various categories of factors on the customer loyalty towards trusted services providers in four different service settings.

**Figure 1: A synthetic representation of the correlation between influencing factors and the level of customer loyalty in various service settings**

**Legend:**

Ns - novelty seeking

- Ra - risk acceptance
- Mk - market knowledge
- Pr - personal relation
- Sc - switching costs
- Sb - special benefits
- Av - availability
- Cp - competitor promotion
- Ac - accessibility
- Positive strong correlation 
- Positive weak correlation 
- Negative strong correlation 
- Negative weak influence 

The results of the data analysis indicate that customer loyalty is not a stable, easily predictable phenomenon, even for the firms that are trusted by their customers. The study has identified four different models of loyalty, which are adopted by consumers depending on the characteristics of the service setting: exclusive, frequent, shared and fragmented loyalty. The disloyal behaviour can be triggered by a desire for new experiences, by the knowledge of alternative service providers, or by circumstantial situations such as attractive competitors' promotions, or problems of availability of, or access to, the trusted service providers.

Nine research hypotheses have been formulated in this study, however, each of them had to be applied and tested in four different contexts of service settings. Considering the correlations identified between various categories of factors and the level of customer loyalty, a synthetic model can be developed to represent these multiple influences (see Figure 1).

The results of this study can be used by both academic researchers and professionals. Based on the research framework developed in this paper, other researchers can initiate similar projects in order to verify the validity of results in various cultural and service settings. The managers of service firms can also use the results presented in order to manipulate the level of customer loyalty, considering the specific characteristics of their service offer.

The study has a number of limitations related with its exploratory perspective. The number of influencing factors is limited, and future studies may identify additional factors with significant importance for the level of customer loyalty. On the other hand, no attempt has been made to identify the profile of various groups of customers that react to specific influencing factors. Further research is necessary to develop and refine this dimension, in order to provide the practitioners with a powerful tool in identifying and targeting specific groups of customers.

**Abstract:** *The purpose of this paper is to develop a theoretical basis for evaluating ambient advertising in relation to the schema. Ambient advertising, a creative form of out-of-home advertising that conveys direct and contextual messages by using and often altering existing elements of the environment in a way that surprises the target audience, appears to be a solution to the increasing clutter from the media. This study draws on the schema congruity theory to offer a better understanding of how consumers are processing information received from advertisements. Schemas are organized structures of knowledge and expectations that consumers develop in order to categorize the incoming information, and that they access every time they are experiencing a new situation. The schema-based approach is important in understanding consumer behavior because consumers are facing an environment filled with similar brands and products promoted by ads that sound and look alike. According to schema congruity theory information perceived as schema congruent offers a comfortable feeling of familiarity and generates limited cognitive processing, whereas schema incongruent information generates surprise and triggers extensive cognitive processing in order to help individual make sense of the unusual situation. Taking into consideration the combination of the different levels of expectancy and relevancy there have been identified three congruency situations: extreme congruity, moderate incongruity and extreme incongruity. Existing research shows that moderate incongruent information offers the best results in recall and recognition and also the highest affect levels compared to extreme congruity and extreme incongruity. Based on evidence from literature this study attempts to position ambient advertising in the moderate incongruity category, thus theoretically proving the assumed effectiveness of this promotional tool. Therefore, this paper is a starting point in bringing the light in the under-researched field of ambient advertising and can offer a theoretical basis for future empirical research on the effectiveness of this promotional tool.*

**Keywords:** advertising; ambient advertising; schema; schema congruity theory; clutter; consumer behavior

## **1. Introduction**

Evidence from empirical research indicates a gradual decline of consumer attitudes towards advertising within the past decades (Zanot, 1984). Amongst the causes of the decline are the rising clutter and the intrusion of advertising messages (Zanot, 1984) and in the same time the increasing familiarity of individuals with current advertising efforts. Clutter is the amount of advertising in a medium (Elliott and Speck, 1998) and results from the ever-increasing number of commercial messages consumers are exposed to. Existing data show that advertisements sometimes occupy more than 50 percent of the contents of a certain medium (Belch and Belch 2003), thus raising the clutter at unprecedented levels. In addition, Elliott and Speck (1998) found that the higher the medium familiarity the lower the ad recall is, as consumers tend to ignore and avoid advertisements in the media they are most familiar with.

The increasing clutter has also affected consumers' information processing and learning behaviors. Individuals are becoming savvier as their understanding of marketers' persuasion techniques is improving every day. As a way to cope with the increasing clutter, consumers have developed schemas that act as protective shields (Dahlén and Edenius, 2007) against the massive amounts of promotional messages. The advertising schemas help individuals identify advertising and trigger an instinctive response of avoidance that is materialized in zapping, flipping the page or simply ignoring the ad.

In this context, ambient advertising has appeared and developed into a major form of promotional communication that seems to be able to overcome the problems faced by traditional advertising. Ambient ads use unconventional media and creative tactics to deliver the promotional message and to grab the attention of the target audience. Its placement in areas where consumers spend most of their time and where they don't expect to encounter promotional messages contributes to the effectiveness of ambient (Hutter and Hoffmann 2011), making it one of the most promising advertising techniques for the future.

The research at hand attempts to position ambient advertising on the schema congruity scale based on the evidence from existing research in both marketing and cognitive psychology areas. This positioning can offer a better understanding of the cognitive mechanisms triggered by this promotional technique and what are the drivers of ambient advertising effectiveness. Moreover, a better theoretical understanding of how ambient advertising works at a cognitive level can offer marketing scholars new opportunities for empirical research that could bring some new light in the under-researched field of unconventional advertising.

## **2. Schema theory**

The schema theory developed in social psychology assumes that cognitive processing is influenced by existing knowledge and it is used to explain how individuals process information by categorizing and evaluating it based on previous experience. Bartlett (1932), one of the pioneers in schema theory research, revealed that individuals organize the accumulated knowledge in so-called schemas, from where the information can be accessed by a word, an image, a symbol or an other cue (Warlaumont, 1997). Schemata are enduring understandings of a specific phenomenon that cannot be easily changed once they are established. When facing a new experience an individual's brain attempts to access the corresponding schema

in order to process the situation more rapidly (Beals, 1998).

Advertising is a form of incoming information that consumers must process. Research has shown that advertising effectiveness is dependent on the extent to which consumers process the information embedded in the commercial message. There is evidence supporting the assumption that individuals have developed an advertising schema (Friestad and Wright, 1994; Friestad and Wright, 1995; Dahlén and Edenius, 2007; Warlaumont, 1997), and therefore their processing behavior can be evaluated based on the schema theory. Existing empirical research indicates that advertising schemata negatively impact consumers' attention (Donthu, Cherijan, and Bhargava, 1993) and attitudes (Stafford and Stafford, 2002) towards advertisements increasing their suspicion against the commercial messages.

Schemas provide general expectations that influence processing of specific situations (Fiske and Taylor, 1984) According to schema theory, individuals access the information stored in the existing schemas every time they encounter a similar instance. As that information has already been processed people don't need to reevaluate the information. Therefore, the schema based processing is faster and easier.

With the aid of existing advertising schemas consumers can identify and interpret advertisements quickly as persuasive messages, their response being shaped by their previous knowledge and experiences in relation to the commercial attempts. Practically, advertising schemas can shape individuals' future response to advertising (Friestad and Wright, 1994), once identified as advertising (Dahlén and Edenius, 2007). According to Brown (2004), consumers ignore advertisements once the schema is activated. Furthermore, Speck and Elliott (1997) discuss avoidance as a common response to advertising, as consumers attempt to reduce their exposure to commercial messages by flipping, zapping, eliminating or ignoring ads.

## **2.1. Schema congruity theory**

Congruity theory attempts to examine the effects of confirmation and disconfirmation of expectations on individual response. The individual response is evaluated on both the information processing behavior and the evaluation behavior. The congruity theory pushes the schema theory even further, by investigating the impact of information based on its consistence or inconsistency with existing schemata. Thus, new experiences can correspond with existing schemas to a larger or smaller extent. If the new experience matches a schema it is congruent, whereas if it doesn't fit any existing schema is incongruent.

According to Mandler (1982) a situation congruent with existing schema generates familiarity and comfort and does not involve any cognitive effort. On the other hand, if a given situation does not match any schema, it stimulates the cognitive efforts to solve the perceived incongruity between the received information and existing schemata. The incongruent information is evaluated piecemeal (attribute by attribute) thus involving more time and effort (Sujan, 1985). The extent of incongruity influences an individual's overall feelings about that particular experience. Thus, if the incongruity is too important, the situation can be perceived negatively, as it can be irritating or even frustrating if the incongruity cannot be addressed. If the incongruity however is moderate, it may result in positive feelings affect, as the individual is able to interpret the new information successfully (Mandler 1982). This opinion is also supported by empirical research (Meyers-Levy and Tybout,, 1989;

Stayman et al, 1992) which shows that moderate schema incongruity produced more favorable evaluations than congruity or extreme incongruity.

The importance of advertising schemas is in close connection to the schema congruity theory. Similar to other areas of psychology where research has shown that schema-congruity influences processing and evaluation (Fiske 1982; Srull et al. 1985), the schema-congruity of advertising has a major role in the processing and evaluation of advertising messages. Consequently, it can influence the success or failure of an ad (Heckler and Childers 1992; Goodstein 1993).

## **2.2. Measuring schema congruity**

Heckler and Childers (1992) developed a bi-dimensional framework based on expectancy and relevancy that contributes to conceptualizing the schema incongruity in advertising. In this context, expectancy is the extent to which an ad is conform to consumer expectations about such advertising, whereas relevancy refers to the degree to which the incongruent elements from an ad provide meaningful information about the brand or the product, easing consumer cognitive process to identify the primary message of the ad (Joost and Verlegh, 2002).

In the same study, Heckler and Childers (1992) developed three categories of advertisements based on a combination of different levels of relevancy and expectancy: expected – relevant, unexpected – relevant, unexpected – irrelevant. Congruent ads include expected and relevant information that match the schema, extreme incongruent ads present unexpected and irrelevant information that do not fit any existing schema, whereas moderately incongruent ads include unexpected but relevant information, depicting novel ideas that challenge the existing schema but that could still be reconciled with it (Heckler and Childers, 1992; Mandler, 1982). The different perceptions of schema incongruity lead to the assumption that an optimal level of incongruity may be established. Yoon (2012) associated schema congruity theory with the theory of optimal stimulation level (Berlyne 1960). According to his findings, the external level of stimulation may determine an individual to seek for an increase if the level is too low or a reduction if the external stimulation is too high. Evidently, stimulation is perceived optimal if it is neither too low nor too high (Steenkamp and Baumgartner 1992). In addition, Raju (1980) assumed that optimal stimulation levels are different for every person. Thus, the final evaluation of an experience depends not only on the stimulation level, but also on how the individual interprets it in relation to his/her existing schemata. Therefore even if stimulation level is optimal, the final outcome may be a negative evaluation or a positive one depending on whether the interpretation failed or the individual did not considered it satisfactory or if it was successful (Yoon, 2012).

## **3. Ambient advertising**

Ambient advertising has become one of the most important forms of unconventional out-of-home advertising. Moreover, existing data shows that it is still expanding at fast pace, taking into consideration the important increase in its registered expenditure (Wehleit, 2003; PQ Media, 2007; PML Group, 2011). This form of promotion has become very popular lately among practitioners, because of its attention grabbing and its ability to stand out from the cluttered advertising environment..

The term “ambient” derives from ambience, which means surrounding. The first use of the concept in relation to advertising dates from the mid 1990’s and it belongs to Concord advertising, an outdoor specialized agency from London, who used it to define the “a bit different” advertising requested by agency’s clients (Luxton and Drummond 2000). Today, ambient advertising refers to a creative form of out-of-home advertising that conveys direct and contextual messages by using and often altering existing elements of the environment in a way that surprises the target audience (Jurca 2012).

Whether ambient advertising can be a viable alternative to traditional advertising it is still open to debate. However, until now the general opinion amongst marketing academicians is that ambient ads are more efficient when implemented as part of an integrated marketing communication campaign together with traditional advertising, rather than as a standalone strategy (Shankar and Horton, 1999, Luxton and Drummond, 2000, Reyburn, 2010, Lee Yuen, 2011). Consequently, the chances that ambient advertising might replace traditional ads are low, however it can enhance the results of the latter.

#### **4. Schema incongruity as a trigger of ambient advertising effectiveness**

The bi-dimensional framework of advertising incongruity developed by Heckler and Childers (1992) identified expectancy and relevancy as the two major factors in establishing the level of incongruity with existing schemas. Within this framework three situations were identified based on the different levels of expectancy and relevancy that an ad can display, expected – relevant, unexpected – relevant, unexpected – irrelevant. As mentioned above, the three possible combinations result in three different levels of congruity between the ad and the existing schemas: congruence, moderate incongruence and extreme incongruence. In what follows the paper will attempt to place ambient advertising in one of the three categories, in order to better assess its effectiveness.

As several authors agree upon, ambient advertising uses the unconventional placement (Luxton and Drummond, 2000; Shankar and Horton, 1999) and the non-traditional media (Pavel and Catoi, 2009; Lee Yuen, 2011) as drivers of surprise for consumers, in order to attract their attention and direct it to the advertising message. Surprise is the result of the divergence between perceptions and expectations (Hutter and Hoffmann, 2011). Thus, by confronting them with visual elements that normally cannot be found in that particular environment (Barnes, 1999) ambient ads challenge individuals’ expectations stored in the existing schemata, and the perceived incongruence generates surprise (Alden, Mukherjee and Hoyer, 2000). In the mind of the consumers, the new experience will neither correspond with schemata that fit an individual’s physical surroundings (e.g., a park or a bus station) nor with the advertising schemas that expect traditional advertising (e.g., on TV, in newspapers, on billboards). According to Waddill and McDaniel (1998), unusual stimuli are processed longer than commonplace stimuli, which can further positively influence the memory. This opinion is also supported by Mandler’s (1982) congruence theory according to which a schema incongruent situation will generate deeper and longer cognitive processing as the individual attempts to make sense of the incongruity.

For ambient advertising, the phrase “medium is the message” coined by Marshall McLuhan in the 1960s (cit. in Dahlén, 2005) is fundamental. As the meaning of the

term “ambient” suggests and in line with the previously mentioned definitions of concept, this promotional technique uses existing elements from the surrounding environment, that are often altered in order to be integrated into the message delivery (Jurca 2012). Reyburn (2010) believes that an ambient campaign must start from the environment, thus making the location one of the most important elements of ambient advertising. In order to be efficient, the ad must fit both the environment and the context in which the consumer encounters it and in the same time the brand must be relevant for the environment (Ryan-Segger, 2007, Reyburn, 2010). Vice versa, also the medium carrying the message and the whole environmental context become relevant for the brand, suggesting a mandatory interaction between the ad message, the brand and the environment. Existing empirical research also suggest an increase in the effectiveness of the advertisement when a match between the brand, the ad and the media context exist (Dahlén, 2005; Dahlén, Friberg and Nilsson, 2009). Following Mandler’s (1982) idea, although the initial surprise generated by the unexpectedness of the ad may startle the audience, after a deeper cognitive processing the audience can reconcile the incongruence of the situation with the existing schemata due to the relevancy of the ad for the promoted brand or product.

Furthermore, another aspect that needs to be taken into consideration is creativity. The concept described by Leo Burnet (1968) as “the art of establishing new and meaningful relationships between previously unrelated things in a manner that is relevant, believable, and in good taste, but which somehow presents the product in a fresh new light” is an important characteristic of ambient advertising. According to Baack, Wilson and Till (2008, p. 86) creative ads are “highly unique and highly relevant”. Sheinin, Varki and Ashley (2011) identified two dimensions of advertising creativity that seem to be accepted throughout the academic literature: the novelty of the execution (or divergence) which refers to how different an execution is from consumers’ expectation, and the relevance (or usefulness) of the message, referring to extent to which an ad contributes to consumers’ understanding of the advertised brand or product. These two dimensions of creativity can be connected with the two dimensions of schema congruency from Heckler and Childers’s model (1992), which the novelty of the execution representing the unexpectedness and the relevance of the message referring to the relevance of the ad. Therefore creativity can create a moderate level of schema incongruity that challenges consumers’ expectations and in the same time as it positively influences the effectiveness of the ad.

By analyzing the above evidence, a conclusion can be drawn in what regards the expectancy and relevancy levels of ambient advertising. Thus it is obvious that one of the basic characteristics of this promotional technique is the unexpected character revealed through both the unusual medium choice and the unusual execution (Luxton and Drummond, 2000) aimed to surprise the audience and grab their attention. Furthermore, although unexpected an ambient ad is relevant for the promoted brand or product as it integrates the medium and the whole context in the delivery of the promotional message. Comparing this evidence with Heckler and Childers’s model (1992) it can be inferred that ambient advertising would fit the unexpected-relevant category thus generating a moderate incongruity with consumers’ existing advertising schemata. Furthermore, by including ambient advertising in the moderate incongruity category of ads it can be a conclusion can be drawn about the effectiveness of this promotional technique. As previous

research showed that ads with moderate congruity seem to be the most effective in what regards both affect and memory these results could be extrapolated to the ambient advertising category also. This categorization offers however an important basis for future research aiming to prove empirically the theoretical conclusion drawn in this paper on ambient ads effectiveness.

## **5. Conclusion**

With the economic recession taking its toll on companies' businesses, the marketing budgets have been cut drastically in order to reduce costs. Marketers are being held responsible for every dime spent and the focus is on the return of investment. This context favors the development of ambient advertising, as its costs are lower than the costs of traditional media and its returns in respect to expenditure seem to be better (Reyburn 2010), delivering extremely targeted campaigns with minimal wastage (PML Group 2011).

Unlike traditional advertising, ambient ads don't use persuasive messages trying to convince the audience to buy, but rather they address to individual's subconscious challenging the existing schemas and creating memorable images of the promoted brands. The creativity and unexpectedness of the ambient execution creates surprise and gets the attention of the viewers, engaging their mind and activating their cognitive processes that help them understand the unusual situation they are facing, and consequently creating an increased awareness of the brand and the ad. However, the scarce empirical research to date that proves the effectiveness of ambient advertising may not be enough to convince advertisers to change their promotional tactics. This paper offers a theoretical basis for advertising researchers to better understand the impact of ambient advertising and how it influences consumers' attitudes in the buying process. However, there is an obvious need for a more in depth empirical research on how ambient advertising works and what cognitive processes triggers in audiences' brain.

Ambient advertising is a versatile promotional technique that deserves more attention as it can be used by both small and large companies (Gambetti, 2010). While large companies use ambient to build brand image, grab attention and differentiate their brand in the hypercompetitive markets small companies take advantage of the low costs of this promotional tool using it as a mean to create awareness within their target audiences (Gambetti, 2010). Moreover, ambient has also been increasingly used in campaigns that attempt to create awareness and change behaviors in respect to social issues regarding environment protection, health issues (such as AIDS), dangerous behaviors (such as drunk driving), world poverty, and so on. This makes ambient a versatile promotional tool that can help any organization reach their communication purposes.

A better understanding of ambient advertising will also benefit advertising agencies, which can focus on improving the characteristics of advertisements that generate positive response from audiences, thus offering quality, rather than concentrating on quantity. For example, depending on the brand and brand's target consumers, advertisers can create ads that are addressed to specific publics (with a higher or lower level of advertising literacy). Furthermore, a lower number of ads with a higher quality can also contribute to reducing the generally perceived advertising clutter that is one of the major factors reducing the effectiveness of promotional messages.

Even though the general opinion is that ambient advertising will not replace

traditional advertising (Krautsack and Aust, 2006), its use in a multi-media campaign can contribute to the success of the promotional attempt, as results of empirical research show (Wehleit, 2003). According to Krautsack and Aust (2006: 7) the “integration of ambient media in marketing plans will be a natural consequence of the development of the last 10 years”. There will be a constant evolution of the forms of ambient that will go along with the changes of consumers’ habits and marketers’ needs, but as long as the “key principles of creation, design and implementation are followed” (Krautsack and Aust 2006: 7) this advertising method will offer a way out of the clutter and into the mind of the consumers.

# METHODOLOGICAL CONSIDERATIONS REGARDING THE SEGMENTATION OF HOUSEHOLD ENERGY CONSUMERS

**Maxim Alexandru**

*The Doctoral School of Economics and Business Administration, "Alexandru Ioan Cuza" University, Iași, Romania  
alexandrumaxim@outlook.com*

**Abstract:** *Over the last decade, the World has shown increased concern for climate change and energy security. The emergence of these issues has pushed many nations to pursue the development of clean domestic electricity production via renewable energy (RE) technologies. However, RE also comes with a higher production and investment cost, compared to most conventional fossil fuel based technologies. In order to analyse exactly how Romanian electricity consumers feel about the advantages and the disadvantages of RE, we have decided to perform a comprehensive study, which will constitute the core of a doctoral thesis regarding the Romanian energy sector and household consumers' willingness to pay for the positive attributes of RE. The current paper represents one step toward achieving the objectives of the above mentioned research, specifically dealing with the issue of segmenting household energy consumers given the context of the Romanian energy sector. It is an argumentative literature review, which seeks to critically assess the methodology used for customer segmentation in general and for household energy users in particular. Building on the experience of previous studies, the paper aims to determine the most adequate segmentation procedure given the context and the objectives of the overall doctoral research. After assessing the advantages and disadvantages of various methodologies, a psychographic segmentation of household consumers based on general life practices is chosen, mainly because it provides more insights into consumers compared to traditional socio-demographic segmentation by focusing on lifestyles and not external characteristics, but it is also realistically implementable compared to more complex procedures such as the standard AIO. However, the life practice scale developed by [Axsen et al. \(2012\)](#) will need to be properly adapted to the specific objectives of the study and to the context of the Romanian energy sector. All modifications will be based on the results of previous research performed by us and on a qualitative study among industry experts and consumers.*

**Keywords:** energy; segmentation; consumer behaviour; psychographics; lifestyle

**JEL classification:** M31; Q41

## 1. Research Background

The energy sector has been the engine driving the fundamental development of humanity ever since the end of the nineteenth century, when electricity became widely used to provide public lighting and transportation in the world's busiest commercial hubs. Nowadays, our personal and professional lives are so intertwined with the need for constant access to electricity that ensuring the stability of the energy sector has become a matter of national security for most, if not all, countries

in the world.

Over the last decades, the international energy markets have been subjected to various shocks, such as steep rises in fuel acquisition prices ([Hopkins, 2008](#)) and even outright interruption of fuel supply ([Jolly, 2009](#)). The emergence of such instability, combined with the ever more tangible negative effects of traditional electricity generation on human health and the environment, has pushed many nations to pursue the development of clean domestic electricity production via renewable energy (RE) technologies.

One of the regions most affected by supply shocks has been Europe, which has seen a rapid growth in its RE production ([World Bank, 2013](#)). Due to recently passed legislation regarding support mechanisms for RE development, Romania has also seen a steep increase in its RE installed base over the last few years ([EWEA, 2013](#)). However, RE also comes with a higher production and investment cost, compared to most conventional fossil fuel based technologies ([Rogner, 2010](#)). Considering the financial difficulties which the whole world and especially Europe are currently facing, the perspective of rising electricity costs may be displeasing for most consumers.

Severe public reaction to increases in energy prices could be seen recently in Bulgaria, where, due to the low average income level, electricity represents a significant part of the household budget ([Euronews, 2013](#)). In order to analyse exactly how Romanian electricity consumers feel about the advantages and the disadvantages of RE, we have decided to perform a comprehensive study regarding the Romanian energy sector and household consumers' willingness to pay for the positive attributes of RE. This research will represent the core of a doctoral thesis on the subject, centred on two main objectives:

- determining Romanian household consumers' willingness to pay in order to benefit from the positive effects of utilising RE
- describing the typologies of Romanian household electricity consumers based on customer segmentation

The doctoral research process was preceded by a series of articles written in collaboration with industry specialists with middle-management and top-management roles in the strategic marketing function of one of the world's largest energy companies ([Maxim and Thoma, 2011](#); [Maxim et al., 2011](#)). These works represented the basis of a dissertation thesis which offered some projections regarding the future evolution of the European RE sector and illustrated some potential development strategies for renewable energy companies ([Maxim, 2011](#)). The aim of the current paper is to establish a methodological approach to satisfying the second objective of the above mentioned doctoral research – describing the typologies of consumers based on customer segmentation. This will be a theoretical paper, based on a review of general and energy marketing research. Section 2 of the paper will present the specific context of the Romanian energy sector. Section 3 will illustrate some of the previous approaches used in segmenting energy consumers. Section 4 will describe the segmentation approach chosen for the current study and will argue its level of adequacy and utility considering the specific context of the research. The final section of the paper will provide an outline for the next steps to be taken in order to achieve the proposed objective and finalize the doctoral research process.

## 2. The Romanian Energy Sector

The Romanian energy sector has been going through a long and significant transformation which started in the second half of the '90s. These changes came as a direct result of the transition to a free-market economy and Romania's strengthening connection with the European Union, of which it became a member in 2007. This section will briefly address the most significant of these changes, starting with the liberalization of the energy sector, the introduction of a RE support scheme and, most recently, the gradual phasing out of regulated electricity tariffs.

In 1998, the Romanian Government issued a decision through which RENEL, the state-run company which had a monopoly position over the entire electricity sector, was broken up into several companies ([ANRE, 2012c](#)), generally grouped along the main components of the energy value chain: generation (or production), transmission (high voltage transportation of electricity), distribution (medium and small voltage transportation of electricity up to the end-user) and supply (sale of electricity to the end-user). Over the following decade, these companies went through further restructuring, privatization, consolidation and even liquidation. Today, the electricity sector is much more granular, especially with regard to generators and suppliers. The state run companies still represent a significant portion of the distribution and generation components, while the transmission is controlled by a single state company which, through its subsidiaries, acts as a supervisor and facilitator of wholesale energy transactions (similar to Spain's Red Eléctrica) ([Red Eléctrica de España, 2013](#)).

The liberalization or "opening" of the electricity market was implemented in Romania in order to harmonize the internal legislation with the one applicable in the other member states of the European Union. Thus, since the 1<sup>st</sup> of July 2007, all Romanian consumers (industrial, commercial or household) are free to choose the company which supplies them with electricity ([ANRE, 2013](#)). However, by the end of 2011, none of the 8.4 mil household consumers had changed suppliers, likely due to the lack of information regarding the possibility and the procedure that needs to be followed, but also due to uncertainties regarding the prices of electricity ([ANRE, 2012c](#)).

All household consumers continue to benefit from a regulated tariff. This means that the National Agency for Regulation in the Energy Sector (ANRE) establishes the price at which suppliers sell electricity to end-users. The tariff is periodically updated. However, starting with September 2012 and July 2013 for companies and households respectively, this system has begun being phased out and replaced with a tariff calculated based on the average costs of electricity observed on the competitive market ([ANRE, 2012b](#)). Thus, any discrepancies between the regulated tariff and the actual costs of supplying energy to consumers will be eliminated. In theory, the measure should encourage consumers to negotiate and opt for the most cost effective offers on the market and suppliers will be motivated to become more competitive in terms of price, resulting in lower electricity costs overall. It remains to be seen whether or not this will actually happen. However, it is certain that consumers will become more aware of the market and of the possibility to change their supplier, making marketing strategies, such as positioning through differentiation and segmentation, more viable for electricity sellers.

With regard to the support mechanisms used to promote the development of RE,

two approaches seem to be most frequently used, especially in Europe: green certificates and feed-in tariffs. Out of these, the Romanian Government chose to implement a support mechanism based on green certificates (GCs). While feed-in tariffs also encourage small, non-specialized generators (household and commercial), leading to a faster increase of the RE production rate, GCs are more adequate for attracting large specialized investors. As with most such mechanisms, in Romania GCs are awarded to green energy generators for a certain amount of electricity which was produced and delivered into the grid. Suppliers are required by law to acquire a certain amount of GCs on the open market and are allowed to transfer the cost of these to the final consumer ([ANRE, 2012a](#)). Choosing a GC system for promoting ER development seems to be the right choice for Romania, considering that by the end of 2010, the country had already reached a 23.6% share of RE in its overall production, out of the 24% established as a target for 2020 through the 2009/28/EC Directive ([European Commission, 2013](#)).

The following sections will look at how previous research has approached the task of segmenting energy users and will illustrate the relevance of customer segmentation considering the context of the Romanian energy sector as described above.

### **3. Past approaches to customer segmentation in the energy sector**

There is evidence that customer segmentation as a marketing strategy was already being implemented within some large industries (household appliances, automotive, tobacco) in the period immediately following the Second World War ([Smith, 1956](#)). However, the first author to actually define and structure this approach seems to have been Wendell Smith in the year 1956. His aim was to provide a marketing vision to the classical and neoclassical economic theory. Thus, starting from concepts such as free market and perfect competition, he notices that demand is not convergent, but actually divergent, with consumers manifesting different specific tastes and preferences. The author wishes to convey the understanding of this heterogeneous market as a sum of “slices” or homogeneous sub-markets which result from the divergence of preferences. He further proposes that companies should approach these “segments” in a differentiated manner in order to satisfy consumer needs more precisely ([Smith, 1956](#)).

The emergence of segmentation brought about the end of standardized mass production (as per Henry Ford’s famous aphorism: “You can buy the Model T in any colour, as long as it’s black”). It is from this point onward that marketing truly begins to develop as a science and as a company function through concepts, methodologies and commercial strategies such as differential advantage, market research, positioning and product differentiation ([Munteanu et al., 2008: 13-17](#)).

#### **3.1. Socio-demographic segmentation**

Among the first and most frequently used approaches to market segmentation were those based on a combination of external or “visible” characteristics: geographical, social and demographical ([Diamantopoulos et al., 2003](#)). These have frequently been referred to as socio-demographics. They represent consumer traits which can be observed externally or which are recorded in a standard format as population statistics: age, sex, income, education, profession, place of residence, marriage status, number of children etc. Such variables have been widely used in the

segmentation process primarily because, compared to other methodologies, socio-demographics are widely available ([Myers, 1996](#)). Generally, they can be obtained without significant costs (or even freely) and their processing and analysis is much more straightforward than, for example, that of personality traits.

In the case of studies concerning the energy sector or environmental protection, socio-demographic segmentation has been frequently used in order to assess attitudes, beliefs and the passive ecological behaviour of consumers, as well as their intention to purchase RE micro-generation equipment ([Ichim, 2012](#); [Menegaki, 2012](#); [Mozumder et al., 2011](#); [Zhang and Wu, 2012](#)). However, in analysing purchase intent, some researchers have combined socio-demographics with psychological traits, such as perception of control or motivation ([Leenheer et al., 2011](#)).

Diamantopoulos et al. combine a comprehensive literature review with an empirical study in their attempt to validate the relationship between socio-demographics and environmental consciousness (assessed as a combination between knowledge, attitude and behaviour) ([Diamantopoulos et al., 2003](#)). Their research was partially motivated by the fact that the majority of studies regarding environmental consciousness were, at that time, focused only on energy consumers from the United States, while their research was targeting the UK population. Diamantopoulos et al. conclude that socio-demographic variables have a weak explanatory power regarding the variance of environmental consciousness and are also unable to explain the behavioural component of consumers. However, they argue that the use of socio-demographics in characterizing consumers is ultimately useful in fine-tuning marketing communication campaigns, given that media consumption profiles are based on such segmentation variables.

One possible explanation found by Diamantopoulos et al. for their results is that there is a generally high level of environmental awareness among Western consumers, regardless of their demographic profile. Thus, in order to achieve a useful segmentation, a more profound analysis would be required – one which would go deeper than the surface level of socio-demographic traits.

### **3.2. Lifestyle segmentation and psychographics**

In order to compensate for the above mentioned shortcomings of consumer studies based on socio-demographics, researchers began to include several psychological variables in their analyses. The combination of “psychology” and “demographics” gave rise to the term “psychographics”, which refers to a much more complex analysis of consumer behaviour which can prove to be a lot more insightful both for academic and managerial purposes. The first such studies relied mainly on psychological research instruments, which were used to generate personality profiles. However, practice again proved that there is a weak correlation between such profiles and consumer behaviour. Thus, they were replaced by analyses focused on “lifestyles” ([Vyncke, 2002](#)).

From a marketing perspective, lifestyle means “a system for assessing an individual, based on his activities, interests, opinions, likes, dislikes and consumption patterns” ([Maxim and Gherasim, 2000: 160](#)) - in other words, the way in which the consumer lives and spends money. Market research focused on lifestyles can prove to be highly valuable, since it can generate both an account of how consumers behave, as well as an understanding of the internal motivation of their actions. However,

such studies can prove to be highly complex and difficult to implement. In addition, there is currently no standardized theoretical framework which can be applied in order to ensure consistency and comparability among various pieces of research. The most widely used method for studying lifestyles is called AIO (activities, interests and opinions) ([Datculescu, 2006](#); [Maxim and Gherasim, 2000](#); [Vyncke, 2002](#)). Activities refers to the actions that the consumer performs (shopping, work, practicing sports etc.). Interest is analysed in relation to something (family, work, an object, a service etc.), while opinions are descriptions of the beliefs and points of view of a consumer.

In order to perform an analysis on these three dimensions, a battery of AIO sentences needs to be created (e.g. "I go shopping several times a week", "Usually, I am interested in celebrity news", "People should be more faithful" etc.). Next, a large scale study is required in order to quantify the degree in which people agree or disagree with each sentence. Then, the sentences need to be reduced or condensed using factor analysis so that, in the end, we are left with a set of variables which respect the "mutually exclusive, collectively exhaustive" principle ([Rasiel and Friga, 2001: 3](#)).

Although the method has been used successfully in the past, it is difficult to implement due to the large scale survey associated with it: 200 – 500 AIO sentences are usually required ([Datculescu, 2006: 181](#)), and factor analysis practice dictates that 5 – 10 respondents are required for each sentence to be analysed ([Pallant, 2011: 183](#)). Thus, the implementation of AIO is problematic both due to the large sample size (1,000 – 10,000 respondents) and due to the significant effort that a respondent makes in order to complete a questionnaire made up of several hundred items.

As a solution to this issue, more recent research attempted to use values as measures of lifestyle. Values can be defined as trans-situational objectives of varied importance which act as guiding principles for an individual's life. Researchers have brought several arguments in favour of this method (e.g. wider applicability, transcendence of specific situations etc.), but the most significant is the fact that research instruments now needed to contain 10 – 20 sentences, as opposed to 200 – 500 ([Vyncke, 2002](#)). The main disadvantage of value based evaluations is the lack of a theoretical framework to guide researchers in the creation of the instrument. Some batteries exist which were considered to be somewhat standard, such as the one proposed by [Rokeach \(1973\)](#). However, some researchers argued that this was only applicable to American middle class families ([Ness and Stith, 1984](#)). This is a good example of why a standard set of variables cannot be established, since values tend to be circumstantial (specific to a certain geographical area, social class or even time period). Since a universally valid scale does not exist, researchers need to perform an initial exploratory study (based on primary or secondary data) in order to establish a relevant set of variables for the population to be examined. Only after completing this initial stage can they begin the actual lifestyle research.

[Vyncke \(2002\)](#) attempts such an approach by performing a large scale exploratory study aimed at creating and demonstrating the practical validity of a lifestyle evaluation instrument. This was built starting from a set of values (35 items), but also adding three other concepts: life visions (20 items), aesthetic styles (28 items) and media preferences (42 items), naming the overall scale VLAM. Significant effort

went into designing the instrument: 5 quantitative and qualitative studies with a total number of nearly 1,000 respondents. The final result is tested through a segmentation exercise applied to four very different markets (automotive, tourism, politics and media). Although the VLAM construct is proven to be more useful than socio-demographics, its complexity resembles that of AIO batteries (125 items excluding socio-demographics).

The more recent research concerning the energy business utilizes more refined and practical approaches for customer segmentation. They tend to use evaluation scales of 10 – 20 items (constructed based on secondary research), which generally address customer beliefs and behaviour. For example, [Sütterlin et al. \(2011\)](#) utilize a scale built around energy consumption patterns and respondents' beliefs regarding the energy sector, while [Axsen et al. \(2012\)](#) use a scale consisting of general "life practices" of consumers. Both studies use cluster analysis to generate market segments and Axsen et al. also use factor analysis in order to compress their segmentation variables.

The scale used by Axsen et al. was constructed based on the theory of [Giddens \(1991\)](#) regarding lifestyle sectors. These are sets of activities which the community or society perceive as being coherent. They are tied to various points of reference within an individual's existence (e.g. family orientation, career orientation, outdoor and sports orientation etc.) and combined they form an individual's "self-concept" ([Axsen et al., 2012](#)).

As a conclusion, there are numerous studies such as that of [Sanquist et al. \(2012\)](#) or any of the ones listed above, that may or may not refer to the energy sector, which prove that a characterization and especially a segmentation of consumers based on lifestyles is more efficient in explaining their purchasing behaviour than the more traditional socio-demographic approaches. Each of the papers mentioned also illustrates some disadvantages specific to the lifestyle methodology, but the general consensus is that the added value of this approach is enough to compensate for any shortcomings, especially if caution is taken when establishing the items to be used in the segmentation scale.

Taking into consideration all of the aspects mentioned above, the segmentation of energy consumers for the present doctoral research will be based on psychographics and will use a set of sentences which illustrate consumer life practices, similar to the example offered by Axsen et al. The following section will offer some additional arguments for this choice and will illustrate its applicability in the context of the Romanian energy sector.

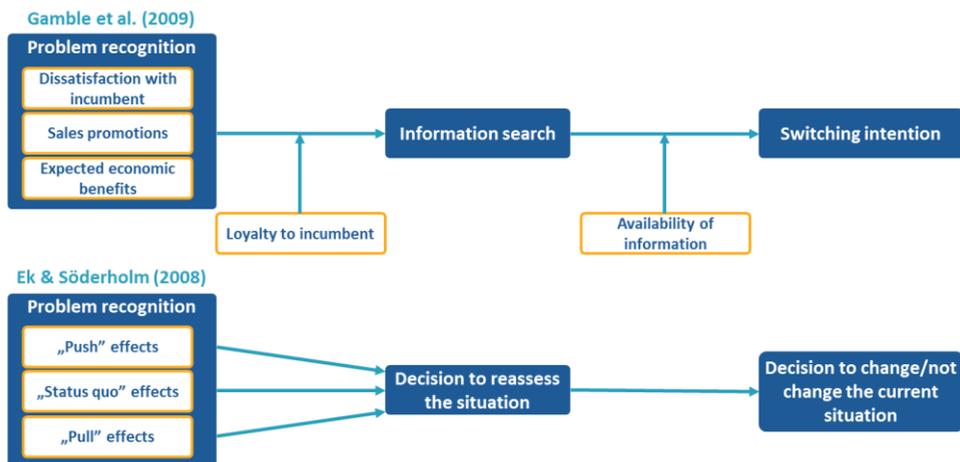

#### **4. The segmentation of Romanian energy consumers**

As mentioned in the previous section, the segmentation method chosen for this research is based on analysing lifestyles. Marketing specialists include lifestyle among the principal factors which explain how consumer behaviour is formed and expressed ([Maxim and Gherasim, 2000: 160](#)). Moreover, the last few years have seen significant changes in the legislation governing how the Romanian retail electricity market functions, giving end-users a more active role. Thus, an incursion into the basic theory of consumer behaviour would be relevant.

Section 2 offered some details regarding the changes which took place in the Romanian retail electricity market since 2007 and especially 2013. The relationship between suppliers and customers has been liberalized and the regulated sales

tariffs have begun being phased out and replaced with market based tariffs. The most significant change is that consumers will be encouraged to have an active behaviour on the market by opting for electricity suppliers based price or their own specific preferences. Since supplier switching is the equivalent of an acquisition, this means that a decision making process for the purchase will take place, as defined by theoretical frameworks ([Munteanu et al., 2008: 77](#)).

[Gamble et al. \(2009\)](#) and [Ek and Söderholm \(2008\)](#) both endeavour to analyse energy consumer behaviour in order to understand the reasons why Swedish household customer tend to have a low supplier switching rate, in spite of the fact that the electricity market in Sweden was liberalized in 1996 (more than a decade prior to the two studies). In both cases, the authors identify three different factors which determine the emergence of the purchase behaviour (as seen in figure 1). In addition, Gamble et al. identify two variables which act as obstacles for the completion of the decision making process: loyalty toward the incumbent supplier (a mostly emotional obstacle) and information availability (which creates an opportunity cost due to the time spent getting informed). Other researchers conclude that a lack of information regarding the switching procedure and the difficulty of comparing electricity tariffs among different companies are also major obstacles for the decision to change suppliers ([Salmela and Varho, 2006](#); [von der Fehr and Hansen, 2010](#)).

**Figure 1:** Models based on energy consumers' decision making process  
Adapted from: [Ek and Söderholm \(2008\)](#); [Gamble et al. \(2009\)](#)

The liberalization and deregulation of the energy sector in Romania will allow for a differentiation of the services offered by suppliers. They will be able to compete on matters such as tariffs, service quality or even energy mix (i.e. the proportion of RE in the total amount of electricity sold). If we consider the two models illustrated in figure 1 and refer only to the proportion of RE in the energy mix as a differentiating factor, we can conclude that it would potentially generate “push” (displeasure with current supplier) and “pull” (attractiveness to other sellers) effects as per the Ek and Söderholm model. Similarly, it could generate “dissatisfaction with incumbent” or it can be used as a “sales promotion” point as per the Gamble et al. model.

Coming back to the discussion regarding the choice of segmentation methods, as concluded from the previous section, psychographics has an increased utility in determining consumer profiles. In addition, it is to be expected that companies which sell electricity are already able to perform a segmentation of their customers based on socio-demographics using the data included in sales contracts and public statistics. However, a psychographic segmentation has the potential to generate insightful consumer profiles which would be highly useful in understanding the structure of the liberalized retail market, so that suppliers can build adequate marketing strategies.

Out of the various psychographic segmentation procedures presented in section 3, the approach used by Axsen et al. is considered to be the most adequate for the current research process. By comparison, the AIO and VLAM procedures are considered to be too demanding both for the limited budget of this research and for the cognitive and temporal availability of the respondents, while the values based approach is likely to have limited accuracy without first carrying out a broad exploratory pilot study. In addition, analysing a combination of consumer lifestyle sectors would allow for a more comprehensive understanding of energy users than a segmentation based primarily on their environmental attitudes. Finally, if the research instrument would put too much focus on ecological behaviour, it could generate a social desirability effect ([Axsen et al., 2012](#)).

## 5. Next steps

In conclusion, the current doctoral research will utilize an adapted version of the life practices scale proposed by Axsen et al. in order to achieve a psychographic segmentation of Romanian energy consumers. The 15 statements listed in Annex 1 will, however, need to be adjusted to suit the local context and the specific objectives of this research project (e.g. no focus on researching automobiles). All modifications will be based on the results of previous research performed by us and on a qualitative study among industry experts and consumers. The resulting scale will be pretested and further modified as needed and the final construct will be included in the main instrument of the doctoral research.

### Annex 1 – Life practices scale used by [Axsen et al. \(2012\)](#)

*How often do you engage in each of the following activities? (Never, Rarely, Occasionally, Frequently, Very Frequently)*

- Developing your career
- Discussing or researching automobiles
- Helping the environment
- Home remodelling or “fix-it” projects
- Nature and the outdoors
- Playing sports, recreation or exercise
- Religious or spiritual practices
- Researching or trying new technology
- School, lectures or other education
- Shopping
- Socializing with others
- Taking care of/spending time with family
- Using the internet for fun or leisure

- Volunteering or giving to charity
- Watching TV or movies

# SEGMENTATION OF SME PORTFOLIO IN BANKING SYSTEM (CONSIDERATIONS)

**Namolosu Simona, Cetina Iuliana**

*Academy of Economic Studies, Marketing Faculty, Bucharest, Romania*

*simona.namolosu@gmail.com*

*cetina.iuliana@gmail.com*

**Abstract:** *The Small and Medium Enterprises (SMEs) represent an important target market for commercial Banks. In this respect, finding the best methods for designing and implementing the optimal marketing strategies (for this target) are a continuous concern for the marketing specialists and researchers from the banking system; the purpose is to find the most suitable service model for these companies. SME portfolio of a bank is not homogeneous, different characteristics and behaviours being identified. The current paper reveals empirical evidence about SME portfolio characteristics and segmentation methods used in banking system. Its purpose is to identify if segmentation has an impact in finding the optimal marketing strategies and service model and if this hypothesis might be applicable for any commercial bank, irrespective of country/ region. Some banks are segmenting the SME portfolio by a single criterion: the annual company (official) turnover; others are considering also profitability and other financial indicators of the company. In some cases, even the banking behaviour becomes a criterion. For all cases, creating scenarios with different thresholds and estimating the impact in profitability and volumes are two mandatory steps in establishing the final segmentation (criteria) matrix. Details about each of these segmentation methods may be found in the paper. Testing the final matrix of criteria is also detailed, with the purpose of making realistic estimations. Example for lending products is provided; the product offer is presented as responding to needs of targeted sub segment and therefore being correlated with the sub segment characteristics. Identifying key issues and trends leads to further action plan proposal. Depending on overall strategy and commercial target of the bank, the focus may shift, one or more sub segments becoming high priority (for acquisition/ activation/ retention/ cross sell/ up sell/ increase profitability etc.), while others (risky/ non-profitable etc.) may be left aside. This entire shift in strategy is considering also growth potential per sub segment. Examples are provided for different strategies considering growth potential of each sub segment.*

**Keywords:** *SME; banking; marketing; strategy; segmentation; lending.*

**JEL classification:** *M31; G21; L22.*

## **1. Introduction**

The segment concept (including also the sub segment concept) is related to a division (or subdivision) of an overall data base (portfolio). It has similar and easy to define characteristics.

Any segment is related to a specific potential and is relevant in terms of the number of members. From the authors perspective, the segmentation, referred to as an action (or method) has the aim to identify similar behaviours and the scope of estimating potential growth, overall and split (in smaller clusters - in our case, we

are referring to segments, sub segments, clusters of a bank's SME portfolio). By creating clusters and applying different thresholds scenarios, important conclusions (such as correlations with the commercial results in terms of impact) may be found, leading to a more accurate estimation of potential. From a bank perspective, the potential is defined in terms of turnover, revenues, lending and liabilities volumes. By analyzing existing portfolio and potential estimation, an extrapolation (of the conclusions) can be applied also to the potential data base; therefore, an overall estimation can be done.

This is why, segmentation is an essential step in defining the marketing strategy (for existing clients' portfolio, but for potential clients also). Calculation of profitability per each segment (even by the simplest method of average net revenue generated to the bank by a client), is leading to establishing the most profitable segments from the existing portfolio. It also leads to identify the highest potential segment (in terms of business increase), while correlated to other criteria (for example, comparison between the company annual turnover and the turnover made by the company through the bank in the same year of analysis). Based on the segmentation analysis and conclusions, different strategic alternatives are suitable for each important segment (for example: retention and loyalty increase for very profitable clients of the bank; turnover increase, loan volume increase, cross sell, up sell for non profitable clients with high potential and so on). On the other hand, segmentation process and calculation of profitability leads to identification of clusters which are generating loss. For sure, it is important to consider also these clusters/ segments and to establish an action plan in order to minimize the loss and increase the profitability of the overall SME portfolio.

## **2. Banking System Service Model for SME Clients**

The SME Service Model of a Bank implies the presence of the customer: face to face with the service provider (usually a financing advisor or an operational staff from a branch), but also self-service, while using online banking, other applications of equipments provided by the bank.

Usually, pro-active selling by need identification and maintenance of the portfolio of clients is the financing advisor's responsibility, while the operational staff is involved in re-active responses to transactional needs of the customers in a certain moment of time. For acquisition and offering to potential clients, the responsibilities can be split, and even the branch manager can take initiative if the client value or client potential is high.

With the purpose of helping the branches in structuring the "consolidated" offer for a client, the Marketing Department can design commercial campaigns, with predefined target, or special offers to be applied based on different criteria. In order to better address the offer, before designing the campaign, portfolio analysis and segmentation is done. Commercial campaigns may be different for each identified sub segment; this differentiation may occur when different strategies are designed.

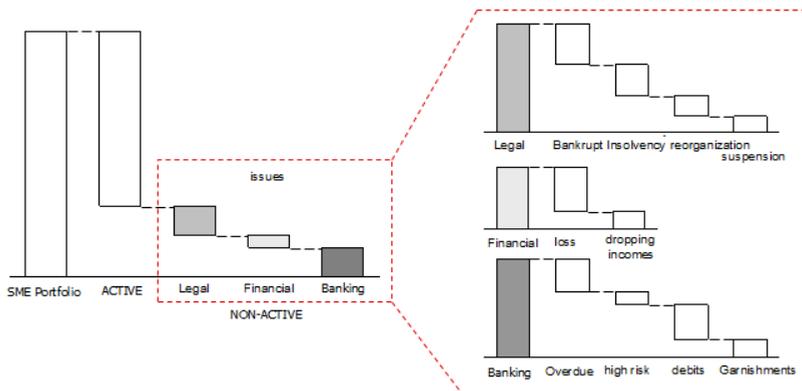

### **2.1. SME Portfolio Analysis and Segmentation**

The banking services are very different when considering segments of clients. The segmentation strategy and process can be done based on many criteria. The banks may address specific offers (and have different divisions and departments) to the following categories (Sources: Romanian banks official sites): Low revenue

Individuals; High revenue Individuals; Private clients; Micro, Small and Medium Enterprises (SME); Large companies (Corporate); Freelancers; Non-Profit Organizations; Public Institutions.

While designing a marketing strategy for SME clients, the first step is to analyze the behaviour and potential of the clients from the (existing or potential) target. If on the market, information about the potential target is limited (meaning expensive or lack of information), a good solution is to deeply analyze the existing portfolio of clients. In this respect, it is important first of all to clean up the portfolio data base, by flagging and excluding the clients with negative signals (categorized as “non-active clients”). At this stage, the portfolio analysis focuses on identifying the unwanted “behaviours”, the clients that generate losses or who have a high potential to generate losses.

The first step consists in analyzing the clients’ portfolio structure and eliminating from the database the clients that have one or several problems (negative signals). An example for the structure of an SME portfolio and the most common negative signals met are shown in the figure below. The figure reveals the split of an SME portfolio into two major categories (active and non-Active Clients), as a prior mandatory step before the segmentation. In authors’ opinion, the active clients of a bank are those resulting through elimination of clients with negative aspects from the portfolio data base. In this respect, identifying all “bad” clients is mandatory; for simplification, negative signals were categorized into: legal negative aspects, financial negative aspects, banking perspective negative aspects. Details regarding each category are shown:

**Figure 1:** Active and Non-Active Clients  
*Source: Personal Contribution of Authors*

The second step of segmentation may refer to clean the data base (portfolio) by eliminating the non-active cluster. After cleaning up the data base, the next step consists in establishing the segmentation of the remaining clients (so called active portfolio of SME clients). The segmentation takes into account different criteria, the most common being the related to company characteristics and banking behaviour. The purpose is to identify common behaviours, in order to establish the categories of clients with a high potential in terms of profitability (in the specific sense, of

course, of the profitability gained through offering a crediting facility).

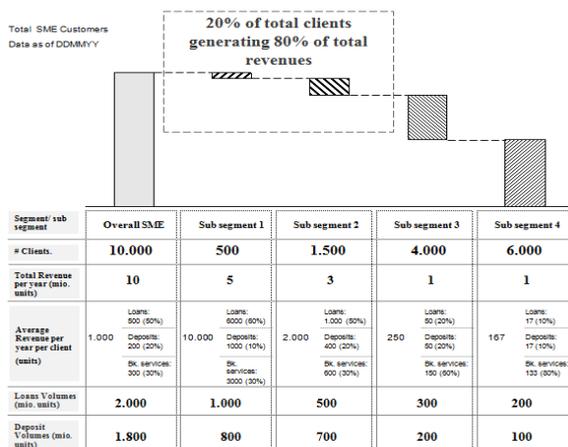

The most common segmentation criteria are related to company characteristics:

- Company turnover, profitability and other financial indicators;
- Field of activity (because the credit risk policy could impose to avoid offering lending facilities to clients belonging to industries with a high risk; it's well - known that, once the economic crisis appeared, the building field of activity suddenly became a sector where credits were being offered only as an exception);
- Geographic Region;
- The debt service (including the debt payment to the state budget).

Other criteria refer to the banking behaviour:

- Incoming payments - turnover on current accounts;
- Revenue generated for the bank in a certain period of time;
- The banking products held at a certain period of time (usually, the last available reports), compared with the identified products potential
- Volumes (Loans and or Deposits);
- The seniority of the client (beginning with the date when the account was opened);
- The payment behaviour, for clients with loans;
- Collateral coverage level;
- The commercial campaigns which had an impact upon the client/which didn't have an impact.

An example of segmentation analysis from banking behaviour perspective is shown in the following figure.

**Figure 2:** Banking Behaviour as Segmentation Criteria

Source: Personal Contribution of Authors

Segments become real targets when the potential is considered large enough and when the characteristics and banking behavior of the segments allow a special positioning which can create a value proposition for the clients in the segment.

From authors' perspective, a market watch analysis is mandatory, so is a qualitative research in order to identify the most adequate solutions for the implementation. If needed, a testing session will be set up. Before roll-out of the new strategy, a pilot

might be done in order to identify aspects to be improved/removed/added. After the implementation, the monitoring of the results and the constant communication is very important. Sometimes lack of monitoring may influence the profitability.

Negative signals can be identified after the segmentation is already designed and the strategy is already set up. This happens because the risk profile and the eligibility of the client is analyzed only after receiving detailed information from each client; for example, some filters will include the rating, the debt service, possible to be made only based on documents (usually financial and legal documents) provided by the client's representatives.

## **2.2. Characteristics of SME Banking Products**

Each SME is different and therefore the banking services are unique. The dependency between the company's characteristics and the service is very high. For some companies, the service is standard; for others, is tailor made (this approach is appropriate to be used for more complex companies and needs).

The quality of the banking services for SMEs is very hard to analyze, especially because the customers' expectations are hard to anticipate and the evaluation of the customer satisfaction can be done only after the banking service is purchased. However, requesting constant feed-back during service providing is very helpful.

How a customer perceives the value of the banking product is directly related to customer satisfaction with the condition of meeting the expectations. This leads to a need of standardizing the service in order for the customer satisfaction conditions to be met.

When addressing to small companies, customer satisfaction standards are easier to identify, anticipate and design. For a medium company, for example, it is recommended to address a combination of standard features and tailor made ones. A banking service feature is designed and established through the document called product card (to be noticed that the concept of banking service was replaced by banking product. Any new product or modification of existing products is approved through this document. The product card contains all the standard features of the product and also details about the non-standardized approach (rules of approval, criteria to consider etc.).

Sometimes the same product card will be used in order to offer standard products to a specific segment of clients, while for other segments, the same product card will become a tailor made offer through applying the existing non-standard rules.

Another special feature of the SME banking product is related to the decision process.

The term of customer has in the end an individual person that will take a decision. That person could be an administrator, shareholder or general manager of the company. For bigger companies, the decision can be taken also by the Financial Manager. Even so, when appreciating the quality of the banking product, or when taking the decision of acquiring the banking product, the customer (individual decision maker) is influenced by his own experiences, claims and expectations; the influencers can be someone from the family (for example, if a family member had a similar experience with the same bank/ branch of a bank etc.), a business partner (client, supplier etc.), even subordinates (financial manager, accountant etc.) and other parties (brokers, consultants etc.).

Sometimes, situational factors influence the decision (for example lack of parking space in the proximity of the branch, no privacy and so on can lead to a negative decision).

While taking the decision to contract a loan, maybe the most important factor is the credibility and confidence inspired by the Relationship Manager. The explanation is simple: the financial situation of the company is important for any administrator/ shareholder (profit is source of dividends and so on) and the risk that a wrongly granted loan could destabilize the financial balance leads to the need of competent advice. That is why professionalism of the Relationship Manager (proven by very well knowing the products, understanding the business, financial indicators knowledge and so on) may also influence the decision.

In authors opinion, the decision is influenced by the ability of the Relationship Manager to inspire confidence, by:

- Very well knowing the banking product, with all its feature (including all costs)
- Understanding the business of the client and correctly identifying the need (a common mistake of low experienced Relationship Manager is offering a Working Capital line instead of an Investment Loan; experienced clients know very well that the company's financial situation can be seriously damaged if acquiring, for example, fixed assets with 5 years amortization, with a working capital line with maturity of 1 year)
- Continuously providing consultancy and advice
- Interactivity and relationship management; the clients need to be involved in the structuring of the banking product (when tailor made approach needed). Face to face meetings are a great premise for identifying further business opportunities for cross selling and future financing (for example, in the meeting, the client may mention a small detail regarding a future investment for building a new warehouse)
- The quality of the banking product cannot meet the clients' expectations unless the Relationship Manager demonstrates fairness; this approach needs to be part of organizational culture, as the values reflect in day to day activity
- Trained on soft skills development: communication, sales, negotiation etc. are a must
- Becoming a single point of contact with the client, "the bank is me"; high expertise and very well knowing the business, together with financial advice and well knowing to identify the needs, are the features that make a Relationship Manager become the face of the bank in front of the customer. That is why the entrepreneurship skills are also very important.

As a conclusion, the skills and know-how of the Relationship Manager might be defining for the decision taking regarding loan facilities. Knowing very well these aspects, the members of the marketing department could be very interested in applying the marketing strategies first of all by "selling" them to the Relationship Managers. The scope is very well illustrated in the figure below.

**Figure 3:** Marketing Strategy Leading to Commercial Results Increase

### 3. Applying Segmentation and Designing SME Lending Strategies

#### 3.1. SME Lending – Characteristics

The loans are some of the most complex banking products, especially because the diversity of financial needs of the companies, but also because the approval process. European Commission (in Silivestru, 2012: 178) conducted a survey revealing that SMEs are highly dependent on bank loans for financing current activity and reaching their development ambitions.

From authors perspective, loans for SMEs can be categorized as follows: Working capital lines (Revolving facilities, the limit stays the same), with general expenses purposes (usually: payments to suppliers or state budget and so on); Working capital loans (Non-Revolving facilities, the limit diminishes while paying the principal), for financing current needs; Factoring Facilities, based on Assigned Debtors (no other collaterals requested); Discounting instruments (cheques and promissory notes, invoices); Investment Facilities (with different purposes: building a warehouses/ premises of the company, acquiring a fixed asset and so on).

Oncioiu (2012: 49) suggests that there are two significantly different concepts at the basis of the design and operation of financing scenarios for SME:

- Financing schemes based on governmental policies, with priority on some categories of SMEs;
- Financing schemes based on market requirements, with same or very close market conditions.

Each financing structure has one or more loans, each with limit and exposure (also called outstanding). The loan limit is the maximum limit amount which can be granted to the client (for revolving loans, this is the amount that appears in the loan contracts). The loan exposure (outstanding) is the amount utilized by the client at a certain moment. The limit is always above the exposure, the only case when the outstanding exceeds the loan limit occurs if the client didn't pay its debts to the bank, being in overdue.

The risk management is a very important feature of each loan. In general, small companies have higher risk than bigger ones, but a good rating is only given by a strong financial situation.

The collateral coverage is also a very well known feature of a loan; depending on the collateral type (mortgage, cash, contract, equipment etc.), a certain weight is applied to the value of the guarantee, so the coverage is usually  $\geq 100\%$ .

Rating and collateral structure and coverage determine the amount of the provisions that the bank needs to constitute for each loan. The provisions are costs (cost of risk, calculated as the percentage of the provision evolution applied to the amount of the exposure).

While calculating the profitability of a loan, there are three components: the interest rate and the fees paid by the client (IF), the funding rate of the bank (cost of

financing; F) and the cost of risk (as described above, CoR).

For calculation of the profitability of the loan, the authors are proposing the following formula:

$RL = IF - FC - CoR$ , where:

- RL = net Revenues generated through the Loan;
- FC = financing cost;
- CoR = Cost of the Risk.

### **3.2. SME Lending – Strategies**

Every banking product strategy follows at least three essential stages: the Design stage, the Implementation stage (which includes: the release itself, the testing – before and/or after the release – and the “technical” implementation) and the subsequent Monitoring (with the purpose of identifying the strengths or the possible optimization alternatives; sometimes it leads even to a radical strategy change).

The effort while designing a strategy is orientated towards the existing clients’ portfolio. This is widely accepted as being an efficient strategy, being less expensive than the strategy of attracting new clients. It is also profitable to simultaneously focus on various transactional segments. The portfolio selection (clean-up) and segmentation is applied for developing a model, taking also into account a perspective based on risk management - clients with less risk and high profitability are preferred.

Once the market segment/segments have been defined, the establishment of the crediting strategy target is made taking into consideration the potential of the chosen segment (which has to be large enough), but especially the possibilities of creating a special positioning, that will be able to generate a value proposition for the clients within the segment.

After establishing the target segment characteristics, the companies whose risk profile don’t meet the eligibility conditions will be eliminated from the database. The conditions will always include the company’s financial rating (based on the scoring developed by the financial institution), the debt service, the client’s profitability and so on.

A competition analysis is a mandatory step, especially when the target segment is composed of small companies. In this case, the strategy will be a standard one, generally available for all companies included in the segment. For larger companies, where a level of service personalization appears, the competition analysis becomes harder, reflecting through the clients who are willing to offer information regarding the offers which they received from the competing banking institutions.

The strategic alternatives when offering credit facilities may regard any aspect below, but the decision regarding optimal strategy could be taken at segment level:

- The market share increase, by increasing the number of clients with credits and/or the total volume of granted loans; if focusing on volumes, the segments with highest potential should be attacked.
- Optimized version/ new version or product to be included into the product catalogue of one or more segments; segments with low results and potential can be attacked by offering optimized products which meet their expectations.
- Client portfolio migration from credit products with a higher risk to credit facilities with lower risk and/or higher profitability (transforming the credits with work

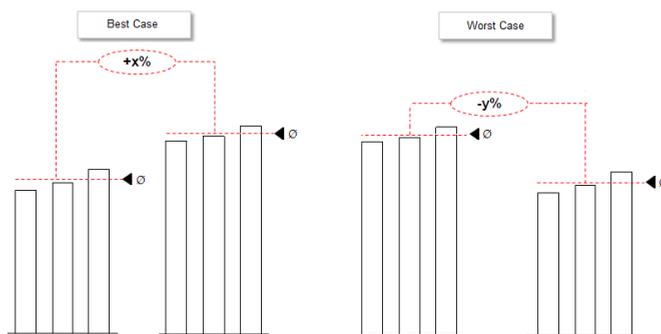

capital into factoring facilities, for which the default risk is lower); segments with high risk (sensitive portfolio) always need a special strategy and action plan.

- The creation of products and services “packages” (for cost optimizing); elite and complex segments can be attacked with innovative products which are leading to turnover increase through the bank (and therefore to non-risk revenue increase); for example, a package with unlimited incoming and outgoing payments and a lot of banking and non- banking benefits included, at a monthly fixed price.
- The establishment of loyalty methods for the existing clients/acquisition of new clients through a simplified flow of offering certain credit facilities (for example, preapproved facilities); segments with good financial performance and with loan appetite will be attracted through a pre-approved limit of money (working capital or credit card), granted by a very simple flow, with no bureaucracy.
- Encouraging certain favorable behaviors (the turnover increase through the current account, which leads to the banking institution’s profitability increase), by offering preapproved working capital lines (according to the client’s previous behavior)
- Some modifications of the existing products are mandatory due to legal rules (especially NBR Regulations, Available: <http://bnro.ro/Legislatie-financiar-bancara-735.aspx>).

Different strategic alternatives for each segment will be proposed, taking into account also the cluster specificities and the objectives that derive from the analysis. For profitable clients but without growth potential the optimal strategies are focused on retention; for unprofitable clients but with a high potential, the optimal strategy will consider the increase of the turnover through the bank, the increase of the product penetrating degree or the increase of the credit volume.

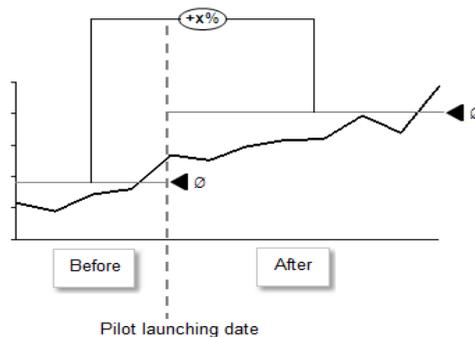

#### 4. SME Strategy Efficiency – Final Testing

Based on criteria defined in segmentation activity, and also through different scenario defining, final thresholds for each numerical criterion will be defined. In order to estimate the results of the marketing strategy, worst case and best case scenarios will be set up. An example for 3 months evolution is provided in the figure below.

**Figure 4:** Three Months Evolution: Best and Worst Case Scenarios (Estimations)  
*Source: Personal Contribution of Authors*

Usually, the final estimation for the strategy is somewhere in between worst and best case. The next step is represented by testing the matrix of criteria, which is usually made through a pilot (branch/ region/ indicated financial advisors, in a limited period of time). After the pilot period, a “Before and After” analysis should be performed, with the purpose of comparing the average (monthly/ quarterly) before launching to the average of the same indicator, but after launching. This is the final analysis, through which, the efficiency/ inefficiency of the designed segmentation is determined (as per the below figure).

**Figure 5:** Before and After Analysis of the Strategy Impact

Source: *Personal Contribution of Authors*

Depending on the strategy profitability and success, further analysis and monitoring of the segments will be done. Best Practices for sub segments may be identified, and, therefore, an optimization of the strategy could be done.

### Concluding Discussion

Considering the methods and strategies presented in the current paper, one can identify correlation and impact between portfolio analysis, market watch, best practice identifying, gathering feed-back (from best sales representatives and clients), analysing the clients profiles and the action plan (as a starting point) of an efficient segmentation process. In this respect, the defining of segments and sub segments may be based on different criteria identified as important during the previously mentioned analysis. If willing to determine if a segmentation structure (matrix) is efficient or not, business case scenarios could be tested. Tailor made strategies may be designed for sub segments by very well knowing the profile, characteristics and behaviour. This is why authors consider that segmentation has an important impact in finding the optimal marketing strategies and service model. SME specificity and characteristics may be found not only in Romania, but also in other countries and regions. Targeted products, behaviour similarities identification and profitability estimation could be done for clusters of companies all over the world. This is why, one can conclude that segmentation methods and strategies presented in the current paper could be applicable to any commercial bank, irrespective of country or region.

# THE EFFECTS OF AMBIENT SCENT ON CONSUMER BEHAVIOR: A REVIEW OF THE LITERATURE

**Olahut Meda Roxana, Plaias Ioan**

*Marketing Department, Faculty of Economics and Business Administration, Babeş-Bolyai University Cluj-Napoca, Romania*

*meda.olahut@econ.ubbcluj.ro*

*ioan.plaias@econ.ubbcluj.ro*

**Abstract** *The main purpose of this paper is to present an extended literature review of relevant empirical studies which examine the effect of ambient scent on consumers' perception, consumers' emotions and consumers' behavioral responses in the context of retailing. Compared with other atmospheric stimuli (such as background music), ambient scent has received little attention from researchers. This paper is also concentrated on identifying the principal dimensions of ambient scent (presence versus absence; congruity versus incongruity and pleasantness versus unpleasantness) and examined how these dimensions of ambient scent have an impact on evaluation of a product, of a store or of a shopping mall and their impact on shopping behavior within a store. The paper also presented the Gulas and Bloch (1995) model, a complex conceptual framework on the influence of ambient scent on consumer responses, in their model the authors introduced the influence of mediating factors on behavioral responses to scent. Their model is a first step on the understanding the role of ambient scent in influencing consumer behavior. Davis, Kooijman and Ward (2003) extending and elaborating the Gulas and Bloch (1995) model by introducing concepts from cognate disciplines and examines mediating factors that help shape the emotional and behavioural responses that are stimulated to encompass current research on human olfaction and brings another specific points for future research. Based on the results of the relevant studies the authors of the present paper concludes by identifying gaps in the literature and suggest future research to explore how the use of scent help to create an overall store atmosphere which influence shopping behavior in the context of retailing.*

**Keywords:** *ambient scent; store atmosphere; consumer behavior; consumer perception; consumer emotion; retail stores.*

**JEL classification:** *M31, M39*

## 1. Introduction

Many retailers have long used ambient scent to influence consumer cognition, emotion and behavior. The notion that ambient scent can be used to influence consumer behavior is derived from the concept of atmospherics. The impact of store atmosphere on consumer behaviour has widely been considered in research over the decades (Kotler, 1973; Turley and Milliman, 2000). Numerous atmospheric stimuli were investigated by researchers including music (Bruner, 1990; Milliman 1982, 1986; Yalch and Spangenberg, 1990, 1993; Herrington and Capella, 1996; Dube, Morin 2001, Morin, Dube, Chebat 2007), color (Belizzi, Crowley, and Hasty 1983; Crowley 1993), lighting (Areni and Kim, 1994) crowding (Harrell and Hutt 1976; Hui and Bateson, 1991) and window displays (Sen, Block and Chandran, 2002, Oh

and Petrie, 2012). Referring to the ambient scent, this can be considered an underdeveloped aspect of the store environment because only a few atmosphere related studies have considered the role of ambient scent and its impact on consumer behaviour (Chebat and Michon, 2003; Turley and Milliman, 2000). The body of the literature based on the impact of ambient scent can be considered somehow as fragmented, some of the earlier research were concentrated to examine the effect of scent in terms of products or brands evaluation (Bone and Jantrania, 1992; Mitchell, Kahn and Knasko, 1995; Morrin and Ratneshwar, 2000) others in terms of stores evaluation (Spangenberg, Crowley and Henderson, 1996) and more recently researchers have concentrated on the effectiveness of ambient scent in retail store and shopping mall settings (Hirsch, 1995; Knasko, 1995; Mattila and Wirtz, 2001; Chebat and Michon, 2003; Michon, Chebat and Turley, 2005). The results of these studies reported ambiguous findings and shortcomings of measurement approaches as can be seen in the next part of this paper.

## 2. Literature review

Ambient scent have not gain so much attention as other atmospheric stimuli. Spangenberg, Crowley and Henderson (1996:67) defined ambient scent as "*scent that is not emanating from a particular object but is present in the environment*". Wilkie (1995) noted in his seminar work that scent as one of the five senses is considered to be the most closely attached to emotional reactions because the olfactory bulb is directly connected to the limbic system in the brain, which is the seat for immediate emotion in humans, so smell perception and interpretation is a complex phenomenon that involves a mixture of biological responses and psychology. This is one of the main reason why odor in a retail environment is important to study as an atmospheric stimulus because scent enhanced likelihood of producing an emotional reaction from consumers (Michon, Chebat and Turley, 2005).

A review of the literature of the studies on the effects of scent on consumer behavior allow us to understand that in-store scent have concentrated on three dimensions: the first dimension is *scent congruity* with the products sold in the store (Bone and Jantrania, 1992; Mitchell et al., 1995; Mattila and Wirtz, 2001). The second dimension is *presence of a scent*, prior research had demonstrated that simply having a scent present may result in affective or behavioural responses (Spangenberg et al., 1996; Morrin and Ratneshwar, 2000). The third dimension is *scent pleasantness*, prior research reveals that having a pleasant scent may result in positive affective or behavioural responses, whilst having an unpleasant scent may result in negative affective or behavioural responses (Mitchell, Kahn and Knasko 1995; Bone and Ellen, 1999; Morrin and Ratneshwar, 2000). Some of the prior studies on ambient scent (Spangenberg, Crowley and Henderson, 1996; Morrin and Ratneshwar, 2000), have tended to look at the pleasantness of the scent, ignoring any association of the scent with the store. As Gulas and Bloch (1995) pointed out, the scent of flowers may be generally perceived as pleasant, but totally inappropriate for a motorcycle shop.

### 3. The effects of ambient scent on product and store evaluations

Prior research reveals that *pleasant odors* influence feeling states, evoke associations from memory, and affect product judgments (Cox, 1969; Hirsch, 1990). Cox (1969) show how odor aroma can influence product sold, they demonstrated that nylon stockings with an orange odor sold better than unscented stockings. Subjects of the study associated smell with the product quality, they felt that the scented stockings were of better quality than the unscented ones. Knasko (1989) suggest that ambient aroma had an influence on the amount of time consumers spent at a jewelry counter. Hirsch (1991) demonstrated that respondents were more likely to purchase Nike shoes in a perfumed room rather than the same shoes displayed in an identical but unodorized room. The results of these earlier studies suggest that the *effects of odor* is associated to its *pleasantness or unpleasantness*. Based on these studies Bone and Jatronia, (1992) states that consumers are influenced by *pleasant odors* which are pleasant experience, which, in turn these pleasant experiences create a mood or an overall feeling, which makes the product as being judged. They conducted an experiment and the findings suggest that product evaluations are enhanced when are scented, the primary olfaction effect is on overall product evaluations rather than the attribute belief level. Congruent scents tend to improve evaluations more than incongruent scents (Bone and Jantrania, 1992).

Morrin and Ratneshwar (2000) investigated the effects of ambient scent on evaluation, attention and memory for familiar and unfamiliar brand, they exposed respondents to familiar and unfamiliar brand names, in a *pleasantly scented* environment or no scented environment and evaluated how much time spend respondents to evaluate each brand through a computer recorded. They demonstrated that a pleasant ambient scent for unfamiliar brand names increased attention and memory also improved evaluations primarily rather than for familiar brand names. Morrin and Ratneshwar (2003) continued their work and examined the relationship between scent congruity and brand memory. The first study tested participant evaluations of images of household cleaner and personal care/toiletries in a scented (geranium and clove) or unscented environment. The results indicated that a pleasant scent with the product category increased subjects'attention to brand stimuli, ambient scent improved consumer memory for familiar and unfamiliar brands as assessed by recall and recognition measures. The impact of congruent and incongruent ambient scent was the same on brand recall and brand recognition (Morrin and Ratneshwar, 2003). In the second study was studied how the presence of ambient scent during both encoding and retrieval phases may be critical based on two different factors. The results reveals that brand memory was affected only by the presence of ambient scent at the brand encoding stage and substantially increased attention. Brand recall or brand recognition was not affected by ambient scent at the brand retrieval stage (Morrin and Ratneshwar, 2003).

Mattila and Wirtz (2001) examined the effects that *pleasant ambient scent* and *pleasant background music* on customer evaluations of a store's environment. They consider three situations of scent and music (no music/scent, pleasant low arousal music/scent and high arousal music/scent). The results of the study reveals that when ambient scent (low and high arousal) and ambient music (low and high arousal) were congruent with each other a positive interaction effects on approach behavior, pleasure, satisfaction and store evaluations were found. Spangenberg,

Grohmann, Sprott, (2005) examined the effects of *ambient scent* and background music on consumers' evaluations of a store, its environment and offered merchandise. The results of the study show that a consistence between ambient Christmas scent and the presence of Christmas music (as compared to no scent and Christmas music) means more favourable store attitudes, stronger intention to visit the store, greater pleasure, arousal and dominance and a more favourable evaluation of the environment.

#### **4. The effects of ambient scent on consumer perception**

Mitchell, Kahn and Knasko (1995) examined the effects of *scent congruity and incongruity* on cognitive variables that are involved in the consumer decision making processes. The results reveals that pleasant ambient odor influence consumer decision making, congruent odors lead to a greater access to congruent attitudes, autobiographical memories, thoughts regarding prior experience with the product class and product class knowledge. Incongruent scents may determine cognitive interference. Scent congruity condition resulted in more time spent in decision-making and increased distribution of decisions across product choice groups in each product category compared with scent incongruity. Chebat and Michon (2003) found that ambient scent is used directly to build a favorable perception of the mall environment and indirectly for product quality. Since odors may affect mall perception, retailers should consider that citrus scent as a powerful way of influencing product perception. Perception of the mall environment affects shoppers' arousal very strongly, whereas perception of product quality has very little impact although it is significant on emotions (Chebat and Michon, 2003).

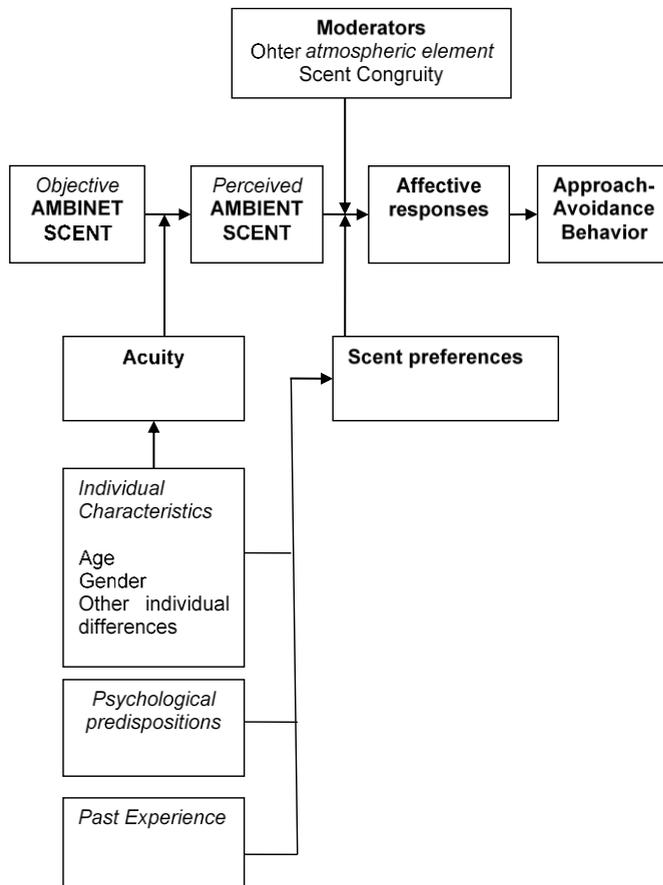

Michon and Chebat (2004) studied the effects of background music and ambient scent on shopper's perception of service quality in a mall atmospheric context. The results show that ambient scent, background music have no direct effect on consumers' perception of service quality, these variables act as mediators rather than moderators of service quality. Michon, Chebat and Turley (2005) examined the effects of ambient odors on shoppers' emotions, perceptions of the retail environment and perceptions of product quality under various levels of retail density in the context of shopping mall. The authors combined moderating effects of ambient scent and retail density which are measured on shoppers' positive affect and on their perception of the mall environment.

#### **5. The effect of ambient scent on consumer behavior**

Numerous studies has demonstrated that ambient scent influence consumer behavior. Hirsch (1995) examined if the effect of the *presence of a pleasant scent* on the amount of money gambling on slot machine in Las Vegas casino, odorized with different aroma over a period of time. The author reveals that the presence of a particular scent increased slot revenues produced in one area of the casino, while a section of the casino that was treated with a second scent and a section of the casino that remained unscented were not observed any significant change in revenues. Knasko (1995) examined the effect of *ambient olfactory stimuli* on approach behavior, mood and perceived health. The results suggest that when individuals were exposed to the pleasant ambient odors had certain effects rather than no odor (longer looking time, better mood and lower hunger ratings). These findings are consistent with prior reserch which show that pleasant environments can improve

mood and increase various types of approach behavior (Knasko, 1989; Ehrlichman and Bastone, 1992).

Gulas and Bloch (1995) develop a model on the influence of ambient scent specifically as an environmental cue on emotional responses and shopping behaviors. Based on the literature from several disciplines, scent was demonstrated to be relevant to consumer behavior in two forms: on the one hand, scent can be directly associated with an evaluation object while on the other hand, scent is part of the overall ambient environment. The model proposed by the authors (see Figure 1) is congruent with other models of environmental effects developed earlier on the work of environmental psychologists (Mehrabian & Russell, 1974; Bitner, 1992). Scent preferences in combination with consumers' perceptions of ambient scent influence affective responses. Between perceived ambient scent and affective responses can be seen potentially significant moderators. Affective responses to ambient scent are expected to result in approach or avoidance reactions relevant to the consumption situation. Gulas and Bloch (1995) model is one of the first steps in developing and understanding a specific consideration of ambient scent perception.

**Figure 1: The Model of the Influence of Ambient Scent on Consumer Responses**

(Source: Bloch and Gulas, 1995:90)

In a study conducted by Spangenberg, Crowley and Henderson (1996) were tested the effect of adding a *pleasant ambient scent* to a simulated retail environment. The authors want to find whether the presence of an inoffensive ambient scent (scents as being either pleasant or neutral) versus no scent affects evaluations influence approach/avoidance behaviors in a retail environment and whether this impact varies according to the affective nature and intensity of the ambient scent. The results of the study demonstrated that the presence or absence of a scent significantly affected evaluation of the environment and subjects evaluations of the products but weaker effects to product judgement. Subjects in the scented conditions did not actually spend significantly less or more time in the store than subjects in the unscented condition, the time consumers spend examining merchandise, waiting in lines, or waiting for help may be perceived themselves as having spent less time there than it actually is by introducing ambient scent into the environment. More specifically odors in the store environments may be perceived as part of the store atmospherics. The results of the tests suggested that only one of three product evaluations appear to be affected by the scent.

Bone and Ellen (1999) defined three dimensions of the odor which are considered to be important: the presence (or absence) of smell; pleasantness of smell and the congruity of smell with the object studied. The authors reveals that smell influence respondents in relation to: elaboration, as defined from both discursive and image-processing perspectives; affective and evaluative response; purchase and repeat visit intention; behavior in terms such as time spend and decision making. Bone and Ellen (1999) suggest that researchers have to examined whether odor effects on affective and behavioral outcomes are direct or are partially or fully mediated by mood state, cognition and other variables.

Ward, Davis and Kooijman, (2003a) examined the linkage between the research conducted in various field of scholarship and its potential application in retailing using the model developed by Gulas and Bloch (1995) and introduce other considerations that might be useful to increase the model focused on issues of totality and congruity. The authors consider that ambient smell is a stimulus which lead consumers to develop a holistic impression of the store which can be consider its atmosphere which links to the notion of retail identity, retail image and consumer behavioral responses in terms of approach and avoidance behavior (Ward, Davis and Kooijman, 2003a). The holistic impression of a store helps retailers to develop a clear, consistent and coherent brand identity that is communicated and vested in the store itself, and the understanding on the importance of the use of smell in this process it is very important (Ward, Davis and Kooijman, 2003a).

Davies, Kooijman and Ward (2003b) extending and elaborating the Gulas and Bloch (1995) and introduces in their paper the ability of smell to communicate a "sense of place" and its potential as a differentiator in crowded marketplace. Compared with original model proposed by Gulas and Bloch (1995), the extending model implied important issues for researchers and retailers such as (Davis, Kooijman and Ward 2003b: 622): smell can be perceived through pre-attentive processing, this means that in some situation consumers respond to a smell without realizing; scent memory provides retailers with a mechanism for triggering memories of emotions; when such emotions are pleasant, appear facilitates the development of a "bond" between retailer and researchers; cultural background must be incorporated to the model to reflect the potential importance of group membership on individual characteristics

and preferences; ambient scent is one of the important stimuli which lead consumers to development a holistic impression of the store; the notion of holistic impression can be linked to the creation of a: "sense of place" where smell has a potential to act as place-marker in this context; psychological state is one of the most important intervening factor in scent perception and interpretation which was not incorporated in initial model proposed by Gulas and Bloch (1995). The model proposed Davis, Kooijman and Ward (2003b) recognized the need for future research which will examine the extensions of elaboration model proposed by Gulas and Bloch (1995). Spangenberg et al., (2006) examined evaluative and behavioral effects of congruity between the perceived gender of an ambient scent and a store's gender-based products. They investigated customers' responses to an congruent versus incongruent scent between the gender-based product offerings and the perceived femininity or masculinity of ambient scent in a clothing store. The results reveal that the presence of an ambient scent congruent with gender-based products influence shoppers to evaluate the store and its merchandise more favorable, shoppers are more likely to exhibit approach behavior in comparison to an incongruent scent. These results were obtained when other store factors (price or advertising) were held constant. (Spangenberg et al., 2006). Also the presence of a gender congruent scent increases the majority of approach behavior in an actual store including money spend. This study is the first published study which demonstrated the effects of varying scent on actual sales. The results of the actual study extend prior research (Spangenberg, Crowley and Henderson 1996) showing that beyond merely incorporating ambient scent it is important to managers to identify gender preferred or gender congruity scent in their store environments. Parsons (2009) noted that some of the earlier studies on scent (Spangenberg, Crowley and Henderson, 1996; Morrin and Ratneshwar, 2000) on the effects of ambient scent tended to look at the pleasantness of the scent, and does not consider any association of the scent with the store. Parsons (2009) analysed whether an associated scent differs from a non-associated scent on its effect on customer liking for the store and consumers' behavioural intentions regarding the store. In this way, the author chose three generic store-types (bookstore only new books; a lingerie store; white-ware appliance store) that were unlikely to have product specific scents. Each respondent view the video of a store, then was measuring affect and behavioural intention. The results reveal that for the store which is odourless, the use of an associated ambient scent will have a strong positive effect on shopper liking for the store. While for all three store categories the presence of a non-associated scent has a negative effect on affect of the store. These results are consistent with prior research (Mitchell, Kahn and Knasko, 1995; Bone and Ellen, 1999). The no scent scenario also has a negative effect on affect, these findings are contrary with prior research (Spangenberg, Crowley and Henderson, 1996; Morrin and Ratneshwar, 2000), which suggested that merely having a scent present may have positive effects, but the results of this study suggest that the absence of scent may have negative effects, rather than the implied null effect suggested by the Spangenberg, Crowley and Henderson (1996) study and that the scent present needs to be one associated with the store type (Parsons, 2009). The effects of scent on purchase intent were found that for the book and lingerie stores the presence of a non-associated scent has a negative effect, whereas the no scent option (congruent) has no effect these results are consistent with Ellen and Bone's (1998) findings. Presence of an

associated scent has a significant positive effect on intention (Pearsons, 2009). The results of the field study was not necessary convincing but reveals that the results of experiment findings have reasonable validity. Scent with other atmospheric stimuli can be use to create an attractive store environment to shoppers. The Pearsons' (2009) study reveals that for a normally odourless store an appropriate scent in the form of an associated scent can enhance shopping behavior.

In a real retail setting of young fashion shoppers Morrison et. al. (2011) examined the effects of music (high/low volume) and aroma (the present/absence of vanilla scent) on customers' arousal and pleasure levels and how these affect approach/avoidance behaviour in term such as time spent in store, expenditure levels and customers satisfaction. The results of the study reveals that music volume and the presence of aroma have a significant effects on shoppers' emotions and subsequently influence shopper behaviors and satisfaction level. More specifically arousal induced by music and aroma results in increased pleasure levels which affect positively shoppers behaviors in terms of money spend, approach behavior satisfaction and overall staisfaction. Teller and Dennis (2012), conducted a field experiment in a regional shopping mall to examine the *effectiveness of ambient scent*, the results reveals that ambient scent did not affect any observed or surveyed variable on consumer behaviour no matter which experimental design was simulated. These results are not consistent with prior research (Hirsch 1995; Knasko 1995; Mattila and Wirtz 2001; and Spangenberg, Crowley and Henderson, 1996)

## **6. Discussions and future research**

Scent as other atmospheric stimuli influence consumer behavior in terms of cognitive, emotional and behavioral responses in retail setting and service environment. Turley and Milliman (2000) noted that smell did not received sufficient attention from the researchers as deserved, recently numerous researchrs examined the effect of scent or interaction between ambient smell and background music on consumer behavior in retail store or shopping mall. If earlier studies were concentrated more on the effects of scent on product evaluation (Bone and 1992) and brand evaluation and association of scent with product sold (Cox, 1969; Hirsch, 1990; Bone and Jantrania, 1992; Mattila and Wirtz, 2001) recently researchers recognized the influence of smell on cosumers' perception or shopping behavior in fashion store or shopping mall (Spangenberg, Crowley and Henderson, 1996, Chebat and Michon, 2003). Gulas and Bloch (1995) observed that the scent of flowers may be generally perceived as pleasant, but totally inappropriate for a motorcycle shop. The Pearsons' (2009) study reveals that for a normally odourless store (electronics store, stationery shop, fashion outlet, or bookseller) an appropriate scent in the form of an associated scent can enhance shopping behavior.

The model proposed by Gulas and Bloch (1995) was one of the first step in developing and understanding a specific consideration of ambient scent perception even if the authos request additional research on smell, specifically in the context of retail environments, not so many researchers try to test their model. Ward, Davis and Kooijman, (2003a) organise their work trying to cover these ares which did not fully developed in Glas and Bloch's (1995) framework starting with those focused on issues of totality and congruity. Davis, Kooijjan and Ward, (2003b) contentrated their work on the use of ambient scent in the retail environment and examined the mediating factos that help shape the emotional and behavioural responses that are

stimulated. Bone and Ellen (1999) proposed a model for conventional wisdom view of odor which influence approach/avoidance behaviors, altering mood state and affecting elaboration. As can be observe non of these studies did test the model proposed in a filed experiment in retail store or in mall environments.

The authors of present study identified some studies on interaction between ambient scent and background music (Mattila and Wirtz, 2001; Michon and Chebat, 2004; Spangenberg, Grohmann, Sprott, 2005; Morrison et al. 2011) future research have to consider the influence of more interior variables (music, scent, color, lighting; crowding) on their impact on shopping behaviour. These studies reveals that scent influence consumer behaviour in terms such as : perceptions of the store, mood, pleasure, arousal, time spend in store, money spend in store, approach avoidance behaviour. A lack of studies are identifies on the influence of ambient scent in service environment or in online environments we identified only a few studies on the effect of scent in services for example Guenguen and Petr (2005) examined the effects of ambient scent on consumer behavior in a restaurnat. Vinitzky and Mazursky (2011) exmined the effect of the iteration between cognitive variable and the presence of scent on online search motivation purchase characteristics, and telepresence.

In the majority of previous papers were investigated the influence of scent on consumer behavior and exclude the impact of scent on employee bahaviour, future researh can consider this and also the importance of factors which moderates this relationship. Our purpose for future research is to develop a framework on the effect of ambient on shopping behavior in clothing store and mentioned the importance of moderators in this relationship.

**Abstract:** *Analyzing products and services around us it is clear that most of them are the result of production factors, labor and capital becoming more international and increasingly less and less national. We are witnessing the globalization of markets and production, to a large global integration and interdependence, increase personalization of production and services as a result of new communication systems interaction and flexible production processes. Markets will continue to homogenize and diversify at the same time, so it is important that as a global marketer one addresses a market segment defined by income, age, and consumption habits and not by membership of a nation. The most visible and polarized is the premium segment fighting for high income clients where brand value plays an important role. Instead identification of large segments of customers offers the advantages of scale economy in production and marketing for global enterprises. Consumer profile is the dominant global consumer requesting and accepting global products and services easily. In fact, what can force an economic alignment to achieve the best performance, rather than the global consumer. The research methodology used includes literature review, comparative analysis, synthesis of data based on bibliographic resources and official documents. The aim of the paper is to highlight current models that underlie the competitive advantage of nations and assess the competitive advantage of Romania in the context of the global market. A case study is used to offer an overview of competitive advantage of Antibiotice Iasi SA, a competitive player, in a global pharmaceutical market with strong global competition. Countries moderate companies' achievements of global efficiency objectives due to the countries' rivalry. Romania has to understand that it is in competition with other countries in order to fulfill economic, political and social objectives. The scope in the end is the well-being of a country's people.*

## **1. Globalization and Global Competition**

Global competition is a reality whether we are willing or not to accept it. Globalization and hence global competition is supported by the development strategy of multi-and transnational companies, governments, international organizations and consumers. Goods and services around us are the result of interaction and integration through trade, capital and labor flows, technology becoming more and more international and increasingly less national. We have today economic actors that are global from their appearance given new experiences of communication. We live in the time of digital economy based on relationships, networks and interaction (Gummerson, 2008). The new realities of the contemporary world resizes international relations and lead to the crystallization of a global economy based on networks (Bari, 2010) by translating the classic foreign trade interdependencies in a system that acquires planetary vocation. Models of multilateral negotiations take gradually instead of bilateral, not only politically but also in the economic (Malița, 2007). Moreover, contemporary economic negotiations call for a much greater extent to ensure success: empathy, creativity and partnership spirit, three distinctive features of relationship marketing (Schebesch, Pop, 2013). From this we can conclude a direct connection between relationship marketing and the globalization. Extending relational marketing approach within strategic alliances (Mâlcome, 2013) by changing the competitors in associates is perhaps the best example.

Technology is one of the main proponent of globalization, and companies are required to keep pace with new technologies and adapt to new consumer trends required. Depending on activity sector forces of the company that favor "global integration" are: capital-intensive production, homogeneous demand, as opposed to 'national adaptation' generated by local standards and barriers, strong local preferences (Kotler, 2008). We are in a phase of global development cycle that is not turning back and follows steps that strengthen global assertion of economic agents. Globalization on the market of material goods opens perspectives by differentiation through attaching specific services. The best example is that of smart phones and their specific applications. Business growth is ensured by covering new markets or better coverage of existing markets. We are seeing an acceleration of acquisition processes and partnerships among global players who thus have access to markets, technology, work processes and utilize the advantages of experience, economy of scale, resource utilization and overall strategy. Global integration is supported by: free trade agreements, new interaction in communication systems, flexible manufacturing processes, consumer preferences, transport optimization, all based on the latest economic trends worldwide.

Global economic environment changes constantly. Today the new triad in international trade is based on relations between Western Europe, extending eastward, the U.S. with Mexico and Canada and last but not least Japan and Pacific countries, hold 86% of global trade (Pop et al., 2011). The largest share of international exports is owned by intraregional trade, and between European countries is developing the third of world exports.

The study "How Global Brands Compete" (Holt et al., 2004) confirms that the choice of global brands is related to three dimensions: quality signal, global myth and social responsibility. The same study shows that only 13% of consumers prefer to avoid transnational companies and therefore are reluctant to consume global goods and services.

Globalization allows consumers to choose the most demanded products and services that the world has to offer, and companies choosing the best suppliers. In fact, what can force an economic alignment to achieve the best performance, rather than global consumers? How can one keep near a global client if the trader is not ready to understand his expressed and potential needs? What competition may be more beneficial than the global one to amplify internal performance and to stimulate the development of better products and services?

Multinational companies require three kinds of specialist – business managers, country managers, functional managers – and a set of senior executives to nurture the specialists and coordinate their efforts (Bartlett, Ghoshal, 2003). Global business management involves identifying appropriate human structures capable of standardization required by the company to adapt its advantages to important local consumer preferences. The organization of global leaders is flat and simple rather than complex and branched. Simple structures increase the speed and clarity of the information and allow focus of energy and valuable resources on innovation and learning and less on control, monitoring and reporting (Keegan, Green, 2013).

The aspects of the globalization that directly affect international firms include (Bradely, 2005):

- New information and communication technologies that enable the firm to go global – a key role for the Internet
- Communication technology that integrates suppliers into their customers business process and consumers lifestyles
- Information about information that is becoming a key source in the firm
- Growth of non-profit businesses in international markets
- Call for more ethical and social responsibility among international firms
- Emergence of a global culture based on music, clothing and entertainment
- Influence of global branding incorporating services and products

Markets will continue to homogenize and diversify at the same time, so it is important that as a global marketer one addresses a market segment defined by income, age, consumption habits and less through membership of a nation. The most visible and polarized is the premium segment fighting for high income clients where brand value plays an important role. Relevant examples are brands like: Hermes – famous fashion brand, an iconic status among men of a certain income, Mont Blank – luxury watches, writing instruments, jewelry & leather, Hennessy – means know-how, cellar, blending, aging, standards for cognac; Louis Vuitton – world leader in luxury, Prada - one of the most innovative fashion brands, capable of re-defining the norms and setting new trends. Instead identification of large segments of customers offers the advantages of economy of scale in production and marketing for global enterprises. Examples are: IBM – a globally integrated company operating in over 170 countries, being world's largest IT and consulting services company, Apple and Samsung as world's largest information technology companies, Hewlett-Packard the world's largest PC vendor by 2012 unit sales.

Many companies outsource all their manufacturing to become research and development and marketing firms where the brand gives the value of the company, e.g. 3M, Zara, Nike, Levis, Adidas.

Globalization is not a process exclusively attributed to the end of the second millennium. The roots were starting from the first industrial revolution. But what

distinguished by its contemporary form and content can be summed up in (Bari, 2010):

- the extent to which it unfold (the process covered the entire world now);
- support provided by technical progress, based mainly on communication cyberspace, miniaturization and other consequences of revolution generated by information technology;
- pace of change, generating dynamic exponential developments

## **2. The national competitive advantage**

National competitive advantage occurs when a nation creates more value than other competing countries by cost, speed of response, quality and innovation. Competitive advantage of a country is based on native values and connotations which add values and connotations acquired by the nation during the time. National or regional approach in achieving competitive advantage increases the chances of sustained success versus at the individual company approach. Today the nations and corporations must find new and creative ways to organize themselves. The need to be cost-effective, customer-oriented, to deliver the best quality are some of the realities of the present. In a highly competitive environment of today there is a need for flexible structures in an effective and efficient system of relationships. As Henry Mintzberg well noticed to Michael Porter effectiveness lies in strategy, while for Tom Peters what matters is the operational - with excellent execution of any strategy.

Competitive advantage occurs when there is a match between distinct competences of the company and the critical factors for success in an industry. Any superior fit between company skills and customer needs, allows the company to perform above the level of competition. Competitive advantage can be achieved in two ways. First, the company can address a low cost strategy which gives the possibility to offer products at lower prices than the competition. Secondly, the company may adopt product differentiation strategy that allows customers to perceive unique benefits, often accompanied by a premium price.

Ultimately the customer perception decides about the quality of the company's strategy. Performance of the organization, such as sales and profits depend on the psychological value created for clients. Finally, who creates more value than the competition, has competitive advantage and customer perception defines the value (Keegan, Green, 2013). Strength of a nation lies in the definition, construction and development of values that create competitive advantage. Today we are speaking about the concept of country brand that is used as a shortcut by stakeholders in their assessment.

The support of the development of national competitive advantage is given according to Porter to the presence or absence of particular national characteristics and less on the ability of the companies to create key competences and competitive advantage. Porter further grouped these national advantages in a diamond made of: factor conditions, demand conditions, related and supporting industries, and firm strategy, structure, and rivalry. Two elements are added to this framework: chance (exogenous influences) and government as a major determinant of national competitive advantage (Porter, 1990). The national diamond is not exogenous to the company. On contrary, companies have to upgrade their home actively by amplifying their home-base advantages and offsetting home-based disadvantage (Van Den Bosch, Van Prooijen, 1992). The influence of national culture on the competitive

advantage of nations is given too little attention in Porter model. Porter's diamond has to be combined with the dimensions of national culture found by Hofstede. After a thorough research project into the influence of national culture within a particular multinational company including 50 countries, Hofstede developed a model that identifies four primary Dimensions to assist in differentiating cultures: Power Distance - PDI, Individualism - IDV, Masculinity - MAS, and Uncertainty Avoidance – UAI. Then added a fifth Dimension after conducting an additional international study with a survey instrument developed with Chinese employees and managers, for that dimension, based on Confucian dynamism, is a long-Term Orientation. Operating across borders demands people who are intercultural savvy so that they can turn international approach into great success.

Some researchers like professor Rugman consider that success of firms based in small economies such as Canada comes from the "diamonds" found in a particular set or combination of home and related countries. Canadian managers have to look to a "double-diamond" and assess the features of both Canada and the US when formulating corporate strategy. Generally speaking it is necessary an approach beyond the nations to the region or to sets of closely linked countries. The same situation is for a country like Romania based in EU space. Howard Davies and Paul Ellis consider in the Journal of Management Studies that nations achieves sustained prosperity without becoming innovation driven and note the absence of strong diamonds in home bases of many global industries.

### **3. Romania's competitive advantage and globalization**

Opportunities appear with global players and besides global players. Romania's economy is subordinated to the global economy and must accept that opportunity derived from the degree of integration in the global economy flows. Our chance is to play successfully in the area of execution partners for global leaders (mostly Europeans) and not as global leaders. After this stage of existence as successful partner for global leaders, we can think that we will see the emergence of global leaders having as basic nation Romania.

Western Europe is the leader in technology and will continue to invest in Eastern Europe and implicitly in Romania. Technology transfer occurs through direct investment in manufacturing but also in research and development. These investments develop clusters and networks (Tantau et al., 2011) that can be considered a catalyst in industrial development and competitive advantage, speeding up the creation of firms and jobs and thereby contributing to growth and prosperity. There is a strong concentration of R&D spending in the world. The first three sectors - pharmaceuticals and biotechnology, technology hardware and equipment, and automobiles and parts - represent 51.7% of total R&D expenditure in the EU. In Romania the first three sectors with the largest investment in R&D are the automotive, chemicals and electrical equipment fields. Romania's economy is characterized by the prevalence of low and medium-technology sectors, with a weak demand for knowledge and an underdeveloped innovation culture. Romania is ranked by European Commission in "Innovation Union Scoreboard 2013 Report" as a modest innovator. More than this Romania has the lowest R&D intensity in the EU and a very low level of business R&D activity. For full picture of poor innovation, the Global Competitiveness Report 2011 classifies Romania as efficiency-driven (together with Bulgaria), all the rest of the EU economies being either in transition

to, or already in the innovation-driven stage. According Porter's diamond for Romania due to the efficiency-driven stage the competitive advantage comes from factor conditions for a nation that is not prosperous and salaries are relatively low in EU space. Even if the crises affect dramatically Romania, in the same time appears the chance to take the advantage of the price oriented consumer attitude. Dacia is one of the most visible examples which are successful competing on cost achieved through wages, scale economies and best practices in manufacturing. Dacia competitive advantage and success of today is sustained by demand conditions and firm strategy, more than basic factor conditions.

#### **4. Case study – SC „Antibiotice” Iași SA**

To understand the competitive advantage we stopped at the Romanian pharmaceutical sector and more specifically the company named Antibiotice S.A.(ATB). ATB was founded in 1955 and manufactures over 150 medicines, used for the treatment of several diseases (infectious, dermatology, cardiovascular, digestive and musculoskeletal). Listed on Bucharest Stock Exchange since 1997, the main shareholder is the Romanian Government (53%). The turnover rose at compound annual growth rate of 10% during the period 2003 - 2012. During 2012 the turnover rose by 7.9% yoy to RON 297mn, the operating revenue increased by 6.4% yoy to RON 327.5mn, while the operating expenses rose by 4% yoy to RON 292.7mn, due to the evolution of the raw materials expenses (up 17.4% yoy) and of the depreciation & amortisation (up 17.2% yoy). Due to this the operating result increased to RON 34.8mn. From the financial operations ATB had a loss of RON 2.3 mm in 2012. The net profit rose by 33.2% yoy to RON 27.4mn.

Over the past years ATB focused on the internationalization. The volume of exports rose from USD 13.2mn in 2009 to USD 20mn in 2012. ATB is the second important producer of Nystatin at international level, with a global market share of 35%.

ATB issued a press-release announcing that in Dec'12 – Jan'13 the company has passed the fourth FDA mandatory inspection for the drug producers distributing on US market with favorable outcome. At the same time two important drugs distributors in USA have audited the quality of ATB injectable powders flux in order to conclude commercial contracts with the Romanian producer. According to the company's management, the FDA favorable inspection result consolidates ATB's position on US market and facilitates the expansion on new markets such as Australia, Canada, South America and South Africa. Currently ATB

exports on USA the active substance Nystatin and Ampicilin injectable powder in four concentrations. Additionally ATB is expected to initiate the export of Nafcillin in two concentrations on US market during Q1'13. According to the management, ATB exports sales are expected to grow by 17% this year can due to its network of over 100 distributors in 60 countries. ATB is a success story in terms of internationalization of its products in the global market and has a huge potential development that can be harnessed by accessing markets of the American and African continent.

As a conclusion for ATB, we have to change our mindset in approaching the competitive advantage of Romanian pharmaceutical industry, being a believer in our creative intelligence based on the existing culture and tradition in the field generated by schools of I. Cantacuzino, V. Babes, N. Paulescu or A. Aslan.

For ATB is mandatory to have a clear understanding of global trends:

- Research and development is now about networking, sharing and partnership. The open innovation concepts promote collaboration within the industry, government agencies, private organization and academic field with the scope to resolve major medical and public health issues.
- Strategic international alliance grown as importance over the years and become a competitive strategy in global marketing management
- Create strong culture inside of the company which support excellent valorization of specialists of the company
- A better capitalization of the countries permeable to Romanian exports, even if we talk about EU and non-EU countries.
- An aggressive marketing campaign in preparing and supporting the market launch of new pharmaceutical products for which the company wants to be competitive at the international level

## **5. In conclusion**

Romania has the opportunity to be in the European Union, with the exceptional possibilities of future development. The distance between Romania and EU countries is so important, that is enough space for Romanian improvement in terms of competitiveness and productivity. In the EU there are global leaders that in order to maintain or improve the productivity and competitiveness of production areas need flexible, efficient, cost effective space of innovation and development. Romania does not have the handicap of past developments that create resistance and blockage in affirmation of new technologies and processes. Romanian managers have to look to a “double-diamond” and assess the features of both Romania and UE when formulating corporate strategy.

Romania must develop superior interaction network of value-added relationships. Our chance is to create strategic partnerships and alliances with international players to take the advantage of their development. A better understanding of marketing tools and a fact that customer perception decides about the quality of the product and service, can help Romanian companies to improve their performance. But because greed is great, at least to some businesses, the risk of blockage in a highly interdependent global economy is high and hence the role of gendarme of regulatory and supervisory institution should be limited, but active.

For harnessing Romania's competitive advantages are required a change of mindset, a creative approach and an aggressive spirit in a good way in the international competition. We need a proactive attitude in a climate of macroeconomic policies able to support Romanian exports.

nicolae\_al\_pop@yahoo.com

**Abstract:** *The topic of the present study is innovation of services in the retail trade of bricolage (Do-It-Yourself, DIY) products and the influence that innovation has on the increase of customer attachment to companies in this field. The Romanian bricolage market brings together representatives of large specialised retail chains in Europe along with large domestic operators, which led us to the choice of this trade as a research field. Innovation is considered an important factor that brings a significant contribution to the success of a business (O’Cass, Song and Yuan, 2012), and services are a priority for economic development. Despite all these, innovation in services is still insufficiently exploited both theoretically and empirically. The object of this study is to apply a qualitative research through semi-conducted interviews with managers from the DIY retail field in order to validate the conceptual model whose inputs, innovation along with the availability and professionalism of the sales staff, act as generators of customer attachment to the company, leading to increased turnover, a permanent fund of customers and loyalty to the store. As a second stage, the proposed model will be tested through a quantitative research, by making use of the customer’s points of view. The three hypotheses of this research (H1: Innovation in services is determined by: the customer’s involvement in the implementation of the service, the use of gadgets in the store to facilitate access to information to the customer, the extension of the in-store services to the virtual environment and customer experience; H2: Innovation together with the availability and knowledge of the sales staff are sources of the customer’s attachment; H3: Attachment acts as a catalyst for the turnover, the permanent fund of customers and the loyalty to the store) have been accepted, the study revealing that in the retail trade of bricolage products, the staff’s availability and professionalism are key elements for the definition of customers’ attachment, along with innovation, which is an extra advantage to customers.*

**Keywords:** *Innovation in services, attachment, retail trade, semi-conducted in-depth interviews*

## **Introduction**

Contemporary social and economic development is determined by the evolution of the services sector, which is an important component of the global economy.

Diachronic and synchronic analysis of the dimension of the services sector shows the strong tendency of the economic systems in the developed countries towards 'globalisation', as well as a correlation between the level of development of services and the level of development of national economies. Thus, in the more developed countries, the share of services goes beyond 60 and even 70% in relation to the employed population. Even so, there are still some differences even in the case of these countries, which are determined by the particular patterns of economic growth, different from the point of view of traditions, customs, etc. .(*Ionciță, accessed online 20.03.2013*).

On the operation of the services sector depends the economic development of a nation because this sector triggers the performance and the economic development - producers and exporters cannot become competitive without services such as banking, insurance, accounting, telecoms, retail or transport, thus leading to an increased rate of innovation and technology transfer, and supporting long-term investments (*Enescu and Enescu, 2012*). According to a report published by Eurostat in October 2012, 43% of the employed population in Romania was working in the services sector in 2011 (Eurostat, *accessed online 20.03.2013*). Nevertheless, economic development in Romania is conditioned by an even more active and daring enterprise in the services sector, by encouraging innovation in this area.

At the microeconomic level, companies admit the need of being innovative in their offer of services in order to be well prepared to face the growing competition. The Director of the Research in Services Department of IBM emphasises that 'people have a certain idea about what technological innovation means, but innovation in services is rather unknown' (Yen, Wang, Wei, Hsu and Chiu, 2012).

With this study we want on the one hand to explain the concept of innovation in services and on the other hand to determine, through a qualitative research, the existence of a relationship between innovation and the degree of attachment to service companies, with a practical application in the DIY retail from Bucharest.

## **Innovation in Services**

Paradoxically, innovation in services is still underused both theoretically and empirically despite the fact that services represent a priority for economic development and innovation is regarded as an important factor contributing to the success of a business (O'Cass, Song and Yuan, 2012),. At the same time, innovation in services is described as 'the Next Big Thing!' (Jana 2007 in O'Cass, Song and Yuan, 2012). The aforementioned situation is the reason behind this research. In a paper from 2010, Ostrom et al. define innovation in services as activities that 'create value for customers, employees, owners, partners and the community through offers and processes of services, but also new and/or improved business models' (Ostrom 2010 in Yen, Wang, Wei, Hsu and Chiu, 2012). In light of this definition, innovation in services reveals itself as a continuous process that consists of a series of incremental changes in the products and processes (OSLO Manual, 2005: 38).

Innovation in services is not limited to the uniqueness or novelty of a service only, but also to innovations in other areas of the system, such as the service delivery processes, the interface with the consumer and the buyer-seller relationship. Even

more, if compared to innovation in products, innovation in services often arises from a need or problem that consumers are facing (Kindström, D., et al., 2012).

According to previous studies of Carman & Langeard (1980), Edvardson & Olsson (1996), and Larsson & Bowen (1989), innovation in services is composed of 'interactive innovation' and 'supportive innovation'.

- Interactive innovation refers to the value created through changes initiated by the service company and is designed to determine the consumers who interact with the new service concept to express themselves in relation to this new concept in cognitive, affective and behavioural ways. Interactive innovation consists of three elements that the customer experiences: changes in image or offer (new or improved offers of services), changes in the service delivery mode and changes relating to service personalisation based on the consumer's needs.
- Supportive innovation refers to the changes that help create value for the new service and includes three types of changes: changes related to the implementation of the service (i.e. the identification of new or improved resources used for the development of the service), changes in the supply chain (new or improved supply chain methods) and changes in the quality of service (initiatives that lead to increased quality of service) (Carman&Langeard,1980, Edvardson&Olsson, 1996, Larsson&Bowen 1989 in Salunke, S., et al., 2012).

Particularly in the services sector, consumers are considered to be co-producers and therefore, according to Gummesson, they should be treated as members of the service company, as part-time employees (Gummesson, 2002:69). The consumers' needs and ideas lead to innovations that will finally increase the consumers' attachment to the service company.

The services field being so vast, we focus our research on retail trade in general and on bricolage (DIY) retail trade in particular. Our approach is based on one hand on the fact that in most South-European countries there is a consistent increase in the traditional service sector such as retail trade, transport and tourism (*Enescuand Enescu, 2012*), and on the other hand on the fact that, through its specific properties, the retail trade of bricolage products get the buyers involved in purchasing decisions at a higher degree and therefore triggers more effort into evaluating innovation on the buyers' side (Pop, Săniuță and Roman, 2012). In addition, this type of trade developed significantly over the last decade on the Romanian market, currently over 135 bricolage (DIY) stores being active across the country.

Innovation in retail trade reflects on: *sales form* (type store), *brands* (especially privately-owned ones) that make up the product range, *process innovation*, *customers' experience*, *information technology*, *new communication media employed*, *methods of payment and of order fulfilment* ( Reinartz et. al, 2011). Even more, being an area in which interaction with the customer is the main focus of all activities, the degree of novelty of products, services, processes or business models depends on whether they are perceived as innovative by consumers mainly, and by company representatives secondarily (Hauser and Urban,1977).As a consequence, we can say that innovation is vital to the future of producers and traders, the novelty of products and services that are significantly different from what already exists on the market ensuring the competitive success of a company (Omar: 1995, in Pop and Săniuță, 2012).

## **Obtaining Customer Loyalty through the Attachment Process**

In today's hyper-competitive business environment, marked by globalisation, customer loyalty is critical for the evolution and intensive development of a business (by obtaining loyalty from the existing customer base) and is a major competitive advantage (Smith and Taylor, 2004). Extensive development (through acquisition of new customers) is more difficult to achieve. The economic crisis that we undergo adds even more difficulty to this task by forcing more and more companies into finding new ways to achieve customer satisfaction and loyalty. Today's consumer is more informed and educated, with easy access to information, and therefore more demanding and more difficult to retain in a market saturated with numerous offers from various players. The financial element is no longer sufficient or decisive when it comes to the choices that the customer makes. Most often, the choice is made based on prior information and, especially, based on the relationship built over time with the organisation.

Customer attachment to the organisation, product or brand is built over time, in several steps: first purchase, repurchase, fidelity, loyalty. The mandatory condition for the transition to the next stage is satisfaction. In case dissatisfaction occurs during one of these stages, the customer will abandon the product or service of that organisation and will switch to a competitor's offer. If, after repeated purchases and after the loyalty phase has been reached, the customer is excited about the value obtained, then he will reach the exclusivity phase when he totally ignores other competing products or services on the market (Pop, 2005). In addition, Oliver (1999) sustains that cumulative satisfaction will influence loyalty, not just satisfaction after a single purchase.

Satisfaction is the customer's answer showing the extent to which his expectations have been met. It is a statement that certain features or the entire purchased product or service provides a satisfactory level of consumption-related fulfilment (Oliver, 1997). In the retail sector, customer satisfaction can be defined as the 'post-consumption evaluation of how well the store or product managed to meet or exceed the customer's expectations' (Levy and Weitz, 2009).

In the Romanian retail system, and not only, loyalty programs typically provide some points that are calculated in report to the sum of money spent on every transaction. In most cases, these points are recorded on a membership card, which is presented at the point of sale.

Loyalty programs provide monetary and non-monetary benefits based on the amount of money spent on purchasing goods and/or services (Stauss et al., 2005). But customer loyalty is about building a long-term relationship with the customer. Therefore, as stated by many researchers in their work (Fournier and Yao, 1997; Pritchard et al., 1999; Bowen and Chen, 2001; Rundle-Thiele and Mackay, 2001; Koo, 2003; Kumar and Shah, 2004; Wong and Sohal, 2003, Rundle-Thiele, 2005), the conceptualisation of loyalty should also take into consideration other emotional factors, such as resistance to the competitors' offerings, tendency towards loyalty, statements of disagreement and complaints, etc.

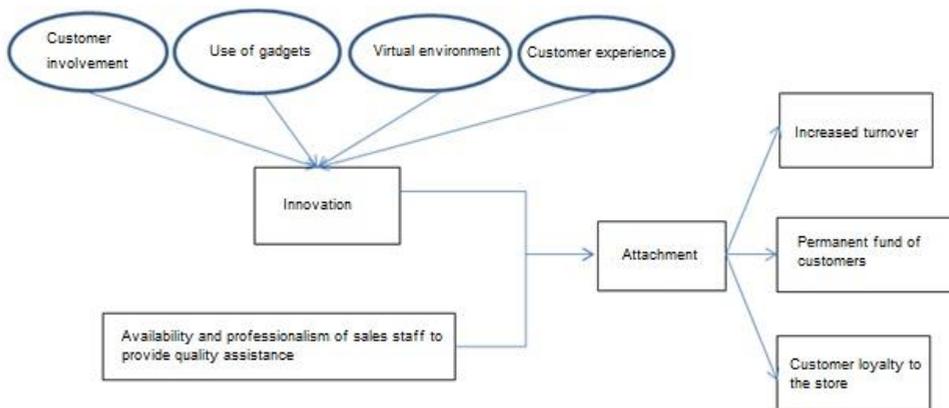

The definition of loyalty in retail can be phrased as follows: 'the attitudinal and behavioural preference for a retailer as compared to the alternatives available at the competitors' (Wallace et al., 2004: 251 in Vesel, Zabkar, 2009). Research shows that 'polygamous loyalty' (consumers' tendency to divide their loyalty among several

brands) closely describes the consumer's behaviour in retail (Dowling and Uncles, 1997 in Davis-Sramek, Mentzer and Stank, 2008).

Long-term loyalty remains an ambitious goal to achieve, an 'elusive dream' for many organisations, indicating that there is still much to learn and understand on this topic (Karjaluoto et. al., 2012).

## Methodology

The proposed conceptual model involves the previously developed concepts: innovation and sales staff's availability and knowledge in order to provide quality services. The two constructs are the input of this model and together determine the attachment. In its turn, attachment generates an increased turnover, a permanent fund of customers and loyalty to the store.

**Figure 1:** – The conceptual model of research  
Source: realized by the authors of this research

According to Churchill (1979: 67), when conceptualizing constructs, it is imperative to analyze the existing literature. To measure innovation in services, four dimensions have been taken into account:

- Customer involvement in achieving the service  
Services emerged in response to customers' (or the market's) needs, so that customers, as main beneficiaries, act as co-producers of services. Co-creation is a key concept in service innovation because innovation depends on a good knowledge of the customer, on his network of acquaintances and on his skills (Chae, 2012). Also, in a recent study conducted by IBM on 26,000 subjects in 14 countries, 89% of participants declared their availability to spend 20 minutes of their time to help a retailer better understand their needs, in order to conceive an offer that meets these needs (IBM Institute for Business Value, 2013).
- The use of gadgets inside the store to facilitate customers' access to information

In a survey conducted in 2012 on 'Perception and communication of innovation in retail', the taxonomy of innovation types in the DIY retail trade has been developed. One type of innovation is 'Innovations in the act of selling itself', with the following concrete forms of expression: mobile assistant (on various gadgets) for shopping, room for testing and creativity, innovative payment and settlement systems, buy-back and customer incentives to recycle materials, electronic information points, displays providing discounts based on the information held about customers (Pop, Săniuță and Roman, 2012).

- Extension of the in-store services to the virtual environment

Today's technologies have changed the way consumers make their purchases. Although for 84% of consumers (IBM Institute for Business Value, 2013), stores are the first choice when it comes to purchases, we should not ignore that consumers gather information in advance in the virtual world. As a result, the weak connection between the two environments, real and virtual, must be improved so that the experience from an environment extends to the other environment.

- Customer experience

Consumers' experience in retail can be expressed as the sum of all the experiences that they have when they make purchases in a store. To use this concept in service innovation, retailers need to understand this phenomenon and to rethink processes so that each visit in the store is an enjoyable experience for the customer (Ostrom et. Al, 2010).

The introduction of the variable 'Availability and professionalism of sales staff to provide quality assistance' is based on the following arguments: Jackson and Shaw (in Kent and Omar, 2003: 172) noted that the most valuable element of the extended marketing mix is the people because of their role in customer service and customer relationship management.

Retail means working and serving customers in a direct and personal way, so, in a rapidly changing and highly competitive environment, well trained and motivated employees are essential to the long-term success of retail companies (Merkel, Jackson and Pick, 2010). In bricolage (DIY) retail, the need of well trained and informed employees is even greater than in other fields because in this sector customers need additional advice and especially because, beyond the material satisfaction of needs, emotional needs are also involved – customer's involvement in creating his own home or entertainment area.

According to Gummesson, employees are motivated to demonstrate their skills and customer orientation if they are well informed (Gummesson, 2002: 202). Additionally, a qualitative research conducted among employees of a bricolage (DIY) retailer in Bucharest showed that employees feel the need for communication training, which will help them establish an empathic connection with the customer. Even more, a new perception is required, that leads to perceiving the customer as a partner in the sales process and not just as a beneficiary of the sale (Pop and Săniuță, 2012).

The high number of competitors on the retail market of bricolage products, which results in a 'war of the offers' having as prize consumers' 'wallet', determined consumers to direct their preferences towards multiple retailers instead of only one. Retailers who succeed to attract consumers on their side and to develop long-term relationships with them will benefit, according to the model to be tested, from:

- Increased turnover
- Permanent fund of customers
- Customer loyalty to the store. According to a survey conducted by the company G.F.K. Nürnberg from Germany, brand loyalty is higher than store loyalty, which motivated us to search for factors that may contribute to the balance between brand loyalty and store loyalty (Mălcome, 2010).

The following hypotheses are illustrated in our model:

H1: Innovation in services is determined by the customer's involvement in the development of the service, in-store use of gadgets to facilitate customer's access to information, extension of services from the store to the virtual environment and customer experience.

H2: Innovation together with the availability and knowledge of sales staff are sources for customer attachment.

H3: Attachment acts as a catalyst on turnover, permanent fund of customers and loyalty to the store.

To validate the model, the first phase consists of a qualitative research in the form of semi-conducted in-depth interviews with managers from Romanian bricolage (DIY) companies. Since the main purpose of this research is to clarify and better understand the coordinates of the bricolage market, we can qualify this approach as an exploratory one, which represents a preliminary step for further studies (Cătoi, 2009: 74). The semi-conducted interview brings a set of topics in discussion, usually five to six, and uses as a tool the interview guide (Zikmund in Brătucu and Brătucu, 2006: 49). The interview guide contained the four parts recommended by Jolibert and Jourdan (2011:23), part 1: The introductory phrase where we explained the purpose of our approach and asked for the manager's permission to record the interview; part 2: the beginning of the interview where a general question was asked in order to establish the main subject; part 3: the interview's themes were freely discussed; part 4: the conclusion allowed us to see if there were any circumstances that could bias the validity of the information – such confidential issues – and also, obtain a feedback from each respondent.

The duration of the interviews ranged between 45 minutes and one hour, during which respondents were asked to talk about the aforementioned constructs and about possible connections among them. No preset order was imposed according to the rules of the semi-conducted interview (Cătoi, 2009: 220), and the views expressed by participants were recorded and analysed at a later time.

The content analysis is usually performed by using the rough material obtained during the interviews (Jolibert and Jourdan: 2011, 52). Therefore, the recorded interviews were transcribed, separately read by the authors and each one build an individual interpretative framework. For this purpose, the lexical analysis allowed identifying redundant words, whereas the textual analysis emphasized phrases that were dealing with the same theme. Once the data was categorized in several themes, a relational analysis (Jolibert and Jourdan: 2011, 55) was performed in order to quantify the associations between concepts, the proximity of their connection or

interference. At the end of the stage, the four resulted analysis were confronted and discussed by the authors.

## Results

Conducted throughout a week, the stage of gathering information for this research revealed interesting results that confirm or contradict the preset hypotheses, as shown below. The gathered data can be applied in the process of customer relationship management and is a basis for starting a customer loyalty program through innovation.

The availability of interlocutors to answer questions, and especially their willingness to share their topic-related experience with us led to the following results. Most subjects gave a positive response with regard to innovation in customer's involvement in the development of the service. The use of technological innovations (e.g. software permitting customers to simulate the design of their bathroom or the look of their favourite room with their choice of parquet) was on the same place as the previously mentioned dimension in terms of the number of responses. The other two dimensions were brought into discussion to a smaller extent, despite the fact that the literature places the customer's buying experience at the core of the process (authors like Vargo and Lusch, 2004; 2010, Prahalad and Ramaswamy, 2004, dedicated a lot of studies to this concept). As early as 1955, Abbott (in Holbrook; 2006) declared that 'what people really want are not products, but products that offer them experiences, they use products with the hope of getting the experience they need.' A part of our interlocutors have mentioned about the change of conduct in the purchasing act and they pointed out that many customers research first for the product in the virtual environment and then come into the store to purchase the item. Although only two of the dimensions were validated by the most of interlocutors, we accept the *hypothesis H1* so we can test it in the quantitative phase of the study.

Subjects agreed unanimously that on how the sales staff treats the customers depends the latter's attachment to the company. Subjects also agreed that innovation as a novelty factor attracts customers, the role of the sales force being to help customers understand the benefits of innovations. One interlocutor said that he was working together with the human resources department on a training program for staff directly involved with customers so that they acquire the ability to empathise with customers and provide them with the best experience possible. 'I have studied this at our main competitor and it seems that, besides the range of products and services, the staff is an important reason that determined customers to turn to our competitor's stores.' Based on the aforementioned information, we accept the *hypothesis H2*.

People who participated in the study say either that they do not have a coherent customer loyalty program or that the existing program (with the cards on which customer accumulate points for their purchases) does not give the expected results. Interlocutors answered affirmatively to the questions meant to test the third hypothesis, and could not provide figures and real cases. One of them said that he understands the necessity of adoption of a holistic perspective of loyalty – not only a system of accumulating points and receiving something in place of this, but a system which transform the customer into a partner of the business.

From a theoretical point of view, *hypothesis H3* can be accepted with reserve, the quantitative research, which will take into account the perspective of customers, being able to validate the proposed conceptual model.

The qualitative approach gave us valuable inputs in order to design the further research that aims to investigate the customer perspective regarding innovation in services and the relationship between it and attachment.

## **Conclusions**

Innovation in the DIY retail requires a strong focus on services which complement the products. This way, customers can make the best choice judging by the triad: price-quality-the extent to which their needs were satisfied. To be able to provide customers with an enjoyable shopping experience, retail employees must have the technical knowledge to provide complete information to customers and must acquire the skills to empathise with them in order to offer the best solutions for home construction or optimisation. As we mentioned in the conceptual clarification, long-term loyalty remains an ambitious objective (Karjaluo et al., 2012), requiring sustainable organisational change which shifts from the transactional view to the relational view.

Although the conceptual model needs to be tested as well through a quantitative research, our findings suggest a couple of implications for companies acting on the DIY market to maximize the value they offer to customer through services. Adopt a culture of innovation by involving the customer in achieving the service, creating a positive customer experience and take advantage of technology and virtual environment will have a favorable impact on the business. Managers who want successfully create a culture of innovation need to understand the necessity of well-trained sales staff – an efficacious workforce is built through selection and training, goal setting and on-the-job coaching (Bandura, 1997; Jex and Bliese, 1999 in Yim, Chan and Lam, 2012).

The main limitation that should be considered when interpreting the results is the qualitative nature of the research. In order to overcome this limitation further research should test the model through a quantitative method to contribute to a fuller understanding of the role of innovation in services from a customer perspective.

**Abstract:** *The use of online social networks has become part of our lives. More and more people join networks, create their online profile, add pictures with themselves, add personal information about them, find people they know and connect with them, share and like posts, comments, pictures or movies and many more. The social networks allow more and more features and people are open and willing to try them. In this context, it is important for those who own such a profile to be aware of how their personal information is handled, who can view the data they publish in the social network and how they can protect the information they post, by granting access to it only to those persons they want to. The objective of this research was to study what type of information Romanian Facebook users are revealing on their profiles. We have conducted an empirical research, based on an online questionnaire which was available to be accessed in March 2013. 42,5% of the respondents, aged between 21 and 40, formed mostly my employees, managers and students, have not shared on their profiles neither their phone number, their home address, nor their messenger ID. Even though we have considered that the email address was also considered personal and very private information, our assumption did not confirmed, about 30% of the respondents have their email address shown on their profile. At the opposite side, it was confirmed that the gender, real name, personal pictures, birthday and current town are information published by more than 80% the respondents. The respondents do know and do make a difference between having their profile shown when searched on Facebook and allowing their profile to be visualised by whomever they want. Even though most of the respondents have their profile public when searched for it, the great majority have set that only their friends to be able to see the information they post online. Only about 10% of the respondents have added or have accepted friendship requests from people they did not know before and about 30% have never accepted such requests. Overall, we may say that our respondents are careful about what their share on Facebook.*

## 1. Introduction

The growing popularity of social networks can be explained by the fact that people want to get in touch with new persons, to be connected to their friends, family, colleagues or acquaintances or to be present online. By using social networks members can create the profile they want for themselves, share photos, videos, music, play games or use different applications available, compile lists of friends that they can link to, create or join groups of people with similar interests, announce events and invite people to attend. In the same time, they can easily communicate with the persons they know, send and receive messages, share their ideas, write entries on their own and the others profiles, walls or timelines, allow comments to their posts.

According to Alexa (2013), the most visited websites worldwide in March 2013 were: google.com, facebook.com, youtube.com, yahoo.com, baidu.com, wikipedia.org, live.com, amazon.com, qq.com, taobao.com, blogspot.com, twitter.com, google.co.in, linkedin.com, yahoo.co.in and bing.com. It can be observed that most of the websites are search engines, but among the top three, there are two social networks. According to their website there were more than a billion monthly active users as of December 2012, out of which about 82% are users located outside US or Canada (Facebook, 2013).

## 2. Literature review

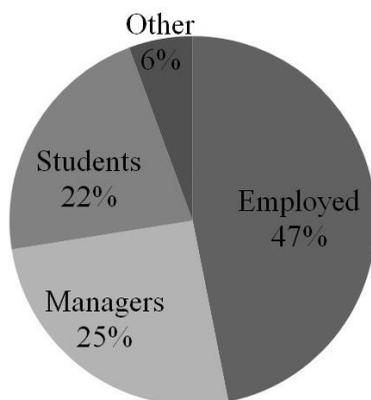

Social networking websites have added a new dimension not only to the way people and organizations communicate, but also to the way in which they use the wealth of information available in the social network (Malik, Malik, 2011), how they search or how they investigate other persons or competitors. Social networking sites record information about users such as: name, gender, birthday, relationship status, educational and employment history, religious or political views, sexual preference etc. (Qi, Edgar-Nevill, 2011, p. 76) and this information will be kept in perpetuity and taking into consideration that one entity collects and controls so much personal data, a user should find a balance between his updates and the protection of his and his beloved ones privacy.

When being members of online social networks people should keep in mind that their privacy and their privacy's 5Ws *what, where, who, why* and *how* is important. The inputs (*what*) that they or their connected profiles (mostly friends) submit, enter the network, from *where*, it can be seen, accessed and observed by other members of the network, *who*, for different reasons may use that information constructively or negatively (*how*). The study done by Ieng-Fat, Kuan-Ta and Ling-Jyh confirms that revealing personal information online is a double-edged sword and discuss the problem of information leakage in social network services (2008, p.2). They also explain the fact that other people may reveal information about a Friend through the comments they make (Friend is "the best steak chef in Boston" - from where the occupation and location is disclosed), by tagging and describing photos uploaded (Him and Friend at Someone's wedding - how friend looks like and the fact that he knows a third person) or by adding them in lists (for instance Faculty colleagues). All this information (and much more) can get on the wrong hands and may lead to stalking (Al Hasib, 2009, p. 291, Tan et.al, 2012, p.212), spamming or phishing (spear or social) (Ieng-Fat, Kuan-Ta, Ling-Jyh, 2008, p.13), malvertising (Sophos, 2010), profile squatting through identity theft (Ulrike, 2011).

### 3. Methodological notes

The objectives of the research included: study the type of information Romanian Facebook users are revealing on their profiles; the use of privacy settings regarding the search and visualisation of their profile; identify some activities done by the consumers on the social network.

A survey was conducted using an online questionnaire, which was delivered randomly over Facebook. We conducted the survey in March 2013 and received 160 full answers, all of the respondents owning at least one Facebook account, for an approximately 4% response rate. The respondents are Romanian, almost evenly balanced between genders, being aged 21 to 40, half of the women and men being aged under or equal 25 years old. 91 of the respondents live in Bucharest and the rest in other towns. A large majority (over 83%) is made of university graduates and hold a professional status as presented in Figure 1 - only 4 of the respondents mentioned that they were unemployed at the moment of filling in the questionnaire.

**Figure 1:** The professional status of the respondents (%)

The "employed" respondents mentioned to be part either of public or private organizations; the "managers" are either freelancers (16,66%), have their own company (40,47%) or they are department managers (42,87%) within private or public organizations. The "students" are either faculty enrolled students, master students or doctoral students. Among the "other" occupations there were mentioned housewives or in maternity leaves.

In Table 1 it is presented the marital status of the respondents, both male and female, in accordance with their age (either under or equal to 25, or above 25 years old up to 40).

**Table 1:** Marital status of the respondents (%)

Marital status	Age		Total
	≤25	>25	
married	1,9%	20,6%	22,5%
live together, not married	6,9%	5,0%	11,9%
not married	41,3%	23,8%	65,0%
divorced	0,0%	0,6%	0,6%
<b>Total</b>	50%	50%	100%

One of the respondents mentioned to be divorced, all the rest were either married (22,5%) or not (76,9%).

The questionnaire included 16 questions, out of which seven were related to their demographic details and social networks' usage and the rest were approaching the privacy of the Facebook account and the way this account was used by the respondent in the last 12 months.

#### 4. Main findings

None of the Facebook users interviewed mentioned to use this social network less than 1 or 2 times a week and only 7 of the respondents do not use or do not have a YouTube account, as seen in Table 2.

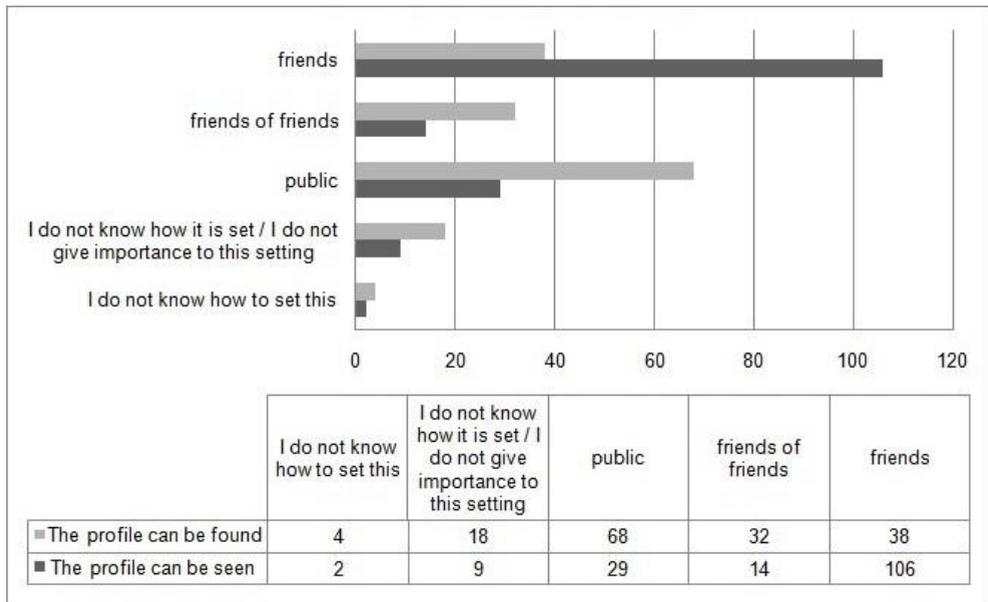

**Table 2:** Frequency of social networks usage (n=160)

	more times a day	about one time a day	3-5 times a week	1-2 times a week	once in several weeks	seldomly	I do not own an account in this network	I do not know / I do not answer
<b>Facebook</b>	127 (79.38%)	22 (13.75%)	9 (5.63%)	2 (1.25%)	0 (0.00%)	0 (0.00%)	0 (0.00%)	0 (0.00%)
<b>YouTube</b>	64 (40.00%)	36 (22.50%)	25 (15.63%)	20 (12.50%)	4 (2.50%)	4 (2.50%)	7 (4.38%)	0 (0.00%)
<b>LinkedIn</b>	8 (5.00%)	11 (6.88%)	12 (7.50%)	25 (15.63%)	12 (7.50%)	20 (12.50%)	59 (36.88%)	13 (8.13%)
<b>Twitter</b>	6 (3.75%)	2 (1.25%)	1 (0.63%)	6 (3.75%)	8 (5.00%)	25 (15.63%)	100 (62.50%)	12 (7.50%)
<b>Google +</b>	23 (14.38%)	6 (3.75%)	3 (1.88%)	5 (3.13%)	15 (9.38%)	43 (26.88%)	56 (35.00%)	9 (5.63%)
<b>Pinterest</b>	1 (0.63%)	5 (3.13%)	5 (3.13%)	5 (3.13%)	10 (6.25%)	11 (6.88%)	104 (65.00%)	19 (11.88%)
<b>Hi5</b>	0 (0.00%)	1 (0.63%)	0 (0.00%)	2 (1.25%)	1 (0.63%)	24 (15.00%)	116 (72.50%)	16 (10.00%)
<b>Netlog</b>	1 (0.63%)	0 (0.00%)	0 (0.00%)	2 (1.25%)	4 (2.50%)	9 (5.63%)	127 (79.38%)	17 (10.63%)
<b>Neogen</b>	0 (0.00%)	0 (0.00%)	1 (0.63%)	1 (0.63%)	0 (0.00%)	9 (5.63%)	130 (81.25%)	19 (11.88%)
<b>MySpace</b>	0 (0.00%)	0 (0.00%)	1 (0.63%)	0 (0.00%)	2 (1.25%)	12 (7.50%)	128 (80.00%)	17 (10.63%)
<b>Flickr</b>	1 (0.63%)	0 (0.00%)	2 (1.25%)	1 (0.63%)	6 (3.75%)	9 (5.63%)	124 (77.50%)	17 (10.63%)

On average, 15 respondents did not hear about social networks such as LinkedIn, Twitter, Google +, Pinterest, Hi5, Netlog, Neogen, MySpace or Flickr and about 105 of them do not have accounts on these networks. The most popular social networks are, by far, Facebook and YouTube, followed by Google + and LinkedIn, all the rest turned out to be not that attractive for the Romanian users.

The percentages are kind of balanced between those respondents who have set for their profile to be private (43,75%, both for friends and friends of friends) and public (42,5%) when searched for it. 22 of the respondents do not know the setting of their searched profile, do not know how to set it or just do not consider important this

setting. As it appears in Figure 2, the things change dramatically when asked about who can see the information they post on their personal Facebook profiles.

**Figure 2:** The profile privacy setting for *search* and *visualisation*

There were only *nine* respondents who mentioned that they did not give importance to this setting or do not know how to set this, out of which four of them are aged under 25 years old (one manager, two students and one other professional status / three females and one male respondent), and from the rest (above 25 years), three are employed and two are managers. The *two* respondents who recognised they do not know how to make the setting are 28, respectively 32 years old. From this total of 11 respondents, nine are among those 22 who answered similarly about their preference for their *searched* profile.

From those 68 respondents whose profile is public when searched on Facebook, 41 of them permit only to their friends to see their information and what they post; two allow also to the friends of their friends, 24 kept it public also for visualization and one does not know for sure.

According to the type of information the respondents have posted on their own Facebook profiles, we have identified that on this social network there are *four* types of privacy levels, presented in Table 2. We consider information such as: home address, messenger ID, webpage and phone number as *very private* information, because equal or less than 15% of the respondents have provided these sections on their Facebook profiles. The religion, favourite quotations, previous jobs, email addresses, whether interested in men or women section, personal motto, upload of a personal movie, political views or the automatically appearance of the location when posting on Facebook are considered to be *private* information since less than half of the respondents provided them on their profiles. Of course, it should be taken into consideration the fact that some people may have not filled in some of these sections not because of their privacy, but because they do not consider it is worthy

to have this information specified (whether interested in men / women, motto, favourite quotations), not having this information (previous jobs, website) or for any other personal reasons.

**Table 2:** The information revealed on the respondents' profiles

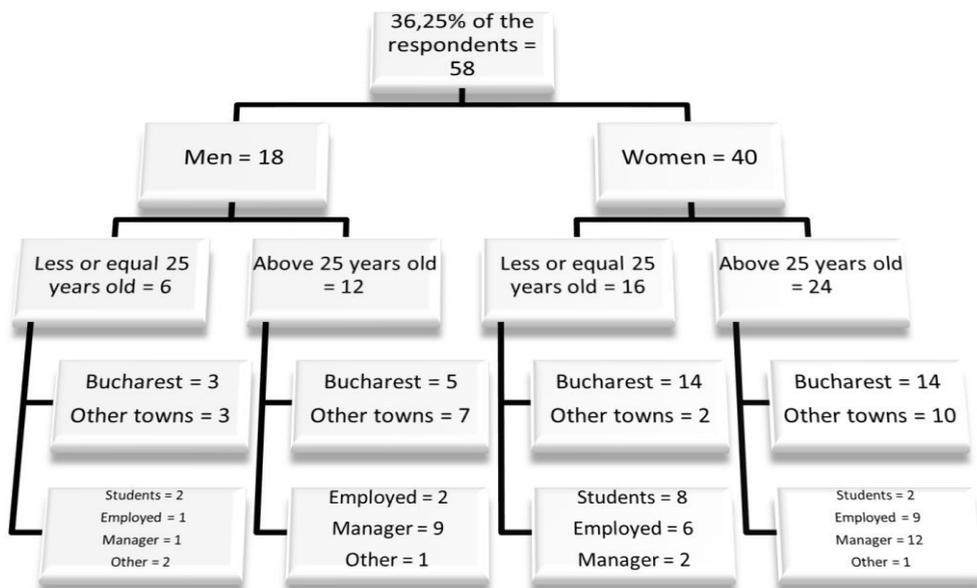

Information revealed	Frequency	Percentage
Gender	150	93,75%
Real name (both first and family)	147	91,88%
Added at least one personal picture	141	88,13%
Birthday	138	86,25%
Current town	131	81,88%
Levels of education graduated	109	68,13%
Added at least one family member	104	65,00%
Hometown	102	63,75%
Where studying	89	55,63%
Relationship status	86	53,75%
Current workplace	84	52,50%
Foreign languages	82	51,25%
Religion	57	35,63%
Favourite quotations	57	35,63%
Previous jobs	57	35,63%
Email address (other than Facebook)	47	29,38%
Interested in (men / women)	44	27,50%
Motto / About you	44	27,50%
Added at least a personal movie	39	24,38%
Political views	33	20,63%
Automatically location appearance	33	20,63%
Phone number	24	15%
Webpage	24	15%
Messenger ID	23	14,38%
Home address	5	3,13%

More than half of the respondents, but less than three-fourths of them, specify the levels of education they graduated, family members, hometown, where they are currently studying, their relationship status, current workplace and the foreign languages they speak, on their Facebook profile. These types of information are *less private*. Due to the fact that more than 80% of the respondents have no problem with offering information such as: current town, birthday, personal picture, real name and gender, on their profiles, we tend to consider these types of information as *not private*. We can conclude this by referring to the presence on Facebook of Romanian consumers who have given access to their friends and friends of friends in a proportion of 75%. It should also be highlighted that only 18.8% of the respondents checked out their Facebook profiles when answering the question.

Being asked about their activity on the social network from the last year, only 17 respondents mentioned that they added people they do not know, as friends on Facebook (and then most of them confirmed that one of the reasons they use this network is to become more popular) and 10 of these have also accepted friendship invitations from people they did not know before. Taking into consideration the rest, 47,5% mentioned they rarely or very rarely have added unknown persons into their network, 40% mentioned they have never added strangers and 3 respondents did not remember or did not want to answer. More than half of the respondents (58,13%) have rarely accepted invitations from people they did not know and 31,25% have never accepted such friendship requests.

Almost half of the respondents uploaded often or very often personal pictures or movies on their profile, only 9 have never uploaded such a file. The great majority (95,62%) of the Facebook users confirmed they have appeared in at least one picture or movie uploaded by their friends and 92,5% have accepted to be tagged in it (to be created a link to their profile, their name to appear on the picture or status), 4 respondents have never appeared and 3 did not remember.

It is very important to be noted the fact that 58 persons have never filled on their Facebook profile, information such as home address, phone number, email address or messenger ID. In Figure 3 there are presented their demographic characteristics:

**Figure 3:** Demographic information about those respondents who have never filled in private information

### 5. Conclusions and future directions of research

People are not concerned about providing their real name and adding a picture of their self on their Facebook profile. On the other hand, some members sign in social networks, connect to people they know and prefer not to share any information about themselves, but they should also be careful about their privacy, since their friends may disclose such data about them.

One of the most surprising conclusion that we draw, was the fact that the personal email address of the respondents did not turn to be that private in social networks. We have started this research with the hypothesis of having as very private information: the home address, phone number, email address and messenger ID, but the email was not confirmed to be as private as we supposed. We may say that the websites do not appear on people's profiles mainly because they probably do not own a company / a blog etc. and do not have to promote it on their Facebook profile. There were a percent of 63,12%, 101 respondents who have not initially filled in the home address, phone number, email address and their messenger ID, but out of which only 58 persons still have not filled in any of those fields in the last year. It would be interesting to assess in the future the perceived usefulness, ease of use, privacy concern and behavioural intention of the Romanian consumers about Facebook. Another future direction of research could include the assessment of the user's awareness about the threats and management of privacy preferences on the social network. Also, it would be interesting to research the existing legislation and whether it deals with the challenges offered by the social networks.

## HOW MUCH CAN WE TRUST PUBLIC OPINION POLLS?

**Vierașu Timotei**

*Faculty of Economic Sciences and Business Administration, Department Marketing, Tourism and International Business, "Transilvania" University, Brasov, Romania.  
timotei.vierasu@unitbv.ro*

**Abstract:** *Peoples trust numbers and likes to give them some significance. Every time we open a newspaper, listen to the radio, watch TV or browse the Internet we'll see some numbers and stats. These numbers can give a brief overview of the world surrounding ourselves and are often used by people or organizations to strengthen their message. Can we trust public opinion poll? Can these polls be manipulated? What method of manipulation can be used to alter the results of these polls? I designed two experiments to see how a person can misinterpret some data and how can a person manipulate a poll to obtain the desired numbers. Experiments are a qualitative market research tool designed to give us an empirical knowledge about the subject we are studying. The objective of this study was to determine whether we can influence subject's voting choices by manipulating their perceptions and their questioners. "Yes Sir" experiment was based on a misleading questioner with a lot of questions that leads the respondent to the desired answer and with formulating the question in such a manner that the respondent feels compelled to give the desired answer. "Fake Poll" experiment is designed to see if previous polls have any influence on voter's intentions and behaviour and is bases on bandwagon effect. The results of these experiments show us that this ways of manipulation works very well and we can influence the way people will vote with a percentage from 3% to 6%.*

**Keywords:** *political marketing, marketing experiment, bandwagon effect, polls manipulation, "Yes Sir" experiment, "Fake Poll" experiment.*

**JEL classification:** *M31*

### 1. Introduction

Almost every day a new poll appears in mass-media giving us an inside view on what customers and clients want. These polls vary from one area to another. A very active area in which we often receive surveys is political marketing. Political marketing is designed to influence consumers about political issues, particular candidates for public office, or public issues. Although political marketing uses many of the same techniques that other forms of marketing do, it is actually used to promote a concept or an idea, rather than a specific product or service, and to motivate people to vote for that idea.

The way people can interpret the information they come in contact with is very important in political marketing. Political marketing was defined as "the applications of marketing principles and procedures in political campaigns by various individuals and organizations. The procedures involved include the analysis, development, execution, and management of strategic campaigns by candidates, political parties, governments, lobbyists, and interest groups that seek to drive public opinion, advance their own ideologies, win elections, and pass legislation and referenda in

response to the need and wants of selected people and groups in society” (Brățucu, 1995, p 25)

One of the biggest problems in political marketing is the bandwagon effect which occurs in voting: some people vote for those candidates or parties who are likely to succeed (or are proclaimed as such by the media), hoping to be on the "winner's side" in the end. The bandwagon effect has been applied to situations involving majority opinion, such as political outcomes, where people alter their opinions to the majority view (McAllister and Studlar, 1991, p 721). Such a shift in opinion can occur because individuals draw inferences from the decisions of others, as in an informational cascade.

Several studies have tested this theory of the bandwagon effect in political decision making. In the 1994 study of Robert K. Goidel and Todd G. Shields in *The Journal of Politics*, 180 students at the University of Kentucky were randomly assigned to nine groups and were asked questions about the same set of election scenarios. About 70% of subjects received information about the expected winner (Goidel and Shields, 1994, p 807). Independents, which are those who do not vote based on the endorsement of any party and are ultimately neutral, were influenced strongly in favour of the person expected to win. Expectations played a significant role throughout the study. It was found that independents are twice as likely to vote for the Republican candidate when the Republican is expected to win. From the results, it was also found that when the Democrat was expected to win, independent Republicans and weak Republicans were more likely to vote for the Democratic candidate.

A study by Albert Mehrabian, reported in *The Journal of Applied Social Psychology* (1998), tested the relative importance of the bandwagon (rally around the winner) effect versus the underdog (empathic support for those trailing) effect. Bogus poll results presented to voters prior to the 1996 Republican primary clearly showed the bandwagon effect to predominate on balance. Indeed, approximately 6% of the variance in the vote was explained in terms of the bogus polls, showing that poll results (whether accurate or inaccurate) can significantly influence election results in closely contested elections. In particular, assuming that one candidate "is an initial favourite by a slim margin, reports of polls showing that candidate as the leader in the race will increase his or her favourable margin" (Mehrabian, 1998, p. 2128). Thus, as poll results are repeatedly reported, the bandwagon effect will tend to snowball and become a powerful aid to leading candidates.

During the 1992 U.S. presidential election, Vicki G. Morwitz and Carol Pluzinski conducted a study, which was published in *The Journal of Consumer Research*. At a large north-eastern university, some of 214 volunteer business students were given the results of student and national polls indicating that Bill Clinton was in the lead. Others were not exposed to the results of the polls. Several students who had intended to vote for Bush changed their minds after seeing the poll results (Morwitz and Pluzinski, 1992, p 58-64).

Additionally, British polls have shown an increase to public exposure. Sixty-eight percent of voters had heard of the general election campaign results of the opinion poll in 1979. In 1987, this number of voters aware of the results increased to 74% (McAllister and Studlar, 1991, p 725).

In June 2012 in Romania took place local elections and approximately 300.000 people from 96 parties, alliances and independents battled for approximately 45.000

seats. In December 2012 in Romania took place parliamentary elections. During the electoral campaign the candidates and media published hundreds of opinion polls and after the election was over they publish the exit-polls. What was peculiar about these opinion polls was the fact that their results were very often in contradiction in spite of the fact that the polls were made in the same period of time, on the same population, same number of people, same sampling and collecting data method. Theoretically the results should be the same. Was this just a statistical error or a case of manipulation?

To answer this question I designed some experiments which will help me to determine if opinion polls influence or change voter's intentions and behaviour.

According to Oxford Dictionaries manipulation is "the action of manipulating something in a skilful manner" or "the action of manipulating someone in a clever or unscrupulous way." One of the most powerful forms of manipulation used by politicians is to quote numbers and statistics that support their assertions and conclusions. They love to show how people love them by using numbers from polls they ordered.

The key to a successful manipulation is to use as much of the truth as possible. In the case of numbers and statistics it works best to use real numbers rather than making them up. The distortion begins with the source of the numbers. If you hire any market research company to do a study for you they can probably engineer almost any result you wish by setting up the study in a certain way that biases the data. This is the garbage in - garbage out phenomenon. Just because the number was accurately calculated does not mean that what is being measured is being measured properly. The messages and statistics are then released to the media through press releases, advertising or delivered by a spokesperson, or in some cases they are delivered directly by company representatives or politicians. This is remarkably effective because the media will often use these "sound bites" of information without checking to find out if they are accurate - this is especially true of numbers and statistics. As news services continue to cut back on investigative journalism resources and staff this is becoming more and more common.

This is a very unfortunate phenomenon because the general public tends trust the media to be true and accurate. As soon as the numbers appear in the media they become more credible and are usually treated as facts. This makes it much easier for the politicians to mislead us.

## **2. "Yes Sir" Experiment**

In my research I found a lot of ways to manipulate using polls. There are easy and rough ways like just faking the numbers and there are more sophisticated ways like influencing people's answers.

I designed an experiment to see how a person can manipulate a poll to obtain the desired numbers by influencing people's answers. One of the most easiest and used method is to setting up the study in a certain way that biases the data. The way they do that is by putting a lot of questions that leads the respondent to the desired answer or by putting the question in such a manner that the respondent feels compelled to give the desired answer.

The wording of the questions, the order in which they are asked and the number and form of alternative answers offered can influence results of polls. This is also referred to as setting up a "context effect." For instance, the public is more likely to

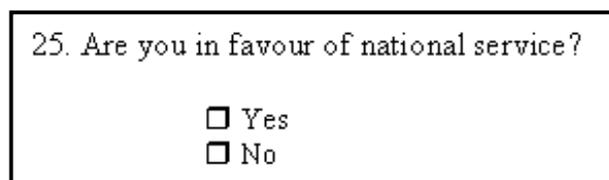

indicate support for a person who is described by the operator or a previous question as one of the "leading candidates". This method uses the spiral of silence technique. The theory asserts that a person is less likely to voice an opinion on a topic if one feels that one is in the minority for fear of reprisal or isolation from the majority.

Why is this method so efficient? Because it uses a lot of persuasion technique and it manipulate people in so many different ways. When I build my questioner I tried to use different technique like foot-in-the-door and the halo effect.

Foot-in-the-door technique (FITD) is a compliance tactic that involves getting a person to agree to a large request by first setting them up by having that person agrees to a modest request. The foot-in-the-door technique succeeds due to a basic human reality that social scientists call "successive approximations". Basically, the more a subject goes along with small requests or commitments, the more likely that subject is to continue in a desired direction of attitude or behavioural change and feel obligated to go along with larger requests. FITD works by first getting a small yes and then getting an even bigger yes. The principle involved is that a small agreement creates a bond between the requester and the requester. The other person has to justify their agreement to themselves. They cannot use the first request as something significant, so they have to convince themselves that it is because they are nice and like the requester or that they actually are interested in the item being requested. In a future request, they then feel obliged to act consistently with their internal explanation they have built.

The halo effect is a cognitive bias whereby the perception of one trait (i.e. a characteristic of a person or object) is influenced by the perception of another trait (or several traits) of that person or object. An example would be answering to multiple questions in the same ways just because the questions look alike.

For my experiment I design 3 false questioners, were I tried to influence the respondents answers by triggering some positive and negative emotions with a couple of questions carefully placed right before the question I tried to influence. For the first questioner, who was given to the control group, I used only a simple question.

25. Are you in favour of national service?

Yes

No

**Figure 1:** Form A of the questioner

Source: My own research

For the second questioner, who was given to group B, I used 5 questions before the question I tried to influence.

20. Are you worried about the number of young people without jobs?	<input type="checkbox"/> Yes	<input type="checkbox"/> No
21. Are you worried about rising crime among teenagers?	<input type="checkbox"/> Yes	<input type="checkbox"/> No
22. Do you think our schools lack discipline?	<input type="checkbox"/> Yes	<input type="checkbox"/> No
23. Do you think young people welcome authority and leadership?	<input type="checkbox"/> Yes	<input type="checkbox"/> No
24. Do you think young people like a challenge?	<input type="checkbox"/> Yes	<input type="checkbox"/> No
25. Would you be in favour of national service?	<input type="checkbox"/> Yes	<input type="checkbox"/> No

**Figure 2:** Form B of the questioner

Source: My own research

For the third questioner, who was given to group C, I used 4 questions before the question I tried to influence.

21. Are you worried about war?	<input type="checkbox"/> Yes	<input type="checkbox"/> No
22. Are you worried about the arms race?	<input type="checkbox"/> Yes	<input type="checkbox"/> No
23. Is it dangerous giving young people guns?	<input type="checkbox"/> Yes	<input type="checkbox"/> No
24. Is it wrong to force people to take up arms?	<input type="checkbox"/> Yes	<input type="checkbox"/> No
25. Would you oppose national service?	<input type="checkbox"/> Yes	<input type="checkbox"/> No

**Figure 3:** Form C of the questioner

Source: My own research

The purpose of this experiment is to see if this method of manipulating the polls by leading the respondent to the desired answers really works and if so how much did this influence the end result. The null hypothesis from which I'm starting is that this method of manipulation really works and we can influence people's answers. The alternative hypothesis is that this method of manipulation doesn't work and we can't influence people's answers.

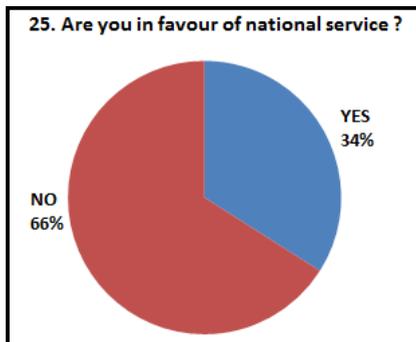

The subjects of the experiment are undergraduate students from Transilvania University of Brasov from all years of study. The numbers of participants in this study is 120, 70 male and 50 female. The participants are very homogeneous, all coming from different backgrounds, 60% of them are from Brasov the rest are from nearby counties temporarily living in Brasov during their studies. They were told that they just have to complete a normal questioner about politics as part of a survey. The questioner contained 45 questions but for this experiment I was only interested in analysing question number 25. The sampling has been done by randomly selecting students from a list of all the undergraduate students from Faculty of Economic Science and Business Administration.

First they were split into two groups of 60 people. The first group participated in the first week of the experiment and the other group took part on the experiment in the second week. This way I tried to see if I can replicate the results of the first experiment. The experiment took place in the first two weeks from February 2013.

The subjects were divided into six groups of 20 people. Two groups (40 people) were the control groups. They were given a standard questioner without any alteration and form of manipulation (form A). Their answers will be compared with the answers of the other groups.

The other groups receive a modified form of the same questioner. Two groups got form B of the questioner and the other two groups got form C of the questioner. After all the data was collected the results were analysed using SPSS software and Microsoft Office Excel.

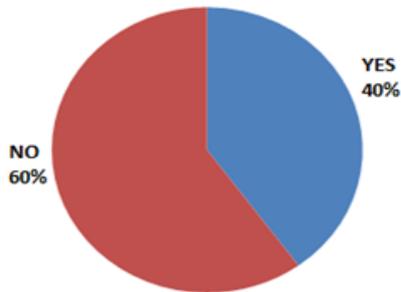

The results of the experiment as we can see from the figure below are: 66% of the respondents from the control group are not in favour of national service, 34% would be in favour of national service.

**Figure 4:** Answers from the control group (group A)  
Source: My own research

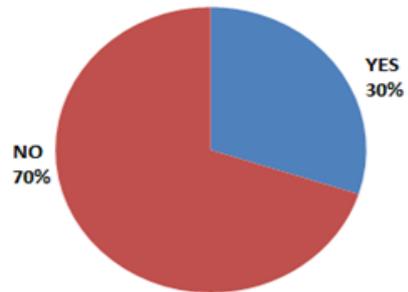

When we analyse the numbers from group B we see that the respondents who would not be in favour of national service have decrease to 60% while the number of respondents who are in favour of national service has increase from 34% to 40%.

25. Would you be in favour of national service ?

**Figure 5:** Answers from group B  
My own research

25. Would you oppose national service ?

**Figure 6:** Answers from group C  
Source: My own research

Source:

Finally when we analyse the numbers from group C we see that the respondents who would not be in favour of national service has increase from 66% to 70% compared with the results from the control group, while the number of respondents who are in favour of national service decrease has from 34% to 30% compared with the results from the control group. Pearson's chi-squared test showed that we can reject the alternative hypothesis and accept the null hypothesis which says that this method of manipulation works and we can influence people's answers.

### 3. "Fake Poll" Experiment

I designed this experiment to see if previous polls have any influence on voter's intentions and behaviour and can manipulate them. In theory when a person has to take a decision that person will search for all the information that he can find in order to make the right decision. One of the easiest ways to find information's about candidates and their programs is mass-media with all its components: printed media, television, radio and internet. Often, candidates use mass-media to publish opinion polls in order to demonstrate their approval among people. When a person is put in front of two groups he tends to go with the majority or the group that has more followers, because he doesn't want to be in minority and this is called bandwagon effect.

According to Oxford Dictionaries bandwagon effect is "an activity, group, movement, etc. that has become successful or fashionable and so attracts many new people". The bandwagon effect is an observed social behaviour in which people tend to go along with what others do or think without considering their actions.

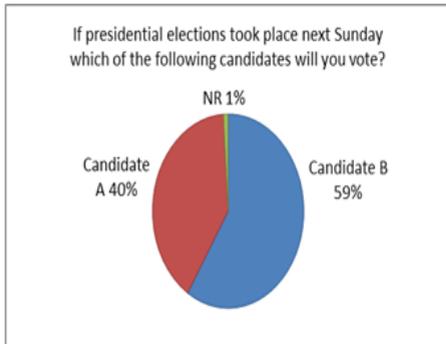

The null hypothesis from which I'm starting this experiment is that this method of manipulation works and we can influence people's answers. The alternative hypothesis is that this method of manipulation doesn't works and we can't influence people's answers.

The subjects of the experiment are the same students from Transilvania University of Braşov from the previous experiment. The numbers of participants in this study

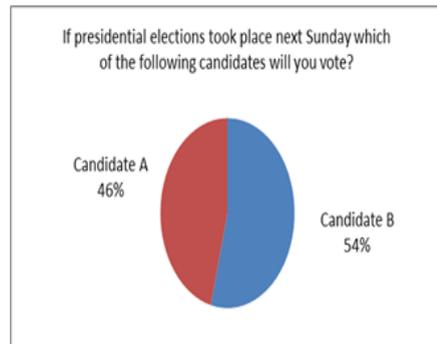

is 120, 70 male and 50 female. The sampling has been done by randomly selecting students from a list of all the undergraduate students from Faculty of Economic Science and Business Administration. They were told that they just have to complete a normal questioner about politics as part of a survey. First they were split into two groups of 60 people. The first group participated in the first week of the experiment and the other group took part on the experiment in the second week. This way I tried to see if I can replicate the results of the first experiment. The experiment took place in the first two weeks from February 2013.

The subjects were divided into six groups of 20 people. Two groups (40 people) were the control groups. They were given a standard questioner of 45 questions without any alteration or form of manipulation. Their answers will be compared with the answers of the other groups.

The other groups received information about the expected winner supposedly from a recent national opinion poll. We assume that are only two candidates left. Two groups got the information that candidate A is the expected winner of the next elections and the other two groups got the information that candidate B is the expected winner of the next elections. After all the data was collected the results were analysed using SPSS software and Microsoft Office Excel.

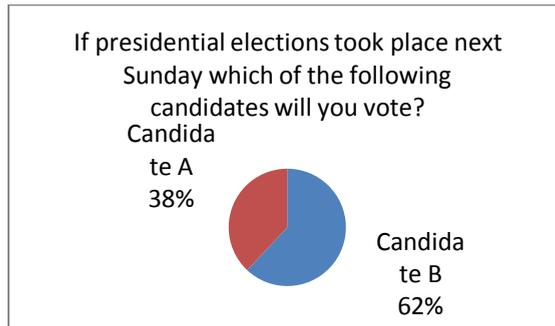

**Figure 7:** Answers from the control group  
Source: My own research

**Figure 8:** Answers from the group A  
Source: My own research

As we can see from the Figure 7, 59% of the respondents from the control group are in favour of candidate B, 40% would be in favour of candidate A and we have a 1% non-response (NR). When we analyse the numbers from Figure 8 we see that the respondents who are in favour of candidate B has decrease to 54% while the number of respondents who are in favour of candidate A has increase from 40% to 46%. Finally when we analyse the numbers from Figure 9 we see that the respondents who would be in favour of candidate B has increase from 59% to 62% compared with the results from the control group, while the number of respondents who are in favour of candidate A decrease has from 40% to 38% compared with the results from the control group.

**Figure 9:** Answers from the group B

Source: My own research

Indeed, approximately 6% of the variance in the vote was explained in terms of the bogus polls, showing that poll results (whether accurate or inaccurate) can significantly influence election results in closely contested elections. In particular, assuming that one candidate is an initial favourite by a slim margin, reports of polls showing that candidate as the leader in the race will increase his or her favourable margin. Pearson's chi-squared test showed that we can reject the alternative hypothesis and accept the null hypothesis which says that this method of manipulation works and we can influence people's answers.

#### 4. Conclusions

Analysing the numbers from "Yes Sir" and "Fake Poll" experiments we can draw the conclusion that this methods of manipulation works very well. Comparing the results from the three groups we can state for sure that we can influence the way people will vote with a percentage from 3% to 6%.

This is due to the so-called bandwagon effect. Bandwagon effect combined with spiral of silence can change some voter's opinions and intentions can increase the percentages for some candidates but it also makes it very hard to quantify on opinion polls and exit-polls thus resulting in large errors.

The limitations of this study are given by the low number of respondents and the way the sample has been selected. Because of the fact that the sampling hasn't been done using a probabilistic method and the fact that the sample is only 120 people, I can't extrapolate the results.

As for future research I will try to find a solution to reduce errors in political opinion polls and exit-polls. I believe that we can accomplish that by doing a more accurate sampling and by moderating the results with a correction factor. I hope we can find this correction factor by analysing the data from previous elections.

# ORDERS MANAGEMENT BY USING OF SMART PHONES

**Demian Horia**

*University of Oradea, Faculty of Economics, Management Marketing Department  
Oradea, Romania*

[horia\\_demian@yahoo.com](mailto:horia_demian@yahoo.com)

**Abstract:** *The main purpose of this paper is to present an idea of using mobile technology for optimization of orders management inside a restaurant. For implementing this idea we used SQL Server 2008 R2 Express for databases, Visual Studio 2010 Express for Windows Phone for developing the application used from phones, Visual Web Developer 2010 Express for developing web services, Internet Information Server for expose the web services to the internet. The phone application can be deployed to Windows Marketplace, and can be downloaded by any potential user. In this case the application can be used by any client of the restaurant if they will receive a username and a password. The entire process of placing orders can be transferred directly to the client, and can be made with the hardware of the client. More clients means more hardware's which can be used concurrently.*

**Keywords:** *mobile technology; windows phone; order*

**JEL classification:** *C81; C88*

## 1. Introduction

The main purpose of this paper is to present the implementation of an idea to optimize orders management by using smart phones. It was a challenging idea to create a phone application which is integrated with a windows desktop application for bar and restaurants management. Waiters of the restaurant can use two types of devices for writing orders. First method is to use the desktop application for bar & restaurant. The second method is to use a windows phone. Also the client can use his own phone for sending orders. If first method is used the desktop application access directly the database. If the second method is used, the windows phone application access web services, and then the web services access the database. Because orders has to be printed, the desktop application will extract orders received from phones, from the database and then it will print. The entire system was built using free tools from Microsoft such as Microsoft Visual Studio 2010 Express for Windows Phone, Microsoft Visual Web Developer 2010 Express and SQL Server 2008 R2 Express version.

## 2. Arhitecture

The entire system consists of the following parts:

- Database
- Desktop Application
- Web services
- Windows Phone Application

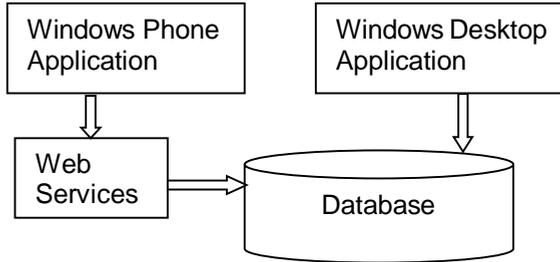

Fig.1. System architecture

2.1. The database was created with a few tables such as *ComandaClient* table used for storing the header of the order, *MiscareComandaClient* table used for storing the details of the order such as product, quantity, and price, *Product* table used for storing description of the products like names, codes, bar codes etc. A part of the database can be seen in fig.

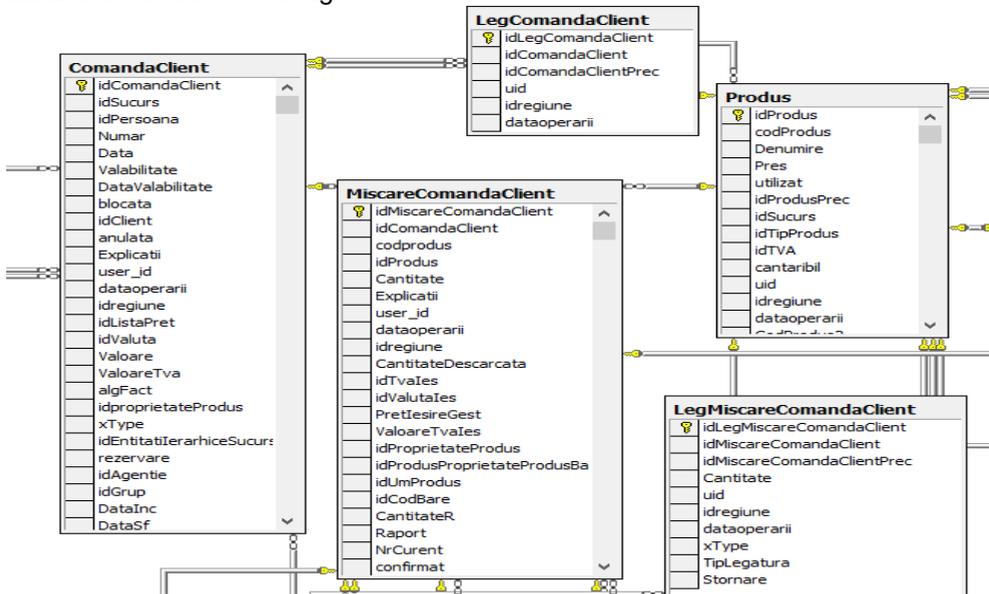

Fig.2. Part of the database

2.2. Desktop application is used for orders input, for printing of the fiscal receipt, orders to the kitchen, orders to the bar, bills. Every waiter based on username and password will choose a table, and place the order on it. Based on that order the desktop application recognize if a product have to be printed to bar or to kitchen, or to any other department which was previously defined and configured.

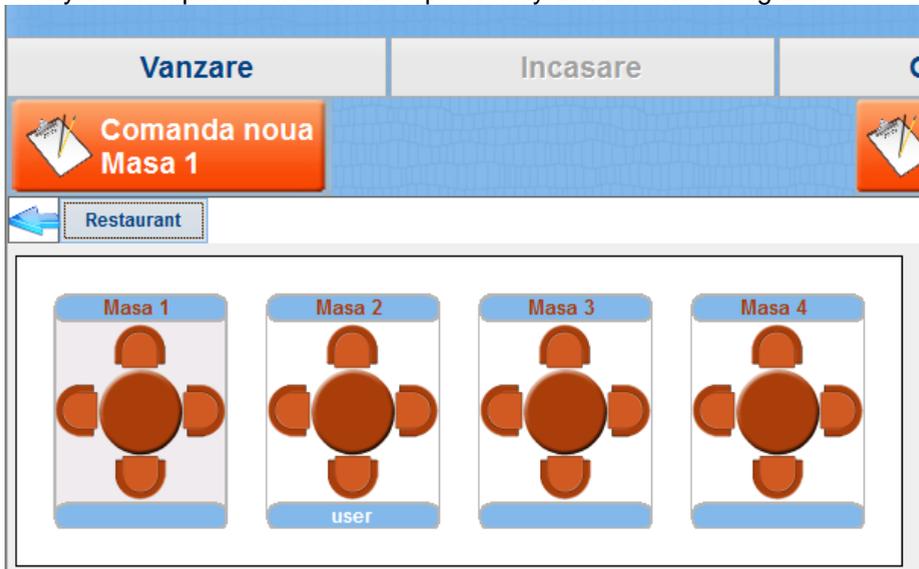

Fig.3. Desktop application. Tables view.

2.3. Web services are used as a bridge between Windows Phone Application and the database. We defined the following web services:

- `string DoLogin(string lcUserName, string lcPassword);` used for verifying the username and the password, and is used for authentication
- `string DoCautaMasa(string lcMasa, string lcUserName, string lcPassword);` used for obtaining an XML string which represent the list of tables which contain the string lcMasa
- `string DoCautaProdus(string CodProdus, string lcUserName, string lcPassword);` used for obtaining an XML string which represent the list of products containing codProdus string in code field
- `string DoCautaProdusDenumire (string lcDenumireProdus, string lcUserName, string lcPassword);` used for obtaining an XML string which represent the list of products containing lcDenumireProdus string in name field
- `string DoAdugaComandaMasa (string lcidEntitatiIerarhiceSucurs, string lcidGestiune, string lcidProdus, decimal lncantitate, string lcUserName, string lcPassword);` used for placing an order on a specified table identified by lcidEntitatiIerarhiceSucurs
- `string DoVizualizareComandaMasa (string lcidEntitatiIerarhiceSucurs, string lcidGestiune, string lcUserName, string lcPassword);` used for viewing of the list with all products contained by an order
- `string DoModificaComanda(string lcidMiscareComandaClient,`

`decimal lnCantitate, string lcUserName, string lcPassword);` used for modifying the quantity of one products contained by an order

2.4. Windows phone application consist of the following pages: MainPage, VizualizareMese page and Comanda page.

*MainPage* is the starting page of application used for prompting the user for login name and password. This page call *DoLogin* web services which confirm if there are a user with the login defined, and if the password of that user is correct or not. In case of a correct user name and password the *VizualizareMese* page is loaded.

*VizualizareMese* page is used for finding a table. This page make calls to *DoCautaMasa* web service. If a table was found, user can select it from a list, and can go to *Comanda* page to put order on selected table..

*Comanda* page used for finding products, for placing orders for those products to a specific table, for modifying the quantity already ordered or for viewing the list of products ordered. This page makes calls to *DoAdaugaComandaMasa* web service for adding products to an order, *DoModificaComanda* web service for modifying the quantity and *DoVizualizareComandaMasa* web service for viewing the order.

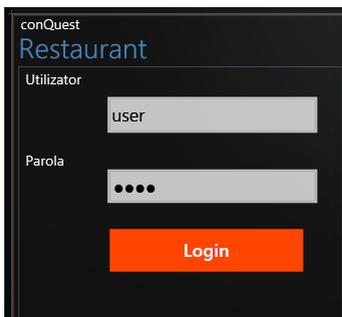

Fig. 4. MainPage

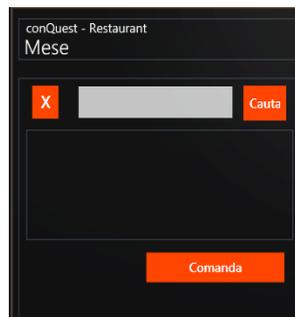

Fig.5. VizualizareMese page

Fig.6. Comanda page

### . 3. Data flow between windows phone application and the database.

One of the main problems which occur in windows phone application (WPA) development is the data transformation. Inside the database data are stored in different fields of different tables and can have different data types like varchar, uniqueidentifier, int, currency and so on. Web services are using the data from the database for different purpose. When WPA needs data, it will make a call to a web services which will make a query against the database and will receive an XML String of data. Then this XML String of data will be send to WPA. WPA is responsible for data interpretation.

SQL Server has the capabilities to transform directly the results obtained for a select statement in XML format. To do this, select statement has to use FOR XML clause.

The next examples show you the presence of FOR XML clause inside a Select statement used for obtaining the list of tables.

```
Select Masa.idEntitatilerarhiceSucurs
```

```

        ,ltrim(rtrim(MASA.Denumire )) as Denumire
        , MASA.X, MASA.Y
    from vVanzare_Mese MASA
    where
        MASA.denumire like '%'
    order by MASA.Denumire FOR XML RAW('MASA'), ROOT('MASA')

```

The result of this query is the following XML string.

```

<MASA>
  <MASA idEntitatilerarhiceSucurs="1AF3C657-DF6E-4463-9059-167D176F886A" Denumire="Masa 1"
X="25.0000" Y="25.0000" />
  <MASA idEntitatilerarhiceSucurs="384ED7E4-3F1A-441E-A0BB-5316C85A3D0B" Denumire="Masa 2"
X="165.0000" Y="25.0000" />
  <MASA idEntitatilerarhiceSucurs="1F701F09-1DA5-4308-A07F-D8C2B87DCAF3" Denumire="Masa 3"
X="305.0000" Y="25.0000" />
  <MASA idEntitatilerarhiceSucurs="39BF7A4D-0641-4A49-82FF-7DB99525C3ED" Denumire="Masa 4"
X="445.0000" Y="25.0000" />
</MASA>

```

This string is send back to the WPA which has called the web service. The WPA will parse the string and create a list of elements. The next example show a method for parse XML String and move the content to a list.

//class definition

```

public class itemListaMese
{
    public string Denumire { get; set; }
    public string idEntitatilerarhiceSucurs { get; set; }
    public string idGestiune { get; set; }
    public string Valoare { get; set; }
    public string UserName { get; set; }
    public itemListaMese(string lcDenumire, string lcIdEntitatilerarhiceSucurs , string lcIdGestiune,
string lcValoare, string lcUserName)
    {
        this.Denumire = lcDenumire;
        this.idEntitatilerarhiceSucurs = lcIdEntitatilerarhiceSucurs;
        this.idGestiune = lcIdGestiune;
        this.Valoare = lcValoare;
        this.UserName = lcUserName;
    }
}

public List<itemListaMese> listMese = new List<itemListaMese>();

```

//parsing XML String

```

XmlReader drXMLListaMese = XmlReader.Create(new
MemoryStream(System.Text.UnicodeEncoding.Unicode.GetBytes(lcResult)));

drXMLListaMese.MoveToContent();
drXMLListaMese.Read();

while (true) {
    if (drXMLListaMese.NodeType == XmlNodeType.Element && drXMLListaMese.Name.ToUpper()
== "MASA") {

```

```

        string lcDenumire = drXMLListaMese.GetAttribute("Denumire");

        string          IcidEntitatilerarhiceSucurs          =
drXMLListaMese.GetAttribute("idEntitatilerarhiceSucurs");

        listMese.Add(new      itemListaMese(lcDenumire,      IcidEntitatilerarhiceSucurs,IcidGestiune
,IcValoare ,lcUserName ));
            drXMLListaMese.Read();
        }
        else
            {
                //deoarece nu s-a gasit in inregistrarea curenta vom forta saltul la urmatoarea
                if (drXMLListaMese.Read())
                    {
                        //se va merge mai departe
                    }
                else
                    {
                        //deoarece nu mai poate citi nimic
                        break;
                    }
            }

        }
        if (drXMLListaMese.NodeType == XmlNodeType.EndElement)
            {
                break;
            }
        }
drXMLListaMese.Close();
.....

```

After the moving of content from XML String to listMese object, that object can be set a datasource for an object used by the user of WPA.

#### 4. Conclusion

After the implementation of this module some immediate advantages can be seen such as:

- reducing the time of the process of making orders by waiters, by operating the order directly at the client table and not on the bar computer through desktop application.
- increasing the number of orders if clients can use their own devices for making orders
- WPA can work together with a desktop application for entire system improvements
- WPA has bad support for printing which has to be compensate by the desktop application

**Abstract:** *In this article I focus on developing an expert system for advising the choice of wine that best matches a specific occasion. An expert system is a computer application that performs a task that would be performed by a human expert. The implementation is done using Delphi programming language. I used to represent the knowledge bases a set of rules. The rules are of type IF THEN ELSE rules, decision rules based on different important wine features.*

**Keywords:** *Decision rules, artificial intelligence, recommendation system.*

**JEL classification:** C41, C61

### Introduction

Expert system represents a computer application that performs a task that would otherwise be performed by a human expert. For example, there are expert systems that can diagnose human illnesses, make financial forecasts, and schedule routes for delivery vehicles, advise people. Some expert systems are designed to take the place of human experts, while others are designed to aid them.

Expert systems are part of a general category of computer applications known as artificial intelligence. To design an expert system, one needs a knowledge engineer, an individual who studies how human experts make decisions and translates the rules into terms that a computer can understand [14].

An expert system is an artificial intelligence tool used to model and aid human decision making in a highly specialized problem domain. Expert systems represent human expertise through a combination of some form of knowledge base and inferencing technique. Some historical uses of expert systems include disease diagnosis, chemical analysis, wine selection, and armored vehicle identification.

The typical expert system receives input describing a problem in its field of expertise, then uses its inferencing technique to extract appropriate information from its knowledge base to produce an answer, diagnosis, or description of a solution. One strength of an expert system is that it can produce a report describing the chain of inference it followed, allowing a human operator to check on the system's reasoning. However, because expert systems are highly specialized, static systems, they can be extremely brittle when presented with novel problems or situations.

Expert systems have a number of major system components and interface with individuals in various roles. The major components are:

- Knowledge base - a declarative representation of the expertise, often in IF THEN rules;
- Working storage - the data which is specific to a problem being solved;

- Inference engine - the code at the core of the system which derives recommendations from the knowledge base and problem-specific data in working storage;
- User interface - the code that controls the dialog between the user and the system.

To understand expert system design, it is also necessary to understand the major roles of individuals who interact with the system. These are:

- Domain expert - the individual or individuals who currently are experts solving the problems the system is intended to solve;
- Knowledge engineer - the individual who encodes the expert's knowledge in a declarative form that can be used by the expert system;
- User - the individual who will be consulting with the system to get advice which would have been provided by the expert.

### Case Study: Application Presentation

I have done a wine advisor expert system. I thought that maybe not many people knows so many things about Romanian wine, that's why I have chosen this field to promote Romanian wine. I have also used in my advisor of wine wines from all over the world. It can be considered a point of start, this application can be much more developed, but, for the moment, I tried to make it easy to manage.

Figure 1. The main window.

When somebody wants to choose a wine, I thought first he/she thinks about what the wine is for, if the wine is to be served as an aperitif (before meal), during the meal (entrée or dinner category), to accompany a dessert or to be used after meal. I think that this is the first thing that somebody is thinking about when wants to choose a wine. The person who wants to be helped to choose a wine I think should know at least this information. So, I extracted the knowledges about wine and I divided then first in these categories. If the wine is to be served as an aperitif then I choose to advise in this field only wines from Romania so I think Romanian wine can be better known. The wine can have full body, medium body or light body. If the wine has a full body then all selected wines are from the Cotnary vineyard. If the wine has a medium body then all selected wines are from Dealu Mare vineyard. If the wine has a full body then all selected wines are from Jidvei vineyard. If the wine has bubbles then it is a sparkling wine, otherwise it is a table wine. All this categories of wines (it does not matter which vineyard do they belong ) can be sparkling or table wine. Then ,when we have all this information depending on the wine colour I can advise the user to choose a specific type of wine by giving a name of a specific type of wine which match the preferences. A wine expert system can be extended more. I am so sorry but in only something around 40 rules my expert system can't be developed extremely much.

If the wine is to used to accompany an entree (it belongs to dinner category) then I have chosen here wines from all over the world and I extracted information about which wine best suits different kind of food. For example, if the wine is to be served with white meat, steak, barbecues, pizza, chinese food, cheese, fish or salad. Then, according to other characteristics ,as the preferred colour, they can be advised to choose a kind of wine. If they want something for dessert, according to the chosen dessert, if it is a fruit of primary fruit dessert the users will be advised to choose a type of wine (a Rougeon wine) and

if it is something very sweet such as chocolate they will be advised something else, so the right choice can be taken. If the

wine is to be used after the dinner then also a specific type of wine will be specified to the user.

I used to represent the knowledge bases a set of rules. For instance: ' if the person wants a wine to be served after the dinner then he/she should choose a Pinot wine. This is an example of a short rule. A rule is, thus, a statement of a relationship, not an instruction. Using a set of assertions, which collectively form the 'working memory', and a set of rules that specify how to act on the assertion set, a rule-based system can be created. Rule-based systems are fairly simplistic, consisting of little more than a set of if-then statements, but provide the basis for so-called "expert systems" which are widely used in many fields. The concept of an expert system is this: the knowledge of an expert is encoded into the rule set. When exposed to the same data, the expert system AI will perform in a similar manner to the expert.

Rule-based systems are a relatively simple model that can be adapted to any number of problems. As with any AI, a rule-based system has its strengths as well as limitations that must be considered before deciding if it's the right technique to use for a given problem. Overall, rule-based systems are really only feasible for

problems for which any and all knowledge in the problem area can be written in the form of if-then rules and for which this problem area is not large. If there are too many rules, the system can become difficult to maintain and can suffer a performance hit. I tried to manage it.

I have done a set of rule and when the algorithm of making a recommendation is applied one rule precedes the other one following the user's desire until a right recommendation is done.

There are two ways in which an inference engine can attempt to apply a set of rules. These are known as 'forward chaining' and 'backward chaining'. In forward chaining, the inference engine starts from known facts and looks at the left-hand 'if' side of the rules, to find any that fit, and then goes on to look for further rules that follow on from those that have been found to apply. In backward chaining, the inference engine starts from the end, from the aim which is sought. So, it starts from the right-hand 'then' side, to find any rules that satisfy the requirement, and works backwards to find what starting conditions are necessary to reach the goal.

In reaching a good option of wine from some given desired from one person, I think the forward reasoning process is the most appropriate.

I have done a user interface which allows the user to choose from multiple answer questions. A dialog with the user is like:

The wine is:

- \*to be consumed before a meal(aperitif)
- \*to accompany an entrée
- \*to accompany dessert
- \*to be consumed after dinner

and when the user makes a choice by clicking one of the buttons then a new page appear for the next step where it can choose another characteristics he/she wants the wine to have.

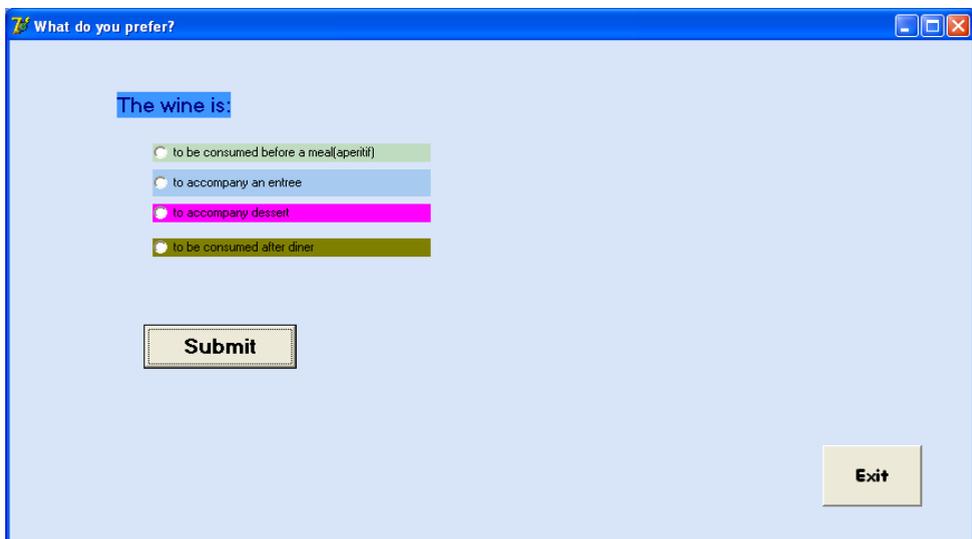

Figure 2. The window with selection' options

## EXAMPLE OF USING MY KNOWLEDGE BASE

I suppose that one person needs help to choose a wine .At the first step he chooses a wine to be consumed before a meal (aperitif), and then he chooses a full body wine and non- sparkling and the color pink. The recommended type of wine is Romanian and the name of wine is Busuioaca Romaneasca .

Applying forward-chaining the result was Busuioaca Romaneasca wine. The rules applied inside of my program to make this recommendation are:

Rule 1 =>Rule 2 => Rule 3 => Rule 9 => Rule 11

Second example :

I suppose that somebody chooses at first step a wine to be consumed be consumed before a meal, a light body wine, non-sparkling and then he/she chooses a pink colour for the wine. Applying forward-chaining the result was "Feteasca Regala" wine. The rules applied inside of my program to make this recommendation are:

Rule 1 => Rule 2 => Rule 17 =>Rule 19

Another example can be:

Somebody wants to choose a wine to accompany an entrée at first step and then he chooses a entrée be white meat and at the next step he chooses the color to be rose. The recommendation in this situation is: Pinot Grisio Rose,Veneto or Cuvee des Amardiens Rosé. Here I have extracted the knowledge about wines from many countries or the same country which can suit a kind of food. The rules applied inside of my program to make this recommendation are:

Rule 21=>Rule 23

I have tried to make many rules from my expert system to be able go one from the other. I have done from some of them, but it is a bit more difficult. All wine expert system I have found online are based on a composite rule to give a recommendation. Here I can give you an example, a link where I have seen an wine expert system and it was also a bit my point of inspiration [9]. I worked hard to do it. It was a bit difficult to separate them in classes but I think now it is well done. I hope you like it.

I have implemented my program in Delphi. I have done a user friendly interface. It is really easy to use it. You can execute my program using "Project1.exe".If you have Delphi program installed on your computer you can see all the source code. Maybe if you don't have Delphi installed on your PC not all the pages will be displayed at their real quality .If sometimes the program does not respond when you try to push a button you must open the program again because it is a Delphi error . It happens sometimes.I can't give you a copy in Notepad with the source code because it is too much.

When you are executing my program, first you can see the welcome page that was presented in Figure 1:

After you click the button "Help me choose a wine" you can go to the next step, the next page will be displayed. It can be seen in "Figure 1" here on the paper.

I have implemented my program by using Radio Buttons and Labels. Each button has in front of him a corresponding label for the choice which can be done. You must click on the button which has near it the choice which best fits your desire. You must make a choice at every page.

For example:

After choosing "to accompany dessert" at the first page the next page is:

**Figura 3. Intermediar decisions**

The user should choose the answer which better fits him/her. When you have click on a button then you can go to the next step by clicking on "Submit" button so a new page will appear.

And then, after this step he/she will go to the next step and so on until the goal is reached and a recommendation of wine is made.

If you have changed your mind and want to exit then you can click on "Exit" button.

This is my wine advisor expert system. I hope it is usefull.

### **USED RULES**

Used rules are:  
APERITIF

RULE 1 [Choosing a aperitif wine]

If [this wine] = "to be consumed before a meal (aperitif)"

Then [a recommended generic wine type] = "aperitif wine"

RULE 2 [Choosing a Romanian wine]

If [this wine] = "aperitif wine"

Then [a recommended generic wine type] = "Romanian wine"

RULE 3 [Choosing a full bodied aperitif Romanian]  
If [a recommended generic wine type] = "Romanian wine"  
[the preferred body] = "full" and  
Then [a recommended generic wine type] = "Cotnary vineyard wine"

RULE 4  
If [a recommended generic wine type] = "Cotnary vineyard wine"  
And  
[a sparkling wine is preferred] = true  
Then [a recommended generic wine type] = "sparkling wine"

RULE 5  
If [a recommended generic wine type] = "sparkling wine"  
Then [a recommended generic wine type] = "Champagne"

**Figura 4. The final recomandation**

RULE 6  
If [a recommended generic wine type] = "Champagne"  
And  
[the preferred colour] = white  
And  
[the preferred body] = "full/medium/light"  
Then [a recommended generic wine type] = "White Champagne"

RULE 7  
If [a recommended generic wine type] = "Champagne"  
And  
[the preferred colour] =pink

And  
[the preferred body] = "full/medium/light"  
Then [a recommended generic wine type] = "Pink Champagne"

RULE 8  
If [a recommended generic wine type] = "Champagne"  
And  
[the preferred colour] = black  
And  
[the preferred body] = "full/medium/light"  
Then [a recommended generic wine type] = "Black Champagne"

RULE 9  
If [a recommended generic wine type] = "Cotnary vineyard wine"  
And  
[a sparkling wine is preferred] = false;  
Then [a recommended generic wine type] = "table wine"

RULE 10  
If [a recommended generic wine type] = "table wine"  
And  
[the colour]=white  
Then [a recommended wine] = " Tamaioasa Romaneasca "

RULE 11  
If [a recommended generic wine type] = "table wine"  
And  
[the colour]=pink  
Then [a recommended wine] = " Busuioaca Romaneasca wine "

RULE 12  
If [a recommended generic wine type] = "table wine"  
And  
[the colour]=red  
Then [a recommended wine] = " Cabernet Sauvignon wine "

RULE 13  
If [a recommended generic wine type] = "Romanian wine"  
and  
[the preferred body] = "medium"  
Then [a recommended generic wine type] = "Dealu Mare vineyard wine"

RULE 14  
If [a recommended generic wine type] = "Dealu Mare vineyard wine"  
And [a sparkling wine is preferred] = false;

[the colour]=white;  
Then [a recommended wine ] = "Feteasca Regala wine"

RULE 15

If [a recommended generic wine type] = "Dealu Mare vineyard wine"  
And  
[a sparkling wine is preferred] = false  
And  
[the colour]=pink  
Then [a recommended wine ] = "Feteasca Roz wine"

RULE 16

If [a recommended generic wine type] = "Dealu Mare vineyard wine"  
And  
[a sparkling wine is preferred] = false  
And  
[the colour]=red  
Then [a recommended wine ] = "Feteasca Neagra, Pinot Noir or Cabernet Byzantium wine"

RULE 17

If [a recommended generic wine type] = "Romanian wine"  
and  
[the preferred body] = "light"  
Then [a recommended generic wine type] = "Jidvei vineyard wine"

RULE 18

If [a recommended generic wine type] = "Jidvei vineyard wine"  
And  
[a sparkling wine is preferred] = false  
And  
[the colour]=white  
Then [a recommended wine ] = "Sauvignon Blanc or Dry Muscat wine"

RULE 19

If [a recommended generic wine type] = "Jidvei vineyard wine"  
And  
[a sparkling wine is preferred] = false  
And  
[the colour]=pink  
Then [a recommended wine ] = "Feteasca Regala wine"

RULE 20

If [a recommended generic wine type] = "Jidvei vineyard wine"  
And  
[a sparkling wine is preferred] = false  
And  
[the colour]=red

Then [a recommended wine ] = "Pinot Noir wine"

RULE 21

If [the wine is to accompany an entree]

Then

If [a recommended generic wine type] = "dinner(entree) wine"

RULE [Is the wine for a white meat entree?] 22

If [this wine] = "entrée wine" and

[the entree] : "white meat"

[the colour]:"white"

Then [a recommended wine] = "Muscat Sec,Samur Blanc or Griffin Vineyards Verdelho"

RULE [Is the wine for a white meat entree?] 23

If [this wine] = "entrée wine" and

[the entree] : "white meat"

[the color]:"rose"

Then [a recommended wine] = "Pinot Grigio Rose,Veneto or Cuvee des Amardies Rose"

RULE [Is the wine for a white meat entree?] 24

If [this wine] = "entrée wine" and

[the entree] : "white meat"

[the color]:"red"

Then [a recommended wine] = "Corbieres 2003,Domain Modelen or Mayor de Castilla 2004,Ribera del Duero"

RULE [Is the wine for a steak entree?] 25

If [this wine] = "entrée wine" and

[the entree] : "steak" and

[the colour]:"white"

THEN [a recommended wine] = "Chateau Agnel 2000,Minervois(France) or Chateau Syrah 2004(France)"

RULE [Is the wine for a steak entree?] 26

If [this wine] = "entrée wine" and

[the entree] : "steak"

[the color]:"rose"

Then [a recommended wine ] = "Busuioaca Romaneasca"

RULE [Is the wine for a steak entree?] 27

If [this wine] = "entrée wine" and

[the entree] : "steak"

[the color]:"red"

Then [a recommended wine ] = "Rosso di Sicilia 2004,Cantine Settesoli(Italy)"

RULE [Is the wine for a barbecues entree?] 28

If [this wine] = "entrée wine" and

[the entree] : "barbecues"

[the colour]:"white"

Then [a recommended wine] = "Riojo Blanco CVNE 2003,Vino Real (Spain) or Chateau Camplazens Syrah 2004(France)"

RULE [Is the wine for a barbecues entree?] 29

If [this wine] = "entrée wine" and

[the entree] : "barbecues"

[the color]:"rose"

Then [a recommended wine type] = "Tamaioasa Regala(Romania)"

RULE [Is the wine for a barbecues entree?] 30

If [this wine] = "entrée wine" and

[the entree] : "barbecues"

[the color]:"red"

Then [a recommended wine type] = "Riojo Tempranillo 2003(Italy),Berberana(Spain) or Protocola Tinto(Spain)"

RULE [Is the wine for a pizza entree?] 31

If [this wine] = "entrée wine" and

[the entree] : "pizza"

[a recommended wine type] = "Chianti wine"

RULE [Is the wine for Chinese Food entree?] 32

If [this wine] = "entrée wine" and

[the entree] : "Chinese Food"

Then [a recommended wine type] = "White Riesling wine"

RULE [Is the wine for cheese entree?] 33

If [this wine] = "entrée wine" and

[the entree] : "cheese"

Then [a recommended wine type] = "Burgundy wine"

RULE [Is the wine for fish entree?] 34

If [this wine] = "entrée wine" and

[the entree] : "fish"

Then [a recommended wine type] = "Chardonnay wine"

RULE [Is the wine for salads entree?] 35

If [this wine] = "entrée wine" and

[the entree] : "salads"

Then [a recommended wine type] = "Bordeau Blanc wines"

DESSERT WINE

RULE [dessert class] 36  
If [this wine] = "is to accompany an dessert" and  
Then [a recommended generic wine type] = "dessert wine"

RULE [Fruit-based dessert] 37  
If [this wine] = "dessert wine" and  
[the dessert] = "fruit or primarily fruit"  
Then [a suggested wine type] = "Rougeon"

RULE [Sweet dessert] 38  
If [this wine] = "dessert wine" and  
[the dessert] = "very sweet such as chocolate"  
Then [a recommended generic wine type] = "Port"

#### AFTER DINNER WINE

RULE [After dinner] 39  
If [this wine] = "to be consumed after dinner"

# OPPORTUNITIES TO IMPROVE THE MANAGEMENT METHODS OF ROMANIAN ORGANIZATIONS

**Gheorghe Gabriela**

*Faculty of Economics and Business Administration, Dunărea de Jos University, Galați, România  
gabriela.gheorghe@ugal.ro*

**Abstract:** *Information Technology has responded to the crisis by change and innovation. Competitive organizations are permanently prepared to identify the cutting-edge technologies which will change the future in business by using the concept of Business Intelligence. Information Technology is developing rapidly and providing decision makers with large amounts of information that require processing and analysis. Business Intelligence are critical decisions support applications, their role being to provide to management, based on information from the company, a landscape of its situation at some time, but also predictions on the medium and long term. This paper describes the architecture of the Business Intelligence Platform and highlights the benefits of using decision support systems for business applications. Nowadays, company executives require relevant and accurate business information in real-time to take strategic decisions. It is also essential to have freedom to access this information anywhere and anytime. There is a real need to extend this functionality beyond the office and on the fingertips of the decision makers. After a presentation of the concept of Data mining with examples from a case study, the paper focuses on the potential of the IT&C decisional sector, which embeds simulation and assistance tools for managerial decisions. Developing new methods for predictive modelling and application of existing techniques in many areas will be a permanent concern for both researchers and companies that are interested to gain competitive advantages.*

**Keywords:** *decision support system, business intelligence, knowledge discovery in databases, data mining technologies.*

**JEL classification:** *L86, M15, O33*

## **1. Introduction**

The IT researchers' concerns for decision support applications have appeared for over 50 years. Many simulation systems have been developed, making it possible to better exploit the mathematical and statistical programming methods. This formalization effort together with the evolution of new generations of computers and operating systems, have led to the development of the first generation of decision-making tools. The first applications of group decision support systems based on models released in the late '60s. These applications were developed in the '70s and in the early '80s appeared financial planning systems and group decision support systems. Then, starting with the '90s, emerged Executive Information Systems (EIS), OLAP (On Line Analytical Processing) technology and Business Intelligence (BI) applications, continuing with the development of Decision Support Systems (DSS) based on web technologies in the mid '90s, and more recently, the concepts of data mining, text mining, web mining, respectively.

One of the earliest definitions proposed for computer based decision support is “a model-based set of procedures for processing data and judgments to assist a manager in his decision making” (Little, 1970).

In 1992, Kanter said in the paper entitled *Managing with Information* that “DSS is used in less structured problems, where the art of management meets science.”

DSS are “those management information systems that rely on the use of analytical models, specialized databases, judgment and intuition of the decision maker and an interactive computer modelling process, that supports semi-structured or unstructured decision making by managers” (O'Brien, 1999).

The concept of BI appears into IBM Journal in 1958 as “automated system used to disseminate information in various sectors of organizations” (Berta, 2012).

BI are high-level decisions support applications, that provide to management, based on information from the company, a picture of its situation at a moment, but also on the medium and long term, facilitating competent decision making. The BI concepts have ceased to be restrictively considered software applications, these tools are advanced management methods that ensure both organization’s data management and their use as management tools for modelling and forecasting.

## **2. Data Mining and Knowledge discovery in databases (KDD) definitions:**

“We analyze Knowledge Discovery and define it as the nontrivial extraction of implicit, previously unknown, and potentially useful information from data“ (Frawley, Piatetsky-Shapiro and Matheus, 1992).

“KDD is the process of finding hidden information in a database. Data Mining is the use of algorithms to extract information and patterns derived by the KDD process” (Dunham, 2003).

DM is “the extraction of hidden predictive information from large databases” with “sophisticated statistical analysis and modelling techniques to uncover patterns and relationships hidden in organizational databases” (Wang, 2003).

Through the knowledge-discovery process, implicit and potentially useful information is extracted from the raw data (Roiger and Geatz, 2003).

Data Mining is “the process of discovering patterns in data. The process must be automatic or (more usually) semiautomatic. The patterns discovered must be meaningful” (Witten and Frank, 2005).

“The automated or convenient extraction of patterns representing knowledge implicitly stored or captured in large databases, data warehouses, the Web or data streams” (Han and Kamber, 2006).

Analyzing accurately and timely of this large amounts of data is a difficult task, in general, not possible with traditional methods. Ability to analyze and use the massive amounts of data remained far behind the possibilities of storing them. This raises new challenges for businessmen and researchers for the purposes of extracting useful information (Wang, Liao & Rees, 2002).

Increasing accuracy for predictions can save significant amount of money for a company and is a major motivation for using the methods of forecasting and systematic investigation for new models and techniques to improve the current results (Zhang, 2003).

According to market surveys conducted by Gartner Group, at present, the world's leading BI market, with important revenues from the sale of these solutions, are SAP,

Oracle, Microsoft, IBM SAS Microstrategy, Actuate, Panorama Software, TIBCO Software etc. (Petthey and van der Meulen, 2012).

### **3. Confidence in the Data is Key to Business Success**

#### **3.1. The emerging need of Business Intelligence instruments**

In the decision-computer era, competitive organizations are permanently prepared to identify the cutting-edge technologies which will change the future in business by using the concept of Business Intelligence, proposing as objectives:

- Identifying products and services offer in order to retain customer loyalty
- Best possible risk management and activities optimization
- Intelligent exploitation of stored data for being more informed than competitors
- Anticipate opportunities and threats

Most companies and organizations collect data on a large scale. This huge amount of data can be used to extract knowledge that can represent a real advantage to business managers.

The “Business Intelligence” term is being used in the modern business world to fulfil the emerging need of analyzing data from large and variable data sources and this need brought an evolution and a new line of competition between vendors of different enterprise systems. The dramatic trendy evolution in IT field from the last decade and the increased demand of data driven knowledge, large companies have enabled themselves to store an enormous amount of data. However, the request to derive information quickly and to facilitate the decision making process of business organizations, a new set of tools was required, which led to Business Intelligence. BI means the idea of collecting, storing, analyzing and providing access to data and it consists of a set of applications and technologies that support decision making, querying and reporting, online analytical processing, statistical analysis, forecasting and data mining.

This requirement for Business Intelligence applications and technologies has led to the development of BI software. Most major software vendors have launched their own Business Intelligence modules that can be packaged with their software products. Nowadays organizations using enterprise systems are also using the services of available BI software on the market. The functionality of this software is independent of the rest of the modules, but also provides means to seamlessly integrate it with enterprise systems.

In order to identify the BI components, we first need to determine the types of problems are the BI tools designed to solve:

- Structuring data for analysis;
- Analyzing data;
- Creating reports;
- Viewing and sharing reports.

As described above, some components are required to prepare data for analysis, while others are designed for analysis, reporting and sharing.

### 3.2. DSS requires Big Data

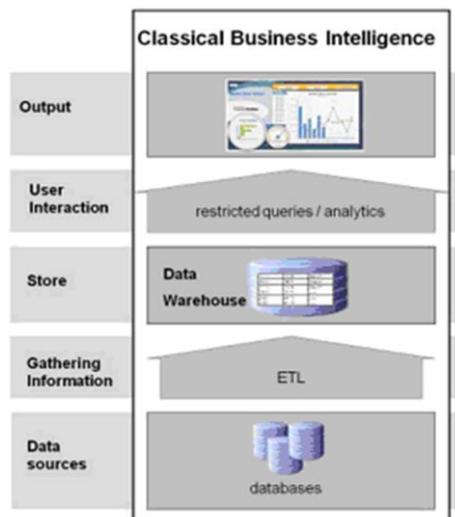

A decision making system requires an overall vision of the Operational Information System. The information it processes is based on the raw operational data, which are subject to processing, that is to the calculations, to which are added different notions of time, location, area, and so on, which can have different meanings depending on the activity field concerned. A common reference system groups elements that can come from several applications, their overlapping representing the memory of the organization.

Enterprises today are beginning to realize the important role Big Data plays in achieving business goals. Concepts like factors that influence a customer to make a purchase, behaviour patterns that point to fraud or misuse, inefficiencies slowing down business processes, now can be understood and addressed by collecting and analyzing Big Data. The insight gained from such analysis helps organizations improve operations and identify new product and service opportunities that they may have otherwise missed. What enterprises need are tools to help them easily and effectively understand and analyze Big Data.

### 3.3. Business Intelligence Platform

Modern Business Intelligence platform should provide an end-to-end infrastructure, solutions and technologies that support following issues, as seen in the figure 1:

- information integration
- master data management
- data warehousing
- BI tools
- repository of best practices and business models

**Figure 1:** The 5 levels of the traditional BI architecture

Source: BI cubist-project, [http://cordis.europa.eu/projects/rcn/95904\\_en.html](http://cordis.europa.eu/projects/rcn/95904_en.html)

### **3.3.1. Data sources**

The data themselves are of two types:

- Operational data from the dedicated transactional processes activities;
- Operational management data consisting of historical data from the activities carried out in a longer period of time, dedicated to strategic management of an organization.

At the operational level, the data is not normalized, there is no conceptual unification. The operational information system can be used to control current activities, but does not allow for long-term decisions, because it does not manage a history of the resulted information. Master data is key business information that may include data about customers, products, employees, materials, suppliers etc. Analysis and reporting is greatly dependent on an organization's master data.

### **3.3.2. ETL (extract, transform, load) tasks**

An Integrated data system is a data collection that gathers consistent data elements from a range of work activities along the continuum of an operational process, stores the data in a coherent way, and is open access by all work activities that require it. Information Aggregation means that from more information with the same semantic side but from different fields is obtained new information, with the same semantic side and a field formed by joining the fields of the processed information.

### **3.3.3. Data storage**

In traditional BI, data is stored in the Data Warehouses, which can be broken down by activity sector in Data mart. The features of the information are stored in metadata dictionaries that describe the semantics, format and rules of extraction.

A data warehouse in Inmon's (1992) concept is a collection of integrated databases, subject-oriented and designed to provide necessary information for decision making. The elements useful for the analysis are stored as tables (relational databases) or data cubes (multidimensional databases).

### **3.3.4. Data analysis**

The search for these valuable information, yet hidden, patterns and relationships within the data is known as data mining.

Business Intelligence provides to organization support to optimally manage information on their so as organization to able to adopt the best decisions for new competitive advantages. In the same time, BI provides users vital information about techniques used in business and thinking of the competitors, their culture, their intentions and ability to implement them.

### **3.3.5. BI Tools for Data Mining**

The BI tools perform the metadata analysis (data about data) to ensure that meaningful data is collected in order to assure a single version of the truth by consistently performing calculations and reporting against the same data.

The combination of analytics and data visualization should be an integrated component of any BI initiative to enable users to explore data, interact with it and apply analytics to understand it. The analysis and presentation tools, the components visible to the end-user, link the production information, the mid-level decision support information and those needed by the enterprise management.

There are other tools that manage the aggregated and normalized data in a specific decision-oriented database, enabling a multidimensional visualization of information, allowing for decision making at all hierarchical levels of the organization: operational control, management control at department or project level and also strategic planning in the organization.

The reporting tool meets the requirements of operational, planning and regulatory reporting, allowing electronic exchange of data between process and business systems to support effective operations management and business process integration.

#### **4. Case study of a Romanian BI solution**

Wizrom Software has released WizWhy application that targets the services sector companies affected by the economic crisis.

The companies that are to change their business partners have a behaviour that can be determined statistically and on which one can create profiles. The proposed solution highlights certain features of the business partner who is about to stop the collaboration, based on the history of the relationship shown in the database. This is just one aspect of the applicability of the data mining solutions for the benefit of the customers. Meanwhile, WizWhy has the ability to also highlight what goes well, so that the management be able to analyze the reasons and act to extend the recipe for success to the whole business.

The operating principle is simple: every company has a database of customers and their business activity. The WizWhy application, the tool we will use as research support for this case study, accesses the database, generating a set of logical rules in which, in addition to quantitative information, qualitative data are also analyzed. The found rules explain with a high percentage of probability why the analyzed results were obtained. Based on these rules, can be highlighted certain profiles used to make predictions. For that matter, the financial services sector, the marketing, market research and insurance are among the main beneficiaries of this software platform.

In addition to the concept of “what if analysis” of the traditional Business Intelligence applications, WizWhy finds on its own those variables that have a significant impact on the results, avoiding subjectivity and can thus detect unusual behaviour of a group of customers through database analysis in order to alert the management. Finding patterns of high-risk companies within financial data enables one to predict to what extent a new customer is risky.

Enterprise Warehouse can reveal interesting phenomena in the data, mainly:

- issuing a summary of the data, reflecting the number of entries, column totals, number of records that meet a set of conditions;
- cases that are exceptions to the rule;
- issuing predictions for new cases starting from the identified rules;
- for auditing purposes: the records that deviate from the discovered patterns in the data might be cases of data entry error or fraud.

Using this BI platform we'll explore the pattern of the first set of data, referred to as training file, and issue predictions for the second data set, the test file.

Sequence of operations:

- First, it opens the data base to be analyzed;
- Second, the working set of data is loaded;

- Once the data set is open, the parameters to be used in the analysis must be defined;
- Analyse the results, trends and reports displayed;
- Generate predictions.

In order to analyse a data set one of the fields should be defined as the dependent variable, while the other fields are considered the independent variables.

A continuous analysis will calculate the specific percent of the dependent variable as a function of the other fields.

The rules that relate between the dependent variable and the other fields are formulated as “if-then” and “if-and-only-if” sentences. On the basis of the discovered rules can be establish the main patterns in the data in order to use them for issuing predictions for new cases.

“Error probability” or “Confidence Level” indicates the degree to which the rule can be relied upon as a basis for predictions (WizWhy Whitepaper, 2011).

Assuming that the data under analysis is a representative sample of an infinite population, the error probability quantifies the chances that the rule does not hold in the entire population and exists accidentally in the file under analysis.

Numeric fields, such as Amount Purchased, are automatically segmented into intervals, and these intervals are the values in the if-then rules. Revealing all the if-then rules is known as the “association rules” method.

Association rule mining, one of the most important and techniques of data mining, introduced in (Agrawal, Imielinski and Swami, 1993) are widely used in various areas such as telecommunication networks, market research studies and risk management, inventory control, web traffic analysis, security on internet surfing, medical research etc.

Various association mining techniques and algorithms are used in order to extract interesting correlations, frequent patterns, associations or casual structures among sets of items in the transaction databases or other data repositories. Association rule mining is to find out association rules that satisfy the predefined minimum support and confidence from a given database.

One of the main challenges of such a method is to validate each possible relationship for a massive data, in a reasonable time-span.

For instance, as we can see in the figure 2, the data we used contain:

- 1,000 records
- 22 fields in each record
- An average of 10 possible values for each field

Cash	Company name	Cost o...	Current assets	Current liabi...	Dividend	Equity...	Goodwill ...	Industry
10,80	ArcelorMittal Roman	1430,40	1267,70	973,40	0,00	380,20	280,80	0121 - Iron & Steel
494,30	UPC Romania	1572,70	2830,60	982,10	0,00	2112,60	358,80	0915 - Communications Services
0,00	Ecosal Ltd.	10,90	3,10	6,80	0,00	-3,30	0,10	0975 - Waste Management Services
36,20	WMC Ltd.	880,70	755,40	658,30	0,31	2781,20	0,00	0124 - Metal Mining
0,30	ING Bank				6,00	8,00	0,00	0730 - S&Ls/Savings Banks
0,10	Still Co	6,30	2,60	3,70	0,00	3,40	4,60	1006 - Computer Hardware
0,60	Hiperdia		0,80	1,50	0,00	0,20	0,00	0803 - Biotechnology & Drugs
7,40	Technautic	110,20	56,90	32,20	0,00	24,80	0,00	1024 - Electronic Instruments & Co...
144,50	Viata Libera	994,10	1374,20	1699,60	0,08	424,20	353,90	0903 - Advertising
2,50	MediTest, Inc.	18,80	14,40	5,00	0,00	52,10	32,00	0812 - Medical Equipment & Supplies
3,40	Nexial.ro, Inc.	0,00	3,50	0,30	0,00	3,50	0,00	0963 - Retail (Specialty Non-Apparel)
12,50	Hobby Tour	91,80	59,30	49,20	0,00	76,80	49,20	0430 - Recreational Products

**Figure 2: Basic data loading: Customers.mdb**  
Source: own compilation

When a data set is opened, it is displayed in the WizWhy work area, as follows:

	Field Name	Field Type	Analyze if Empty	Ignore Field	Dependent Variable
2	Company name	Category	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3	Cost of goods sold	Number	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4	Current assets	Number	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5	Current liabilities	Number	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6	Dividend	Number	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7	Equity (common)	Number	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8	Goodwill and intangibl	Number	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
9	Industry	Category	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
10	Liabilities and equity	Number	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
11	Long-term debt	Number	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

**Figure 3: WizWhy Analyzer work area displays the tabbed dialog boxes**

Dependent Variable: Sales

The total range of the Field's values is: 0,10 - 111.630,00

Average: 1.355,39    Standard Deviation: 6.491,88    Median: 73,40

Select the range of values to be analyzed in the rules [Boolean analysis]:

Predicted Value:  More than: 1000    Frequency: 15.83 %  
 Less or equal than: 111630

Minimum probability of if-then rules: 22 %  
 Minimum probability of if-then-NOT rules: 91 %  
 Minimum number of cases in a rule: 100 10.0%  
 Maximum number of conditions in a rule: 3

Search for Unexpected Rules     Re-display Rule Parameters after reading the data.

**Figure 4: Settings the rule parameters: Sales>1000 and cases in a rule>=100**  
Source: own compilation

For the prediction: 'Sales is more than 1.000' when the Issue Rules button is pressed the following summary report is generated:

Summary Report:

C:\Customers.mdb

Total number of records: 1000

Minimum number of cases in a rule: 100

Dependent Variable: Sales

Predicted Value (analyzed as Boolean): more than 1.000,00

The total number of case explained by the set of conditions: 928.

The total number of cases in the data: 935.

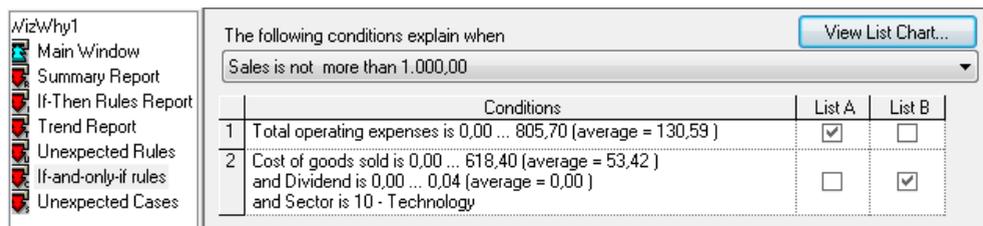

Average probability of the predicted value is 0,158.

When performing an analysis on a database of clients in order to discover the rules of loyalty winning, the first step is to identify the basic rules and trends. Parameters are calculated, representing the "importance" of each field to identify customers who are likely to head for the competitors.

If-then rules represent sufficient conditions (the "if" condition is a sufficient condition for the result). If-and-only-if rules go one step further: they represent necessary and sufficient conditions.

Obviously such a relation cannot be accidental, and therefore might be relied upon when issuing predictions. Indeed, when WizWhy reveals if-and-only-if rules it takes them into account when issuing predictions for new cases.

"If-and-only-if" type of relationship offers a higher degree of safety and is considered in order to develop predictions, as we can see in figure 5:

**Figure 5:** "If-and-only-if" relationship discovered for the given parameters and data  
Source: analysis performed with WizWhy

In the previous example, the two conditions, (1) and (2), are necessary and sufficient conditions for the dependent variable 'Sales' being less than 1.000. If at least one of them holds there is a high probability that the Boolean analysis 'Sales grater than 1.000' is false. If the two of them do not hold, there is high probability, respectively 0,961 (147 out of 153 cases) that the condition 'Sales is more than 1.000' is true. In the second if-and-only-if rule above, the first condition refers to the case where the value in the Cost of goods sold field is the interval between 0 and 618,40. The platform employs a unique algorithm for the optimal segmentation of numeric (continuous) fields.

## 5. Conclusions

The organizational repository of enterprise wide data across the lines of business contains massive and integrated data and represents the complete organizational view of information needed to run and understand the business.

This unprecedented development of IT technologies has led to different changes in the business environment: the appearance and development of knowledge-based organizations, and of the knowledge-based management within the organizations. Within the total resources of a knowledge-based organization, the informational resources register a spectacular dynamic.

Both the explosive growth in the amount of information inside companies, and the rapid evolution of IT equipments, determine more and more companies to adapt their strategies. Due to the diversification of the type of data to be stored, companies need a new way to manage unitarily both their applications and data files, thus adapting themselves easier to the market dynamics.

The IT resources are now becoming the engine of successful enterprises, representing not only the operational base, but also the means for marketing and communication strategies. At the same time, organisations must review the relevance of knowledge management to operational managers.

The knowledge-based organizations are able to gather, extract, label, organize process and share knowledge to make superior performances possible: better business solutions and decisions, a better collaboration and share of information.

In order to face new challenges, the companies must improve their digital and technological knowledge capacities, even during crises or financial restraints.

New software applications accelerate the decisional process in this big data era. Important IT companies announce the launching of new software applications that offer clients a complex method to decrease the big data volume and to speed up the business processes, by making it easy to obtain useful information.

Companies that have deployed data visualization solutions to help derive value from Big Data are finding that there are behind-the-scenes benefits to using these tools. Not only does the combination of strong analytics and data visualization give users the power to make the right business decisions, it also facilitates the joining of different disciplines within an enterprise to help solve business problems.

## ERP ASSIMILATION: AN END-USER APPROACH

**Hurbean Luminita, Negovan Ana-Maria**

*West University of Timisoara (Faculty of Economics and Business Administration,  
Department of Business Information Systems), Timisoara, Romania*

*luminita.hurbean@feaa.uvt.ro*

*ana\_negovan@yahoo.com*

**Abstract:** *One premise of this paper is that ERP implementation is an “organization wide revolution” because a large number of changes happen. Unfortunately, after 20 years of experience, many implementations of ERP systems take longer and cost more than projected or even fail. As many authors stated, one major cause appears to be that organizational issues are neglected or underestimated. In this type of IT project the organizations confront with many problems because they put inadequate stress on the management of change brought about by the technology. We consider that the success of the implementation depends highly on the company’s openness to change. Change is not always welcomed by end-users, so the first step is to ensure that the executive management supports the team’s vision, the vendor selection and the implementation project from beginning to completion. When an ERP software provider is selected, it should display the qualities and be prepared to act as a “change agent”, one who can explain short-term and long-term benefits of the proposed changes, while being sensitive to each end-user’s level of change acceptance. Our study was focused on the end-users behaviour and perception.*

*The paper discusses the ERP adoption based on the IT assimilation theory. The ERP lifecycle is associated with the IT assimilation steps. We propose a distribution of these steps along the lifecycle. Derived from the findings in the reviewed literature we will focus the cultural factors, in particular those related to the end-users (determined as a major impact factor in our previous study: Negovan et al., 2011). Our empirical study is centred on the end-users perspective and it tries to determine if and how their behaviour affects the achievement of the ERP assimilation steps. The paper reasons that organizations that understand the IT assimilation steps correlated to the ERP implementation critical factors are more likely to implement and use ERP successfully.*

**JEL classification:** *L86, O32, O33*

### 1. Introduction

In order to respond to the imperative of reducing costs while expanding business and improving customer services, companies abandoned the legacy systems and turned to integrated systems. The end of 20th century brought Enterprise Resource Planning (ERP) – a new generation of innovation management software to support business processes, but also to move on the culture in an organization. During the 1990s costly ERP software was adopted mostly to improve and integrate many (possibly all) business processes (Jacobs et al., 2003). When the organization

began to understand the full-power that the ERP system can deliver and understand the need to extend the ERP system, it gained better business value, with tighter collaboration with customers, suppliers, and ultimately, end users (Wallace and Kremzar, 2001). At the same time, many authors (Davenport, 2000; Nah, 2001) pointed out the ease of failure, raising the need of analyzing the factors that lead to successful ERP implementations. Identifying factors leading to success or failure of ERP projects became a remarkable topic in the 2000s literature (Sumner, 2000; Bingi et al., 1999; Bahmanziari, 2004; Markus, 2000 to mention but a few). Furthermore, the technological context evolved essentially making the state of affairs even more complex and the ERP systems more innovative than ever and their assimilation more challenging. Our assumption is that implementing an ERP system is a complex process and is likely to be a radical technological innovation, necessitating not only technical expertise, but also a range of organizational adaptations in a well performed change management process.

## **2. ERP assimilation and change management**

Implementation of an innovation is a dynamic process of adaptation. As reported in the literature, adoption of an ERP is a challenging and complex organizational learning and change management process (Kumar et al., 2000; Markus et al., 2000; Davenport, 2000; Nah et al., 2001). Therefore, the success of the implementation depends highly on the company's openness to change. Change is not always welcomed by all individuals, so the first step is to ensure that the executive management supports the team's vision, the vendor selection and the implementation project from beginning to completion. When an ERP software provider is selected, it should display the qualities and be prepared to act as a "change agent", one who has the ability to lead the company confidently and rapidly through the change process, one who can explain short-term and long-term benefits of the proposed changes, while being sensitive to each employee's level of change acceptance.

The ERP implementation's ultimate success is more than the effective IS implementation. As some authors pointed out when talking about information system success (Kwon and Zmud, 1987), the ERP system should be integrated and embedded in the organization and its culture before it can generate business value. The most noticeable aspect is related to the user acceptance. Practice revealed that one major ERP implementation problem is the lack of commitment, acceptance and readiness of users to deploy the system (mentioned as a major failure issue in many papers). The mentioned explanations include: lack of ERP product knowledge and of appropriate users' training, insufficient internal expertise, deficiency of education about the system's benefits and usefulness, lack of support documentation (Markus et al., 2000; Loh and Koh, 2004; Gargeya et al., 2005).

### **2.1 The concept of IT assimilation**

Founded on this line of reasoning, the ERP implementation should be also analyzed in terms of organizational IT assimilation. Based on Merriam-Webster dictionary, one good definition for assimilation is "the process of receiving new facts or of responding to new situations in conformity with what is already available to consciousness" (<http://www.merriam-webster.com/dictionary/assimilation>). We consider this approach to be consistent with IT (ERP in particular) assimilation,

rather than another frequently cited definition which says that “IT assimilation is an important outcome in the efforts of firms to leverage the potential of information technologies in their business activities and strategies” (Armstrong and Sambaburthy, 1999). We also agree with Purvis et al. (2001) that consider IT assimilation as the extent to which the IT becomes routinized and embedded in the organization’s business processes and value chain activities. ERP assimilation is the process which extends from the early awareness of the ERP initiative to its wide-scale organizational deployment. Fichman (2000) describes an IT assimilation process with the following stages: awareness, interest, evaluation, trial, commitment, and deployment. Another point of view (Cooper and Zmud, 1990; Gallivan, 2001) is based on the diffusion of innovation theory (Rogers, 1995) and identifies six stages of organizational IT assimilation: initiation, adoption, adaptation, acceptance, routinization and infusion.

In the first stage, the need to change emerges and an IT project – an ERP system in our case – is initiated. **Adoption** happens when a key person in a managerial position sustains and rationalizes the ERP project in terms of benefits and expected results. Here is where the change effort is engaged: priorities are realigned and necessary resources are authorized. The **adaptation** phase prepares the organization for the technological innovation and it is based on openness and determination in accepting the change. In case of ERP, this phase has two big challenges: the business processes reengineering (BPR) and the users’ resistance to change. BPR is supposed to align the organization’s business processes with the ERP system while pursuing to maximize the operational efficiency. In order to do the BPR, the managers should have a vision and a commitment to see the change through. A knowledge transfer from inside the organization to the vendor’s analysts takes place. For that reason the users’ resistance to change needs to be overcome. Two directions should be tackled: the need for change and the desire for change. Therefore, the users’ training starts with their education about the need for the new system, its implications (design and definition of the new processes) and its benefits. In the final part of the ERP implementation, in the fourth stage of IT assimilation, the focus of training moves to the understanding of functionality of the software, through the transfer of knowledge and skills about the application exploitation. The **acceptance** of the users should be achieved. Tactics such as communication and participation (users’ involvement) are beneficial here more than in the other stages. At the ERP’s go live moment, users should be committed to the new technology, their attitude should be a fair one, and their work habits should be changed not only because they have assessed the required knowledge and skills, but they have agreed to the change. The fifth stage of **routinization** and the last one of **infusion** take part in the post-implementation time. While mastering better the new technology utilization, they transform it into routine and they shift understanding to a new level of competency.

## 2.2 The ERP assimilation – phases and critical factors

Considering the ERP lifecycle (see Figure 1), there is a discussion related to the connection of the IT assimilation stages with the ERP project phases.

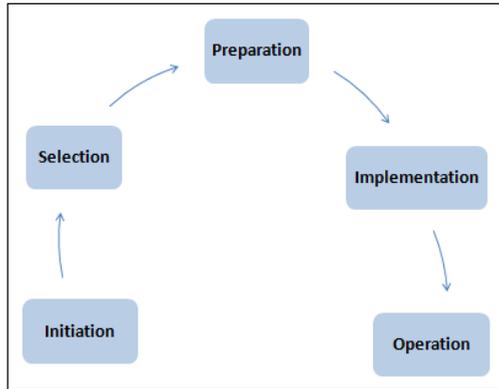

Figure 1. ERP project stages

Some authors (like Bajwa et al, 2004) are correlating the stages from the beginning (Figure 2a), while others (Cooper and Zmud, 1990) are placing the IT assimilation steps in the last part of the ERP project, continuing in the post-implementation phase (Figure 2b).

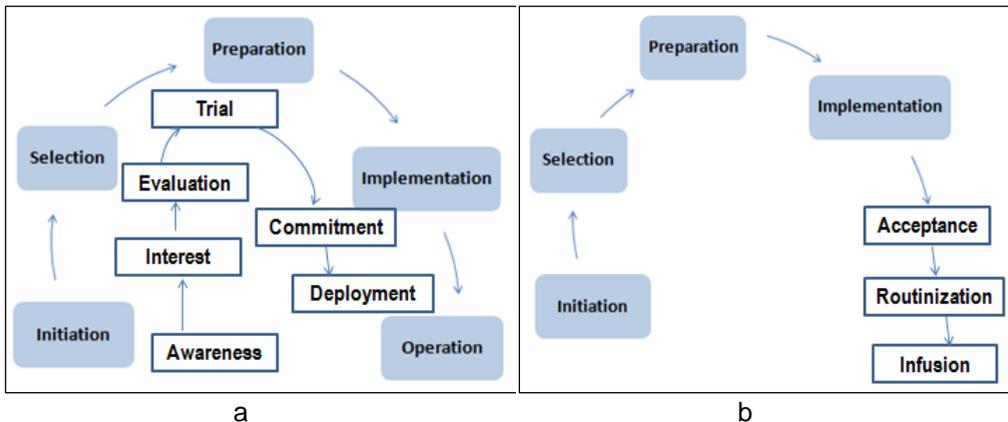

Figure 2. ERP project stages and IT assimilation steps

In our opinion, in the case of ERP assimilation, the picture from Figure 2b should be amended by introducing the opening steps in the first part of the project and by moving the acceptance step before the go live moment, continuing in the post-implementation phase with routinization and infusion (see Figure 3).

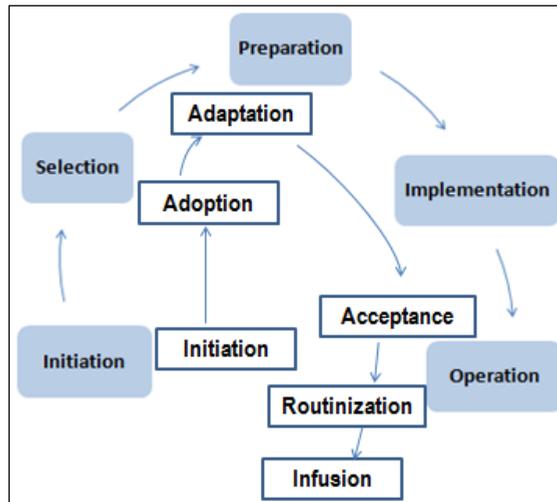

Figure 3. ERP project stages and IT assimilation steps during the entire ERP lifecycle

The ERP implementation is a project orchestrated by three parties: the client organization, the vendor, and an organization aiding the implementation (the consultant). In small and medium-sized projects the vendor is also carrying on the implementation. Generally, the vendor carries the burden of the ERP project success, everyone expecting him to have all the necessary knowledge and skills to conduct and control it. Experience shows that with all the expertise in the world, great reputation and credibility, the ERP project might fail. The explanation is quite simple: business-related outcomes are only partially related to the system implementation itself or, in other words, because of the knowledge gap. In the literature review on factors that potentially affect ERP implementation we found some studies about knowledge integration/diffusion. They all explore the process of knowledge integration and they agree on the difficulties and importance of integrating the knowledge of all parties that take part in the implementation (Sumner, 2000; Soh et al., 2000) and some of them identify impediments which prevent participants from transferring their knowledge successfully (Huang et al., 2001). Far less discussed is the importance of the knowledge held by the beneficiary. It is commonly recognized that the client has the best knowledge of its particular business processes, organizational issues, as well as the competitive situation. We believe that the knowledge transfer takes place both ways in the interaction between the users and the implementation team.

A significant factor for the ERP assimilation, revealed in each and every paper on ERP implementation analysis is users' resistance to change, derived from the organizational change and related to the organizational culture. Some cultures are more conducive to change than others, since a culture where everyone works together is likely to stimulate change more successively than one that is characterized by internal strife (Harwood, 2003). The group of people that form an organization share "philosophies, ideologies, values, beliefs, expectations, attitudes, and norms" that keeps them together (Kilmann et al., 1996). But culture can change, or hopefully, it evolves over time to an improved state. Top

management team promotes a vision and leads or indulges the cultural change. In an ERP implementation, their involvement and sustained support through all the phases help ensuring change management and eliminating resistance to change (Nah et al., 2003; Somers and Nelson, 2004; Al-Mashari et al., 2003; Dezdar et al., 2011). Maditinos et al (2012) consider that top management should ensure user support in order to achieve a successful ERP implementation. They identified several ways to obtain such an outcome, as follows: users should be able to express their point of view on the necessity to implement the solution, users should be able to express their opinion about the specification of the future system, users should be able to actively participate in the implementation process and users should be rewarded if the ERP system will be used with success.

### 3. ERP assimilation – a survey in a Romanian public university

Based on the literature review and on the ERP assimilation steps as illustrated in Figure 3, we will analyze the ERP assimilation from the end-user perspective. The survey was conducted in a Romanian University, a public organization, which finished the implementation of an integrated information system 18 months ago (October 2011). The users belonged to the administrative staff (secretary position); they are using the same module of software, so they have the same experience of adopting a new technology. In a total number of 57 users with similar positions in different faculties, we have questioned 20 users, in three different faculties.

Table 1. Evaluation of the ERP assimilation steps in the studied organization

Assimilation steps	Factors	Evaluation criteria	Result
Initiation	X	X	X
Adoption	Organizational culture IT education &knowledge	Openness to change Top management commitment	Not succeed
Adaptation	Change management	Top management commitment Level of knowledge before implementation	Partially achieved
Acceptance	Users' resistance to change	Knowledge transfer	Partially achieved
Routinization	Users' digital competencies	Level of knowledge after implementation Users' satisfaction	Achieved
Infusion	X	X	X

As described in Table 1, our survey focused some factors we considered relevant from the end-users' point of view. For each factor we had some evaluation criteria (covered by the questions in the survey). The last column established the result for each step of the assimilation process.

*The adoption step (Q1, Q2).* We aimed to find out whether the end-users were asked if they would agree or disagree with the implementation of the new system, and the

results were astonishing: only 5% of our population was informed of the changes to come and their opinion requested. The decision was taken at the management level. At the time users were officially announced about the new project, their opinion was negative, unenthusiastic, and even pessimistic: almost 60% thought it was definitely another software application they will have to learn, and only 20% considered it the best IT solution of the department they worked in.

*The adaptation step (Q5, Q3).* Considering the results of our study we can assert that top management didn't ask the end-users about their opinion about the new ERP system and didn't create and maintain communication channels with them. 80% of the interviewed end-users indicated us that the dean or vice dean and the IT manager didn't help them at all to understand or use the new system. They consider to be supported the most by the internal consultants (85%) and their chief secretary (40%) and they were really counting on each other while 55% declare to understand the new system from the other colleagues.

A factor with positive effect in this step of ERP assimilation is a good level of knowledge, the end-users should be at least PC literate. In the studied organization, based on the results determined, we found that end-users have high levels of knowledge of using specialized office software, like MS Office Word and MS Office Excel, and their PC skills are more than above average, while 55% declare to have an excellent knowledge level.

*The acceptance step (Q6).* In this project, the end-users interacted with the ERP vendor consultants and the internal consultants. They revealed us that the vendor consultants didn't help them neither understand how the system works or how they can use it. Over 65% of the end-users felt that external expertise didn't act as allies in this rough road to assimilate the ERP system. On the other hand, over 90% of the end-users believe that the internal expertise was exploited to its maximum. The internal consultants were always present when they needed to understand how the system work in order to fulfil their task and when they needed support on how to use it in their daily job routine. Likewise, the support in using the new system should have been granted by the direct hierarchical manager, in our case the chief secretary (35%) or by the colleagues with similar position. Again 55% of the responses indicate that they count on their colleagues support and only 15% declare they did not ask questions to their co-workers.

*The routinization step (Q7, Q4).* The new system was assimilated, even though the users still have a disapproving belief with 10% considering that that system needs to be replaced. 60% of the users that considered in the beginning that the new ERP was just another software application to learn are thinking now that it is a solution that can be successfully used, but still needs some changes to be made in order to be the perfect software for their needs. Moreover, the percentage of those who assumed that the new information system is the best solution has increased by 10%, reaching now 30% of the interviewed population. 35% of interviewed users considered their digital competencies improved, while the rest considered they remained at the same level – a positive situation overall.

**To sum up**, the new ERP system was assimilated in the end, but the process took longer than anticipated and it had difficult instants, especially in the first part of the project. If the perception of the users would have been different, they would have accepted the change naturally, they would have been open to communicate with the vendor's consultants and, of course, open to learn.

#### 4. Conclusions

ERP implementation is a major change process that includes all areas of an organization, and the most important aspect is the human resource. Change isn't always desired by all the people in the organization, but it is important that executive management to be involved in this process from beginning until the final stages. The top management has to have the ability to explain the benefits of such a solution and to support an easier transition from the existing system to the new ERP based information system.

Our case study had a happy end eventually, but a lot of time and money could be saved with a different approach of each ERP assimilation step. The users' adversity discontinued the activities and obstructed the knowledge transfer to the vendors' consultants who were confronted with strong disagreement and even hostility. We could not establish which the exact determiners for their behaviour were, and this might constitute an objective for further research, along with a correlation analysis within the sample. However, we know that they reside in the organizational culture, a wide-ranging factor with the highest influence in what seems to be a technological project.

maresdaniel@yahoo.com

**Abstract:** *Marketing activity involves many decision situations. They may have a lower or higher complexity, but all involve organizing, processing, extracting and analyzing of a large volume of information. By using specialized software that provides tools for analysis, company managers can quickly obtain significant information about market. They can also get overview, synthesis of certain aspects of company activities. In the data analysis activity traditional methods and software tools can be used, such as: dispersion analysis software, multi-factor techniques, regression analysis software and data-series analysis software, useful in data-series analysis in their trend format, seasonality and of the other dynamic series components. But if a more complex economic analysis is demanded, where the information is needed to be presented in the form of diagrams, is necessary to use specialized software tools for analysis, such as those offered by spreadsheet applications. Of those who know and use spreadsheet applications for drawing up the reports necessary for carrying out the work, many use the Microsoft Excel. Using Microsoft Excel software, data can be organized and processed quickly, accurately and thoroughly. Also, the facilities for the extraction, aggregation and analysis bring real value to a business activity. From the same volume of processed data a higher volume of complex and diversified information can be obtained, thus offering a more complete picture on the analyzed decisional situation in its entire. For this reason we conducted a study in which we sought to obtain information on how these applications are used in the marketing activities of companies. Microsoft Excel software is used a lot in marketing activities of companies in Bihor County, but data analysis tools it provides are used too little. Collected and stored data are not used to their full value. In this way, companies do not have information that could help to better understand customer behavior and market products.*

**Keywords:** *data analysis; spreadsheet software; economic analysis activity*

**JEL classification:** M21; C83

## **1. Introduction**

Marketing activity involves many decision situations. They may have a lower or higher complexity, but all involve organizing, processing, extracting and analyzing of a large volume of information (Popa and Sasu, 2008). By using specialized software that provides tools for analysis, company managers can quickly obtain significant information about market, costs, prices, sells, market promotion and emergence on specific geographic areas, consumer categories. Also, one can get overviews, image synthesis of certain aspects of dynamic activities such as monthly or quarterly growth in sales of a certain product groups in a given geographical area, profit made in a given period of time (week, month, quarter) by selling a product type.

Low-end tools of data analysis provide opportunities for simple queries, being useful for people who need a quick-reference to the databases information. Powerful tools for data analysis, such as multidimensional analysis, allows performing complex analysis (Han and Kamber, 2006), capitalization of the information found in databases for effective decision making, both at the strategic and technical levels (Soares, Peng, Meng, Washio and Zhou, 2008). They provide the possibility of data consolidation, of complex spreadsheets use, which allows grouping of rows and columns expressing different dimensions and different levels of aggregation, and of the aggregation level change, needed to determine the optimum level of granularity for analysis. They can be successfully used in marketing for: the analysis of products, sales, company's customers and suppliers, market segmentation, risk analysis, forecasting customer preferences, attracting new customers, and so on.

For different reasons some companies are opting for a summary analysis of data, while others for a complex analysis of the data. For this aim traditional analysis software tools or specialized analysis software tools are used.

Many companies use spreadsheet applications for inventory, data processing and analysis, useful for marketing activities. Microsoft Excel software is used by many of those who know and use spreadsheet applications for drawing up the reports necessary for carrying out the work.

## **2. Tools offered by Microsoft Excel software**

Using Microsoft Excel, data can be organized and processed quickly, accurately and thoroughly. Also, the facilities for the extraction, aggregation and analysis bring real value to a business activity (Nagy and Vizental, 2009). From the same volume of processed data a higher volume of complex and diversified information can be obtained, thus offering a more complete picture on the analyzed decisional situation in its entire.

Facilities offered by the Microsoft Excel software are used differently by different companies.

For example, in some companies Microsoft Excel software is used only for recording data as spreadsheets by using simple formulas and common functions. Mainly, a person compares current month data with data on the previous month and decides what to do in the month which follows. These companies are devoid of vital information that might help them better understand, for example, customer behaviour or market behaviour.

For other companies, computing power and data analysis provided by Microsoft Excel software is used to a large extent. Using tools to organize, aggregate, statistic processing, modelling and data analysis provided by spreadsheet application, these

companies can make complex economic analyses that provide benefits for the case of rapidly changing market environment.

Managing data in the form of spreadsheets makes them be easily found. Worksheets for a customer or supplier may be suggestively named and stored in a single spreadsheet, thus information being easily located. Complex mathematical, statistical and financial calculations can be made, data lists can be efficiently processed, suggestive reports that contain different levels of detail and also charts can be created, analysis and forecasts leading to the best decisions can be made (Johnson, 2008).

Microsoft Excel software provides efficient solutions to many situations for a business activity. Using the tools it offers, following activities can be made:

- Summary tables without levels of detail, based on data stored in different spreadsheets. They can be used, for example, to obtain a quarterly summary on monthly expenses (Taylor, 1999).
- Filtering, which allows to quickly find and highlight information that meet certain criteria. They can be applied for example, to the costs lists in order to obtain the desired information quickly.
- Sorting, which allows organizing data in a logical manner. They can be used, for example, to present costs lists in a suggestive manner.
- Subtotals of a data list. They allow the creation of a summary containing details that can be shown or hidden as needed. May be helpful in expenses analysis.
- Pivot tables that offer great flexibility in data presentation (Jacobson, R. 1997). Allow organizing data stored in multiple spreadsheets, show or hide details, change in the pattern or level of detail displayed. For example, costs can be displayed by categories and quarters.
- Charts. They show visual data and the relationships between them, allowing quick understanding of their meaning. They are used to calculate a trend series data, such as monthly sales over a period of time, and to predict future sales
- What-if analysis which evaluates various possibilities for the cases when one, two or more factors influences the values of the results. (Lacurezeanu and Buchmann, 2009) They can be used, for example, to analyze the way in which the number unit sales, unit price, advertising expense affect a company's profits.
- Analysis of situations in which several parameters may be changed simultaneously in order to reach a specific goal. They are useful in determining the optimal mix of products, efficient organizing of human resources, in solving the problems of transport and distribution, efficient allocation of financial resources, financial planning. (Bălan and Dumitru, 2011).

Microsoft Excel software has the status of a standard in spreadsheet software. It is integrated with Microsoft Office software so that the data and the processing results can be transferred between all components of Microsoft Office software, which is an important advantage in creating various reports.

### 3. The premises of the research

In the performed research we started from the following hypothesis:

- Companies in Bihor County are using Microsoft Excel software.
- Companies in Bihor County are using Microsoft Excel software in the marketing activities.
- Companies in Bihor County are using data analysis tools offered by Microsoft Excel software in the marketing activities.

### 4. The research methodology

Companies analyzed in this research were selected from a database organized at national level, which can be accessed online at [www.listafirme.ro](http://www.listafirme.ro) (accessed on October, 2012). The database which we used has a search engine that allows searches of companies in terms of location and filtering the results by number of employees. This way it was possible to make a list of companies in Bihor County filtered by size, such as: up to 10 employees, between 10 and 50 employees, more than 50 employees.

We randomly selected from this database 1200 companies, 400 of each category. To collect the necessary information we used questionnaires. The first question in the questionnaire was if they use Microsoft Excel software in their activity. If the answer was affirmative, they were asked to respond to the questions which follow. A number of 936 of the total questionnaires were returned and used for analysis, resulting a response rate of 78%. Response rate for each category considered is presented in the Table1:

**Table 1:** Response rate for each category considered

<b>Response rate / Company's size</b>	
up to 10 employees	67,25 %
between 10 and 50 employees	76,50%
with more than 50 employees	90,25 %

The questions were grouped as follows:

- Questions related to the company's size.  
The companies were structured as follows:
  - up to 10 employees
  - between 10 and 50 employees
  - with more than 50 employees
- Questions related to existence of a marketing department in company's organizational structure and employees number.
- Questions related to marketing activities of the company.
- Questions related to department in which the employee in charge with marketing activities is hired (if the company does not have a marketing department) and position which he holds in the company.
- Questions related to the complexity of the reports needed in marketing activity.
- Questions related to the analysis activity of the economic data.

- Questions related to the graduated domain, informatics studies attended and software application known by the employee in charge with marketing activity.
- Questions related to the software applications they currently use in marketing activities.
- Questions related to how much Microsoft Excel software is used in organizing, processing, presenting and analyzing data.
- Questions related to the tools which they use for organizing, processing and analyzing data offered by Microsoft Excel software and used in marketing activities.
- Questions related to the importance given by the senior management in improving the employees' knowledge in using Microsoft Excel software.

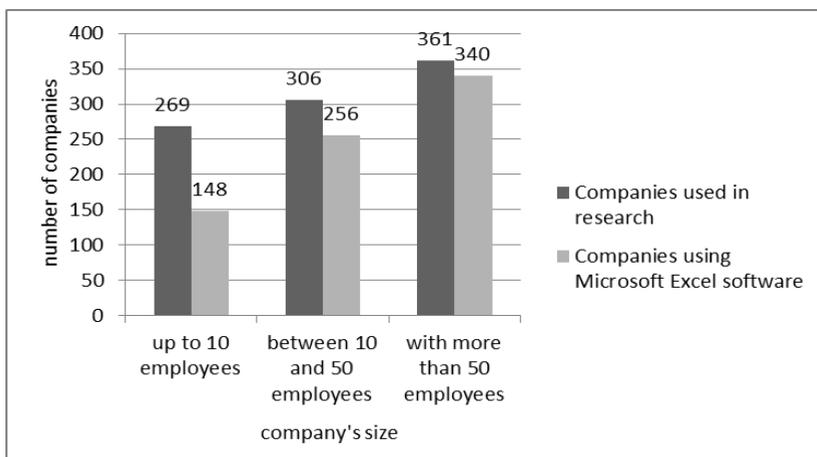

### 5. Data analysis and interpretation

A number of 744 questionnaires have confirmed the fact that companies use Microsoft Excel software. Distribution for each category considered is presented in Table2:

**Table 2:** Usage of Microsoft Excel software, depending on company size

Number of companies/ Company's size	N	Total number of companies	Companies using Microsoft Excel software
up to 10 employees	%	269	148 55,02
between 10 and 50 employees	%	306	256 83,66
with more than 50 employees	%	361	340 94,18

For a visual presentation of the data and better understand their significance we represented the data as a chart, in Figure 1:

**Figure 1:** Usage of Microsoft Excel software by companies

Regarding the first hypothesis, Table1 shows that Microsoft Excel software is used to a lesser extent in small companies with less than 10 employees and to a greater extent in other.

Therefore, many of the small companies with less than 10 employees (44,98%), neither they give enough importance in data organizing, data processing and analysis, nor their employees know how to use Microsoft Excel.

Regarding the last two hypotheses, collected data showed that:

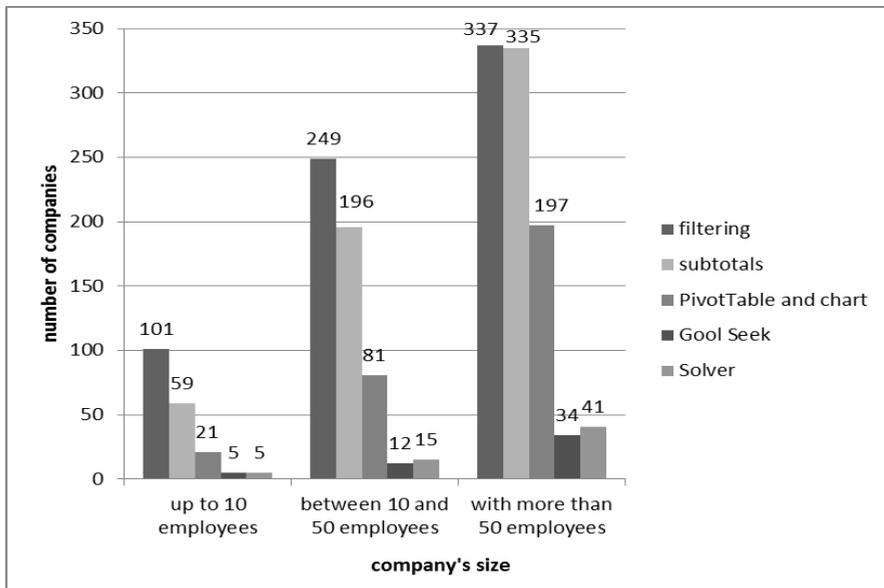

- In 31,76% of the companies with less than 10 employees Microsoft Excel software is used mainly in data inventory using spreadsheet forms, due to lack of knowledge in how to use Microsoft Excel software. Only simple formulas are used, like sorting and usual functions (such as sum, average, count, max, min). Using the results, a person can make a decision, usually regarding to what to do in the upcoming month, based on the current data, compared to the data acquired in the previous month.
- Only 39,86% of the companies with less than 10 employees and 76,56% of the companies with a number of employees between 10 and 50 use subtotal function. By using the subtotal function, detailed information such as lists of expenses, individual sales records, number of articles in each type of inventory could be used effectively in the decision making process.
- Pivot tables and charts are used to a greater extent in companies with more than 50 employees (57,94%). Therefore, we noticed that still too few companies give importance in organizing, processing and presenting data in a manner which allows effective marketing decisions.  
PivotTables ensure great flexibility in data presentation. They allow dynamic summaries for efficient data analysis. Stored data can be organized in multiple spreadsheets. All required details can be displayed or hidden. The way in which data is presented can be changed easily, by changing either the configuration or the level of the details displayed. A chart creates a visual representation of the data and their relations with other data, which allows easy understanding of their significance. Trend line to a data series, such as, for example, monthly sales during the year, can be calculated and used to forecast future sales. Similar data series, but represented on different numeric scales, such as, for example, sales volume (in pieces) and price (in euro/piece) can be displayed on the same chart, using a secondary axis. Thus, it is possible to relate the sales volume and selling price in a direct and significant manner.
- Very few companies use data analysis tools offered by Microsoft Excel software. This is because employees have only basic knowledge in using Microsoft Excel.
- Companies that use Goal Seek tool, also use Solver tool, which was expected.
- Most companies don't give proper consideration to data analysis tools offered by Microsoft Excel software. Their use could bring many benefits to companies.

Results are synthesized in the Table3.

**Table 3:** Usage of tools offered by Microsoft Excel software in the marketing activities, depending on company size

Instruments used/ Company's size	N	Filtering	Subtotals	PivotTables and chart	Goal Seek	Solver
up to 10 employees	%	101 68,24	59 39,86	21 14,19	5 3,38	5 3,38
between 10 and 50 employees	%	249 97,26	196 76,56	81 31,64	12 4,82	15 6,02
with more than 50 employees	%	337 99,12	335 98,53	197 57,94	34 10,09	41 12,17
Total	%	687 92,34	590 79,30	299 40,19	51 6,85	61 8,20

For a visual presentation of the data and better understanding of their significance, the data is represented as a chart, in Figure 2:

**Figure 2:** Usage of data analysis tools by companies

## 6. Conclusions

Microsoft Excel software offers a number of powerful tools and techniques that can be used for organizing, processing, modelling, analysis and presentation of data. Conducted research shows that Microsoft Excel software is used, in most cases, at its basic techniques level. This is because employees have only basic knowledge in using Microsoft Excel. Tools for organizing and statistical data processing, for presentation and assessment of trends and relationships between data, for data analysis are known and used in a lesser extent. Few of the respondents use tools for creating scenarios in decision making.

Microsoft Excel software is used a lot in marketing activities of companies in Bihor County, but data analysis tools it provides are used too little. Collected and stored data are not used to their real extent. This way, companies do not have information that could help them to better understand customer behaviour and market products.

**Abstract:** *Number of Internet users who access the websites of different companies to find information and to buy online is growing. In these conditions, the companies to be able to communicate the informational message, promotional message or intention to initiate trading exchange, must be present in the virtual environment. The company's website can be used as a tool in marketing strategy, as a means of developing identity or increasing the brand exposure, as a support for communication with potential clients or as a means for market research. The website, as an interface between customers and company, must answer as many questions as possible and it must trigger the impulse that motivates consumers to return and buy products/services from the company. This paper contains a study of the websites belonging to 330 companies from the Bihor County. In the study conducted were considered companies in Bihor County that are present in the virtual environment through websites. The elements that have been analysed are the measure and the manner in which companies use the online environment to communicate their identity. The websites are analysed in terms of their design, in terms of the way it influences the experience in visualising the site and in terms of the design elements used to facilitate navigability, to encourage interaction between the visitor and the company, to prove credibility, accuracy and valability of the information and to demonstrate that the information is presented in an objective manner. We considered the following criteria for evaluation of sites: the presence of information about the organization such as general information, information about products and means of distribution, company location; the structure used to present the information on the website home page, the navigability elements, the elements to prove credibility, the quality level of the company products, the presence and percentage of graphics, applying the design principles, the presence of those elements that ensure interaction with the website visitors.*

**Keywords:** *website; virtual environment; design elements; design principles; marketing strategy*

**JEL classification:** *L81; C85*

## **1. Introduction**

An increasing number of users of Internet use to search for information about products and services and to buying products or services. In these circumstances companies should be present in the online environment to initiate a dialogue with them. Must be present in the online environment to be able to communicate the informational message, promotional message or intention to initiate commercial exchange (Gay, Charlesworth and Esen, 2009).

Companies use websites for different purposes: to communicate information about the company, to promote products or services, to provide potential customers the opportunity to purchase these products online, to interact with them (Charlesworth, 2009). Website of a company ensure its constant presence and can be used as a tool in marketing strategy, can be used as a means of developing identity and increase brand exposure, as support for relationships with potential buyers or as a means of achieving market research (Armstrong and Kotler 2010). But for the website to fulfill the purpose for which it was made must give due consideration to certain aspects.

In the study conducted we watched those elements of websites, which in combination, can lead to obtaining a successful website (McClurg-Genevese, 2005). Website design must consider customer requirements. Some interactive features of the website, such as ease of navigation, ease of product selection they can attract customers (McClurg-Genevese, 2005)). But the elements that confer trust, privacy, security are decisive for triggering the buying process.

## 2. Research methodology

The websites analyzed in the research conducted were selected from a database composed at national level (*www.listafirme.ro*, accessed september, 2012). The database used has a search engine that allows searches based on criteria such as name, location and domain, advanced searches based on the number of employees, turnover, profit, filtering of results based on: phone number or fax, e-mail, website, etc.

The websites selection had three stages:

- Selecting companies from the Bihor county. Grouping companies by type of activity carried out in three categories: manufacturing industry, trade and services. Share of companies by type of activity carried out is presented in Table1

**Table 1:** Percentage of firms according to the type of activity carried

<b>Activity</b>	<b>Percent</b>
Manufacturing industry	10,98%
Commerce	10,04%
Services	78,98%
<b>TOTAL</b>	<b>100%</b>

- Selecting those companies from the Bihor county that have websites. The result is a number of 1553 companies with websites.
- Selecting websites for analysis. 330 websites were selected, taking into account the percentages in Table 1. We obtained the situation presented in Table 2.

**Table 2.** The number of company websites, selected depending on the type of company activity

<b>Activity</b>	<b>Number of websites</b>	<b>Percent</b>
Manufacturing industry	33	10%
Commerce	33	10%
Services	264	80%
<b>TOTAL</b>	<b>330</b>	<b>100%</b>

### 3. Website evaluation criteria

We considered the following criteria for evaluation of sites:

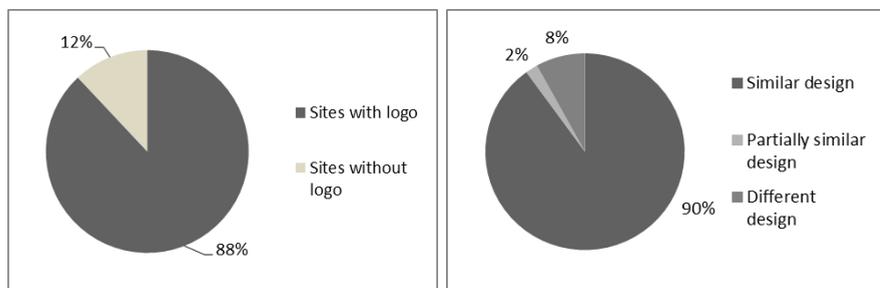

1. The presence of the following types of information about the organization: general information, information about products and means of distribution, company location.
2. The structure used to present the information on the website home page: framing, horizontal or vertical page segmentation, presence of the scroll bar, proportion between text and image/animation.
3. The navigability elements: page number, existence of an internal search engine, whose importance is strongly connected to the complexity of the site, options to display the text in multiple languages.
4. Elements that demonstrate credibility, the quality level of the company products. This category includes those elements that prove the existence and competence of the company and its employees in the domain activity: portfolio, partners, independent quality certification, company history, organisational chart and resumes of the most important employees
5. The presence and percentage of graphics: images, video and animations. The right proportion between text and visual elements has a great influence on the general aspect of the web page (Williams and Tollet 2002), the purpose of the latter being to animate the „dead zones” in the page or to create contrast.
6. Colour scheme and font, as well as applying the design principles: alignment, proximity, repetition and contrast (Fong-Gong and Cheih-Ying, 2009). All these design concepts refer to elements in a web page and how they interact in order to create a pleasing overall appearance. (Beaird, 2011).
7. The presence of those elements that ensure interaction with the website visitors: newsletter, comment or message section incorporated in the website, online purchase option, instant messaging IDs, blogs, social networking contact options, useful links to websites with additional information, product advertising outside the website domain, through social networks, public websites, entertainment or informative websites, generating the economic exchange or any other type of exchange that is included in the company activity domain or which is complementary to it.

#### 4. Data analysis and interpretation

The data related to the analysed websites were separated into two groups (general information and design related information) and were organised into an Excel table. After data analysis we concluded that:

1. Regarding the appearance (the identity elements, colour scheme, layout type, usage of photography, video or other graphic elements, scroll bar and the percentage between text and graphics were all taken into consideration):

- A percent of 12% of the companies did not have identity elements such as logos and taglines. In the case of the other, the majority of them have used de logo design to generate a consistent general appearance, by copying and repeating the colour scheme, the font and the font graphics (Figure 1).
- Just 2% websites have a partially similar design to their logo, while 8% other websites have a design that is completely different, thus isolating the logo from the other site elements (Figure 1). As a conclusion, there still are companies that do not use the basic tools to identify themselves in front of the public. The logos are placed on the page by following the convention which consists of placing important site elements: logo, menu and other navigability assistance tools on the top part of the page, in the first frame.

**Figure 1:** The usage of the basic identity elements

- As far as the website domain names are concerned, two different tendencies have been noticed: usage of the company registered name as website domain name (71% of the companies) and of a descriptive name, different from the official one.
- In the case of the home page structure, the most popular layouts are the ones with vertical framing, which help organise the information in columns. From the total number of websites, 91% use this type of structure, 7% have cut the pages on horizontal frames and 2% are unstructured. Sectioning the pages in frames is a simple way to structure the pieces of information depending on the group they belong to, and to help the visitors in finding the information they are looking for. Sectioning the page in a number of frames higher than two columns creates a vague appearance; the visitors are overwhelmed by the quantity of information they are being offered and thus they don't succeed in separating the important information from the additional one, destined to provide further explanation and detail concerning the products. In this case most of the websites use two columns, the percentage of the websites that have one and three columns respectively, being equal.

- The position of the web page on the screen is of three types: centered, on the left and on the right of the screen. The most used of the three is the centered position (76% of the websites) because this gives the best visibility to the content.
- The scroll bar is present on the home page in 30% of the cases. These companies want to assist the visitors by providing as many pieces of information as possible from the first click. This decision is highly debated: on one side the Internet users don't have to make an effort to search for information inside the site, while on the other side the home page becomes crowded, thus making it difficult for the visitors to track down the information they need. The utility of the scroll bar on the home page, from the visitors perspective, depends on the type of site. News websites, portals and online shops have a good justification in the large amount of information. Meanwhile the private companies websites, especially the ones with a presentation purpose, provide a much smaller amount of information, that allows them to split it on more web pages, to encourage the exploratory side of the visitors.
- As far as the type of content found on the home page is concerned, in 41% of the cases the main content is text, in 32% of the cases the proportion between text and images is balanced and in 27% on the cases the main content are images or other types of graphics. The websites that have a high amount of text are also the ones that are missing visual and audio elements. By using text and visual elements simultaneously and on the same page, the contrast that breaks the flatness given by the sole use of text is given. The most frequently found is photography (67% of the websites), followed by animation (43% of the websites), video (12% of the websites) and audio (6% of the websites). Thereby there are two types of websites to be observed: those which use only text and those which use all forms of content. The latter exposes the companies to the danger of promoting themselves through a „noisy” design.
- The general quality level of the visual appearance is measured with the help of the following elements: alignment, repetition, contrast and proximity. The alignment refers to the position of the elements on the page but also to the position of these elements towards each other. Most websites have the alignment of the text on the left while the images are centered. 18% of them have a correct alignment given by the use of frames and of graphics to create the right position on the page for the content. 22% of the websites have problems regarding alignment, in a way that some of them are inconsistent while others are misaligned.
- Most of the websites use colours as the main means of creating contrast (71% of the websites), some of these by mixing colour with graphics (32% of the websites). Texture and spacing are used in few cases, and 20% of all the websites do not use the contrast principle in their design. As far as repetition is concerned, the situation presents itself in a better light. 69% of the websites have distinctive layout, used for all the site pages.

2. Concerning the technical elements there were taken into consideration those elements which are considered to be of direct and large influence on the visitors' experience on the websites: the presence of meta-tags, the presence of dynamic content and the loading speed on the website:

- A percent of 20% of the analysed websites do not use meta-tags. A percent of 71% use them correctly, while 9% have an insufficient number of key-words (less than 10) to describe the content of the websites.
- The loading speed is one of the first elements that gets into contact with the visitors, giving them the opportunity to get a first impression on the website, from the point of view of the time it takes for the site to load. In most of the cases the loading speed is satisfactory.

3. Concerning the typography elements (there were taken into consideration those elements that have a considerable influence on the ease with which the visitors read the content on the pages: type of font, size, diacritics, text contrast, typing errors):

- A percent of 10% of the websites have typing errors, many of them on the home page.
- The diacritics are used only in 4% of the cases.
- The most frequently used fonts are the standard ones; italic fonts are used in a very few cases, only for titles.
- The contrast on the page is accomplished through alternating the size and styles of the fonts. In many cases different font sizes are combined with different styles, in order to emphasize the text areas or key words in a paragraph. The result is counterproductive for the visitors, whose attention is taken away from the message by the appearance of the text.

4. Concerning the information content (there were taken into consideration the accuracy and validity of the information, the credibility and the objectivity):

- From the objectivity point of view, the analysis of the content followed its purpose: to inform and to advertise. Most of the websites use both types of content, but depending on the case, it is either the informative or the advertising side that prevails. 24% of the websites use equally informative and advertising content.
- The objective nature of the information can be reinforced by proving its accuracy through independent sources: clients or organisations specialised in independent evaluation. The existence of such elements was followed: references, links leading to independent evaluation websites and, insofar as the company activity allows it, free samples of the products. Despite the importance these elements have in persuading the consumers to purchase, only 30% of the websites have included them in their web pages. 48% of these websites have on display on their pages lists with important clients, messages from clients concerning the product experiences or guestbooks as references. 54% of these post links to redirect visitors to independent, specialised evaluation websites, such as websites that rate service quality of tourism companies, and 6% websites offer the visitors the possibility to test the products, taking into consideration that in each case the nature of the products imposes limitations on this marketing instrument.
- The validity criterion takes into consideration the frequency with which the information on the websites is being updated. The difference between the online product description and the real one affects consumer perception on

the companies professional level and it diminishes their trust towards information given through the virtual environment. From the total number of companies, only 29% have regularly updated their websites. Most of the modifications are found in the promotional offers section, followed by the news and articles section, portfolio pages and financial information section.

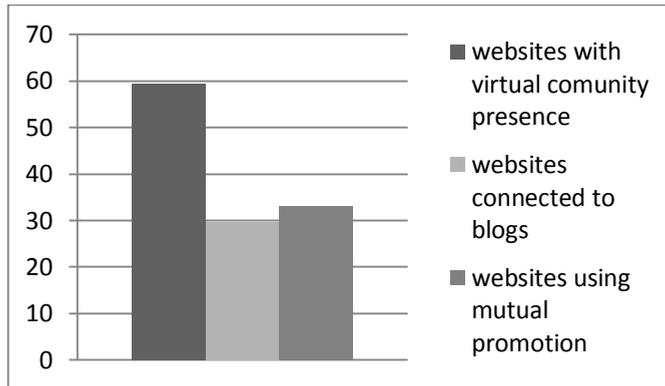

- The credibility elements have the goal to prove the existence and competence of a company in its field. Offering evidence to support the actual existence of the company headquarters, its branches, workstations or points of sale increases consumer trust and helps them locate the geographic area of the company. 32% of the websites offer the visitors location maps. The competence is proven with photographs, quality certificates, through brand association with clients, business partners, other products and sponsored events, through company history or its positive financial results. Most of the websites have posted photographs (of the offices, products or the manufacturing process, as well as others), 22% websites display quality certificates or operating permits, 29% websites have at least lists with the most important business partners and clients, 14% site have resumes of their most important employees while a lot less offer the company history and financial information.

5. Concerning the interaction and transaction elements:

- A percent of 72% of the websites have this type of elements, and from this group, 28% were classified into this category only because of the presence of contact forms, the most basic tools for online interaction.
- A percent of 29% of the websites allow online commercial exchange by posting links to online shops, such as companies trading in commerce or some services companies, by placing online orders, by allowing online appointments or by initiating consultancy dialogue with the clients, as it is the case with consultancy firms.
- A percent of 8% of the websites redirect visitors to virtual shops, while 14% of them give updates through newsletters and blogs and 16% of the websites communicate with public virtual spaces such as social networks and instant messaging programs. The latter category allows the exchange of information between the companies and users and it creates a community of visitors that have showed a strong interest in the company.

6. Concerning the advertisement elements (there were taken into consideration advertisements through websites or virtual community programs, connections between the website and blogs with information regarding the companies economic field and link exchange between companies that belong to complementary fields), as shown in Figure 2:

- A percent of 18% of the websites have a virtual community presence
- A percent of 9% of the website are connected to blogs
- A percent of 10% of the websites made arrangements with other companies in order to mutually promote themselves through link exchange. This marketing tool uses banners placed on the right side or at the bottom of the home page, their objective being to redirect visitors interested in a certain company or a type of service to the websites of other companies or products that are complementary to the former.

**Figure 2:** The usage of advertisement elements

## 5. Conclusions

As far as the appearance is concerned, in specialised works the idea of using a traditional layout versus an alternative layout, with an original structure, is highly debated (Skal, 2009), (Scott, 2010). On one side it is advisable to follow design conventions that Internet visitors are accustomed to, while some studies show they are adaptable to new layout schemes, provided that these schemes are consistent throughout the site.

The conducted study shows that there is an approximately equal proportion between websites with modern graphics that neglect the interests of visitors as far as the information they seek is concerned and websites with basic graphics that contain relevant information for visitors. There are two trends to be observed in the site design: the utilitarian trend, which believes information content to be more important than the graphics, and the aesthetic trend of manipulating the way information is presented in elaborate graphical shapes. One of the explanations for this could be that target consumers are a guiding criterion in designing the site. Thus, if a company's target consumers are conservative in nature, it will choose the utilitarian trend, while if the target consumers are innovative the website will have distinct design.

The site, as an interface between customers and company, must answer to as many questions as possible and it must trigger the impulse that motivates consumers to return and buy products/services from the company. The low number of websites that have interaction elements (only a half, given the importance of interaction with the public in the virtual environment, and excluding those websites that use only with basic contact forms) can be explained through the perpetuation of the idea that only firms in certain fields (trade companies – virtual shops; firms with a high frequency of new product release - newsletters) can use these tools.
